Abstract

Bounds are obtained for the efficiency or mean to peak ratio $E(\Omega)$ for the first Dirichlet eigenfunction for open, connected sets $\Omega$ with finite measure in Euclidean space $\mathbb{R}^m$. It is shown that (i) localisation implies vanishing efficiency, (ii) a vanishing upper bound for the efficiency implies localisation, (iii) localisation occurs for a wide class of elongating bounded, open, convex and planar sets, (iv) the efficiency of any quadrilateral with perpendicular diagonals of lengths $1$, and $n$ respectively is $O(n^{-2/3} \log n)$ as $n \to \infty$, and (v) the efficiency of $\{(x_1, x_2) : (2|n^{-1}x_1|)^\alpha + (2|x_2|)^\alpha < 1, 1 \leq \alpha < \infty, \}$ is $O(n^{-2/(\alpha+2)}(\log n)^{\max\{1/\alpha, 1/2\}})$, $n \to \infty$. This disproves some claims in the literature. A key technical tool is the Feynman-Kac formula.

Keywords: Efficiency, first Dirichlet eigenfunction, localisation.

1 Introduction

Let $\Omega$ be an open set in Euclidean space $\mathbb{R}^m$, $m \geq 2$, with boundary $\partial \Omega$, and finite measure $|\Omega|$. It is well known that the spectrum of the Dirichlet Laplacian acting in $L^2(\Omega)$ is discrete, and consists of an increasing sequence of eigenvalues

$$\lambda_1(\Omega) \leq \lambda_2(\Omega) \leq ....,$$

accumulating at infinity. We denote a corresponding orthonormal basis of eigenfunctions by $\{u_{j,\Omega}, j \in \mathbb{N}\}$,

$$-\Delta u_{j,\Omega} = \lambda_j(\Omega)u_{j,\Omega}, \ u_{j,\Omega} \in H_0^1(\Omega).$$

Throughout this paper we suppose that $\lambda(\Omega) := \lambda_1(\Omega)$ has multiplicity 1. This is for example satisfied if $\Omega$ is connected. In that case the eigenfunction $u_{1,\Omega}$ is uniquely defined up to a sign. We abbreviate, and choose, $u_\Omega := u_{1,\Omega} > 0$.

The Rayleigh-Ritz variational principle asserts that

\[
\lambda(\Omega) = \inf_{\varphi \in H^1_0(\Omega) \setminus \{0\}} \frac{\int_{\Omega} |\nabla \varphi|^2}{\int_{\Omega} \varphi^2}.
\] (1)

The efficiency ratio or average to peak ratio of \( \Omega \) is defined by

\[
E(\Omega) = \frac{\|u_\Omega\|_1}{|\Omega| \|u_\Omega\|_\infty},
\] (2)

where \( \| \cdot \|_p, 1 \leq p \leq \infty \) denotes the standard \( L^p(\Omega) \) norm.

The study of \( E(\Omega) \) goes back to the pioneering results of [19, 23]. In Theorem 3 of [19], it was shown that if \( \Omega \) is bounded and convex then

\[
E(\Omega) \leq \frac{2}{\pi},
\] (3)

with equality in (3) if \( \Omega \) is a bounded interval in \( \mathbb{R}^1 \). A non-linear version has been proved in [10] for the \( p \)-Laplacian with \( 1 < p < \infty \). More general results have been obtained in [7].

There it was shown that if \( \Omega \) is a bounded region in \( \mathbb{R}^m \) then,

\[
E(\Omega) \geq E(B) \left( \frac{|B| \lambda(B)}{|\Omega| \lambda(\Omega)} \right)^{m/2},
\] (4)

where \( B \) is a ball in \( \mathbb{R}^m \).

Moreover, it was asserted in Table 1 in [19] that \( \frac{2}{\pi} \) is the limit of the efficiency of a thinning annulus in \( \mathbb{R}^m \). The proof of this assertion (Theorem 10) will be given in Section 4 below. There we will also compute the efficiency for the equilateral triangle, square, and disc. These data support the conjecture that the efficiency of a bounded, convex planar set is maximised by the disc. We note that the efficiency for an arbitrary long rectangle is \( (2/\pi)^2 \approx 0.4053... \), whereas the efficiency of a disc is approximately \( 0.4317... \).

Inequalities (6.9) in [13], and (4.7) in [18] assert that for \( \Omega \) open, bounded, planar, and convex,

\[
u_\Omega(x) \leq \min\{|x - y| : y \in \partial \Omega\} \frac{\lambda(\Omega)^{1/2}}{|\Omega|} \|u_\Omega\|_1,
\] (5)

and both papers refer to [19] for details. However, no such inequality can be found in [19]. Inequality (5) would, by first maximising its right-hand side over all \( x \in \Omega \), and subsequently its left-hand side over all \( x \in \Omega \), imply that

\[
\|u_\Omega\|_\infty \leq \rho(\Omega) \frac{\lambda(\Omega)^{1/2}}{|\Omega|} \|u_\Omega\|_1.
\] (6)

Since the Dirichlet eigenvalues are monotone in the domain, and \( \Omega \) contains a disc of radius \( \rho(\Omega) \),

\[
\lambda(\Omega) \leq \frac{j_0^2}{\rho(\Omega)^2}.
\]

This, by (2) and (6), implies that for a bounded, planar convex set \( \Omega \),

\[
E(\Omega) \geq j_0^{-1},
\] (7)
where \( j_0 \) is the first positive zero of the Bessel function \( J_0 \). Inequality (6) was also quoted in formula (2.24) in [11]. However, (6) and (7) cannot hold true. In Theorem [5] and Corollary [6] below we give a wide class of elongating (or by scaling thinning) sequences with vanishing efficiency, which contradicts (7). This class includes the circular sector \( S_n(r) \) in \( \mathbb{R}^2 \).

\[
S_n(r) = \{ (\rho, \theta) : 0 < \rho < r, 0 < \theta < \pi/n \},
\]

the quadrilateral with vertices \((0, a_n), (0, -1 + a_n), (b_n, 0), (0, -n + b_n)\), where \( a_n \in [0, 1] \), and \( b_n \in [0, n] \), and the isosceles triangle with vertices \((n/2, 0), (-n/2, 0), (1, 0)\). The example of a circular sector allows for an explicit computation involving Bessel functions to show that \( \lim_{n \to \infty} E(S_n(r)) = 0 \). Example [8] below immediately implies that assertion, avoiding the Bessel function computations.

Recently a connection has been established between localisation of eigenfunctions and an effective potential such as the inverse of the torsion function (see [1]). In a similar spirit it has been shown in certain special cases such as a bounded interval in \( \mathbb{R} \) or a square in \( \mathbb{R}^2 \) that the eigenfunctions of the Schrödinger operator of Anderson type localise (see [2], and [3]).

In Theorem [2] below we establish a connection between a sequence of open sets with finite measure and with vanishing efficiency, that is \( E(\Omega_n) \to 0, n \to \infty \) and localisation. We recall the following definition in [13], (formula (7.1) for \( p = 1 \)).

**Definition 1.** Let \((\Omega_n)\) be a sequence of open, connected sets in \( \mathbb{R}^m \) with \(|\Omega_n| < \infty, n \in \mathbb{N}\), and let \( u_{\Omega_n} \) be the first Dirichlet eigenfunction normalised in \( L^2(\Omega_n) \). Let \( \varepsilon \in (0, 1) \). A sequence \((\Omega_n)_{n \in \mathbb{N}}\) is \( \varepsilon \)-localising if there exists a sequence of measurable sets \((A_{n,\varepsilon})\), with \( A_{n,\varepsilon} \subset \Omega_n, n \in \mathbb{N} \) such that

\[
\frac{|A_{n,\varepsilon}|}{|\Omega_n|} \leq \varepsilon,
\]

and

\[
\int_{A_{n,\varepsilon}} u_{\Omega_n}^2 \geq 1 - \varepsilon.
\]

A sequence \((\Omega_n)\) is localising if it is \( \varepsilon \)-localising for all \( \varepsilon \in (0, 1) \).

