# WEIGHTED LEAVITT PATH ALGEBRAS THAT ARE ISOMORPHIC TO UNWEIGHTED LEAVITT PATH ALGEBRAS 

RAIMUND PREUSSER

#### Abstract

Let $K$ be a field. We characterise the row-finite weighted graphs $(E, w)$ such that the weighted Leavitt path algebra $L_{K}(E, w)$ is isomorphic to an unweighted Leavitt path algebra. Moreover, we prove that if $L_{K}(E, w)$ is locally finite, or Noetherian, or Artinian, or von Neumann regular, or has finite GelfandKirillov dimension, then $L_{K}(E, w)$ is isomorphic to an unweighted Leavitt path algebra.

## 1. Introduction

In a series of papers $[8,9,10,11]$ William Leavitt studied algebras that are now denoted by $L_{K}(n, n+$ $k)$ and have been coined Leavitt algebras. Let $X=\left(x_{i j}\right)$ and $Y=\left(y_{j i}\right)$ be $(n+k) \times n$ and $n \times(n+k)$ matrices consisting of symbols $x_{i j}$ and $y_{j i}$, respectively. Then for a field $K, L_{K}(n, n+k)$ is the unital $K$-algebra generated by all $x_{i j}$ and $y_{j i}$ subject to the relations $X Y=I_{n+k}$ and $Y X=I_{n}$. The algebra $L_{K}(n, n+k)$ can be described as the $K$-algebra $A$ with a universal left $A$-module isomorphism $A^{n} \rightarrow A^{n+k}$, cf. [4, second paragraph on p. 35].
(Unweighted) Leavitt path algebras are algebras associated to directed graphs. They were introduced by G. Abrams and G. Aranda Pino in 2005 [1] and independently by P. Ara, M. Moreno and E. Pardo in 2007 [3]. For the directed graph

with one vertex and $k+1$ loops one recovers the Leavitt algebra $L_{K}(1, k+1)$. The definition and the development of the theory were inspired on the one hand by Leavitt's construction of $L_{K}(1, k+1)$ and on the other hand by the Cuntz algebras $\mathcal{O}_{n}[5]$ and the Cuntz-Krieger algebras in $C^{*}$-algebra theory [16]. The Cuntz algebras and later Cuntz-Krieger type $C^{*}$-algebras revolutionised $C^{*}$-theory, leading ultimately to the astounding Kirchberg-Phillips classification theorem [12]. The Leavitt path algebras have created the same type of stir in the algebraic community.

There have been several attempts to introduce a generalisation of the Leavitt path algebras which would cover the algebras $L_{K}(n, n+k), n \geq 2$ as well. In 2013, R. Hazrat [6] introduced weighted Leavitt path algebras. These are algebras associated to weighted graphs. For the weighted graph

with one vertex and $n+k$ loops of weight $n$ one recovers the Leavitt algebra $L_{K}(n, n+k)$. If the weights of all the edges are 1, then the weighted Leavitt path algebras reduce to the unweighted Leavitt path algebras.

[^0]Which are the new examples in the class of weighted Leavitt path algebras? In [7] it was shown that any simple or graded simple weighted Leavitt path algebra is isomorphic to an unweighted Leavitt path algebra. In [14] and [15] it was shown that any finite-dimensional or Noetherian weighted Leavitt path algebra is isomorphic to an unweighted Leavitt path algebra. Furthermore, graph-theoretic criterions that are sufficient and necessary for $L_{K}(E, w)$ being finite-dimensional/Noetherian were found (see [15, Theorems 25 and 52]). On the other hand, it was shown in [13, Corollary 16], that the class of weighted Leavitt path algebras contains infinitely many domains which are neither isomorphic to an unweighted Leavitt path algebra nor to a Leavitt algebra $L_{K}(n, n+k)$.

As examples consider the weighted graphs

where a number above or below an edge indicates the weight of that edge. In [14, Example 40] it was shown that $L_{K}(E, w) \cong L_{K}(F)$ where $F$ is the directed graph

In [13, Example 21] it was shown that $L_{K}\left(E^{\prime}, w^{\prime}\right) \cong L_{K}\left(F^{\prime}\right)$ where $F^{\prime}$ is the directed graph

But it remained unclear if $L_{K}\left(E^{\prime \prime}, w^{\prime \prime}\right)$ is isomorphic to an unweighted Leavitt path algebra. It will follow from the results of this paper that $L_{K}\left(E^{\prime \prime}, w^{\prime \prime}\right)$ cannot be isomorphic to an unweighted Leavitt path algebra.

In this paper we obtain a graph-theoretic criterion that is sufficient and necessary for $L_{K}(E, w)$ being isomorphic to an unweighted Leavitt path algebra (Condition (LPA), cf. Definition 15). Moreover, we prove that if $L_{K}(E, w)$ is Artinian, or von Neumann regular, or has finite Gelfand-Kirillov dimension, then $L_{K}(E, w)$ is isomorphic to an unweighted Leavitt path algebra.

The rest of the paper is organised as follows.
In Section 2 we recall some standard notation which is used throughout the paper.
In Section 3 we recall the definitions of the unweighted and weighted Leavitt path algebras.
In Section 4 we introduce Condition (LPA).
In Section 5 we prove that if $(E, w)$ is a row-finite weighted graph that satisfies Condition (LPA), then $L_{K}(E, w)$ is isomorphic to an unweighted Leavitt path algebra.

In Section 6 we prove that if $(E, w)$ is a row-finite weighted graph that does not satisfy Condition (LPA), then $L_{K}(E, w)$ is not isomorphic to an unweighted Leavitt path algebra. Moreover, we prove that if $L_{K}(E, w)$ is Artinian, or von Neumann regular, or has finite Gelfand-Kirillov dimension, then $L_{K}(E, w)$ is isomorphic to an unweighted Leavitt path algebra. We also prove again that if $L_{K}(E, w)$ is locally finite or Noetherian, then $L_{K}(E, w)$ is isomorphic to an unweighted Leavitt path algebra (that has already been shown in [15], but the paper was never published in a journal).

In Section 7 we summarise the main results of this paper.

## 2. Notation

Throughout the paper $K$ denotes a field. By a $K$-algebra we mean an associative (but not necessarily commutative or unital) $K$-algebra. By an ideal we mean a two-sided ideal. $\mathbb{N}$ denotes the set of positive integers, $\mathbb{N}_{0}$ the set of nonnegative integers, $\mathbb{Z}$ the set of integers and $\mathbb{R}_{+}$the set of positive real numbers.

## 3. Unweighted and weighted Leavitt path algebras

Definition 1. A (directed) graph is a quadruple $E=\left(E^{0}, E^{1}, s, r\right)$ where $E^{0}$ and $E^{1}$ are sets and $s, r$ : $E^{1} \rightarrow E^{0}$ maps. The elements of $E^{0}$ are called vertices and the elements of $E^{1}$ edges. If $e$ is an edge, then $s(e)$ is called its source and $r(e)$ its range.

## Remark 2.

(a) Let $E$ be a graph, $v \in E^{0}$ a vertex and $e \in E^{1}$ an edge. Then we say that $v$ emits $e$ if $s(e)=v$ and $v$ receives $e$ if $r(e)=v$.
(b) In this article all graphs are assumed to be row-finite. Recall that a graph $E=\left(E^{0}, E^{1}, s, r\right)$ is called row-finite if $s^{-1}(v)$ is a finite set for any vertex $v$.
Definition 3. Let $E$ be a graph. The $K$-algebra $L_{K}(E)$ presented by the generating set $\left\{v, e, e^{*} \mid v \in\right.$ $\left.E^{0}, e \in E^{1}\right\}$ and the relations
(i) $u v=\delta_{u v} u \quad\left(u, v \in E^{0}\right)$,
(ii) $s(e) e=e=e r(e), r(e) e^{*}=e^{*}=e^{*} s(e) \quad\left(e \in E^{1}\right)$,
(iii) $e^{*} f=\delta_{e f} r(e) \quad\left(v \in E^{0}, e, f \in s^{-1}(v)\right)$ and
(iv) $\sum_{e \in s^{-1}(v)} e e^{*}=v \quad\left(v \in E^{0}, s^{-1}(v) \neq \emptyset\right)$
is called the (unweighted) Leavitt path algebra of $E$.
Remark 4. Let $E$ be a graph and $A$ a $K$-algebra that contains a set $X=\left\{\alpha_{v}, \beta_{e}, \gamma_{e} \mid v \in E^{0}, e \in E^{1}\right\}$ such that
(i) the $\alpha_{v}$ 's are pairwise orthogonal idempotents,
(ii) $\alpha_{s(e)} \beta_{e}=\beta_{e}=\beta_{e} \alpha_{r(e)}, \alpha_{r(e)} \gamma_{e}=\gamma_{e}=\gamma_{e} \alpha_{s(e)} \quad\left(e \in E^{1}\right)$,
(iii) $\gamma_{e} \beta_{f}=\delta_{e f} \alpha_{r(e)} \quad\left(v \in E^{0}, e, f \in s^{-1}(v)\right)$ and
(iv) $\sum_{e \in s^{-1}(v)} \beta_{e} \gamma_{e}=\alpha_{v} \quad\left(v \in E^{0}, s^{-1}(v) \neq \emptyset\right)$.

We call $X$ an $E$-family in $A$. By the relations defining $L_{K}(E)$, there exists a unique $K$-algebra homomorphism $\phi: L_{K}(E) \rightarrow A$ such that $\phi(v)=\alpha_{v}, \phi(e)=\beta_{e}$ and $\phi\left(e^{*}\right)=\gamma_{e}$ for all $v \in E^{0}$ and $e \in E^{1}$. We will refer to this as the Universal Property of $L_{K}(E)$.

Definition 5. A weighted graph is a pair $(E, w)$ where $E$ is a graph and $w: E^{1} \rightarrow \mathbb{N}$ is a map. If $e \in E^{1}$, then $w(e)$ is called the weight of $e$. For a vertex $v \in E^{0}$ we set $w(v):=\max \left\{w(e) \mid e \in s^{-1}(v)\right\}$ with the convention $\max \emptyset=0$.

Definition 6. Let $(E, w)$ be a weighted graph. The $K$-algebra $L_{K}(E, w)$ presented by the generating set $\left\{v, e_{i}, e_{i}^{*} \mid v \in E^{0}, e \in E^{1}, 1 \leq i \leq w(e)\right\}$ and the relations
(i) $u v=\delta_{u v} u \quad\left(u, v \in E^{0}\right)$,
(ii) $s(e) e_{i}=e_{i}=e_{i} r(e), r(e) e_{i}^{*}=e_{i}^{*}=e_{i}^{*} s(e) \quad\left(e \in E^{1}, 1 \leq i \leq w(e)\right)$,
(iii) $\sum_{1 \leq i \leq w(v)} e_{i}^{*} f_{i}=\delta_{e f} r(e) \quad\left(v \in E^{0}, e, f \in s^{-1}(v)\right)$ and
(iv) $\sum_{e \in s^{-1}(v)} e_{i} e_{j}^{*}=\delta_{i j} v \quad\left(v \in E^{0}, 1 \leq i, j \leq w(v)\right)$
is called the weighted Leavitt path algebra of $(E, w)$. In relations (iii) and (iv) we set $e_{i}$ and $e_{i}^{*}$ zero whenever $i>w(e)$.

Example 7. If $(E, w)$ is a weighted graph such that $w(e)=1$ for all $e \in E^{1}$, then $L_{K}(E, w)$ is isomorphic to the unweighted Leavitt path algebra $L_{K}(E)$.

Example 8. Let $n \geq 1$ and $k \geq 0$. Let $(E, w)$ be the weighted graph

with one vertex $v$ and $n+k$ edges $e^{(1)}, \ldots, e^{(n+k)}$ each of which has weight $n$. Then $L_{K}(E, w)$ is isomorphic to the Leavitt algebra $L_{K}(n, n+k)$, for details see [6, Example 5.5] or [7, Example 4].

