A SIMPLE PROOF FOR IMNANG’S ALGORITHMS

EBRAHIM SOORI

1. Introduction

In this paper, a simple proof for the convergence of a iterative algorithm is presented which improve and refine the original proof. Indeed, using \(\alpha\)-expansive mappings, the proof will be refine.

2. Preliminaries

Let \(C\) be a nonempty closed convex subset of a real normed linear space \(E\) and \(E^*\) be the dual space of \(E\). Suppose that \(\langle\cdot,\cdot\rangle\) denote the pairing between \(E\) and \(E^*\). The normalized duality mapping \(J : E \rightarrow E^*\) is defined by

\[ J(x) = \{ f \in E^* : \langle x, f \rangle = \|x\|^2 = \|f\|^2 \} \]

for each \(x \in E\). Suppose that \(U = \{ x \in E : \|x\| = 1 \}\). A Banach space \(E\) is called smooth if for all \(x \in U\), there exists a unique functional \(j_x \in E^*\) such that \(\langle x, j_x \rangle = \|x\|\) and \(\|j_x\| = 1\) (see [1]).

Recall the following well known concepts:

(1) let \(C\) be a nonempty closed convex subset of a real Banach space \(E\). a mapping \(B : C \rightarrow E\) is said to be relaxed \((u,v)\)-cocoercive [2], if there exist two constants \(u, v > 0\) such that

\[ \langle Bx - By, j(x - y) \rangle \geq (-u)\|Bx - By\|^2 + v\|x - y\|^2, \]

for all \(x, y \in C\) and \(j(x - y) \in J(x - y)\).
(2) Let $C$ be a nonempty closed convex subset of a real Banach space $E$. Let $B$ be a self mapping on $C$. Suppose that there exists a positive integer $\alpha$ such that

$$\|Bx - By\| \geq \alpha \|x - y\|,$$

for all $x, y \in C$, then $B$ is said to be $\alpha$-expansive.

**Lemma 2.1.** [3, Lemma 2.8] Let $C$ be a nonempty closed convex subset of a real 2-uniformly smooth Banach space $X$. Let the mapping $A : C \rightarrow X$ be relaxed $(c, d)$-cocoercive and $L_A$-Lipschitzian. Then, we have

$$\|(I - \lambda A)x - (I - \lambda A)y\|^2 \leq \|x - y\|^2 + 2(\lambda c L_A^2 - \lambda d + K^2 \lambda^2 L_A^2)\|x - y\|^2,$$

where $\lambda > 0$. In particular, if $d > c L_A^2$ and $\lambda \leq \frac{d - c \lambda^2}{K^2 L_A^2}$, then $I - \lambda A$ is nonexpansive.

In this paper, using relaxed $(u, v)$-cocoercive mappings, a new proof for the iterative algorithm [2] is presented.

3. A simple proof for the theorem

S. Imnang [2] considered an iterative algorithm for finding a common element of the set of fixed points of nonexpansive mappings and the set of solutions of a variational inequality. First, it is needed to prove a lemma as follows:

**Lemma 3.1.** Let $C$ be a nonempty closed convex subset of a Banach space $E$. Let $A : C \rightarrow E$ be a relaxed $(m, v)$-cocoercive mapping and $\epsilon$-Lipschitz continuous such that $v - \epsilon m^2 > 0$. Then $A$ is a $(v - \epsilon m^2)$-expansive mapping.

**Proof.** Since $A$ is $(m, v)$-cocoercive and $\epsilon$-Lipschitz continuous, for each $x, y \in C$ and $j(x - y) \in f(x - y)$, it is concluded that

