Abstract. We provide a generalization of Mundici’s equivalence between unital Abelian lattice-ordered groups and MV-algebras: the category of unital commutative lattice-ordered monoids is equivalent to the category of MMV-algebras (for Monoidal MV-algebras). Roughly speaking, unital commutative lattice-ordered monoids are unital Abelian lattice-ordered groups without the unary operation \( x \mapsto -x \). The primitive operations are +, ∨, ∧, 0, 1, −1. A prime example of these structures is \( \mathbb{R} \), with the obvious interpretation of the operations. Analogously, MMV-algebras are MV-algebras without the negation \( x \mapsto \neg x \). The primitive operations are ⊕, ⊙, ∨, ∧, 0, 1. A motivating example of MMV-algebra is the negation-free reduct of the standard MV-algebra \([0, 1] \subseteq \mathbb{R}\). We obtain the original Mundici’s equivalence as a corollary of our main result.

1. Introduction

In [11], Mundici proved that the category of Abelian lattice-ordered groups with strong unit (Abelian uℓ-groups, for short) is equivalent to the category of MV-algebras. In Theorem 7.22 our main result, we establish the following generalization: The category of unital commutative lattice-ordered monoids is equivalent to the category of MMV-algebras.

Roughly speaking, unital commutative lattice-ordered monoids (commutative uℓ-monoids, for short) are Abelian uℓ-groups without the unary operation \( x \mapsto -x \), whereas MMV-algebras are MV-algebras without the negation \( x \mapsto \neg x \) (precise definitions will be given in Section 2). The operations of commutative uℓ-monoids are +, ∨, ∧, 0, 1, −1, whereas the operations of MMV-algebras are ⊕, ⊙, ∨, ∧, 0, 1. A motivating example of commutative uℓ-monoid is \( \mathbb{R} \), with the obvious interpretation of the operations, whereas a motivating example of MMV-algebra is the negation-free reduct of the standard MV-algebra \([0, 1] \subseteq \mathbb{R}\). Furthermore, for every space \( X \) equipped with a preorder, the set of bounded continuous monotone functions from \( X \) to \( \mathbb{R} \) is an example of a commutative uℓ-monoid, whereas the set of continuous monotone functions from \( X \) to \([0, 1]\) is an example of an MMV-algebra. The author’s interest for commutative uℓ-monoids originated from these last examples, as we now illustrate in some detail.

Given a compact Hausdorff space \( X \), the set \( C(X, \mathbb{R}) \) of continuous functions from \( X \) to \( \mathbb{R} \) is a divisible Archimedean Abelian uℓ-group, complete in the uniform metric. In fact, we have a duality between the category \( \text{CompHaus} \) of compact Hausdorff spaces and continuous maps and the category \( \text{G} \) of divisible Archimedean metrically complete Abelian uℓ-groups (see [10, 15]). Similarly, we may consider on the set \( C(X, [0, 1]) \) of continuous functions from \( X \) to \([0, 1]\) pointwise-defined
operations inherited from $[0, 1]$; for example, the operations of MV-algebras. Developing this idea, one can show that $\text{CompHaus}$ is dually equivalent to a variety $\Delta$ of (infinitary) algebras (see [6], [8], and [9]). These algebras can be thought of as MV-algebras with an additional operation of countably infinite arity satisfying some additional axioms. In fact, we have an equivalence between $\mathbb{G}$ and $\Delta$, which is essentially a restriction of the equivalence between Abelian $\ell\ell$-groups and MV-algebras.

If we replace compact Hausdorff spaces by Nachbin’s partially ordered compact spaces (see [12] and definition below), then we should accordingly replace Mundici’s equivalence with our Theorem 7.22. A partially ordered compact space is a compact space $X$ endowed with a partial order $\leq$ on $X$ so that the set $\{(x, y) \in X \times X \mid x \leq y\}$ is closed in $X \times X$ with respect to the product topology. Morphisms are the continuous monotone functions. Given a partially ordered compact space $X$, we can consider the set $C_\prec(X, [0, 1])$ of continuous monotone functions from $X$ to $[0, 1]$. We can further endow this set with pointwise-defined operations $\oplus, \odot, \lor, \land, 0, 1$ (which are the operations of MMV-algebras). Pursuing a similar idea, in [7] it was proven that the category of partially ordered compact spaces is dually equivalent to a quasi-variety of infinitary algebras ([1] shows that the quasi-variety actually is a variety). However, the operations are somewhat unwieldy, and one might want to investigate the set $C_\prec(X, \mathbb{R})$ of continuous monotone real-valued functions, instead. In fact, $C_\prec(X, \mathbb{R})$ is a commutative $\ell\ell$-monoid. The main motivation of this paper is to make the connection between $C_\prec(X, \mathbb{R})$ (commutative $\ell\ell$-monoids) and $C_\prec(X, [0, 1])$ (MMV-algebras) explicit.

In fact, there are both pros and cons in working with commutative $\ell\ell$-monoids or MMV-algebras. On one hand, as we mentioned above, it is easier to work with operations of commutative $\ell\ell$-monoids rather than operations of MMV-algebras. On the other hand, the category of MMV-algebras is a variety of finitary algebras axiomatized by a finite number of equations, so the powerful tools of universal algebra apply. The equivalence established here allows to transfer the pros of one category to the other one.

Our result specializes to Mundici’s equivalence between Abelian $\ell\ell$-groups and MV-algebras (Appendix A). We remark that, in contrast to [11] for Mundici’s equivalence, we do not make use of Subdirect Representation Theorem or any form of the axiom of choice to prove the equivalence between commutative $\ell\ell$-monoids and MMV-algebras.

We sketch the proof of our main result, Theorem 7.22: we will obtain an equivalence

$$\ell\ell\text{M}_u \xrightarrow{\tilde{\Gamma}} \mathbb{M}\text{MV}$$

between the category $\ell\ell\text{M}_u$ of commutative $\ell\ell$-monoids and the category $\mathbb{M}\text{MV}$ of MMV-algebras by composing two equivalences

$$\ell\ell\text{M}_u \xrightarrow{(-)^+} \ell\ell\text{M}_u^+ \xrightarrow{\tilde{\Gamma}} \mathbb{M}\text{MV}.$$ 

Here $\ell\ell\text{M}_u^+$ is the category of ‘commutative positive-$\ell\ell$-monoids’ (Definition 4.1), which are, up to isomorphism, the positive cones of some commutative $\ell\ell$-monoid. The functor $\tilde{\Gamma}$ maps a commutative $\ell\ell$-monoid $M$ to its ‘unital interval’ $\tilde{\Gamma}(M)$.
(Section 3). We construct a quasi-inverse in two steps. As a first step, given an
MMV-algebra $A$, we define the set $G(A)$ of ‘good sequences in $A’$ (Section 3), and we
equip this set with the structure of commutative positive-uf-monoid (Section 3). As
a second step, we consider translations of the elements of $G(A)$ by negative integers;
in this way we obtain a commutative uf-monoid $\tilde{\Gamma}$, we write $\tilde{\Gamma}$ as the composite of two functors
(Section 4). To show that the composition of these two steps provides a
second step, we consider translations of the elements of
$G$ to make this set with the structure of commutative positive-uf-monoid (Section 3). We construct a quasi-inverse in two steps. As a first step, given an
MMV-algebra $A$ with two distinguished elements $0 \in A$ and $1 \in A$ endowed with operations $+$ (addition), $\vee$ (maximum), $\wedge$ (minimum), and the constants $0, 1, -1$ is
a prototypical example of unital commutative lattice-ordered monoid.

Definition 2.1. A commutative lattice-ordered monoid (commutative uf-monoid,
for short) is a set $M$, endowed with operations $\vee, \wedge, +$ of arity 2, and with an
element $0 \in M$, with the following properties.

(M1) $\langle M, \vee, \wedge \rangle$ is a distributive lattice.

(M2) $\langle M, +, 0 \rangle$ is a commutative monoid.

(M3) $+$ distributes over $\vee$ and $\wedge$:

(a) $(x \vee y) + z = (x + z) \vee (y + z)$;
(b) $(x \wedge y) + z = (x + z) \wedge (y + z)$. □

A unital commutative lattice-ordered monoid (commutative uf-monoid, for short)
is a commutative uf-monoid $M$ with two distinguished elements $-1, 1 \in M$ with the
following properties.

(U1) $-1 \leq 0 \leq 1$.

(U2) $(-1) + 1 = 0$.

(U3) For all $x \in M$, there exists $n \in \mathbb{N}$ such that $n(-1) \leq x \leq n1$.

The element 1 is called positive unit, whereas the element $-1$ is called negative
unit. □

A morphism of commutative uf-monoids is a map that preserves $\vee, \wedge, +, 0, -1$ and 1. We denote with $\ell M_0$ the category of commutative uf-monoids.

We warn the reader that some authors do not assume the lattice to be distribu-
tive, and some authors do not assume that $+$ distributes over $\wedge$ and $\vee$.

Example 2.2. For every topological space $X$ equipped with a preorder, the set of
bounded continuous monotone functions from $X$ to $\mathbb{R}$ is a commutative uf-monoid.

2.2. MMV-algebras. In the following, we are going to define a variety MMV of
finitary algebras, which is finitely axiomatized. Our main result is that the
categories $\ell M_0$ and MMV are equivalent. Without giving many details now, we antici-
pate the fact that the equivalence is given by the functor $\tilde{\Gamma}$: $\ell M_0 \to$ MMV that maps
a commutative uf-monoid $M$ to the set $\{x \in M \mid 0 \leq x \leq 1\}$, endowed with appro-
piate operations. The primitive operations of MMV will be $0, 1, \wedge, \vee, \oplus, \odot$, and
we define a variety \( \text{MMV} \) (for `Monoidal MV-algebras’) of finitary algebras of type \( F = \{\oplus, \odot, \lor, \land, 0, 1\} \) with arities \( 2, 2, 2, 0, 0 \). Specifically, an algebra \( A = (A, \oplus, \odot, \lor, \land, 0, 1) \) belongs to \( \text{MMV} \) (and we call \( A \) an \( \text{MMV-algebra} \)) if \( A \) satisfies the following equational axioms.

\[
\begin{align*}
(A1) & \quad \langle A, \lor, \land, 0, 1 \rangle \text{ is a bounded distributive lattice.} \\
(A2) & \quad \langle A, \oplus, 0 \rangle \text{ and } \langle A, \odot, 1 \rangle \text{ are commutative monoids.} \\
(A3) & \quad x \oplus 1 = 1. \\
(A4) & \quad x \odot 0 = 0. \\
(A5) & \quad \text{The operations } \oplus \text{ and } \odot \text{ distribute over } \lor \text{ and } \land: \\
& \quad (a) \quad (x \lor y) \oplus z = (x \oplus z) \lor (y \oplus z); \\
& \quad (b) \quad (x \land y) \oplus z = (x \oplus c) \land (y \odot c); \\
& \quad (c) \quad (x \lor y) \odot z = (x \odot z) \lor (y \odot z); \\
& \quad (d) \quad (x \land y) \odot z = (x \odot z) \land (y \odot z). \\
(A6) & \quad [(x \oplus y) \odot z] \oplus (x \odot y) = [(x \odot y) \oplus z] \lor (x \oplus y). \\
(A7) & \quad [(x \oplus y) \odot z] \oplus (x \odot y) = [(x \odot z) \odot y] \lor (x \odot z). \\
(A8) & \quad (x \oplus y) \odot z = \{[(x \oplus y) \odot z] \oplus (x \odot y)\} \land z. \\
(A9) & \quad (x \odot y) \odot z = \{[(x \odot y) \odot z] \oplus (x \odot y)\} \lor z.
\end{align*}
\]

\( \Box \)

Let us define the term

\[ \sigma(x, y, z) := [(x \oplus y) \odot z] \oplus (x \odot y), \]
and the ‘dual’ term

\[ \hat{\sigma}(x, y, z) := [(x \odot y) \odot z] \lor (x \oplus y). \]

In \([0, 1]\) we have

\[ \sigma(x, y, z) = \hat{\sigma}(x, y, z) = [(x + y + z - 1) \lor 0] \land 1. \]

Axioms (A6-A9) may be written more concisely as follows.

\[
\begin{align*}
(A6) & \quad \sigma(x, y, z) = \hat{\sigma}(x, y, z). \\
(A7) & \quad \sigma(x, y, z) = \sigma(x, z, y). \\
(A8) & \quad (x \oplus y) \odot z = \sigma(x, y, z) \land z. \\
(A9) & \quad (x \odot y) \odot z = \sigma(x, y, z) \lor z.
\end{align*}
\]

We remark that \( \text{MMV} \) is a variety of finitary algebras axiomatized by a finite number of equations.

3. The functor \( \tilde{\Gamma} \) FROM COMMUTATIVE UL-MONOIDS TO MMV-ALGEBRAS

In this section we define a functor \( \tilde{\Gamma} : \text{iM}_{\text{u}} \to \text{MMV} \), and the main goal of the paper is to show that it is an equivalence. For a commutative ul-monoid \( M \), we set \( \tilde{\Gamma}(M) := \{ x \in M \mid 0 \leq x \leq 1 \} \). We are going to endow \( \tilde{\Gamma}(M) \) with a structure of \( \text{MMV-algebra} \). Clearly, \( 0, 1 \in \tilde{\Gamma}(M) \). Moreover, we define \( \lor \) and \( \land \) on \( \tilde{\Gamma}(M) \) by restriction. Finally, for \( x, y \in \tilde{\Gamma}(M) \), we set

\[ x \oplus y := (x + y) \land 1, \]

and

\[ x \odot y := (x + y - 1) \lor 0. \]

To see that \( \oplus \) and \( \odot \) are internal operations on \( \tilde{\Gamma}(M) \), we make use of the following.
Lemma 3.1. Let $M$ be a commutative $ul$-monoid, and let $x, y, x', y' \in M$. If $x \leq x'$ and $y \leq y'$, then $x + y \leq x' + y'$.

Proof. We have $x + y \leq x + y'$ because $(x + y) \lor (x + y') = x + (y \lor y') = x + y'$. Analogously, $x + y' \leq x' + y'$. Hence, $x + y \leq x' + y'$.

Using Lemma 3.1, we show that that $\oplus$ and $\odot$ are internal operations on $\tilde{\Gamma}(M)$: we have $x \oplus y \in \tilde{\Gamma}(M)$ because $x + y \geq 0 + 0 = 0$, and we have $x \odot y \in \tilde{\Gamma}(M)$ because $x + y - 1 \leq 1 + 1 - 1 = 1$.

Since $+$ distributes over $\lor$, we have an equivalent formulation for $\odot$ in $\tilde{\Gamma}(M)$:

$$x \odot y = [(x + y) \lor 1] - 1.$$

Our next goal—met in Theorem 3.6 below—is to show that $\tilde{\Gamma}(M)$ is an MMV-algebra. We need some lemmas.

Lemma 3.2. Let $M$ be a commutative $ul$-monoid, and let $x, y, z \in \tilde{\Gamma}(M)$. Then,

$$(x \oplus y) \odot z = [(x + y + z - 1) \land z] \lor 0,$$

and

$$(x \odot y) \oplus z = [(x + y + z - 1) \lor z] \land 1.$$

Proof. We have

$$(x \oplus y) \odot z = [(x \oplus y) + z - 1] \lor 0 = \{(x + y) \land 1 + z - 1\} \lor 0 = \{(x + y + z - 1) \land z\} \lor 0$$

and

$$(x \odot y) \oplus z = [(x \odot y) + z] \land 1 = \{(x + y - 1) \lor 0\} \land 1 = [(x + y + z - 1) \lor z] \land 1.$$

Lemma 3.3. Let $M$ be a commutative $\ell$-monoid, and let $x, y \in M$. Then

$$(x \land y) + (x \lor y) = x + y.$$

Proof. We recall the proof, available in [3], of the two inequalities:

$$(x \land y) + (x \lor y) = [(x \land y) + x] \lor [(x \land y) + y] \leq (y + x) \lor (x + y) = x + y,$$

$$(x \land y) + (x \lor y) = [x + (x \lor y)] \land [y + (x \lor y)] \geq (x + y) \land (y + x) = x + y.$$

Lemma 3.4. Let $M$ be a commutative $ul$-monoid, and let $x, y \in \tilde{\Gamma}(M)$. Then

$$(x \oplus y) + (x \odot y) = x + y.$$

Proof. We have

$$(x \oplus y) + (x \odot y) = [(x + y) \land 1] + [(x + y) \lor 1] - 1 \overset{\text{Lem. 3.3}}{=} x + y + 1 - 1 = x + y.$$

Lemma 3.5. Let $M$ be a commutative $ul$-monoid. Then, for every $x, y, z \in \tilde{\Gamma}(M)$, we have

$$\sigma(x, y, z) = \check{\sigma}(x, y, z) = [(x + y + z - 1) \lor 0] \land 1.$$

Proof. We have

$$\check{\sigma}(x, y, z) = [(x \odot y) \cap z] \oplus (x \odot y) \overset{\text{Lem. 3.2}}{=} [(x \odot y) + z + (x \odot y) - 1] \land (x \odot y) \overset{\text{Lem. 3.1}}{=} [x + y + z - 1] \land (x \odot y) \lor 0 = [x + y + z - 1] \land 1 \lor 0 = [x + y + z - 1] \land 0 = [(x + y + z - 1) \lor 0] \land 1.$$
Moreover,
\[ \sigma(x, y, z) = [(x \odot y) \odot z] \oplus (x \odot y) \]
by Lemma 3.2.

\[ = [(x + y + z + x \odot y - 1) \lor (x \odot y)] \land 1 \]
by Lemma 3.4.

\[ = [(x + y + z - 1) \lor (x \odot y)] \land 1 \]

\[ = [(x + y + z - 1) \lor (x + y - 1) \lor 0] \land 1 = [(x + y + z - 1) \lor 0] \land 1. \]

\[ \square \]

**Theorem 3.6.** Let \( M \) be a commutative u\(\ell\)-monoid. Then \( \tilde{\Gamma}(M) \) is an MMV-algebra.

**Proof.** Axioms (A1-A5) are obtained by straightforward computations. Axioms (A6-A7) hold by Lemma 3.5. Axioms (A8-A9) hold by Lemmas 3.2 and 3.5. \[ \square \]

Given a be a morphism of commutative u\(\ell\)-monoids \( f : M \to N \), we denote with \( \tilde{\Gamma}(f) \) its restriction \( \tilde{\Gamma}(f) : \tilde{\Gamma}(M) \to \tilde{\Gamma}(N) \) This establishes a functor

\[ \tilde{\Gamma} : \ell M_{u} \to MMV. \]

Our main goal is to show that \( \tilde{\Gamma} \) is an equivalence of categories.

