Abstract

We study the properties of the third order sequence \((w_n) = (w_n(a, b, c; r, s, t))\) defined by the recurrence relation \(w_n = rw_{n-1} + sw_{n-2} + tw_{n-3} (n \geq 3)\) with \(w_0 = a, w_1 = b, w_2 = c\), where \(a, b, c, r, s\) and \(t\) are arbitrary complex numbers and \(t \neq 0\). Properties examined include the partial sum of the terms of the sequence, with indices in arithmetic progression, as well as double binomial summation identities.

1 Introduction and preliminary results

We wish to study the properties of the linear homogeneous third order sequence \((w_n) = (w_n(a, b, c; r, s, t))\) defined by the recurrence relation

\[
w_n = rw_{n-1} + sw_{n-2} + tw_{n-3} (n \geq 3); \tag{1.1}
\]

with \(w_0 = a, w_1 = b, w_2 = c\), where \(a, b, c, r, s\) and \(t\) are arbitrary complex numbers, with \(t \neq 0\).

The sequence \((w_n)\) and its special cases have been studied by various authors, notably Jarden [4], Shannon and Horadam [7], Yalavigi [9], Pethe [5], Gerdes [2], Waddil [8] and Rabinowitz [6]. Our main aim here is to develop presumably new properties of \((w_n)\). Chief among these are the partial sum of the terms of the sequence, with indices in arithmetic progression, double binomial summation identities and multiple argument formulas.

The table below shows some special cases of \((w_n)\), the first four of which are now well known in the literature.

</table>
Let $\alpha$, $\beta$ and $\gamma$ be the zeroes (assumed all distinct) of the characteristic polynomial $x^3 - rx^2 - sx - t$ of the sequence $(w_n)$. Then,

$$\alpha + \beta + \gamma = r, \quad \alpha\beta\gamma = t, \quad \alpha\beta + \alpha\gamma + \beta\gamma = -s.$$  \hfill (1.2)

Standard methods for solving difference equations give

$$w_n = A\alpha^n + B\beta^n + C\gamma^n,$$  \hfill (1.3)

where

$$A = \frac{\beta(a\gamma - b) + c - b\gamma}{(\alpha - \beta)(\alpha - \gamma)}, \quad B = \frac{\gamma(a\alpha - b) + c - b\alpha}{(\beta - \alpha)(\beta - \gamma)}, \quad C = \frac{\alpha(a\beta - b) + c - b\beta}{(\gamma - \alpha)(\gamma - \beta)}.$$  \hfill (1.4)

Three important particular cases of $(w_n)$ are $(u_n(r,s,t))$, $(v_n(r,s,t))$ and $(z_n(r,s,t))$, with terms given by $u_n(r,s,t) = w_n(0,1;r,s,t)$, $v_n(r,s,t) = w_n(3,r,r^2+2s;r,s,t)$ and $z_n(r,s,t) = w_n(1,1,1;r,s,t)$. Thus,

$$u_n = A'\alpha^n + B'\beta^n + C'\gamma^n,$$  \hfill (1.5)

$$v_n = \alpha^n + \beta^n + \gamma^n$$  \hfill (1.6)

and

$$z_n = A''\alpha^n + B''\beta^n + C''\gamma^n;$$  \hfill (1.7)

where

$$A' = \frac{\alpha}{(\alpha - \beta)(\alpha - \gamma)}, \quad B' = \frac{\beta}{(\beta - \alpha)(\beta - \gamma)}, \quad C' = \frac{\gamma}{(\gamma - \alpha)(\gamma - \beta)},$$  \hfill (1.8)

and

$$A'' = \frac{(\gamma - 1)(\beta - 1)}{(\alpha - \beta)(\alpha - \gamma)}, \quad B'' = \frac{(\gamma - 1)(\alpha - 1)}{(\beta - \alpha)(\beta - \gamma)}, \quad C'' = \frac{(\alpha - 1)(\beta - 1)}{(\gamma - \alpha)(\gamma - \beta)}.$$  \hfill (1.9)

Note that $T_n = u_n(1,1,1)$, $K_n = v_n(1,1,1)$, $P_n = z_n(0,1,1)$ and $Q_n = v_n(0,1,1)$.