Remark 9. Let $(E, w)$ be a weighted graph and $A$ a $K$-algebra that contains a set $X=\left\{\alpha_{v}, \beta_{e, i}, \gamma_{e, i} \mid v \in\right.$ $\left.E, e \in E^{1}, 1 \leq i \leq w(e)\right\}$ such that
(i) the $\alpha_{v}$ 's are pairwise orthogonal idempotents,
(ii) $\alpha_{s(e)} \beta_{e, i}=\beta_{e, i}=\beta_{e, i} \alpha_{r(e)}, \alpha_{r(e)} \gamma_{e, i}=\gamma_{e, i}=\gamma_{e, i} \alpha_{s(e)} \quad\left(e \in E^{1}, 1 \leq i \leq w(e)\right)$,
(iii) $\sum_{1 \leq i \leq w(v)} \gamma_{e, i} \beta_{f, i}=\delta_{e f} \alpha_{r(e)} \quad\left(v \in E^{0}, e, f \in s^{-1}(v)\right)$ and
(iv) $\sum_{e \in s^{-1}(v)} \beta_{e, i} \gamma_{e, j}=\delta_{i j} \alpha_{v} \quad\left(v \in E^{0}, 1 \leq i, j \leq w(v)\right)$.

In relations (iii) and (iv) we set $\beta_{e, i}$ and $\gamma_{e, i}$ zero whenever $i>w(e)$. We call $X$ an $(E, w)$-family in $A$. By the relations defining $L_{K}(E, w)$, there exists a unique $K$-algebra homomorphism $\phi: L_{K}(E, w) \rightarrow A$ such that $\phi(v)=\alpha_{v}, \phi\left(e_{i}\right)=\beta_{e, i}$ and $\phi\left(e_{i}^{*}\right)=\gamma_{e, i}$ for all $v \in E^{0}, e \in E^{1}$ and $1 \leq i \leq w(e)$. We will refer to this as the Universal Property of $L_{K}(E, w)$.

Remark 10. Let $(E, w)$ be a weighted graph. Then $L_{K}(E, w)$ has the properties (a)-(d) below, for details see [6, Proposition 5.7].
(a) If $E^{0}$ is a finite set, then $L_{K}(E, w)$ is a unital ring (with $\sum_{v \in E^{0}} v$ as multiplicative identity).
(b) $L_{K}(E, w)$ has a set of local units, namely the set of all finite sums of distinct elements of $E^{0}$. Recall that an associative ring $R$ is said to have a set of local units $X$ in case $X$ is a set of idempotents in $R$ having the property that for each finite subset $S \subseteq R$ there exists an $x \in X$ such that $x s x=s$ for any $s \in S$.
(c) There is an involution $*$ on $L_{K}(E, w)$ mapping $k \mapsto k, v \mapsto v, e_{i} \mapsto e_{i}^{*}$ and $e_{i}^{*} \mapsto e_{i}$ for any $k \in K$, $v \in E^{0}, e \in E^{1}$ and $1 \leq i \leq w(e)$.
(d) Set $n:=\sup \left\{w(e) \mid e \in E^{1}\right\}$. One can define a $\mathbb{Z}^{n}$-grading on $L_{K}(E, w)$ by $\operatorname{setting} \operatorname{deg}(v):=0$, $\operatorname{deg}\left(e_{i}\right):=\epsilon_{i}$ and $\operatorname{deg}\left(e_{i}^{*}\right):=-\epsilon_{i}$ for any $v \in E^{0}, e \in E^{1}$ and $1 \leq i \leq w(e)$. Here $\epsilon_{i}$ denotes the element of $\mathbb{Z}^{n}$ whose $i$-th component is 1 and whose other components are 0.

## 4. The Condition (LPA)

We start with a couple of definitions.

Definition 11. Let $E$ be a graph. A path is a nonempty word $p=x_{1} \ldots x_{n}$ over the alphabet $E^{0} \cup E^{1}$ such that either $x_{i} \in E^{1}(i=1, \ldots, n)$ and $r\left(x_{i}\right)=s\left(x_{i+1}\right)(i=1, \ldots, n-1)$ or $n=1$ and $x_{1} \in E^{0}$. By definition, the length $|p|$ of $p$ is $n$ in the first case and 0 in the latter case. We set $s(p):=s\left(x_{1}\right)$ and $r(p):=r\left(x_{n}\right)$ (here we use the convention $s(v)=v=r(v)$ for any $v \in E^{0}$ ).

Definition 12. Let $E$ be a graph and $v \in E^{0}$. A closed path (based at $v$ ) is a path $p$ such that $|p|>0$ and $s(p)=r(p)=v$. A cycle (based at $v$ ) is a closed path $p=x_{1} \ldots x_{n}$ based at $v$ such that $s\left(x_{i}\right) \neq s\left(x_{j}\right)$ for any $i \neq j$.

Definition 13. Let $E$ be a graph. If $u, v \in E^{0}$ and there is a path $p$ in $E$ such that $s(p)=u$ and $r(p)=v$, then we write $u \geq v$. If $u \in E^{0}$, then $T(u):=\left\{v \in E^{0} \mid u \geq v\right\}$ is called the tree of $u$. If $X \subseteq E^{0}$, we define $T(X):=\bigcup_{v \in X} T(v)$. Two edges $e, f \in E^{1}$ are called in line if $e=f$ or $r(e) \geq s(f)$ or $r(f) \geq s(e)$

Definition 14. Let $(E, w)$ be a weighted graph. An edge $e \in E^{1}$ is called unweighted if $w(e)=1$ and weighted if $w(e)>1$. The subset of $E^{1}$ consisting of all unweighted edges is denoted by $E_{u w}^{1}$ and the subset consisting of all weighted edges by $E_{w}^{1}$.

Now we can introduce Condition (LPA).
Definition 15. We say that a weighted graph $(E, w)$ satisfies Condition (LPA) if the following holds true:
(LPA1) Any vertex $v \in E^{0}$ emits at most one weighted edge.
(LPA2) Any vertex $v \in T\left(r\left(E_{w}^{1}\right)\right)$ emits at most one edge.
(LPA3) If two weighted edges $e, f \in E_{w}^{1}$ are not in line, then $T(r(e)) \cap T(r(f))=\emptyset$.
(LPA4) If $e \in E_{w}^{1}$ and $c$ is a cycle based at some vertex $v \in T(r(e))$, then $e$ belongs to $c$.
Each of the Conditions (LPA1)-(LPA4) in Definition 15 above "forbids" a certain constellation in the weighted graph $(E, w)$. The pictures below illustrate these forbidden constellations. Symbols above or below edges indicate the weight. A dotted arrow stands for a path.
(LPA1)

(LPA2)

(LPA3)

(LPA4)

Remark 16. Conditions (LPA1), (LPA2) and (LPA3) already appeared in [14] and [15]. They were independently found by N. T. Phuc. Condition (LPA4) is new, this condition is slightly weaker then Condition (iv) in [15, Definition 19].

## 5. Presence of Condition (LPA)

Lemma 17. Let $(E, w)$ be a weighted graph that satisfies Condition (LPA). If e and $f$ are distinct edges such that $s(e), s(f) \in T\left(r\left(E_{w}^{1}\right)\right)$, then $r(e) \neq r(f)$.

Proof. Let $e, f \in E^{1}$ such that $s(e), s(f) \in T\left(r\left(E_{w}^{1}\right)\right)$ and $r(e)=r(f)$. We will show that $e=f$. Since $s(e), s(f) \in T\left(r\left(E_{w}^{1}\right)\right)$, there are $g, h \in E_{w}^{1}$ such that $s(e) \in T(r(g))$ and $s(f) \in T(r(h))$. It follows that $r(e)=r(f) \in T(r(g)) \cap T(r(h))$. Since $(E, w)$ satisfies Condition (LPA3), $g$ and $h$ are in line. It follows that $s(e), s(f) \in T(r(g))$ or $s(e), s(f) \in T(r(h))$. W.l.o.g. assume that $s(e), s(f) \in T(r(g))$.
Case 1 Assume that there is a cycle $c$ based at some vertex $v \in T(r(g))$. Since $(E, w)$ satisfies (LPA4), $g$ belongs to $c$. Write $c=\alpha^{(1)} \ldots \alpha^{(n)}$ where $\alpha^{(1)}, \ldots, \alpha^{(n)} \in E^{1}$. Set $x_{i}:=s\left(\alpha^{(i)}\right)(1 \leq i \leq n)$. Then, in view of (LPA2), we have $T(r(g))=\left\{x_{1}, \ldots, x_{n}\right\}$. Moreover, each $x_{i}$ emits precisely one edge, namely $\alpha^{(i)}$. Since $s(e), s(f) \in T(r(g))$, we get that $s(e)=x_{i}$ and $s(f)=x_{j}$ for some $1 \leq i, j \leq n$. Hence $e=\alpha^{(i)}$ and $f=\alpha^{(j)}$. Since $r(e)=r(f)$, it follows that $i=j$ and hence $e=f$.

Case 2 Assume that no cycle is based at a vertex in $T(r(g))$. Since $s(e), s(f) \in T(r(g))$, there are paths $p$ and $q$ such that $s(p)=r(g)=s(q), r(p)=s(e)$ and $r(q)=s(f)$. Clearly pe and $q f$ are paths starting at $r(g)$ and ending at $r(e)=r(f)$. It follows from (LPA2) and the assumption that no cycle is based at a vertex in $T(r(g))$, that $p e=q f$. Hence $e=f$.

Recall that if $E$ is a graph, then a vertex $v$ that does not emit any edges is called a sink.
Lemma 18. Let $(E, w)$ be a weighted graph that satisfies Condition (LPA). Then there is a weighted graph $(\tilde{E}, \tilde{w})$ such that the ranges of the weighted edges in $(\tilde{E}, \tilde{w})$ are sinks, no vertex in $(\tilde{E}, \tilde{w})$ emits or receives two distinct weighted edges, and $L_{K}(\tilde{E}, \tilde{w}) \cong L_{K}(E, w)$.

Proof. Set $Z:=T\left(r\left(E_{w}^{1}\right)\right)$. Define a weighted $\operatorname{graph}(\tilde{E}, \tilde{w})$ by $\tilde{E}^{0}=E^{0}, \tilde{E}^{1}=\tilde{E}_{Z}^{1} \sqcup \tilde{E}_{Z^{c}}^{1}$ where

$$
\tilde{E}_{Z}^{1}=\left\{e^{(1)}, \ldots, e^{(w(e))} \mid e \in E^{1}, s(e) \in Z\right\} \text { and } \tilde{E}_{Z^{c}}^{1}=\left\{e \mid e \in E^{1}, s(e) \notin Z\right\}
$$

$\tilde{s}\left(e^{(i)}\right)=r(e), \tilde{r}\left(e^{(i)}\right)=s(e)$ and $\tilde{w}\left(e^{(i)}\right)=1$ for any $e^{(i)} \in \tilde{E}_{Z}^{1}$ and $\tilde{s}(e)=s(e), \tilde{r}(e)=r(e)$ and $\tilde{w}(e)=w(e)$ for any $e \in \tilde{E}_{Z^{c}}^{1}$. We have divided the rest of the proof into three parts. In Part I we show that the ranges of the weighted edges in $(\tilde{E}, \tilde{w})$ are sinks, in Part II we show that no vertex in $(\tilde{E}, \tilde{w})$ emits or receives two distinct weighted edges, and in Part III we show that $L_{K}(\tilde{E}, \tilde{w}) \cong L_{K}(E, w)$.