It follows directly by scaling of both \( u_{\Omega} \) and \( |\Omega| \) that if \( \Omega \) is open and connected with \(|\Omega| < \infty\), and if \( \alpha > 0 \), then

\[
E(\alpha \Omega) = E(\Omega),
\]

where \( \alpha \Omega \) is a homothety of \( \Omega \) by a factor \( \alpha \).

If \( \Omega_1 \) and \( \Omega_2 \) are open and connected sets in \( \mathbb{R}^{m_1} \), and \( \mathbb{R}^{m_2} \) respectively, and with finite measures \(|\Omega_1|_{m_1}\) and \(|\Omega_2|_{m_2}\), then

\[
E(\Omega_1 \times \Omega_2) = E(\Omega_1)E(\Omega_2),
\]

where \( \Omega_1 \times \Omega_2 \) is the Cartesian product in \( \mathbb{R}^{m_1+m_2} \). The proof of (12) follows by factorisation. We have that \( \Delta = \Delta_1 \oplus \Delta_2 \) is acting in \( L^2(\Omega_1 \times \Omega_2) \), \( \lambda(\Omega) = \lambda_1(\Omega_1) + \lambda_1(\Omega_2) \), \( u_{\Omega} = u_{1,\Omega_1} u_{1,\Omega_2} \), \( \| u_{\Omega} \|_1 = \| u_{1,\Omega_1} \|_1 \| u_{1,\Omega_2} \|_1 \) and \( \| u_{\Omega} \|_\infty = \| u_{1,\Omega_1} \|_\infty \| u_{1,\Omega_2} \|_\infty \).

Finally if \( \| u_{\Omega} \|_2 = 1 \), then

\[
|\Omega|^{-1} \| u_{\Omega} \|_\infty^{-2} \leq E(\Omega) \leq |\Omega|^{-1/2} \| u_{\Omega} \|_\infty^{-1},
\]

and

\[
E(\Omega) \leq |\Omega|^{-1} \left( \int_{\Omega} u_{\Omega} \right)^2.
\]
The second inequality of (13) follows immediately from Cauchy-Schwarz’s inequality, and the fact that \(\|u_\Omega\|_2 = 1\). The first inequality of (13) follows from

\[
1 = \|u_\Omega\|_2 \leq \|u_\Omega\|_\infty \int_\Omega u_\Omega.
\]  

Inequality (14) also follows from (15).

We have the following.

**Theorem 2.**  
(i) If \((\Omega_n)\) is a sequence of open sets in \(\mathbb{R}^m\) with \(|\Omega_n| < \infty, n \in \mathbb{N}\) which is localising, then \(\lim_{n \to \infty} E(\Omega_n) = 0\).

(ii) If \((\Omega_n)\) is a sequence of open sets in \(\mathbb{R}^m\) with \(|\Omega_n| < \infty, n \in \mathbb{N}\), and if

\[
\lim_{n \to \infty} \frac{1}{|\Omega_n|} \left( \int_{\Omega_n} u_{\Omega_n} \right)^2 = 0,
\]

then \((\Omega_n)\) is localising.

We do not have the statement that vanishing efficiency implies localisation but, in view of (14), Theorem 2 (ii) goes in that direction.

Denote by \(\rho(\Omega) = \sup\{\min\{|x - y| : y \in \partial\Omega\}, x \in \Omega\}\) the inradius of \(\Omega\), by \(\text{diam}(\Omega) = \sup\{|x - y| : x \in \Omega, y \in \Omega\}\) the diameter of \(\Omega\), and by \(w(\Omega)\) the width of \(\Omega\). For a measurable set \(A\) in \(\mathbb{R}^k\) with \(k < m\) we denote its \(k\)-dimensional Lebesgue measure by \(|A|_k\). The indicator function of a set \(A\) is denoted by \(\mathbf{1}_A\).

Below we show that sets with small \(E(\Omega)\) have a small inradius, and a large diameter.

**Theorem 3.** For all open, connected \(\Omega\) with \(|\Omega| < \infty\),

\[
\frac{\rho(\Omega)}{|\Omega|^{1/m}} \leq \left(\frac{e\pi^2(m-2)/2}{2\pi m}\right)^{1/2} E(\Omega)^{1/m}.
\]

If \(\Omega\) is open, planar, bounded, and convex, then

\[
\frac{\text{diam}(\Omega)}{|\Omega|^{1/2}} \geq \left(\frac{\pi}{e\rho(\Omega)}\right)^{1/2} E(\Omega)^{-1/2}.
\]

It is straightforward to construct sequences which are localising and, as a consequence of Theorem 2 (ii), have vanishing efficiency.

For example, let \(\Omega_n\) be the disjoint union of one disc \(B\) with radius 1, and \(4n\) discs with radii 1/2. All of the \(L^2\) mass of the first eigenfunction of \(\Omega_n\) is supported on \(B\), with \(|B|/|\Omega_n| = \frac{1}{m+1}\), which tends to 0 as \(n \to \infty\).

Theorem 3 below implies localisation for a wide class of regions. We first introduce the necessary notation.

**Definition 4.** The Dirichlet heat kernel for a non-empty open set \(\Omega\) is denoted by \(p_\Omega(x, y; t)\), \(x \in \Omega, y \in \Omega, t > 0\). Points in \(\mathbb{R}^m\) will be denoted by a Cartesian pair \((x_1, x')\) with \(x_1 \in \mathbb{R}, x' \in \mathbb{R}^{m-1}\). If \(\Omega\) is an open set in \(\mathbb{R}^m\), then we define \(\Omega(x_1) = \{x' \in \mathbb{R}^{m-1} : (x_1, x') \in \Omega\}\). If \(\Omega(x_1)\) is open, bounded, and non-empty in \(\mathbb{R}^{m-1}\), then we denote its first \((m-1)\)-dimensional Dirichlet eigenvalue by \(\mu(\Omega(x_1))\), and the corresponding Dirichlet heat kernel by \(\pi_{\Omega(x_1)}(x', y'; t), x' \in \Omega(x_1), y' \in \Omega(x_1), t > 0\). We also put \(\mu(\emptyset) = \infty\), \(\pi_\emptyset(x', y'; t) = 0\), and \(\Omega' = \bigcup_{x_1 \in \mathbb{R}} \Omega(x_1)\). A set \(\Omega \subset \mathbb{R}^m\) is horn-shaped if it is open, connected, \(x_1 > x_2 > 0\) implies \(\Omega(x_1) \subset \Omega(x_2)\), and \(x_1 < x_2 < 0\) implies \(\Omega(x_1) \subset \Omega(x_2)\).
Theorem 5. If $\Omega \subset \mathbb{R}^m$ is horn-shaped with $|\Omega| < \infty$, $|\Omega'|_{m-1} < \infty$, 

$$\mu(\Omega') \geq (m-1)(\lambda(\Omega) - \mu(\Omega')),$$

and if 

$$\varepsilon \in (0, |\Omega|\mu(\Omega')^{m/2}], \quad (20)$$

then 

$$\frac{1}{|\Omega|} \left( \int_{\Omega} u_{\Omega} \right)^2 \leq 2\varepsilon
+ \frac{2|\Omega'|_{m-1}}{|\Omega|} \{ x_1 \in \mathbb{R} : \frac{\mu(\Omega(x_1/2)) - \mu(\Omega')}{2(\lambda(\Omega) - \mu(\Omega'))} \leq \log \left( \varepsilon^{-1}|\Omega|\mu(\Omega(x_1/2))^{m/2} \right) \} \leq
+ \frac{2^{5/2}|\Omega'|_{m-1}}{|\Omega|} \left( \lambda(\Omega) - \mu(\Omega') \right)^{-1/2} \left( \log \left( \varepsilon^{-1}|\Omega|\mu(\Omega')^{m/2} \right) \right)^{1/2}. \quad (21)$$

Theorem 5 simplifies in the case of an open, bounded, planar, convex set $\Omega$. If $\Omega$ is bounded, then its width $w(\Omega) < \infty$. It is always possible to choose points $p$ and $q$ on $\partial \Omega$ such that $|p-q| = w(\Omega)$, and $p-q$ is perpendicular to the pair of straight parallel lines tangent to $\partial \Omega$ at $p$ and $q$ which define the width $w(\Omega)$. See Theorem 1.5 and its proof in [5]. We choose the origin $(0,0) = \frac{1}{2}(p+q)$, and choose the positive $x_1$-axis parallel to these straight lines. The $x' = x_2$-axis is chosen such that $q = (0, \frac{1}{2}w(\Omega))$. It is straightforward to verify that $\Omega$ is horn-shaped with $\Omega' = (-\frac{1}{2}w(\Omega), \frac{1}{2}w(\Omega))$.