Extension of the definition of $(w_n)$ to negative indices is provided by writing the recurrence relation as

$$w_{-n} = (w_{-(n-3)} - rw_{-(n-2)} - sw_{-(n-1)})/t.$$  \hfill (1.10)

The table below shows the first few terms of the sequences $(u_n)$, $(v_n)$ and $(z_n)$:

<table>
<thead>

</tr>
</tbody>
</table>

The identities in (1.2) and identity (1.6) can be collected as

$$\alpha^n + \beta^n + \gamma^n = v_n,$$  \hfill (1.11)

$$(\alpha\beta\gamma)^n = t^n$$  \hfill (1.12)

and

$$(\alpha\beta)^n + (\alpha\gamma)^n + (\beta\gamma)^n = \frac{(\alpha\beta\gamma)^n}{\gamma^n} + \frac{(\alpha\gamma\beta)^n}{\beta^n} + \frac{(\beta\gamma\alpha)^n}{\alpha^n} = t^nv_{-n}. $$  \hfill (1.13)
Theorem 1. The following identity holds for integers $n$ and $m$:

$$w_{n+m} = u_nw_{m+1} + (u_{n+1} - ru_n)w_m + tu_{n-1}w_{m-1}.$$ 

In particular, we have

$$w_n = bu_n + (c - br)u_{n-1} + atu_{n-2}$$  \hspace{1cm} (1.14)

which also gives

$$v_n = ru_n + 2su_{n-1} + 3tu_{n-2},$$  \hspace{1cm} (1.15)
$$z_n = u_n + (1 - r)u_{n-1} + tu_{n-2}$$  \hspace{1cm} (1.16)

and

$$\alpha^n = u_{n-1}\alpha^2 + (u_n - ru_{n-1})\alpha + tu_{n-2};$$  \hspace{1cm} (1.17)

with similar expressions for $\beta^n$ and $\gamma^n$.

Proof. We seek to express a number from the $(w_n)$ sequence as a linear combination of three numbers from the $(u_n)$ sequence. Let

$$w_{m+n} = f_1u_n + f_2u_{n-1} + f_3u_{n-2},$$  \hspace{1cm} (1.18)

where the coefficients $f_1$, $f_2$ and $f_3$ are to be determined. Setting $n = 0$, $n = 1$ and $n = 2$, in turn, we find $f_1 = w_{m+1}$, $f_2 = w_{m+2} - rw_{m+1}$ and $f_3 = tw_m$ and the identity of the theorem is established after shifting the indices $m$ and $n$. 

Note that identity (1.17) follows from the fact that the sequences $(\alpha^n)$, $(\beta^n)$ and $(\gamma^n)$ are also special cases of the generalized sequence $(w_n)$.

The identities below, in Theorem 2, based on identities (1.6) and (1.17), make it possible to access the negative index terms of $(w_n)$ and the special cases directly, without using the recurrence relation (1.10).

Lemma 1. Let $a_0, a_1, a_2, \ldots, a_n$ and $b_0, b_1, b_2, \ldots, b_n$ be rational numbers. Let $\lambda_1, \lambda_2, \ldots, \lambda_n$ be linearly independent irrational numbers. Then

$$a_0 + a_1\lambda_1 + a_2\lambda_2 + \cdots + a_n\lambda_n = b_0 + b_1\lambda_1 + b_2\lambda_2 + \cdots + b_n\lambda_n$$

implies that $a_0 = b_0, a_1 = b_1, a_2 = b_2, \ldots, a_n = b_n$.

