MODELS FOR DAMPED WATER WAVES

RAFAEL GRANERO-BELINCHÓN AND STEFANO SCROBOGNA

Abstract. In this paper we derive some new weakly nonlinear asymptotic models describing viscous waves in deep water with or without surface tension effects. These asymptotic models take into account several different dissipative effects and are obtained from the free boundary problems formulated in the works of Dias, Dyachenko and Zakharov (Physics Letters A, 2008), Jiang, Ting, Perlin and Schultz (Journal of Fluid Mechanics, 1996) and Wu, Liu and Yue (Journal of Fluid Mechanics, 2006).

1. Introduction

The motion of a free boundary irrotational and incompressible flow is a classical research topic [41]. In most applications, the flow is also assumed to be inviscid [7, 28]. However, even if in most situations in coastal engineering the assumption of inviscid flow leads to very accurate results, there are other physical scenarios where the viscosity needs to be taken into account. Moreover, there are many situations in which the viscosity is very large and the vorticity is small and its effect negligible. Actually, certain discrepancies between experiments...
and inviscid theory have been previously reported in the literature. For instance, Wu [45] found that:

*From this comparison the theory appears quite satisfactory in predicting the wave phases during the inward focusing and the subsequent reflection within a radial distance as far as \( r = 20 \), while the peak amplitudes observed in the experiments are slightly smaller than those predicted by the theory. This discrepancy can be ascribed to the neglect of the viscous effects in the theory and to the approximation that the initial wave generated in the tank was not cylindrical in shape and departed slightly from a perfect solitary wave profile in the experiment.*

In addition to this, Zabusky and Galvin [46] wrote:

*A laboratory-data/numerical-solution comparison of the number of crests and troughs and their phases (or relative locations within a period) shows only negligible difference. As one expects, the crest-to-trough amplitudes differ somewhat more because they are more sensitive to dissipative forces. To quantify some of the details we recommend a study including dissipation.*

and, furthermore, Longuet-Higgins [30] stated that:

*For certain applications, however, viscous damping of the waves is important, and it would be highly convenient to have equations and boundary conditions of comparable simplicity as for undamped waves.*

The purpose of this paper is to derive new weakly nonlinear asymptotic models (in the spirit of [6,17–19,31–33,37]) describing damped water waves and, at the same time, keeping the features of potential flows. We observe that, at first sight, the idea of viscous damping of potential flows is somehow paradoxical since the hypothesis of irrotational velocity implies that the viscous term in the Navier-Stokes equations vanishes.

The problem of describing the motion of an irrotational, incompressible, inviscid and homogeneous fluid with a free surface in two dimensions is known as the 2D water waves problem. The equations for the water waves problem are [47]

\[
\begin{align*}
\Delta \phi &= 0 \quad \text{in } \Omega(t) \times [0, T], \\
\rho \left( \phi_t + \frac{1}{2} |\nabla \phi|^2 + Gh \right) - \gamma K &= 0 \quad \text{on } \Gamma(t) \times [0, T], \\
h_t &= \nabla \phi \cdot \left( 1 + (\partial_1 h)^2 \right)^{1/2} \quad \text{on } \Gamma(t) \times [0, T],
\end{align*}
\]

where \( G \) stands for the gravity force,

\[
\begin{align*}
\Omega(t) &= \left\{ (x_1, x_2) \in \mathbb{R}^2 \mid -L\pi < x_1 < L\pi, -\infty < x_2 < h(x_1, t), \ t \in [0, T] \right\}, \\
\Gamma(t) &= \left\{ (x_1, h(x_1, t)) \in \mathbb{R}^2 \mid x_1 \in S^1, \ t \in [0, T] \right\}
\end{align*}
\]

are the region occupied by the fluid and the surface wave, respectively. We write

\[ n = \frac{-\partial_1 h}{\left( 1 + (\partial_2 h)^2 \right)^{1/2}} \]
the unit normal to the surface wave, $2L\pi$ to denote the characteristic wavelength of the surface wave, $\phi$ for the scalar potential of the flow, i.e. the velocity field $u$ satisfies $u = \nabla \phi$, $\rho$ is the density of the fluid, $\gamma$ for the surface tension coefficient and

$$K = \frac{\partial^2 h}{\left(1 + (\partial_1 h)^2\right)^{3/2}}$$

is the curvature of the surface wave.

The first attempts to include viscosity effects go back as far as to the works of Boussinesq [5] and Lamb [27]. Later on, Ruvinsky & Freidman [40] formulated a system of equations for weakly damped surfaces waves in deep water and used this system to compute capillary-gravity ripples riding on the forward face of steep gravity waves (see also [39]). Then, these first results were generalized by Ruvinsky, Feldstein & Freidman [38] and the following system is proposed

$$\Delta \phi = 0 \quad \text{in } \Omega(t) \times [0, T], \quad (4a)$$

$$\rho \left( \phi_t + \frac{1}{2} |\nabla \phi|^2 + Gh \right) - \gamma K = -2\mu \partial^2_n \phi \quad \text{on } \Gamma(t) \times [0, T], \quad (4b)$$

$$h_t = \nabla \phi \cdot \left(1 + (\partial_1 h)^2\right)^{1/2} n + v \quad \text{on } \Gamma(t) \times [0, T], \quad (4c)$$

$$v_t = \partial^2 \partial_2 \phi \quad \text{on } \Gamma(t) \times [0, T], \quad (4d)$$

where $v$ and $\mu$ denote the vertical component of the vortex part of fluid velocity and the dynamic viscosity. Equation (4) was also studied by Kharif, Skandrani & Poitevin [26].

Using a clever change of variables, Longuet-Higgins [30] simplified the previous system and obtained

$$\Delta \phi = 0 \quad \text{in } \Omega(t) \times [0, T], \quad (5a)$$

$$\rho \left( \phi_t + \frac{1}{2} |\nabla \phi|^2 + Gh \right) - \gamma K = -4\mu \partial^2_n \phi \quad \text{on } \Gamma(t) \times [0, T], \quad (5b)$$

$$h_t = \nabla \phi \cdot \left(1 + (\partial_1 h)^2\right)^{1/2} n \quad \text{on } \Gamma(t) \times [0, T], \quad (5c)$$

A similar model was also studied by Jiang, Ting, Perlin & Schultz [22] and Wu, Liu & Yue [44], namely

$$\Delta \phi = 0 \quad \text{in } \Omega(t) \times [0, T], \quad (6a)$$

$$\rho \left( \phi_t + \frac{1}{2} |\nabla \phi|^2 + Gh \right) - \gamma K = -\delta D^s \phi \quad \text{on } \Gamma(t) \times [0, T], \quad (6b)$$

$$h_t = \nabla \phi \cdot \left(1 + (\partial_1 h)^2\right)^{1/2} n \quad \text{on } \Gamma(t) \times [0, T], \quad (6c)$$

where the dissipative terms are chosen as

$$D^2 \phi = \partial^2_2 \phi \text{ or } D^0 \phi = \phi.$$  

(7)

Another similar model where the dissipation acts only on the velocity is the one by Joseph & Wang [23, Equation (6.7) and (6.8)] (see also Wang & Joseph [43]).

We would like to remark that, in the models of damped water waves mentioned so far, there are no dissipative effects acting on the free surface.
In a more recent paper, Dias, Dyachenko & Zakharov [10] proposed a system where the free surface experiments dissipative effects. In particular, based on the linear problem, these authors derived

\[ \Delta \phi = 0 \quad \text{in } \Omega(t) \times [0, T], \quad (8a) \]

\[ \rho \left( \phi_t + \frac{1}{2} |\nabla \phi|^2 + Gh \right) = -2\mu \partial_x^2 \phi \quad \text{on } \Gamma(t) \times [0, T], \quad (8b) \]

\[ h_t = \nabla \phi \cdot \left( 1 + (\partial_x h)^2 \right)^{1/2} n + \frac{2\mu}{\rho} \partial_x^2 h \quad \text{on } \Gamma(t) \times [0, T], \quad (8c) \]

as a model of viscous water waves. This model was also considered by several other authors. Dutykh & Dias [16] obtain a new set of viscous potential free-surface flow equations in the spirit of (8) taking into account the effects of the bottom topography. These authors also derived a long wave approximation. This approximate model takes the form of a nonlocal (in time) Boussinesq system (see also [11, 13–15]). Kakleas & Nicholls [24], using the analytic dependence of the Dirichlet-Neumann operator, derived a system of two equations modelling (8). These equations are the viscous analog of the classical Craig-Sulem WW2 model and were mathematically studied by Ambrose, Bona & Nicholls [3]. The well-posedness of the full (8) was studied very recently by Ngom & Nicholls [36]. In particular these authors proved global existence of solutions starting from a small enough initial data for the case of non-vanishing surface tension \( \gamma \neq 0 \).

Some other related results are those by Kharif, Kraenkel, Manna & Thomas [25] and Hunt & Dutykh [21]. Kharif, Kraenkel, Manna & Thomas studied a similar situation to (8) within the framework of a forced and damped nonlinear Schrödinger equation (see also Touboul & Kharif [42]), while Hunt & Dutykh considered the problem of the interface motion under the capillary-gravity and an external electric force in the case of an incompressible, viscous, perfectly conducting fluid. Finally, let us mention the recent work by Guyenne & Parau [20] where the authors applied a simplified version of (8) to model wave attenuation in sea ice.