Corollary 6. If $\Omega$ is an open, bounded, planar, and convex set, oriented such that $\Omega$ is horn-shaped with $\Omega' = (-\frac{1}{2}w(\Omega), \frac{1}{2}w(\Omega))$ as in the preceding paragraph, if 

$$\lambda(\Omega)w(\Omega)^2 \leq 2\pi^2, \quad (22)$$

and if 

$$\varepsilon \in (0, \pi^2 \text{diam}(\Omega)/(2w(\Omega))], \quad (23)$$

then 

$$\frac{1}{|\Omega|} \left( \int_{\Omega} u_{\Omega} \right)^2 \leq 2\varepsilon + \frac{4}{\text{diam}(\Omega)} \{ x_1 \in \mathbb{R} : \frac{\mu(\Omega(x_1/2))w(\Omega)^2 - \pi^2}{2(\lambda(\Omega)w(\Omega)^2 - \pi^2)} \leq \log \left( 4\pi^2\varepsilon^{-1}w(\Omega)^{-1}\text{diam}(\Omega) \right) \} \leq
+ \frac{2^{7/2}w(\Omega)}{\text{diam}(\Omega)} \left( \lambda(\Omega)w(\Omega)^2 - \pi^2 \right)^{-1/2} \left( \log \left( \pi^2\varepsilon^{-1}w(\Omega)^{-1}\text{diam}(\Omega) \right) \right)^{1/2}. \quad (24)$$

Corollary 6 provides a wealth of examples of localising sequences of bounded, planar, and convex sets.

Example 7. If $(a_n), (b_n), n \in \mathbb{N}$ are sequences in $\mathbb{R}$ satisfying $a_n \in [0,1], b_n \in [0,n]$, and if $\Omega_n$ is the quadrilateral with vertices $(0, a_n), (0, -1+a_n), (b_n, 0), (-n+b_n, 0)$, then $(\Omega_n)$ is localising, and 

$$E(\Omega_n) = O(n^{-2/3} \log n), \quad n \to \infty. \quad (25)$$

Example 8. Let $R_n \subset \mathbb{R}^2$ be the rhombus with vertices $(\frac{a}{2}, 0), (-\frac{a}{2}, 0), (0, \frac{b}{2}), (0, -\frac{b}{2})$, and let $\Omega_n$ be an open subset of $R_n$ which contains the open triangle with vertices $(\frac{a}{2}, 0), (0, \frac{b}{2}), (0, -\frac{b}{2})$. Then $(\Omega_n)$ is localising, and its efficiency satisfies (25).
Example 8 implies that the sequence of sectors \((S_n(r_n))\) with radii \(r_n = \frac{n}{2\cos(\pi/(2n))}\), and opening angles \(\pi/n\) localises as \(n \to \infty\). Indeed, for \(n \geq 2\), a translation and rotation of \(S_n(r_n)\) is contained in the rhombus \(R_n\), and contains the triangle \(T_n\).

Example 9. If \(1 \leq \alpha < \infty\), and if

\[
\Omega_{n,\alpha} = \{(x_1, x_2) : (2n^{-1}|x_1|)^\alpha + (2|x_2|)^\alpha < 1\}, \quad n \in \mathbb{N},
\]

then \((\Omega_{n,\alpha})\) is localising, and

\[
E(\Omega_{n,\alpha}) = O(n^{-2/(\alpha+2)}(\log n)^{\max\{1/\alpha, 1/2\}}), \quad n \to \infty.
\]  

\[(26)\]

Theorem 10. If \(R > 0, \varepsilon > 0\), and

\[
\Omega_{R, R+\varepsilon} = \{x \in \mathbb{R}^m : R < |x| < R + \varepsilon\},
\]

then

\[
\lim_{\varepsilon \downarrow 0} \varepsilon^2 \lambda(\Omega_{R, R+\varepsilon}) = \pi^2,
\]  

\[(27)\]

and

\[
\lim_{\varepsilon \downarrow 0} E(\Omega_{R, R+\varepsilon}) = \frac{2}{\pi}.
\]  

\[(28)\]

If \(\triangle \subset \mathbb{R}^2\) is an equilateral triangle, then

\[
E(\triangle) = \frac{2}{\pi \sqrt{3}}.
\]  

\[(29)\]

If \(\square \subset \mathbb{R}^2\) is a rectangle, then

\[
E(\square) = \frac{4}{\pi^2}.
\]  

\[(30)\]

If \(B \subset \mathbb{R}^2\) is a disc, then

\[
E(B) \approx 0.6782 \frac{2}{\pi}.
\]  

\[(31)\]

This paper is organised as follows. The proofs of Theorems 2 and 3 are deferred to Section 2 below. The proof of Theorem 5, Corollary 6, and Examples 7, 8, and 9 will be given in Section 3. The proof of Theorem 10 will be given in Section 4.

2 Proofs of Theorems 2 and 3

Proof of Theorem 2(i). It is well known that \(u_{\Omega_n} \in L^\infty(\Omega_n)\) whenever the spectrum of the Dirichlet Laplacian acting in \(L^2(\Omega_n)\) is discrete. The latter is certainly the case since
\[|\Omega_n| < \infty.\] Hence by (14), and Cauchy-Schwarz’s inequality we have

\[
E(\Omega_n) \leq \frac{1}{|\Omega_n|} \left( \int_{\Omega_n} u_{\Omega_n}^2 \right)
= \frac{1}{|\Omega_n|} \left( \int_{A_{n,\varepsilon}} u_{\Omega_n}^2 + \int_{\Omega_n \setminus A_{n,\varepsilon}} u_{\Omega_n}^2 \right)
\leq \frac{2}{|\Omega_n|} \left( \left( \int_{A_{n,\varepsilon}} u_{\Omega_n}^2 \right)^2 + \left( \int_{\Omega_n \setminus A_{n,\varepsilon}} u_{\Omega_n}^2 \right)^2 \right)
\leq \frac{2}{|\Omega_n|} \left( |A_{n,\varepsilon}| + |\Omega_n \setminus A_{n,\varepsilon}| \int_{\Omega_n \setminus A_{n,\varepsilon}} u_{\Omega_n}^2 \right)
\leq 2 \left( \frac{|A_{n,\varepsilon}|}{|\Omega_n|} + \varepsilon \right)
\leq 4\varepsilon,
\]

where we have used that \((\Omega_n)\) is \(\varepsilon\)-localising with (9) and (10). Since \(\varepsilon \in (0, 1)\) was arbitrary we conclude that

\[
\lim_{n \to \infty} E(\Omega_n) = 0. \tag{32}
\]

Proof of Theorem 2(ii). Let \(\varepsilon \in (0, 1)\) be arbitrary. There exists \(N_{\varepsilon} \in \mathbb{N}\) such that

\[
n \geq N_{\varepsilon} \Rightarrow \int_{\Omega_n} u_{\Omega_n} \leq \varepsilon^{1/2} |\Omega_n|^{1/2}. \tag{33}
\]