Part I Let $\tilde{e} \in \tilde{E}_{w}^{1}$. We will show that $\tilde{r}(\tilde{e})$ is a $\operatorname{sink}$ in $(\tilde{E}, \tilde{w})$. Clearly $\tilde{e} \in \tilde{E}_{Z^{c}}^{1}$ since all the edges in $\tilde{E}_{Z}^{1}$ have weight one in $(\tilde{E}, \tilde{w})$. Hence there is an $e \in E^{1}, s(e) \notin Z$ such that $\tilde{e}=e$. Clearly $w(e)=\tilde{w}(e)=\tilde{w}(\tilde{e})>1$. Now suppose that there is an $\tilde{f} \in \tilde{E}^{1}$ such that $\tilde{s}(\tilde{f})=\tilde{r}(\tilde{e})$.
Case 1 Assume that $\tilde{f} \in \tilde{E}_{Z}^{1}$. Then there is an $f \in E^{1}, s(f) \in Z$ and an $i \in\{1, \ldots, w(f)\}$ such that $\tilde{f}=f^{(i)}$ (note that $e \neq f$, since $\left.s(e) \notin Z\right)$. It follows that $r(e)=\tilde{r}(e)=\tilde{r}(\tilde{e})=\tilde{s}(\tilde{f})=\tilde{s}\left(f^{(i)}\right)=$ $r(f)$. Since $s(f) \in Z=T\left(r\left(E_{w}^{1}\right)\right)$, there is a $g \in E_{w}^{1}$ such that $s(f) \in T(r(g))$. It follows that $r(f) \in T(r(e)) \cap T(r(g))$. Since $(E, w)$ satisfies Condition (LPA3), we get that $e$ and $g$ are in line and hence $e=g$ or $r(e) \geq s(g)$ or $r(g) \geq s(e)$.

Case 1.1 Assume that $e=g$. Since $s(f) \in T(r(g))=T(r(e))$, there is a path $p$ such that $s(p)=r(e)$ and $r(p)=s(f)$. Since $r(f)=r(e)$, we have a closed path $p f$ based at $r(e)$. That implies the existence of a cycle $c$ based at $r(e)$. Since ( $E, w$ ) satisfies (LPA4), $e$ belongs to $c$ and therefore $s(e) \in T(r(e))$. Now we get the contradiction $s(e) \in T(r(e)) \subseteq T\left(r\left(E_{w}^{1}\right)\right)=Z$.

Case 1.2 Assume that $r(e) \geq s(g)$. Then there is a path $p$ such that $s(p)=r(e)$ and $r(p)=s(g)$. Since $s(f) \in T(r(g))$, there is a path $q$ such that $s(q)=r(g)$ and $r(q)=s(f)$. Since $r(f)=r(e)$,
we have a closed path pgqf based at $r(e)$. Now we can proceed as in Case 1.1 to get a contradiction.
Case 1.3 Assume that $r(g) \geq s(e)$. Then we get the contradiction $s(e) \in T(r(g)) \subseteq T\left(r\left(E_{w}^{1}\right)\right)=Z$.
Case 2 Assume that $\tilde{f} \in \tilde{E}_{Z}^{1}$. Then there is an $f \in E^{1}, s(f) \notin Z$ such that $\tilde{f}=f$. It follows that $r(e)=$ $\tilde{r}(e)=\tilde{r}(\tilde{e})=\tilde{s}(\tilde{f})=\tilde{s}(f)=s(f)$. Hence we get the contradiction $s(f)=r(e) \in T\left(r\left(E_{w}^{1}\right)\right) \subseteq Z$.
Thus the ranges of the weighted edges in $(\tilde{E}, \tilde{w})$ are sinks.
Part II Assume that there are distinct $\tilde{e}, \tilde{f} \in \tilde{E}_{w}^{1}$ such that $\tilde{s}(\tilde{e})=\tilde{s}(\tilde{f})$. Clearly $\tilde{e}, \tilde{f} \in \tilde{E}_{Z \mathrm{Z}}^{1}$ since all the edges in $\tilde{E}_{Z}^{1}$ have weight one in $(\tilde{E}, \tilde{w})$. Hence there are distinct $e, f \in E^{1}, s(e), s(f) \notin Z$ such that $\tilde{e}=e$ and $\tilde{f}=f$. It follows that $s(e)=\tilde{s}(e)=\tilde{s}(\tilde{e})=\tilde{s}(\tilde{f})=\tilde{s}(f)=s(f)$ which contradicts the assumption that $(E, w)$ satisfies Condition (LPA1) (note that $w(e)=\tilde{w}(\tilde{e})>1$ and $w(f)=\tilde{w}(\tilde{f})>1)$. Thus no vertex emits two distinct weighted edges in $(\tilde{E}, \tilde{w})$.
Now assume that there are distinct $\tilde{e}, \tilde{f} \in \tilde{E}_{w}^{1}$ such that $\tilde{r}(\tilde{e})=\tilde{r}(\tilde{f})$. Clearly $\tilde{e}, \tilde{f} \in \tilde{E}_{Z^{c}}^{1}$ since all the edges in $\tilde{E}_{Z}^{1}$ have weight one in $(\tilde{E}, \tilde{w})$. Hence there are distinct $e, f \in E^{1}, s(e), s(f) \notin Z$ such that $\tilde{e}=e$ and $\tilde{f}=f$. It follows that $r(e)=\tilde{r}(e)=\tilde{r}(\tilde{e})=\tilde{r}(\tilde{f})=\tilde{r}(f)=r(f)$. Since $(E, w)$ satisfies Condition (LPA3), we get that $e$ and $f$ are in line. Since $e$ and $f$ are distinct, it follows that $r(e) \geq s(f)$ or $r(f) \geq s(e)$. But in the first case we get the contradiction $s(f) \in Z$ and in the second case the contradiction $s(e) \in Z$. Thus no vertex receives two distinct weighted edges in $(\tilde{E}, \tilde{w})$.

Part III It remains to show that $L_{K}(\tilde{E}, \tilde{w}) \cong L_{K}(E, w)$. Set $X:=\left\{v, e_{i}, e_{i}^{*} \mid v \in E^{0}, e \in E^{1}, 1 \leq i \leq w(e)\right\}$ and $\tilde{X}:=\left\{\tilde{v}, \tilde{e}_{i}, \tilde{e}_{i}^{*} \mid \tilde{v} \in \tilde{E}^{0}, \tilde{e} \in \tilde{E}^{1}, 1 \leq i \leq \tilde{w}(\tilde{e})\right\}$. Let $K\langle X\rangle$ and $K\langle\tilde{X}\rangle$ be the free $K$-algebras generated by $X$ and $\tilde{X}$, respectively. Then the bijection $X \rightarrow \tilde{X}$ mapping

$$
\begin{array}{ll}
v \mapsto v & \\
e_{i} \mapsto\left(v \in E^{0}\right), \\
\left.e_{i}^{(i)}\right)^{*} & \\
e_{i}^{*} e_{1}^{(i)} & \\
e_{i} \mapsto e_{i} & \left(e \in E^{1}, s(e) \in Z, 1 \leq i \leq w(e)\right), \\
e_{i}^{*} \mapsto e_{i}^{*} & \\
\left(e \in E^{1}, s(e) \notin Z, 1 \leq i \leq w(e)\right), \\
\left(e \in E^{1}, s(e) \notin Z, 1 \leq i \leq w(e)\right),
\end{array}
$$

induces an isomorphism $\phi: K\langle X\rangle \rightarrow K\langle\tilde{X}\rangle$. Let $I$ and $\tilde{I}$ be the ideals of $K\langle X\rangle$ and $K\langle\tilde{X}\rangle$ generated by the relations (i)-(iv) in Definition 6, respectively (hence $L_{K}(E, w) \cong K\langle X\rangle / I$ and $\left.L_{K}(\tilde{E}, \tilde{w}) \cong K\langle\tilde{X}\rangle / \tilde{I}\right)$. In order to show that $L_{K}(E, w) \cong L_{K}(\tilde{E}, \tilde{w})$ it suffices to show that $\phi(I)=\tilde{I}$. Set

$$
\begin{gathered}
A^{(i)}:=\left\{u v-\delta_{u v} u \mid u, v \in E^{0}\right\} \\
A^{(i i)}:=\left\{s(e) e_{i}-e_{i}, e_{i} r(e)-e_{i}, r(e) e_{i}^{*}-e_{i}^{*}, e_{i}^{*} s(e)-e_{i}^{*} \mid e \in E^{1}, 1 \leq i \leq w(e)\right\},
\end{gathered}
$$

and for any $v \in E^{0}$

$$
A_{v}^{(i i i)}:=\left\{\sum_{1 \leq i \leq w(v)} e_{i}^{*} f_{i}-\delta_{e f} r(e) \mid e, f \in s^{-1}(v)\right\}
$$

and

$$
A_{v}^{(i v)}:=\left\{\sum_{e \in s^{-1}(v)} e_{i} e_{j}^{*}-\delta_{i j} v \mid 1 \leq i, j \leq w(v)\right\} .
$$

Then $I$ is generated by $A^{(i)}, A^{(i i)}$, the $A_{v}^{(i i i)}$,s and the $A_{v}^{(i v)}$ 's. Analogously define subsets $B^{(i)}, B^{(i i)}, B_{v}^{(i i i)}(v \in$ $\left.\tilde{E}^{0}\right), B_{v}^{(i v)}\left(v \in \tilde{E}^{0}\right)$ of $K\langle\tilde{X}\rangle$. Then $\tilde{I}$ is generated by $B^{(i)}, B^{(i i)}$, the $B_{v}^{(i i i)}$,s and the $B_{v}^{(i v)}$,s. Clearly $\phi\left(A^{(i)}\right)=B^{(i)}$ and $\phi\left(A^{(i i)}\right)=B^{(i i)}$. One checks easily that $\phi\left(A_{v}^{(i i i)}\right)=B_{v}^{(i i i)}$ and $\phi\left(A_{v}^{(i v)}\right)=B_{v}^{(i v)}$ if $v \notin Z$.

Let now $v \in Z$ be not a sink in $(E, w)$ (if $v \in Z$ is a $\operatorname{sink}$ in $(E, w)$, then $A_{v}^{(i i i)}=A_{v}^{(i v)}=\emptyset$ ). Then we have $s^{-1}(v)=\{e\}$ for some $e \in E^{1}$ since $(E, w)$ satisfies Condition (LPA2). Set $\bar{v}:=r(e)$. Clearly

$$
A_{v}^{(i i i)}=\left\{\sum_{1 \leq i \leq w(e)} e_{i}^{*} e_{i}-\bar{v}\right\}
$$

and

$$
A_{v}^{(i v)}=\left\{e_{i} e_{j}^{*}-\delta_{i j} v \mid 1 \leq i, j \leq w(e)\right\} .
$$

It follows from Lemma 17 that $\tilde{s}^{-1}(\bar{v})=\left\{e^{(1)}, \ldots, e^{(w(e))}\right\}$. Hence

$$
B_{\bar{v}}^{(i i i)}=\left\{\left(e_{1}^{(i)}\right)^{*} e_{1}^{(j)}-\delta_{i j} v \mid 1 \leq i, j \leq w(e)\right\}
$$

and

$$
B_{\bar{v}}^{(i v)}=\left\{\sum_{1 \leq i \leq w(e)} e_{1}^{(i)}\left(e_{1}^{(i)}\right)^{*}-\bar{v}\right\}
$$

Clearly $\phi\left(A_{v}^{(i i i)}\right)=B_{\bar{v}}^{(i v)}$ and $\phi\left(A_{v}^{(i v)}\right)=B_{\bar{v}}^{(i i i)}$. It follows from Lemma 17 that the map ${ }^{-}: v \mapsto \bar{v}$ defines a bijection between the elements of $Z$ that are not a $\operatorname{sink}$ in $(E, w)$ and the elements of $Z$ that are not a $\operatorname{sink}$ in $(\tilde{E}, \tilde{w})$. Hence $\phi(I)=\tilde{I}$ and thus $L_{K}(\tilde{E}, \tilde{w}) \cong L_{K}(E, w)$.

Example 19. Consider the weighted graph
$(E, w):$

One checks easily that $(E, w)$ satisfies Condition (LPA) (note that $\left.T\left(r\left(E_{w}^{1}\right)\right)=\{t, u, x, y, z\}\right)$. Let $(\tilde{E}, \tilde{w})$ be defined as in the proof of Lemma 18. Then $(\tilde{E}, \tilde{w})$ is the weighted graph

There is only one weighted edge in ( $\tilde{E}, \tilde{w}$ ), namely $f$, and its range is a sink. The proof of Lemma 18 shows that $L_{K}(E, w) \cong L_{K}(\tilde{E}, \tilde{w})$.

Lemma 20. Let $(E, w)$ be a weighted graph such that the ranges of the weighted edges are sinks and no vertex emits or receives two distinct weighted edges. Then there is a graph $\tilde{E}$ such that $L_{K}(E, w) \cong L_{K}(\tilde{E})$.