**Remark 3.7.** Every bounded distributive lattice \( L \) can be made into an MMV-algebra by setting \( x \oplus y := x \lor y \) and \( x \odot y := x \land y \). In fact, the category of bounded distributive lattices is a subvariety of the variety of MMV-algebras, obtained by adding the axioms \( x \oplus y = x \lor y \) and \( x \odot y = x \land y \). For one such distributive lattice \( L \), a commutative u\(\ell\)-monoid \( M \) such that \( \tilde{\Gamma}(M) \cong L \) is the set of monotone continuous functions from \( X \) to \( \mathbb{Z} \), where \( X \) is the Priestley space associated to \( L \).

## 4. The Positive Cone of Commutative u\(\ell\)-Monoids

In [5, Chapter 2], the authors proceed in two steps in order to prove that, for an MV-algebra \( A \), there exists an Abelian u\(\ell\)-group that envelops \( A \). First, a partially ordered monoid \( M_{A} \) is constructed from \( A \). Second, since \( M_{A} \) satisfies certain properties, an Abelian u\(\ell\)-group \( G_{A} \) is defined (in a way which is analogous to the definition of \( \mathbb{Z} \) from \( \mathbb{N} \)). In this paper, we proceed analogously: the role of \( A \) is played by MMV-algebras, the role of \( G_{A} \) is played by commutative u\(\ell\)-monoid, and the role of \( M_{A} \) is played by what we are going to call commutative positive-u\(\ell\)-monoids. Roughly speaking, if we think of a commutative u\(\ell\)-monoid as the interval \((-\infty, +\infty)\), then an MMV-algebra is the interval \([0, 1]\), whereas a commutative positive-u\(\ell\)-monoid is the interval \([0, +\infty)\).

In order to prove that \( \tilde{\Gamma} \) is an equivalence, we show that \( \tilde{\Gamma} \) is the composite of two equivalences

\[ \ell M_{u} \xrightarrow{(-)^{+}} \ell M_{u}^{+} \xrightarrow{U} MMV, \]

where \( \ell M_{u}^{+} \) is the category—yet to be defined—of commutative positive-u\(\ell\)-monoids. The idea is that, for \( M \in \ell M_{u} \),

\[ M^{+} := \{ x \in M \mid x \geq 0 \}, \]

and for \( N \in \ell M_{u}^{+} \),

\[ U(N) := \{ x \in N \mid x \leq 1 \}, \]

so that

\[ U(M^{+}) = \{ x \in M \mid 0 \leq x \leq 1 \} = \tilde{\Gamma}(M). \]

In this section, we define the functor \((-)^{+} \), and we exhibit a quasi-inverse \( T \).
Given a commutative \( \ell \)-monoid \( M \), we set \( M^+ := \{ x \in M \mid x \geq 0 \} \). With the following definition, we aim to capture the structure of \( M^+ \).

**Definition 4.1.** A positive-unital commutative lattice-ordered monoid (commutative positive-\( \ell \)-monoid, for short) is a commutative \( \ell \)-monoid \( M \) with a distinguished element \( 1 \), and with a unary operation \(- \odot 1\), with the following properties.

(P1) For all \( x \in M \), \( x \geq 0 \).
(P2) For all \( x \in M \), there exists \( n \in \mathbb{N} \) such that \( x \leq n1 \).
(P3) For all \( x \in M \), \( (x + 1) \odot 1 = x \).
(P4) For all \( x \in M \), \( (x \odot 1) + 1 = x \vee 1 \).

A morphism of commutative positive-\( \ell \)-monoids is a function that preserves \( +, \vee, \wedge, 0, 1 \) and \(- \odot 1\). We denote with \( \ell \mathcal{M}_u^+ \) the category of commutative positive-\( \ell \)-monoids. In this section, we show that \( \ell \mathcal{M}_u \) and \( \ell \mathcal{M}_u^+ \) are equivalent.

**Lemma 4.2.** Let \( M \) be a commutative positive-\( \ell \)-monoid, let \( x, y \in M \), and let \( n \in \mathbb{N} \). If \( x + n = y + n \), then \( x = y \).

**Proof.** The proof proceeds by induction on \( n \in \mathbb{N} \). The case \( n = 0 \) is trivial. Suppose the statement holds for \( n \in \mathbb{N} \), and suppose \( x + (n + 1) = y + (n + 1) \). Then \( x + n = (x + n + 1) \odot 1 = (y + n + 1) \odot 1 = y + n \). By inductive hypothesis, \( x = y \).

**Remark 4.3.** Let \( M \) be a commutative positive-\( \ell \)-monoid, and let \( x, y \in M \). Then \( y = x \odot 1 \) if, and only if, \( y + 1 = x \vee 1 \). Moreover, \( y = 0 \) if, and only if \( y + 1 = 1 \). This shows that the unary operation \(- \odot 1\) and the constant 0 can be explicitly defined from \( \{\vee, \wedge, 1, +\} \).

From Remark 4.3, we have the following.

**Lemma 4.4.** Given any function \( f : M \to N \) between commutative positive-\( \ell \)-monoids, if \( f \) preserves \( +, \vee, \wedge \) and 1, then it preserves also \(- \odot 1\) and 0, and hence \( f \) is a morphism of commutative positive-\( \ell \)-monoids.

**Proposition 4.5.** Given \( M \) a commutative \( \ell \)-monoid, \( M^+ \) is a commutative positive-\( \ell \)-monoid, where \( +, \vee, \wedge, 0, 1 \) are defined by restriction, and \( x \odot 1 := (x - 1) \vee 0 \).

**Proof.** By Lemma 3.1, the restriction of \( + \) on \( M^+ \) is a well defined operation. It is immediate that \( \vee, \wedge \) and \(- \odot 1\) are well defined, as well, and that \( 0, 1 \in M^+ \).

(P1) By definition of \( M^+ \), every element is positive.
(P2) By (U3), for all \( x \in M^+ \), there exists \( n \in \mathbb{N} \) such that \( x \leq n1 \).
(P3) For all \( x \in M^+ \), \( (x + 1) \odot 1 = (x + 1) \vee 0 = x \vee 0 = x \).
(P4) For all \( x \in M^+ \), \( (x \odot 1) + 1 = [(x - 1) \vee 0] + 1 = x \vee 1 \).

Given a morphism \( f : M \to N \) of commutative \( \ell \)-monoids, \( f \) restricts to a function \( f^+ \) from \( M^+ \) to \( N^+ \). Moreover, \( f \) is a morphism of commutative positive-\( \ell \)-monoids, as it preserves \( +, \vee, \wedge \) and 1. This establishes a functor

\[ (-)^+ : \ell \mathcal{M}_u \to \ell \mathcal{M}_u^+ \]

that maps \( M \) to \( M^+ \), and maps a morphism \( \varphi : M \to N \) to its restriction \( \varphi^+ : M^+ \to N^+ \). We shall prove that \(( - )^+ \) is an equivalence of categories (Theorem 4.17 below). To do so, we exhibit a quasi-inverse \( T : \ell \mathcal{M}_u^+ \to \ell \mathcal{M}_u \).

Let \( M \) be a commutative positive-\( \ell \)-monoid. We want to construct a commutative \( \ell \)-monoid \( T(M) \) such that, if \( N \) is a commutative \( \ell \)-monoid such that \( N^+ \cong M \), \( T(M) \cong N \). Every element of a commutative \( \ell \)-monoid \( N \) is of the
form $x - n$, for some $x \in N^+$ and $n \in \mathbb{N}$. Roughly speaking, we will obtain $T(N^+) \cong N$ by translating the elements of $N^+$ by negative integers. In fact, $T$ stands for ‘translations’.

This suggests us to consider, given a commutative $u\ell$-monoid $M$, the relation $\sim$ defined on $M \times \mathbb{N}$ as follows: $(x, n) \sim (y, m)$ if, and only if, $x + m = y + n$. Using Lemma 4.6, it is not difficult to show that $\sim$ is an equivalence relation. We set $T(M) := \frac{M \times \mathbb{N}}{\sim}$, and we endow $T(M)$ with the operations of commutative $u\ell$-monoid.

$$0 := [(0, 0)].$$
$$1 := [(1, 0)].$$
$$-1 := [(0, 1)].$$
$$[(x, n)] + [(y, m)] := [(x + y, n + m)].$$
$$[(x, n)] \lor [(y, m)] := [((x + m) \lor (y + n), n + m)].$$
$$[(x, n)] \land [(y, m)] := [((x + m) \land (y + n), n + m)].$$

Straightforward computations show that these operations are well-defined.

**Remark 4.6.** We have $(x, n) \sim (x + m, n + m)$.

**Lemma 4.7.** We have

$$[(x, n)] \lor [(y, n)] = [(x \lor y, n)],$$
and

$$[(x, n)] \land [(y, n)] = [(x \land y, n)].$$

**Proof.** We have

$$[(x, n)] \lor [(y, n)] = [((x + n) \lor (y + n), n + n)] = [((x \lor y) + n, n + n)] \overset{\text{Rem. 4.6}}{=} [(x \lor y, n)],$$
and analogously for $\land$. \hfill \Box

**Proposition 4.8.** $T(M)$ is a commutative $u\ell$-monoid.

**Proof.** The fact that $T(M)$ is a commutative monoid follows from the fact that $M$ and $\mathbb{N}$ are commutative monoids. Checking that $T(M)$ is a distributive lattice is facilitated by Remark 4.6 and Lemma 4.7. Let us prove that $+$ distributes over $\lor$:

$$[(x, n)] + [(y, m)] \lor [(z, m)] = [(x + y, v + z, n + m)] = [((x + y) \lor (x + z), n + m)] = [x + y, n + m] \lor [x + z, n + m] = [((x, n)] + [(y, m)]) \lor [((x, n)] + [(z, m)]).$$

Analogously for $\land$. The axioms for 1 and $-1$ are easily seen to hold. \hfill \Box

For a morphism of commutative positive-$u\ell$-monoids $f: M \to N$, we set

$$T(f): T(M) \longrightarrow T(N)$$

$$[(x, n)] \longmapsto [(f(x), n)].$$

To show that $T(f)$ is well defined, suppose $(x, n) \sim (y, m)$: $x + m = y + n$. Then, $f(x) + m = f(x + m) = f(y + n) = f(y) + n$. Moreover, $T(f)$ is a morphism of commutative $u\ell$-monoids. We show only that $+$ is preserved. $(T(f))( [(x, n)] + [(y, m)]) = (T(f))([(x + y, n + m)]) = [(f(x + y), n + m)] = [(f(x) + f(y), n + m)] = [(f(x), n)] + [(f(y), m)].$

One easily verifies that $T: \ell M^+_n \to \ell M_n$ is a functor.
For each commutative \( u\ell\) monoid, we consider the function
\[
\varepsilon^0_M : T(M^+) \to M
\]
\[
[(x, n)] \mapsto x - n.
\]
The function \( \varepsilon^0_M \) is well defined: \([x, n] = [y, m] \Rightarrow x + m = y + n \Rightarrow x - n = y - m \).

**Proposition 4.9.** \( \varepsilon^0_M \) is a morphism of commutative \( u\ell\) monoids.

**Proof.** We have \( \varepsilon^0_M([0, 0]) = 0 - 0 = 0, \varepsilon^0_M([1, 0]) = 1 - 0 = 1, \) and \( \varepsilon^0_M([0, 1]) = 0 - 1 = -1 \). Hence, \( \varepsilon^0_M \) preserves 0, 1, and \(-\). Let \( x, y \in M^+ \), and \( n \in \mathbb{N} \). Then,
\[
\varepsilon^0_M([(x, n)] + [(y, m)]) = \varepsilon^0_M([(x + y, n + m)]) = (x + y) - (n + m) = (x - n) + (y - m) = \varepsilon^0_M([(x, n)]) + \varepsilon^0_M([(y, m)]).
\]
Hence, \( \varepsilon^0_M \) preserves +. Moreover,
\[
\varepsilon^0_M([(x, n)] \vee [(y, m)]) = \varepsilon^0_M([(x + m) \vee (y + n), n + m]) = [(x + m) \vee (y + n)] - (n + m) = (x + n) \vee (y + m).
\]
Hence, \( \varepsilon^0_M \) preserves \( \vee \). Analogously, \( \varepsilon^0_M \) preserves \( \wedge \).

**Proposition 4.10.** \( \varepsilon^0 : T(-)^+ \to 1_{\text{End}}(\mathbb{M}) \) is a natural transformation, i.e., for every morphism of commutative \( u\ell\) monoids \( f : M \to N \), the following diagram commutes.

\[
\begin{array}{ccc}
T(M^+) & \xrightarrow{\varepsilon^0_M} & M \\
\downarrow T(f^+) & & \downarrow f \\
T(N^+) & \xrightarrow{\varepsilon^0_N} & N
\end{array}
\]

**Proof.** For \( x \in M^+ \) and \( n \in \mathbb{N} \) we have
\[
\varepsilon^0_N(T(f^+)([(x, n)])) = \varepsilon^0_N([(f^+(x), n)]) = \varepsilon^0_N([(f(x), n)]) = f(x) - n = f(x - n) = f([(x, n)]).
\]

**Proposition 4.11.** For any commutative \( u\ell\) monoid \( M \), \( \varepsilon^0_M : T(M^+) \to M \) is bijective.

**Proof.** To prove injectivity, let \( x, y \in M^+ \), \( n, m \in \mathbb{N} \), and suppose \( \varepsilon^0_M([(x, n)]) = \varepsilon^0_M([(y, m)]) \). Then, \( x - n = \varepsilon^0_M([(x, n)]) = \varepsilon^0_M([(y, m)]) = y - m \); hence \( x + n = y + n \), and thus \([x, n] = [y, m]\). This proves injectivity. To prove surjectivity, for \( x \in M \), choose \( n \in \mathbb{N} \) such that \(-n \leq x\); then \( \varepsilon^0_M([(x + n, n)]) = x + n - n = x \).