1.1. Plan of the paper. First we obtain the dimensionless Eulerian formulation in the moving domain and transform it to a dimensionless Arbitrary Lagrangian-Eulerian (ALE) formulation in a fixed domain in section 2. Then we introduce the asymptotic expansion and obtain the cascade of linear equations for the different scales presents in the problem with \( s = 0 \) corresponding to the models by Jiang, Ting, Perlin & Schultz [22] and Wu, Liu & Yue [44] in Section 3. After neglecting errors of \( O(\varepsilon^2) \) we find the nonlocal wave equation modelling the case \( s = 0 \). After that we consider the case \( s = 2 \) and, following a similar approach, find the nonlocal wave equation for the model of Dias, Dyachenko, and Zakharov [10]. Finally, we conclude with a parabolic system of Craig-Sulem flavour in section 5.

1.2. Notation. Let \( A \) be a matrix, and \( b \) be a column vector. Then, we write \( A_{ij} \) for the component of \( A \), located on row \( i \) and column \( j \). We will use the Einstein summation convention for expressions with indexes.

We write

\[ \partial_j f = \frac{\partial f}{\partial x_j}, \quad f_t = \frac{\partial f}{\partial t} \]
for the space derivative in the $j$–th direction and for a time derivative, respectively. Unless parenthesis are involved, every differential operator acts locally. For instance,

$$\partial_t f \partial_t \eta = (\partial_t f)(\partial_t \eta).$$

Let $f(x_1)$ denote a $L^2$ function on $S^1$ (as usually, identified with the interval $[-\pi, \pi]$ with periodic boundary conditions). We define the Hilbert transform $\mathcal{H}$ and the Dirichlet-to-Neumann operator $\Lambda$ and its powers, respectively, using Fourier series

$$\mathcal{H} f(k) = -i \text{sgn}(k) \hat{f}(k), \quad \Lambda f(k) = |k| \hat{f}(k), \quad \Lambda^2 f(k) = |k|^2 \hat{f}(k),$$

where

$$\hat{f}(k) = \frac{1}{2\pi} \int_{S^1} f(x_1) e^{-ikx_1} dx_1.$$  

In particular, for zero-mean functions, we note that

$$\partial_t \mathcal{H} = \Lambda, \quad \mathcal{H}^2 = -1, \quad \partial_t \Lambda^{-1} = -\mathcal{H}.$$  

These last equalities will be used extensively throughout the whole text. Finally, we define the commutator as

$$[A, B] f = A(Bf) - B(Af).$$

2. Damped water waves

2.1. The equations in the Eulerian formulation. We consider system the system

$$\Delta \phi = 0 \quad \text{in } \Omega(t) \times [0, T],$$

$$\rho \left( \dot{\phi}_t + \frac{1}{2} |\nabla \phi|^2 + G h \right) - \gamma K = -\delta_1 \mathcal{D}^s \phi \quad \text{on } \Gamma(t) \times [0, T],$$

$$h_t = \nabla \phi \cdot \left( 1 + (\partial_t h)^2 \right)^{1/2} n + \delta_2 \partial_t^2 h \quad \text{on } \Gamma(t) \times [0, T],$$

where $\delta_1 \geq 0$ are constant, the dissipative terms are as in (7), $\phi$ is the scalar potential (units of length$^2$/time), $h$ denotes the surface wave (units of length) and $G$ (units of length/time$^2$) is the gravity acceleration. The constant $\delta_1$ has units of mass/(length$^2$ · time) (when $\mathcal{D}^0 \phi = \phi$) and of mass/time (when $\mathcal{D}^2 \phi = \partial_t^2 \phi$) while $\delta_2$ has units of length$^2$/time. We observe that, for appropriate choice of $\delta_i$ and $s$ we recover (exactly) (6) and (8). Indeed, if $\delta_2 = 0$ we obtain the same model by Jiang, Ting, Perlin & Schultz [22] ($\delta_2 = 0$ and $s = 0$) and Wu, Liu & Yue [44] ($\delta_2 = 0$ and $s = 0$ or $s = 2$), while if $\delta_2 = \delta_1 / \rho$ and $s = 2$ we recover the model by Dias, Dyachenko & Zakharov [10].

Following the pioneer work of Zakharov [47], we use the trace of the velocity potential $\xi(t, x) = \phi(t, x, h(t, x))$ (units of length$^2$/time). Now we observe that

$$\xi_t(t, x) = \phi_t(t, x, h(t, x)) + \partial_2 \phi(t, x, h(t, x)) h_t(t, x)$$

$$= \phi_t(t, x, h(t, x)) + \partial_2 \phi(t, x, h(t, x)) \left( \nabla \phi \cdot (-\partial_x h, 1) + \delta_2 \partial_t^2 h \right).$$

Thus, (10) can be written as

$$\Delta \phi = 0 \quad \text{in } \Omega(t) \times [0, T],$$

$$\phi = \xi \quad \text{on } \Gamma(t) \times [0, T].$$
\[ \xi_t = \partial_2 \phi \left( \nabla \phi \cdot (-\partial_1 h, 1) + \delta_2 \partial_1^2 h \right) - \frac{1}{2} |\nabla \phi|^2 - Gh + \frac{\gamma \kappa}{\rho} - \frac{\delta_1}{\rho} \mathcal{D}^s \phi \quad \text{on } \Gamma(t) \times [0, T], \]

\[ h_t = \nabla \phi \cdot \left( 1 + (\partial_1 h)^2 \right)^{1/2} n + \delta_2 \partial_1^2 h \quad \text{on } \Gamma(t) \times [0, T]. \]

The system (11) is supplemented with an initial condition for \( h \) and \( \xi \):

\[ h(x, 0) = h_0(x), \quad \xi(x, 0) = \phi(x, h(0, x), 0) = \xi_0(x). \]

**2.2. Nondimensional Eulerian formulation.** We denote by \( H \) and \( L \) the typical amplitude and wavelength of the water wave. We change to dimensionless variables (denoted with \( \tilde{\cdot} \))

\[ x = L \tilde{x}, \quad t = \sqrt{\frac{L}{G}} \tilde{t}, \]

and unknowns

\[ h(x_1, t) = H \tilde{h}(\tilde{x}_1, \tilde{t}), \quad \phi(x_1, x_2, t) = H \sqrt{G} \tilde{\phi}(\tilde{x}_1, \tilde{x}_2, \tilde{t}). \]

with the non-dimensionalized fluid domain

\[ \tilde{\Omega}(t) = \left\{ (\tilde{x}_1, \tilde{x}_2) \mid -\pi < \tilde{x}_1 < \pi, -\infty < \tilde{x}_2 < \frac{H}{L} \tilde{h}(\tilde{x}_1, t), \ t \in [0, T] \right\}, \]

\[ \tilde{\Gamma}(t) = \left\{ (\tilde{x}_1, \frac{H}{L} \tilde{h}(\tilde{x}_1, t)), \ t \in [0, T] \right\}. \]

We find the following dimensionless parameters:

\[ \varepsilon = \frac{H}{L}, \quad \alpha_1^s = \frac{\delta_1}{\rho \sqrt{G} L^{s-2}}, \quad \alpha_2 = \frac{\delta_2}{\sqrt{G} L^{3/2}}, \quad \beta = \frac{\gamma}{\rho G L^2}, \]

where \( s = 0 \) if \( \mathcal{D} \phi = \phi \) and \( s = 2 \) if \( \mathcal{D} \phi = \partial_1^2 \phi \). The first parameter is known as the **steepness parameter** and measures the ratio between the amplitude and the wavelength of the wave. The \( \alpha_1^s \)'s consider the ratio between gravity and viscosity forces. Finally, the fourth one is the Bond number that compares gravity forces with capillary forces. Dropping the tildes for the sake of clarity, we have the following dimensionless form of the damped water waves problem

\[ \Delta \phi = 0 \quad \text{in } \Omega(t) \times [0, T], \]

\[ \phi = \xi \quad \text{on } \Gamma(t) \times [0, T], \]

\[ \xi_t = -\frac{\varepsilon}{2} |\nabla \phi|^2 - h + \frac{\beta \partial_1^2 h}{\left(1 + (\varepsilon \partial_1 h)^2\right)^{3/2}} - \alpha_1^s \mathcal{D}^s \phi \]

\[ + \varepsilon \partial_2 \phi \left( \nabla \phi \cdot (-\varepsilon \partial_1 h, 1) + \alpha_2 \partial_1^2 h \right) \quad \text{on } \Gamma(t) \times [0, T], \]

\[ h_t = \nabla \phi \cdot (-\varepsilon \partial_1 h, 1) + \alpha_2 \partial_1^2 h \quad \text{on } \Gamma(t) \times [0, T], \]

where we have used the nondimensional parameters (16).
2.3. The equations in the Arbitrary Lagrangian-Eulerian formulation. In the present section we want to express system (17) on the reference domain $\Omega$ and reference interface $\Gamma$

$$\Omega = S^1 \times (-\infty, 0), \quad \Gamma = S^1 \times \{0\}.$$  

The easiest way to do so is, supposing that $h$ is regular, defining the following family (parametrized in $t \in [0, T]$) of diffeomorphisms

$$\psi : [0, T] \times \Omega \rightarrow \Omega (t), \quad (x_1, x_2, t) \mapsto \psi (x_1, x_2, t) = (x_1, x_2 + \varepsilon h (x_1, t)).$$