Theorem 2. The following identities hold for any integer $n$:

$$u_{-n} = (u_{n-1} - u_nu_{n-2})/t^{n-1},$$  \hspace{1cm} (1.19)
$$v_{-n} = (v_{n}^2 - v_{2n})/(2t^n).$$  \hspace{1cm} (1.20)

Proof. Since $\alpha$ and $\alpha^2$ are linearly independent irrationals, write

$$\alpha^{-n} = c_1\alpha^2 + c_2\alpha + c_3,$$  \hspace{1cm} (1.21)

where $n$ is an integer and $c_1$, $c_2$ and $c_3$ are to be determined. Thus, we have

$$1 = c_1\alpha^{n+2} + c_2\alpha^{n+1} + c_3\alpha^n$$
$$= \alpha^2(c_1f_{n+2} + c_2f_{n+1} + c_3f_n) + \alpha(c_1g_{n+2} + c_2g_{n+1} + c_3g_n)$$
$$+ (c_1h_{n+2} + c_2h_{n+1} + c_3h_n),$$  \hspace{1cm} (1.22)
where we have used identity (1.17) with \( f_n = u_{n-1}, g_n = u_n - ru_{n-1} \) and \( h_n = tu_{n-2} \).

From Lemma 1 and identity (1.22) we have
\[
\begin{align*}
f_{n+2}c_1 + f_{n+1}c_2 + f_nc_3 &= 0, \\
g_{n+2}c_1 + g_{n+1}c_2 + g_nc_3 &= 0
\end{align*}
\]
and
\[
h_{n+2}c_1 + h_{n+1}c_2 + h_nc_3 = 1,
\]
to be solved simultaneously for the coefficients \( c_1, c_2 \) and \( c_3 \).

We find
\[
c_1 = \frac{g_n f_{n+1} - f_n g_{n+1}}{\Delta_n},
\]
where
\[
\Delta_n = \begin{vmatrix} f_{n+2} & f_{n+1} & f_n \\ g_{n+2} & g_{n+1} & g_n \\ h_{n+2} & h_{n+1} & h_n \end{vmatrix}.
\]

Now, from (1.17), we have
\[
\alpha^{-n} = f_{-n}\alpha^2 + g_{-n}\alpha + h_{-n}.
\]

Equating coefficients of \( \alpha^2 \) from (1.21) and (1.25), using (1.23), and shifting index gives
\[
f_{-n+1} = \frac{g_{n-1}f_n - f_{n-1}g_n}{\Delta_{n-1}},
\]
so that we have
\[
u_{-n} = \frac{u_{n-1}^2 - u_n u_{n-2}}{\Delta_{n-1}}.
\]

Application of the principle of mathematical induction shows that \( \Delta_n = t^n \) and identity (1.19) follows.

We have
\[
\begin{align*}
u_n^2 &= (\alpha^n + \beta^n + \gamma^n)^2 \\
&= \alpha^{2n} + \beta^{2n} + \gamma^{2n} + 2(\alpha\gamma^n + (\alpha\beta)^n + (\beta\gamma)^n) \\
&= \alpha^{2n} + \beta^{2n} + \gamma^{2n} + 2t^n(\gamma^{-n} + \beta^{-n} + \alpha^{-n}) \\
&= \nu_{2n} + 2t^n\nu_{-n},
\end{align*}
\]

from which identity (1.20) follows.

Use of (1.19) in (1.14) gives
\[
w_{-n} = \frac{bt(u_{n-1}^2 - u_n u_{n-2}) + (c - br)(u_n^2 - u_{n+1} u_{n-1}) + a(u_{n+1}^2 - u_{n+2} u_n)}{(bu_n + (c - br)u_{n-1} + atu_{n-2})t^n}w_n.
\]

We require the following identities in the sequel:

**Lemma 2.** The following identities hold for arbitrary \( x_1, x_2, x_3 \):
\[
\begin{align*}
x_1^2 + x_2^2 + x_3^2 &= (x_1 + x_2 + x_3)^2 - 2(x_1x_2 + x_1x_3 + x_2x_3), \quad (1.29) \\
x_1^3 + x_2^3 + x_3^3 &= (x_1 + x_2 + x_3)^3 - 3(x_1 + x_2 + x_3)(x_1x_2 + x_1x_3 + x_2x_3) + 3x_1x_2x_3, \quad (1.30)
\end{align*}
\]