For each commutative positive-\( u\ell\)-monoid \( M \), consider the function
\[
\eta^0_M : M \to (T(M))^+
\]
\[
x \mapsto [(x, 0)].
\]

**Proposition 4.12.** The function \( \eta^0_M \) is a morphism of commutative positive-\( u\ell\)-monoids.

**Proof.** It is easy to see that \( \eta^0_M \) preserves 1, +, \( \vee \) and \( \wedge \). Then, by Lemma 4.4, \( \eta^0_M \) is a morphism of commutative positive-\( u\ell\)-monoids.
Proposition 4.13. η^0: 1_M^+ → (−)^+ is a natural transformation, i.e., for every morphism of commutative positive-ul-monooids \( f: M \to N \), the following diagram commutes.

\[
\begin{array}{ccc}
M & \xrightarrow{\eta^0_M} & (T(M))^+ \\
\downarrow f & & \downarrow (T(f))^+ \\
N & \xrightarrow{\eta^0_N} & (T(N))^+
\end{array}
\]

Proof. For \( x \in M \), we have

\[
((T(f))^+)\eta^0_M(m)) = ((T(f))^+)\eta^0_M([x, 0]) = (T(f))(\eta^0_M([x, 0])) = [f(x), 0] = \eta^0_N(f(x)).
\]

\(\square\)

Notation 4.14. Let \( M \) be a commutative positive-ul-monoid. We define, inductively on \( n \in \mathbb{N} \), a function \( (\cdot) \circ n: M \to M \).

\[
x \circ 0 := x;
\]

\[
\text{(for } n \geq 1 \text{)} \quad x \circ n = (x \circ (n - 1)) \circ 1.
\]

Lemma 4.15. Let \( M \) be a commutative positive-ul-monoid. For every \( x \in M \), and every \( n \in \mathbb{N} \), we have

\[
(x \circ n) + n = x \lor n.
\]

Proof. We prove the statement by induction. The case \( n = 0 \) is trivial. Let \( n \in \mathbb{N}_{>0} \), suppose the statement holds for \( n - 1 \), and let us prove it for \( n \). We have

\[
(x \circ n) + n = (x \circ (n - 1)) \circ 1 + n = ((x \circ (n - 1)) \circ 1) + 1 + (n - 1) =
\]

\[
= (x \lor (n - 1)) \lor 1 + (n - 1) = (x \lor (n - 1)) \lor n = x \lor n.
\]

\(\square\)

Proposition 4.16. Let \( M \) be a commutative positive-ul-monoid. Then, the function \( \eta^0_M: M \to (T(M))^+ \) is bijective.

Proof. First, we prove that \( \eta^0_M \) is injective. Let \( x, y \in M \), and suppose \( \eta^0_M(x) = \eta^0_M(y) \). Then, \( x + 0 = y + 0 \), which proves \( x = y \). Second, we prove that \( \eta^0_M \) is surjective. Let \( [x, n] \in (T(M))^+ \). Then, \( [x, n] \lor [(0, 0)] = [x, n], \) i.e., \( [x, n] \lor [(n, n)] = [x, n], \) i.e., \( [x \lor n, n] = [x, n], \) i.e., \( (x \lor n) + n = x + n, \) i.e., \( x \lor n = x, \) i.e., \( n \leq x \). Hence, \( x = x \lor n = (x \circ n) + n \). Therefore, \( \eta^0_M(x \circ n) = \eta^0_M(x \circ n). \)

\(\square\)

Theorem 4.17. The functors \( (−)^+ \) and \( T \) in the diagram are quasi-inverses.

\[
\begin{array}{ccc}
\ell M_u & \xrightarrow{(−)^+} & \ell M_u^+ \\
\downarrow \wr & & \downarrow \wr \\
\ell M_u^+ & \xrightarrow{T} & \ell M_u^+
\end{array}
\]

Proof. The functors \( 1_{\ell M_u}: \ell M_u^+ \to \ell M_u^+ \) and \( (T)^+: \ell M_u^+ \to \ell M_u^+ \) are naturally isomorphic, by Propositions 4.12, 4.13, 4.16. The functors \( 1_{\ell M_u}: \ell M_u \to \ell M_u \) and \( T(−)^+: \ell M_u \to \ell M_u \) are naturally isomorphic, by Propositions 4.9, 4.10, 4.11. \(\square\)
5. Good sequences: definition and remarks

Definition 5.1. Let $A$ be an MMV-algebra. A good pair in $A$ is a pair $(x_0, x_1)$ of elements of $A$ such that $x_0 \oplus x_1 = x_0$ and $x_0 \odot x_1 = x_1$. A good sequence in $A$ is a sequence $(x_0, x_1, x_2, \ldots)$ of elements of $A$ which is definitely 0 and such that, for each $n \in \mathbb{N}$, $(x_n, x_{n+1})$ is a good pair. Instead of $(x_0, \ldots, x_n, 0, 0, 0, \ldots)$ we shall often write, more concisely, $(x_0, \ldots, x_n)$. Thus, if $0^m$ denotes an $m$-tuple of zeros, the good sequences $(x_1, \ldots, x_n)$ and $(x_0, \ldots, x_n, 0^m)$ are identical. For each $x \in A$, the good sequence $(x, 0, 0, 0, \ldots)$ will be denoted by $(x)$. □

Remark 5.2. In our definition of good pair we included both the condition $x_0 \oplus x_1 = x_0$ and the condition $x_0 \odot x_1 = x_1$, because, in general,

$x_0 \oplus x_1 = x_0 \not\implies x_0 \odot x_1 = x_1$.

For example, let $A$ be the MMV-algebra consisting of three elements $\{0, a, 1\}$, where $a \oplus a = a$, and $a \odot a = 0$. This is an MMV-algebra, because $A \cong \hat{\Gamma}(\mathbb{Z} \times \{0, a\})$, where $\mathbb{Z} \times \{0, 1\}$ is the lexicographic product of the two commutative $\ell$-monoids $\mathbb{Z}$ (with addition), and $\{0, 1\}$ (with $+$ = $\lor$), and where the positive and negative units are, respectively, $(1, 0)$ and $(-1, 0)$. In $A$, we have $a \oplus a = a$, but $a \odot a = 0 \neq a$.

In order to prove the equivalence between the categories of MV-algebras and Abelian $\ell$-groups (see [11] or [5]), Mundici used the facts that subdirectly irreducible MV-algebras are totally ordered and that good sequences in totally ordered MV-algebras are of the form $(1, 1, 1, 0, 0, \ldots)$.

In this paper we do not make use of subdirect representation (in fact, we do not make use of the axiom of choice) to establish the equivalence between $\ell$MMV and MMV. The reason why this is done is that, initially, the author was unable to prove that, in subdirectly irreducible MV-algebras, good sequences are of the form $(1, 1, 1, 0, 0, \ldots)$. At the end, one such proof was found, and, even if we decided to write it in the appendix (Corollary 6.4), we do not use this result in the present paper for the following reasons. First, in this way, the proof that we provide for the equivalence between $\ell$MMV and MMV may be applied in similar settings, where it is not known how subdirectly irreducible algebras are. Secondly, the proof we give does not use the axiom of choice, which is something that some authors might find interest in. In particular, up to proving without the axiom of choice that the axioms of MMV-algebras hold in any MV-algebra, we obtain a proof of the equivalence between Abelian $\ell$-groups and MV-algebras that does not make use of the axiom of choice.

We must pay some attention, because for MMV-algebras something happens that differs from MV-algebras. In particular, even if subdirectly irreducible MMV-algebras are totally ordered (Theorem 3.3), there exist totally ordered MMV-algebras in which not all good sequences are of the form $(1, 1, 1, 0, 0, \ldots)$. This is related to the fact that the enveloping commutative $\ell$-monoid of a totally ordered MMV-algebra does not need to be totally ordered. The following example shall clarify these aspects.

Example 5.3. The chain $L$ of three elements $0 < a < 1$ can be made into an MMV-algebra by setting $x \oplus y = x \lor y$, and $x \odot y = x \land y$ (see Remark 3.7). The commutative $\ell$-monoid $M$ such that $\hat{\Gamma}(M) \cong L$ is

$M := \{(n, m) \subseteq \mathbb{Z} \times \mathbb{Z} \mid n \leq m\}$,

where the operations $+$, $\lor$, $\land$, $0$, $1$, $-1$ are computed pointwise. We can view $M$ as the set of continuous monotone functions from the discrete topological space $P := \{s, t\}$, with order $s < t$, to $\mathbb{Z}$; notice that $P$ is the Priestley space associated to $L$. We have that $M$ is not totally ordered, since the elements $(0, 2)$ and $(1, 1)$...
are not comparable. However, its unit interval \( \bar{I}(M) = \{(0, 0), (0, 1), (1, 1)\} \cong L \) is totally ordered. The pair \((a, a)\) in \(L\) is good, and so is the sequence \((a, a, 0, 0, 0, \ldots)\). So, \(L\) is an example of totally ordered MMV-algebra where not every good sequence is of the form \((1, 1, 1, x, 0, 0, \ldots)\).

The totally ordered MMV-algebra \(L\) in Example 5.3 is not subdirectly irreducible. Indeed, in the subdirect representation \(L \subseteq \{0, 1\} \times \{0, 1\}\), where \(0 \mapsto (0, 0)\), \(a \mapsto (0, 1)\), and \(1 \mapsto (1, 1)\), none of the projection is an isomorphism. Analogously, \(M\) is not subdirectly irreducible as \(\{+, \vee, \wedge, 0, 1, -1\}\)-algebra. So, Example 5.3 does not contradict the aforementioned fact that a good sequence in a subdirectly irreducible MMV-algebra is of the form \((1, 1, 1, x, 0, 0, \ldots)\) (Corollary C.4).

6. Operations on the set of good sequences

We denote with \(G(A)\) the set of good sequences in \(A\). We will endow \(G(A)\) with a structure of commutative positive-uf-monoid.

Notation 6.1. Let \(A \in \text{MMV}\). We call order-dual algebra of \(A\) the MMV-algebra \(A^\varnothing\) with the following properties: \(A^\varnothing\) shares the same underlying set to \(A\), \(\vee_{A^\varnothing} = \wedge_A\), \(\wedge_{A^\varnothing} = \vee_A, \odot_{A^\varnothing} = \odot_A, \odot_{A^\varnothing} = \odot_A, 0_{A^\varnothing} = 1_A, \text{ and } 1_{A^\varnothing} = 0_A\). Inspection of the axioms that define MMV-algebras shows that \(A^\varnothing\) is indeed an MMV-algebra.

Lemma 6.2. Let \(A\) be an MMV-algebra. The following properties hold for all \(x, y, z, x', y' \in A\).

1. \(x \leq y \Rightarrow x \odot z \leq y \odot z\).
2. \(x \leq y \Rightarrow x \odot z \leq y \odot z\).
3. \(x \leq x \odot y\).
4. \(y \leq x \odot y\).
5. \(x \leq x' \text{ and } y \leq y', \text{ then } x \odot y \leq x' \odot y'\).
6. \(x \leq x' \text{ and } y \leq y', \text{ then } x \odot y \leq x' \odot y'\).

Proof. (1) If \(x \leq y\), then \(x \odot z = (x \wedge y) \odot z = (x \odot z) \wedge (y \odot z)\).

3. From \(0 \leq y\) we obtain \(x \odot 0 \leq x \odot y\). Since \(x \odot 0 = x\), \(x \leq x \odot y\).

5. We have \(a \odot b \leq a \odot b'\) because \((a \odot b) \vee (a \odot b') = a \odot (b \vee b') = a \odot b'\). Analogously, \(a \odot b' \leq a' \odot b\). Hence, \(a \odot b \leq a \odot b' \leq a' \odot b\).

Items (2), (4) and (6) in \(A\) coincide respectively with items (1), (3) and (5) in the order-dual algebra of \(A\).

Lemma 6.3. For any good pair \((x, y)\) in an MMV-algebra \(A\), and any \(u \in A\), the pairs \((x \odot u, y)\) and \((x, y \odot v)\) are good.

Proof. The pair \((x \odot u, y)\) is good because \((x \odot u) \odot y = (x \odot y) \odot u = x \odot u\), and \(y = x \odot y \leq (x \odot u) \odot y \leq y\), which implies \((x \odot u) \odot y = y\). Dually, \((x, y \odot v)\) is good.

We denote with \(0\) the good sequence \((0, 0, 0, \ldots)\), and we denote with \(1\) the good sequence \((1, 0, 0, 0, \ldots)\).

For \(a = (a_0, a_1, a_2, \ldots)\) and \(b = (b_0, b_1, b_2, \ldots)\) good sequences, we set

\[a \vee b := (a_0 \vee b_0, a_1 \vee b_1, a_2 \vee b_2, \ldots),\]

and

\[a \wedge b := (a_0 \wedge b_0, a_1 \wedge b_1, a_2 \wedge b_2, \ldots)\]

Proposition 6.7 below asserts that \(a \vee b\) and \(a \wedge b\) are good sequences. In order to prove it, we establish the following lemmas.
Lemma 6.4. Let $A$ be an MMV-algebra. For every $x, y, z \in A$, the following holds.

$$\sigma(x, y, z) = \sigma(x, z, y) = \sigma(y, x, z) = \sigma(z, x, y) = \sigma(z, y, x) = \hat{\sigma}(x, y, z) = \hat{\sigma}(y, z, x) = \hat{\sigma}(z, x, y) = \hat{\sigma}(z, y, x) = \delta(x, y, z).$$

Proof. This follows from the fact that, for every $x, y, z$, we have $\sigma(x, y, z) = \sigma(x, z, y)$ (Axiom (A7)), $\sigma(x, y, z) = \sigma(y, x, z)$ (by commutativity of $\oplus$), and $\sigma(x, y, z) = \hat{\sigma}(x, y, z)$ (Axiom (A6)). \qed

Lemma 6.5. Let $A$ be an MMV-algebra, let $(x_0, x_1)$ be a good pair in $A$, and let $y \in A$. Then,

$$x_1 \leq \sigma(x_0, x_1, y) \leq x_0.$$

Proof. We have $\sigma(x_0, x_1, y) = [(x_0 \oplus x_1) \ominus y] \ominus (x_0 \oplus x_1) \leq (x_0 \oplus x_1) = x_0$. Moreover, $\sigma(x_0, x_1, y) = [(x_0 \oplus x_1) \ominus y] \ominus (x_0 \oplus x_1) \geq (x_0 \oplus x_1) = x_1$. \qed

Lemma 6.6. If $(x_0, x_1)$ and $(y_0, y_1)$ are good pairs, then $(x_0 \lor y_0, x_1 \lor y_1)$ and $(x_0 \land y_0, x_1 \land y_1)$ are good pairs.

Proof. We prove that $(x_0 \lor y_0, x_1 \lor y_1)$ is a good pair. We have

$$(x_0 \lor y_0) \ominus (x_1 \lor y_1) = (x_0 \ominus x_1) \lor (y_0 \ominus y_1) \lor (y_0 \ominus x_1) =$$

$$= x_0 \lor (x_0 \ominus y_1) \lor (y_0 \ominus x_1) \lor y_0 = (x_0 \ominus y_1) \lor (y_0 \ominus x_1) =$$

$$= [(x_0 \ominus (y_0 \ominus y_1)) \lor (x_0 \ominus (x_0 \ominus x_1))] =$$

$$= [\sigma(x_0, x_1, y_0) \ominus x_0] \lor [\sigma(x_0, x_1, y_0) \ominus y_0].$$

By Lemma 6.5, $\sigma(x_0, x_1, y_0) \leq x_0$, and $\sigma(y_0, y_1, x_0) \leq y_0$. Therefore $\sigma(y_0, y_1, x_0) \lor x_0 \lor \sigma(x_0, x_1, y_0) \lor y_0 = x_0 \lor y_0$. Hence, $(x_0 \lor y_0) \ominus (x_1 \lor y_1) = x_0 \lor y_0$. Moreover,

$$(x_0 \lor y_0) \ominus (x_1 \lor y_1) = (x_0 \ominus x_1) \lor (y_0 \ominus y_1) \lor (y_0 \ominus x_1) \lor (y_0 \ominus y_1) =$$

$$= x_1 \lor (x_0 \ominus y_1) \lor (y_0 \ominus x_1) \lor y_1 = x_1 \lor y_1.$$

Hence, $(x_0 \lor y_0, x_1 \lor y_1)$ is a good pair. Dually, $(x_0 \land y_0, x_1 \land y_1)$ is a good pair. \qed

As a consequence of Lemma 6.6, we have the following.

Proposition 6.7. Let $A$ be an MMV-algebra, and let $a$ and $b$ be good sequences in $A$. Then $a \lor b$ and $a \land b$ are good sequences.

Proposition 6.8. Let $A$ be an MMV-algebra. Then, $(\mathcal{G}(A), \lor, \land)$ is a distributive lattice.

Proof. $(\mathcal{G}(A), \lor, \land)$ is a distributive lattice, because $\lor$ and $\land$ are applied componentwise, and $(A, \lor, \land)$ is a distributive lattice. \qed

For $A$ an MMV-algebra, we have a partial order $\leq$ on $\mathcal{G}(A)$, induced by the lattice operations. Since the lattice operations are defined componentwise, we have the following.

Remark 6.9. Let $A$ be an MMV-algebra, and let $a = (a_0, a_1, a_2, \ldots)$ and $b = (b_0, b_1, b_2, \ldots)$ be good sequences. Then, $a \leq b$ if, and only if, for all $n \in \mathbb{N}$, $a_n \leq b_n$.

Now, we want to define sum of good sequences. Let $a = (a_0, a_1, a_2, \ldots)$ and $b = (b_0, b_1, b_2, \ldots)$. There are two natural ways to define a sequence $c = (c_0, c_1, c_2, \ldots)$ as the sum of $a$ and $b$. The first one is

$$c_n := (a_0 \oplus b_n) \ominus \cdots \ominus (a_n \oplus b_0),$$

and the second one is

$$c_n := b_n \ominus (a_0 \ominus b_0) \ominus \cdots \ominus (a_{n-1} \ominus b_0) \ominus a_n.$$
Our first aim, reached in Proposition 6.13 below, is to show that these two ways coincide.