Such a technique has been already used in the past by different authors (see for instance [6, 7, 17, 28, 36] and the references therein). We compute

$$\nabla \psi = \left( \varepsilon \partial_1 h (x_1, t) \begin{array}{c} 1 \\ 0 \end{array}, \begin{array}{c} 0 \\ 1 \end{array} \right), \quad A = (\nabla \psi)^{-1} = \left( -\varepsilon \partial_1 h (x_1, t) \begin{array}{c} 1 \\ 0 \end{array} \right).$$  

With such map we can define the push-back of any application $\Theta$ defined on $\Omega (t)$ simply as $\Theta = \theta \circ \psi$, whence in particular we define

$$\Phi = \phi \circ \psi.$$  

We let $N = e_2$ denote the outward unit normal to $\Omega$ at $\Gamma$. We also recall that, if $\Theta = \theta \circ \psi$, the following formula holds

$$\partial_j \theta \circ \psi = A^k_j \partial_k \Theta,$$

where Einstein convention is used. Then, we can rewrite (17) as the following system of variable coefficients nonlinear PDEs posed on a fixed reference domain

$$A^j_k \partial_j \left( A^k_i \partial_i \Phi \right) = 0 \quad \text{in } \Omega \times [0, T],$$

$$\Phi = \xi \quad \text{on } \Gamma \times [0, T],$$

$$\xi_t = -\varepsilon A^k_j \partial_k \Phi A^j_i \partial_i \Phi - h + \frac{\beta \partial_1^2 h}{\left( 1 + (\varepsilon \partial_1 h)^2 \right)^{3/2}} - \alpha \xi^4 \mathcal{D}^s \Phi$$

$$+ \varepsilon A^k_j \partial_k \Phi \left( A^j_i \partial_i \Phi A^j_i + \alpha^2 \partial_1^2 h \right) \quad \text{on } \Gamma \times [0, T],$$

$$h_t = A^k_j \partial_k \Phi A^j_i + \alpha^2 \partial_1^2 h \quad \text{on } \Gamma \times [0, T],$$

where the operator $\mathcal{D}^s$ is

$$\mathcal{D}^0 \Phi = \xi, \quad \mathcal{D}^2 \Phi = A^k_j \partial_k \left( A^j_i \partial_i \Phi \right).$$

Next we explicit the values of the $A^j_i$’s in the above system (see (19)) obtaining hence

$$\Delta \Phi = \varepsilon \left( \partial_1^2 h \partial_2 \Phi + 2 \partial_1 h \partial_2 \Phi \right) - \varepsilon^2 (\partial_1 h)^2 \partial_1^2 \Phi, \quad \text{in } \Omega \times [0, T],$$

$$\Phi = \xi \quad \text{on } \Gamma \times [0, T],$$

$$\xi_t = -\frac{\varepsilon}{2} \left[ (\partial_1 \Phi)^2 + (\varepsilon \partial_1 h \partial_2 \Phi)^2 + (\partial_2 \Phi)^2 - 2 \varepsilon \partial_1 h \partial_2 \Phi \partial_1 \Phi \right]$$

$$- h + \frac{\beta \partial_1^2 h}{\left( 1 + (\varepsilon \partial_1 h)^2 \right)^{3/2}} - \alpha \xi^4 \mathcal{D}^s \Phi$$

$$+ \varepsilon \partial_2 \Phi \left( -\varepsilon \partial_1 h \partial_1 \Phi + \varepsilon^2 (\partial_1 h)^2 \partial_2 \Phi + \partial_2 \Phi + \alpha \partial_1^2 h \right) \quad \text{on } \Gamma \times [0, T],$$
\[ h_t = -\varepsilon \partial_1 h \partial_1 \Phi + \varepsilon^2 (\partial_1 h)^2 \partial_2 \Phi + \partial_2 \Phi + \alpha_2 \partial_1^2 h \quad \text{on } \Gamma \times [0, T], \quad (21d) \]

where

\[ \mathcal{D}^0 \Phi = \Phi, \quad \mathcal{D}^2 \Phi = \partial_2^2 \Phi. \]

3. The asymptotic model for damped water waves when \( s = 0 \)

In this section we consider the case \( s = 0 \) (the model by Jiang, Ting, Perlin & Schultz \[22\] and Wu, Liu & Yue \[44\]). In this case we have that

\[ \mathcal{D}^0 \Phi = \Phi. \]

We introduce the following ansatz:

\[
\Phi(x_1, x_2, t) = \sum_n \varepsilon^n \Phi^{(n)}(x_1, x_2, t), \\
\xi(x_1, t) = \sum_n \varepsilon^n \xi^{(n)}(x_1, t), \\
h(x_1, t) = \sum_n \varepsilon^n h^{(n)}(x_1, t). \tag{22}
\]

With this ansatz we can re-profile the nonlinear system (21) in an equivalent sequence of linear systems where the evolution of the \( n \)-th profile is determined by the evolution of the preceding \( n - 1 \) profiles.

We are interested in a model approximating (21) with an error \( O(\varepsilon^2) \). Using that

\[
1 + \frac{(1 + x^2)^{3/2}}{2} = 1 + O(x^2),
\]

we obtain that

\[
\beta \partial_1^2 h = \beta \partial_1^2 h + O(\varepsilon^2). \tag{23d}
\]

For the case \( n = 0 \), we have that

\[
\begin{align*}
\Delta \Phi^{(0)} &= 0, & \text{in } \Omega \times [0, T], \\
\Phi^{(0)} &= \xi^{(0)}, & \text{on } \Gamma \times [0, T], \\
\xi_t^{(0)} &= -h^{(0)} + \beta \partial_1^2 h^{(0)} - \alpha_1 \Phi^{(0)}, & \text{on } \Gamma \times [0, T], \\
h_t^{(0)} &= \partial_2 \Phi^{(0)} + \alpha_2 \partial_1^2 h^{(0)}, & \text{on } \Gamma \times [0, T].
\end{align*} \tag{23a,b,c,d}
\]

Recalling that

\[ \tilde{\Phi}(0)(k, x_2, t) = \xi^{(0)}(k, t)e^{\|k\|x_2} \quad \text{in } \Omega \times [0, T] \]

so

\[ \partial_2 \Phi^{(0)} = \Lambda \xi^{(0)} \quad \text{on } \Gamma, \]

we find that (23d) can be equivalently written as

\[ h_{tt}^{(0)} = \Lambda \left( -h^{(0)} + \beta \partial_1^2 h^{(0)} - \alpha_1 \Phi^{(0)} \right) + \alpha_2 \partial_1^2 h^{(0)} \quad \text{on } \Gamma \times [0, T]. \]

We note that (23d) can be equivalently written as

\[ \xi^{(0)} = \Lambda^{-1} \left[ h_t^{(0)} - \alpha_2 \partial_1^2 h^{(0)} \right], \tag{24} \]
Thus, we find that
\[
\Delta \Phi^{(1)} = \partial_1^2 h^{(0)} \partial_2 \Phi^{(0)} + 2 \partial_1 h^{(0)} \partial_1 \Phi^{(0)},
\]
in \( \Omega \times [0, T] \),
\[
\Phi^{(1)} = \xi^{(1)}
\]
on \( \Gamma \times [0, T] \),
\[
\xi_t^{(1)} = \frac{1}{2} \left[ (\partial_2 \Phi^{(0)})^2 - (\partial_1 \Phi^{(0)})^2 \right] - h^{(1)} + \beta \partial_1^2 h^{(1)} - \alpha_1^0 \Phi^{(1)} + \alpha_2 \partial_2 \Phi^{(0)} \partial_1^2 h^{(0)}
\]
on \( \Gamma \times [0, T] \),
\[
h_t^{(1)} = -\partial_1 h^{(0)} \partial_1 \Phi^{(0)} + \partial_2 \Phi^{(0)} + \alpha_2 \partial_1^2 h^{(1)}
\]
on \( \Gamma \times [0, T] \),

Similarly, in the case \( n = 1 \), we find that
\[
\Delta \Phi^{(1)} = \partial_1^2 h^{(0)} \partial_2 \Phi^{(0)} + 2 \partial_1 h^{(0)} \partial_1 \Phi^{(0)},
\]
in \( \Omega \times [0, T] \),
\[
\Phi^{(1)} = \xi^{(1)}
\]
on \( \Gamma \times [0, T] \),
\[
\xi_t^{(1)} = \frac{1}{2} \left[ (\partial_2 \Phi^{(0)})^2 - (\partial_1 \Phi^{(0)})^2 \right] - h^{(1)} + \beta \partial_1^2 h^{(1)} - \alpha_1^0 \Phi^{(1)} + \alpha_2 \partial_2 \Phi^{(0)} \partial_1^2 h^{(0)}
\]
on \( \Gamma \times [0, T] \),
\[
h_t^{(1)} = -\partial_1 h^{(0)} \partial_1 \Phi^{(0)} + \partial_2 \Phi^{(0)} + \alpha_2 \partial_1^2 h^{(1)}
\]
on \( \Gamma \times [0, T] \),

Let us define
\[
b = \partial_2 h^{(0)} \partial_2 \Phi^{(0)} + 2 \partial_1 h^{(0)} \partial_1 \Phi^{(0)},
\]

We now use Lemma A.1 in order to compute
\[
\partial_2 \Phi^{(1)} (k, 0, t) = \int_{-\infty}^{0} \hat{b} (k, y_2, t) e^{iky_2} dy_2 + |k| \xi^{(1)} (k, t).
\]

