NEW ESTIMATE FOR THE MULTINOMIAL MITTAG-LEFFLER FUNCTION

Murat Mamchuev

Abstract

In this paper, a new estimate is obtained for the multinomial Mittag-Leffler function. This function was introduced by Yuri Luchko and Rudolfo Gorenflo as the fundamental solution of the ordinary differential equation of fractional discrete distributed order.

Keywords: multinomial Mittag-Leffler function, fractional differential equations, estimate.

The multinomial Mittag-Leffler function is defined as [1]

\[ E_{\mu_1,\mu_2,\ldots,\mu_n,\gamma}(z_1, z_2, \ldots, z_n) \]

\[ = \sum_{k=0}^{\infty} \sum_{l_1+\ldots+l_n=k} \frac{(k;l_1,\ldots,l_n)}{\Gamma(\gamma + \sum_{i=1}^{n} \mu_i l_i)}. \]

here \((k;l_1,\ldots,l_n)\) denotes the multinomial coefficient

\[ (k;l_1,\ldots,l_n) = \frac{k!}{l_1! \cdots l_n!}, \quad k = \sum_{i=1}^{n} l_i, \]

where \(l_i(i = 1,\ldots,n)\) are non-negative integers.

We also need the following definition of the Mittag-Leffler-type function [2]

\[ E_{\mu,\nu}(z) = \sum_{k=0}^{\infty} \frac{z^k}{\Gamma(\mu k + \nu)}. \]

Lemma 1. Let \(0 < \mu_1 < \mu_2 < \ldots < \mu_n, \gamma > 0\), then the estimate

\[ |E_{\mu_1,\mu_2,\ldots,\mu_n,\gamma}(z_1, z_2, \ldots, z_n)| \leq C E_{\mu_1,\gamma}(|z_1| + |z_2| + \ldots + |z_n|) \]

holds, here \(C = 1 + \frac{\Gamma(\gamma + \mu_1 n_0)}{\Gamma(\gamma)}, n_0 \in \mathbb{N}\) is a number such that

\[ \mu_1 n_0 < x_0 - \gamma < \mu_1 (n_0 + 1), \quad x_0 = \min_{x > 0} \Gamma(x). \]

Proof. The following relation

\[ \sum_{l_1+\ldots+l_n=k} (k;l_1,\ldots,l_n) \prod_{i=1}^{n} z_i^{l_i} = (z_1 + \ldots + z_n)^k, \quad (1) \]

1 Institute of Applied Mathematics and Automation of KBSC of RAS, Shorantova str. 89-A, Nalchik, 360000, Kabardino-Balkar Republic, Russia, E-mail: mamchuev@rambler.ru
can be proved by the mathematical induction method.

Note that

\[ \gamma + \sum_{i=1}^{n} \mu_i l_i = \gamma + \mu_j \sum_{i=1}^{n} (\mu_i - \mu_j) l_i = \gamma + \mu_j k + \sum_{i=1}^{n} (\mu_i - \mu_j) l_i, \quad 0 \leq j \leq n. \]

Consequently,

\[ \gamma + \mu_1 k < \gamma + \sum_{i=1}^{n} \mu_i l_i < \gamma + \mu_n k. \]

Since the function \( \frac{1}{\Gamma(x)} \) has only one maximum on the interval \((0, \infty)\) which reached at the point \( x_0 = 1, 4616321... \), and decreases on the interval \((x_0, \infty)\), then there exists the number \( n_0 \in \mathbb{N} \) such that the inequality

\[ \frac{1}{\Gamma(\gamma + \sum_{i=1}^{n} \mu_i l_i)} < \frac{1}{\Gamma(\gamma + \mu_1 k)} \quad (2) \]

holds for every numbers \( k > n_0 \). For \( 0 \leq k \leq n_0 \) we have the inequality

\[ \frac{1}{\Gamma(\gamma + \sum_{i=1}^{n} \mu_i l_i)} < C_0 \frac{1}{\Gamma(\gamma + \mu_1 k)}, \quad (3) \]

where

\[ C_0 = \max_{0 \leq k \leq n_0} \frac{\Gamma(\gamma + \mu_1 k)}{\Gamma(\gamma + \sum_{i=1}^{n} \mu_i l_i)} = \frac{\Gamma(\gamma + \mu_1 n_0)}{\Gamma(\gamma)} > 0. \]

Hence, by virtue of (1) – (3), we get

\[ |E_{(\mu_1, \mu_2, \ldots, \mu_n), \gamma}(z_1, z_2, \ldots, z_n)| \]

\[ = \sum_{k=0}^{\infty} \sum_{l_1 + \ldots + l_n = k} (k; l_1, \ldots, l_n) \frac{|z_1|^{l_1} \cdot \ldots \cdot |z_n|^{l_n}}{\Gamma(\gamma + \sum_{i=1}^{n} \mu_i l_i)} \]

\[ \leq C \sum_{k=0}^{\infty} \frac{1}{\Gamma(\gamma + \mu_1 k)} \sum_{l_1 + \ldots + l_n = k} (k; l_1, \ldots, l_n) \prod_{i=1}^{n} |z_i|^{l_i} \]

\[ = C \sum_{k=0}^{\infty} \left( |z_1| + \ldots + |z_n| \right)^k \frac{1}{\Gamma(\gamma + \mu_1 k)} = CE_{\mu_1, \gamma}(|z_1| + |z_2| + \ldots + |z_n|), \]

where \( C = 1 + C_0 \).

The Lemma 1 is proved.