**Lemma 6.10.** Let $A$ be an MMV-algebra, and let $x, y, z \in A$. If $(x, y)$ and $(y, z)$ are good pairs, then $(x, z)$ is a good pair.

**Proof.** We have $x \otimes z = (x \otimes y) \otimes z = x \otimes (y \otimes z) = x \otimes y = x$, and $x \otimes z = x \otimes (y \otimes z) = (x \otimes y) \otimes z = y \otimes z = z$. \hfill \Box

**Lemma 6.11.** Let $A$ be an MMV-algebra, let $n, m \in \mathbb{N}$, let $x_0, \ldots, x_n, y_0, \ldots, y_m \in A$ and suppose that, for every $i \in \{0, \ldots, n\}$ and every $j \in \{0, \ldots, m\}$, the pair $(x_i, y_j)$ is good. Then,

$$(x_0 \circ \cdots \circ x_n, y_0 \oplus \cdots \oplus y_m)$$

is a good pair.

**Proof.** The statement is trivial for $(n, m) = (0, 0)$. We prove the statement for $(n, m) = (1, 0)$. Case $(n, m) = (1, 0)$: $(x_0 \circ x_1) \oplus y_0 = x_0 \circ (x_1 \oplus y_0) = x_0 \circ x_1$, and $(x_0 \circ x_1) \oplus y_0 = x_0 \circ (x_1 \oplus y_0) = x_0 \oplus y_0 = y_0$. The case $(n, m) = (0, 1)$ is done analogously. Let $(n, m) \in \mathbb{N} \times \mathbb{N} \setminus \{(0, 0), (0, 1), (1, 0)\}$, and suppose that the statement is true for each $(h, k) \in \mathbb{N} \times \mathbb{N}$ such that $(h, k) \neq (n, m)$, $h \leq n$, $k \leq m$. We prove that the statement holds for $(n, m)$. At least one of the two conditions $n \neq 0$ and $m \neq 0$ holds. Suppose, for example, $n \neq 0$. Then, by inductive hypothesis, the pairs $(x_0 \circ \cdots \circ x_{n-1}, y_0 \oplus \cdots \oplus y_m)$ and $(x_n, y_0 \oplus \cdots \oplus y_m)$ are good. Now we apply the statement for the case $(1, 0)$, and we obtain that $(x_0 \circ \cdots \circ x_n, y_0 \oplus \cdots \oplus y_m)$ is a good pair. The case $m \neq 0$ is done analogously. \hfill \Box

**Proposition 6.12.** Let $A$ be an MMV-algebra, let $(x_0, x_1)$ be a good pair in $A$, and let $y \in A$. Then,

$$(x_0 \circ y) \circ x_1 = (x_0, x_1, y) = x_0 \circ (y \circ x_1).$$

**Proof.** We have $(x_0 \circ y) \circ x_1 = [(x_0 \circ x_1) \circ y] \circ (x_0 \circ x_1) = \sigma(x_0, x_1, y) = \hat{\sigma}(x_0, x_1, y) = [(x_0 \circ x_1) \circ y] \circ (x_0 \circ x_1) = (x_0 \circ (x_1 \circ y)) \circ (x_0 \circ x_1) = x_0 \circ (y \circ x_1).$ \hfill \Box

**Proposition 6.13.** Let $A$ be an MMV-algebra, let $m \in \mathbb{N}$, and let $(a_0, \ldots, a_m)$ and $(b_0, \ldots, b_m)$ be good sequences in $A$. Then,

$$(a_0 \oplus b_m) \circ \cdots \circ (a_m \oplus b_0) = a_0 \circ (a_1 \oplus b_m) \circ \cdots \circ (a_m \circ b_1) \circ b_0,$$

and

$$(a_0 \circ b_m) \circ \cdots \circ (a_m \circ b_0) = b_m \circ (a_0 \circ b_{m-1}) \circ \cdots \circ (a_{m-1} \circ b_0) \circ a_m.$$
The chain of equalities established in (1), (2) and (3) settles the first equality of the statement. The second one is ‘dual’. □

Given an MMV-algebra $M$, and given two good sequences $a = (a_0, a_1, a_2, \ldots)$ and $b = (b_0, b_1, b_2, \ldots)$, we set

$$a + b := (c_0, c_1, c_2, \ldots),$$

where

$$c_n := (a_0 \oplus b_n) \oplus \cdots \oplus (a_n \oplus b_0),$$

or, equivalently (by Proposition 6.13),

$$c_n := b_n \oplus (a_0 \oplus b_{n-1}) \oplus \cdots \oplus (a_{n-1} \oplus b_0) \oplus a_n.$$

In Proposition 6.16 below, we show that $a + b$ is a good sequence. In preparation for Proposition 6.16, we establish the following lemmas.

**Lemma 6.14.** Let $A$ be an MMV-algebra, and let $x, y \in A$. Then $(x \odot y, x \odot y)$ is a good pair.

Proof. We have

$$(x \oplus y) \odot (x \odot y) = [(x \odot y) \odot 1] \odot (x \odot y) = \sigma(x, y, 1) = \sigma(x, y, 1) =
= [x \odot y \odot (x \odot y) = 1 \odot (x \odot y) = x \odot y.

Dually, $(x \odot y) \odot (x \odot y) = x \odot y$.

**Lemma 6.15.** Let $(a_0, \ldots, a_n)$ and $(b_0, \ldots, b_n)$ be good sequences. Then,

$$((a_0 \oplus b_m) \oplus \cdots \oplus (a_m \oplus b_0), (a_0 \odot b_m) \oplus \cdots \oplus (a_m \odot b_0))$$

is a good pair.

Proof. By Lemma 6.11, it is enough to show that, for every $i, j \in \{0, \ldots, m\}$, the pair $(a_i \oplus b_{n-i}, a_j \odot b_{n-j})$ is good. The case $i = j$ is covered by Lemma 6.14. If $i < j$, then, by Lemma 6.14, $(a_i, a_j)$ is a good pair; by Lemma 6.3, $(a_i \odot b_{n-i}, a_j \odot b_{n-j})$ is a good pair. If $i > j$, then, by Lemma 6.14, $(b_{m-1}, b_{n-j})$ is a good pair; by Lemma 6.3, $(a_i \oplus b_{n-i}, a_j \odot b_{n-j})$ is a good pair.

**Proposition 6.16.** Let $A$ be an MMV-algebra, and let $a$ and $b$ be good sequences in $A$. Then, $a + b$ is a good sequence.

Proof. Let $n, m \in \mathbb{N}$ be such that, for every $j \geq n$ and every $k \geq m$, we have $a_j = 0$ and $b_k = 0$. Then, for every $h \geq n + m$, $c_h = 0$. Let $n \in \mathbb{N}$, then

$$c_n = (a_0 \oplus b_n) \oplus \cdots \oplus (a_n \oplus b_0) =$$

$$= (1 \oplus b_{n+1}) \oplus (a_0 \oplus b_n) \oplus \cdots \oplus (a_n \oplus b_0) \odot (a_{n+1} \oplus 1),$$

and

$$c_{n+1} = (1 \odot b_{n+1}) \oplus (a_0 \odot b_n) \oplus \cdots \oplus (a_n \odot b_0) \odot (a_{n+1} \odot 1).$$

By Lemma 6.15, $(c_n, c_{n+1})$ is a good pair.

**Proposition 6.17.** Sum of good sequences is commutative.

Proof. By commutativity of $\oplus$ and $\odot$, we have

$$a + b = (a_0 \oplus b_n) \oplus \cdots \oplus (a_n \oplus b_0) = (b_0 \oplus a_n) \oplus \cdots \oplus (b_n \oplus a_0) = b + a.$$

**Remark 6.18.** Let $A$ be an MMV-algebra, and let $a \in G(A)$. Then, $a + 0 = a$. □
Now, we want to show that the addition of good sequences is associative. In other words, we want to prove that, given an MMV-algebra $A$, for all $x, y, z \in G(A)$ we have $(x + y) + z = x + (y + z)$. A direct verification, which seems difficult in general, becomes treatable when $y$ is of the form $(y_0, 0, 0, \ldots)$ (Lemma 6.23 below). In fact, Light’s associativity test (Lemma 6.22 below) guarantees that this is enough to imply associativity, thanks to the fact that the elements of the form $(y_0, 0, 0, \ldots)$ ‘generate’ $G(A)$ (Lemma 6.19 below). In the following, we carry out the details.

**Lemma 6.19.** Let $A$ be an MMV-algebra, and let $(a_0, \ldots, a_n)$ be a good sequence in $A$. Then

$$(a_0, \ldots, a_n) = (a_0, \ldots, a_{n-1}) + (a_n).$$

**Proof.** Set $(b_0, b_1, b_2, \ldots) := (a_0, \ldots, a_{n-1}) + (a_n)$. For $k \in \{0, \ldots, n-1\}$, we have 

$$b_k = a_0 \circ a_1 \circ \cdots \circ a_{k-1} \circ (a_k \oplus a_n) = a_0 \circ a_1 \circ \cdots \circ a_{k-1} \circ a_k = a_k.$$ 

Moreover, $b_n = a_0 \circ a_1 \circ \cdots \circ a_{n-1} \circ a_n = a_n$, and, for $k > n$, we have $b_k = 0$. In conclusion, $(a_0, \ldots, a_n) = (b_0, b_1, b_2, \ldots) = (a_0, \ldots, a_{n-1}) + (a_n).$ \hfill $\square$

**Notation 6.20.** A magma $(X, \cdot)$ consists of a set $X$ a binary operation $\cdot$ on $X$. Given a subset $T$ of a magma $X$, we define, inductively on $n \in \mathbb{N}_{\geq 0}$, the subset $T_n$; we set $T_1 := T$, and, for $n \in \mathbb{N}_{>0}$, $T_n := \{tz \mid t \in T, z \in T_{n-1}\} \cup \{zt \mid t \in T, z \in T_{n-1}\}$. Roughly speaking, $T_n$ is the set of elements of $X$ which can be obtained with at most $n$ occurrences of elements of $T$ via application of the operation $\cdot$. We say that $T$ generates $X$ if $\bigcup_{n \in \mathbb{N}_{>0}} T_n = X$.

By induction, using Lemma 6.19 we obtain the following.

**Lemma 6.21.** Let $A$ be an MMV-algebra. The set $\{(x) \in G(A) \mid x \in A\}$ generates the magma $(G(A), +)$.

**Lemma 6.22** (Light’s associativity test). Let $(X, \cdot)$ be a magma, and let $T$ be a subset of $X$ that generates $X$. Suppose that, for every $x, z \in X$ and $t \in T$, $(xt)z = x(tz)$. Then, the operation $\cdot$ is associative.

**Proof.** Since $T$ generates $X$, we have $\bigcup_{n \in \mathbb{N}_{>0}} T_n = X$. We prove, by induction on $\mathbb{N}_{>0}$, that, for every $y \in T_n$, and every $x, y \in X$, we have $(xy)z = x(yz)$. The case $n = 1$ is ensured by hypothesis. Let $n \geq 2$, and suppose that the case $1, \ldots, n-1$ holds. Then, either $y = ty'$ or $y = y't$, for some $t \in T$ and $y' \in T_n$. Suppose, for example, $y = y't$. Then, $(xy)z = (x(ty'))z = ((xt)y')z = (xt)(y'z) = x((ty')z) = x(yz)$. The case $y = ty'$ is analogous. \hfill $\square$

**Lemma 6.23.** If $(x_0, x_1)$ and $(y_0, y_1)$ are good pairs, then

$$[x_0 \oplus y_1 \oplus (y_0 \oplus z)] \oplus [x_1 \oplus y_0 \oplus z] = [x_0 \oplus y_1 \oplus z] \oplus [x_1 \oplus y_1 \oplus (x_0 \oplus z)].$$

**Proof.** Since $(x_1 \oplus y_0 \oplus z, y_1)$ and $(x_0 \oplus (y_0 \oplus z), x_1)$ is a good pair, using Proposition 6.12 we obtain

$$[x_0 \oplus y_1 \oplus (y_0 \oplus z)] \oplus [x_1 \oplus y_0 \oplus z] = \{[x_1 \oplus y_0 \oplus z] \oplus [x_0 \oplus (y_0 \oplus z)]\} \oplus y_1 =$$

$$= \{[x_0 \oplus (y_0 \oplus z)] \oplus (y_0 \oplus z)\} \oplus x_1 \oplus y_1.$$ 

Analogously we have

$$[x_0 \oplus y_1 \oplus z] \oplus [x_1 \oplus y_1 \oplus (x_0 \oplus z)] = \{[y_0 \oplus (x_0 \oplus z)] \oplus (x_0 \oplus z)\} \oplus x_1 \oplus y_1.$$ 

Since $[x_0 \oplus (y_0 \oplus z)] \oplus (y_0 \oplus z) = [y_0 \oplus (x_0 \oplus z)] \oplus (x_0 \oplus z)$, we have $[x_0 \oplus y_1 \oplus (y_0 \oplus z)] \oplus [x_1 \oplus y_0 \oplus z] = [x_0 \oplus y_1 \oplus z] \oplus [x_1 \oplus y_1 \oplus (x_0 \oplus z)].$ \hfill $\square$
Lemma 6.24. Let $A$ be an MMV-algebra, let $n \in \mathbb{N}_{>0}$, let $(a_0, \ldots, a_n)$ and $(b_0, \ldots, b_n)$ be good sequences, and let $x \in A$. Then,

$$(a_0 \oplus b_n \oplus (b_{n-1} \circ x)) \circ \cdots \circ ((a_{n-1} \oplus b_1 \oplus (b_0 \circ x)) \circ (a_n \oplus b_0 \circ x) =
$$

$$(a_0 \oplus b_n \circ x) \circ (a_1 \oplus b_{n-1} \oplus (a_0 \circ x)) \circ \cdots \circ (a_n \oplus b_0 \oplus (a_{n-1} \circ x)).$$

Proof. We prove it by induction on $n \in \mathbb{N}_{>0}$. The case $n = 1$ reads as follows.

$$(a_0 \oplus b_1 \oplus (b_0 \circ x)) \circ (a_1 \oplus b_0 \oplus x) = (a_0 \oplus b_1 \oplus x) \circ (a_1 \oplus b_0 \oplus (a_0 \circ x)).$$

This is true by Lemma 6.23. Now let $n \in \mathbb{N} \setminus \{0, 1\}$, and suppose that the statement holds for $n - 1$. By inductive hypothesis, we have

$$(a_{n-1} \oplus b_1 \oplus (b_0 \circ x)) \circ (a_n \oplus b_0 \oplus x) = (a_{n-1} \oplus b_1 \oplus x) \circ (a_n \oplus b_0 \oplus (a_{n-1} \circ x)).$$

Hence,

$$(a_0 \oplus b_n \oplus (b_{n-1} \circ x)) \circ \cdots \circ (a_{n-1} \oplus b_1 \oplus (b_0 \circ x)) \circ (a_n \oplus b_0 \oplus x) =
$$

$$= (a_0 \oplus b_n \oplus (b_{n-1} \circ x)) \circ \cdots \circ (a_{n-2} \oplus b_2 \oplus (b_1 \circ x)) \circ (a_{n-1} \oplus b_1 \oplus x) \circ (a_n \oplus b_0 \oplus (a_0 \circ x)).$$

By inductive hypothesis,

$$(a_0 \oplus b_n \oplus (b_{n-1} \circ x)) \circ \cdots \circ (a_{n-2} \oplus b_2 \oplus (b_1 \circ x)) \circ (a_{n-1} \oplus b_1 \oplus x) =$$

$$= (a_0 \oplus b_n \oplus x) \circ (a_1 \oplus b_n-1 \oplus (a_0 \circ x)) \circ \cdots \circ (a_{n-1} \oplus b_1 \oplus (a_{n-2} \circ x)).$$

Hence,

$$[(a_0 \oplus b_n \oplus (b_{n-1} \circ x)) \circ \cdots \circ (a_{n-2} \oplus b_2 \oplus (b_1 \circ x)) \circ (a_{n-1} \oplus b_1 \oplus (a_0 \circ x))] \circ (a_n \oplus b_0 \oplus (a_0 \circ x)) =$$

$$= [(a_0 \oplus b_n \oplus x) \circ (a_1 \oplus b_n-1 \oplus (a_0 \circ x)) \circ \cdots \circ (a_{n-1} \oplus b_1 \oplus (a_{n-2} \circ x))] \circ$$

$$\circ (a_n \oplus b_0 \oplus (a_{n-1} \circ x)).$$

\[\square\]

Lemma 6.25. Let $A$ be an MMV-algebra. Let $a$ and $b$ be good sequences, and let $x \in A$. Then,

$$(a + (x)) + b = a + ((x) + b).$$

Proof. Set $d := a + (x)$. We have $d_0 = a_0 \oplus x$ and, for every $n \in \mathbb{N}_{>0}$, $d_n = a_n \oplus (a_{n-1} \circ x)$. Set $e := (x) + b$. Then, $e_0 = b_0 \oplus x$ and, for every $n \in \mathbb{N}_{>0}$, $e_n = b_n \oplus (b_{n-1} \circ x)$. We set $f := (a + (x)) + b$ and $g := a + ((x) + b)$. We have

$$f_n := (d_0 \oplus b_n) \circ \cdots \circ (d_n \oplus b_0) =$$

$$= (a_0 \oplus b_n \oplus x) \circ (a_1 \oplus b_{n-1} \oplus (a_0 \circ x)) \circ \cdots \circ (a_n \oplus b_0 \oplus (a_{n-1} \circ x)),$$

and

$$g_n := (a_0 \oplus e_n) \circ \cdots \circ (a_n \oplus e_0) =$$

$$= (a_0 \oplus b_n \oplus (b_{n-1} \circ x)) \circ \cdots \circ (a_{n-1} \oplus b_1 \oplus (b_0 \circ x)) \circ (a_n \oplus b_0 \circ x).$$

By Lemma 6.24, $f_n = g_n$.

\[\square\]

From Lemmas 6.24 and 6.21, we obtain the following.

