FACTORIZATIONS OF SCHUR FUNCTIONS

RAMLAL DEBNATH AND JAYDEB SARKAR

ABSTRACT. The Schur class, denoted by $S(\mathbb{D})$, is the set of all functions analytic and bounded by one in modulus in the open unit disc $\mathbb{D}$ in the complex plane $\mathbb{C}$, that is

$$S(\mathbb{D}) = \{ \varphi \in H^\infty(\mathbb{D}) : \| \varphi \|_\infty := \sup_{z \in \mathbb{D}} |\varphi(z)| \leq 1 \}.$$ 

The elements of $S(\mathbb{D})$ are called Schur functions.

Suppose $\varphi : \mathbb{D} \rightarrow \mathbb{C}$ is a function. A classical result going back to I. Schur states: $\varphi \in S(\mathbb{D})$ if and only if there exist a Hilbert space $\mathcal{H}$ and an isometry (known as colligation matrix or scattering matrix and nonunique in general)

$$V = \begin{bmatrix} a & B \\ C & D \end{bmatrix} : \mathcal{C} \oplus \mathcal{H} \rightarrow \mathcal{C} \oplus \mathcal{H},$$

such that $\varphi$ admits a transfer function realization corresponding to $V$, that is

$$\varphi(z) = a + zB(I_{\mathcal{H}} - zD)^{-1}C \quad (z \in \mathbb{D}).$$

An analogous statement holds true for Schur functions on the bidisc. On the other hand, Schur-Agler class functions in several variables (a class of analytic functions of more than one variable on the unit ball and more than two variables on the unit polydisc in $\mathbb{C}^n$) is a well-known “analogue” of Schur functions on $\mathbb{D}$. In this paper, we present algorithms to factorize Schur functions and Schur-Agler class functions in terms of colligation matrices. More precisely, we isolate checkable conditions on colligation matrices that ensure the existence of Schur (Schur-Agler class) factors of a Schur (Schur-Agler class) function and vice versa. This paper also seeks to contribute to the understanding of the delicate structure of bounded analytic functions in several complex variables.

1. Introduction

In this paper, $\mathbb{D}^n$ denotes the open unit polydisc in $\mathbb{C}^n$, $n \geq 1$. By definition, the classical Schur class $S(\mathbb{D}^n)$ consists of complex-valued analytic functions mapping from $\mathbb{D}^n$ into the closed unit disk $\overline{\mathbb{D}}$, that is

$$S(\mathbb{D}^n) = \{ \varphi : \mathbb{D}^n \rightarrow \mathbb{C} : \varphi \text{ is analytic and } \| \varphi \|_\infty \leq 1 \},$$

where $\| \cdot \|_\infty$ denotes the supremum norm over $\mathbb{D}^n$. In other words, $S(\mathbb{D}^n)$ is the closed unit ball of the commutative Banach algebra $H^\infty(\mathbb{D}^n)$, the set of all bounded analytic functions.
on $\mathbb{D}^n$ under the supremum norm. The elements in the set $S(\mathbb{D}^n)$ are called Schur functions \[31, 32\].

It is a very remarkable fact that the one variable (and two variables too but not more than two variables, as we will see soon) Schur functions are closely related, via isometric colligations (or “lurking isometries” [4]), to bounded linear operators on Hilbert spaces. Recall that a colligation (or scattering matrix) is any bounded linear operator $V$ of the form

$$V = \begin{bmatrix} A & B \\ C & D \end{bmatrix} : \mathcal{E} \oplus \mathcal{H} \to \mathcal{E}_* \oplus \mathcal{H},$$

where $\mathcal{H}$, $\mathcal{E}$ and $\mathcal{E}_*$ are Hilbert spaces. The colligation is said to be isometry if $V$ is isometry. Now, let $\mathcal{H}$ be a Hilbert space and let

$$V = \begin{bmatrix} a & B \\ C & D \end{bmatrix} : \mathbb{C} \oplus \mathcal{H} \to \mathbb{C} \oplus \mathcal{H},$$

be an isometric colligation. Then a straightforward but lengthy and conceptual calculation (cf. page 73, [4]) verifies that $\tau_V \in S(\mathbb{D})$, where

$$\tau_V(z) = a + zB(I_H - zD)^{-1}C \quad (z \in \mathbb{D}).$$

We call $\tau_V$ the transfer function realization of the isometric colligation $V$. Conversely, if $\varphi \in S(\mathbb{D})$, then there exist a Hilbert space $\mathcal{H}$ and an isometric colligation $V$ on $\mathbb{C} \oplus \mathcal{H}$, as in (1.1), such that

$$\varphi = \tau_V.$$

At this point, it is worth pointing out that the isometric colligation $V$ is not uniquely determined by $\varphi$ (cf. Example 3, Subsection 6.2).

We now pause, with our background so far, to state one of our main results specializing to the $n = 1$ case (see Theorem 3.4): Suppose $\varphi \in S(\mathbb{D})$. If $\varphi = \varphi_1\varphi_2$ for some $\varphi_1$ and $\varphi_2$ in $S(\mathbb{D})$, then there exist Hilbert spaces $\mathcal{H}_1$ and $\mathcal{H}_2$ and an (explicit) isometric colligation

$$V = \begin{bmatrix} a & B \\ C & D \end{bmatrix} = \begin{bmatrix} a & B_1 & B_2 \\ C_1 & D_{11} & D_{12} \\ C_2 & D_{21} & D_{22} \end{bmatrix} : \mathbb{C} \oplus (\mathcal{H}_1 \oplus \mathcal{H}_2) \to \mathbb{C} \oplus (\mathcal{H}_1 \oplus \mathcal{H}_2),$$

such that

$$D_{21} = 0 \quad \text{and} \quad aD_{12} = C_1B_2,$$

and

$$\varphi = \tau_V,$$

where

$$\tau_V(z) = a + zB(I_{\mathcal{H}_1 \oplus \mathcal{H}_2} - zD)^{-1}C \quad (z \in \mathbb{D}).$$

The converse is true under an additional assumption that $\varphi(0) \neq 0$ (see Theorem 5.1, Section 5 for the case $\varphi(0) = 0$): If $\varphi = \tau_V$ for some isometric colligation $V$ as in (1.2) satisfying
and $a := \varphi(0) \neq 0$, then $\varphi = \varphi_1 \varphi_2$ for some $\varphi_1$ and $\varphi_2$ in $S(D)$. Moreover, in this case, $\varphi$ and $\psi$ are explicitly given by $\varphi_1 = \tau V_1$ and $\varphi_2 = \tau V_2$ where

$$V_1 = \begin{bmatrix} \alpha & B_1 \\ \frac{1}{\beta} C_1 & D_{11} \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_1) \quad \text{and} \quad V_2 = \begin{bmatrix} \beta & \frac{1}{\alpha} B_2 \\ C_2 & D_{22} \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_2),$$

are isometric colligations and $\alpha$ and $\beta$ are non-zero scalars which satisfy the following conditions (see (3.12) and (3.14))

$$|\beta|^2 = |a|^2 + C_1^* C_1 \quad \text{and} \quad \alpha = \frac{a}{\beta}.$$

In view of the above results, it is now clear that the goal of this paper is to clarify the link between isometric colligations and factors of Schur functions. We continue the discussion by presenting a transfer function realization of a two variables Schur function (see [3] and also page 171, [4]):

**Theorem 1.1. (Agler)** Let $\varphi$ be a function on $D^2$. Then $\varphi \in S(D^2)$ if and only if there exist Hilbert spaces $\mathcal{H}_1$ and $\mathcal{H}_2$ and an isometric colligation $V = \begin{bmatrix} \alpha & B \\ C & D \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus (\mathcal{H}_1 \oplus \mathcal{H}_2))$, such that $\varphi = \tau V$ where

$$\tau_V(z) = a + B(I_{\mathcal{H}_1 \oplus \mathcal{H}_2} - E_{\mathcal{H}_1 \oplus \mathcal{H}_2}(z) D)^{-1} E_{\mathcal{H}_1 \oplus \mathcal{H}_2}(z) C,$$

and $E_{\mathcal{H}_1 \oplus \mathcal{H}_2}(z) = z_1 I_{\mathcal{H}_1} \oplus z_2 I_{\mathcal{H}_2}$ for all $z \in D^2$.

Here and throughout the paper, elements of $\mathbb{C}^n$ will be denoted by $z$, that is, $z = (z_1, \ldots, z_n) \in \mathbb{C}^n$. Also we denote by $\mathcal{B}(\mathcal{H}_1, \mathcal{H}_2)$ the set of all bounded linear operators from the Hilbert space $\mathcal{H}_1$ into the Hilbert space $\mathcal{H}_2$. We denote this simply by $\mathcal{B}(\mathcal{H}_1)$ when $\mathcal{H}_1 = \mathcal{H}_2$.

Agler’s result exemplify the possibility of transfer function realizations (corresponding to isometric colligations) of Schur functions in $n$-variables, $n > 2$. This is, however, not true in general, and the possibility of transfer function realizations of functions in $S(D^n)$, $n \geq 3$, is closely related to (as also the ideas in Agler’s proof suggests) the subtlety of von Neumann inequality of commuting $n$-tuples of contractions, $n > 2$, on Hilbert spaces.

This motivates consideration of a special class of bounded analytic functions: The Schur-Agler class $SA(D^n)$ [1] consists of scalar-valued analytic functions $\varphi$ on $D^n$ such that $\varphi$ satisfies the $n$-variables von Neumann inequality, that is

$$\|\varphi(T_1, \ldots, T_n)\|_{\mathcal{B}(\mathcal{H})} \leq 1,$$

for any $n$-tuples of commuting strict contractions on a Hilbert space $\mathcal{H}$. The elements of $SA(D^n)$ are called Schur-Agler class functions. If $\varphi \in SA(D^n)$, then we also say that $\varphi$ is a function in the Schur-Agler class $SA(D^n)$. The following theorem of Jim Agler [1] then obtains:
**Theorem 1.2.** (Agler) Let \( \varphi \) be a function on \( \mathbb{D}^n \). Then \( \varphi \in \mathcal{SA}(\mathbb{D}^n) \) if and only if there exist Hilbert spaces \( \mathcal{H}_1, \ldots, \mathcal{H}_n \) and an isometric colligation

\[
V = \begin{bmatrix} a & B \\ C & D \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_1^n),
\]

such that \( \varphi = \tau_V \) where

\[
\tau_V(z) = a + B(I_{\mathcal{H}_1^n} - E_{\mathcal{H}_1^n}(z)D)^{-1}E_{\mathcal{H}_1^n}(z)C,
\]

\( \mathcal{H}_1^n = \bigoplus_{i=1}^n \mathcal{H}_i \) and \( E_{\mathcal{H}_1^n}(z) = \bigoplus_{i=1}^n z_i I_{\mathcal{H}_i} \) for all \( z \in \mathbb{D}^n \).