We want to provide an explicit expression for the term \( \int_{-\infty}^{0} \hat{b} (k, y_2, t) e^{iky_2} dy_2 \) considering the form of \( b \). We compute that
\[
\int_{-\infty}^{0} \hat{b} (k, y_2, t) e^{iky_2} dy_2 = \int_{-\infty}^{0} e^{iky_2} \hat{h}^{(0)} (k - m) \hat{\xi}^{(0)} (m) dy_2,
\]
\[
= - |m| \frac{|k|^2 - |m|^2}{|k| + |m|} \hat{h}^{(0)} (k - m) \hat{\xi}^{(0)} (m),
\]
\[
= - |m| [k] \hat{h}^{(0)} (k - m) \hat{\xi}^{(0)} (m).
\]

Thus, we find that
\[
\partial_2 \Phi^{(1)} \big|_{x_2=0} = \Lambda \xi^{(1)} - \left[ \Lambda, h^{(0)} \right] \Lambda e^{i\xi^{(0)}}.
\]

The evolution equations for \( h^{(1)} \) and \( \xi^{(1)} \) become hence
\[
h_t^{(1)} = -\partial_1 h^{(0)} \partial_1 \xi^{(0)} + \Lambda \xi^{(1)} - \left[ \Lambda, h^{(0)} \right] \Lambda e^{i\xi^{(0)}} + \alpha_2 \partial_1^2 h^{(1)},
\]
\[
\xi_t^{(1)} = \frac{1}{2} \left[ (\Lambda \xi^{(0)})^2 - (\partial_1 \xi^{(0)})^2 \right] - h^{(1)} + \beta \partial_1^2 h^{(1)} - \alpha_1^0 \Phi^{(1)} + \alpha_2 \partial_2 \Phi^{(0)} \partial_1^2 h^{(0)}.
\]

Using the above equation for \( h_t^{(1)} \) (28) we can express \( \xi^{(1)} \) as a function of \( h^{(0)} \), \( \xi^{(0)} \) and \( h^{(1)} \) as follows
\[
\xi^{(1)} = \Lambda^{-1} \left[ h_t^{(1)} + \partial_1 h^{(0)} \partial_1 \xi^{(0)} + \left[ \Lambda, h^{(0)} \right] \Lambda \xi^{(0)} - \alpha_2 \partial_1^2 h^{(1)} \right].
\]

Time differentiating (28) and inserting (29), we deduce
\[
h_t^{(1)} = -\partial_1 h^{(0)} \partial_1 \xi^{(0)} - \partial_1 h^{(0)} \partial_1 \xi^{(0)} + \frac{1}{2} \Lambda \left[ (\Lambda \xi^{(0)})^2 - (\partial_1 \xi^{(0)})^2 \right] - \Lambda h^{(1)} + \beta \Lambda \partial_1^2 h^{(1)} - \alpha_1^0 \Phi^{(1)} + \alpha_2 \Lambda \left( \Lambda \xi^{(0)} \partial_1^2 h^{(0)} \right)
\]
We group the nonlinear terms according to the coefficient in front. At \( \mathcal{O}(1) \) we find that

\[
\begin{align*}
\frac{1}{2} \left[ \Lambda, h_t(0) \right] \Lambda \xi(0) - \left[ \Lambda, h(0) \right] \Lambda \xi(0) + \alpha_2 \partial_t^2 h_t^{(1)}.
\end{align*}
\]

Recalling the definition of the Riesz potential \( \Lambda^{-1} \) and using \((23c)\) and \((24)\) in order to express \( \xi(0) \) and \( \xi_t(0) \) in terms of \( h(0) \), we find that

\[
\begin{align*}
\frac{1}{2} \left[ \Lambda, h_t(0) \right] \Lambda \xi(0) - \left[ \Lambda, h(0) \right] \Lambda \xi(0) + \alpha_2 \partial_t^2 h_t^{(1)}.
\end{align*}
\]

Using Tricomi identity

\[
(\mathcal{H}f)^2 - f^2 = 2\mathcal{H}(f\mathcal{H}f),
\]

the previous equation can be further simplified and we find that

\[
\begin{align*}
\frac{1}{2} \left[ \Lambda, h_t(0) \right] \Lambda \xi(0) - \left[ \Lambda, h(0) \right] \Lambda \xi(0) + \alpha_2 \partial_t^2 h_t^{(1)}.
\end{align*}
\]

We can express \( \alpha_1 \Phi(0) \) in terms of \( h(0) \) as follows

\[
\alpha_1 \Phi(0) \bigg|_{x=0} = \alpha_1 \xi(0) = \alpha_1 \Lambda^{-1} \left[ h_t(0) - \alpha_2 \partial_t^2 h(0) \right],
\]

and, inserting the previous formula into \((30)\), we find that

\[
\begin{align*}
\alpha_1 \Phi(1) \bigg|_{x=0} = \alpha_1 \xi(1),
\quad
\text{where}
\quad
\begin{align*}
\alpha_1 \Phi(1) \bigg|_{x=0} &= \alpha_1 \Lambda^{-1} \left[ h_t(1) + \partial_t h(0) \partial_t \xi(0) + \left[ \Lambda, h(0) \right] \Lambda \xi(0) - \alpha_2 \partial_t^2 h(1) \right],
\quad
\begin{align*}
\alpha_1 \Lambda^{-1} \left[ h_t(1) + \partial_t h(0) \partial_t \xi(0) + \left[ \Lambda, h(0) \right] \Lambda \xi(0) - \alpha_2 \partial_t^2 h(1) \right],
\quad
\end{align*}
\end{align*}
\]

Substituting the previous expressions into the equation for \( h_t^{(1)} \), we deduce the following equation:

\[
\begin{align*}
\frac{1}{2} \left[ \Lambda, h_t(0) \right] \Lambda \xi(0) - \left[ \Lambda, h(0) \right] \Lambda \xi(0) + \alpha_2 \partial_t^2 h_t^{(1)}.
\end{align*}
\]

We group the nonlinear terms according to the coefficient in front. At \( \mathcal{O}(1) \) we find that
\[ \partial_t h_t^{(0)} \mathcal{H} h_t^{(0)} + \left( \partial_t h_t^{(0)} \right)^2 + \frac{\Lambda}{2} \left\{ \left[ h_t^{(0)} \right]^2 - \left( \mathcal{H} h_t^{(0)} \right)^2 \right\} - \left[ \Lambda, h_t^{(0)} \right] h_t^{(0)} + \left[ \Lambda, h_t^{(0)} \right] \Lambda h_t^{(0)} \]
\[ = - \Lambda \left( \mathcal{H} h_t^{(0)} \right)^2 + \partial_t \left[ \mathcal{H}, h_t^{(0)} \right] \Lambda h_t^{(0)}, \quad (32) \]

where we have used the identity (31). At \( \mathcal{O}(\beta) \) we obtain that
\[ \beta \left( - \partial_t h_t^{(0)} \partial_t^2 h_t^{(0)} - \left[ \Lambda, h_t^{(0)} \right] \Lambda \partial_t^2 h_t^{(0)} \right) = \beta \left( \Lambda \left( h_t^{(0)} \Lambda^2 h_t^{(0)} \right) - \partial_t \left( h_t^{(0)} \partial_t^2 h_t^{(0)} \right) \right) \]
\[ = \beta \partial_t \left[ \mathcal{H}, h_t^{(0)} \right] \Lambda^3 h_t^{(0)}. \quad (33) \]

At \( \mathcal{O}(\alpha_2) \) we find the following contribution
\[- \alpha_2 \left[ \partial_t h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} + \partial_t \left\{ h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} \right\} \right] \]
\[- \Lambda \left[ h_t^{(0)} \partial_t^2 h_t^{(0)} \right] - \left[ \Lambda, h_t^{(0)} \right] \partial_t^2 h_t^{(0)} \]
\[ = - \alpha_2 \left[ \partial_t h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} + \partial_t \left\{ h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} \right\} \right] + \partial_t \left\{ \partial_t^2 h_t^{(0)} \mathcal{H} h_t^{(0)} \right\} \]
\[ - 2 \Lambda \left[ h_t^{(0)} \partial_t^2 h_t^{(0)} \right] + h_t^{(0)} \Lambda \partial_t^2 h_t^{(0)}. \quad (34) \]

Using
\[ \mathcal{H} f \mathcal{H} g - \mathcal{H} \left( f \mathcal{H} g + g \mathcal{H} f \right) = fg, \quad (35) \]
we find that
\[ \Lambda \left[ h_t^{(0)} \partial_t^2 h_t^{(0)} \right] = \Lambda \left( \mathcal{H} h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} \right) + \partial_t \left( h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} + \partial_t^2 h_t^{(0)} \mathcal{H} h_t^{(0)} \right) . \]

Thus, we can group terms in (34) as follows
\[- \alpha_2 \left[ \partial_t \left( h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} \right) - 2 \Lambda \left( \mathcal{H} h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} \right) - \partial_t \left( h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} + \partial_t^2 h_t^{(0)} \mathcal{H} h_t^{(0)} \right) \right] \]
\[ = \alpha_2 \partial_t \left[ \mathcal{H}, h_t^{(0)} \right] \mathcal{H} \partial_t^2 h_t^{(0)} + \alpha_2 \Lambda \left( \mathcal{H} h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} \right) . \quad (36) \]

At \( \mathcal{O}(\alpha_2 \alpha_2) \), we find that
\[ \alpha_2^2 \left[ \partial_t \left\{ \partial_t^2 h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} \right\} \right] - \Lambda \left( \left( \partial_t^2 h_t^{(0)} \right)^2 \right) = - \alpha_2^2 \partial_t \left[ \mathcal{H}, \partial_t^2 h_t^{(0)} \right] \partial_t^2 h_t^{(0)} . \quad (37) \]