Proposition 6.26. Sum of good sequences is associative.

Our next aim—reached in Proposition 6.30 below—is to show that good sequences satisfy $a + (b \vee c) = (a + b) \vee (a + c)$. We need some lemmas.

Lemma 6.27. If $(x_0, x_1)$ is a good pair, then $(z \oplus x_1) \circ y \leq [(z \oplus x_1) \circ x_0] \vee (z \circ y)$. 

\[\square\]
Proof. We have

\[(z \oplus x_1) \circ y = (z \oplus (x_0 \circ x_1)) \circ y = (\sigma(z, x_0, x_1) \lor z) \circ y =\]

\[= (\sigma(z, x_0, x_1) \lor y) \lor (z \circ y) \leq \sigma(z, x_0, x_1) \lor (z \circ y) \]

Prop. 6.12

\[= \left[ (z \oplus x_1) \circ x_0 \right] \lor (z \circ y). \]

Lemma 6.28. Let \(A\) be an MMV-algebra. If \((x_0, x_1)\) and \((y_0, y_1)\) are good pairs in \(A\), then

\[[(z \oplus x_1) \circ x_0] \lor [(z \oplus y_1) \circ y_0] = [z \oplus (x_1 \lor y_1)] \circ [x_0 \lor y_0].\]

Proof.

\[[(z \oplus (x_1 \lor y_1)) \circ [x_0 \lor y_0] = [(z \oplus x_1) \lor (z \oplus y_1)] \circ [x_0 \lor y_0] =\]

\[= [[(z \oplus x_1) \circ x_0] \lor [x_0 \lor y_0]] \circ [(z \oplus y_1) \circ (x_0 \lor y_0)] =\]

\[= [(z \oplus x_1) \circ x_0] \lor [(z \oplus y_1) \circ y_0] \circ [(z \oplus y_1) \circ y_0].\]

By Lemma 6.27

\[[(z \oplus x_1) \circ y_0] \leq [(z \oplus x_1) \circ x_0] \lor [(z \oplus y_1) \circ y_0],\]

and

\[[(z \oplus y_1) \circ x_0] \leq [(z \oplus y_1) \circ y_0] \lor [(z \oplus x_1) \circ x_0],\]

Therefore,

\[[(z \oplus x_1) \circ x_0] \lor [(z \oplus y_1) \circ y_0] \leq [(z \oplus y_1) \circ x_0] \lor [(z \oplus y_1) \circ y_0],\]

Prop. 6.29

Lemma 6.29. Let \(A\) be an MMV-algebra, let \(a \in A\) and let \(b, c\) be good sequences. Then, \((a)+(b \lor c) = ((a)+b) \lor ((a)+c)\).

Proof. We set \(d := (a) + (b \lor c)\). Then,

\[d_n = (a \oplus (b_n \lor c_n)) \circ (b_{n-1} \lor c_{n-1}) \circ \cdots \circ (b_0 \lor c_0) = (a \oplus (b_n \lor c_n)) \circ (b_{n-1} \lor c_{n-1}).\]

We set \(f := (a) + b, g := (a) + c\) and \(h := f \lor g = ((a) + b) \lor ((a) + c)\). We have

\[f_n = (a \oplus b_n) \circ b_{n-1} \circ \cdots \circ b_0 = (a \oplus b_n) \circ b_{n-1},\]

\[g_n = (a \oplus c_n) \circ c_{n-1} \circ \cdots \circ c_0 = (a \oplus c_n) \circ c_{n-1},\]

\[h_n = f_n \lor g_n = [(a \oplus b_n) \circ b_{n-1}] \lor [(a \oplus c_n) \circ c_{n-1}] = (a \oplus (b_n \lor c_n)) \circ (b_{n-1} \lor c_{n-1}) = d_n.\]

Proposition 6.30. Let \(A\) be an MMV-algebra, let \(a, b, c\) be good sequences. Then, \(a+(b \lor c) = (a+b) \lor (a+c)\).

Proof. Set \(A := \{ (x) \in G(A) \mid x \in A \}\). By Lemma 6.21 \(\hat{A}\) generates the magma \((G(A), +)\). Following notation 6.20 for \(n \in \mathbb{N}_{\geq 0}\), we denote with \(\hat{A}_n\) the subset of \(G(A)\) consisting of all elements of \(G(A)\) which can be obtained with at most \(n\) occurrences of elements of \(\hat{A}\) via application of the operation \(+\). We prove by induction on \(n \in \mathbb{N}_{\geq 0}\) that, for all \(a \in \hat{A}_n\) and \(b, c \in G(A)\), \(a+(b \lor c) = (a+b) \lor (a+c)\). The case \(n = 1\) is Lemma 6.29. Let us suppose that the statement holds for a fixed \(n \in \mathbb{N}_{\geq 0}\), and let us prove it for \(n+1\). Let \(a \in \hat{A}_{n+1}\), and \(b, c \in G(A)\). Then, there exists \(a' \in \hat{A}_n\) and \(x \in A\) such that \(a = a' + x\) or \(a = x + a'\). Since
addition is commutative by Proposition 6.17; these two conditions are equivalent. Hence, \( a = x + a' \). Then

\[
\begin{align*}
a + (b \lor c) &= (x + a') + (b \lor c) = x + (a' + (b \lor c)) = x + (a' + b) \lor (a' + c) = \[(x + a') + b] \lor (x + a' + c) = (a + b) \lor (a + c).
\end{align*}
\]

\( \Box \)

Analogously, one obtains the following.

**Proposition 6.31.** Let \( A \) be an MMV-algebra, let \( a, b, c \) be good sequences. Then, \( a + (b \land c) = (a + b) \lor (a + c) \).

Given a good sequence \( a = (a_0, a_1, a_2, \ldots) \) in an MMV-algebra \( A \), we set

\[
a \odot 1 := (a_1, a_2, a_3, \ldots).
\]

The sequence \( a \odot 1 \) is good sequence in \( A \).

**Theorem 6.32.** For an MMV-algebra \( A \), \( G(A) \) is a commutative positive-\( \ell \)-monoid.

**Proof.** By Proposition 6.8, \( G(A) \) is a distributive lattice. By Propositions 6.17, 6.26, and Remark 6.18, \( G(A) \) is a commutative monoid. By Proposition 6.30 and 6.31, \(+\) distributes over \( \land \) and \( \lor \). Thus, \( G(A) \) is a commutative \( \ell \)-monoid. Since the order in \( G(A) \) is pointwise (Remark 6.9), and \( 0 \) is the least element \( A \), we have (P1), i.e., \( 0 \) is the least element of \( G(A) \). By induction, one proves \( n1 = (1, \ldots, 1, 0, 0, 0, \ldots) \).

Since \( 1 \) is the maximum of \( A \), we have (P2), i.e., for all \( a \in G(A) \), there exists \( n \in \mathbb{N} \) such that \( a \leq n1 \). It is easy to see that \((a_0, a_1, a_2, \ldots) + 1 = (1, a_0, a_1, a_2, \ldots) \). Therefore, we have (P3), i.e., for all \( a \in G(A) \), \( a + 1 \circ 1 = a \). Finally, for all \( a \in G(A) \), we have \((a \odot 1) + 1 = a \lor 1 \), which establishes (P4).

Given a morphism of MMV-algebras \( f: A \to B \), we set

\[
G(f): G(A) \rightarrow G(B),
\]

\[
(x_0, x_1, x_2, \ldots) \mapsto (f(x_0), f(x_1), f(x_2), \ldots).
\]

**Lemma 6.33.** \( G(f) \) is a morphism of commutative positive-\( \ell \)-monoids.

**Proof.** Let us prove that \( G(f) \) preserves \( + \). Set \( z := x + y \), \( u := f(z) \), and \( w := f(x) + f(y) \). Let \( z = (z_0, z_1, z_2, \ldots) \), \( u = (u_0, u_1, u_2, \ldots) \) and \( w = (w_0, w_1, w_2, \ldots) \). We shall show \( u = w \). For each \( n \in \mathbb{N} \), we have \( z_n = (x_0 \oplus y_0) \odot \cdots \odot (x_n \oplus y_0) \).

Thus,

\[
u_n = f((x_0 \oplus y_0) \odot \cdots \odot (x_n \oplus y_0)) = (f(x_0) \oplus f(y_0)) \odot \cdots \odot (f(x_n) \oplus f(y_n)) = f((x_0 \oplus y_0) \odot \cdots \odot (x_n \oplus y_0)) = u_n.
\]

Therefore, \( G(f) \) preserves \( + \). Straightforward computations show that \( G(f) \) preserves also 0, 1, \( \lor \), \( \land \) and \( \odot \).

It is easy to see that \( G: MMV \rightarrow \ell M_n^+ \) is a functor.
7. MMV-algebras and commutative positive-\(\ell\)-monoids are equivalent

7.1. The functor \(U\). Let \(M\) be a commutative positive-\(\ell\)-monoid. We set \(U(M) := \{x \in M \mid x \leq 1\}\); \(U\) stands for ‘unital interval’. We endow \(M\) with the operations of MMV-algebra. The operations \(\lor, \land, 0, 1\) are defined by restriction. For \(x, y \in U(M)\), we set

\[x \oplus y := (x + y) \land 1,\]

and

\[x \otimes y := (x + y) \lor 1.\]

By the equivalence between \(\ell M_\ell^+\) and \(\ell M_\ell\), established in Theorem 4.17, and since \(\tilde{\Gamma}(M')\) is an MMV-algebra for any commutative u-\(\ell\)-monoid \(M'\) (Theorem 3.6), we have that \(U(M)\) is an MMV-algebra. Given a morphism \(f: M \to N\) of commutative positive-\(\ell\)-monoids, we set \(U(f): U(M) \to U(N)\) as the restriction of \(f\). This assignment establishes a functor

\[U: \ell M_\ell^+ \to \text{MMV}.\]

7.2. The unit. For each MMV-algebra \(A\), consider the function

\[\eta_A^1: A \to UG(A)\]

\[x \mapsto (x).\]

Proposition 7.1. Let \(A\) be an MMV-algebra. Then, \(\eta_A^1: A \to G(A)\) is an isomorphism of MMV-algebras.

Proof. The facts that \(\eta_A^1\) is a bijection and that it preserves \(0, 1, \lor, \land\) is immediate. Let \(x, y \in A\). Then,

\[(x) + (y) = (x \oplus y, x \otimes y).\]

Therefore

\[\eta_A^1(x) \oplus \eta_A^1(y) = (x) \oplus (y) = ((x) + (y)) \land 1 = (x \oplus y, x \otimes y) \land 1 = (x \oplus y) = \eta_A^1(x \oplus y),\]

and

\[\eta_A^1(x) \otimes \eta_A^1(y) = (x) \otimes (y) = ((x) + (y)) \lor 1 = (x \oplus y, x \otimes y) \lor 1 = (x \otimes y) = \eta_A^1(x \otimes y).\]

\[\square\]

Proposition 7.2. \(\eta^1: \text{1}_{\text{MMV}} \to UG\) is a natural transformation, i.e., for every morphism of MMV-algebras \(f: A \to B\), the following diagram commutes.

\[
\begin{array}{ccc}
A & \xrightarrow{\eta_A^1} & UG(A) \\
\downarrow f & & \downarrow UG(f) \\
B & \xrightarrow{\eta_B^1} & UG(B)
\end{array}
\]

Proof. For \(x \in A\) we have \((UG(f))(\eta_A^1(x)) = (UG(f))(()) = (G(f))(()) = (f(x)) = \eta_B^1(f(x))\).
7.3. The counit. For each commutative positive-uf-monoid, we consider the function
\[ \varepsilon^1_M : GU(M) \to M \]
\[ (x_0, \ldots, x_n) \mapsto x_0 + \cdots + x_n. \]

Our next goal, met in Theorem 7.12, is to prove that \( \varepsilon^1_M \) is bijective, i.e., a commutative positive-uf-monoid \( M \) is in bijection with the set of good sequences in its unital interval \( U(M) \).

Lemma 7.3. Let \( M \) be a commutative positive-uf-monoid, let \( x \in M \), and let \( n \in \mathbb{N} \). Then, the following properties hold.

1. \( x = (x \land n) + (x \lor n) \).
2. If \( x \leq n \), then \( x \land n = 0 \).

Proof. (1) \( (x \land n) + (x \lor n) + n \overset{\text{Lem. 4.15}}{=} (x \land n) + (x \lor n) \overset{\text{Lem. 3.3}}{=} x + n \). By Lemma 4.2, \( (x \land n) + (x \lor n) = x \).

(2) By Lemma 4.15, \( (x \lor n) + n = x \lor n = n = 0 + n \). By Lemma 4.2, \( x \land n = 0 \).

Lemma 7.4. Let \( M \) be a commutative positive-uf-monoid, let \( x \in M \), and let \( n, k \in \mathbb{N} \). Then,
\[ (x \land n) \land k = [x \land (n + k)] \lor n. \]

Proof. \( [(x \land n) \land k] + n = [(x \land n) + n] \land (k + n) \overset{\text{Lem. 4.15}}{=} (x \land n) \land (k + n) = [x \land (k + n)] \lor n \overset{\text{Lem. 4.15}}{=} [(x \land (k + n)) \lor n] + n \). By Lemma 4.2, \( (x \land n) \land k = [x \land (n + k)] \lor n \).

Lemma 7.5. Let \( M \) be a commutative positive-uf-monoid, let \( x \in M \) and let \( n \in \mathbb{N} \). Then,
\[ \{[(x \land n) \land 1] + [(x \lor (n + 1)) \land 1]\} \land 2 = (x \lor n) \land 2. \]

Proof. Let us prove it for \( n = 1 \) first. We recall that \( x \lor 0 = x \). We shall prove
\[ \{[(x \land 1) + [(x \lor 1) \land 1]\} \land 2 = x \land 2. \quad (4) \]

We have
\[ \{[(x \land 1) + [(x \lor 1) \land 1]\} \land 2] + 1 = \{[(x \land 1) + [(x \lor 1) \land 1]\} + 1 \land 3 = \]
\[ = \{(x \land 1) + [(x \lor 1) \land 2]\} \land 3 = \]
\[ = \{[(x \land 1) + (x \lor 1)] \land [(x \land 1) + 2]\} \land 3 = \]
\[ = [(x + 1) \land (x + 2) \land 3] \land 3 = (x + 1) \land 3 = \]
\[ = (x \land 2) + 1. \]

Hence, by Lemma 4.2, (4) is proven. This settles the case \( n = 0 \). Applying the case \( n = 0 \) to \( x \lor n \) (instead of \( x \)), we get
\[ \{[(x \lor n) \land 1] + [(x \lor n) \lor 1] \land 1\} \land 2 = (x \lor n) \land 2, \]
which is precisely the desired statement, since \( x \lor (n + 1) = (x \lor n) \lor 1 \).

Proposition 7.6. Let \( M \) be a commutative positive-uf-monoid, let \( x \in M \) and, for each \( n \in \mathbb{N} \), set \( x_n := (x \lor n) \land 1 \). Then, \( (x_0, x_1, x_2, \ldots) \) is a good sequence in \( U(M) \).
Proof. Since $x \leq n$ for some $n \in \mathbb{N}$, $(x_0, x_1, x_2, \ldots)$ is definitely 0, by Lemma 7.3 (2). We have

$$x_n \oplus x_{n+1} = (x_n + x_{n+1}) \land 1 = [(x_n + x_{n+1}) \land 2] \land 1 \overset{\text{Lem. 7.3}}{=} (x \lor n) \land 1 = (x \lor n) \land 1 = x_n.$$  

Moreover, we have

$$x_n \oplus x_{n+1} = (x_n + x_{n+1}) \lor 1 = [(x_n + x_{n+1}) \lor 1] \land 1.$$  

Hence,

$$(x_n \lor x_{n+1}) + 1 = \{(x_n + x_{n+1}) \lor 1\} + 1 = [(x_n + x_{n+1}) \lor 1] \land 2 = (x \lor n) \land 1 = 1.$$  

Thus, $x_n \lor x_{n+1} = x_{n+1}$.