Following the classical (one variable) von Neumann inequality, Ando \[6\] proved that the von Neumann inequality also holds for commuting pairs of contractions. On the other hand, as we have pointed out earlier, the von Neumann inequality does not hold in general for \( n \)-tuples, \( n > 2 \), of commuting contractions \[12, 34\]. It follows then that

\[
\mathcal{S}(\mathbb{D}) = \mathcal{SA}(\mathbb{D}) \quad \text{and} \quad \mathcal{S}(\mathbb{D}^2) = \mathcal{SA}(\mathbb{D}^2),
\]

but

\[
\mathcal{S}(\mathbb{D}^n) \supset \mathcal{SA}(\mathbb{D}^n),
\]

for all \( n > 2 \).

Needless to say, transfer function realizations and isometric colligation matrices corresponding to Schur-Agler class functions in \( n \)-variables, \( n \geq 1 \), are among the most frequently used techniques in problems in function theory, operator theory and interdisciplinary subjects such as Nevanlinna-Pick interpolation \[3\], commutant lifting theorem and analytic model theory \[30, 15, 16\], scattering theory \[7\], interpolation and Toeplitz corona theorem \[8\], electrical network theory \[19, 20\], signal processing \[22, 17\], linear systems \[21, 13, 33\], operator algebras \[26, 27\] and image processing \[29\] (just to name a few). In this context and for deeper studies, we refer the reader to a number of classic work such as Livšic \[24, 25\], Brodskiǐ \[9\], Brodskiǐ and M. Livšic \[10\] and Pavlov \[28\]. Also see \[2, 5, 11, 18\] and \[23\] and the references therein.

From this point of view, along with a question of interest in its own right, here we aim at finding necessary and sufficient conditions on isometric colligations which guarantee that a Schur-Agler class function factors into a product of Schur-Agler class functions. More precisely, we aim to solve the following problem: Given \( \theta \in \mathcal{SA}(\mathbb{D}^n) \), find a set of necessary and sufficient conditions on isometric colligations \( V \) which ensures that

\[
\theta = \tau_V = \varphi \psi,
\]

for some (explicit) \( \varphi \) and \( \psi \) in \( \mathcal{SA}(\mathbb{D}^n) \).

In this paper we give a complete answer to this question by identifying checkable conditions on isometric colligations. Our results and approach are new even in the case of one variable and two-variable Schur functions. In this context, it is also worth noting that the structure of bounded analytic functions in several variables is much more complicated than the structure of Schur functions on the unit disc (for instance, consider the existence of inner-outer factorizations of bounded analytic functions in one variable). From this point of view, our
approach is also focused on providing an understanding of the complex area of bounded analytic functions of two or more variables (as the transfer function realization technique has already proven to be extremely useful in proving many classical results like Nevanlinna-Pick interpolation theorem and Carathéodory interpolation theorem etc. in several variables).

Our main results, specializing to the \(n = 2\) case, yields the following: Suppose \(\theta \in \mathcal{S}(\mathbb{D}^2)\) and \(a := \theta(0) \neq 0\). Then:

1. **Theorem 2.3** implies that: \(\theta(z) = \varphi_1(z_1)\varphi_2(z_2)\), \(z \in \mathbb{D}^2\), for some \(\varphi_1\) and \(\varphi_2\) in \(\mathcal{S}(\mathbb{D})\) if and only if there exist Hilbert spaces \(\mathcal{H}_1\) and \(\mathcal{H}_2\) and isometric colligation

\[
V = \begin{bmatrix}
    a & B_1 & B_2 \\
    C_1 & D_{11} & \frac{\alpha}{a} C_1 B_2 \\
    C_2 & D_{21} & D_{22}
\end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus (\mathcal{H}_1 \oplus \mathcal{H}_2)),
\]

such that

\[\theta(z) = \tau_{V}(z) \quad (z \in \mathbb{D}^2).\]

2. **Theorem 3.3** implies that: \(\theta(z) = \varphi(z)\psi(z)\), \(z \in \mathbb{D}^2\), for some \(\varphi\) and \(\psi\) in \(\mathcal{S}(\mathbb{D}^2)\) if and only if there exist Hilbert spaces \(\{\mathcal{M}_i\}_{i=1}^n\) and \(\{\mathcal{N}_i\}_{i=1}^n\) and isometric colligation

\[
V = \begin{bmatrix}
    a & B_1 & B_2 \\
    C_1 & D_{11} & D_{12} \\
    C_2 & D_{21} & D_{22}
\end{bmatrix} \in \mathcal{B}\left(\mathbb{C} \oplus ((\mathcal{M}_1 \oplus \mathcal{N}_1) \oplus (\mathcal{M}_2 \oplus \mathcal{N}_2))\right),
\]

such that

\[\theta(z) = \tau_{V}(z) \quad (z \in \mathbb{D}^2),\]

and representing \(B_i, C_i\) and \(D_{ij}\) as

\[
B_i = \begin{bmatrix}
    B_i(1) & B_i(2)
\end{bmatrix} \in \mathcal{B}(\mathcal{M}_i \oplus \mathcal{N}_i, \mathbb{C}) \quad \text{and} \quad C_i = \begin{bmatrix}
    C_i(1) \\
    C_i(2)
\end{bmatrix} \in \mathcal{B}(\mathbb{C}, \mathcal{M}_i \oplus \mathcal{N}_i),
\]

and

\[
D_{ij} = \begin{bmatrix}
    D_{ij}(1) & D_{ij}(12) \\
    D_{ij}(21) & D_{ij}(2)
\end{bmatrix} \in \mathcal{B}(\mathcal{M}_j \oplus \mathcal{N}_j, \mathcal{M}_i \oplus \mathcal{N}_i),
\]

respectively, one has

\[
D_{ij}(21) = 0 \quad \text{and} \quad aD_{ij}(2) = C_i(1)B_j(2),
\]

for all \(i, j = 1, 2\).

Moreover, in the case of (1) (see Theorem 2.3): \(\varphi_1(z) = \tau_{V_1}(z)\) and \(\varphi_2(z) = \tau_{V_2}(z)\), \(z \in \mathbb{D}\), where

\[
\tilde{V}_1 = \begin{bmatrix}
    \frac{\alpha}{\beta} C_1 & B_1 \\
    1 & D_{11}
\end{bmatrix} \quad \text{and} \quad \tilde{V}_2 = \begin{bmatrix}
    \frac{\beta}{\alpha} C_2 & B_2 \\
    1 & \alpha D_{22}
\end{bmatrix},
\]

and \(\alpha\) and \(\beta\) are non-zero scalars which satisfy the following conditions

\[|\beta|^2 = 1 - C_2^* C_2 \quad \text{and} \quad \alpha = \frac{a}{\beta};\]

and, in the case of (2) (see Theorem 3.3): \(\varphi(z) = \tau_{V_1}(z)\) and \(\psi(z) = \tau_{V_2}(z)\), \(z \in \mathbb{D}^2\), where

\[
V_1 = \begin{bmatrix}
    \frac{\alpha}{\beta} C(1) & B(1) \\
    1 & D(1)
\end{bmatrix} \quad \text{and} \quad V_2 = \begin{bmatrix}
    \beta & \frac{1}{\alpha} B(2) \\
    C(2) & \alpha D(2)
\end{bmatrix},
\]
and
\[ B(i) = \begin{bmatrix} B_1(i) & B_2(i) \end{bmatrix}, \quad C(i) = \begin{bmatrix} C_1(i) \\ C_2(i) \end{bmatrix}, \]
for all \( i = 1, 2 \), and
\[ D(1) = \left[ D_{kl}(1) \right]_{k,l=1}^2, \quad D(2) = \left[ D_{kl}(2) \right]_{k,l=1}^2, \]
and \( \alpha \) and \( \beta \) are non-zero scalars which satisfy the following conditions
\[ |\beta|^2 = |a|^2 + C(1)^*C(1) \quad \text{and} \quad \alpha = \frac{a}{\beta}. \]

**Remark 1.3.** The assumption that \( \theta(0) \neq 0 \) is not essential for the necessary parts of the above results (and Theorems 2.4 and 3.4) and the case of \( \theta(0) = 0 \) will be treated separately in Section 5. As we will see there, functions vanishing at the origin reveals more detailed properties of corresponding isometric colligations.

The rest of this paper is organized as follows. Section 2 contains the definition of \( \mathcal{F}_m(n) \) class of isometric colligations, \( 1 \leq m < n \), and a classification of factorizations of functions in the Schur-Agler class \( \mathcal{SA}(\mathbb{D}^n), n > 1 \), into Schur-Agler class factors with fewer variables. Section 3 introduces the \( \mathcal{F}(n) \) class of isometric colligations, which connects the representation of a Schur-Agler class function to its Schur-Agler class factors. Section 4 deals with similar factorization results in the setting of the unit ball in \( \mathbb{C}^n \). In Section 5 we will discuss factorizations of Schur-Agler class functions vanishing at the origin. The concluding Section 6 outlines some concrete examples and presents results concerning one variable factors of Schur-Agler class functions and a remark on the reversibility of our method of factorizations.

