A NOTE ON A CONJECTURE BY ULAS ON POLYNOMIAL SUBSTITUTIONS

PETER MÜLLER

Abstract. We prove a recent conjecture by Ulas on reducible polynomial substitutions.

We prove the following result, which was conjectured by Ulas in [2] and proven for \( d \leq 4 \) there.

**Theorem.** Let \( f(X) \) be an irreducible polynomial of degree \( d \geq 3 \) over a field \( K \). Then there is a polynomial \( h(X) \in K[X] \) of degree \( \leq d - 1 \) such that \( f(h(X)) \) is reducible over \( K \).

**Proof.** Let \( \alpha \) be a root of \( f(X) \) in some extension of \( K \), and \( g(X) \) be the minimal polynomial of \( \frac{1}{\alpha} \) over \( K \). (So \( g(X) \) is, up to a non-zero factor from \( K \), the reciprocal of \( f(X) \).) Since \( K(\frac{1}{\alpha}) = K(\alpha) \), and \( \frac{1}{\alpha} \) has degree \( d \) over \( K \), we have \( \alpha = h(\frac{1}{\alpha}) \) for some \( h(X) \in K[X] \) of degree at most \( d - 1 \).

We obtain \( f(h(\frac{1}{\alpha})) = f(\alpha) = 0 \). So \( f(h(X)) \) shares the root \( \frac{1}{\alpha} \) with the irreducible polynomial \( g(X) \), thus \( g(X) \) divides \( f(h(X)) \). The degree of \( h \) is at least 2, for otherwise \( \alpha \) would have degree at most 2 over \( K \), contrary to \( d \geq 3 \).

The assertion now follows from \( \deg f(h(X)) \geq 2d \) and \( \deg g(X) = d \). \( \square \)

**Remark.** (a) Of course one can formulate the proof without reference to the algebraic element \( \alpha \). Suppose without loss that \( f(X) \) is monic. Set \( g(X) = X^{d}f(1/X) \) and \( h(X) = (1 - g(X))/X \). Then \( h(X) \) is a polynomial, and \( g(X) \) divides \( f(h(X)) \). This example is similar to the one by Schinzel in [1, Lemma 10], which, as pointed out by Ulas [2, page 59], proves the theorem provided that \( d - 1 \) does not divide the characteristic of \( K \).

(b) The answer to [2, Question 5.5], a kind of converse to the above theorem, is negative if \( K = \mathbb{R} \) by lack of irreducible polynomials of degree \( \geq 3 \).