**Proposition 7.7.** Let $M$ be a commutative positive-ul-monoid, and let $m \in \mathbb{N}$. Then, for every $x \in M$ such that $x \leq m$, we have

$$x = \sum_{n \in \{0, \ldots, m-1\}} (x \lor n) \land 1.$$  

Proof. We prove the statement by induction on $m \in \mathbb{N}$. If $m = 0$, then $x = 0$, and the assertion holds. Let us suppose that it holds for a fixed $m$, and let us prove that it holds for $m + 1$. We recall that, by Lemma 7.3, $(x \lor n) \land 1 = [x \land (n+1)] \lor n$. We have

$$x = \sum_{n \in \{0, \ldots, m-1\}} (x \land m) + (x \lor m) \overset{\text{Lem. 7.3}}{=} [(x \land m) \land (x \land m)] \land 1 \overset{\text{ind. hyp.}}{=} x \land (m+1) \lor n = \sum_{n \in \{0, \ldots, m\}} (x \land (n+1)) \lor n = \sum_{n \in \{0, \ldots, m\}} (x \land (n+1)) \lor n.$$  

**Lemma 7.8.** Let $M$ be a commutative positive-ul-monoid, and let $m \in \mathbb{N}$. Then, for every $(x_0, \ldots, x_m)$ good sequence in $U(M)$, we have

$$(x_0 + \cdots + x_m) \land 1 = x_0.$$  

Proof. We prove the statement by induction on $m \in \mathbb{N}$. The case $m = 0$ is trivial. Suppose the statement holds for a fixed $m \in \mathbb{N}$, and let us prove it for $m + 1:

$$(x_0 + \cdots + x_{m+1}) \land 1 = (x_0 + \cdots + x_{m+1}) \land (1 + x_0 + \cdots + x_{m-1}) \land 1 = \{x_0 + \cdots + x_{m-1} + [(x_m + x_{m+1}) \land 1] \land 1 \overset{\text{ind. hyp.}}{=} x_0.$$
Lemma 7.9. Let $M$ be a commutative positive-u\textendash monoid, and let $m \in \mathbb{N}$. For every $(x_0, \ldots, x_m)$ good sequence in $U(M)$, we have
\[
(x_0 + \cdots + x_m) \cap m = x_m. \tag{5}
\]

Proof. We prove the statement by induction on $m \in \mathbb{N}$. (5) is equivalent to $[(x_0 + \cdots + x_m) \cap m] + m = x_m + m$, i.e., $(x_0 + \cdots + x_m) \lor m = x_m + m$. The case $m = 0$ is trivial. Suppose (5) holds for a fixed $m \in \mathbb{N}$, and let us prove it for $m + 1$. We have
\[
(x_0 + \cdots + x_{m+1}) \lor (m + 1) = (x_0 + \cdots + x_{m+1}) \lor (1 + x_2 + \cdots + x_{m+1}) \lor (m + 1) =
\]
\[
= \{x_2 + \cdots + x_{m+1} + [(x_0 + x_1) \lor 1]\} \lor (m + 1) = (x_2 + \cdots + x_{m+1} + x_1 + 1) \lor (m + 1) =
\]
\[
= 1 + [(x_1 + \cdots + x_{m+1}) \lor m] \text{ ind. hyp.} \quad 1 + x_{m+1} + m = x_{m+1} + (m + 1).
\]

\[]

Lemma 7.10. Let $M$ be a commutative positive-u\textendash monoid, and let $k \in \mathbb{N}$. Then, for every $n \in \mathbb{N}$ and $(x_0, \ldots, x_{n-1}, x_n, \ldots, x_{n+k})$ good sequence in $U(M)$, we have
\[
(x_0 + \cdots + x_{n-1} + x_n + \cdots + x_{n+k}) \cap n = x_n + \cdots + x_{n+k}. \tag{6}
\]

Proof. We prove this statement by induction on $k \in \mathbb{N}$. The case $k = 0$ is treated in Lemma 7.9. Suppose that the statement holds for a fixed $k \in \mathbb{N}$, and let us prove that it holds for $k + 1$. Adding $n$ on both sides, (6) is equivalent to $(x_0 + \cdots + x_{n+k}) \lor n = n + x_n + \cdots + x_{n+k}$. We have
\[
\begin{align*}
& n + x_n + \cdots + x_{n+k+1} = (n + x_n + \cdots + x_{n+k}) + x_{n+k+1} \quad \text{ind. hyp.} \\
& = ([x_0 + \cdots + x_{n+k}] \lor n) + x_{n+k+1} = \\
& = (x_0 + \cdots + x_{n+k} + x_{n+k+1}) \lor n + x_{n+k+1} \quad \text{base case} = \\
& = (x_0 + \cdots + x_{n+k+1}) \lor [(x_{k+1} + \cdots + x_{n+k+1}) \lor n] = \\
& = (x_0 + \cdots + x_{n+k+1}) \lor n.
\end{align*}
\]

\[]

Proposition 7.11. Let $M$ be a commutative positive-u\textendash monoid, let $m \in \mathbb{N}$, and let $(x_0, \ldots, x_m)$ and $(y_0, \ldots, y_m)$ be good sequences in $U(M)$. If $x_0 + \cdots + x_m = y_0 + \cdots + y_m$, then, for all $i \in \{0, \ldots, m\}$, $x_i = y_i$.

Proof. We prove the statement by induction on $m$. The case $m = 0$ is trivial. Suppose that the statement holds for a fixed $m \in \mathbb{N}$, and let us prove it for $m + 1$. By Lemma 7.8, $x_0 = (x_0 + \cdots + x_{m+1}) \cap 1 = (y_0 + \cdots + y_{m+1}) \cap 1 = y_0$. By Lemma 7.10,
\[
x_1 + \cdots + x_{m+1} = (x_0 + x_1 + \cdots + x_{m+1}) \cap 1 = (y_0 + y_1 + \cdots + y_{m+1}) \cap 1 = y_1 + \cdots + y_{m+1}.
\]

By inductive hypothesis, for all $i \in \{1, \ldots, m + 1\}$, $x_i = y_i$.

\[]

Theorem 7.12. Let $M$ be a commutative positive-u\textendash monoid, and let $x \in M$. Then, there exists exactly one good sequence $(x_0, \ldots, x_m)$ in $U(M)$ such that $x = x_0 + \cdots + x_m$, given by
\[
x_n = (x \cap n) \cap 1.
\]

In other words, $\varepsilon^1_M : GU(M) \rightarrow M$ is bijective.

Proof. Propositions 7.7 and 7.10 show that $x_n = (x \cap n) \cap 1$ works. Uniqueness is ensured by Proposition 7.11.

\[]

Our next goal is to prove that $\varepsilon^1_M$ is a morphism of commutative positive-u\textendash monoids (Proposition 7.19 below). We need some lemmas.
Lemma 7.13. Let $M$ be a commutative positive-\ell-monoid, and let $n \in \mathbb{N}_{>0}$. Then, for every $m \in \mathbb{N}$ and $(x_0, \ldots, x_m)$ good sequence in $\mathbb{U}(M)$, we have
\[ (x_0 + \cdots + x_m) \land n = x_0 + \cdots + x_{n-1}. \]

Proof. We prove it by induction on $n$. The case $n = 1$ is ensured by Lemma 7.8.

Suppose the statement holds for $n - 1$. We have
\[ (x_0 + \cdots + x_m) \land n = ((x_0 + \cdots + x_m) \land n) + ((x_0 + \cdots + x_m) \lor n) \lor 1 = \]
\[ = (x_0 + \cdots + x_m) \land 1 + ((x_0 + \cdots + x_m) \lor 1) \land (n - 1) = \]
\[ = x_0 + [(x_0 + \cdots + x_m) \lor 1] \land (n - 1) \]
\[ \text{Lemma 7.10} \]
\[ = x_0 + (x_1 + \cdots + x_m) \land (n - 1) = \]
\[ \text{ind. hyp.} \]
\[ x_0 + x_1 + \cdots + x_{n-1}. \]
\[ \square \]

Lemma 7.14. Let $M$ be a commutative positive-\ell-monoid, let $(x_0, \ldots, x_m)$ and $(y_0, \ldots, y_m)$ be good sequences in $\mathbb{U}(M)$. Then,
\[ \{(x_0 + \cdots + x_m) \lor (y_0 + \cdots + y_m)\} \land n \land 1 = x_n \lor y_n, \]
\[ \text{(7)} \]
and
\[ \{(x_0 + \cdots + x_m) \land (y_0 + \cdots + y_m)\} \land n \land 1 = x_n \land y_n. \]
\[ \text{(8)} \]

Proof. Let us prove (7). Set $x := x_0 + \cdots + x_n$, and $y := y_0 + \cdots + y_n$. By Theorem 7, we have $x_n = (x \lor n) \land 1$ and $y_n = (y \lor n) \land 1$. Adding $n$ on both sides of (7), we obtain the equivalent statement
\[ [(x \lor y) \land n] \land (n + 1) = [x \land (n + 1)] \lor [(y \land n) \land (n + 1)], \]
which holds by the distributivity laws. The proof of (8) is analogous. \[ \square \]

Lemma 7.15. Let $M$ be a commutative positive-\ell-monoid, let $n \in \mathbb{N} \setminus \{0\}$, and let $x, y \in M$ be such that $y \leq n$. Then,
\[ (x + y) \kat n = [x \kat (n - 1) + y] \kat 1. \]

Proof.
\[ [x \kat (n - 1) + y] \kat 1 + n = [x \kat (n - 1) + y] \kat 1 + 1 + (n - 1) = \]
\[ = [x \kat (n - 1) + y] \lor 1 + (n - 1) = \]
\[ = [x \kat (n - 1) + y] \lor (n - 1] \lor n = \]
\[ = \{(x \lor (n - 1]) + y\} \lor n = \]
\[ = [(x + y) \lor (y + (n - 1)] \lor n \geq 1 (x + y) \lor n = \]
\[ = [(x + y) \kat n] + n. \]
\[ \square \]

Lemma 7.16. Let $M$ be a commutative positive-\ell-monoid, let $n \in \mathbb{N} \setminus \{0\}$, and let $x, y \in M$. Then,
\[ (x + y) \land n = [(x \land n) + y] \land n. \]

Proof. \[ [(x \land n) + y] \land n = (x + y) \land (n + y) \land n = (x + y) \land n. \]
\[ \square \]

Lemma 7.17. Let $M$ be a commutative positive-\ell-monoid, let $(x_0, x_1)$ be a good pair in $\mathbb{U}(M)$, and let $y \in M$ such that $y \leq 1$. Then,
\[ [(x_0 + x_1 + y) \lor 1] \land 1 = (x_1 \lor y) \lor x_0. \]
\[ \square \]
Proof. Set \( x := x_0 + x_1 \). We have \( x_0 = x \land 1 \). Moreover,
\[
(x_1 \oplus y) \odot x_0 = \left[\left( x_0 + y \right) \land 1 \right] \odot 1 = \left[\left( x_0 + x_1 + y \right) \land (x_0 + 1) \right] \odot 1 = \left[\left( x_0 + y \right) \land 1 \right] \odot 1 = \left[\left( x_0 + y \right) \land 2 \right] \odot 1 = \left[\left( x_0 + y \right) \land 1 \right] \odot 1 \text{.}
\]
and
\[
\left( x_0 + y \right) \odot 1 \land 1 \odot 1 = \left[\left( x_0 + y \right) \land 2 \right] \odot 1 = \left[\left( x_0 + y \right) \land 1 \right] \odot 1 .
\]

\[ \Box \]

**Lemma 7.18.** Let \( M \) be a commutative positive-ul-monoid, let \((x_0, \ldots, x_m)\) be a good sequence in \( U(M) \), let \( y \in U(M) \), and let \( n \in \mathbb{N} \). Then,
\[
\big\{(x_0 + \cdots + x_m + y) \odot n\big\} \land 1 = (x_n \odot y) \odot (x_{n-1} - 1).
\]

(By convention, we set \( x_{-1} = 1 \).)

**Proof.** Case \( n = 0 \).
\[
\big\{(x_0 + \cdots + x_m + y) \odot 0\big\} \land 1 = \left( (x_0 + x_1 + y) \land 1 \right) \odot 1 = (x_0 + y) \land 1 = x_0 \odot y .
\]

Case \( n \neq 0 \).
\[
\big\{(x_0 + \cdots + x_m + y) \odot n\big\} \land 1 \odot 1 = \left( (x_0 + x_1 + y) \land 1 \right) \odot 1 = \left( (x_n + x_{n+1} + y) \land 2 \right) \odot 1 = \left( (x_n + x_{n+1} + y) \land 1 \right) \odot 1 = (x_1 \odot y) \odot x_0 .
\]

\[ \Box \]

**Proposition 7.19.** \( \varepsilon_M^1 \) is a morphism of commutative positive-ul-monoids.

**Proof.** Clearly, \( \varepsilon_M^1 \) preserves \( 1 \). Let us prove that \( \varepsilon_M^1 \) preserves \( \lor \). Let \( x = (x_0, \ldots, x_m) \) and \( y = (y_0, \ldots, y_n) \) be good sequences in \( U(M) \). We shall prove \( (x_0 + \cdots + x_m) \lor (y_0 + \cdots + y_n) = (x_0 \lor y_0) + \cdots + (x_m \lor y_n) \). By Proposition 6.7, \( (x_0 \lor y_0, \ldots, x_m \lor y_n) \) is a good sequence. By Theorem 7.14, it is enough to show that, for every \( n \in \mathbb{N} \), \( \left[\left( (x_0 + \cdots + x_m) \lor (y_0 + \cdots + y_n) \right) \odot n\right] \land 1 = x_n \lor y_n \). This holds by Lemma 7.14. Analogously, \( \varepsilon_M^1 \) preserves \( \land \).

Let us prove that \( \varepsilon_M^1 \) preserves \( \oplus \). We prove, by induction on \( n \in \mathbb{N} \), that, for all \( m \in \mathbb{N} \), and for all \( (x_0, \ldots, x_m) \) and \( (y_0, \ldots, y_n) \) good sequences in \( U(M) \), we have \( \varepsilon_M^1((x_0, \ldots, x_m) + (y_0, \ldots, y_n)) = \varepsilon_M^1(x_0, \ldots, x_m) + \varepsilon_M^1(y_0, \ldots, y_n) \), i.e.,
\[
\varepsilon_M^1((x_0, \ldots, x_m) + (y_0, \ldots, y_n)) = x_0 + \cdots + x_m + y_0 + \cdots + y_n .
\]

Let us prove the base case \( n = 0 \). Let \( m \in \mathbb{N} \), let \( (x_0, \ldots, x_m) \) be a good sequence in \( U(M) \), and let \( y \in U(M) \). Then, from the definition of sum of good sequences, we obtain that \( (x_0, \ldots, x_m) \lor (y) \) is the good sequence \( (z_0, \ldots, z_{m+1}) \) where, for every \( k \in \mathbb{N} \), \( z_k = (x_k \lor y) \odot x_k - 1 \) (where, by convention, \( x_{-1} = 1 \)). By Lemma
for every $k \in \mathbb{N}$, we have $[(x_0 + \cdots + x_m + y) \otimes k] \land 1 = (x_k \oplus y) \otimes x_{k-1} = z_k$.

By Theorem 7.12 $z_0 + \cdots + z_{m+1} = x_0 + \cdots + x_m + y$; this settles the base case.

Let us suppose that the case $n$ holds, for a fixed $n \in \mathbb{N}$, and let us prove the case $n + 1$. Let $m \in \mathbb{N}$, and let $(x_0, \ldots, x_m)$ and $(y_0, \ldots, y_{n+1})$ be good sequences in $U(M)$. By Lemma 6.19 we have $(y_0, \ldots, y_{n+1}) = (y_0, \ldots, y_n) + (y_{n+1})$. Therefore,

$\varepsilon_1^M((x_0, \ldots, x_m) + (y_0, \ldots, y_{n+1})) = \varepsilon_1^M((x_0, \ldots, x_m) + ((y_0, \ldots, y_n) + (y_{n+1}))) = \\
\varepsilon_1^M((x_0, \ldots, x_m)+(y_0, \ldots, y_{n+1})) \text{ case } n=0 \varepsilon_1^M((x_0, \ldots, x_m)+(y_0, \ldots, y_n)) + \\
\varepsilon_1^M((y_{n+1})) \text{ induction } \varepsilon_1^M((x_0, \ldots, x_m)) + \varepsilon_1^M((y_0, \ldots, y_n)) + y_{n+1} = x_0 + \cdots + x_m + y_0 + \cdots + y_n + y_{n+1}. \\
\varepsilon_1^M$ is an equivalence of categories.