## 2. Factorizations and Property \( \mathcal{F}_m(n) \)

In this section, we present results concerning factorizations of Schur-Agler class functions in \( \mathcal{SA}(\mathbb{D}^n), n > 1 \), into Schur-Agler class factors with fewer variables. More specifically, our interest here is to identify (and then classify) isometric colligations \( V \) such that \( \tau_V \in \mathcal{SA}(\mathbb{D}^n) \) and
\[ \tau_V(z) = \varphi(z_1, \ldots, z_m)\psi(z_{m+1}, \ldots, z_n) \quad (z \in \mathbb{D}^n), \]
for some (canonical, in terms of \( V \)) \( \varphi \in \mathcal{SA}(\mathbb{D}^m) \) and \( \psi \in \mathcal{SA}(\mathbb{D}^{n-m}) \). Throughout this section we will always assume that \( 1 \leq m < n \).

We begin with fixing some notation. Given \( 1 \leq m < p \leq n \) and Hilbert spaces \( \mathcal{H}_1, \ldots, \mathcal{H}_n \), we set
\[ \mathcal{H}_m^p = \mathcal{H}_m \oplus \mathcal{H}_{m+1} \oplus \cdots \oplus \mathcal{H}_p. \]
In particular
\[ \mathcal{H}_m^n = \bigoplus_{i=1}^n \mathcal{H}_i. \]
Moreover, with respect to the orthogonal decomposition
\[ \mathcal{H}_m^1 = \mathcal{H}_1^m \oplus \mathcal{H}_{m+1}^n, \]
we represent an operator $D \in B(\mathcal{H}_n^m)$ as
\[
D = \begin{bmatrix} D_{11} & D_{12} \\ D_{21} & D_{22} \end{bmatrix} \in B(\mathcal{H}_1^m \oplus \mathcal{H}_m^{n+1}).
\]
Similarly, if $\mathcal{E}$ and $\mathcal{E}_*$ are Hilbert spaces, $B \in B(\mathcal{H}_1^m, \mathcal{E})$ and $C \in B(\mathcal{E}_*, \mathcal{H}_1^n)$, then we write
\[
B = \begin{bmatrix} B_1 & B_2 \end{bmatrix} \in B(\mathcal{H}_1^m \oplus \mathcal{H}_m^{n+1}, \mathcal{E}) \quad \text{and} \quad C = \begin{bmatrix} C_1 \\ C_2 \end{bmatrix} \in B(\mathcal{E}_*, \mathcal{H}_1^m \oplus \mathcal{H}_m^{n+1}).
\]
Now we are ready to introduce the central object of this section.

**Definition 2.1.** Let $1 \leq m < n$. We say that an isometry $V \in B(\mathcal{H})$ satisfies property $F_m(n)$ if there exist Hilbert spaces $\mathcal{H}_1, \ldots, \mathcal{H}_n$ such that
\[
\mathcal{H} = \mathbb{C} \oplus \mathcal{H}_1^n,
\]
and representing $V$ as
\[
V = \begin{bmatrix} a & B_1 & B_2 \\ C_1 & D_{11} & D_{12} \\ C_2 & D_{21} & D_{22} \end{bmatrix} \in B(\mathbb{C} \oplus \mathcal{H}_1^m \oplus \mathcal{H}_m^{n+1}),
\]
one has
\[
D_{21} = 0,
\]
and
\[
aD_{12} = C_1B_2.
\]
More specifically, an isometry $V \in B(\mathcal{H})$ satisfies property $F_m(n)$ if there exist Hilbert spaces $\mathcal{H}_1, \ldots, \mathcal{H}_n$ such that
\[
\mathcal{H} = \mathbb{C} \oplus \mathcal{H}_1 \oplus \cdots \oplus \mathcal{H}_n,
\]
and writing $V$ as
\[
V = \begin{bmatrix} a & B_1 & \cdots & B_n \\ C_1 & D_{11} & \cdots & D_{1n} \\ \vdots & \vdots & \ddots & \vdots \\ C_n & D_{n1} & \cdots & D_{nn} \end{bmatrix},
\]
on $\mathbb{C} \oplus (\mathcal{H}_1 \oplus \cdots \oplus \mathcal{H}_n)$, one has
\[
D_{ij} = 0,
\]
for all $i = m+1, \ldots, n$ and $j = 1, \ldots, m$, and
\[
aD_{ij} = C_iB_j,
\]
for all $i = 1, \ldots, m$ and $j = m+1, \ldots, n$. By way of example, we consider the two variables situation. We say that an isometry $V$ satisfies property $F_1(2)$ if there exist Hilbert spaces $\mathcal{H}_1$ and $\mathcal{H}_2$ such that
\[
V = \begin{bmatrix} a & B_1 & B_2 \\ C_1 & D_{11} & D_{12} \\ C_2 & 0 & D_{22} \end{bmatrix} \in B(\mathbb{C} \oplus \mathcal{H}_1 \oplus \mathcal{H}_2)
and

$$aD_{12} = C_1B_2.$$  

Let us introduce some more notation. Let \(1 \leq m < p \leq n\). We set

$$E_{\mathcal{H}_m^p}(z) = z_mI_{\mathcal{H}_m} \oplus \cdots \oplus z_pI_{\mathcal{H}_p} \quad (z \in \mathbb{C}^n).$$

Also for \(X \in \mathcal{B}(\mathcal{H}_m^p), \|X\| \leq 1\), define

$$R_{m}^{p}(z, X) = \left(I_{\mathcal{H}_m^p} - E_{\mathcal{H}_m^p}(z)X\right)^{-1} \quad (z \in \mathbb{D}^n).$$

Note that \(R_{m}^{p}(z, X)\) is a function of \(\{z_m, \ldots, z_p\}\) variables. Moreover, we will denote \(R_{1}^{n}(z, X)\) simply by \(R(z, X)\).

Now we proceed to prove that a pair of isometric colligations is naturally associated with an isometric colligation satisfying property \(F_{m}(n)\). More specifically, given \(\tau_{V_1} \in SA(D^m_1)\) and \(\tau_{V_2} \in SA(D^{n-m}_n)\) for some isometric colligations \(V_1\) and \(V_2\), we aim to construct an explicit isometric colligation \(V\) such that \(V\) satisfies property \(F_{m}(n)\) and

$$\tau_{V}(z) = \tau_{V_1}(z_1, \ldots, z_m)\tau_{V_2}(z_{m+1}, \ldots, z_n) \quad (z \in \mathbb{D}^n).$$

To this end, let \(\mathcal{H}_1, \ldots, \mathcal{H}_n\) be Hilbert spaces. Suppose

$$V_1 = \begin{bmatrix} a_1 & B_1 \\ C_1 & D_1 \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_1^m),$$

and

$$V_2 = \begin{bmatrix} a_2 & B_2 \\ C_2 & D_2 \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_n^{m+1}),$$

are isometric colligations. Define \(\tilde{V}_1\) and \(\tilde{V}_2\) in \(\mathcal{B}(\mathbb{C} \oplus \mathcal{H}_1^m \oplus \mathcal{H}_n^{m+1})\) by

$$\tilde{V}_1 = \begin{bmatrix} a_1 & B_1 & 0 \\ C_1 & D_1 & 0 \\ 0 & 0 & I \end{bmatrix} \quad \text{and} \quad \tilde{V}_2 = \begin{bmatrix} a_2 & 0 & B_2 \\ 0 & I & 0 \\ C_2 & 0 & D_2 \end{bmatrix},$$

and set

$$V = \tilde{V}_1\tilde{V}_2.$$  

It is easy to check, by swapping rows and columns (of \(\tilde{V}_2\)), that \(\tilde{V}_1\) and \(\tilde{V}_2\) are isometries and thus the isometric colligation

$$V = \begin{bmatrix} a_1a_2 & B_1 & a_1B_2 \\ a_2C_1 & D_1 & C_1B_2 \\ C_2 & 0 & D_2 \end{bmatrix} \in \mathcal{B}\left(\mathbb{C} \oplus (\mathcal{H}_1^m \oplus \mathcal{H}_n^{m+1})\right),$$

satisfies property \(F_{m}(n)\). Let \(z \in \mathbb{D}^n\). Clearly

$$\tau_{V}(z) = a_1a_2 + [B_1 \ a_1B_2]R(z, \begin{bmatrix} D_1 & C_1B_2 \\ 0 & D_2 \end{bmatrix})E_{\mathcal{H}_1^m}(z) \begin{bmatrix} a_2C_1 \\ C_2 \end{bmatrix},$$
where

\[
R(z, \begin{bmatrix} D_1 & C_1 B_2 \\ 0 & D_2 \end{bmatrix})^{-1} = I_{H_1^m} - \begin{bmatrix} E_{H_1^m}(z) & 0 \\ 0 & E_{H_{m+1}^n}(z) \end{bmatrix} \begin{bmatrix} D_1 & C_1 B_2 \\ 0 & D_2 \end{bmatrix}
\]

\[
= \begin{bmatrix} I_{H_1^m} - E_{H_1^m}(z)D_1 & -E_{H_1^m}(z)C_1 B_2 \\ 0 & I_{H_{m+1}^n} - E_{H_{m+1}^n}(z)D_2 \end{bmatrix}.
\]

By the inverse formula of an invertible upper triangular matrix, it follows that

\[
R(z, \begin{bmatrix} D_1 & C_1 B_2 \\ 0 & D_2 \end{bmatrix}) = \begin{bmatrix} R_1^m(z, D_1) & R_1^m(z, D_1)E_{H_1^m}(z)C_1 B_2 R_{m+1}^n(z, D_2) \\ 0 & R_{m+1}^n(z, D_2) \end{bmatrix}.
\]