and
\[
\begin{align*}
x_1^4 + x_2^4 + x_3^4 &= (x_1 + x_2 + x_3)^4 - 4(x_1^2 + x_2^2 + x_3^2)(x_1x_2 + x_1x_3 + x_2x_3) \\
&\quad - 6((x_1x_2)^2 + (x_1x_3)^2 + (x_2x_3)^2) - 8x_1x_2x_3(x_1 + x_2 + x_3), \quad (1.31)
\end{align*}
\]
Lemma 3. The following identity holds for integers $n$ and $m$ and arbitrary $x_1$, $x_2$ and $x_3$:

\[
\begin{align*}
&c_1 x_1^{n+m} + c_2 x_2^{n+m} + c_3 x_3^{n+m} = (x_1^n + x_2^m + x_3^m)(c_1 x_1^m + c_2 x_2^m + c_3 x_3^m) \\
&\quad - ((x_1 x_2)^m + (x_1 x_3)^m + (x_2 x_3)^m)(c_1 x_1^{n-m} + c_2 x_2^{n-m} + c_3 x_3^{n-m}) \\
&\quad + c_1 x_1^{n-m}(x_2 x_3)^m + c_2 x_2^{n-m}(x_1 x_3)^m + c_3 x_3^{n-m}(x_1 x_2)^m.
\end{align*}
\]

Lemma 4. The following identity holds for integers $m$, $n$ and $k$ and arbitrary $c_1$, $c_2$, $c_3$, $x_1$, $x_2$ and $x_3$:

\[
\sum_{j=0}^{k} (c_1 x_1^{mj+n} + c_2 x_2^{mj+n} + c_3 x_3^{mj+n}) h^j = (x_1 x_2 x_3)^m \frac{c_1 x_1^{mk+n} + c_2 x_2^{mk+n} + c_3 x_3^{mk+n}}{(x_1 x_2 x_3)^m h^3 - ((x_1 x_3)^m + (x_2 x_3)^m + (x_1 x_2)^m) h^2 + (x_1^m + x_2^m + x_3^m) h - 1} \frac{h^{k+3}}{h^{k+2}} \\
\quad - (x_1 x_2 x_3)^m \frac{c_1 x_1^{mk+n} + c_2 x_2^{mk+n} + c_3 x_3^{mk+n}}{(x_1 x_2 x_3)^m h^3 - ((x_1 x_3)^m + (x_2 x_3)^m + (x_1 x_2)^m) h^2 + (x_1^m + x_2^m + x_3^m) h - 1} \frac{h^{k+1}}{h^2} \\
\quad + (x_1 x_2 x_3)^m \frac{c_1 x_1^{mk+n} + c_2 x_2^{mk+n} + c_3 x_3^{mk+n}}{(x_1 x_2 x_3)^m h^3 - ((x_1 x_3)^m + (x_2 x_3)^m + (x_1 x_2)^m) h^2 + (x_1^m + x_2^m + x_3^m) h - 1} \frac{h^k}{h} \\
\quad - (x_1 x_2 x_3)^m \frac{c_1 x_1^{mk+n} + c_2 x_2^{mk+n} + c_3 x_3^{mk+n}}{(x_1 x_2 x_3)^m h^3 - ((x_1 x_3)^m + (x_2 x_3)^m + (x_1 x_2)^m) h^2 + (x_1^m + x_2^m + x_3^m) h - 1} \frac{h}{x_1^m + x_2^m + x_3^m} \\
\quad - (x_1 x_2 x_3)^m \frac{c_1 x_1^{mk+n} + c_2 x_2^{mk+n} + c_3 x_3^{mk+n}}{(x_1 x_2 x_3)^m h^3 - ((x_1 x_3)^m + (x_2 x_3)^m + (x_1 x_2)^m) h^2 + (x_1^m + x_2^m + x_3^m) h - 1} \frac{h}{x_1^m + x_2^m + x_3^m}.
\]