**Proposition 7.20.** $\varepsilon_1 : GU \rightarrow \ell M_u$ is a natural transformation, i.e., for every morphism of commutative positive-ul-monoids $f : M \rightarrow N$, the following diagram commutes.

\[
\begin{array}{ccc}
GU(M) & \xrightarrow{\varepsilon_1^M} & M \\
\downarrow{GU(f)} & & \downarrow{f} \\
GU(N) & \xrightarrow{\varepsilon_1^N} & N
\end{array}
\]

**Proof.** Let $(x_0, \ldots, x_m) \in GU(M)$. Then,

$\varepsilon_1^N((GU(f)((x_0, \ldots, x_m))) = \varepsilon_1^N(((U(f))(x_0), \ldots, (U(f))(x_m))) = \\
= \varepsilon_1^N((f(x_0), \ldots, f(x_m))) = \\
= f(x_0) + \cdots + f(x_m) = f(x_0 + \cdots + x_m) = \\
= f(\varepsilon_1^M(x_0, \ldots, x_m)).
\]

\[
\square
\]

7.4. $U$ and $\tilde{\Gamma}$ are equivalences.

**Theorem 7.21.** The functors $U$ and $G$ in the diagram are quasi-inverses.

\[
\begin{array}{ccc}
\ell M_u & \xrightarrow{G} & MMV \\
U & \xleftarrow{\tilde{\Gamma}} & \xrightarrow{U} MMV
\end{array}
\]

**Proof.** The functors $1_{MMV} : MMV \rightarrow MMV$ and $UG : MMV \rightarrow MMV$ are naturally isomorphic, by Propositions 7.11 and 7.2. The functors $1_{M_u^+} : \ell M_u^+ \rightarrow \ell M_u^+$ and $GU: \ell M_u^+ \rightarrow \ell M_u^+$ are naturally isomorphic, by Propositions 7.19, 7.20 and Theorem 7.12.

We are ready to prove the main result of the paper.

**Theorem 7.22.** The functor $\tilde{\Gamma}: \ell M_u \rightarrow MMV$ is an equivalence of categories.

**Proof.** The functor $\tilde{\Gamma}$ is the composite of $(-)^+$ and $U$, which are equivalences by Theorems 4.17 and 7.21.

Notice that, by Theorems 4.17 and 7.21 a quasi-inverse of $\tilde{\Gamma}$ is given by the composite $TG$.
The reason why we have constructed a quasi-inverse of $\hat{\Gamma}$ as the composite of two functors is because in this way the proofs seemed easier. Anyway, one could construct directly a quasi-inverse of $\hat{\Gamma}$ by considering, for any MMV-algebra $A$, the set of $\mathbb{Z}$-indexed good sequences $(\ldots, x_{-2}, x_{-1}, x_0, x_1, x_2, \ldots)$, where $x_n = 1$ for $n$ close enough to $-\infty$, $x_n = 0$ for $n$ close enough to $+\infty$, and $(x_n, x_{n+1})$ a good pair for every $n \in \mathbb{Z}$.

8. Further research

There are several interesting results about commutative $\ell$-monoids in the literature, that suggest similar results for algebras in the language $\langle \oplus, \odot, \lor, \land, 0, 1 \rangle$. For example, in [13] it is shown that the variety generated by $(\mathbb{R}, +, \lor, \land)$ is not finitely based; in particular, we conjecture that the variety of MMV-algebras is not generated by $[0, 1]$.

We suspect that one could also use the results in the present paper to deduce a nice axiomatization of the quasi-variety generated by $([0, 1], \oplus, \odot, \lor, \land, 0, 1)$ and of the class of $[\oplus, \odot, \lor, \land, 0, 1]$-subreducts of MV-algebras (conjecturally, these two classes coincide).

Finally, the results in [7] about algebras of the form $C_ε(X, [0, 1])$ suggest, via translation to $\ell$-monoids, that the category of partially ordered compact spaces is dually equivalent to the category of ‘cancellable divisible Archimedean metrically complete commutative $\ell_\ell$-monoids’—appropriate definitions would be needed here, in analogy with the case of $\ell$-groups.

Appendix A. The equivalence restricts to lattice-ordered groups and MV-algebras

**Definition A.1.** An Abelian lattice-ordered group (Abelian $\ell$-group, for short) is a set $G$ endowed with operations $\lor, \land, +, 0, -$ of arities $2, 2, 2, 0, 1$, such that $(M, \lor, \land)$ is a distributive lattice, $(M, +, 0, -)$ is an Abelian group, and + distributes over $\lor$ and $\land$. A unital Abelian lattice-ordered group (Abelian $\ell_\ell$-group, for short) is an Abelian $\ell$-group $G$ with a distinguished element $1 \in G$, which is a strong (order) unit, i.e., $0 \leq 1$ and for all $x \in M$, there exists $n \in \mathbb{N}$ such that $x \leq n1$.

A morphism of Abelian $\ell_\ell$-groups is a function that preserves the operations $\lor, \land, +, 0, -, 1$. We denote with $\ell\mathbf{G}_u$ the category of Abelian $\ell_\ell$-groups. For all basic notions and results about lattice-ordered groups, we refer to [2].

We have a forgetful functor $U_g : \ell\mathbf{G}_u \to \ell\mathbf{M}_u$, which maps an Abelian $\ell_\ell$-group $G$ to the commutative $\ell_\ell$-monoid which has the same underlying set of $G$, where $+, \lor, \land, 0, 1$ are defined as in $G$, and where $-1$ is defined as the opposite in $G$ of $1$.

A morphism $\phi$ in $\ell\mathbf{G}_u$ is mapped to the function $\phi$ itself. It is easy to verify that the forgetful functor $U_g : \ell\mathbf{G}_u \to \ell\mathbf{M}_u$ is full, faithful, injective on objects, and that the objects in the image are precisely the commutative $\ell_\ell$-monoids such that every element has an inverse. Hence, the category of Abelian $\ell_\ell$-groups coincides with the full subcategory of $\ell\mathbf{M}_u$ given by those $M \in \ell\mathbf{M}_u$ such that each element of $M$ has an inverse.

**Definition A.2.** An MV-algebra $(A, \oplus, \neg, 0)$ is a set $A$ equipped with a binary operation $\oplus$, a unary operation $\neg$ and a constant $0$ such that $(A, \oplus, 0)$ is a commutative monoid, $\neg 0 \oplus x = \neg x$, $\neg(\neg x \oplus y) \oplus y = \neg(\neg y \oplus x) \oplus x$.

Via $\oplus, \neg, 0$, one defines the operations $1 := 0, x \circ y := (x \oplus \neg y) \oplus y, x \lor y := (x \land \neg y) \oplus y, x \land y := x \land (\neg x \lor y)$. Morphisms of MV-algebras are functions that
preserve $\oplus, \neg, 0$ (and thus $1, \odot, \lor, \land$). We denote the category of MV-algebras with MV. For all basic notions and results about MV-algebras we refer to [5].

**Lemma A.3.** For each MV-algebra $A$, $(A, \oplus, \odot, \lor, \land, 0, 1)$ is an MMV-algebra.

**Proof.** It is well known that (A1-A5) hold. The fact that in any MV-algebra the equation (A6) holds is proven in [3, Proposition 3.3, (8)]. The equation (A7) appears as (9) in the proof of [3, Proposition 3.3]; there it is proven. Using the fact that, for every $x, y \in [0, 1]$, either $x \odot y = 1$ or $x \odot y = 0$, one easily proves that (A8-A9) hold in $[0, 1]$. Since $[0, 1]$ generates the variety of MV-algebras [3, Theorem 2.3.5], (A8-A9) hold in any MV-algebra. \[ \Box \]

We have a forgetful functor $U_{mv}: MV \rightarrow MMV$, which maps an MV-algebra $A$ to the MMV-algebra which has the same underlying set of $A$, where $\odot, \odot, \lor, \land, 0, 1$ are defined as in $A$. By Lemma A.3 this assignment is well defined. The forgetful functor $U_{mv}$ maps a morphism $\phi$ in MV to the function $\phi$ itself.

**Lemma A.4.** Let $A$ be an MMV-algebra, and let $x, y, z \in A$. Then

$$x \odot (y \oplus z) \leq (x \odot y) \oplus z.$$  

**Proof.** $x \odot (y \oplus z) = \sigma(x, y, z) \land x \leq \sigma(x, y, z) \lor x = (x \odot y) \oplus z$. \[ \square \]

It is easy to see that the forgetful functor $U_{mv}: MV \rightarrow MMV$ is full, faithful and injective on objects.

**Lemma A.5.** The objects in the image of the forgetful functor $U_{mv}: MV \rightarrow MMV$ are precisely the MMV-algebras $M$ such that, for every $x \in M$, there exists $y \in M$ such that $x \odot y = 1$ and $x \odot y = 0$.

**Proof.** If $A$ in an MV-algebra, then, for every $x \in A$, we have $x \odot \neg x = 1$ and $x \odot \neg x = 0$. This settles one direction.

For the converse direction, let $M$ be an MMV-algebra, and suppose that, for every $x \in M$, there exists $y \in M$ such that $x \odot y = 1$ and $x \odot y = 0$. We claim that such an element $y$ is unique. Indeed, let $y, z \in M$ be such that $x \odot y = 1$, $x \odot y = 0$, $x \odot z = 1$ and $x \odot z = 0$. Then,

$$y = 0 \oplus y = (z \odot x) \oplus y \overset{\text{Lem. A.4}}{\geq} x \odot (x \odot y) = z \odot 1 = z.$$  

Analogously, $z \geq y$. Thus, $y = z$.

For every $x \in M$, we let $\neg x$ denote the element such that $x \odot \neg x = 1$ and $x \odot \neg x = 0$. We have $\neg 0 = 1$, because $0 \oplus 1 = 1$, and $0 \oplus 1 = 1$. Hence, $x \oplus -0 = x \oplus 1 = 1 = \neg 0$. We have $\neg x = x$, because $\neg x \odot x = x \oplus \neg x = 1$, and $\neg x \odot x = x \odot \neg x = 0$.

Moreover, we have

$$x \odot y = \neg (\neg x \oplus \neg y),$$  

because

$$(x \odot y) \oplus (\neg x \oplus \neg y) = [(x \odot y) \oplus \neg x] \oplus \neg y \overset{\text{Lem. A.4}}{=} [(x \oplus \neg x) \odot y] \oplus \neg y =$$

$$= (1 \odot y) \oplus \neg y = y \oplus \neg y = 1$$

(and hence $(x \odot y) \oplus (\neg x \oplus \neg y) = 1$), and

$$(x \odot y) \odot (\neg x \oplus \neg y) = x \odot [y \odot (\neg x \oplus \neg y)] \overset{\text{Lem. A.4}}{\leq} x \odot [(y \odot \neg x) \oplus \neg x] =$$

$$= x \odot [0 \oplus \neg x] = x \odot \neg x = 0$$

(and hence $(x \odot y) \odot (\neg x \oplus \neg y) = 0$).
Moreover, we have
\[ \sigma(x, -x, y) = [(x \odot -x) \oplus y] \odot (x \oplus -x) = [0 \oplus y] \odot 1 = y. \]

We have
\[ \neg(-x \oplus y) \oplus y = (x \odot -y) \oplus y = \sigma(x, -y, y) \lor y = x \lor y, \]
Analogously, \[\neg(y \oplus x) \oplus x = y \lor x. \] Hence, \[\neg(x \oplus y) \oplus y = x \lor y = \neg(-y \oplus x) \oplus x. \quad \square \]

Thus, the category of MV-algebras coincides with the full subcategory of MMV given by those \( M \in \text{MMV} \) such that, for every \( x \in M \), there exists \( y \in M \) such that \( x \oplus y = 1 \) and \( x \odot y = 0 \).

**Theorem A.6.** The equivalence \( \tilde{\Gamma} : \ell M_u \to \text{MMV} \) restricts to an equivalence between \( \ell G_u \) and MV.

**Proof.** We shall prove that, for any \( M \in \ell M_u \), the following conditions are equivalent.

1. Every element of \( M \) is invertible.
2. For every \( x \in \tilde{\Gamma}(M) \), there exists \( y \in \tilde{\Gamma}(M) \) such that \( x \oplus y = 1 \) and \( x \odot y = 0 \).

Let us prove that (1) implies (2). Suppose that every element \( x \) of \( M \) admits an inverse \(-x\). Let \( x \in \tilde{\Gamma}(M) \). We shall prove that there exists \( y \in \tilde{\Gamma}(M) \) such that \( x \oplus y = 1 \) and \( x \odot y = 0 \). Set \( y := 1 - x \). It is immediate that \( y \in \tilde{\Gamma}(M) \). We have \( x \oplus y = (x + 1) \land 1 = (x + 1 - x) \land 1 = 0 \land 1 = 0, \) and \( x \odot y = (x + y - 1) \lor 0 = (x + 1 - x - 1) \lor 0 = 0 \lor 0 = 0 \).

Let us prove that (2) implies (1). We first prove that every element \( x \in \tilde{\Gamma}(M) \) admits an inverse. For \( x \in \tilde{\Gamma}(M) \), let \( y \in \tilde{\Gamma}(M) \) be such that \( x \oplus y = 1 \) and \( x \odot y = 0 \). The element \( y - 1 \) is the inverse of \( x \), because \( x + (y - 1) = [(x + y - 1) \lor 0] + [(x + y - 1) \land 0] = (x \odot y) + \{[(x + y - 1) \land 1] - 1\} = (x \odot y) + (x \odot y) - 1 = 0 + 1 - 1 = 0 \).

Every element of \( G \) is invertible because it may be written be written as a sum of elements of \( \tilde{\Gamma}(M) \cup \{-1\} \). \( \square \)

**Remark A.7.** To establish Theorem A.6 we have made use of the axiom of choice. Precisely, we used the choice-based fact that \([0, 1]\) generates the variety of MV-algebras in order to verify that the axioms of MMV-algebras are satisfied by every MV-algebra (Lemma A.3). If one proved without the axiom of choice that the axioms of MMV-algebras are satisfied by every MV-algebra (and we suspect this to be possible), one would have a choice-free proof of Mundici’s equivalence.

**Appendix B. Subdirectly irreducible MV-algebras are totally ordered**

In this section we prove that any subdirectly irreducible MV-algebra is totally ordered (Theorem B.3). In Appendix C, we will prove that any good sequence in a subdirectly irreducible MV-algebra is of the form \((1, \ldots, 1, x, 0, 0, \ldots)\) (Corollary C.4) (or, equivalently, that, for every \( x, y \), either \( x \oplus y = 1 \) or \( x \odot y = 0 \)). To prove these results, one could use two different approaches: either one provides a direct proof, or one uses what is known about subdirectly irreducible \( \ell \)-monoids and the fact that \( \tilde{\Gamma} \) is an equivalence. We will provide a direct proof, that does not make use of the fact \( \tilde{\Gamma} \) is an equivalence; at the end of Appendix C, some comments are made about the other approach.

The aim of this section is to prove that subdirectly irreducible MV-algebras are totally ordered. To do so, we proceed in analogy with Section 1 of [14].
Let $S$ be an MMV-algebra, and let $\theta$ be any lattice congruence on $S$ such that $|S/\theta| = 2$. We set

$$\theta^* := \{(a, b) \in S \times S \mid \forall x \in S \ (a \oplus x, b \oplus x) \in \theta \text{ and } (a \odot x, b \odot x) \in \theta\}.$$ 

With $0(\theta)$ and $1(\theta)$ we denote classes of the lattice congruence $\theta$ corresponding to smallest and greatest elements of the lattice $S/\theta$. An MMV-congruence on an MMV-algebra is an equivalence relation on $M \times M$ that respects $\oplus, \odot, \lor, \land, 0, 1$.

**Lemma B.1.** Let $S$ be an MMV-algebra, and let $\theta$ be any lattice congruence on $S$ such that $|S/\theta| = 2$. Then, $\theta^*$ is the greatest MMV-congruence contained in $\theta$.

**Proof.** We have $\theta^* \subseteq \theta$ because for every $(a, b) \in \theta^*$ we have $(a, b) = (a \oplus 0, b \oplus 0) \in \theta$.

We prove that $\theta^*$ contains every congruence contained in $\theta$. Let $\rho \subseteq \theta$ be a congruence. Let $(a, b) \in \rho$, and let $x \in S$. Since $(x, x) \in \rho$, and $\rho$ is a congruence, we have $(a \oplus x, b \oplus x) \in \rho \subseteq \theta$, and $(a \odot x, b \odot x) \in \rho \subseteq \theta$. Thus, $(a, b) \in \theta^*$.