Proof. If $v \in r\left(E_{w}^{1}\right)$, then there is a unique edge $g^{v} \in E_{w}^{1}$ such that $r\left(g^{v}\right)=v$ (since no vertex in ( $E, w$ ) receives two distinct weighted edges). Define a graph $\tilde{E}$ by

$$
\begin{aligned}
\tilde{E}^{0} & =M \sqcup N \text { where } \\
M & =E^{0} \backslash r\left(E_{w}^{1}\right), \\
N & =\left\{v^{(1)}, \ldots, v^{\left(w\left(g^{v}\right)\right)} \mid v \in r\left(E_{w}^{1}\right)\right\}, \\
\tilde{E}^{1} & =A \sqcup B \sqcup C \sqcup D \text { where } \\
A & =\left\{e \mid e \in E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)\right\}, \\
B & =\left\{e^{(1)}, \ldots, e^{\left(w\left(g^{r(e)}\right)\right)} \mid e \in E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right)\right\}, \\
C & =\left\{e^{(1)} \mid e \in E_{w}^{1}\right\}, \\
D & =\left\{e^{(2)}, \ldots, e^{(w(e))} \mid e \in E_{w}^{1}\right\}, \\
\tilde{s}(e) & =s(e), \tilde{r}(e)=r(e) \quad(e \in A), \\
\tilde{s}\left(e^{(i)}\right) & =s(e), \tilde{r}\left(e^{(i)}\right)=r(e)^{(i)} \quad\left(e^{(i)} \in B\right), \\
\tilde{s}\left(e^{(1)}\right) & =s(e), \tilde{r}\left(e^{(1)}\right)=r(e)^{(1)} \quad\left(e^{(1)} \in C\right), \\
\tilde{s}\left(e^{(i)}\right) & =r(e)^{(i)}, \tilde{r}\left(e^{(i)}\right)=s(e) \quad\left(e^{(i)} \in D\right),
\end{aligned}
$$

(note that if $e \in E^{1}$, then $s(e) \in E^{0} \backslash r\left(E_{w}^{1}\right)$ since the elements of $r\left(E_{w}^{1}\right)$ are sinks). We have divided the rest of the proof into three parts. In Part I we define a homomorphism $\phi: L_{K}(E, w) \rightarrow L_{K}(\tilde{E})$, in Part II we define a homomorphism $\tilde{\phi}: L_{K}(\tilde{E}) \rightarrow L_{K}(E, w)$, and in Part III we show that $\phi$ and $\tilde{\phi}$ are inverse to each other.

## Part I Set

$$
\begin{aligned}
& \alpha_{v}:= \begin{cases}v, & \text { if } v \notin r\left(E_{w}^{1}\right), \\
\sum_{i=1}^{v\left(g^{v}\right)} v^{(i)}, & \text { if } v \in r\left(E_{w}^{1}\right),\end{cases} \\
& \beta_{e, i}:= \begin{cases}e, & \text { if } e \in E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right), i=1, \\
w\left(g^{r(e)}\right) \\
\sum_{j=1}^{(j)} e^{(j)}, & \text { if } e \in E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right), i=1, \\
e^{(1)}, & \text { if } e \in E_{w}^{1}, i=1, \\
\left(e^{(i)}\right)^{*}, & \text { if } e \in E_{w}^{1}, i>1,\end{cases} \\
& \gamma_{e, i}:= \begin{cases}e^{*}, & \text { if } e \in E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right), i=1, \\
w\left(g^{\left(g^{r e)}\right)} \sum_{j=1}^{j}\left(e^{(j)}\right)^{*},\right. & \text { if } e \in E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right), i=1, \\
\left(e^{(1)}\right)^{*}, & \text { if } e \in E_{w}^{1}, i=1, \\
e^{(i)}, & \text { if } e \in E_{w}^{1}, i>1 .\end{cases}
\end{aligned}
$$

In order to show that $X:=\left\{\alpha_{v}, \beta_{e, i}, \gamma_{e_{i}} \mid v \in E^{0}, e \in E^{1}, 1 \leq i \leq w(e)\right\}$ is an $(E, w)$-family in $L_{K}(\tilde{E})$, one has to show that the relations (i)-(iv) in Remark 9 are satisfied. We leave (i) and (ii) to the reader and show (iii) and (iv).
First we check (iii). Let $v \in E^{0}$ and $e, f \in s^{-1}(v)$. We have to show that $\sum_{1 \leq i \leq w(v)} \gamma_{e, i} \beta_{f, i}=\delta_{e f} \alpha_{r(e)}$.
Case 1 Assume that $e, f \in E_{u w}^{1}$.

Case 1.1 Assume that $r(e), r(f) \notin r\left(E_{w}^{1}\right)$. Then

$$
\sum_{1 \leq i \leq w(v)} \gamma_{e, i} \beta_{f, i}=e^{*} f=\delta_{e f} \tilde{r}(e)=\delta_{e f} r(e)=\delta_{e f} \alpha_{r(e)}
$$

Case 1.2 Assume that $r(e) \notin r\left(E_{w}^{1}\right)$ and $r(f) \in r\left(E_{w}^{1}\right)$. Then

$$
\sum_{1 \leq i \leq w(v)} \gamma_{e, i} \beta_{f, i}=e^{*} \sum_{j=1}^{w\left(g^{r(f)}\right)} f^{(j)}=\sum_{j=1}^{w\left(g^{r(f)}\right)} e^{*} f^{(j)}=0=\delta_{e f} \alpha_{r(e)}
$$

Case 1.3 Assume that $r(e) \in r\left(E_{w}^{1}\right)$ and $r(f) \notin r\left(E_{w}^{1}\right)$. Then

$$
\sum_{1 \leq i \leq w(v)} \gamma_{e, i} \beta_{f, i}=\sum_{j=1}^{w\left(g^{r(e)}\right)}\left(e^{(j)}\right)^{*} f=0=\delta_{e f} \alpha_{r(e)}
$$

Case 1.4 Assume that $r(e), r(f) \in r\left(E_{w}^{1}\right)$. Then

$$
\sum_{1 \leq i \leq w(v)} \gamma_{e, i} \beta_{f, i}=\sum_{j=1}^{w\left(g^{r(e)}\right)}\left(e^{(j)}\right)^{*} \sum_{k=1}^{w\left(g^{r(f)}\right)} f^{(k)}=\sum_{j=1}^{w\left(g^{r(e)}\right)} \sum_{k=1}^{w\left(g^{r(f)}\right)}\left(e^{(j)}\right)^{*} f^{(k)}=\delta_{e f} \sum_{j=1}^{w\left(g^{r(e)}\right)} r(e)^{(j)}=\delta_{e f} \alpha_{r(e)}
$$

Case 2 Assume that $e \in E_{u w}^{1}$ and $f \in E_{w}^{1}$.
Case 2.1 Assume that $r(e) \notin r\left(E_{w}^{1}\right)$. Then

$$
\sum_{1 \leq i \leq w(v)} \gamma_{e, i} \beta_{f, i}=e^{*} f^{(1)}=0=\delta_{e f} \alpha_{r(e)}
$$

Case 2.2 Assume that $r(e) \in r\left(E_{w}^{1}\right)$. Then

$$
\sum_{1 \leq i \leq w(v)} \gamma_{e, i} \beta_{f, i}=\sum_{j=1}^{w\left(g^{r(e)}\right)}\left(e^{(j)}\right)^{*} f^{(1)}=0=\delta_{e f} \alpha_{r(e)}
$$

Case 3 Assume that $e \in E_{w}^{1}$ and $f \in E_{u w}^{1}$. This case is similar to Case 2 and therefore is ommitted.
Case 4 Assume that $e, f \in E_{w}^{1}$. Since no vertex emits two distinct weighted edges in $(E, w)$, it follows that $e=f$ and $w(v)=w(e)$. Clearly

$$
\sum_{1 \leq i \leq w(v)} \gamma_{e, i} \beta_{f, i}=\left(e^{(1)}\right)^{*} e^{(1)}+\sum_{j=2}^{w(e)} e^{(j)}\left(e^{(j)}\right)^{*}=r(e)^{(1)}+\sum_{j=2}^{w(e)} r(e)^{(j)}=\delta_{e f} \alpha_{r(e)}
$$

(note that $e^{(j)}$ is the only edge emitted by $r(e)^{(j)}$ in $\left.\tilde{E}\right)$.

Thus (iii) holds.
Next we check (iv). Let $v \in E^{0}$ and $1 \leq i, j \leq w(v)$. Note that the existence of $i, j$ with the property $1 \leq i, j \leq w(v)$ implies that $w(v) \geq 1$, i.e. that $v$ is not a $\operatorname{sink}$ in $(E, w)$. It follows that $v \in E^{0} \backslash r\left(E_{w}^{1}\right)$. We have to show that $\sum_{e \in s^{-1}(v)} \beta_{e, i} \gamma_{e, j}=\delta_{i j} \alpha_{v}$.

Case (a) Assume that $i=j=1$. Clearly

$$
\begin{aligned}
& \sum_{e \in s^{-1}(v)} \beta_{e, 1} \gamma_{e, 1} \\
& =\sum_{\substack{e \in s^{-1}(v) \cap E_{1}^{1} \\
r(e) \notin r\left(E_{w}^{1 w}\right)}} \beta_{e, 1} \gamma_{e, 1}+\sum_{\substack{e \in s^{-1}(v) \cap E_{1}^{1} \\
r(e) \in r\left(E_{w}^{1 u w}\right)}} \beta_{e, 1} \gamma_{e, 1}+\sum_{\substack{ \\
s^{-1}(v) \cap E_{w}^{1}}} \beta_{e, 1} \gamma_{e, 1} \\
& =\sum_{\substack{e \in s^{-1}(v) \cap E_{1 w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)}} e e^{*}+\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1} \\
r(e) \in r\left(E_{w}^{1}\right)}} \sum_{j=1}^{w\left(g^{r(e)}\right)} e^{(j)} \sum_{k=1}^{w\left(g^{r(e)}\right)}\left(e^{(k)}\right)^{*}+\sum_{e \in s^{-1}(v) \cap E_{w}^{1}} e^{(1)}\left(e^{(1)}\right)^{*} \\
& =\underbrace{\sum_{\substack{e \in s^{-1}(v) \cap E_{1 u}^{1} \\
r(e) \notin r\left(E_{w}^{1}\right)}} e e^{*}+\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1} \\
r(e) \in r\left(E_{w}^{1}\right)}} \sum_{j, k=1}^{w\left(g^{r(e)}\right)} e^{(j)}\left(e^{(k)}\right)^{*}+\sum_{e \in s^{-1}(v) \cap E_{w}^{1}} e^{(1)}\left(e^{(1)}\right)^{*}}_{T_{1}:=} .
\end{aligned}
$$

Since $\tilde{r}\left(e^{(j)}\right)=r(e)^{(j)}$ for any $e \in E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right)$, we have $e^{(j)}\left(e^{(k)}\right)^{*}=0$ in $L_{K}(\tilde{E})$ whenever $j \neq k$. Hence

$$
T_{1}=\underbrace{}_{T_{2}:=} \sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)}} e e^{*}+\sum_{\substack{e \in s^{-1}(v) \cap E_{1 w}^{1}, r(e) \in r\left(E_{w}^{1}\right)}} \sum_{j=1}^{w\left(g^{r(e)}\right)} e^{(j)}\left(e^{(j)}\right)^{*}+\sum_{\substack{ \\e \in s^{-1}(v) \cap E_{w}^{1}}} e^{(1)}\left(e^{(1)}\right)^{*} .
$$

One checks easily that

$$
\begin{aligned}
\tilde{s}^{-1}(v)= & \left\{e \mid e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)\right\} \\
& \sqcup\left\{e^{(j)} \mid e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right), 1 \leq j \leq w\left(g^{r(e)}\right)\right\} \\
& \sqcup\left\{e^{(1)} \mid e \in s^{-1}(v) \cap E_{w}^{1}\right\} .
\end{aligned}
$$