We group now the \( \mathcal{O}(\alpha_0^0) \) terms:
\[ \alpha_0^0 \left[ - \partial_t h_t^{(0)} \mathcal{H} h_t^{(0)} + \partial_t h_t^{(0)} \mathcal{H} h_t^{(0)} - \left[ \Lambda, h_t^{(0)} \right] h_t^{(0)} + \left[ \Lambda, h_t^{(0)} \right] h_t^{(0)} \right] = 0. \quad (38) \]

Finally, we are left with the \( \mathcal{O}(\alpha_0^0 \alpha_2) \) terms. These terms are
\[ \alpha_0^0 \alpha_2 \left[ \partial_t h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} - \partial_t h_t^{(0)} \mathcal{H} \partial_t^2 h_t^{(0)} + \left[ \Lambda, h_t^{(0)} \right] \partial_t^2 h_t^{(0)} - \left[ \Lambda, h_t^{(0)} \right] \partial_t^2 h_t^{(0)} \right] = 0. \quad (39) \]

Thus, using (32), (33), (36), (37), (38) and (39), we conclude that
\[ h_t^{(1)} + \Lambda h_t^{(1)} + \beta \Lambda^2 h_t^{(1)} + \alpha_0^0 h_t^{(1)} - \alpha_0^0 \alpha_2 \partial_t^2 h_t^{(1)} - \alpha_2^2 \partial_t^2 h_t^{(1)} \]
\[ = - \Lambda \left( \mathcal{H} h_t^{(0)} \right)^2 + \partial_t \left[ \mathcal{H}, h_t^{(0)} \right] \Lambda h_t^{(0)} + \beta \partial_t \left[ \mathcal{H}, h_t^{(0)} \right] \Lambda^3 h_t^{(0)} + \alpha_2 \partial_t \left[ \mathcal{H}, h_t^{(0)} \right] \mathcal{H} \partial_t^2 h_t^{(0)} \]
Similarly, due to the fact that we find that the previous equation for We use the ansatz (40)

We define the renormalized variable

\[ f = h^{(0)} + \varepsilon h^{(1)}. \] (40)

Using

\[ \varepsilon h^{(0)} = \varepsilon f + \mathcal{O}(\varepsilon^2), \]

and neglecting errors \( \mathcal{O}(\varepsilon^2) \), we conclude the following model:

\[
\begin{align*}
    f_{tt} + \Lambda f + \beta \Lambda^3 f + &\; \alpha_1^0 f_t - \alpha_1^0 \alpha_2 \partial^2 \beta f - \alpha_2 \partial^2 \beta f_t \\
    = &\; \varepsilon \left[ -\Lambda \left( (\mathcal{H}f_t)^2 \right) + \partial_t [\mathcal{H}, f] \Lambda f + \beta \partial_t [\mathcal{H}, f] \Lambda^3 f + \alpha_2 \partial_t [\mathcal{H}, f] \partial^2 \beta f \\
    &\quad + \alpha_2 \Lambda (\mathcal{H}f_t \partial^2 \beta f) - \alpha_2^2 \partial_1 [\mathcal{H}, \partial^2 \beta f] \partial^2 \beta f \right].
\end{align*}
\] (41)

When \( \alpha_2 = 0 \), equation (41) is an asymptotic model of the damped water waves system proposed by Jiang, Ting, Perlin & Schultz [22] and Wu, Liu & Yue [44]. Also, when \( \alpha_2 = \alpha_1^0 = 0 \), equation (41) recovers the quadratic \( h \)--model in [1, 2, 6, 31–33].

4. The asymptotic model for damped water waves when \( s = 2 \)

In this section we focus on the case \( s = 2 \) (the model by Dias, Dyachenko, and Zakharov [10]). In this case we have that

\[ \mathcal{D}^2 \Phi = \partial^2_\xi \Phi. \]

We use the ansatz (22) and follow the previous steps. The first term in the series solves

\[
\begin{align*}
    \Delta \Phi^{(0)} = 0, &\quad \text{in } \Omega \times [0, T], \quad (42a) \\
    \Phi^{(0)} = \xi^{(0)}, &\quad \text{on } \Gamma \times [0, T], \quad (42b) \\
    \xi_t^{(0)} = -h^{(0)} + \beta \partial^2 \beta h^{(0)} - \alpha_1^2 \partial^2 \beta \Phi^{(0)}, &\quad \text{on } \Gamma \times [0, T], \quad (42c) \\
    h_t^{(0)} = \partial^2_\Phi \Phi^{(0)} + \alpha_2 \partial^2 \beta h^{(0)}, &\quad \text{on } \Gamma \times [0, T]. \quad (42d)
\end{align*}
\]

Taking a time derivative of the equation (42d), using the fact that

\[ \partial^2_\Phi \Phi^{(0)} \bigg|_{x_2=0} = \Lambda \xi^{(0)} = h_t^{(0)} - \alpha_2 \partial^2 \beta h^{(0)} \]

and substituting (42c), we find that

\[ h_{tt}^{(0)} = \Lambda \left( -h^{(0)} + \beta \partial^2 \beta h^{(0)} - \alpha_1 \partial^2 \beta \Phi^{(0)} \right) + \alpha_2 \partial^2 \beta h_t^{(0)} \]

on \( \Gamma \times [0, T] \). Similarly, due to the fact that

\[ \partial^2_\xi \Phi^{(0)} \bigg|_{x_2=0} = \Lambda^2 \xi^{(0)} = \Lambda \left[ h_t^{(0)} - \alpha_2 \partial^2 \beta h^{(0)} \right] \]

we find that the previous equation for \( h_{tt} \) can be written as

\[ h_{tt}^{(0)} = -\Lambda h^{(0)} - \beta \Lambda^3 h^{(0)} + \alpha_1^2 \partial^2 \beta h^{(0)} + \alpha_1 \alpha_2 \partial^2 \beta h^{(0)} + \alpha_2 \partial^2 \beta h_t^{(0)} \]