Let \(\alpha > 0\), and define

\[B_{n,\alpha} = \{x \in \Omega_n : u_{\Omega_n}(x) > \alpha\}.
\]

It follows that

\[
\int_{\Omega_n \setminus B_{n,\alpha}} u_{\Omega_n}^2 \leq \alpha^2 |\Omega_n \setminus B_{n,\alpha}|,
\]

and

\[
\int_{B_{n,\alpha}} u_{\Omega_n}^2 \geq 1 - \alpha^2 |\Omega_n \setminus B_{n,\alpha}| \geq 1 - \alpha^2 |\Omega_n|.
\]

Furthermore,

\[
\int_{B_{n,\alpha}} u_{\Omega_n} \geq \alpha |B_{n,\alpha}|. \tag{34}
\]

It follows by (33) and (34) that

\[
n \geq N_{\varepsilon} \Rightarrow |B_{n,\alpha}| \leq \alpha^{-1} \int_{B_{n,\alpha}} u_{\Omega_n} \leq \alpha^{-1} \int_{\Omega_n} u_{\Omega_n} \leq \alpha^{-1} \varepsilon^{1/2} |\Omega_n|^{1/2}.
\]

We now choose

\[
\alpha = \varepsilon^{1/4} |\Omega_n|^{-1/2},
\]

and conclude that for \(n \geq N_{\varepsilon}\),

\[
\int_{B_{n,\varepsilon^{1/4} |\Omega_n|^{-1/2}}} u_{\Omega_n}^2 \geq 1 - \varepsilon^{1/2}, \quad \frac{|B_{n,\varepsilon^{1/4} |\Omega_n|^{-1/2}}|}{|\Omega_n|} \leq \varepsilon^{1/4} \leq \varepsilon^{1/2}.
\]
Since \( \varepsilon \in (0,1) \) was arbitrary, \((\Omega_n)\) is localising.

**Proof of Theorem 3** By Lemma 3.1 in [8] we have, taking into account that the estimates there are for the Dirichlet Laplacian with an extra factor \( \frac{1}{2} \), that

\[
\|u_\Omega\|_\infty^2 \leq \left( \frac{e}{2\pi m} \right)^{m/2} \lambda(\Omega)^{m/2}.
\]

Since \( \Omega \) contains a ball with inradius \( \rho(\Omega) \), we have by domain monotonicity

\[
\lambda(\Omega) \leq \frac{j^2_{(m-2)/2}}{\rho(\Omega)^2} \rho(\Omega)^m.
\]

By (35), and (36),

\[
\|u_\Omega\|_\infty^2 \geq \left( \frac{2\pi m}{e^2 j_{(m-2)/2}} \right)^{m/2} \rho(\Omega)^m,
\]

and (17) follows by (13). By [15] we have that for planar convex sets, \( |\Omega| \leq 2 \text{diam}(\Omega) \rho(\Omega) \). This, together with (17), implies (18).

**3 Proof of Theorem 5, Corollary 6, and Examples 7, 8, 9**

In order to prove localisation it suffices to show that (16) holds. We proceed via a number of lemmas.

**Lemma 11.** If \( \Omega \) is an open set with \( |\Omega| < \infty \) and if \( \|u_\Omega\|_2 = 1 \) then for any \( \varepsilon > 0 \),

\[
\frac{1}{|\Omega|} \left( \int_\Omega u_\Omega \right)^2 \leq 2\varepsilon^2 |\Omega| + \frac{2}{|\Omega|} |\{ x \in \Omega : u_\Omega(x) > \varepsilon \}|.
\]

**Proof.** Let \( \Omega^\varepsilon = \{ x \in \Omega : u_\Omega \leq \varepsilon \} \).

We have by Cauchy-Schwarz’s inequality that

\[
\frac{1}{|\Omega|} \left( \int_\Omega u_\Omega \right)^2 = \frac{1}{|\Omega|} \left( \int_{\Omega^\varepsilon} u_\Omega + \int_{\Omega \setminus \Omega^\varepsilon} u_\Omega \right)^2
\]

\[
\leq \frac{2}{|\Omega|} \left( \int_{\Omega^\varepsilon} u_\Omega^2 + \int_{\Omega \setminus \Omega^\varepsilon} u_\Omega^2 \right)
\]

\[
\leq \frac{2}{|\Omega|} \left( \varepsilon^2 |\Omega^\varepsilon|^2 + |\Omega \setminus \Omega^\varepsilon| \int_{\Omega \setminus \Omega^\varepsilon} u_\Omega^2 \right)
\]

\[
\leq 2\varepsilon^2 |\Omega| + \frac{2}{|\Omega|} |\{ x \in \Omega : u_\Omega(x) > \varepsilon \}|.
\]

**Lemma 12.** If \( \Omega \) is an open set in \( \mathbb{R}^m \) with \( |\Omega| < \infty \), then

\[
p_\Omega(x,x;t) \leq \left( \frac{e}{2\pi m} \right)^{m/2} \lambda(\Omega)^{m/2} e^{-t\lambda(\Omega)}, \quad t \geq \frac{m}{2\lambda(\Omega)}.
\]

\[
8
\]
Proof. Since $|\Omega| < \infty$, the Dirichlet heat kernel $p_{\Omega}(x, y; t)$, $x \in \Omega, y \in \Omega$, $t > 0$ for $\Omega$ has an $L^2(\Omega)$ eigenfunction expansion given by
\begin{equation}
\sum_{j=1}^{\infty} e^{-t\lambda_j(\Omega)} u_{j,\Omega}^2(x) = p_{\Omega}(x, x; t).
\tag{39}
\end{equation}
It follows from (39) that for $\alpha \in [0, 1)$,
\begin{align*}
p_{\Omega}(x, x; t) &= \sum_{j=1}^{\infty} e^{-(\alpha+1-\alpha)t\lambda_j(\Omega)} u_{j,\Omega}^2(x) \\
&\leq e^{-\alpha t\lambda(\Omega)} \sum_{j=1}^{\infty} e^{-(1-\alpha)t\lambda_j(\Omega)} u_{j,\Omega}^2(x) \\
&= e^{-\alpha t\lambda(\Omega)} p_{\Omega}(x, x; (1-\alpha)t) \\
&\leq e^{-\alpha t\lambda(\Omega)} p_{\Omega}(x, x; (1-\alpha)t) \\
&= e^{-\alpha t\lambda(\Omega)} (4\pi(1-\alpha)t)^{-m/2},
\end{align*}
where we have used monotonicity of the Dirichlet heat kernel. For $t \geq m/(2\lambda(\Omega))$ we choose $\alpha$ as to optimise the right-hand side of (39). This yields,
\[ \alpha = 1 - \frac{m}{2t\lambda(\Omega)}. \]
This in turn gives (38).
\qed

The main idea in the proof of Theorem 5 is to use Brownian motion techniques to achieve an efficient way of separation of variables for horn-shaped domains. These have been used extensively elsewhere. See for example [3], and Lemma 7 in [4].