Hence $T_{2}=v=\delta_{11} \alpha_{v}$.
Case (b) Assume that $i=1$ and $j>1$. Then $w(v) \geq j>1$ and hence $v$ emits precisely one weighted edge $f$. Since $\gamma_{e, j}=0$ whenever $j \geq w(e)$, we have

$$
\sum_{e \in s^{-1}(v)} \beta_{e, 1} \gamma_{e, j}=\beta_{f, 1} \gamma_{f, j}=f^{(1)} f^{(j)}=0=\delta_{1 j} \alpha_{v}
$$

(note that $\left.\tilde{r}\left(f^{(1)}\right)=r(f)^{(1)} \neq r(f)^{(j)}=\tilde{s}\left(f^{(j)}\right)\right)$.
Case (c) Assume that $i>1$ and $j=1$. Then $v$ emits precisely one weighted edge $f$. Clearly

$$
\sum_{e \in s^{-1}(v)} \beta_{e, i} \gamma_{e, 1}=\beta_{f, i} \gamma_{f, 1}=\left(f^{(i)}\right)^{*}\left(f^{(1)}\right)^{*}=0=\delta_{i 1} \alpha_{v}
$$

(note that $\left.\tilde{s}\left(f^{(i)}\right)=r(f)^{(i)} \neq r(f)^{(1)}=\tilde{r}\left(f^{(1)}\right)\right)$.
Case (d) Assume that $i, j>1$. Then $v$ emits precisely one weighted edge $f$. Clearly

$$
\sum_{e \in s^{-1}(v)} \beta_{e, i} \gamma_{e, j}=\beta_{f, i} \gamma_{f, j}=\left(f^{(i)}\right)^{*} f^{(j)}=\delta_{i j} \tilde{r}\left(f^{(i)}\right)=\delta_{i j} v=\delta_{i j} \alpha_{v} .
$$

Thus (iv) holds too and hence $X$ is an $(E, w)$-family in $L_{K}(\tilde{E})$. By the Universal Property of $L_{K}(E, w)$ there is a unique $K$-algebra homomorphism $\phi: L_{K}(E, w) \rightarrow L_{K}(\tilde{E})$ such that $\phi(v)=\alpha_{v}, \phi\left(e_{i}\right)=\beta_{e, i}$ and $\phi\left(e_{i}^{*}\right)=\gamma_{e, i}$ for all $v \in E^{0}, e \in E^{1}$ and $1 \leq i \leq w(e)$.

## Part II Set

$$
\begin{aligned}
& \tilde{\alpha}_{\tilde{v}}:= \begin{cases}v, & \text { if } \tilde{v}=v \in M, \\
\left(g_{i}^{v}\right)^{*} g_{i}^{v}, & \text { if } \tilde{v}=v^{(i)} \in N,\end{cases} \\
& \tilde{\beta}_{\tilde{e}}:= \begin{cases}e_{1}, & \text { if } \tilde{e}=e \in A, \\
e_{1}\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)}, & \text { if } \tilde{e}=e^{(i)} \in B, \\
e_{1}, & \text { if } \tilde{e}=e^{(1)} \in C, \\
e_{i}^{*}, & \text { if } \tilde{e}=e^{(i)} \in D,\end{cases} \\
& \tilde{\gamma}_{\tilde{e}}:= \begin{cases}e_{1}^{*}, & \text { if } \tilde{e}=e \in A, \\
\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)} e_{1}^{*}, & \text { if } \tilde{e}=e^{(i)} \in B, \\
e_{1}^{*}, & \text { if } \tilde{e}=e^{(1)} \in C, \\
e_{i}, & \text { if } \tilde{e}=e^{(i)} \in D .\end{cases}
\end{aligned}
$$

In order to show that $\tilde{X}:=\left\{\tilde{\alpha}_{\tilde{v}}, \tilde{\beta}_{\tilde{e}}, \tilde{\gamma}_{\tilde{e}} \mid \tilde{v} \in \tilde{E}^{0}, \tilde{e} \in \tilde{E}^{1}\right\}$ is an $\tilde{E}$-family in $L_{K}(E, w)$, one has to show that the relations (i)-(iv) in Remark 4 are satisfied. We leave (i) and (ii) to the reader and show (iii) and (iv). First we check (iii). Let $\tilde{v} \in \tilde{E}^{0}$ and $\tilde{e}, \tilde{f} \in \tilde{s}^{-1}(\tilde{v})$. We have to show that $\tilde{\gamma}_{\tilde{e}} \tilde{\beta}_{\tilde{f}}=\delta_{\tilde{e} \tilde{f}} \tilde{\alpha}_{\tilde{r}(\tilde{e})}$.
Case 1 Assume that $\tilde{v} \in M$. Then $\tilde{e}, \tilde{f} \in A \cup B \cup C$ since $\tilde{s}^{-1}(D) \subseteq N$.
Case 1.1 Assume that $\tilde{e}, \tilde{f} \in A$. Then there are $e, f \in E_{u w}^{1}, r(e), r(f) \notin r\left(E_{w}^{1}\right)$ such that $\tilde{e}=e$ and $\tilde{f}=f$. Clearly $\tilde{\gamma}_{\tilde{e}} \tilde{\beta}_{\tilde{f}}=e_{1}^{*} f_{1}=\delta_{e f} r(e)=\delta_{\tilde{e} \tilde{f}} \tilde{\tilde{r}}_{\tilde{r}(\tilde{e})}$.

Case 1.2 Assume that $\tilde{e} \in A$ and $\tilde{f} \in B$. Then there is an $e \in E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)$ such that $\tilde{e}=e$. Moreover, there is an $f \in E_{u w}^{1}, r(f) \in r\left(E_{w}^{1}\right)$ and an $1 \leq i \leq w\left(g^{r(f)}\right)$ such that $\tilde{f}=f^{(i)}$. Clearly $e \neq f$ and $\tilde{e} \neq \tilde{f}$. Hence $\tilde{\gamma}_{\tilde{e}} \tilde{\beta}_{\tilde{f}}=e_{1}^{*} f_{1}\left(g_{i}^{r(f)}\right)^{*} g_{i}^{r(f)}=\delta_{e f}\left(g_{i}^{r(f)}\right)^{*} g_{i}^{r(f)}=0=\delta_{\tilde{e} \tilde{f}} \tilde{\tilde{r}}_{\tilde{r}(\tilde{e})}$.
Case 1.3 Assume that $\tilde{e} \in A$ and $\tilde{f} \in C$. Then there is an $e \in E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)$ such that $\tilde{e}=e$. Moreover, there is an $f \in E_{w}^{1}$ such that $\tilde{f}=f^{(1)}$. Clearly $e \neq f$ and $\tilde{e} \neq \tilde{f}$. Hence $\tilde{\gamma}_{\tilde{e}} \tilde{\beta}_{\tilde{f}}=$ $e_{1}^{*} f_{1}=\delta_{e f} r(e)=0=\delta_{\tilde{e} \tilde{f}} \tilde{q}_{\tilde{r}(\tilde{e})}$.
Case 1.4 Assume that $\tilde{e} \in B$ and $\tilde{f} \in A$. Then there is an $e \in E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right)$ and an $1 \leq i \leq w\left(g^{r(e)}\right)$ such that $\tilde{e}=e^{(i)}$. Moreover, there there is an $f \in E_{u w}^{1}, r(f) \notin r\left(E_{w}^{1}\right)$ such that $\tilde{f}=f$. Clearly $e \neq f$ and $\tilde{e} \neq \tilde{f}$. Hence $\tilde{\gamma}_{\tilde{e}} \tilde{\beta}_{\tilde{f}}=\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)} e_{1}^{*} f_{1}=\delta_{e f}\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)}=0=\delta_{\tilde{e} \tilde{f}} \tilde{\tilde{r}}_{\tilde{r}(\tilde{e})}$.
Case 1.5 Assume that $\tilde{e}, \tilde{f} \in B$. Then there are $e, f \in E_{u w}^{1}, r(e), r(f) \in r\left(E_{w}^{1}\right)$ and $1 \leq i \leq w\left(g^{r(e)}\right), 1 \leq$ $j \leq w\left(g^{r(f)}\right)$ such that $\tilde{e}=e^{(i)}$ and $\tilde{f}=f^{(j)}$. Clearly $\tilde{\gamma}_{\tilde{e}} \tilde{\beta}_{\tilde{f}}=\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)} e_{1}^{*} f_{1}\left(g_{j}^{r(f)}\right)^{*} g_{j}^{r(f)}=$ $\delta_{e f}\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)}\left(g_{j}^{r(f)}\right)^{*} g_{j}^{r(f)}=\delta_{e f} \delta_{i j}\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)}=\delta_{\tilde{e} \tilde{f}} \tilde{\alpha}_{\tilde{r}(\tilde{e})}$.
Case 1.6 Assume that $\tilde{e} \in B$ and $\tilde{f} \in C$. Then there is an $e \in E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right)$ and a $1 \leq i \leq w\left(g^{r(e)}\right)$ such that $\tilde{e}=e^{(i)}$. Moreover, there is an $f \in E_{w}^{1}$ such that $\tilde{f}=f^{(1)}$. Clearly $e \neq f$ and $\tilde{e} \neq \tilde{f}$. Hence $\tilde{\gamma}_{\tilde{e}} \tilde{\beta}_{\tilde{f}}=\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)} e_{1}^{*} f_{1}=\delta_{e f}\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)}=0=\delta_{\tilde{e} \tilde{f}} \tilde{\alpha}_{\tilde{r}(\tilde{e})}$.
Case 1.7 Assume that $\tilde{e} \in C$ and $\tilde{f} \in A$. Then there is an $e \in E_{w}^{1}$ such that $\tilde{e}=e^{(1)}$. Moreover, there is an $f \in E_{u w}^{1}, r(f) \notin r\left(E_{w}^{1}\right)$ such that $\tilde{f}=f$. Clearly $e \neq f$ and $\tilde{e} \neq \tilde{f}$. Hence $\tilde{\gamma}_{\tilde{e}} \tilde{\beta}_{\tilde{f}}=e_{1}^{*} f_{1}=\delta_{e f} r(e)=0=\delta_{\tilde{e} \tilde{f}} \tilde{f}_{\tilde{r}(\tilde{e})}$.
Case 1.8 Assume that $\tilde{e} \in C$ and $\tilde{f} \in B$. Then there is an $e \in E_{w}^{1}$ such that $\tilde{e}=e^{(1)}$. Moreover, there is an $f \in E_{u w}^{1}, r(f) \in r\left(E_{w}^{1}\right)$ and an $1 \leq i \leq w\left(g^{r(f)}\right)$ such that $\tilde{f}=f^{(i)}$. Clearly $e \neq f$ and $\tilde{e} \neq \tilde{f}$. Hence $\tilde{\gamma}_{\tilde{e}} \tilde{\beta}_{\tilde{f}}=e_{1}^{*} f_{1}\left(g_{i}^{r(f)}\right)^{*} g_{i}^{r(f)}=\delta_{e f}\left(g_{i}^{r(f)}\right)^{*} g_{i}^{r(f)}=0=\delta_{\tilde{e} \tilde{f}} \tilde{\tilde{r}}_{\tilde{r}(\tilde{e})}$.