on \( \Gamma \times [0, T]. \) (43)
As before, we want to reduce everything to a single equation for
\[ \Phi(1) = \xi(1) \]
and
\[ \xi_t(1) = \frac{1}{2} \left[ (\partial_2 \Phi(0))^2 - (\partial_1 \Phi(0))^2 \right] - h(1) + \beta \partial_t^2 h(1) - \alpha_1 \partial_2^2 \Phi(1) + \alpha_2 \partial_2 \Phi(0) \partial_1^2 h(0) \]
on \[ \Omega \times [0, T], \]
(44c)
\[ h_t(1) = -\partial_1 h(0) \partial_1 \Phi(0) + \partial_2 \Phi(1) + \alpha_2 \partial_1^2 h(1) \]
on \[ \Gamma \times [0, T], \]
(44d)
We use Lemma A.1 and (27) to find that
\[ \partial_2 \Phi(1)_{|x_2=0} = \Lambda \xi(1) - \left[ \Lambda, h(0) \right] \Lambda \xi(0) \]
\[ \partial_2^2 \Phi(1)_{|x_2=0} = \Lambda^2 \xi(1) + \partial_1^2 h(0) \Lambda \xi(0) + 2 \partial_1 h(0) \partial_1 \Lambda \xi(0). \]
Then we find the following system of equations
\[ h_t(1) = -\partial_1 h(0) \partial_1 \xi(0) + \Lambda \xi(1) - \left[ \Lambda, h(0) \right] \Lambda \xi(0) + \alpha_2 \partial_1^2 h(1), \]
(45)
\[ \xi_t(1) = \frac{1}{2} \left[ \left( \Lambda \xi(0) \right)^2 - \left( \partial_1 \xi(0) \right)^2 \right] - h(1) + \beta \partial_t^2 h(1) - \alpha_1^2 \left[ \Lambda^2 \xi(1) + \partial_1^2 h(0) \Lambda \xi(0) + 2 \partial_1 h(0) \partial_1 \Lambda \xi(0) \right] + \alpha_2 \Lambda \xi(0) \partial_1^2 h(0). \]
These equations are the analog (when \( s = 2 \)) of the equations (28) and (29).
As before, we want to reduce everything to a single equation for \( h(1) \) and \( h(0) \). Using (42d), we find that
\[ \Lambda \xi(1) = h_t(1) - \partial_1 h(0) \partial_1 \xi(0) + \alpha_2 \partial_1^2 h(0) \]
\[ - \alpha_2 \partial_1^2 h(1) + \left[ \Lambda, h(0) \right] \left[ h_t(0) - \alpha_2 \partial_1^2 h(0) \right]. \]
As a consequence, we have that
\[ \alpha_1 \partial_1^2 \Phi(1)_{|x_2=0} = \alpha_2^2 \Lambda \left[ h_t(1) - \partial_1 h(0) \partial_1 \xi(0) + \alpha_2 \partial_1^2 h(0) - \partial_1 h(0) \partial_1 \xi(0) - \left[ \Lambda, h(0) \right] \Lambda \xi(1) \right], \]
(46)
Time differentiating (45) and inserting (46), we deduce
\[ h_{tt}(1) = -\partial_1 h_t(0) \partial_1 \xi(0) + \Lambda \xi_t(1) - \left[ \Lambda, h_t(0) \right] \Lambda \xi(0) + \alpha_2 \partial_1^2 h_t(1) - \partial_1 h(0) \partial_1 \xi(0) - \left[ \Lambda, h(0) \right] \Lambda \xi_t(0), \]
\[ = \partial_1 h_t(0) \partial_1 \xi(0) - \left[ \Lambda, h_t(0) \right] \Lambda \xi(0) + \alpha_2 \partial_1^2 h_t(1) - \partial_1 h(0) \partial_1 \xi(0) - \left[ \Lambda, h(0) \right] \Lambda \xi(0), \]
\[ + \alpha_2 \partial_1^2 h_t(1) - \partial_1 h(0) \partial_1 \left[ -h(0) + \beta \partial_t^2 h(0) - \alpha_1 \Lambda \left[ h_t(0) - \alpha_2 \partial_1^2 h(0) \right] \right] \]
\[ - \left[ \Lambda, h(0) \right] \Lambda \left[ h_t(0) - \beta \partial_t^2 h(0) - \alpha_1 \Lambda h_t(0) - \alpha_2 \partial_1^2 h(0) \right], \]
\[ = \alpha_1 \partial_1 h_t(0) \partial_1 \xi(0) - \left[ \Lambda, h_t(0) \right] \Lambda \xi(0) + \alpha_2 \partial_1^2 h_t(1) - \partial_1 h(0) \partial_1 \xi(0) - \left[ \Lambda, h(0) \right] \Lambda \xi(0), \]
\[ + \frac{1}{2} \Lambda \left[ \left( \Lambda \xi(0) \right)^2 - \left( \partial_1 \xi(0) \right)^2 \right] \]
\[ + \Lambda \left[ -h(1) + \beta \partial_t^2 h(1) - \alpha_1 \Lambda \left[ h_t(0) - \alpha_2 \partial_1^2 h(0) \right] \right] + \alpha_2 \Lambda \xi(0) \partial_1^2 h(0) \]
\[ = \partial_1 h_t(0) \partial_1 \xi(0) - \left[ \Lambda, h_t(0) \right] \Lambda \xi(0) + \alpha_2 \partial_1^2 h_t(1) - \partial_1 h(0) \partial_1 \xi(0) - \left[ \Lambda, h(0) \right] \Lambda \xi(0), \]
+ \alpha_2 \partial_t^2 h_t^{(1)} \partial_t \left[ -h^{(0)} + \beta \partial_t^2 h^{(0)} - \alpha_2^2 \Lambda \left[ h_t^{(0)} - \alpha_2 \partial_t^2 h^{(0)} \right] \right] \\
\frac{1}{2} \Lambda \left[ h_t^{(0)} - \alpha_2 \partial_t^2 h^{(0)} \right]^2 - \left( \mathcal{H} h_t^{(0)} - \alpha_2 \mathcal{H} \partial_t^2 h^{(0)} \right)^2 \\
+ \Lambda \left\{ -h_1^{(1)} + \beta \partial_t^2 h_1^{(1)} - \alpha_2^2 \partial_t^2 h_1^{(0)} \right\} \partial_t \left[ h_t^{(0)} - \alpha_2 \partial_t^2 h^{(0)} \right] + 2 \partial_1 h^{(0)} \partial_1 \left[ h_t^{(0)} - \alpha_2 \partial_t^2 h^{(0)} \right] \\
+ \alpha_2 \left[ h_t^{(0)} - \alpha_2 \partial_t^2 h^{(0)} \right] \partial_t^2 h^{(0)} \\
- \alpha_2^2 \Lambda^2 \left\{ h_1^{(1)} - \partial_1 h^{(0)} \right\} \left[ h_t^{(0)} - \alpha_2 \partial_t^2 h^{(0)} \right] - \alpha_2 \partial_2^2 h_1^{(1)} + \left[ \Lambda, h^{(0)} \right] \left[ h_t^{(0)} - \alpha_2 \partial_t^2 h^{(0)} \right],

where we have used the previous expression for \Lambda^{(1)}. We group the different nonlinear contributions according to the coefficient in front: at \mathcal{O}(1) we find (32), while at \mathcal{O}(\beta) we have (33).

Using Tricomi identity (31) to obtain

\begin{align*}
\frac{1}{2} \Lambda \left[ h_t^{(0)} - \alpha_2 \partial_t^2 h^{(0)} \right]^2 - \left( \mathcal{H} h_t^{(0)} - \alpha_2 \mathcal{H} \partial_t^2 h^{(0)} \right)^2 &= \partial_1 \left[ \left( h_t^{(0)} - \alpha_2 \partial_t^2 h^{(0)} \right) \left( \mathcal{H} h_t^{(0)} - \alpha_2 \mathcal{H} \partial_t^2 h^{(0)} \right) \right],
\end{align*}

we find that the \mathcal{O}(\alpha_2) contribution is given by (34) and, as a consequence, it can be further simplify to conclude (36). At \mathcal{O}(\alpha_2 \alpha_2) we have the terms (37). We collect now the \mathcal{O}(\alpha_2^2) terms:

\begin{align*}
\alpha_2^2 \left[ \partial_t h^{(0)} \partial_1 \Lambda h_t^{(0)} - \partial_t^2 \left( \partial_1 h^{(0)} \mathcal{H} h_t^{(0)} \right) - \left[ \Lambda, h^{(0)} \right] \partial_t^2 h_t^{(0)} + \partial_t^2 \left[ \Lambda, h^{(0)} \right] h_t^{(0)} \right] \\
- \Lambda \left\{ \partial_t^2 h^{(0)} h_t^{(0)} + 2 \partial_1 h^{(0)} \partial_1 h_t^{(0)} \right\} &= \alpha_1^2 \left[ - \partial_t^2 h^{(0)} \mathcal{H} h_t^{(0)} - 2 \partial_t^2 h^{(0)} \Lambda h_t^{(0)} \right] \\
+ 2 \left[ \Lambda, \partial_1 h^{(0)} \right] \partial_1 h_t^{(0)} + \left[ \Lambda, \partial_t^2 h^{(0)} \right] h_t^{(0)} - \Lambda \left\{ \partial_t^2 h^{(0)} h_t^{(0)} + 2 \partial_1 h^{(0)} \partial_1 h_t^{(0)} \right\} \\
&= -\alpha_1^2 \partial_1 \left[ \partial_t^2 h^{(0)} \right] \mathcal{H} h_t^{(0)}. \quad (47)
\end{align*}

Finally, we consider the \mathcal{O}(\alpha_2 \alpha_2^2) terms and obtain

\begin{align*}
\alpha_2 \alpha_2^2 \left[ - \partial_t h^{(0)} \Lambda \partial_t^2 h^{(0)} + \left[ \Lambda, h^{(0)} \right] \partial_1^4 h^{(0)} - \partial_t^2 \left[ \Lambda, h^{(0)} \right] \partial_t^2 h^{(0)} \right] \\
+ \Lambda \left[ \left( \partial_t^2 h^{(0)} \right)^2 + 2 \partial_1 h^{(0)} \partial_t^2 h^{(0)} \right] + \partial_t^2 \left( \partial_t h^{(0)} \partial_1 \Lambda h^{(0)} \right) \right] \\
&= \alpha_1^2 \partial_1 \left[ \partial_t^2 h^{(0)} \right] \Lambda h^{(0)}. \quad (48)
\end{align*}

Collecting (32), (33), (36), (37), (47) and (48), we conclude the following equation for \( h^{(1)} \)

\begin{align*}
h_{tt}^{(1)} - (\alpha_2^2 + \alpha_2^2) \partial_t^2 h_{tt}^{(1)} + \Lambda h^{(1)} + \beta \Lambda^3 h^{(1)} + \alpha_2^2 \alpha_2 \partial_t^2 h^{(1)} \\
= -\Lambda \left( \left( \mathcal{H} h_t^{(0)} \right)^2 \right) + \partial_1 \left[ \mathcal{H}, h^{(0)} \right] \Lambda h^{(0)} + \beta \partial_1 \left[ \mathcal{H}, h^{(0)} \right] \Lambda^3 h^{(0)} \\
+ \alpha_2 \partial_1 \left[ \mathcal{H}, \mathcal{H} h_t^{(0)} \right] \mathcal{H} \partial_1^2 h^{(0)} + \alpha_2 \Lambda \left( \mathcal{H} h_t^{(0)} \mathcal{H} \partial_1^2 h^{(0)} \right) + \alpha_2^2 \alpha_2 \partial_1 \left[ \partial_1^2 h^{(0)} \right] \Lambda h^{(0)} \\
- \alpha_1^2 \partial_1 \left[ \partial_t^2 h^{(0)} \right] \mathcal{H} h_t^{(0)} - \alpha_2 \alpha_2 \partial_1 \left[ \mathcal{H}, \partial_t^2 h^{(0)} \right] \partial_t h^{(0)}. 
\end{align*}
Thus, neglecting errors of order $O(\varepsilon^2)$, we conclude the following model for the renormalized variable (40):

$$f_{tt} - (\alpha_1^2 + \alpha_2)\partial_t^2 f_t + \Lambda f + \beta \Lambda^3 f + \alpha_1^2 \alpha_2 \partial_t^4 f$$

$$= \varepsilon \left\{ - \Lambda \left( (\bar{h} f_t)^2 \right) + \partial_1 [\bar{H}, f] \Lambda f + \beta \partial_1 [\bar{H}, f] \Lambda^3 f + \alpha_2 \partial_1 [\bar{H}, \bar{h} \partial_t^2 f] + \alpha_2 \Lambda (\bar{h} f_t \partial_1^2 f) + \alpha_1^2 \alpha_2 \partial_1 [\partial_1^2 f] \Lambda \partial_t f - \alpha_1^2 \partial_1 [\partial_1^2 f] \bar{H} f_t - \alpha_2 \alpha_2 \partial_1 [\bar{H}, \partial_1^2 f] \partial_1^2 f \right\}. \quad (49)$$

When $\alpha_2 = \alpha_1^2$, equation (49) is an asymptotic model of the damped water waves system proposed by Dias, Dyachenko, and Zakharov [10]. Also, when $\alpha_2 = \alpha_1^2 = 0$, equation (49) again recovers the quadratic $\bar{h}$–model in [1, 2, 6, 31–33].