Lemma 13. Let $\Omega$ be a horn-shaped set in $\mathbb{R}^m$. If $x_1 \in \mathbb{R}, x' \in \Omega(x_1)$, then
\begin{equation}
p_{\Omega}(x, x; t) \leq (4\pi t)^{-1/2} \pi_{\Omega(x_1/2)}(x', x'; t) + (4\pi t)^{-1/2} e^{-x^2/(4t)} \xi_{\Omega}(x', x'; t).
\tag{40}
\end{equation}
Proof. The proof relies on the Feynman-Kac formula (20). We have that for any non-empty open set $\Omega$ in $\mathbb{R}^m$,
\begin{equation}
p_{\Omega}(x, y; t) = (4\pi t)^{-m/2} e^{-|x-y|^2/(4t)} \mathbb{P}( \cup_{0 \leq \tau \leq t} x(\tau) \subset \Omega | x(0) = x, x(t) = y),
\tag{41}
\end{equation}
where $x(\tau), 0 \leq \tau \leq t$ is a Brownian bridge on $\mathbb{R}^m$. The term $\mathbb{P}( \cup_{0 \leq \tau \leq t} x(\tau) \subset \Omega | x(0) = x, x(t) = y)$ in (41) is the conditional probability that the Brownian bridge stays in $\Omega$, conditioned with $x(0) = x, x(t) = y$. We write $x(\tau) = (x_1(\tau), x'(\tau))$ with $x_1(0) = x_1, x_1(t) = y_1, x'(0) = x', x'(t) = y'$, where $x_1(\tau), 0 \leq \tau \leq t$, and $x'(\tau), 0 \leq \tau \leq t$ are independent Brownian bridges. Recall that if $x_1(\tau), 0 \leq \tau \leq t$ is a one-dimensional Brownian bridge with $x_1(0) = x_1(t) = 0$, then
\begin{equation}
\mathbb{P}( \max_{0 \leq \tau \leq t} x_1(\tau) \leq \xi | x_1(0) = x_1(t) = 0) = \frac{2\xi}{t} e^{-\xi^2/t} 1_{[0,\infty)}(\xi).
\tag{42}
\end{equation}
We first consider the case \( x_1 > 0 \). By (41), and (42),
\[
p_{\Omega}(x, t) = (4\pi t)^{-m/2} \mathbb{P}(\cup_{0 \leq \tau \leq t} x(\tau) \subset \Omega \mid x(0) = x(t) = x) \\
\leq (4\pi t)^{-m/2} \int_0^{x_1/2} d\xi \frac{2\xi}{t} e^{-\xi^2/2t} \mathbb{P}(\cup_{0 \leq \tau \leq t} x(\tau) \subset \Omega(x_1 - \xi) \mid x'(0) = x'(t) = x') \\
+ (4\pi t)^{-m/2} \int_{x_1/2}^{\infty} d\xi \frac{2\xi}{t} e^{-\xi^2/2t} \mathbb{P}(\cup_{0 \leq \tau \leq t} x(\tau) \subset \Omega(x_1 - \xi) \mid x'(0) = x'(t) = x') \\
\leq (4\pi t)^{-1/2} \int_0^{x_1/2} d\xi \frac{2\xi}{t} e^{-\xi^2/2t} \pi_{\Omega(x_1/2)}(x', x'; t) \\
+ (4\pi t)^{-1/2} \int_{x_1/2}^{\infty} d\xi \frac{2\xi}{t} e^{-\xi^2/2t} \pi_{\Omega}(x', x'; t) \\
\leq (4\pi t)^{-1/2} \pi_{\Omega(x_1/2)}(x', x'; t) + (4\pi t)^{-1/2} e^{-x_1^2/(4t)} \pi_{\Omega'}(x', x'; t),
\]
where we have used that \( \Omega(x_1 - \xi) \subset \Omega(x_1/2) \) for \( \xi \in [0, x_1/2] \), and \( \Omega(x_1 - \xi) \subset \Omega' \) for \( \xi \geq x_1/2 \). We next consider the case \( x_1 < 0 \). By (41), and (42),
\[
p_{\Omega}(x, t) = (4\pi t)^{-m/2} \mathbb{P}(\cup_{0 \leq \tau \leq t} x(\tau) \subset \Omega \mid x(0) = x(t) = x) \\
\leq (4\pi t)^{-m/2} \int_0^{x_1/2} d\xi \frac{2\xi}{t} e^{-\xi^2/2t} \mathbb{P}(\cup_{0 \leq \tau \leq t} x(\tau) \subset \Omega(x_1 - \xi) \mid x'(0) = x'(t) = x') \\
+ (4\pi t)^{-m/2} \int_{x_1/2}^{\infty} d\xi \frac{2\xi}{t} e^{-\xi^2/2t} \mathbb{P}(\cup_{0 \leq \tau \leq t} x(\tau) \subset \Omega(x_1 - \xi) \mid x'(0) = x'(t) = x') \\
\leq (4\pi t)^{-1/2} \int_0^{x_1/2} d\xi \frac{2\xi}{t} e^{-\xi^2/2t} \pi_{\Omega(x_1/2)}(x', x'; t) \\
+ (4\pi t)^{-1/2} \int_{x_1/2}^{\infty} d\xi \frac{2\xi}{t} e^{-\xi^2/2t} \pi_{\Omega}(x', x'; t) \\
\leq (4\pi t)^{-1/2} \pi_{\Omega(x_1/2)}(x', x'; t) + (4\pi t)^{-1/2} e^{-x_1^2/(4t)} \pi_{\Omega'}(x', x'; t),
\]
where we have used that \( \Omega(x_1 + \xi) \subset \Omega(x_1/2) \) for \( \xi \in [0, |x_1|/2] \), and \( \Omega(x_1 + \xi) \subset \Omega' \) for \( \xi \geq |x_1|/2 \). In both cases we arrive at (43).

**Proof of Theorem 3** We now apply Lemma 12 to the \((m - 1)\)-dimensional heat kernels \( \pi_{\Omega(x_1/2)} \) and \( \pi_{\Omega'} \) respectively, and obtain that for
\[
t \geq \frac{m - 1}{2\mu(\Omega')}, \tag{43}
\]
both
\[
\pi_{\Omega(x_1/2)}(x', x'; t) \leq \left( \frac{e}{2\pi(m - 1)} \right)^{(m-1)/2} \mu(\Omega(x_1/2))^{(m-1)/2} e^{-t\mu(\Omega(x_1/2))}, \tag{44}
\]
and
\[
\pi_{\Omega'}(x', x'; t) \leq \left( \frac{e}{2\pi(m - 1)} \right)^{(m-1)/2} \mu(\Omega')^{(m-1)/2} e^{-t\mu(\Omega')}. \tag{45}
\]
Indeed, (43) implies \( t \geq \frac{m - 1}{2\mu(\Omega(x_1/2))} \) by domain monotonicity. For \( t \) satisfying (43),
\[
(4\pi t)^{-1/2} \leq \left( \mu(\Omega')/(2\pi(m - 1)) \right)^{1/2}, \tag{46}
\]
and we obtain by Lemma [9, 14], [15], and [16] that for \( t \) satisfying (43),

\[
p_\Omega(x, x; t) \leq e^{-1/2} \left( \frac{e}{2\pi(m-1)} \right)^{m/2} (\mu(\Omega(x_1/2)))^{m/2} e^{-t\mu(\Omega(x_1/2))} + \mu(\Omega')^{m/2} e^{-x_1^2/(4t) + t\mu(\Omega')}) .
\]

Bounding the left-hand side of (39) from below by \( e^{-t\lambda(\Omega)}u_\Omega(x)^2 \) we find by (44) that if (43), then

\[
\{ u_\Omega(x)^2 \geq \varepsilon^2 \} \subset \left\{ x \in \Omega : e^{-1/2} \left( \frac{e}{2\pi(m-1)} \right)^{m/2} (\mu(\Omega(x_1/2)))^{m/2} e^{-t(\mu(\Omega(x_1/2)) - \lambda(\Omega))} \geq \varepsilon^2/2 \right\} \cup \left\{ x \in \Omega : e^{-1/2} \left( \frac{e}{2\pi(m-1)} \right)^{m/2} \mu(\Omega')^{m/2} e^{-x_1^2/(4t) - t(\mu(\Omega') - \lambda(\Omega))} \geq \varepsilon^2/2 \right\}
= \left\{ x \in \Omega : 2^{1/2} e^{-1/4} \left( \frac{e}{2\pi(m-1)} \right)^{m/4} (\mu(\Omega(x_1/2)))^{m/4} e^{-t(\mu(\Omega(x_1/2)) - \lambda(\Omega))} \geq \varepsilon \right\} \cup \left\{ x \in \Omega : 2^{1/2} e^{-1/4} \left( \frac{e}{2\pi(m-1)} \right)^{m/4} \mu(\Omega')^{m/4} e^{-x_1^2/(8t) - t(\mu(\Omega') - \lambda(\Omega))} \geq \varepsilon \right\}
:= A_1 \cup A_2,
\]

with obvious notation. We choose

\[
t = (2(\lambda(\Omega) - \mu(\Omega')))^{-1},
\]

and let

\[
\varepsilon \in (0, \mu(\Omega')^{m/4}].
\]

