DEPTH OF AN INITIAL IDEAL

TAKAYUKI HIBI AND AKIYOSHI TSUCHIYA

ABSTRACT. Given an arbitrary integer $d > 0$, we construct a homogeneous ideal $I$ of the polynomial ring $S = K[x_1, \ldots, x_{3d}]$ in $3d$ variables over a field $K$ for which $S/I$ is a Cohen–Macaulay ring of dimension $d$ with the property that, for each of the integers $0 \leq r \leq d$, there exists a monomial order $<_r$ on $S$ with depth$(S/in_{<_r}(I)) = r$, where $in_{<_r}(I)$ is the initial ideal of $I$ with respect to $<_r$.

1. BACKGROUND

In order to answer a question suggested in [2, p. 38], the first author [6, p. 285] discovered a graded Gorenstein Hodge algebra whose corresponding discrete Hodge algebra is not a Cohen–Macaulay ring. In the modern language of Gröbner bases and initial ideals, the work guarantees the existence of a homogeneous ideal $I$ of the polynomial ring $S = K[x_1, \ldots, x_n]$ over a field $K$ for which $S/I$ is Cohen–Macaulay with the property that there is an initial ideal $in_{<_r}(I)$ of $I$ for which $S/(in_{<_r}(I))$ is not Cohen–Macaulay. On the other hand, in [1 Corollary 3.9], it is shown that if $A$ is an ASL (algebra with straightening laws) and $A_0$ is its discrete ASL, then depth$A = $ depth$A_0$. In particular the discrete ASL of a Cohen–Macaulay ASL is again Cohen–Macaulay.

Take the above background into consideration, one cannot escape the temptation to study the question as follows:

**Question 1.1.** Given an arbitrary integer $d > 0$, does there exist a homogeneous ideal $I$ of the polynomial ring $S$ over a field $K$ for which $S/I$ is a Cohen–Macaulay ring of dimension $d$ with the property that, for each of the integers $0 \leq r \leq d$, there is a monomial order $<_r$ on $S$ with depth$(S/in_{<_r}(I)) = r$, where $in_{<_r}(I)$ is the initial ideal of $I$ with respect to $<_r$?

The purpose of the present paper is to solve Question 1.1 and, in addition, to supply related questions.

2. RESULT

We refer the reader to [4, Chapter 2] for fundamental materials and standard notation on Gröbner bases.

Let $S = K[x_1, \ldots, x_n]$ denote the polynomial ring in $n$ variables over a field $K$. Given a vector $w = (w_1, \ldots, w_d) \in \mathbb{Z}^n$ and a monomial $u = x_1^{a_1} \cdots x_n^{a_n} \in S$, the weight of $u$ with respect to $w$ is defined to be $a_1w_1 + \cdots + a_nw_n$. 

\textbf{Key words and phrases.} initial ideal, depth, Gröbner basis.

Theorem 2.1. Given an arbitrary integer $d > 0$, there exists a homogeneous ideal $I$ of the polynomial ring $S = K[x_1, \ldots, x_{3d}]$ in $3d$ variables over a field $K$ for which $S/I$ is a Cohen–Macaulay ring of dimension $d$ with the property that, for each of the integers $0 \leq r \leq d$, there is a monomial order $<_r$ on $S$ with depth($S/\text{in}_{<_r}(I)$) = $r$.

Proof. (First Step) Let $d = 1$. Let $S = K[x_1, x_2, x_3]$ and

$$I = \langle x_1^2 - x_2x_3, x_1x_2 - x_3^2, x_1x_3 - x_2^2 - x_3^2 \rangle \subset S$$

([4 Example 3.3.6]). Then $S/I$ is a one-dimensional Cohen–Macaulay ring. Let $<$ be the lexicographic order on $S$ with $x_3 < x_2 < x_1$. Let, in addition, $w_0 = (1, 1, 1)$ and $w_1 = (1, 2, 2)$. For each $r \in \{0, 1\}$, we introduce the monomial order $<_r$ on $S$ as follows: One has $u <_r v$ if and only if one of the following holds:

- The weight of $u$ is less than that of $v$ with respect to $w_r$;
- The weight of $u$ is equal to that of $v$ with respect to $w_r$ and $u < v$.

Then

$$\{x_1^2 - x_2x_3, x_1x_2 - x_3^2, x_1x_3 - x_2^2 - x_3^2\}$$

is a Gröbner basis of $I$ with respect to $<_0$ and depth($S/\text{in}_{<_0}(I)$) = 0. On the other hand,

$$\{x_2x_3 - x_1^2, x_3^2 - x_1x_2, x_2^2 - x_1x_3\}$$

is a Gröbner basis of $I$ with respect to $<_1$ and depth($S/\text{in}_{<_1}(I)$) = 1.

(Second Step) Let $d > 1$. Let $S = K[x_1, \ldots, x_{3d}]$ and

$$I = \langle \{x_{3i-2}^2 - x_{3i-1}x_{3i}, x_{3i-2}x_{3i-1} - x_{3i}^2, x_{3i-2}x_{3i} - x_{3i-1}^2 : 1 \leq i \leq d \} \rangle \subset S.$$

Let $S_i = K[x_{3i-2}, x_{3i-1}, x_{3i}]$ and

$$I_i = \langle x_{3i-2}^2 - x_{3i-1}x_{3i}, x_{3i-2}x_{3i-1} - x_{3i}^2, x_{3i-2}x_{3i} - x_{3i-1}^2 \rangle \subset S_i,$$

where $1 \leq i \leq d$. Thus

$$S/I \cong S_1/I_1 \otimes_K \cdots \otimes_K S_d/I_d$$

and $S/I$ is a Cohen–Macaulay ring of dimension $d$.