Case 1.9 Assume that $\tilde{e}, \tilde{f} \in C$. Then there are $e, f \in E_{w}^{1}$ such that $\tilde{e}=e^{(1)}$ and $\tilde{f}=f^{(1)}$. Since $s(e)=\tilde{s}\left(e^{(1)}\right)=\tilde{s}(\tilde{e})=\tilde{s}(\tilde{f})=\tilde{s}\left(f^{(1)}\right)=s(f)$, we have $e=f$ (because no vertex in $(E, w)$ emits two distinct weighted edges). It follows that $\tilde{e}=\tilde{f}$. Clearly $\tilde{\gamma}_{\tilde{e}} \tilde{\beta}_{\tilde{f}}=e_{1}^{*} e_{1}=\delta_{\tilde{e} \tilde{f}} \tilde{\alpha}_{\tilde{r}(\tilde{e})}$.
Case 2 Assume that $\tilde{v} \in N$. Then $\tilde{v}=v^{(i)}$ for some $v \in r\left(E_{w}^{1}\right)$ and $1 \leq i \leq w\left(g^{v}\right)$. One checks easily that $\tilde{s}^{-1}(\tilde{v})=\emptyset$ if $i=1$ and $\tilde{s}^{-1}(\tilde{v})=\left\{\left(g^{v}\right)^{(i)}\right\}$ if $i>1$. It follows that $i>1$ and $\tilde{e}=\tilde{f}=\left(g^{v}\right)^{(i)}$. Hence $\tilde{\gamma}_{\hat{e}} \tilde{\beta}_{\tilde{f}}=g_{i}^{v}\left(g_{i}^{v}\right)^{*}=s\left(g^{v}\right)=\delta_{\tilde{e} \tilde{f}} \tilde{\tilde{r}}_{\tilde{r}(\tilde{e})}$.
Thus (iii) holds.
Next we check (iv). Let $\tilde{v} \in \tilde{E}^{0}$ such that $\tilde{s}^{-1}(v) \neq \emptyset$. We have to show that $\sum_{\tilde{e} \in \tilde{s}^{-1}(\tilde{v})} \tilde{\beta}_{\tilde{e}} \tilde{\gamma}_{\tilde{e}}=\tilde{\alpha}_{\tilde{v}}$.
Case (a) Assume that $\tilde{v} \in M$. Then $\tilde{v}=v$ for some $v \in E^{0} \backslash r\left(E_{w}^{1}\right)$. One checks easily that

$$
\begin{aligned}
\tilde{s}^{-1}(\tilde{v})= & \left\{e \mid e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)\right\} \\
& \sqcup\left\{e^{(i)} \mid e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right), 1 \leq i \leq w\left(g^{r(e)}\right)\right\} \\
& \sqcup\left\{e^{(1)} \mid e \in s^{-1}(v) \cap E_{w}^{1}\right\} .
\end{aligned}
$$

Hence

$$
\begin{aligned}
& \sum_{\tilde{e} \in \tilde{s}^{-1}(\tilde{v})} \tilde{\beta}_{\tilde{e}} \tilde{\gamma}_{\tilde{e}} \\
& =\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)}} \tilde{\beta}_{e} \tilde{\gamma}_{e}+\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right)}} \sum_{i=1}^{w\left(g^{r(e)}\right)} \tilde{\beta}_{e^{(i)}} \tilde{\gamma}_{e^{(i)}}+\sum_{e \in s^{-1}(v) \cap E_{w}^{1}} \tilde{\beta}_{e(1)} \tilde{\gamma}_{e^{(1)}} \\
& =\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)}} e_{1} e_{1}^{*}+\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right)}} \sum_{i=1}^{w\left(g^{r(e)}\right)} e_{1}\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)}\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)} e_{1}^{*}+\sum_{e \in s^{-1}(v) \cap E_{w}^{1}} e_{1} e_{1}^{*} \\
& =\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)}} e_{1} e_{1}^{*}+\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right)}} \sum_{i=1}^{w\left(g^{r(e)}\right)} e_{1}\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)} e_{1}^{*}+\sum_{e \in s^{-1}(v) \cap E_{w}^{1}} e_{1} e_{1}^{*} \\
& =\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)}} e_{1} e_{1}^{*}+\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1} \\
r(e) \in r\left(E_{w}^{1}\right)}} e_{1}\left(\sum_{i=1}^{w\left(g^{r(e)}\right)}\left(g_{i}^{r(e)}\right)^{*} g_{i}^{r(e)}\right) e_{1}^{*}+\sum_{e \in s^{-1}(v) \cap E_{w}^{1}} e_{1} e_{1}^{*} \\
& =\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)}} e_{1} e_{1}^{*}+\sum_{\substack{e \in s^{-1}(v) \cap E_{u w}^{1} \\
r(e) \in r\left(E_{w}^{1}\right)}} e_{1} e_{1}^{*}+\sum_{e \in s^{-1}(v) \cap E_{w}^{1}} e_{1} e_{1}^{*} \\
& =v=\tilde{\alpha}_{\tilde{v}} .
\end{aligned}
$$

Case (b) Assume that $\tilde{v} \in N$. Then $\tilde{v}=v^{(i)}$ for some $v \in r\left(E_{w}^{1}\right)$ and $1 \leq i \leq w\left(g^{v}\right)$. As mentioned above we have $\tilde{s}^{-1}(\tilde{v})=\emptyset$ if $i=1$ and $\tilde{s}^{-1}(\tilde{v})=\left\{\left(g^{v}\right)^{(i)}\right\}$ if $i>1$. Since by assumption $\tilde{s}^{-1}(\tilde{v}) \neq \emptyset$, it follows that $i>1$ and $\sum_{\tilde{e} \in \tilde{S}^{-1}(\tilde{v})} \tilde{\beta}_{\tilde{e}} \tilde{\gamma}_{\tilde{e}}=\tilde{\beta}_{\left(g^{v}\right)^{(i)}} \tilde{\gamma}_{\left(g^{v}\right)^{(i)}}=\left(g_{i}^{v}\right)^{*} g_{i}^{v}=\tilde{\alpha}_{\tilde{v}}$.
Thus (iv) holds too and hence $\tilde{X}$ is an $\tilde{E}$-family in $L_{K}(E, w)$. By the Universal Property of $L_{K}(\tilde{E})$ there is a unique $K$-algebra homomorphism $\tilde{\phi}: L_{K}(\tilde{E}) \rightarrow L_{K}(E, w)$ such that $\tilde{\phi}(\tilde{v})=\tilde{\alpha}_{\tilde{v}}, \tilde{\phi}(\tilde{e})=\tilde{\beta}_{\tilde{e}}$ and $\tilde{\phi}\left(\tilde{e}^{*}\right)=\tilde{\gamma}_{\tilde{e}}$ for all $\tilde{v} \in \tilde{E}^{0}$ and $\tilde{e} \in \tilde{E}^{1}$.

Part III First we show that $\tilde{\phi} \circ \phi=\operatorname{id}_{L_{K}(E, w)}$. Clearly it suffices to show that $\tilde{\phi} \circ \phi$ fixes all elements of $\left\{v, e_{i}, e_{i}^{*} \mid v \in E^{0}, e \in E^{1}, 1 \leq i \leq w(e)\right\}$ since these elements generate $L_{K}(E, w)$ as a $K$-algebra. One checks easily that $\tilde{\phi} \circ \phi$ fixes all elements $v, e_{i}, e_{i}^{*}$ where $v \in E^{0}$ and $e \in E_{w}^{1}$ or $e \in E_{u w}^{1}, r(e) \notin r\left(E_{w}^{1}\right)$. Let now $e \in E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right)$. Then

$$
\tilde{\phi}\left(\phi\left(e_{1}\right)\right)=\tilde{\phi}\left(\sum_{j=1}^{w\left(g^{r(e)}\right)} e^{(j)}\right)=\sum_{j=1}^{w\left(g^{r(e)}\right)} e_{1}\left(g_{j}^{r(e)}\right)^{*} g_{j}^{r(e)}=e_{1} \sum_{j=1}^{w\left(g^{r(e)}\right)}\left(g_{j}^{r(e)}\right)^{*} g_{j}^{r(e)}=e_{1} r(e)=e_{1} .
$$

Similarly one can show that $\phi\left(\phi\left(e_{1}^{*}\right)\right)=e_{1}^{*}$ in this case. Hence $\tilde{\phi} \circ \phi=\operatorname{id}_{L_{K}(E, w)}$.
Now we show that $\phi \circ \tilde{\phi}=\operatorname{id}_{L_{K}(\tilde{E})}$. Clearly it suffices to show that $\phi \circ \tilde{\phi}$ fixes all elements of $\left\{\tilde{v}, \tilde{e}, \tilde{e}^{*} \mid \tilde{v} \in\right.$ $\left.\tilde{E}^{0}, \tilde{e} \in \tilde{E}^{1}\right\}$ since these elements generate $L_{K}(\tilde{E})$ as a $K$-algebra. One checks easily that $\phi \circ \tilde{\phi}$ fixes all elements $\tilde{v}, \tilde{e}, \tilde{e}^{*}$ where $\tilde{v} \in \tilde{E}^{0}$ and $\tilde{e} \in \tilde{E}^{1} \backslash B$. Let now $\tilde{e} \in B$. Then $\tilde{e}=e^{(i)}$ for some $e \in E_{u w}^{1}, r(e) \in r\left(E_{w}^{1}\right)$ and $1 \leq i \leq w\left(g^{r(e)}\right)$. Clearly

But $\left(\left(g^{r(e)}\right)^{(1)}\right)^{*}\left(g^{r(e)}\right)^{(1)}=\tilde{r}\left(\left(g^{r(e)}\right)^{(1)}\right)=r\left(g^{r(e)}\right)^{(1)}=r(e)^{(1)}$ in $L_{K}(\tilde{E})$. Since $\tilde{r}\left(e^{(j)}\right)=r(e)^{(j)}$, it follows that $\sum_{j=1}^{w\left(g^{r(e)}\right)} e^{(j)}\left(\left(g^{r(e)}\right)^{(1)}\right)^{*}\left(g^{r(e)}\right)^{(1)}=e^{(1)}=\tilde{e}$ if $i=1$. Now assume that $i>1$. One checks easily that $\tilde{s}^{-1}\left(r(e)^{(i)}\right)=\left\{\left(g^{r(e)}\right)^{(i)}\right\}$. Hence $\left(g^{r(e)}\right)^{(i)}\left(\left(g^{r(e)}\right)^{(i)}\right)^{*}=r(e)^{(i)}$ in $L_{K}(\tilde{E})$. Since $\tilde{r}\left(e^{(j)}\right)=r(e)^{(j)}$, it follows that $\sum_{j=1}^{w\left(g^{r(e)}\right)} e^{(j)}\left(g^{r(e)}\right)^{(i)}\left(\left(g^{r(e)}\right)^{(i)}\right)^{*}=e^{(i)}=\tilde{e}$. Hence we have shown that $\phi(\tilde{\phi}(\tilde{e}))=\tilde{e}$ if $\tilde{e} \in B$. Similarly one can show that $\phi\left(\tilde{\phi}\left(\tilde{e}^{*}\right)\right)=\tilde{e}^{*}$ in this case. Hence $\phi \circ \tilde{\phi}=\operatorname{id}_{L_{K}(\tilde{E})}$ and thus $L_{K}(E, w) \cong L_{K}(\tilde{E})$.
Example 21. Consider the weighted graph
$(E, w):$

Let $\tilde{E}$ be defined as in the proof of Lemma 20. Then $\tilde{E}$ is the graph

The proof of Lemma 20 shows that $L_{K}(E, w) \cong L_{K}(\tilde{E})$.
Lemma 18 and 20 directly imply the theorem below.
Theorem 22. Let $(E, w)$ be a weighted graph that satisfies Condition (LPA). Then the weighted Leavitt path algebra $L_{K}(E, w)$ is isomorphic to an unweighted Leavitt path algebra.

Example 23. Consider the weighted graph
$(E, w):$

which satisfies Condition (LPA), and the graph

By Examples 19 and 21 we have $L_{K}(E, w) \cong L_{K}(\tilde{E})$.