We now infer, in view of the above equality, that

\[
\tau_V(z) = a_1 a_2 + [B_1 \quad a_1 B_2] R(z, \begin{bmatrix} D_1 & C_1 B_2 \\ 0 & D_2 \end{bmatrix}) E_{H_1^m}(z) \begin{bmatrix} a_2 C_1 \\ C_2 \end{bmatrix}
\]

\[
= a_1 a_2 + [B_1 \quad a_1 B_2] \begin{bmatrix} R_1^m(z, D_1) & R_1^m(z, D_1)E_{H_1^m}(z)C_1 B_2 R_{m+1}^n(z, D_2) \\ 0 & R_{m+1}^n(z, D_2) \end{bmatrix}
\]

\[
\times \begin{bmatrix} a_2 E_{H_1^m}(z)C_1 \\ E_{H_{m+1}^n}(z)C_2 \end{bmatrix}
\]

\[
= a_1 a_2 + a_2 B_1 R_1^m(z, D_1)E_{H_1^m}(z)C_1 + a_1 B_2 R_{m+1}^n(z, D_2)E_{H_{m+1}^n}(z)C_2
\]

\[
+ B_1 R_1^m(z, D_1)E_{H_1^m}(z)C_1 B_2 R_{m+1}^n(z, D_2)E_{H_{m+1}^n}(z)C_2
\]

\[
= \left(a_1 + B_1 R_1^m(z, D_1)E_{H_1^m}(z)C_1 \right) \left(a_2 + B_2 R_{m+1}^n(z, D_2)E_{H_{m+1}^n}(z)C_2 \right)
\]

\[
= \tau_{V_1}(z_1, \ldots, z_m) \tau_{V_2}(z_{m+1}, \ldots, z_n),
\]

for all \(z \in \mathbb{D}^n\). We have therefore proved the following result:

**Theorem 2.2.** Let \(1 \leq m < n\), and let \(\mathcal{H}_1, \ldots, \mathcal{H}_n\) be Hilbert spaces. Suppose

\[
V_1 = \begin{bmatrix} a_1 & B_1 \\ C_1 & D_1 \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus (\bigoplus_{i=1}^m \mathcal{H}_i)) \quad \text{and} \quad V_2 = \begin{bmatrix} a_2 & B_2 \\ C_2 & D_2 \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus (\bigoplus_{i=m+1}^n \mathcal{H}_i)),
\]

are isometric colligations. Define \( \tilde{V}_1, \tilde{V}_2 \) and \( V \) in \( \mathcal{B}\left(\mathbb{C} \oplus \left(\bigoplus_{i=1}^m \mathcal{H}_i\right) \oplus \left(\bigoplus_{i=m+1}^n \mathcal{H}_i\right)\right) \) by

\[
\tilde{V}_1 = \begin{bmatrix} a_1 & B_1 \\ C_1 & D_1 \\ 0 & 0 \end{bmatrix} \quad \text{and} \quad \tilde{V}_2 = \begin{bmatrix} a_2 & 0 & B_2 \\ 0 & I & 0 \\ C_2 & 0 & D_2 \end{bmatrix},
\]

and

\[
V = \tilde{V}_1 \tilde{V}_2,
\]

respectively. Then

\[
V = \begin{bmatrix} a_1 a_2 & B_1 & a_1 B_2 \\ a_2 C_1 & D_1 & C_1 B_2 \\ C_2 & 0 & D_2 \end{bmatrix} \in \mathcal{B}\left(\mathbb{C} \oplus \left(\bigoplus_{i=1}^m \mathcal{H}_i\right) \oplus \left(\bigoplus_{i=m+1}^n \mathcal{H}_i\right)\right),
\]
is an isometric colligation, \( V \) satisfies property \( \mathcal{F}_m(n) \) and
\[
\tau_V(z) = \tau_{V_1}(z_1, \ldots, z_m)\tau_{V_2}(z_{m+1}, \ldots, z_n) \quad (z \in \mathbb{D}^n).
\]

Now to prove the reverse direction, we assume in addition that \( \tau_V(0) \neq 0 \) (for the case of transfer functions vanishing at the origin, see Section 5) : Suppose \( \mathcal{H}_1, \ldots, \mathcal{H}_n \) are Hilbert spaces and
\begin{equation}
V = \begin{bmatrix}
a & B_1 & B_2 \\
C_1 & D_{11} & D_{12} \\
C_2 & 0 & D_{22}
\end{bmatrix} \in B(\mathbb{C} \oplus \mathcal{H}_1^m \oplus \mathcal{H}_m^{n+1}),
\end{equation}
is an isometric colligation satisfying property \( \mathcal{F}_m(n) \). Thus
\begin{equation}
aD_{12} = C_1B_2.
\end{equation}
Suppose
\[ a := \tau_V(0) \neq 0. \]

Since \( V^*V = I \), we have
\begin{equation}
\begin{bmatrix}
|a|^2 + C_1^*C_1 + C_2^*C_2 & \bar{a}B_1 + C_1^*D_{11} & \bar{a}B_2 + C_1^*D_{12} + C_2^*D_{22} \\
\bar{a}B_1^* + D_{11}^*C_1 & B_1^*B_1 + D_{11}^*D_{11} & B_2^*B_1 + D_{11}^*D_{12} \\
\bar{a}B_2^* + D_{12}^*C_1 + D_{22}C_2 & B_2^*B_1 + D_{12}^*D_{11} & B_2^*B_2 + D_{12}^*D_{12} + D_{22}^*D_{22}
\end{bmatrix} = I.
\end{equation}

Now
\[ |a|^2 + C_1^*C_1 + C_2^*C_2 = 1, \]
implies that
\[ 1 - C_2^*C_2 = |a|^2 + C_1^*C_1 > 0, \]
as \( a \neq 0 \). Then there exists a scalar \( \beta, 0 < |\beta| \leq 1, \) such that
\[ |\beta|^2 = 1 - C_2^*C_2. \]

It now follows that
\begin{equation}
C_1^*C_1 = |\beta|^2 - |a|^2,
\end{equation}
and
\begin{equation}
\alpha := \frac{a}{\beta},
\end{equation}
is a non-zero scalar. Define
\[ V_1 = \begin{bmatrix}
\alpha & \frac{1}{\beta}C_1 & 0 \\
\frac{1}{\beta}C_1 & D_{11} & 0 \\
0 & 0 & I
\end{bmatrix} \quad \text{and} \quad V_2 = \begin{bmatrix}
\beta & 0 & \frac{1}{\alpha}B_2 \\
0 & I & 0 \\
C_2 & 0 & D_{22}
\end{bmatrix},
\]
on \( \mathbb{C} \oplus \mathcal{H}_1^m \oplus \mathcal{H}_m^{n+1} \). Then
\begin{equation}
V_1^*V_1 = \begin{bmatrix}
|\alpha|^2 + \frac{1}{|\beta|^2}C_1^*C_1 & \bar{\alpha}B_1 + \frac{1}{\beta}C_1^*D_{11} & 0 \\
\alpha B_1^* + \frac{1}{\beta}D_{11}^*C_1 & B_1^*B_1 + D_{11}^*D_{11} & 0 \\
0 & 0 & I
\end{bmatrix}.
\end{equation}
It follows from (2.4) and (2.5) that
\[
|\alpha|^2 + \frac{1}{|\beta|^2} C_1^* C_1 = |\alpha|^2 + \frac{1}{|\beta|^2} (|\beta|^2 - |\alpha|^2) \\
= 1 + |\alpha|^2 - \frac{|\alpha|^2}{|\beta|^2} \\
= 1,
\]
that is
(2.6) \[ |\alpha|^2 + \frac{1}{|\beta|^2} C_1^* C_1 = 1. \]

Also, from (2.3) we see that
\[ B_1^* B_1 + D_{11}^* D_{11} = I, \]
and
\[
\bar{\alpha} B_1 + \frac{1}{\beta} C_1^* D_{11} = \frac{1}{\beta} (\bar{\alpha} \bar{\beta} B_1 + C_1^* D_{11}) \\
= \frac{1}{\beta} (\bar{a} B_1 + C_1^* D_{11}) \\
= 0,
\]
and hence
\[ V_1^* V_1 = I. \]

We now proceed to prove that \( V_2 \) is also an isometry. First, we compute
\[
V_2^* V_2 = \begin{bmatrix}
|\beta|^2 + C_2^* C_2 & 0 & \frac{\bar{\beta}}{\alpha} B_2 + C_2^* D_{22} \\
0 & I & 0 \\
\frac{\bar{\beta}}{\alpha} B_2^* + D_{22}^* C_2 & 0 & \frac{1}{|\alpha|^2} B_2^* B_2 + D_{22}^* D_{22}
\end{bmatrix}.
\]
Now equating (1, 3)-th entries on each side of (2.3) we get
\[
\bar{a} B_2 + C_1^* D_{12} + C_2^* D_{22} = 0,
\]
and hence, by (2.2), we have
\[
0 = \bar{a} B_2 + C_1^* D_{12} + C_2^* D_{22} \\
= \bar{a} B_2 + \frac{1}{\alpha} C_1^* C_1 B_2 + C_2^* D_{22} \\
= \frac{\bar{a}_2}{\alpha} (|\alpha|^2 + \frac{1}{|\beta|^2} C_1^* C_1 B_2 + C_2^* D_{22}).
\]
Then (2.6) implies that
\[
\frac{\bar{\beta}}{\alpha} B_2 + C_2^* D_{22} = 0.
\]
Finally, equating (3, 3)-th entries on each side of (2.3) we get
\[
B_2^* B_2 + D_{12}^* D_{12} + D_{22}^* D_{22} = I.
\]
Now again by (2.2) we have
\[
B^*_2B_2 + D^*_1D_{12} + D^*_2D_{22} = B^*_2B_2 + \frac{1}{|a|^2}B^*_2C^*_1C_1B_2 + D^*_2D_{22}
\]
\[
= B^*_2(1 + \frac{1}{|a|^2}C^*_1C_1)B_2 + D^*_2D_{22}
\]
\[
= \frac{1}{|\alpha|^2}B^*_2(|\alpha|^2 + \frac{1}{|\beta|^2}C^*_1C_1)B_2 + D^*_2D_{22},
\]
so that
\[
\frac{1}{|\alpha|^2}B^*_2B_2 + D^*_2D_{22} = I,
\]
by (2.6), from which we conclude that \(V^*_2V_2 = I\). Finally, notice that
\[
V_1V_2 = \begin{bmatrix} \alpha \beta & B_1 \\ C_1 & D_{11} \frac{1}{\alpha \beta}C_1B_2 \end{bmatrix} \begin{bmatrix} a & B_1 \\ C_1 & D_{11} \frac{1}{\alpha}C_1B_2 \end{bmatrix} = \begin{bmatrix} a B_1 \\ C_1D_{11} \frac{1}{\alpha}C_1B_2 \\ C_2 & D_{22} \end{bmatrix},
\]
and hence
\[
V = V_1V_2,
\]
by (2.2). Then, by Theorem 2.2 we have
\[
\tau_{V}(z) = \tau_{V_1}(z_1, \ldots, z_m)\tau_{V_2}(z_{m+1}, \ldots, z_n),
\]
for all \(z \in \mathbb{D}^n\) where
\[
\tilde{V}_1 = \begin{bmatrix} \alpha \beta \\ \frac{1}{\beta}C_1 \\ D_{11} \end{bmatrix} \quad \text{and} \quad \tilde{V}_2 = \begin{bmatrix} \beta \\ C_2 \frac{1}{\alpha}B_2 \\ D_{22} \end{bmatrix}.
\]
Thus we have proved the following statement:

**Theorem 2.3.** Suppose \(\mathcal{H}_1, \ldots, \mathcal{H}_n\) are Hilbert spaces and \(a\) be a non-zero scalar. If
\[
V = \begin{bmatrix} a & B_1 \\ C_1 & D_{11} \frac{1}{\alpha}C_1B_2 \\ C_2 & D_{22} \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus (\bigoplus_{i=1}^{m} \mathcal{H}_i) \oplus (\bigoplus_{i=m+1}^{n} \mathcal{H}_i)),
\]
is an isometric colligation, then
\[
\tilde{V}_1 = \begin{bmatrix} \alpha \beta \\ \frac{1}{\beta}C_1 \\ D_{11} \end{bmatrix} \quad \text{and} \quad \tilde{V}_2 = \begin{bmatrix} \beta \\ C_2 \frac{1}{\alpha}B_2 \\ D_{22} \end{bmatrix}.
\]
are isometric colligations in \(\mathcal{B}(\mathbb{C} \oplus (\bigoplus_{i=1}^{m} \mathcal{H}_i))\) and \(\mathcal{B}(\mathbb{C} \oplus (\bigoplus_{i=m+1}^{n} \mathcal{H}_i))\), respectively, and
\[
\tau_{V}(z) = \tau_{\tilde{V}_1}(z_1, \ldots, z_m)\tau_{\tilde{V}_2}(z_{m+1}, \ldots, z_n) \quad (z \in \mathbb{D}^n),
\]
where \(\alpha\) and \(\beta\) are non-zero scalars and satisfies the following conditions
\[
|\beta|^2 = |a|^2 + C_1^*C_1 \quad \text{and} \quad \alpha = \frac{a}{\beta}.
\]
Summing up the results of Theorems 2.2 and 2.3, we conclude the following factorization theorem on Schur-Agler class functions in $\mathcal{SA}(\mathbb{D}^n), n \geq 2$:

**Theorem 2.4.** Let $1 \leq m < n$, and let $\theta \in \mathcal{SA}(\mathbb{D}^n)$. If $\theta(0) \neq 0$, then

$$\theta(z) = \varphi(z_1, \ldots, z_m)\psi(z_{m+1}, \ldots, z_n) \quad (z \in \mathbb{D}^n),$$

for some $\varphi \in \mathcal{SA}(\mathbb{D}^m)$ and $\psi \in \mathcal{SA}(\mathbb{D}^{n-m})$ if and only if

$$\theta(z) = \tau_V(z) \quad (z \in \mathbb{D}^n),$$

for some isometric colligation $V$ satisfying property $\mathcal{F}_m(n)$.

We again point out that the assumption $\theta(0) \neq 0$ is not needed to prove the necessary part of the above theorem. Classification of factorizations of functions vanishing at the origin will be discussed in detail in Section 5.

### 3. Factorizations and Property $\mathcal{F}(n)$

In this section we investigate general $n$-variables Schur-Agler class factors of Schur-Agler class functions in $\mathcal{SA}(D^n)$. More specifically, for a given $\theta \in \mathcal{SA}(\mathbb{D}^n)$, we give a set of necessary and sufficient conditions on isometric colligations ensuring the existence of $\varphi$ and $\psi$ in $\mathcal{SA}(\mathbb{D}^n)$ such that $\theta = \varphi\psi$. We identify a new class of isometric colligations, namely $\mathcal{F}(n)$, and prove that the (Schur-Agler class) factors of Schur-Agler class functions are completely determined by isometric colligations satisfying property $\mathcal{F}(n)$. Here we do not set any restriction on $n$, that is, we will assume that $n \geq 1$.

We first identify the relevant isometric colligations:

**Definition 3.1.** We say that an isometry $V \in B(\mathcal{H})$ satisfies property $\mathcal{F}(n)$ if there exist Hilbert spaces $\{\mathcal{M}_i\}_{i=1}^n$ and $\{\mathcal{N}_i\}_{i=1}^n$ such that

$$\mathcal{H} = \mathbb{C} \oplus \left( \bigoplus_{i=1}^n (\mathcal{M}_i \oplus \mathcal{N}_i) \right),$$

and representing $V$ as

$$V = \begin{bmatrix}
    a & B_1 & \cdots & B_n \\
    C_1 & D_{11} & \cdots & D_{1n} \\
    \vdots & \vdots & \ddots & \vdots \\
    C_n & D_{n1} & \cdots & D_{nn}
\end{bmatrix} \in B\left( \mathbb{C} \oplus \left( \bigoplus_{i=1}^n (\mathcal{M}_i \oplus \mathcal{N}_i) \right) \right),$$

and $B_i, C_i$ and $D_{ij}$ as

$$B_i = \begin{bmatrix} B_i(1) & B_i(2) \end{bmatrix} \in B(\mathcal{M}_i \oplus \mathcal{N}_i, \mathbb{C}), \quad C_i = \begin{bmatrix} C_i(1) \\
    C_i(2) \end{bmatrix} \in B(\mathbb{C}, \mathcal{M}_i \oplus \mathcal{N}_i),$$

and

$$D_{ij} = \begin{bmatrix} D_{ij}(1) & D_{ij}(12) \\
    D_{ij}(21) & D_{ij}(2) \end{bmatrix} \in B(\mathcal{M}_j \oplus \mathcal{N}_j, \mathcal{M}_i \oplus \mathcal{N}_i),$$

one has

$$D_{ij}(21) = 0.$$
and
\[ aD_{ij}(12) = C_i(1)B_j(2), \]

for all \( i, j = 1, \ldots, n \).

In particular, an isometry \( V \in \mathcal{B}(\mathcal{H}) \) satisfies property \( F(2) \) if there exist Hilbert spaces \( \mathcal{M}_i \) and \( \mathcal{N}_i \) such that \( \mathcal{H} \) admits a decomposition of the form

\[ \mathcal{H} = \mathbb{C} \oplus (\mathcal{M}_1 \oplus \mathcal{N}_1) \oplus (\mathcal{M}_2 \oplus \mathcal{N}_2), \]

and with respect to this decomposition \( V \) can be represented as

\[
V = \begin{bmatrix}
\alpha & B_1(1) & B_1(2) & B_2(1) & B_2(2) \\
C_1(1) & D_{11}(1) & \frac{1}{a}C_1(1)B_1(2) & D_{12}(1) & \frac{1}{a}C_1(1)B_2(2) \\
C_1(2) & 0 & D_{11}(2) & 0 & D_{12}(2) \\
C_2(1) & 0 & \frac{1}{a}C_2(1)B_1(2) & D_{22}(1) & \frac{1}{a}C_2(1)B_2(2) \\
C_2(2) & 0 & D_{21}(2) & 0 & D_{22}(2)
\end{bmatrix}.
\]

As in Section 2, here we also first prove that a pair of isometric colligations is naturally associated with an isometric colligation satisfying property \( F(n) \).

Let \( \mathcal{M}_i \) and \( \mathcal{N}_i \) be Hilbert spaces, and let

\[ V_1 = \begin{bmatrix}
\alpha & B_1 & \cdots & B_n \\
C_1 & D_{11} & \cdots & D_{1n} \\
\vdots & \vdots & \ddots & \vdots \\
C_n & D_{n1} & \cdots & D_{nn}
\end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{M}_i^n), \]

and

\[ V_2 = \begin{bmatrix}
\beta & F_1 & \cdots & F_n \\
G_1 & H_{11} & \cdots & H_{1n} \\
\vdots & \vdots & \ddots & \vdots \\
G_n & H_{n1} & \cdots & H_{nn}
\end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{N}_i^n), \]

be isometric colligations. Given \( i = 1, \ldots, n \), we define the Hilbert space \( \mathcal{H}_i \) as

\[ \mathcal{H}_i = \mathcal{M}_i \oplus \mathcal{N}_i, \]

and bounded linear operators \( \tilde{B}_i, \tilde{C}_i \) and \( \tilde{D}_{ij} \) as

\[ \tilde{B}_i = \begin{bmatrix} B_i & 0 \end{bmatrix} \in \mathcal{B}(\mathcal{H}_i, \mathbb{C}), \quad \tilde{C}_i = \begin{bmatrix} C_i & 0 \end{bmatrix} \in \mathcal{B}(\mathbb{C}, \mathcal{H}_i), \]

and

\[ \tilde{D}_{ij} = \begin{bmatrix} D_{ij} & 0 \\
0 & \delta_{ij}I \end{bmatrix} \in \mathcal{B}(\mathcal{H}_j, \mathcal{H}_i), \]