Now, we employ the lexicographic order $<$ on $S$ with

$$x_{3d} < x_{3d-1} < \cdots < x_1$$

on $S$ and the vectors

$$w_r = (\overbrace{1, 2, 2, \ldots, 1, 2, 2}^{3r}, \overbrace{1, 1, 1, \ldots, 1, 1, 1}^{3(d-r)}) \in \mathbb{Z}^{3d}, \ 0 \leq r \leq d.$$

For each $0 \leq r \leq d$, we introduce the monomial order $<_r$ on $S$ as follows: One has $u <_r v$ if and only if one of the following holds:

- The weight of $u$ is less than that of $v$ with respect to $w_r$;
- The weight of $u$ is equal to that of $v$ with respect to $w_r$ and $u < v$.

It then follows that the set $A \cup B$, where

$$A = \{x_{3i-1}x_{3i} - x_{3i-2}^2, x_{3i-1}^2 - x_{3i-2}x_{3i}, x_{3i}^2 - x_{3i-2}x_{3i-1} : 1 \leq i \leq r \}$$

and

$$B = \{x_{3i-2}^2 - x_{3i-1}x_{3i}, x_{3i-2}x_{3i-1} - x_{3i}^2, x_{3i-1}x_{3i} - x_{3i}^2, x_{3i-1}^2 - x_{3i}^2 : r + 1 \leq i \leq d \},$$
is a Gröbner basis of $I$ with respect to $<_r$. Since
\[ S/\text{in}_{<_r}(I) \cong K[x_1, x_2, x_3] \otimes K \cdots \otimes K \]
\[ \frac{K[x_{3r-1}, x_{3r-1}, x_{3r}]}{(x_2 x_3, x_3^3, x_2^3, x_2^2, x_3)} \]
\[ \otimes K \]
\[ \frac{K[x_{3r+1}, x_{3r+2}, x_{3r+3}]}{(x_3^3, x_3^2, x_3, x_2^3, x_2^2, x_2)} \]
\[ \otimes K \cdots \]
\[ \frac{K[x_{3d-2}, x_{3d-1}, x_{3d}]}{(x_3^3, x_3^2, x_3, x_2^3, x_2^2, x_2)} \],
one has $\text{depth}(S/\text{in}_{<_r}(I)) = r$, as desired.
\[ \square \]

**Remark 2.2.** Let $S/I$ be the quotient ring studied in the proof of Theorem 2.1 and $\text{reg}(S/I)$ its regularity. On has $\text{reg}(S/I) = d$. Furthermore, it follows that
\[ \text{depth}(S/\text{in}_{<_r}(I)) + \text{reg}(S/\text{in}_{<_r}(I)) = 2d \]
for each of $0 \leq r \leq d$.

3. **Questions**

We conclude the present paper with related questions.

**Question 3.1.** In Question 1.1 one may ask if $S/I$ can be a Gorenstein ring.

**Question 3.2.** In Question 1.1 one may ask if $I$ can be a prime ideal.

**Question 3.3.** Let $I \subset S = K[x_1, \ldots, x_n]$ be a homogeneous ideal with $\text{reg}(S/I) = r$ and $\text{depth}(S/I) = e$. Suppose that there is a monomial order $\prec$ on $S$ with $\text{reg}(S/\text{in}_{\prec}(I)) = r'$ and $\text{depth}(S/\text{in}_{\prec}(I)) = e'$. Then, for each $r \leq r'' \leq r'$ and for each $e' \leq e'' \leq e$, does there exist a monomial order $\prec'$ on $S$ with $\text{reg}(S/\text{in}_{\prec'}(I)) = r''$ and $\text{depth}(S/\text{in}_{\prec'}(I)) = e''$?

Let $I \subset S = K[x_1, \ldots, x_n]$ be the toric ideal of a unimodular convex polytope [5, p. 107]. Thus, for any monomial order $\prec$ on $S$, its initial ideal $\text{in}_{\prec}(I)$ is generated by squarefree monomials. It then follows from [1] that $\text{reg}(S/\text{in}_{\prec}(I)) = \text{reg}(S/I)$ and $\text{depth}(S/I) = \text{depth}(S/\text{in}_{\prec}(I))$.

**Question 3.4.** Is there a nice class of toric ideals $I \subset S$ for which $\text{reg}(S/\text{in}_{\prec}(I)) = \text{reg}(S/I)$ for any monomial order $\prec$ on $S$ and for which there is a monomial order $\prec$ on $S$ with $\text{depth}(S/\text{in}_{\prec}(I)) < \text{depth}(S/I)$?

Let $D$ be a finite distributive lattice and $\mathcal{R}_K[D]$ the ASL on $D$ over a field $K$ ([7, p. 98]). It is known that $\mathcal{R}_K[D]$ is normal and Cohen–Macaulay. Its discrete ASL is Cohen–Macaulay. Let $S = K[x_\alpha : \alpha \in D]$ the polynomial ring in $|D|$ variables over $K$. The defining ideal of $\mathcal{R}_K[D]$ is
\[ I_D = \{ x_\alpha x_\beta - x_{\alpha \wedge \beta} x_{\alpha \vee \beta} : \alpha \not\leq \beta, \beta \not\leq \alpha \} \subset S. \]

**Question 3.5.** For which finite distributive lattices $D$, does there exist a monomial order $\prec$ on $S = K[x_\alpha : \alpha \in D]$ with $\text{mindepth}(S/\text{in}_{\prec}(I_D)) = 0$?