Proof. The identity expresses the linear combination of the following geometric progression summation identities:

\[
\sum_{j=0}^{k} x_1^{mj+n} h^j = \frac{x_1^{mk+n} h^{k+1} - x_1^n}{x_1^m h - 1}, \quad \sum_{j=0}^{k} x_2^{mj+n} h^j = \frac{x_2^{mk+n} h^{k+1} - x_2^n}{x_2^m h - 1}
\]

and

\[
\sum_{j=0}^{k} x_3^{mj+n} h^j = \frac{x_3^{mk+n} h^{k+1} - x_3^n}{x_3^m h - 1}.
\]

Lemma 5 ([1, Lemma 5]). Let $(X_n)$ be any arbitrary sequence, $X_n$ satisfying a four-term recurrence relation $h X_n = f_1 X_{n-c_1} + f_2 X_{n-c_2} + f_3 X_{n-c_3}$, where $h$, $f_1$, $f_2$ and $f_3$ are arbitrary non-vanishing functions and $c_1$, $c_2$ and $c_3$ are integers. Then, the following identities hold:

\[
\begin{align*}
&\sum_{j=0}^{k} \sum_{i=0}^{j} \binom{k}{j} \binom{j}{i} f_3^{k-j} f_2^{k-j-i} f_1^{c_1 X_{n-c_1} + (c_3-c_2)j + (c_2-c_1)i} = h^k f_3 X_n, \\
&\sum_{j=0}^{k} \sum_{i=0}^{j} \binom{k}{j} \binom{j}{i} f_3^{k-j} f_2^{k-j-i} f_1^{c_2 X_{n-c_2} + (c_3-c_2)j + (c_2-c_1)i} = h^k f_3^2 X_n.
\end{align*}
\]
Theorem 3. \( \sum_{j=0}^{k} \sum_{i=0}^{j} \binom{k}{j} \binom{j}{i} f_{1}^{k-j} f_{3}^{k+j-i} f_{2}^{i} X_{n-c+i(c_{1}+c_{2})j+(c_{1}+c_{2})i} = h^{k} f_{3}^{k} X_{n}, \) \hspace{1cm} (1.34)

\[ \sum_{j=0}^{k} \sum_{i=0}^{j} (-1)^{i} \binom{k}{j} \binom{j}{i} h^{i} f_{3}^{k-j} f_{2}^{j-i} f_{1}^{i} X_{n-(c_{1}-c_{2})k+(c_{1}-c_{2})j+c_{2}i} = (-f_{1})^{k} X_{n}, \] \hspace{1cm} (1.35)

\[ \sum_{j=0}^{k} \sum_{i=0}^{j} (-1)^{i} \binom{k}{j} \binom{j}{i} h^{i} f_{3}^{k-j} f_{1}^{j-i} X_{n-(c_{3}-c_{1})k+(c_{3}-c_{1})j+c_{1}i} = (-f_{2})^{k} X_{n}, \] \hspace{1cm} (1.36)

and

\[ \sum_{j=0}^{k} \sum_{i=0}^{j} (-1)^{i} \binom{k}{j} \binom{j}{i} h^{i} f_{2}^{k-j} f_{1}^{j-i} X_{n-(c_{2}-c_{1})k+(c_{2}-c_{1})j+c_{1}i} = (-f_{3})^{k} X_{n}. \] \hspace{1cm} (1.37)

2 Main results

Theorem 3 (Partial sum of a generalized third order sequence with indices in arithmetic progression). The following identity holds for integers \( m, n \) and \( k \):

\[ \sum_{j=0}^{k} w_{n+jm} h^{j} = \frac{t^{m} w_{n+km} h^{k+3} - (v_{m} w_{n+km} - w_{n+2m+km}) h^{k+2}}{t^{m} h^{3} - t^{m} v_{m} h^{2} + v_{m} h - 1} + \frac{w_{n+km} h^{k+1} - t^{m} w_{n-m} h^{2} + (v_{m} w_{n} - w_{n+km}) h - w_{n}}{t^{m} h^{3} - t^{m} v_{m} h^{2} + v_{m} h - 1}. \]

Proof. Set \((x_{1}, x_{2}, x_{3}) = (\alpha, \beta, \gamma)\) and \((c_{1}, c_{2}, c_{3}) = (A, B, C)\) in Lemma 4.