respectively, for all \( i, j = 1, \ldots, n \). Set

\[ (3.1) \quad \tilde{V}_i = \begin{bmatrix}
\alpha & \tilde{B}_1 & \cdots & \tilde{B}_n \\
\tilde{C}_1 & D_{11} & \cdots & D_{1n} \\
\vdots & \vdots & \ddots & \vdots \\
\tilde{C}_n & \tilde{D}_{n1} & \cdots & \tilde{D}_{nn}
\end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_i^n). \]
On the other hand, let
\begin{equation}
\tilde{V}_2 = \begin{bmatrix}
\beta & \tilde{F}_1 & \cdots & \tilde{F}_n \\
\tilde{G}_1 & H_{11} & \cdots & H_{1n} \\
\vdots & \vdots & \ddots & \vdots \\
\tilde{G}_n & H_{n1} & \cdots & H_{nn}
\end{bmatrix} \in B(\mathbb{C} \oplus \mathcal{H}_1^n),
\end{equation}
where
\begin{equation}
\tilde{F}_i = \begin{bmatrix} 0 & F_i \end{bmatrix} \in B(\mathcal{H}_i, \mathbb{C}), \quad \tilde{G}_i = \begin{bmatrix} 0 \\ G_i \end{bmatrix} \in B(\mathbb{C}, \mathcal{H}_i),
\end{equation}
and
\begin{equation}
\tilde{H}_{ij} = \begin{bmatrix} \delta_{ij} I & 0 \\ 0 & H_{ij} \end{bmatrix} \in B(\mathcal{H}_j, \mathcal{H}_i),
\end{equation}
for all $i, j = 1, \ldots, n$. Define $V = \tilde{V}_1 \tilde{V}_2$.
It then follows that $V \in B(\mathbb{C} \oplus \mathcal{H}_1^n)$ is an isometry and
\begin{equation}
V = \begin{bmatrix}
\alpha \beta & \hat{B}_1 & \cdots & \hat{B}_n \\
\hat{C}_1 & D_{11} & \cdots & D_{1n} \\
\vdots & \vdots & \ddots & \vdots \\
\hat{C}_n & D_{n1} & \cdots & D_{nn}
\end{bmatrix} := \begin{bmatrix}
\alpha \beta & \hat{B} \\
\hat{C} & \hat{D}
\end{bmatrix},
\end{equation}
where
\begin{equation}
\hat{B}_i = \begin{bmatrix} B_i & \alpha F_i \end{bmatrix} \in B(\mathcal{H}_i, \mathbb{C}), \quad \hat{C}_i = \begin{bmatrix} \beta C_i \\ G_i \end{bmatrix} \in B(\mathbb{C}, \mathcal{H}_i),
\end{equation}
and
\begin{equation}
\hat{D}_{ij} = \begin{bmatrix} D_{ij} & C_i F_j \\ 0 & H_{ij} \end{bmatrix} \in B(\mathcal{H}_j, \mathcal{H}_i),
\end{equation}
for all $i, j = 1, \ldots, n$. Define $X(z) : \mathbb{C} \to \mathbb{C}$, $z \in \mathbb{D}^n$, by
\begin{equation}
X(z) = \hat{B}(I_{\mathcal{H}_1^n} - E_{\mathcal{H}}(z)\hat{D})^{-1}E_{\mathcal{H}}(z)\hat{C}.
\end{equation}
Then
\begin{equation}
\tau_V(z) = \alpha \beta + X(z),
\end{equation}
for all $z \in \mathbb{D}^n$. Next, define the flip operator
\begin{equation}
\eta : \mathcal{H}_1^n \to \mathcal{M}_1^n \oplus \mathcal{N}_1^n,
\end{equation}
by
\begin{equation}
\eta \left( \bigoplus_{i=1}^n (f_i \oplus g_i) \right) = \left( \bigoplus_{i=1}^n f_i \right) \oplus \left( \bigoplus_{i=1}^n g_i \right),
\end{equation}
for all $f_i \in \mathcal{M}_i$ and $g_i \in \mathcal{N}_i$, $i = 1, \ldots, n$. Then $\eta$ is a unitary operator and so
\begin{equation}
X(z) = (\hat{B}\eta^*)(I_{\mathcal{M}_1^n \oplus \mathcal{N}_1^n} - (\eta E_{\mathcal{H}_1^n}(z)\eta^*)(\eta \hat{D}\eta^*))^{-1}(\eta E_{\mathcal{H}_1^n}(z)\eta^*)(\eta \hat{C}).
\end{equation}
On the other hand, the definition of the flip operator $\eta$ reveals that
\[
\hat{B}\eta^* = \left[ B \quad \alpha F \right], \quad \eta\hat{C} = \left[ \beta C \quad G \right], \quad \eta\hat{D}\eta^* = \left[ D \quad CF \right],
\]
and
\[
\eta E_{\mathcal{H}_1^\eta}(z)\eta^* = \left[ E_{\mathcal{M}_1^\eta}(z) \quad 0 \right] \left[ 0 \quad E_{\mathcal{N}_1^\eta}(z) \right].
\]
In particular, this yields
\[
I_{\mathcal{M}_1^\eta \oplus \mathcal{N}_1^\eta} - (\eta E_{\mathcal{H}_1^\eta}(z)\eta^*)(\eta\hat{D}\eta^*) = \left[ I - E_{\mathcal{M}_1^\eta}(z)D \quad -E_{\mathcal{M}_1^\eta}(z)CF \right] \left[ 0 \quad I - E_{\mathcal{N}_1^\eta}(z)H \right],
\]
for all $z \in \mathbb{D}^n$.

In order to further ease the notation, for Hilbert spaces $\{S_i\}_{i=1}^n$ and $z \in \mathbb{D}^n$, we set
\[
E_S(z) = \bigoplus_{i=1}^n z_i I_{S_i},
\]
and, for $Y \in B(\bigoplus_{i=1}^n S_i)$, $\|Y\| \leq 1$, define
\[
r(z, Y) = \left( I_{S_i^\eta} - E_S(z)Y \right)^{-1}.
\]
Continuing the above computation, for each $z \in \mathbb{D}^n$, we now have
\[
\left( I_{\mathcal{M}_1^\eta \oplus \mathcal{N}_1^\eta} - (\eta E_{\mathcal{H}_1^\eta}(z)\eta^*)(\eta\hat{D}\eta^*) \right)^{-1} = \left[ r(z, D) \quad r(z, D)E_{\mathcal{M}_1^\eta}(z)CFr(z, H) \right].
\]
Moreover, since \[
(\eta E_{\mathcal{H}_1^\eta}(z)\eta^*)(\eta\hat{C}) = \left[ \beta E_{\mathcal{M}_1^\eta}(z)C \quad E_{\mathcal{N}_1^\eta}(z)G \right],
\]
it follows that
\[
X(z) = \left[ B \quad \alpha F \right] \left[ \beta r(z, D)E_{\mathcal{M}_1^\eta}(z)C + r(z, D)E_{\mathcal{M}_1^\eta}(z)CFr(z, H)E_{\mathcal{N}_1^\eta}(z)G \right] \\
= \beta Br(z, D)E_{\mathcal{M}_1^\eta}(z)C + Br(z, D)E_{\mathcal{M}_1^\eta}(z)CFr(z, H)E_{\mathcal{N}_1^\eta}(z)G \\
+ \alpha Fr(z, H)E_{\mathcal{N}_1^\eta}(z)G,
\]
and so
\[
\tau_V(z) = \tau_{V_1}(z)\tau_{V_2}(z),
\]
for all $z \in \mathbb{D}^n$. We have therefore proved:

**Theorem 3.2.** Suppose
\[
V_1 = \left[ \begin{array}{cc} \alpha & B \\ C & D \end{array} \right] \in B\left( \mathbb{C} \oplus \bigoplus_{i=1}^n \mathcal{M}_i \right) \quad \text{and} \quad V_2 = \left[ \begin{array}{cc} \beta & F \\ G & H \end{array} \right] \in B\left( \mathbb{C} \oplus \bigoplus_{i=1}^n \mathcal{N}_i \right)
\]
are isometric colligations, and let
\[
V = \tilde{V}_1\tilde{V}_2,
\]
where $\tilde{V}_1$ and $\tilde{V}_2$ are as in (3.1) and (3.2), respectively. Then the isometric colligation $V \in B\left(\mathbb{C} \oplus \bigoplus_{i=1}^{n}(M_i \oplus N_i)\right)$ as in (3.3) satisfies property $\mathcal{F}(n)$ and
\[
\tau_{\tilde{V}}(z) = \tau_{\tilde{V}_1}(z)\tau_{\tilde{V}_2}(z) \quad (z \in \mathbb{D}^n).
\]

We have the following interpretations of the above theorem: Let $\theta, \varphi, \psi \in SA(\mathbb{D}^n)$, and let $\theta(z) = \varphi(z)\psi(z)$ $(z \in \mathbb{D}^n)$. Suppose $V_1 = \begin{bmatrix} \alpha & B \\ C & D \end{bmatrix}$ and $V_2 = \begin{bmatrix} \beta & F \\ G & H \end{bmatrix}$ are isometric colligations on $\mathbb{C} \oplus M_i^n$ and $\mathbb{C} \oplus N_i^n$, respectively, and suppose that
\[
\varphi(z) = \tau_{V_1}(z) \quad \text{and} \quad \psi(z) = \tau_{V_2}(z) \quad \text{for all} \quad z \in \mathbb{D}^n.
\]
Then the isometric colligation $V = \tilde{V}_1 \tilde{V}_2$, as constructed in Theorem 3.2, satisfies property $\mathcal{F}(n)$ and
\[
\tau_{V}(z) = \tau_{V_1}(z)\tau_{V_2}(z) \quad \text{for all} \quad z \in \mathbb{D}^n,
\]
that is $\theta = \tau_{V}$.

Now we proceed to treat the converse of Theorem 3.2. Let $V \in B(\mathcal{H})$ be an isometric colligation, and let $V$ satisfies property $\mathcal{F}(n)$. As in Theorem 2.3, here also we assume that $a := \tau_{V}(0) \neq 0$.