5. Craig-Sulem models for damped water waves

The pioneer work of Craig & Sulem [9] (see also [8, 34, 35]) lead, among other things, to several asymptotic models obtained by truncating a Taylor series for the Dirichlet-to-Neumann operator present in the Zakharov formulation of the water waves problem [47]. Probably the most famous model of this type is the Craig-Sulem WW2 model corresponding for the model of Dias, Dyachenko, and Zakharov [10]:

$$f_t = -\varepsilon \partial_1 f \partial_1 \zeta + \Lambda \zeta - \varepsilon [\Lambda, f] \Lambda \zeta, \quad (50)$$

$$\zeta_t = \frac{\varepsilon}{2} \left[ (\Lambda \zeta)^2 - (\partial_1 \zeta)^2 \right] - f + \beta \partial_1^2 f. \quad (51)$$

Using Tricomi identity (31),

$$(\Lambda \zeta)^2 - (\partial_1 \zeta)^2 = 2\bar{H} (\partial_1 f \Lambda f),$$

so the previous system can be equivalently written as

$$f_t = -\varepsilon \partial_1 f \partial_1 \zeta + \Lambda \zeta - \varepsilon [\Lambda, f] \Lambda \zeta, \quad (52)$$

$$\zeta_t = \varepsilon \bar{H} (\partial_1 f \Lambda f) - f + \beta \partial_1^2 f. \quad (53)$$

5.1. Case $s = 0$. Using (28) and (29) we find that, up to an error $O(\varepsilon^2)$ the variables

$$f = h^{(0)} + \varepsilon h^{(1)}, \quad \zeta = \xi^{(0)} + \varepsilon \xi^{(1)},$$

solve the system

$$f_t = -\varepsilon \partial_1 f \partial_1 \zeta + \Lambda \zeta - \varepsilon [\Lambda, f] \Lambda \zeta + \alpha_2 \partial_1^2 f, \quad (55)$$

$$\zeta_t = \varepsilon \bar{H} (\partial_1 f \Lambda f) - f + \beta \partial_1^2 f - \alpha_1^0 \zeta + \alpha_2 \varepsilon \Lambda \zeta \partial_1^2 f. \quad (56)$$

5.2. Case $s = 2$. Using (45) and (46), we also find the viscous analog (called Craig-Sulem WWV2 [3, 24]) of the Craig-Sulem WW2 model corresponding for the model of Dias, Dyachenko, and Zakharov [10] of water waves with viscosity

$$f_t = -\varepsilon \partial_1 f \partial_1 \zeta + \Lambda \zeta - \varepsilon [\Lambda, f] \Lambda \zeta + \alpha_2 \partial_1^2 f, \quad (57)$$

$$\zeta_t = \varepsilon \bar{H} (\partial_1 f \Lambda f) - f + \beta \partial_1^2 f - \alpha_1^2 (\Lambda^2 \zeta + \varepsilon \partial_1^2 f \Lambda \zeta + 2 \varepsilon \partial_1 f \partial_1 \Lambda \zeta) + \alpha_2 \varepsilon \Lambda \zeta \partial_1^2 f. \quad (58)$$
6. Study of the models and discussion

In this paper we have obtained a number of new models for damped water waves. Of course, one may ask why viscosity effects are required when studying water waves. Besides the fact that every liquid is viscous, there are a number of scenarios where the viscous damping needs to be taken into account. For instance, damping has been used to study standing surface waves generated in a vertically oscillating container (these waves are called Faraday waves) or the question of stabilization of the Benjamin-Feir stability \[44\].

In particular, we derived two nonlocal wave equations, namely,

\[
\begin{align*}
    f_{tt} + \Lambda f + \beta \Lambda^3 f + \alpha_1^0 f_t - \alpha_1^0 \alpha_2 \partial_1^2 f - \alpha_2 \partial_1^2 f_t &= \\
    &= \varepsilon \left[ -\Lambda \left( (\mathcal{H} f_t)^2 \right) + \partial_1 [\mathcal{H}, f] \Lambda f + \beta \partial_1 [\mathcal{H}, f] \Lambda^3 f + \alpha_2 \partial_1 [\mathcal{H}, \mathcal{H} f_t] \Lambda \partial_1^2 f \\
    &\quad + \alpha_2 \Lambda \left( \mathcal{H} f_t \Lambda \partial_1^2 f \right) - \alpha_2^2 \partial_1 [\mathcal{H}, \partial_1^2 f] \partial_1^2 f \right], \tag{59}
\end{align*}
\]

and

\[
\begin{align*}
    f_{tt} - (\alpha_1^2 + \alpha_2) \partial_1^2 f_t + \Lambda f + \beta \Lambda^3 f + \alpha_1^2 \alpha_2 \partial_1^4 f &= \\
    &= \varepsilon \left[ -\Lambda \left( (\mathcal{H} f_t)^2 \right) + \partial_1 [\mathcal{H}, f] \Lambda f + \beta \partial_1 [\mathcal{H}, f] \Lambda^3 f \\
    &\quad + \alpha_2 \partial_1 [\mathcal{H}, \mathcal{H} f_t] \partial_1^2 f + \alpha_2 \Lambda \left( \mathcal{H} f_t \Lambda \partial_1^2 f \right) + \alpha_2^2 \partial_1 [\partial_1^2 f] \Lambda \partial_1 f \\
    &\quad - \alpha_2^4 \partial_1 [\partial_1^2 f, f] \mathcal{H} f_t - \alpha_2 \alpha_2 \partial_1 [\mathcal{H}, \partial_1^2 f] \partial_1^2 f \right]. \tag{60}
\end{align*}
\]

Equation (59) is an asymptotic model of the damped water waves system proposed by Jiang, Ting, Perlin & Schultz \[22\] and Wu, Liu & Yue \[44\], while equation (60) is an asymptotic model of the water waves with viscosity system proposed by Dias, Dyachenko, and Zakharov \[10\].

It is a natural question to ask whether these ideas can be extended to three dimensional waves. Although the extension would not be trivial, these ideas can be applied to three dimensions. This should be addressed in a future work.

Another reasonable is which model is better for which application. In general, it is assumed in the literature that (10) is more realistic when \(s = 2\), regardless of whether \(\delta_2 = 0\) or not (see \[44\] for instance). That would mean that (60) corresponds to a more realistic description of viscous damping of water waves.

One of the advantages of having an asymptotic model akin to (59) or (60) is that, as there is no Dirichlet-Neumann operator nor elliptic problem involved, it is easier and cheaper to simulate than the full problem (10). However, when \(\alpha_1^2, \alpha_2 \neq 0\), the presence of higher order operators as the bilaplacian may cause numerical difficulties. Thus, although (60) is linked to a more realistic description, its implementation may not be straightforward. A careful numerical study of these models should be addressed elsewhere. Also, this numerical study could help to make the decision of which models is better for which application.
6.1. **Typical values of the dimensionless parameters.** Let’s consider a numerical example. The value of the physical parameters is (see [28]):

\[ G = 9.8 \text{m/s}^2, \quad \gamma = 72 \cdot 10^{-3} \text{kg/s}^2, \quad \rho = 1029 \text{kg/m}^3. \]

We consider a wave of size

\[ H = 0.02 \text{m}, \quad L = 0.6 \text{m}. \]

This wave follows the scenario in [22]. Recalling (16) (where \( \delta_2 = \nu \)), we have that

\[ \varepsilon \approx 0.03, \quad \beta = \frac{72 \cdot 10^{-3}}{1029 \cdot 9.8 \cdot (0.6)^2} \approx 2 \cdot 10^{-5}, \quad (61) \]

According to [22, Section 4], the experimental decay rate in the scenario modelled by (59) is estimated as \( 0.05 \text{s}^{-1} \). Also, following [10] we have that the right viscosity to be used in these applications is the eddy viscosity value

\[ \nu = 10^{-3}. \]

That means that

\[ \alpha_1^0 = 0.05 \sqrt{9.8 \cdot (0.6)^{-2}} \approx 0.01, \quad \alpha_2^0 = \frac{10^{-3}}{\sqrt{9.8(0.6)^{3/2}}} \approx 6.8 \cdot 10^{-4}. \quad (62) \]

Then, we see that viscous damping effects are at the same level as \( \varepsilon^2 \) and are somehow more relevant than surface tension effects.

6.2. **Linear analysis and dispersion relations.** In this section we are going to study the dispersion relation of the models (see also [12]). In the case where viscous effects are neglected (\( \alpha_1^s = \alpha_2 = 0 \)) the model was studied in [6]. In this case, the dispersion relation is

\[ \omega_I (k) = \sqrt{|k| \left( 1 + \beta |k|^2 \right)}, \quad \beta \geq 0, \quad (63) \]

which is, of course, the same dispersion relation as for the full water waves problem with infinite depth.