In particular, we have

\[ \sum_{j=0}^{k} w_{j} h^{j} = \frac{t w_{j} h^{k+3} - (r w_{k+1} - w_{k+2}) h^{k+2} + w_{k+1} h^{k+1} - (c - rb - sa) h^{2} + (ra - b) h - a}{t h^{3} + s h^{2} + rh - 1}, \] \hspace{1cm} (2.1)

and

\[ \sum_{j=0}^{k} w_{j} = \frac{t w_{k} + (r - 1)(a + b - w_{k+1}) + w_{k+2} + as - c}{r + s + t - 1}. \] \hspace{1cm} (2.2)

Rabinowitz [6, Identities (48), (49) and (50)] are special cases of the identity of Theorem 3.

Corollary 4 (Generating function for a generalized third order sequence with indices in arithmetic progression). The following identity holds for integers \( m, n \) and \( k \):

\[ \sum_{j=0}^{\infty} w_{n+jm} h^{j} = \frac{w_{n} - (v_{m} w_{n} - w_{n+km}) h + t^{m} w_{n-m} h^{2}}{1 - v_{m} h + t^{m} v_{m} h^{2} - t^{m} h^{3}}; \]

and in particular,

\[ \sum_{j=0}^{\infty} w_{j} h^{j} = \frac{a - (ra - b) h + (c - rb - sa) h^{2}}{1 - rh - sh^{2} - th^{3}}. \] \hspace{1cm} (2.3)
Theorem 5 (Exponential generating function for a generalized third order sequence with indices in arithmetic progression). The following identity holds for integers \( m \) and \( n \):
\[
\sum_{j=0}^{\infty} \frac{w_{mj+n} h^j}{j!} = A \alpha^n e^{\alpha h} + B \beta^n e^{\beta h} + C \gamma^n e^{\gamma h}.
\]

Theorem 6 (Multiple argument formulas for the \( v \) sequence). The following identities hold for integer \( n \):
\[
v_{2n} = u_n v_{n+1} + (u_{n+1} - ru_n)v_n + tu_{n-1}v_{n-1}, \tag{2.4}
\]
\[
2v_{3n} = 6t^n - v_n^3 + 3u_n v_{n+1} + 3(u_{n+1} - ru_n)v_n^2 + 3tu_{n-1}v_{n-1}v_n, \tag{2.5}
\]
\[
2v_{4n} = 2(u_{n+1} - ru_n)v_n^3 + (2tu_{n-1}v_{n-1} + (u_{n+1} - ru_n)^2 + 2u_nv_{n+1})v_n^2
\]
\[
+ 2((u_{n+1} - ru_n)u_nv_{n+1} + 4t^n + tu_{n-1}v_{n-1}(u_{n+1} - ru_n))v_n
\]
\[
+ t^2 u_{n-1}^2 v_{n-1}^2 + 2u_nv_{n+1}u_{n-1}v_{n-1} + u_n^2 v_{n+1}^2 - v_n^4.
\]  

Proof. Identity (2.4) is obtained by setting \( m = n \) in the identity of Theorem 1 with \( (w_n) = (v_n) \). Identities (2.5) and (2.6) come from Lemma 2, identities (1.30) and (1.31) respectively, by setting \( (x_1, x_2, x_3) = (\alpha, \beta, \gamma) \).

Theorem 7 (An identity for the \( u \) sequence). The following identity holds for integer \( n \):
\[
t^n = t^3 u_{n-2}^3 + t(u_n - ru_{n-1})^3 + t^2 u_{n-1}^3
\]
\[
+ tu_{n-1}(u_n - ru_{n-1})(-su_{n-1} + r(u_n - ru_{n-1}))
\]
\[
+ ru_{n-2}(u_n - ru_{n-1})(tu_{n-1} + u_{n-2})
\]
\[
+ t^2(r^2 + 2s)u_{n-1}u_{n-2}^2 - t(r^3 + 3rs + 3t)u_{n-1}u_{n-2}(u_n - ru_{n-1})
\]
\[
- su_{n-2}(u_n - ru_{n-1})^2 + ts^2 - 2rt)u_{n-2}u_{n-1}^2.
\]

Proof. This identity comes from multiplying out \( \alpha^n \beta^n \gamma^n \), using identity (1.17) and the corresponding \( \beta^n \) and \( \gamma^n \) identities.