Then the constraint on \( t \) in (43) is satisfied for all \( \Omega \) satisfying (19). For the above choice of \( t \) we have

\[
|A_1| \leq |\Omega'|_{m-1} \left\{ x_1 \in \mathbb{R} : \frac{\mu(\Omega(x_1/2)) - \mu(\Omega')}{4(\lambda(\Omega) - \mu(\Omega'))} < \log \left( e^{-1}\mu(\Omega(x_1/2))^{m/4} \right) \right\}_1 , \quad |A_2| \leq 4|\Omega'|_{m-1} (\lambda(\Omega) - \mu(\Omega'))^{-1/2} \left( \log \left( e^{-1}\mu(\Omega')^{m/4} \right) \right)^{1/2} .
\]

By (37), (48), (49), and (50) we obtain

\[
\frac{1}{|\Omega|} \left( \int_\Omega u_\Omega \right)^2 \leq 2\varepsilon^2 |\Omega| + \frac{2|\Omega'|_{m-1}}{|\Omega|} \left\{ x_1 \in \mathbb{R} : \frac{\mu(\Omega(x_1/2)) - \mu(\Omega')}{4(\lambda(\Omega) - \mu(\Omega'))} < \log \left( e^{-1}\mu(\Omega(x_1/2))^{m/4} \right) \right\}_1 + \frac{8|\Omega'|_{m-1}}{|\Omega|} (\lambda(\Omega) - \mu(\Omega'))^{-1/2} \left( \log \left( e^{-1}\mu(\Omega')^{m/4} \right) \right)^{1/2} .
\]
Substitution of $\varepsilon^2|\Omega| = \varepsilon'$, and deleting the $'$ yields (21) for all $\varepsilon$ satisfying (20).

Proof of Corollary 6. Since $\Omega'$ is a line segment with length $w(\Omega)$, we have

$$\mu(\Omega') = \frac{\pi^2}{w(\Omega)^2}. \quad (52)$$

Moreover, since $\Omega$ is planar, bounded, and convex,

$$\frac{1}{2} w(\Omega) \text{diam}(\Omega) \leq |\Omega| \leq w(\Omega) \text{diam}(\Omega). \quad (53)$$

See for example [17], and [21]. In particular

$$x_1(\Omega) := \sup\{x_1 : \Omega(x_1) \neq \emptyset\} < \infty, \ x_1(\Omega)^- = \inf\{x_1 : \Omega(x_1) \neq \emptyset\} > -\infty.$$  

Let $x_1^+, x_1^-$ be points of $\partial \Omega$ with $x_1$ coordinates $x_1(\Omega)^+$ and $x_1(\Omega)^-$ respectively. By convexity $\Omega$ contains either a triangle with vertices $(0, \frac{1}{2}), (0, -\frac{1}{2}), (x_1^+, 0)$ or a triangle with vertices $(0, \frac{1}{2}), (0, -\frac{1}{2}), (x_1^-, 0)$ (or both). Hence for any $x = (x_1, x') \in \Omega$, $\frac{1}{2} x_1(\Omega)^- \leq x_1/2 \leq \frac{1}{2} x_1(\Omega)^+$, and $\Omega(x_1/2)$ contains a line segment with length at least $\frac{1}{2} w(\Omega)$. So

$$\mu(\Omega(x_1/2)) \leq \frac{4\pi^2}{w(\Omega)^2}. \quad (54)$$

First note that (22) and (53) imply (19), and that (52) and (23) and (53) imply and (20).

Inequality (24) follows from (21), (52), and (53).

Proof of Example 7. P. Kröger observed that one can get upper bounds for the first Dirichlet eigenvalue of the circular sector $S_n(r)$ with radius $r$ and opening angle $\pi/n$, which have the correct leading term by choosing an optimal rectangle inside the sector [16]. Similar observations were used in the proof of Theorem 1.5 in [5], and also in the proof of Theorem 1.3 in [14]. In the case at hand Theorem 1.5 in [5] implies the existence of a constant $c_1 < \infty$ such that

$$\lambda(\Omega_n) \leq \pi^2 + c_1 n^{-2/3}, \ n \in \mathbb{N}. \quad (55)$$

We note that $\Omega_n$ is horn-shaped with respect to the coordinate system which defines it in Example 7. This is not necessarily the one used to prove Corollary 6. Since $\Omega_n'$ is an interval of length 1, $\mu(\Omega_n') = \pi^2$. Straightforward computations show,

$$\mu(\Omega_n(x_1)) = \pi^2 \left( 1 - \frac{x_1}{b_n} \right)^{-2}, \ 0 < x_1 < b_n, \quad (56)$$

$$\mu(\Omega_n(x_1)) = \pi^2 \left( 1 - \frac{|x_1|}{n - b_n} \right)^{-2}, \ b_n - n < x_1 < 0, \quad (57)$$

$$\mu(\Omega_n(x_1/2)) \geq \pi^2 \left( 1 + \frac{x_1}{b_n} \right), \ 0 < x_1 < b_n, \quad (58)$$

$$\mu(\Omega_n(x_1/2)) \geq \pi^2 \left( 1 + \frac{|x_1|}{n - b_n} \right), \ b_n - n < x_1 < 0, \quad (59)$$

$$\mu(\Omega_n(x_1/2)) \leq 4\pi^2, \quad (60)$$
and

$$|\Omega_n| = \frac{n}{2}$$  \hspace{1cm} (61)

By (55) we see that (19) holds for all

$$n \geq N_\Omega := \min\{n \in \mathbb{N} : n^{2/3} \geq \pi^{-2} c_1\}.$$  

We obtain by (55)-(61) that the second term in the right-hand side of (21) is bounded from above by

$$4n^{-1}\left|\left\{x_1 \in \mathbb{R} : \frac{\mu(\Omega_n(x_1/2)) - \pi^2}{2(\lambda(\Omega_n) - \pi^2)} < \log \left(\varepsilon^{-1}|\Omega_n|\mu(\Omega_n(x_1/2))\right)\right\}\right|_1$$

$$\leq 8\pi^{-2}c_1n^{-2/3}\log (2^{-1}n^{2}\varepsilon^{-1}n), \ 0 < \varepsilon \leq 2^{-1}\pi^2n. \hspace{1cm} (62)$$

To obtain an upper bound on the third term in the right-hand side of (21) we require a lower bound for \(\lambda(\Omega_n)\). We first use Steiner symmetrisation of \(\Omega_n\) with respect to the \(x_1\) direction, followed by Steiner symmetrisation with respect to the \(x_2\) direction. This doubly Steiner-symmetrised region is a rhombus with vertices at \((0, \frac{1}{\pi}), (0, -\frac{1}{\pi}), (\frac{2}{\pi}, 0), (-\frac{2}{\pi}, 0)\). This rhombus has first Dirichlet eigenvalue less or equal than \(\lambda(\Omega_n)\). It follows from Theorem 6.2 in [12] there exists \(c_2 > 0\) such that

$$\lambda(\Omega_n) \geq \pi^2 + c_2n^{-2/3}, \ n \in \mathbb{N}. \hspace{1cm} (63)$$