We want to understand now how this dispersion relation is affected by the viscous effects. Keeping only the linear terms in the equations (59) and (60) and inserting the standard plane wave ansatz

\[ f(x,t) = e^{ikx-i\omega t}, \]

we obtain the following dispersion relations

\[ \omega_+^0 (k) = \pm \sqrt{-\left( |k|^2 \alpha_2 + \alpha_1^0 \right)^2 + 4(|k|(1 + \beta |k|^2) + |k|^2 \alpha_1^0 \alpha_2)}, \]

\[ - \frac{i (\alpha_1^0 + \alpha_2 |k|^2)}{2}, \quad (64) \]

\[ \omega_+^2 (k) = \pm \sqrt{-\left( \alpha_1^2 + \alpha_2 \right)^2 |k|^4 + 4(|k|(1 + \beta |k|^2) + \alpha_1^2 \alpha_2 |k|^4)} \]

\[ - \frac{i (\alpha_1^2 + \alpha_2 |k|^2)}{2}, \quad (65) \]
where $\omega_\pm^0$ and $\omega_\pm^2$ correspond to equation (59) and (60), respectively. These dispersion relations are valid for the whole range of values of the dimensionless parameters. We emphasize that the imaginary parts present in the previous expressions for the dispersion relations imply parabolic behavior or, if $\alpha_2 = 0$ in (64), at least absorption.

Using the previous numerical values (61) and (62), we find that, neglecting terms of order $O(10^{-5})$ for a large range of $k'$s, the dispersion relation (64) can be approximated by

$$\omega_\pm^0 (k) \approx \pm \sqrt{-\frac{(\alpha_1^0)^2 + 4 |k|^2}{2}} - i \frac{\alpha_1^0 + \alpha_2 |k|^2}{2}.$$

Similarly,

$$\omega_\pm^2 (k) \approx \pm \sqrt{|k|} - i \frac{(\alpha_1^2 + \alpha_2) |k|^2}{2},$$

From the previous dispersion relations, $\omega_\pm^s$, and the dispersion relation for the inviscid model $\omega_I$, we see that both models (59) and (60) have a parabolic behavior. In fact, the dissipation rate in (59) when $\alpha_2 = 0$ is independent of the Fourier mode $k$, while, for model (60) the dissipation is purely of parabolic type $O(|k|^2)$ (see [27]).

**Appendix A. The explicit solution of an elliptic problem**

**Lemma A.1.** Let us consider the Poisson equation

$$\begin{cases}
\Delta u (x_1, x_2) = b (x_1, x_2), & (x_1, x_2) \in S^1 \times (-\infty, 0), \\
u (x_1, 0) = g (x_1), & x_1 \in S^1, \\
\lim_{x_2 \to -\infty} \partial_2 u (x_1, x_2) = 0, & x_1 \in S^1,
\end{cases}$$

(66)

where we assume that the forcing $b$ and the boundary data $g$ are smooth and decay sufficiently fast at infinity. Then, the unique solution $u$ of (66) is given by

$$u (x_1, x_2) = -\frac{1}{\sqrt{2\pi}} \sum_{k=-\infty}^{\infty} \left\{ \frac{1}{|k|} \int_{-\infty}^{0} \hat{b} (k, y_2) e^{\frac{|k| y_2}{2}} dy_2 - |k| \hat{g} (k) \right\} e^{\frac{|k|}{2} x_2}$$

$$- \frac{1}{2 |k|} \int_{-\infty}^{0} \hat{b} (k, y_2) e^{\frac{|k| y_2}{2}} dy_2 e^{-|k| x_2}$$

$$+ \int_{0}^{x_2} \frac{\hat{b} (k, y_2)}{2 |k|} \left[ e^{|k| (y_2 - x_2)} - e^{\frac{|k|}{2} (x_2 - y_2)} \right] dy_2 \right\} e^{i k x_1},$$

(67)

where the operator $\hat{\cdot}$ denotes the Fourier transform in the variable $x_1$. In particular

$$\partial_2 u (x_1, 0) = \int_{-\infty}^{0} e^{y_2 \Lambda} b (x_1, y_2) dy_2 + \Lambda g (x_1),$$

$$\partial_2^2 u (x_1, 0) = -\partial_2^2 g (x_1) + b (x_1, 0).$$

(68)

(69)
Proof. Let us apply the Fourier transform to the equation (66), this transforms the PDE (66) in the following series of second-order inhomogeneous constant coefficients ODE’s

\[
\begin{align*}
&-k^2 \hat{u}(k, x_2) + \partial_{x_2}^2 \hat{u}(k, x_2) = \hat{b}(k, x_2), \quad (k, x_2) \in \mathbb{Z} \times (-\infty, 0), \\
&\hat{u}(k, 0) = \hat{g}(k), \quad k \in \mathbb{Z}, \\
&\lim_{x_2 \to -\infty} \partial_2 \hat{u}(k, x_2) = 0, \quad k \in \mathbb{Z}.
\end{align*}
\]

The generic solution of (70) can be deduced using the variation of parameters method, whence

\[
\hat{u}(k, x_2) = C_1(k) e^{k|x_2|} + C_2(k) e^{-k|x_2|} - \int_0^{x_2} \frac{\hat{b}(k, y_2)}{2 |k|} \left[ e^{k|y_2-x_2|} - e^{k|x_2-y_2|} \right] dy_2.
\]

The boundary conditions determine the values of the \(C_i\)’s:

\[
\begin{align*}
C_2(k) &= -\frac{1}{2 |k|} \int_{-\infty}^0 \hat{b}(k, y_2) e^{k|y_2|} dy_2, \quad C_1(k) = -C_2(k) + \hat{g}(k).
\end{align*}
\]

We provide now the detailed computations for the sake of clarity. From the generic solution (71) we easily derive that \(C_1 = -C_2 + \hat{g}\) simply setting \(x_2 = 0\) and solving the resulting equation in \(C_1\). Next we compute \(\partial_2 u\), which gives

\[
\partial_2 \hat{u}(k, x_2) = \left(-C_2(k) + \hat{g}(k)\right) |k| e^{k|x_2|} - C_2(k) |k| e^{-k|x_2|} + \frac{1}{2} \int_0^{x_2} \hat{b}(k, y_2) \left[ e^{k|y_2-x_2|} + e^{k|x_2-y_2|} \right] dy_2.
\]

Due to the negative weight on the exponential, we deduce that

\[
\lim_{x_2 \to -\infty} \left[ \left(-C_2(k) + \hat{g}(k)\right) |k| e^{k|x_2|} \right] = 0.
\]

Let us now consider the limit

\[
\lim_{x_2 \to -\infty} \left[ \frac{1}{2} \int_0^{x_2} \hat{b}(k, y_2) e^{k|x_2-y_2|} dy_2 \right] = 0.
\]

We prove now that such limit is equal to zero by dominated convergence. Let us consider the family of functions

\[
(f_{k, x_2}(y_2))_{x_2 \in \mathbb{R}} = \left(1_{[x_2, 0]}(y_2) \hat{b}(k, y_2) e^{k|x_2-y_2|} \right)_{x_2 \in \mathbb{R}}.
\]

Since every element of such family is nonzero only when \(y_2 \in [x_2, 0]\) we know that \(e^{k|x_2-y_2|} \leq 1\), hence every \(f_{k, x_2}\) can be pointwise bounded by

\[
f_{k, x_2}(y_2) \leq \left| \hat{b}(k, y_2) \right|,
\]

uniformly in \(x_2\). Moreover we assumed \(b \in L^2(S^1; L^1(\mathbb{R}))\), hence for every \(k\) we have that \(\hat{b}(k, \cdot) \in L^1(\mathbb{R})\) and we can indeed apply the Lebesgue dominated convergence theorem in order to deduce

\[
\lim_{x_2 \to -\infty} \left[ \frac{1}{2} \int_0^{x_2} \hat{b}(k, y_2) e^{k|x_2-y_2|} dy_2 \right] = 0,
\]

for every \(k \in \mathbb{Z}\). What remains is the following equality

\[
\lim_{x_2 \to -\infty} \left[ -C_2(k) |k| e^{-k|x_2|} + \frac{1}{2} \int_0^{x_2} \hat{b}(k, y_2) e^{k|y_2-x_2|} dy_2 \right] = 0,
\]

\[
\lim_{x_2 \to -\infty} \left[ \frac{1}{2} \int_0^{x_2} \hat{b}(k, y_2) e^{k|x_2-y_2|} dy_2 \right] = 0.
\]
which in turn gives the required constant
\[ C_2(k) = \frac{-1}{2|k|} \int_{-\infty}^{0} \hat{b}(k, y_2) e^{i|k|y_2} dy_2. \]

Setting \( x_2 = 0 \) in (73) we find that
\[ \partial_2^2 \hat{u}(k, 0) = -2|k| C_2(k) + |k| \hat{g}(k), \] (74)

which reduces to (68). We now differentiate (73) in \( x_2 \) obtaining
\[ \partial_2^2 \hat{u}(k, x_2) = \left( -C_2(k) + \hat{g}(k) \right) |k|^2 e^{i|k|x_2} + C_2(k) |k|^2 e^{-i|k|x_2} \]
\[ + \hat{b}(k, x_2) - \frac{|k|}{2} \int_{0}^{x_2} \hat{b}(k, y_2) \left[ e^{i|k|(y_2-x_2)} - e^{i|k|(x_2-y_2)} \right] dy_2. \] (75)

Fixing \( x_2 = 0 \) in (75) the previous equation simplifies to
\[ \partial_2^2 \hat{u}(k, 0) = |k|^2 \hat{g}(k) + \hat{b}(k, x_2), \]
which proves (69). \( \square \)