## 6. Abscence of Condition (LPA)

Throughout this subsection $(E, w)$ denotes a weighted graph. We start by recalling the basis result of [7]. Set $X:=\left\{v, e_{i}, e_{i}^{*} \mid v \in E^{0}, e \in E^{1}, 1 \leq i \leq w(e)\right\}$, let $\langle X\rangle$ the set of all nonempty words over $X$ and set $\overline{\langle X\rangle}:=\langle X\rangle \cup\{$ empty word\}. Together with juxtaposition of words $\langle X\rangle$ becomes a semigroup and $\overline{\langle X\rangle}$ a monoid. If $A, B \in \overline{\langle X\rangle}$, then $B$ is called a subword of $A$ if there are $C, D \in \overline{\langle X\rangle}$ such that $A=C B D$ and a suffix of $A$ if there is a $C \in \overline{\langle X\rangle}$ such that $A=C B$.
Definition 24. Let $p=x_{1} \ldots x_{n} \in\langle X\rangle$. Then $p$ is called $a d$-path if either $x_{1}, \ldots, x_{n} \in X \backslash E^{0}$ and $r\left(x_{i}\right)=s\left(x_{i+1}\right)(1 \leq i \leq n-1)$ or $x_{1} \in E^{0}$ and $n=1$. Here we use the convention $s(v):=v, r(v):=v$, $s\left(e_{i}\right):=s(e), r\left(e_{i}\right):=r(e), s\left(e_{i}^{*}\right):=r(e)$ and $r\left(e_{i}^{*}\right):=s(e)$ for any $v \in E^{0}, e \in E^{1}$ and $1 \leq i \leq w(e)$.
Remark 25. Let $\hat{E}$ be the directed graph associated to $(E, w)$ and $\hat{E}_{d}$ the double graph of $\hat{E}$ (see [14, Definitions 2 and 8]). The d-paths are precisely the paths in the double graph $\hat{E}_{d}$.

Fix for any $v \in E^{0}$ such that $s^{-1}(v) \neq \emptyset$ an edge $e^{v} \in s^{-1}(v)$ such that $w\left(e^{v}\right)=w(v)$. The $e^{v}$ 's are called special edges.
Definition 26. The words $e_{i}^{v}\left(e_{j}^{v}\right)^{*}\left(v \in E^{0}, 1 \leq i, j \leq w(v)\right)$ and $e_{1}^{*} f_{1}\left(e, f \in E^{1}\right)$ in $\langle X\rangle$ are called forbidden. A normal d-path or nod-path is a d-path $p$ such that none of its subwords is forbidden.

Let $K\langle X\rangle$ the free $K$-algebra generated by $X$ (i.e. the $K$-vector space with basis $\langle X\rangle$ which becomes a $K$-algebra by linearly extending the juxtaposition of words). Then $L_{K}(E, w)$ is the quotient of $K\langle X\rangle$ by the ideal generated by the relations (i)-(iv) in Definition 6. Let $K\langle X\rangle_{\text {nod }}$ be the linear subspace of $K\langle X\rangle$ spanned by the nod-paths.
Theorem 27 (Hazrat, Preusser, 2017). The canonical map $K\langle X\rangle_{\text {nod }} \rightarrow L_{K}(E, w)$ is an isomorphism of $K$-vector spaces. In particular the images of the nod-paths under this map form a linear basis for $L_{K}(E, w)$.

Proof. See [7, Theorem 16] and its proof.
The following lemma will be used in the proofs of Theorems 29,30,31,32,33,34 and 37.
Key Lemma 28. Suppose that $(E, w)$ does not satisfy Condition (LPA). Then there is a nod-path whose first letter is $e_{2}$ and whose last letter is $e_{2}^{*}$ for some $e \in E_{w}^{1}$.

Proof. [14, Proof of Lemma 35] shows that if one of the Conditions (LPA1), (LPA2) and (LPA3) is not satisfied, then then there is a nod-path whose first letter is $e_{2}$ and whose last letter is $e_{2}^{*}$ for some $e \in E_{w}^{1}$. Assume now that $(E, w)$ does not satisfy Condition (LPA4). Then there is an $e \in E_{w}^{1}$, a path $p$ and a cycle $c$ such that $s(p)=r(e), r(p)=s(c)$ and $e$ does not belong to $c$. Write $c=f^{(1)} \ldots f^{(m)}$ where $f^{(1)}, \ldots, f^{(m)} \in E^{1}$. If $p=r(e)$, then $e_{2} f_{1}^{(1)} \ldots f_{1}^{(m)} e_{2}^{*}$ is a nod-path (since $f^{(m)} \neq e$ ). Now assume that $p=g^{(1)} \ldots g^{(n)}$ where $g^{(1)}, \ldots, g^{(n)} \in E^{1}$. Clearly we assume that no letter of $p$ is a letter of $c$. One checks easily that $e_{2} g_{1}^{(1)} \ldots g_{1}^{(n)} f_{1}^{(1)} \ldots f_{1}^{(m)}\left(g_{1}^{(n)}\right)^{*} \ldots\left(g_{1}^{(1)}\right)^{*} e_{2}^{*}$ is a nod-path (note that $\left.f^{(m)} \neq g^{(n)}\right)$.
Theorem 29. Suppose that $(E, w)$ does not satisfy Condition (LPA). Then $L_{K}(E, w)$ is neither simple nor graded simple.

Proof. By Lemma 28, there is a nod-path $p$ whose first letter is $e_{2}$ and whose last letter is $e_{2}^{*}$ for some $e \in E_{w}^{1}$. One checks easily that the ideal $I$ generated by $p$ equals the linear span of all nod-paths that contain $p$ as a subword (note that $e_{2}$ is not the second letter of a forbidden word and $e_{2}^{*}$ not the first letter of a forbidden word). It follows that $I$ is a proper ideal of $L_{K}(E, w)$ (it is not the zero ideal since it contains the basis element $p$ and it is not equal to $L_{K}(E, w)$ since it does not contain any vertex). Since $I$ is generated by a homogeneous element, it is a graded ideal.

Recall that a group graded $K$-algebra $A=\underset{g \in G}{ } A_{g}$ is called locally finite if $\operatorname{dim}_{K} A_{g}<\infty$ for every $g \in G$.
Theorem 30. Suppose that $(E, w)$ does not satisfy Condition (LPA). Then $L_{K}(E, w)$ is not locally finite.
Proof. By Lemma 28, there is a nod-path $p=x_{1} \ldots x_{n}$ such that $x_{1}=e_{2}$ and $x_{n}=e_{2}^{*}$ for some $e \in E_{w}^{1}$. Set $p^{*}:=x_{n}^{*} \ldots x_{1}^{*}\left(\right.$ where $\left(f_{i}^{*}\right)^{*}=f_{i}$ for any $f \in E^{1}$ and $\left.1 \leq i \leq w(f)\right)$. One checks easily that for any $n \in \mathbb{N}$, $\left(p p^{*}\right)^{n}$ is a nod-path that lies in the homogeneous 0 -component $L_{K}(E, w)_{0}$. It follows from Theorem 27 that $\operatorname{dim}_{K}\left(L_{K}(E, w)_{0}\right)=\infty$.

Theorem 31. Suppose that $(E, w)$ does not satisfy Condition (LPA). Then $L_{K}(E, w)$ is not Noetherian.
Proof. By Lemma 28, there is a nod-path $p$ whose first letter is $e_{2}$ and whose last letter is $e_{2}^{*}$ for some $e \in E_{w}^{1}$. Let $q$ be the nod-path one gets by replacing the first letter of $p$ by $e_{1}$. For any $n \in \mathbb{N}$ let $I_{n}$ be the left ideal generated by the nod-paths $p, p q, \ldots, p q^{n}$. One checks easily that $I_{n}$ equals the linear span of all nod-paths $o$ such that one of the words $p, p q, \ldots, p q^{n}$ is a suffix of $o$. It follows that $I_{n} \subsetneq I_{n+1}$ (clearly none of the words $p, p q, \ldots, p q^{n}$ is a suffix of $p q^{n+1}$ since $p$ and $q$ have the same length but are distinct; hence $p q^{n+1} \notin I_{n}$ ).
Theorem 32. Suppose that $(E, w)$ does not satisfy Condition (LPA). Then $L_{K}(E, w)$ is not Artinian.
Proof. By Lemma 28, there is a nod-path $p$ whose first letter is $e_{2}$ and whose last letter is $e_{2}^{*}$ for some $e \in E_{w}^{1}$. For any $n \in \mathbb{N}$ let $I_{n}$ be the left ideal generated by $p^{n}$. One checks easily that $I_{n}$ equals the linear span of all nod-paths $o$ such that $p^{n}$ is a suffix of $o$. Hence $I_{n} \supsetneq I_{n+1}$ (clearly $p^{n+1}$ is not a suffix of $p^{n}$ and hence $\left.p^{n} \notin I_{n+1}\right)$.

Theorem 33. Suppose that $(E, w)$ does not satisfy Condition (LPA). Then $L_{K}(E, w)$ is not von Neumann regular.

Proof. By Lemma 28, there is a nod-path $p$ whose first letter is $e_{2}$ and whose last letter is $e_{2}^{*}$ for some $e \in E_{w}^{1}$. One checks easily that for any $x \in L_{K}(E, w), p x p$ is a linear combination of nod-paths of length $\geq 2|p|$. Hence the equation $p x p=p$ has no solution $x \in L_{K}(E, w)$.

We recall some general facts on the growth of algebras. Let $A \neq\{0\}$ be a finitely generated $K$-algebra. Let $V$ be a finite-dimensional generating subspace of $A$, i.e. a finite-dimensional subspace of $A$ that generates
$A$ as a $K$-algebra. For $n \geq 1$ let $V^{n}$ denote the linear span of the set $\left\{v_{1} \ldots v_{k} \mid k \leq n, v_{1}, \ldots, v_{k} \in V\right\}$. Then

$$
V=V^{1} \subseteq V^{2} \subseteq V^{3} \subseteq \ldots, \quad A=\bigcup_{n \in \mathbb{N}} V^{n} \text { and } d_{V}(n):=\operatorname{dim} V^{n}<\infty
$$

Given functions $f, g: \mathbb{N} \rightarrow \mathbb{R}^{+}$, we write $f \preccurlyeq g$ if there is a $c \in \mathbb{N}$ such that $f(n) \leq c g(c n)$ for all $n$. If $f \preccurlyeq g$ and $g \preccurlyeq f$, then the functions $f, g$ are called asymptotically equivalent and we write $f \sim g$. If $W$ is another finite-dimensional generating subspace of $A$, then $d_{V} \sim d_{W}$. The Gelfand-Kirillov dimension or GK dimension of $A$ is defined as

$$
\operatorname{GK} \operatorname{dim} A:=\limsup _{n \rightarrow \infty} \log _{n} d_{V}(n)
$$

The definition of the GK dimension does not depend on the choice of the finite-dimensional generating subspace $V$. If $d_{V} \preccurlyeq n^{m}$ for some $m \in \mathbb{N}$, then $A$ is said to have polynomial growth and we have GKdim $A \leq m$. If $d_{V} \sim a^{n}$ for some real number $a>1$, then $A$ is said to have exponential growth and we have $\operatorname{GK} \operatorname{dim} A=\infty$. If $A$ does not happen to be finitely generated over $K$, then the GK dimension of $A$ is defined as

$$
\operatorname{GKdim}(A):=\sup \{\operatorname{GKdim}(B) \mid B \text { is a finitely generated subalgebra of } A\} .
$$

For the algebra $A=\{0\}$ we set GKdim $A:=0$.
Theorem 34. Suppose that $(E, w)$ does not satisfy Condition (LPA). Then $\operatorname{GKdim}\left(L_{K}(E, w)\right)=\infty$.
Proof. Suppose first that $(E, w)$ is finite (in our setting that means that $E^{0}$ is a finite set). By Lemma 28, there is a nod-path $p$ in $(E, w)$ whose first letter is $e_{2}$ and whose last letter is $e_{2}^{*}$ for some $e \in E_{w}^{1}$. Let $q$ be the nod-path one gets by replacing the first letter of $p$ by $e_{1}$. Let $n \in \mathbb{N}$. Consider the nod-paths

$$
\begin{equation*}
p^{i_{1}} q^{i_{2}} \ldots p^{i_{k-1}} q^{i_{k}}(k \text { even }), \text { and } p^{i_{1}} q^{i_{2}} \ldots p^{i_{k-2}} q^{i_{k-1}} p^{i_{k}}(k \text { odd }) \tag{1}
\end{equation*}
$$

where $k, i_{1}, \ldots, i_{k} \in \mathbb{N}$ satisfy

$$
\begin{equation*}
\left(i_{1}+\cdots+i_{k}\right)|p| \leq n \tag{2}
\end{equation*}
$$

Clearly different solutions $\left(k, i_{1}, \ldots, i_{k}\right)$ and ( $k^{\prime}, i_{1}^{\prime}, \ldots, i_{k^{\prime}}^{\prime}$ ) of inequality (2) correspond to different nodpaths in (1) since $|p|=|q|$. Let $V$ denote the finite-dimensional subspace of $L_{K}(E, w)$ spanned by $\left\{v, f_{i}, f_{i}^{*} \mid\right.$ $\left.v \in E^{0}, f \in E_{1}, 1 \leq i \leq w(f)\right\}$. By Theorem 27 the nod-paths in (1) are linearly independent in $V^{n}$. The number of solutions of $(2)$ is $\sim 2^{n}$ and hence $L_{K}(E, w)$ has exponential growth.
Now suppose that $(E, w)$ is not finite. One checks easily that there is a finite complete weighted subgraph $(\tilde{E}, \tilde{w})$ of $(E, w)$ that does not satisfy Condition (LPA) (see [6, p. 884 and Proof of Lemma 5.19]). By the previous paragraph $L_{K}(\tilde{E}, \tilde{w})$ has exponential growth. Clearly the inclusion $(\tilde{E}, \tilde{w}) \hookrightarrow(E, w)$ induces an algebra monomorphism $L_{K}(\tilde{E}, \tilde{w}) \rightarrow L_{K}(E, w)$ since one can choose the special edges such that distinct nod-paths are mapped to distinct nod-paths. Hence $L_{K}(E, w)$ has a finitely generated subalgebra with exponential growth. It follows from the definition of the GK dimension that GKdim $L_{K}(E, w)=\infty$.