Theorem 8 (An identity for the \( v \) sequence). The following identity holds for integer \( n \):
\[
t^{-n}(v_n^3 - v_{3n}) = t^n(v_{-n}^3 - v_{-3n}).
\]

Proof. Setting \( (x_1, x_2, x_3) = (\alpha, \beta, \gamma) \) in identity (1.30), Lemma 2 gives
\[
t^{-n}v_{3n} = t^{-n}v_n^3 - 3v_nv_{-n} + 3, \tag{2.7}
\]
which, by replacing \( n \) with \(-n\) also means
\[
t^n v_{-3n} = t^n v_{-n}^3 - 3v_nv_{-n} + 3, \tag{2.8}
\]
and hence the identity of the theorem.
Theorem 9 (An identity for the \(w\) sequence). The following identity holds for integers \(n\) and \(m\):
\[
w_{n+m} = v_m w_n - t^m v_{-m} w_{n-m} + t^m w_{n-2m},
\]
or, by employing identity (1.20),
\[
2w_{n+m} = 2v_m w_n - (v_m^2 - v_{2m}) w_{n-m} + 2t^m w_{n-2m}.
\]

Proof. Set \((x_1, x_2, x_3) = (\alpha, \beta, \gamma)\) and \((c_1, c_2, c_3) = (A, B, C)\) in Lemma 3. The identity of Theorem 9 was discovered by Howard [3]. However, the proof here is much simpler than the one given by Howard. Setting \(m = n\) in identity (2.9) gives
\[
w_{-n} = \frac{2w_{2n} - 2v_n w_n + a(v_n^2 - v_{2n})}{2t^n},
\]
which is a more elegant alternative to identity (1.28) for the direct access to negative index terms of the \(w\) sequence.

From identity (2.10), we get alternative formulas for \(u_{-n}\) and \(z_{-n}\), namely,
\[
u_{-n} = \frac{(u_{2n} - u_n v_n)}{t^n}
\]
and
\[
z_{-n} = \frac{2z_{2n} - 2v_n z_n + v_n^2 - v_{2n}}{2t^n}.
\]

Theorem 10 (Reciprocal sums involving the \(u\) sequence). The following identities hold for integers \(k\) and \(n\) for which the summand is non-singular in the summation interval:
\[
\sum_{j=0}^{k} \frac{j^j u_{k-n-j-1}}{u_{n-k+j} u_{n-k+j+1}} = t^{k-n} (u_n u_{n-k} - u_{n+1} u_{n-k-1}),
\]

\[
\sum_{j=0}^{k} \frac{j^j u_{k-n-j-1}}{u_{n-k+j} u_{n-k+j+1}} = t^{k-n} (u_n u_{n-k} - u_{n+1} u_{n-k-1}).
\]

Proof. Division through identity (1.19) by \(u_n u_{n-1}\) and a shift of index gives
\[
\frac{t^n u_{-n-1}}{u_n u_{n+1}} = \frac{u_n}{u_{n+1}} - \frac{u_{n-1}}{u_n},
\]
from which identity (2.13) follows by telescoping summation.