Now
\[
\mathcal{H} = \mathbb{C} \oplus \left(\bigoplus_{i=1}^{n}(M_i \oplus N_i)\right),
\]
for some Hilbert spaces $\{M_i\}_{i=1}^{n}$ and $\{N_i\}_{i=1}^{n}$, and
\[
V = \begin{bmatrix} a & B \\ C & D \end{bmatrix} = \begin{bmatrix} a & B_1 & \cdots & B_n \\ C_1 & D_{11} & \cdots & D_{1n} \\ \vdots & \vdots & \ddots & \vdots \\ C_n & D_{n1} & \cdots & D_{nn} \end{bmatrix},
\]
where
\[
B_i = \begin{bmatrix} B_i(1) & B_i(2) \end{bmatrix} \in B(M_i \oplus N_i, \mathbb{C}), \quad C_i = \begin{bmatrix} C_i(1) \\ C_i(2) \end{bmatrix} \in B(\mathbb{C}, M_i \oplus N_i),
\]
and
\[
D_{ij} = \begin{bmatrix} D_{ij}(1) & \frac{1}{a}C_i(1)B_j(2) \\ 0 & D_{ij}(2) \end{bmatrix} \in B(M_j \oplus N_j, M_i \oplus N_i),
\]
for all $i, j = 1, \ldots, n$. Set
\[
D(1) = \left[ D_{ij}(1) \right]_{i,j=1}^{n} \in B\left(\bigoplus_{i=1}^{n} M_i \right), \quad \quad D(2) = \left[ D_{ij}(2) \right]_{i,j=1}^{n} \in B\left(\bigoplus_{i=1}^{n} N_i \right).
\]
and
\[ D(12) = \left[ D_{ij}(12) \right]_{i,j=1}^{n} \in B\left( \bigoplus_{i=1}^{n} M_i, \bigoplus_{i=1}^{n} N_i \right), \]
and consider the flip operator (see (3.6))
\[ \eta : \left( \bigoplus_{i=1}^{n} (M_i \oplus N_i) \right) \rightarrow \left( \bigoplus_{i=1}^{n} M_i \right) \oplus \left( \bigoplus_{i=1}^{n} N_i \right). \]
Then
\[ \eta D \eta^* = \begin{bmatrix} D(1) & D(12) \\ 0 & D(2) \end{bmatrix} \in B\left( \bigoplus_{i=1}^{n} M_i, \bigoplus_{i=1}^{n} N_i \right). \]
If we define
\[ V_\eta := \begin{bmatrix} 1 & 0 \\ 0 & \eta \end{bmatrix} V \begin{bmatrix} 1 & 0 \\ 0 & \eta \end{bmatrix}^*, \]
it then follows that
\[ V_\eta = \begin{bmatrix} a & B \eta^* \\ \eta C & \eta D \eta^* \end{bmatrix} \in B\left( \bigoplus_{i=1}^{n} (M_i \oplus N_i) \right), \]
is an isometry. Moreover, since
\[ B \eta^* = \begin{bmatrix} B(1) & B(2) \end{bmatrix}, \quad \text{and} \quad \eta C = \begin{bmatrix} C(1) \\ C(2) \end{bmatrix}, \]
we see that
\[ V_\eta = \begin{bmatrix} a & B(1) \\ C(1) & D(1) \end{bmatrix} \begin{bmatrix} 1 & \frac{1}{a} C(1) B(2) \\ 0 & D(2) \end{bmatrix} \in B\left( \mathbb{C} \oplus \bigoplus_{i=1}^{n} M_i, \bigoplus_{i=1}^{n} N_i \right), \]
where
\[ (3.11) \quad B(i) = \begin{bmatrix} B_1(i) & B_2(i) \end{bmatrix} \quad \text{and} \quad C(i) = \begin{bmatrix} C_1(i) \\ C_2(i) \end{bmatrix}, \]
for all \( i = 1, 2 \). We have now arrived at the setting of the proof of Theorem 2.4 (more specifically, compare \( V_\eta \) with \( V \) in (2.1)). Following the constructions of \( V_1 \) and \( V_2 \) in the proof of Theorem 2.4, we set
\[ \begin{cases} V_1 = \begin{bmatrix} \alpha & B_1(1) \\ \frac{1}{\beta} C(1) & D_1(1) \end{bmatrix} \in B\left( \mathbb{C} \oplus \bigoplus_{i=1}^{n} M_i \right) \\ V_2 = \begin{bmatrix} \beta & B_2(2) \\ C_2(2) & D_2(2) \end{bmatrix} \in B\left( \mathbb{C} \oplus \bigoplus_{i=1}^{n} N_i \right), \end{cases} \]
where
\[ (3.12) \quad |\beta|^2 = |a|^2 + C(1)^* C(1) = 1 - C(2)^* C(2), \]
and

\[(3.14) \quad \alpha = \frac{a}{\beta}.
\]

Since \(a \neq 0\), it follows that \(\alpha\) (and \(\beta\) too) is a non-zero scalars. One may now proceed, similarly as in the proof of Theorem 2.4, to see that \(V_1\) and \(V_2\) are isometries. Then, applying Theorem 3.2 to the pair of isometries \(V_1\) and \(V_2\), we get the canonical pair of isometries \(\tilde{V}_1\) and \(\tilde{V}_2\) such that \(\tau_{\tilde{V}_1} \tilde{V}_2 = \tau_{V_1} V_2\). On the other hand, it follows directly from the construction of \(\tilde{V}_1\) and \(\tilde{V}_2\) (see (3.3)) that \(V = \tilde{V}_1 \tilde{V}_2\) and consequently, \(\tau_V = \tau_{\tilde{V}_1} \tilde{V}_2 = \tau_{V_1} V_2\). We have therefore proved the following counterpart of Theorem 2.3 for isometric colligations satisfying property \(F(n)\).

**Theorem 3.3.** Let \(V \in \mathcal{B}(\mathbb{C} \oplus \bigoplus_{i=1}^{n} (\mathcal{M}_i \oplus \mathcal{N}_i))\) be an isometric colligation, and let \(V\) satisfies property \(F(n)\). If \(\tau_V(0) \neq 0\) and \(V\) admits the representation as in (3.7) with \(B, C\) and \(D\) as in (3.8) and (3.9), respectively, then

\[
V_1 = \begin{bmatrix} \alpha & B(1) \\ \frac{1}{\beta} C(1) & D(1) \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \bigoplus_{i=1}^{n} \mathcal{M}_i) \quad \text{and} \quad V_2 = \begin{bmatrix} \beta & \frac{1}{\alpha} B(2) \\ C(2) & D(2) \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \bigoplus_{i=1}^{n} \mathcal{N}_i),
\]

are isometric colligations where \(B(i), C(i)\) and \(D(i)\) are as in (3.10) and (3.11) and \(\alpha\) and \(\beta\) are non-zero scalars and satisfies the following conditions

\[
|\beta|^2 = |a|^2 + C(1)^* C(1) \quad \text{and} \quad \alpha = \frac{a}{\beta}.
\]

Moreover

\[
\tau_V = \tau_{V_1} \tau_{V_2}.
\]

This along with Theorem 3.2 yields the following classification of Schur-Agler class factors of Schur-Agler class functions in \(\mathcal{SA}(\mathbb{D}^n), n \geq 1:\)

**Theorem 3.4.** Suppose \(\theta \in \mathcal{SA}(\mathbb{D}^n)\), and suppose that \(\theta(0) \neq 0\). Then

\[
\theta = \varphi \psi,
\]

for some \(\varphi, \psi \in \mathcal{SA}(\mathbb{D}^n)\) if and only if

\[
\theta = \tau_V,
\]

for some isometric colligation \(V\) satisfying property \(F(n)\).

Given \(\theta = \tau_V\) for some isometric colligation \(V\) satisfying property \(F(n)\), as presented above, we now know that \(\theta = \varphi \psi\) for some \(\varphi, \psi \in \mathcal{SA}(\mathbb{D}^n)\). If \(V\) admits the representation as in (3.7), then it follows moreover from (3.12) that

\[
(3.15) \quad \begin{cases} 
\varphi(z) = \alpha + \frac{1}{\beta} B(1)(I_{\mathcal{M}_1} - E_{\mathcal{M}_1}(z))^{-1} E_{\mathcal{M}_1}(z) C(1) \\
\psi(z) = \beta + \frac{1}{\alpha} B(2)(I_{\mathcal{N}_1} - E_{\mathcal{N}_1}(z))^{-1} E_{\mathcal{N}_1}(z) C(2),
\end{cases}
\]

for all \(z \in \mathbb{D}^n\).
The assumption that $\theta(0) \neq 0$ in the proof of the sufficient part will be discussed in Section 5. Also see Subsection 6.3 for a natural connection between $\mathcal{F}_m(n)$ and $\mathcal{F}(n)$, $1 \leq m < n$.

4. Factorizations of multipliers on the ball

In this section, we continue with our study of factorizations of bounded analytic functions. Here we are interested in factorizations of multipliers of the Drury-Arveson space on the unit ball $\mathbb{B}^n$ in $\mathbb{C}^n$. However (and curiously, if not surprisingly), the techniques involved in representing multiplier factors of multipliers of the Drury-Arveson space seems relatively simpler than that of the Schur-Agler class functions on $\mathbb{D}^n$. Moreover, since the proofs of the following results are often similar (in spirit) to the case of $\mathcal{SA}(\mathbb{D}^n)$, we will be rather sketchy.