The main result of this section is Theorem 37. In order to prove it we need two lemmas.
Lemma 35. Let $p$ be a nod-path starting with $e_{2}$ and ending with $e_{2}^{*}$ for some $e \in E_{w}^{1}$. Then the ideal I of $L_{K}(E, w)$ generated by $p$ contains no nonzero idempotent.

Proof. For a nod-path $q=x_{1} \ldots x_{n}$ define $m(q)$ as the largest nonnegative integer $m$ such that there are indices $i_{1}, \ldots, i_{m} \in\{1, \ldots, n\}$ such that $i_{j}+|p|-1<i_{j+1}(1 \leq j \leq m-1), i_{m}+|p|-1 \leq n$ and $x_{i_{j}} \ldots x_{i_{j}+|p|-1}=p(1 \leq j \leq m)$. Hence $m(q)$ is maximal with the property that $q$ contains $m(q)$ not overlapping copies of $p$.
Now let $a \in I \backslash\{0\}$. By Theorem 27 we can write $a=\sum_{r=1}^{t} k_{r} q_{r}$ where $k_{1}, \ldots, k_{t} \in K \backslash\{0\}$ and $q_{1}, \ldots, q_{t}$ are pairwise distinct nod-paths. Clearly $m\left(q_{r}\right) \geq 1$ for any $1 \leq r \leq t$, since $I$ consists of all linear combinations of nod-paths containing $p$ as a subword. It easy to show, using the fact that $e_{2}$ is not the second letter of a forbidden word and $e_{2}^{*}$ not the first letter of a forbidden word, that for any $1 \leq r, s \leq t$
the product $q_{r} q_{s}$ is a linear combination of nod-paths $o$ such that $m(o) \geq m\left(q_{r}\right)+m\left(q_{s}\right)$ (cf. [7, Proof of Proposition 40]). It follows that $a^{2}=\sum_{r, s=1}^{t} k_{r} k_{s} q_{r} q_{s}$ is a linear combination of nod-paths $o$ such that $m(o) \geq 2 m\left(q_{r_{\min }}\right)>m\left(q_{r_{\text {min }}}\right)$ where $1 \leq r_{\min } \leq t$ is chosen such that $m\left(q_{r_{\min }}\right)$ is minimal. Hence $a^{2}$ is a linear combination of nod-paths none of which equals $q_{r_{\min }}$. Thus $a^{2}$ cannot be equal to $a$.

If $\Lambda$ is an infinite set and $S$ is a unital ring, then we denote by $M_{\Lambda}(S)$ the $K$-algebra consisting of all square matrices $M$, with rows and columns indexed by $\Lambda$, with entries from $S$, for which there are at most finitely many nonzero entries in $M$ (cf. [2, Notation 2.6.3]).

Lemma 36. Let $\Lambda$ be an infinite set and $S$ a left Noetherian, unital ring. Let $I_{1} \subseteq I_{2} \subseteq \ldots$ be an ascending chain of left ideals of $M_{\Lambda}(S)$. Suppose there is a finite subset $\Lambda^{\text {fin }}$ of $\Lambda$ such that $\sigma_{\lambda \mu}=0$ for any $n \in \mathbb{N}$, $\sigma \in I_{n}, \lambda \in \Lambda$ and $\mu \in \Lambda \backslash \Lambda^{\mathrm{fin}}$. Then the chain $I_{1} \subseteq I_{2} \subseteq \ldots$ eventually stabilises.

Proof. Write $\Lambda^{\text {fin }}=\left\{\lambda_{1}, \ldots, \lambda_{m}\right\}$. Fix a $\tau \in \Lambda$. For any $n \in \mathbb{N}$, let $N_{n}$ be the left $S$-submodule of $S^{m}$ consisting of all row vectors $\left(\sigma_{\tau \lambda_{1}}, \ldots, \sigma_{\tau \lambda_{m}}\right)$ where $\sigma$ varies over all matrices in $I_{n}$. Then $I_{n}$ equals the set of all matrices $\sigma \in M_{\Lambda}(S)$ such that $\sigma_{\lambda \mu}=0$ for any $\lambda \in \Lambda, \mu \in \Lambda \backslash \Lambda^{\text {fin }}$ and $\left(\sigma_{\lambda \lambda_{1}}, \ldots, \sigma_{\lambda \lambda_{m}}\right) \in N_{n}$ for any $\lambda \in \Lambda$. Since $S$ is a left Noetherian ring, $S^{m}$ is a Noetherian module. It follows that the chain $N_{1} \subseteq N_{2} \subseteq \ldots$ eventually stabilises and thus the chain $I_{1} \subseteq I_{2} \subseteq \ldots$ eventually stabilises.

Theorem 37. Suppose that $(E, w)$ does not satisfy Condition (LPA). Then $L_{K}(E, w)$ is not isomorphic to an unweighted Leavitt path algebra.

Proof. Assume there is a graph $F$ and an isomorphism $\phi: L_{K}(E, w) \rightarrow L_{K}(F)$. By Lemma 28, there is a nod-path $p$ whose first letter is $e_{2}$ and whose last letter is $e_{2}^{*}$ for some $e \in E_{w}^{1}$. Let $q$ be the nod-path one gets by replacing the last letter of $p$ by $e_{1}^{*}$. By Lemma 35 , the ideal $I$ of $L_{K}(E, w)$ generated by $p$ contains no nonzero idempotent. Similarly, for any $n \in \mathbb{N}$, the ideal $I_{n}$ of $L_{K}(E, w)$ generated by $q p^{n}$ contains no nonzero idempotent. It follows from [2, Proposition 2.7.9], that $\phi(I), \phi\left(I_{n}\right) \subseteq I\left(P_{c}(F)\right)(n \in \mathbb{N})$ where $I\left(P_{c}(F)\right)$ is the ideal of $L_{K}(F)$ generated by all vertices in $F^{0}$ which belong to a cycle without an exit. It follows that $\phi(p), \phi\left(q p^{n}\right) \in I\left(P_{c}(F)\right)(n \in \mathbb{N})$. By [2, Theorem 2.7.3] we have

$$
\begin{equation*}
I\left(P_{c}(F)\right) \cong \bigoplus_{i \in \Gamma} M_{\Lambda_{i}}\left(K\left[x, x^{-1}\right]\right) \tag{3}
\end{equation*}
$$

as a $K$-algebra. The sets $\Gamma$ and $\Lambda_{i}(i \in \Gamma)$ in (3) might be infinite if $F$ is not finite.
It follows from the previous paragraph that there is a subalgebra $A$ of $L_{K}(E, w)$ such that $p, q p^{n} \in A(n \in \mathbb{N})$ and $A \cong \bigoplus_{i \in \Gamma} M_{\Lambda_{i}}\left(K\left[x, x^{-1}\right]\right)$. For any $n \in \mathbb{N}$ let $J_{n}$ be the left ideal of $A$ generated by $q p^{2}, \ldots, q p^{n+1}$. Then $J_{n}$ is contained in the linear span of all nod-paths $o$ such that one of the words $q p^{2}, \ldots, q p^{n+1}$ is a suffix of $o$. It follows that $J_{n} \subsetneq J_{n+1}$ (clearly none of the words $q p^{2}, \ldots, q p^{n+1}$ is a suffix of $q p^{n+2}$ since $p$ and $q$ have the same length but are distinct). If the sets $\Gamma$ and $\Lambda_{i}(i \in \Gamma)$ are finite, then we already have a contradiction since it is well-known that $\bigoplus_{i \in \Gamma} M_{\Lambda_{i}}\left(K\left[x, x^{-1}\right]\right)$ is Noetherian in this case. Hence the next two paragraphs are only needed if one of the sets $\Gamma$ and $\Lambda_{i}(i \in \Gamma)$ is infinite.
If $a \in A$, then we identify $a$ with its image in $\bigoplus_{i \in \Gamma} M_{\Lambda_{i}}\left(K\left[x, x^{-1}\right]\right)$ and write $a_{i}$ for the $i$-th component of $a$. Set $\Gamma^{\mathrm{fin}}:=\left\{i \in \Gamma \mid p_{i} \neq 0\right\}$. Then $\Gamma^{\mathrm{fin}}$ is a finite subset of $\Gamma$. Clearly $\left(q p^{n}\right)_{i}=0$ for any $i \in \Gamma \backslash \Gamma^{\mathrm{fin}}$ and $n \geq 2\left(\right.$ since $\left(q p^{n}\right)_{i}=\left(q p^{n-1} p\right)_{i}=\left(q p^{n-1}\right)_{i} p_{i}$ for any $\left.n \geq 2\right)$. Hence we can reduce to the case that $\Gamma$ is finite.
For any $n \in \mathbb{N}$ and $i \in \Gamma$, let $J_{n, i}$ be the left ideal of $M_{\Lambda_{i}}\left(K\left[x, x^{-1}\right]\right)$ generated by $\left(q p^{2}\right)_{i}, \ldots,\left(q p^{n+1}\right)_{i}$. Then $J_{n}=\underset{i \in \Gamma}{\times} J_{n, i}$ since each $M_{\Lambda_{i}}\left(K\left[x, x^{-1}\right]\right)$ has local units. Now fix an $i \in \Gamma$. Let $\Lambda_{i}^{\text {fin }}$ be the finite subset of $\Lambda_{i}$ consisting of all $\lambda \in \Lambda_{i}$ such that the $\lambda$-th column of $p_{i}$ has a nonzero entry. Then clearly $\sigma_{\lambda \mu}=0$ for any $n \in \mathbb{N}, \sigma \in J_{n, i}, \lambda \in \Lambda_{i}$ and $\mu \in \Lambda_{i} \backslash \Lambda_{i}^{\text {fin }}$ (since any element of $J_{n, i}$ is a left multiple of
$\left.p_{i}\right)$. Hence, by Lemma 36, the chain $J_{1, i} \subseteq J_{2, i} \subseteq \ldots$ eventually stabilises. Since this holds for any $i \in \Gamma$, we get the contradiction that the chain $J_{1} \subseteq J_{2} \subseteq \ldots$ eventually stabilises.

## 7. Summary

Theorem 38. Let $(E, w)$ be a row-finite weighted graph and $K$ a field. Then $L_{K}(E, w)$ is isomorphic to an unweighted Leavitt path algebra iff $(E, w)$ satisfies Condition (LPA) (see Definition 15).

Proof. Follows from the Theorems 22 and 37.
Theorem 39. Let $(E, w)$ be a row-finite weighted graph and $K$ a field. If $L_{K}(E, w)$ is simple, or graded simple, or locally finite, or Noetherian, or Artinian, or von Neumann regular, or has finite GK dimension, then $L_{K}(E, w)$ is isomorphic to an unweighted Leavitt path algebra.

Proof. Follows from the Theorems 29,30,31,32,33,34 and 22.