Theorem 11 (Double binomial summation identities invoked by the definition of the generalized third order sequence). The following identities hold for positive integer \(k\) and integers \(m\) and \(n\):
\[
\sum_{j=0}^{k} \sum_{i=0}^{j} \binom{j}{i} t^{k-j} s^{k+j-i} t^i w_{n-3k+j+i} = s^k w_n.
\]
\[
\sum_{j=0}^{k} \sum_{i=0}^{j} \binom{k}{j} \binom{j}{i} s^{k-j} t^{k+j-i} r^{i} w_{n-2k-j+2i} = t^{k} w_{n},
\]
(2.17)

\[
\sum_{j=0}^{k} \sum_{i=0}^{j} \binom{k}{j} \binom{j}{i} r^{k-j} t^{k+j-i} s^{i} w_{n-k-2j+i} = t^{k} w_{n},
\]
(2.18)

\[
\sum_{j=0}^{k} \sum_{i=0}^{j} (-1)^{i} \binom{k}{j} \binom{j}{i} t^{k-j} s^{j-i} w_{n-2k+j+2i} = (-r)^{k} w_{n},
\]
(2.19)

\[
\sum_{j=0}^{k} \sum_{i=0}^{j} (-1)^{i} \binom{k}{j} \binom{j}{i} t^{k-j} r^{j-i} w_{n-k+2j+i} = (-s)^{k} w_{n},
\]
(2.20)

\[
\sum_{j=0}^{k} \sum_{i=0}^{j} (-1)^{i} \binom{k}{j} \binom{j}{i} s^{k-j} r^{j-i} w_{n+k+j+i} = (-t)^{k} w_{n}.
\]
(2.21)

**Proof.** The identities follow directly from Lemma 5 and the recurrence relation (1.1). \qed

**Theorem 12** (More double binomial summation identities involving third order sequences). The following identities hold for positive integer \( k \) and integers \( m \) and \( n \):

\[
\sum_{j=0}^{k} \sum_{i=0}^{j} (-1)^{i} \binom{k}{j} \binom{j}{i} (tu_{m-1})^{k-j} u_{m}^{k-j-i} w_{n-k+2j+(m-1)i} = (u_{m+1} - ru_{m})^{k} (-u_{m})^{k} w_{n},
\]
(2.22)

\[
\sum_{j=0}^{k} \sum_{i=0}^{j} (-1)^{i} \binom{k}{j} \binom{j}{i} u_{m}^{k-j} (tu_{m-1})^{k+j-i} w_{n-k+2j+(m-1)i} = (u_{m+1} - ru_{m})^{k} (-tu_{m-1})^{k} w_{n},
\]
(2.23)

\[
\sum_{j=0}^{k} \sum_{i=0}^{j} (-1)^{i} \binom{k}{j} \binom{j}{i} (tu_{m-1})^{k+j-i} u_{m}^{i} w_{n+mk-(m+1)j+2i} = (u_{m+1} - ru_{m})^{k} (tu_{m-1})^{k} w_{n},
\]
(2.24)

\[
\sum_{j=0}^{k} \sum_{i=0}^{j} \binom{k}{j} \binom{j}{i} (tu_{m-1})^{k-j} u_{m}^{j-i} (u_{m+1} - ru_{m})^{i} w_{n-(m+1)k+2j-i} = w_{n},
\]
(2.25)

\[
\sum_{j=0}^{k} \sum_{i=0}^{j} (-1)^{i+j} \binom{k}{j} \binom{j}{i} (tu_{m-1})^{k-j} (u_{m+1} - ru_{m})^{i} w_{n-2k+(m+1)j-mi} = (-1)^{k} u_{m}^{k} w_{n}
\]
(2.26)

and

\[
\sum_{j=0}^{k} \sum_{i=0}^{j} (-1)^{i+j} \binom{k}{j} \binom{j}{i} u_{m}^{k-j} (u_{m+1} - ru_{m})^{i} w_{n+2k+(m-1)j-mi} = (-1)^{k} (tu_{m-1})^{k} w_{n}.
\]
(2.27)

**Proof.** Write the identity of Theorem 1 as

\[
(u_{m+1} - ru_{m}) w_{n} = w_{n+m} - u_{m} w_{n+1} - tu_{m-1} w_{n-1}.
\]

Identify \( h = u_{m+1} - ru_{m}, f_{1} = 1, f_{2} = -u_{m}, f_{3} = tu_{m-1}, c_{1} = -m, c_{2} = -1 \) and \( c_{3} = 1 \) and use these in Lemma 5. \qed