By (63) we find that the third term in the right-hand side of (21) is for \(0 < \varepsilon \leq 2^{-1}\pi^2n\) and \(n \geq N_\Omega\) bounded from above by

$$2^{7/2}n^{-1}(\lambda(\Omega_n) - \pi^2)^{-1/2}\left(\log (2^{-1}\pi^2\varepsilon^{-1}n)\right)^{1/2} \leq 2^{7/2}c_1^{-1/2}n^{-2/3}\left(\log (2^{-1}\pi^2\varepsilon^{-1}n)\right)^{1/2}. \hspace{1cm} (64)$$

We find for \(n \geq N_\Omega\), and \(\varepsilon \in (0,2^{-1}\pi^2n]\) by (62), (64), and (21),

$$\frac{1}{|\Omega_n|}\left(\int_{\Omega_n} u_{\Omega_n} \right)^2 \leq 2\varepsilon + 8\pi^{-2}c_1n^{-2/3}\log (2^{-1}\pi^2\varepsilon^{-1}n) + 2^{7/2}c_2^{-1/2}n^{-2/3}\left(\log (2^{-1}\pi^2\varepsilon^{-1}n)\right)^{1/2}. \hspace{1cm} (65)$$

Choosing \(\varepsilon = n^{-2/3}\) implies that the right-hand side of (65) is \(O(n^{-2/3}\log n)\). This implies localisation by Theorem 3(ii), and (23) follows by (14) and (65) for that choice of \(\varepsilon\). \hspace{1cm} □

Proof of Example 8. By choosing an optimal rectangle in \(T_n\) one shows, similarly to (55), the existence of \(c_3 < \infty\) such that \(\lambda(T_n) \leq \pi^2 + c_3n^{-2/3}\). By domain monotonicity of the Dirichlet eigenvalues, and (63),

$$\pi^2 + c_2n^{-2/3} \leq \lambda(R_n) \leq \lambda(\Omega_n) \leq \lambda(T_n) \leq \pi^2 + c_3n^{-2/3}.$$ 

By domain monotonicity of Dirichlet heat kernels,

$$e^{-t\lambda(\Omega)}u_{\Omega_n}(x)^2 \leq p_{\Omega_n}(x, x; t)$$

$$\leq p_{R_n}(x, x; t)$$

$$\leq (4\pi t)^{-1/2}\pi_{R_n(x_1/2)}(x', x'; t) + (4\pi t)^{-1/2}e^{-x_1^2/(4t)}\pi_{R_n}(x', x'; t).$$
Since $\mu(R_n) = \pi^2, |R_n|_1 = 1$, we have for $t \geq (2\pi^2)^{-1}$, following the proof of Theorem 5 from [44] onwards,

$$\frac{1}{|\Omega_n|} \left( \int_{\Omega_n} u_{\Omega_n} \right)^2 \leq 2\varepsilon + \frac{2}{|\Omega_n|} \left\{ x_1 \in \mathbb{R} : \frac{\mu(R_n(x_1/2)) - \pi^2}{2(\lambda(\Omega_n) - \pi^2)} \leq \log \left( \varepsilon^{-1}|\Omega_n|\mu(R_n(x_1/2))^{m/2} \right) \right\}_1$$

$$+ \frac{2^{5/2}}{|\Omega_n|} (\lambda(\Omega_n) - \pi^2)^{-1/2} \left( \log (\varepsilon^{-1}|\Omega_n|\pi^2) \right)^{1/2}. \quad (66)$$

Furthermore we have,

$$n = \frac{n}{4} = |T_n| \leq |\Omega_n| \leq |R_n| = \frac{n}{2}.$$

We now proceed as in Example 7 and find that for $\varepsilon \in (0, 4^{-1} \pi^2 n]$, and all $n$ sufficiently large,

$$\frac{1}{|\Omega_n|} \left( \int_{\Omega_n} u_{\Omega_n} \right)^2 \leq 2\varepsilon + 16c_3 n^{-2/3} \log (2^{-1} \pi^2 \varepsilon^{-1} n) + 2^{9/2} c_2 n^{-2/3} \left( \log (2^{-1} \pi^2 \varepsilon^{-1} n) \right)^{1/2}. \quad (67)$$

Choosing $\varepsilon = n^{-2/3}$ implies that the right-hand side of (67) is $O(n^{-2/3} \log n)$. This implies localisation by Theorem 3(ii), and (25) follows by (14) and (67) for that choice of $\varepsilon$. \hfill \Box

**Proof of Example 5** By the results of Theorem 1 in [6] we have the existence of $c(\alpha) \in (1, \infty)$ such that

$$\pi^2 + c(\alpha)^{-1} n^{-2\alpha/(\alpha+2)} \leq \lambda(\Omega_{n,\alpha}) \leq \pi^2 + c(\alpha) n^{-2\alpha/(\alpha+2)}, n \in \mathbb{N}.$$ 

For $-\frac{n}{2} < x_1 < \frac{n}{2}$, $\Omega(x_1)$ is a line segment of length $(1 - (2|x_1|/n)^{\alpha})^{1/2}$. Hence,

$$\mu(\Omega(x_1/2)) = \pi^2 \left( 1 - (n^{-1}|x_1|)^{\alpha} \right)^{-2/\alpha} \geq \pi^2 \left( 1 + 2\alpha^{-1} (n^{-1}|x_1|)^{\alpha} \right),$$

and

$$\mu(\Omega_{n,\alpha}') = \pi^2, \quad \mu(\Omega_{n,\alpha}(x_1/2)) \leq 4\pi^2. \quad (68)$$

We have for all $\alpha > 1$, and $n \in \mathbb{N}$,

$$\frac{n}{2} \leq |\Omega_{n,\alpha}| \leq n. \quad (69)$$

For $\varepsilon \in (0, 2^{-1} \pi^2 n]$, and all $n$ sufficiently large, we have that the second term in the right-hand side of (21) is bounded by

$$4n^{-1} \left\{ x_1 \in \mathbb{R} : \frac{\mu(\Omega_{n,\alpha}(x_1/2)) - \pi^2}{2(\lambda(\Omega_{n,\alpha}) - \pi^2)} \leq \log \left( 4\pi^2 \varepsilon^{-1} n \right) \right\}_1$$

$$\leq 8 \left( \alpha c(\alpha)/\pi^2 \right)^{1/\alpha} n^{-2/(\alpha+2)} \left( \log (4\pi^2 \varepsilon^{-1} n) \right)^{1/\alpha}. \quad (70)$$

Similarly we find that the third term in the right-hand side of (21) is, for $\varepsilon \in (0, 2^{-1} \pi^2 n]$, and all $n$ sufficiently large, bounded by

$$2^{7/2} n^{-1} (\lambda(\Omega_{n,\alpha}) - \pi^2)^{-1/2} \left( \log (\pi^2 \varepsilon^{-1} n) \right)^{1/2} \leq 2^{7/2} c(\alpha)^{1/2} n^{-2/(\alpha+2)} \left( \log (\pi^2 \varepsilon^{-1} n) \right)^{1/2}. \quad (71)$$
Choosing $\varepsilon = n^{-2/(\alpha+2)}$ implies by Theorem 5 (70), and (71),

$$
\frac{1}{|\Omega_{n,\alpha}|} \left( \int_{\Omega_{n,\alpha}} u_{\Omega_{n,\alpha}} \right)^2 = O\left( n^{-2/(\alpha+2)} \left( \log n \right)^{\max\{1/\alpha, 1/2\}} \right), \quad n \to \infty.
$$

(72)

This implies localisation by Theorem 3(ii), and (26) follows by (14) and (72) for that choice of $\varepsilon$. □