$$\langle Ax - Ay, j(x - y) \rangle \geq (-m)\|Ax - Ay\|^2 + v\|x - y\|^2$$

$$\geq (-\epsilon m^2)\|x - y\|^2 + v\|x - y\|^2$$

$$= (v - \epsilon m^2)\|x - y\|^2 \geq 0,$$

hence, it is implied that

$$\|Ax - Ay\| \geq (v - \epsilon m^2)\|x - y\|,$$

so $A$ is $(v - \epsilon m^2)$-expansive. \hfill \Box

Now, Theorem 3.1 of S. Imnang [2] is considered to solve the viscosity iterative problem for a new general system of variational inequalities in Banach spaces:
**Theorem 3.2.** (i.e., Theorem 3.1, from [2, §3, p.7]) Let $X$ be a uniformly convex and 2-uniformly smooth Banach space with the 2-uniformly smooth constant $K$, let $C$ be a nonempty closed convex subset of $X$ and $Q_C$ be a sunny nonexpansive retraction from $X$ onto $C$. Let the mappings $A_i : C \rightarrow X$ be relaxed $(c_i, d_i)$-cocoercive and $L_i$-Lipschitzian with $0 < \lambda_i < \frac{d_i - c_i L_i^2}{K^2 L_i^2}$ for all $i = 1, 2, 3$. Let $f$ be a contractive mapping with the constant $\alpha \in (0, 1)$ and let $S : C \rightarrow C$ be a nonexpansive mapping such that $\Omega = F(S) \cap F(G) \neq \emptyset$, where $G$ is the mapping defined as in Lemma 2.11. For a given $x_1 \in C$, let $\{x_n\}, \{y_n\}$ and $\{z_n\}$ be the sequences generated by

\[
\begin{align*}
z_n &= Q_C(x_n - \lambda_3 A_3 x_n), \\
y_n &= Q_C(z_n - \lambda_2 A_2 z_n), \\
x_{n+1} &= a_n f(x_n) + b_n x_n + (1 - a_n - b_n) SQ_C(y_n - \lambda_1 A_1 y_n),
\end{align*}
\]

where $\{a_n\}$ and $\{b_n\}$ are two sequences in $(0, 1)$ such that (C1) $\lim_{n \to \infty} a_n = 0$ and $\sum_{n=1}^{\infty} a_n = \infty$; (C2) $0 < \liminf_{n \to \infty} b_n \leq \limsup_{n \to \infty} b_n < 1$.

Then $\{x_n\}$ converges strongly to $q \in \Omega$, which solves the following variational inequality:

\[
\langle q - f(q), f(q - p) \rangle \leq 0, \forall f \in \Pi_C, p \in \Omega.
\]

Next, in the following remark, a simple proof for Theorem 3.2 is introduced:

**Remark 3.3.** A simple Proof: Let $i = 1, 2, 3$. Consider Theorem 3.2 and the $L_i$-Lipschitz continuous and relaxed $(c_i, d_i)$-cocoercive mapping $A_i$ in Theorem 3.2. From the condition that $0 < \lambda_i < \frac{d_i - c_i L_i^2}{K^2 L_i^2}$, it is concluded that $0 < 1 + 2(\lambda_i c_i L_i^2 - \lambda_i d_i) + K^2 \lambda_i^2 L_i^2 < 1$ then from Lemma 2.1 G is a contraction hence from Banach contraction principle $F(G)$ is a singleton set and hence, $\Omega$ is a singleton set i.e., there exists an element $p \in X$ such that $\Omega = \{p\}$. Since $(d_i - c_i L_i^2) > 0$, from Lemma 3.1 $A_i$ is $(d_i - c_i L_i^2)$-expansive, i.e,

\[
\|A_i x - A_i y\| \geq (d_i - c_i L_i^2)\|x - y\|,
\]

in Theorem 3.2. The authors have proved (see (3.12) in [2, p.11]) that

\[
\lim_{n \to \infty} \|A_3 x_n - A_3 p\| = 0,
\]

for $x' = p$. Now, put $x = x_n$ and $y = p$ in (1), and from (1) and (2), we have

\[
\lim_{n \to \infty} \|x_n - p\| = 0.
\]

Hence, $x_n \rightarrow p$. As a result one of the main claims of Theorem 3.2 is established (note $\Omega = \{p\}$). Note the proof in Theorem 3.2 can be simplified.
further by using this remark (for example the relations between (3.12) in [2, p. 11-18] to step 4 of the proof are not needed since it can be deduced from (3.12) in [2, p.11] and the fact that $z_n \to p$). Since $\Omega$ is singleton, the second part of the theorem i.e,

$$\langle q - f(q), J(q - p) \rangle \leq 0, \forall f \in \Pi_C, p \in \Omega.$$ 

is obvious, because $p = q$ and $J(0) = \{0\}$. Also step 5 may be removed from the proof. Consequently, the relations between (3.12) in [2, p. 11] to end of the proof are not needed.

4. Discussion

In this paper, a simple proof for the convergence of an algorithm by relaxed $(u, v)$-cocoercive mappings due to S. Imnang is presented.

5. Conclusion

In this paper, a refinement of the proof of the results due to S. Imnang is given.