We prove that $\theta^*$ is a congruence. The relation $\theta^*$ is an equivalence relation because $\theta$ is so. In the following, let $a, a', b, b' \in S$, and suppose $(a, a') \in \theta^*$ and $(b, b') \in \theta^*$: for all $x \in S$, we have $(a \oplus x, a' \oplus x) \in \theta$, $(a \odot x, a' \odot x) \in \theta$, $(b \oplus x, b' \odot x) \in \theta$, and $(b \odot x, b' \odot x) \in \theta$.

Let us prove that $(a \lor b, a' \lor b') \in \theta^*$. Let $x \in S$. Since $(a \oplus x, a' \oplus x) \in \theta$, $(b \odot x, b' \odot x) \in \theta$, and $\theta$ is a lattice congruence, $((a \oplus x) \lor (b \odot x), (a' \oplus x) \lor (b' \odot x)) \in \theta$, i.e., $((a \lor b) \odot x, (a' \lor b') \odot x) \in \theta$. Analogously, $((a \lor b) \odot x, (a' \lor b') \odot x) \in \theta$. This proves $(a \lor b, a' \lor b') \in \theta^*$. Analogously, $(a \land b, a' \land b') \in \theta^*$.

Let us prove that $(a \oplus b, a' \oplus b') \in \theta^*$. Let $x \in S$. We shall prove

$$((a \oplus b) \oplus x, (a' \oplus b') \oplus x) \in \theta,$$

$$((a \oplus b) \odot x, (a' \oplus b') \odot x) \in \theta.$$ 

Let us prove (9): we have $((a \oplus b) \odot x, (a' \oplus b') \odot x) \in \theta$ and $(b \odot (a' \oplus x), b' \odot (a \oplus x)) \in \theta$; hence, by transitivity of $\theta$, $(a \oplus b \odot x, a' \oplus b' \odot x) \in \theta$.

Let us prove (10). By transitivity of $\theta$, it is enough to prove

$$((a \oplus b) \odot x, (a' \oplus b') \odot x) \in \theta.$$ 

Let us prove (11). Suppose, by way of contradiction, $((a \oplus b) \odot x, (a' \oplus b') \odot x) \notin \theta$. Then, without loss of generality, we may assume $(a \oplus b) \odot x \in 0(\theta)$ and $(a' \oplus b) \odot x \in 1(\theta)$. We have $1(\theta) \ni (a' \oplus b) \odot x \leq x$; thus $x \in 1(\theta)$. We have

$$a \oplus b \odot x = \sigma(a, b, x) \land \underbrace{x}_{\in 1(\theta)}.$$ 

Hence $\sigma(a, b, x) \in 0(\theta)$. We have

$$a' \oplus b \odot x = \sigma(a', b, x) \land \underbrace{x}_{\in 1(\theta)}.$$ 

Hence, $\sigma(a', b, x) \in 1(\theta)$. We have $0(\theta) \ni \sigma(a, b, x) = ([b \odot x] \odot a) \oplus ([b \odot x] \odot x) \geq (b \odot x) \odot a$. Therefore, $a \odot (b \odot x) \in 0(\theta)$. Hence, since $(a, a') \in \theta^*$, we have $a' \odot (b \odot x) \in 0(\theta)$. We have

$$a' \odot (b \odot x) = \sigma(a', b, x) \land a'.$$

Therefore, $a' \in 0(\theta)$.

We have $1(\theta) \ni \sigma(a', b, x) = ([b \odot x] \odot a') \oplus (b \odot x) \leq (b \odot x) \odot a'$. Therefore, $a' \odot (b \odot x) \in 1(\theta)$. Hence, since $(a, a') \in \theta^*$, we have $a \odot (b \odot x) \in 1(\theta)$. We have

$$a \odot (b \odot x) = \sigma(a, b, x) \lor a.$$ 

Hence, $\sigma(a, b, x) \in 0(\theta)$.
Therefore, $a \in 1(\theta)$. Thus, $a \in 1(\theta)$ and $a' \in 0(\theta)$. This contradicts $(a, a') \in \theta^* \subseteq \theta$. In conclusion (11) holds, and (12) analogously. By transitivity of $\theta$, (10) holds. This proves $(a \oplus b, a' \oplus b') \in \theta^*$. Analogously, $(a \oplus b, a' \oplus b') \in \theta^*$. □

We denote with $\Delta$ the identity relation $\{ (s, s) \mid s \in S \}$. 

**Lemma B.2.** If $S$ is a subdirectly irreducible MMV-algebra, then there exists a lattice congruence $\theta_1 \subseteq \theta$ on $S$ such that $|S/\theta_1| = 2$ and $\theta^* = \Delta$.

**Proof.** $S$ is distributive as a lattice and therefore it can be decomposed into a subdirect product of two-element lattices. Let $\{ \theta_i \}_{i \in I}$ be the set of lattice congruences of $S$ corresponding with such a decomposition. Then $\bigcap_{i \in I} \theta_i = \Delta$. By Lemma B.1 each $\theta_i^*$ is an MMV-congruence, and $\Delta \subseteq \theta_i^* \subseteq \theta_i$. Therefore we have $\bigcap_{i \in I} \theta_i^* = \Delta$, and the fact that $S$ is subdirectly irreducible implies $\theta_j^* = \Delta$ for some $j \in I$. □

**Theorem B.3.** Every subdirectly irreducible MMV-algebra is totally ordered.

**Proof.** Let $S$ be a subdirectly irreducible MMV-algebra. By Lemma B.2 there exist a lattice congruence $\theta$ on $S$ such that $|S/\theta| = 2$ and $\theta^* = \Delta$, i.e., for all distinct $a, b \in S$, there exists $x \in S$ such that $(a \oplus x, b \oplus x) \notin \theta$, or $(a \oplus x, b \oplus x) \notin \theta$.

Let $a, b \in S$. We shall prove that either $a \leq b$ or $b \leq a$. Suppose, by way of contradiction, that this is not the case: $a \land b \neq a$ and $a \land b \neq b$. From $a \land b \neq a$, we obtain that there exists $x \in S$ such that $((a \land b) \oplus x, a \land x) \notin \theta$ or $((a \land b) \circ x, a \circ x) \notin \theta$. From $a \land b \neq b$, we obtain that there exists $y \in S$ such that $((a \land b) \oplus y, b \circ y) \notin \theta$ or $((a \land b) \circ y, b \circ y) \notin \theta$. We have four cases.

1. Case $((a \land b) \oplus x, a \oplus x) \notin \theta$ and $((a \land b) \oplus y, b \circ y) \notin \theta$.

Then, since $a \land b \leq a$, and $a \land b \leq b$, we have $(a \land b) \oplus x \in 0(\theta)$, $a \oplus x \in 1(\theta)$, $(a \land b) \oplus y \in 0(\theta)$, and $b \circ y \in 1(\theta)$. Then, we have

$$0(\theta) \ni ([a \land b] \oplus x) \lor ([a \land b] \oplus y) = (a \land b) \oplus (x \lor y) =
$$

$$= [a \oplus (x \lor y)] \lor [b \oplus (x \lor y)] \ni (a \oplus x) \land (b \circ y) \in 1(\theta),$$

which is a contradiction.

2. The case $((a \land b) \circ x, a \circ x) \notin \theta$ and $((a \land b) \circ y, b \circ y) \notin \theta$ is analogous to (1).

3. Case $((a \land b) \oplus x, a \oplus x) \notin \theta$ and $((a \land b) \circ y, b \circ y) \notin \theta$.

Then, since $a \land b \leq a$, we have $(a \land b) \oplus x \in 0(\theta)$, and $a \oplus x \in 1(\theta)$. Therefore,

$$0(\theta) \ni (a \land b) \oplus x = (a \oplus x) \land (b \oplus x),$$

Hence $b \oplus x \in 0(\theta)$, which implies $b \in 0(\theta)$, which implies $(a \land b) \circ y \in 0(\theta)$ and $b \circ y \in 0(\theta)$, which contradicts $((a \land b) \circ y, b \circ y) \notin \theta$.

4. The case $((a \land b) \circ x, a \circ x) \notin \theta$ and $((a \land b) \circ y, b \circ y) \notin \theta$ is analogous to (3).

In any case, we are lead to a contradiction. □

**Appendix C.** Good pairs in subdirectly irreducible MMV-algebras

The goal of this section—met in Corollary C.3—is to prove that good sequences in a subdirectly irreducible MMV-algebra are of the form $(1, \ldots, 1, x, 0, 0, \ldots)$. To prove it, the fact that subdirectly irreducible MMV-algebras are totally ordered (Theorem B.3) does not help much, and we do not use it.

Let $A$ be an MMV-algebra and let $x \in A$. For $a, a' \in A$, set $a \sim^+_x a'$ if, and only if, there exist $n, m \in \mathbb{N}$ such that

$$a \oplus (x \oplus \cdots \oplus x) \geq a',$$

$n$ times
We prove (1). It is immediate that
\[
  \sim_A \text{ congruence on } a, b
\]

Moreover, set \( a \sim_x^\top a' \) if, and only if, there exist \( n, m \in \mathbb{N} \) such that
\[
  b \circ (x \circ \cdots \circ x) \leq b'
\]
\[
  b' \circ (x \circ \cdots \circ x) \leq b.
\]

**Lemma C.1.** For an MMV-algebra \( A \) and \( x \in A \) the following hold.

1. \( \sim_x^\top \) is the smallest MMV-congruence \( \sim \) on \( A \) such that \( x \sim 0 \).
2. \( \sim_x^\top \) is the smallest MMV-congruence \( \sim \) on \( A \) such that \( x \sim 1 \).

**Proof.** We prove (1). It is immediate that \( x \sim_x^\top 0 \), and that, if \( \sim \) is an MMV-congruence on \( A \) such that \( x \sim 0 \), then \( \sim \subseteq \sim_x^\top \). To prove that \( \sim_x^\top \) is a congruence, we first prove that \( \sim_x^\top \) is an equivalence relation. The relation \( \sim_x^\top \) is trivially reflexive and symmetric. To prove transitivity, suppose \( a \sim_x^\top b \sim_x^\top c \). Then
\[
  (a \oplus (x \oplus \cdots \oplus x)) \oplus (x \oplus \cdots \oplus x) \geq b \oplus (x \oplus \cdots \oplus x) \geq c.
\]

Analogously for the other inequality.

Suppose \( a \sim_x^\top a' \) and \( b \sim_x^\top b' \). Then,
\[
  a \oplus (x \oplus \cdots \oplus x) \geq a',
\]
\[
  a' \oplus (x \oplus \cdots \oplus x) \geq a,
\]
\[
  b \oplus (x \oplus \cdots \oplus x) \geq b',
\]
\[
  b' \oplus (x \oplus \cdots \oplus x) \geq b.
\]

We prove \( a \land b \sim_x^\top a' \land b' \):
\[
  (a \land b) \oplus (x \oplus \cdots \oplus x) =
\]
\[
  = (a \oplus (x \oplus \cdots \oplus x)) \land (b \oplus (x \oplus \cdots \oplus x)) \geq a' \land b',
\]
and analogously for the other inequality. Analogously, \( a \lor b \sim_x^\top a' \lor b' \).

We prove \( a \otimes b \sim_x^\top a' \otimes b' \):
\[
  (a \otimes b) \oplus (x \oplus \cdots \oplus x) =
\]
\[
  = (a \oplus (x \oplus \cdots \oplus x)) \otimes (b \oplus (x \oplus \cdots \oplus x)) \geq a' \otimes b',
\]
and analogously for the other inequality.

We prove \( a \circ b \sim_x^\top a' \circ b' \):
\[
  (a \circ b) \oplus (x \oplus \cdots \oplus x) \geq
\]
\[
  \geq (a \oplus (x \oplus \cdots \oplus x)) \circ (b \oplus (x \oplus \cdots \oplus x)) \geq a' \circ b',
\]
and analogously for the other inequality.

(2) is analogous.

**Lemma C.2.** Let \( A \) be an MMV-algebra, let \((x_0, x_1)\) be a good pair in \( A \), and let \( a, b \in A \) be such that \( a \leq b \oplus x_1 \), and \( a \circ x_0 \leq b \). Then, \( a \leq b \).
Proof. Let us first deal with the case where \( b \leq a \); under this hypothesis, we shall prove \( a = b \). Since \((x_0, x_1)\) is a good pair, we have
\[
\sigma(a, x_0, x_1) = (a \odot x_0) \odot x_1 = (a \oplus x_1) \odot x_0,
\]
\[
\sigma(b, x_0, x_1) = (b \oplus x_1) \odot x_0 = (b \odot x_0) \oplus x_1.
\]
Since \( a \leq b \odot x_1 \), we have
\[
a \odot x_0 \leq (b \oplus x_1) \odot x_0 = \sigma(b, x_0, x_1).
\]
Since \( a \odot x_0 \leq b \), and \( a \odot x_0 \leq \sigma(b, x_0, x_1) \), we have \( a \odot x_0 \leq b \land \sigma(b, x_0, x_1) = b \odot (x_0 \oplus x_1) = b \odot x_0 \). Since \( b \leq a \), we have \( b \odot x_0 \leq a \odot x_0 \). Hence, \( a \odot x_0 = b \odot x_0 \).

Analogously, \( a \odot x_1 = b \odot x_1 \). Hence,
\[
\sigma(a, x_0, x_1) = (a \odot x_0) \odot x_1 = (b \odot x_0) \odot x_1 = \sigma(b, x_0, x_1).
\]
Set \( \sigma := \sigma(a, x_0, x_1) = \sigma(b, x_0, x_1) \). To prove \( a = b \) it is enough to prove \( a \lor \sigma = b \lor \sigma \), and \( a \land \sigma = b \land \sigma \).

We have
\[
a \lor \sigma = a \odot x_1 = b \oplus x_1 = b \lor \sigma.
\]
\[
a \land \sigma = a \odot x_0 = b \odot x_0 = b \land \sigma.
\]
Hence, \( a = b \).

If \( b \) is not assumed to be smaller than \( a \), we may replace \( b \) with \( a \land b \), because
\[
a \leq (a \oplus x_1) \land (b \odot x_1) = (a \land b) \odot x_1,
\]
and
\[
a \odot x_0 \leq a \land b,
\]
Since \( a \land b \leq a \), by the previous part we obtain \( a \land b = a \), i.e., \( a \leq b \). \( \square \)

Theorem C.3. Let \( A \) be a subdirectly irreducible MMV-algebra. Then, for every \( x, y \in A \), either \( x \oplus y = 1 \) or \( x \odot y = 0 \).

Proof. Set \( u := x \oplus y \), and \( v := x \odot y \). Let us consider the two congruences \( \sim_u \) and \( \sim_u^T \). Denoting with \( \Delta \) the identity relation, we claim
\[
(\sim_u) \cap (\sim_u^T) = \Delta.
\]
Indeed, let us take \( a, b \in A \) such that \( a \sim_u b \) and \( a \sim_u^T b \). Then, there exists \( n, m \in \mathbb{N} \) such that
\[
a \leq b \oplus (v \cdots \odot v) \quad \text{m times}
\]
and
\[
a \odot (u \cdots \odot u) \leq b. \quad \text{n times}
\]
Since \((u, v)\) is a good pair, then also \((u \odot \cdots \odot u, v \odot \cdots \odot v)\) is so (Lemma C.2). By Lemma C.2, \( a \leq b \). Analogously, \( b \leq a \), and therefore \( a = b \). This settles the claim \( (\sim_u) \cap (\sim_u^T) = \Delta \). Since \( A \) is subdirectly irreducible, either \( \sim_u = \Delta \) or \( \sim_u^T = \Delta \). In the former case we have \( v = 0 \); in the latter one we have \( u = 1 \). \( \square \)

Corollary C.4. Every good sequence in a subdirectly irreducible MMV-algebra is of the form \((1, \ldots, 1, x, 0, 0, \ldots)\).

Remark C.5. In Theorems B.3 and C.3 we have proved that any subdirectly irreducible MMV-algebra \( A \) is totally-ordered and is such that, for all \( x, y \in A \), either \( x \oplus y = 1 \) or \( x \odot y = 0 \). We have provided a direct proof of these facts. We mention that, if we used the fact that \( \Gamma \) is an equivalence, an alternative proof would have been possible using the following facts.
(1) Subdirectly irreducible commutative lattice-ordered monoids are totally ordered; this is a corollary of [14, Lemma 1.4], but already in [10, Corollary 2] the author proved that any commutative lattice-ordered monoid is a subdirect product of totally ordered ones, and asserted, in Remark 3 of the same paper, that this was an unpublished result by Fuchs.

(2) Totally ordered commutative uℓ-monoids correspond, via ˜Γ, to totally ordered MMV-algebras A such that, for all x, y ∈ A, either x ⊕ y = 1 or x ⊙ y = 0.

(3) A commutative uℓ-monoid M is subdirectly irreducible (as {+, ∨, ∧, 0, 1, −1}-algebra) if, and only if, ˜Γ(M) is subdirectly irreducible (as {⊕, ⊙, ∨, ∧, 0, 1}-algebra).