4 Proof of Theorem 10

Proof of Theorem 10. Choosing $\varphi(x) = \sin(\pi(|x| - R)/\varepsilon)$ as a test function in (1) we have that

$$
\lambda(\Omega_{R,R+\varepsilon}) \leq \frac{\pi^2}{\varepsilon^2} \frac{\int_{R}^{R+\varepsilon} \cos^2 \left( \frac{\pi(r-R)}{\varepsilon} \right) r^{m-1} dr}{\int_{R}^{R+\varepsilon} \sin^2 \left( \frac{\pi(r-R)}{\varepsilon} \right) r^{m-1} dr} \leq \frac{\pi^2}{\varepsilon^2} \left( \frac{R+\varepsilon}{R} \right)^{m-1} \frac{\int_{R}^{R+\varepsilon} \cos^2 \left( \frac{\pi(r-R)}{\varepsilon} \right) dr}{\int_{R}^{R+\varepsilon} \sin^2 \left( \frac{\pi(r-R)}{\varepsilon} \right) dr} = \frac{\pi^2}{\varepsilon^2} \left( \frac{R+\varepsilon}{R} \right)^{m-1}.
$$

(73)

On the other hand, since the first Dirichlet eigenfunction of $\Omega_{R,R+\varepsilon}$ is radial, $u_{\Omega_{R,R+\varepsilon}}(x) := u(r)$, we have that

$$
\lambda(\Omega_{R,R+\varepsilon}) = \frac{\int_{R}^{R+\varepsilon} u'(r)^2 r^{m-1} dr}{\int_{R}^{R+\varepsilon} u(r)^2 r^{m-1} dr} \geq \left( \frac{R}{R+\varepsilon} \right)^{m-1} \frac{\int_{R}^{R+\varepsilon} u'(r)^2 dr}{\int_{R}^{R+\varepsilon} u(r)^2 dr} \geq \left( \frac{R}{R+\varepsilon} \right)^{m-1} \min_{v \in H_{0}^{1}(\Omega_{R,R+\varepsilon}) \setminus \{0\}} \frac{\int_{R}^{R+\varepsilon} v'(r)^2 dr}{\int_{R}^{R+\varepsilon} v(r)^2 dr} = \frac{\pi^2}{\varepsilon^2} \left( \frac{R}{R+\varepsilon} \right)^{m-1},
$$

(74)

and (27) follows from (73) and (74).

To prove (28) we consider the radial solution $\psi_{\varepsilon}(|x|) = u_{\varepsilon}(x)$ of

$$
-\Delta u_{\Omega_{R,R+\varepsilon}} = \lambda(\Omega_{R,R+\varepsilon}) u_{\Omega_{R,R+\varepsilon}},
$$
with zero boundary condition, and $\|\psi_\varepsilon\|_\infty = 1$. The function $\psi_\varepsilon$ satisfies

$$\psi''_\varepsilon + \frac{m - 1}{r} \psi'_\varepsilon + \lambda_\varepsilon \psi_\varepsilon = 0$$ in $(R, R + \varepsilon),$$

with boundary condition $\psi_\varepsilon(R) = \psi_\varepsilon(R + \varepsilon) = 0$, and normalisation $\|\psi_\varepsilon\|_\infty = 1$, where $\lambda_\varepsilon = \lambda(\Omega_{R,R+\varepsilon})$. Define

$$\phi_\varepsilon(t) = \psi_\varepsilon(R + \varepsilon t), \quad t \in (0, 1).$$

Then $\phi_\varepsilon$ satisfies

$$\begin{cases} 
\phi''_\varepsilon + \frac{(m - 1)\varepsilon}{R + \varepsilon t} \phi'_\varepsilon + \varepsilon^2 \lambda_\varepsilon \phi_\varepsilon = 0 \text{ in }]0, 1[,} \\
\phi_\varepsilon(0) = \phi_\varepsilon(1) = 0, \\
\|\phi_\varepsilon\|_\infty = 1.
\end{cases} \quad (75)$$

Integrating between the maximum point $t_m$ of $\phi$ and $t \in (0, 1)$, we get that

$$|\phi'_\varepsilon(t)| = \left| \int_{t_m}^t \left( \frac{(m - 1)\varepsilon \phi'_\varepsilon(t)}{R + \varepsilon t} + \varepsilon^2 \lambda_\varepsilon \phi_\varepsilon(t) \right) dt \right|$$

$$\leq (m - 1) \left( \frac{2\varepsilon}{R} + \varepsilon^2 \lambda_\varepsilon \right). \quad (76)$$

Hence $\phi_\varepsilon, \phi'_\varepsilon$ are equibounded in $(0, 1)$ and, by the Ascoli-Arzelà Theorem, $\phi_\varepsilon$ converges uniformly, as $\varepsilon \to 0^+$, to a continuous function $\phi(t)$ in $(0, 1)$. From (75), (76), we also obtain equiboundedness of the second derivatives $\phi''_\varepsilon$. Hence $\phi_\varepsilon$ converges uniformly to $\phi$ in $C^1$. Moreover we obtain uniform convergence of the second derivatives $\phi''_\varepsilon$. Passing to the limit in the equation, we infer that $\phi$ satisfies

$$\begin{cases} 
\phi'' + \pi^2 \phi = 0 \quad \text{in } ]0, 1[,} \\
\phi(0) = \phi(1) = 0, \\
\|\phi\|_\infty = 1.
\end{cases} \quad (77)$$

Hence $\phi(t) = \sin(\pi t)$, and

$$\lim_{\varepsilon \downarrow 0} \int_{[0,1]} \phi_\varepsilon(t) dt = \int_{[0,1]} \phi(t) dt = \frac{2}{\pi}. \quad (78)$$

So we obtain

$$E(\Omega_{R,R+\varepsilon}) = |\Omega_{R,R+\varepsilon}|^{-1} \int_{\Omega_{R,R+\varepsilon}} \psi_\varepsilon$$

$$\geq \left( \frac{R}{R + \varepsilon} \right)^{m-1} \int_{[0,1]} \phi_\varepsilon(t) dt,$$

and, by (78),

$$\liminf_{\varepsilon \downarrow 0} E(\Omega_{R,R+\varepsilon}) \geq \frac{2}{\pi}.$$ 

Similarly we have that

$$E(\Omega_{R,R+\varepsilon}) \leq \left( \frac{R + \varepsilon}{R} \right)^{m-1} \int_{[0,1]} \phi_\varepsilon(t) dt,$$
and, by (78),
\[
\limsup_{\varepsilon \downarrow 0} E(\Omega_{R,R+\varepsilon}) \leq \frac{2}{\pi}.
\]

To prove (29) we consider an equilateral triangle $\Delta$ with vertices at $(0,0), (1,0), (\frac{1}{2}, \frac{1}{2} \sqrt{3})$. The first Dirichlet eigenfunction is given by (formula (2.1) in [22]),
\[
u_{\Delta}(x_1, x_2) = \sin\left(\frac{4\pi x_2}{\sqrt{3}}\right) - \sin\left(2\pi \left(x_1 + \frac{x_2}{\sqrt{3}}\right)\right) + \sin\left(2\pi \left(x_1 - \frac{x_2}{\sqrt{3}}\right)\right).
\]
We find that $|\Delta| = \frac{\sqrt{3}}{4}$,
\[
\|\nu_{\Delta}\|_{\infty} = u(1/2, \sqrt{3}/6) = \frac{3\sqrt{3}}{2},
\]
and
\[
\|\nu_{\Delta}\|_{1} = \int_{\Delta} \nu_{\Delta}(x_1, x_2) dx_1 dx_2 = \frac{9}{4\pi \sqrt{3}}.
\]
This proves (29).

The efficiency of an interval is given by $\frac{2}{\pi}$. Formula (30) follows by (12).

To prove (31) we let $B = \{x \in \mathbb{R}^2 : |x| < 1\}$. Then
\[
u_{B}(r, \theta) = J_0(j_0 r), 0 \leq r < 1, 0 < \theta \leq 2\pi,
\]
and
\[
\|\nu_{B}\|_{1} = \int_{[0,1]} dr \int_{[0,2\pi]} d\theta J_0(j_0 r) \approx .215882(2\pi).
\]
Since $\|\nu_{B}\|_{\infty} = J_0(0) = 1$, we have that
\[
E(B) \approx .6782 \frac{2}{\pi}.
\]