Recall that the Drury-Arveson space, denoted by $H^2_n$, is the Hilbert space of holomorphic functions on $\mathbb{B}^n$ corresponding to the reproducing kernel (cf. [8])

$$k(z, w) = \frac{1}{1 - \langle z, w \rangle} \quad (z, w \in \mathbb{B}^n),$$

where $\langle z, w \rangle$ is the usual scalar product in $\mathbb{C}^n$. A complex-valued function $\varphi$ on $\mathbb{B}^n$ is said to be a multiplier (of the Drury-Arveson space $H^2_n$) if

$$\varphi H^2_n \subseteq H^2_n.$$

If $\varphi$ is a multiplier, then the operator $M_\varphi$ defined by

$$(M_\varphi f)(w) = \varphi(w)f(w) \quad (f \in H^2_n, w \in \mathbb{B}^n),$$

is bounded on $H^2_n$. We let $\mathcal{M}(H^2_n)$ denote the commutative Banach algebra of multipliers equipped with the operator norm $\|\varphi\| := \|M_\varphi\|_{\mathcal{B}(H^2_n)}$. Also we define

$$\mathcal{M}_1(H^2_n) = \{\varphi \in \mathcal{M}(H^2_n) : \|\varphi\| \leq 1\}.$$

We now fix some notation: Given a Hilbert space $\mathcal{H}$, we denote by $\mathcal{H}^n$ the $n$-copies of $\mathcal{H}$, that is

$$\mathcal{H}^n = \mathcal{H} \oplus \cdots \oplus \mathcal{H},$$

and $E_{\mathcal{H}^n} : \mathbb{B}^n \to \mathcal{B}(\mathcal{H}^n, \mathcal{H})$ the row operator

$$E_{\mathcal{H}^n}(z) = (z_1 I_{\mathcal{H}}, \ldots, z_n I_{\mathcal{H}}) \quad (z \in \mathbb{B}^n).$$

The following characterization of multipliers (see [8, 14]), parallel to the transfer function realizations of Schur-Agler class functions on $\mathbb{D}^n$ (see Theorem 1.2), is our starting point:

**Theorem 4.1.** Suppose $\varphi$ is a complex-valued function on $\mathbb{B}^n$. Then the following are equivalent:

1. $\varphi \in \mathcal{M}_1(H^2_n)$.
2. There exist a Hilbert space $\mathcal{H}$ and an isometric colligation

$$V = \begin{bmatrix} a & B \\ C & D \end{bmatrix} : \mathbb{C} \oplus \mathcal{H} \to \mathbb{C} \oplus \mathcal{H}^n,$$
such that $\varphi = \tau_V$ where

$$
\tau_V(z) = a + B(I_H - E_{\mathcal{H}_n}(z))^{-1}E_{\mathcal{H}_n}(z)C \quad (z \in \mathbb{B}^n).
$$

The following simple observation on isometric colligations is quite useful: Suppose $\mathcal{H}$ is a Hilbert space and

$$
V = \begin{bmatrix} a & B \\ C & D \end{bmatrix} : \mathbb{C} \oplus \mathcal{H} \to \mathbb{C} \oplus \mathcal{H}^n,
$$

is a bounded linear operator. Then $V$ is an isometry (that is $V^*V = I_{\mathbb{C} \oplus \mathcal{H}}$) if and only if

$$
\begin{align*}
|a|^2 + C^*C &= 1 \\
\bar{a}B + C^*D &= 0 \\
B^*B + D^*D &= I_{\mathcal{H}}.
\end{align*}
$$

Before proceeding we make a brief remark concerning notation: Given Hilbert spaces $\mathcal{H}$ and $\mathcal{K}$, in what follows, we represent an operator $A \in \mathcal{B}(\mathcal{H}, \mathcal{K}^n)$ as

$$
A = \begin{bmatrix} A_1 \\ \vdots \\ A_n \end{bmatrix}.
$$

We now proceed to prove the first factorization result for contractive multipliers of the Drury-Arveson space. Suppose $1 \leq m < n$, $\theta \in \mathcal{M}_1(H^2_n)$, $\varphi \in \mathcal{M}_1(H^2_m)$ and $\psi \in \mathcal{M}_1(H^2_{n-m})$. Suppose that

$$
\theta(z) = \varphi(z_1, \ldots, z_m)\varphi(z_{m+1}, \ldots, z_n) \quad (z \in \mathbb{B}^n).
$$

Then there exist Hilbert spaces $\mathcal{M}$ and $\mathcal{N}$ and isometric colligations

$$
V_1 = \begin{bmatrix} \alpha & E \\ F & G \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{M}, \mathbb{C} \oplus \mathcal{M}^m) \quad \text{and} \quad V_2 = \begin{bmatrix} \beta & Y \\ Z & W \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{N}, \mathbb{C} \oplus \mathcal{N}^{n-m}).
$$

such that $\varphi = \tau_{V_1}$ and $\psi = \tau_{V_2}$. Define

$$
\mathcal{H} = \mathcal{M} \oplus \mathcal{N},
$$

and

$$
V = \begin{bmatrix} \alpha \beta & B \\ C & D \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}, \mathbb{C} \oplus \mathcal{H}^n),
$$

where $B = [E \quad \alpha Y]$ and

$$\begin{align*}
C_j &= \begin{bmatrix} \beta F_j \\ 0 \end{bmatrix} \quad \text{if } 1 \leq j \leq m \\
C_j &= \begin{bmatrix} 0 \\ Z_{j-m} \end{bmatrix} \quad \text{if } m + 1 \leq j \leq n,
\end{align*}$$
and

\[
D_j = \left\{ \begin{array}{ll}
G_j & \text{if } 1 \leq j \leq m \\
F_j Y & \\
0 & \text{if } m + 1 \leq j \leq n.
\end{array} \right.
\]

By taking into account of isometric properties of \( V_1 \) and \( V_2 \) and using property (4.1) repeatedly, we conclude that \( V \) is an isometry in \( B(\mathbb{C} \oplus \mathcal{H}, \mathbb{C} \oplus \mathcal{H}^n) \). We now compute

\[
(I_{\mathcal{H}} - E_{\mathcal{H}^n}(z)D)^{-1} = (I_{\mathcal{H}} - \sum_{i=1}^{n} z_i D_i)^{-1}
\]

\[
= (I_{\mathcal{H}} - \sum_{j=1}^{m} z_j D_j - \sum_{j=m+1}^{n} z_j D_j)^{-1}
\]

\[
= \left( \begin{array}{cc}
I_M & 0 \\
0 & I_N
\end{array} \right) - \sum_{j=1}^{m} z_j \left( \begin{array}{cc}
G_j & F_j Y \\
0 & 0
\end{array} \right) - \sum_{j=m+1}^{n} z_j \left( \begin{array}{cc}
0 & 0 \\
W_{j-m} & 0
\end{array} \right)^{-1}
\]

\[
= \left( I_M - \sum_{j=1}^{m} z_j G_j \right) - \sum_{j=1}^{m} z_j F_j Y \\
0 & I_N - \sum_{j=m+1}^{n} z_j W_{j-m}
\]

\[
= \left( I_M - \sum_{j=1}^{m} z_j G_j \right)^{-1} \begin{bmatrix} T \\
0 & (I_N - \sum_{j=m+1}^{n} z_j W_{j-m})^{-1} \end{bmatrix},
\]

where

\[
T = (I_M - \sum_{j=1}^{m} z_j G_j)^{-1} \left( \sum_{j=1}^{m} z_j F_j \right) Y (I_N - \sum_{j=m+1}^{n} z_j W_{j-m})^{-1}.
\]

Moreover, since

\[
E_{\mathcal{H}^n}(z)C = \begin{bmatrix}
\beta \sum_{j=1}^{m} z_j F_j \\
\sum_{j=m+1}^{n} z_j Z_{j-m}
\end{bmatrix},
\]
it follows that
\[ \tau_V(z) = \alpha \beta + B(I_H - E_{H^n}(z)D)^{-1}E_{H^n}(z)C \]
\[ = \alpha \beta + \left[ E \quad \alpha Y \right] (I_H - E_{H^n}(z)D)^{-1}E_{H^n}(z)C \]
\[ = \alpha \beta E(I_M - \sum_{j=1}^{m} z_j G_j)^{-1} \left( \sum_{j=1}^{m} z_j F_j \right) + ET \sum_{j=m+1}^{n} z_j Z_{j-m} \]
\[ = \alpha \beta E^2 \left[ \sum_{j=m+1}^{n} z_j W_{j-m} \right]^{-1} \left( \sum_{j=m+1}^{n} z_j Z_{j-m} \right) \]
\[ = \tau_{V_1}(z_1, \ldots, z_m) \tau_{V_2}(z_{m+1}, \ldots, z_n), \]
for all \( z \in \mathbb{D}^n \). Since \( \theta = \tau_{V_1} \tau_{V_2} \), it then follows that
\[ \theta = \tau_V, \]
where \( V \) is the isometric colligation as in (4.2). We have thus proved part of the following theorem.

**Theorem 4.2.** Suppose \( \theta \in \mathcal{M}_1(H^2_n) \) and \( \theta(0) \neq 0 \). Then the following are equivalent:

1. There exist multipliers \( \varphi \in \mathcal{M}_1(H^2_m) \) and \( \psi \in \mathcal{M}_1(H^2_{n-m}) \) such that
   \[ \theta(z) = \varphi(z_1, \ldots, z_m) \psi(z_{m+1}, \ldots, z_n) \quad (z \in \mathbb{D}^n). \]
2. There exist Hilbert spaces \( \mathcal{H}_1 \) and \( \mathcal{H}_2 \) and isometric colligation
   \[ V = \begin{bmatrix} a & B \\ C & D \end{bmatrix} : \mathbb{C} \oplus (\mathcal{H}_1 \oplus \mathcal{H}_2) \to \mathbb{C} \oplus (\mathcal{H}_1 \oplus \mathcal{H}_2)^n, \]
   such that writing \( B = [B(1) \quad B(2)] \), \( C = \begin{bmatrix} C_1 \\ \vdots \\ C_n \end{bmatrix} \) and \( D = \begin{bmatrix} D_1 \\ \vdots \\ D_n \end{bmatrix} \), one has
   \[ C_j = \begin{cases} \begin{bmatrix} C_j(1) \\ 0 \end{bmatrix} & \text{if } 1 \leq j \leq m \\ \begin{bmatrix} 0 \\ C_j(2) \end{bmatrix} & \text{if } m+1 \leq j \leq n, \end{cases} \]
   and
   \[ D_j = \begin{cases} \begin{bmatrix} D_j(1) & D_j(2) \\ 0 & 0 \end{bmatrix} & \text{if } 1 \leq j \leq m \\ \begin{bmatrix} 0 & 0 \\ 0 & D_j(3) \end{bmatrix} & \text{if } m+1 \leq j \leq n, \end{cases} \]
   and
   \[ aD_j(2) = C_j(1)B(2), \]
for all \( i = 1, \ldots, m \), and
\[
\theta(z) = a + B(I_{\mathcal{H}_1 \oplus \mathcal{H}_2} - E_{(\mathcal{H}_1 \oplus \mathcal{H}_2)^n}(z)D)^{-1}E_{(\mathcal{H}_1 \oplus \mathcal{H}_2)^n}(z)C \quad (z \in \mathbb{D}^n).
\]

**Proof.** We only need to show that (2) implies (1). Note that \( V^*V = I \) implies, in particular, that
\[
|a|^2 + \sum_{j=1}^m C_j(1)^*C_j(1) + \sum_{j=m+1}^n C_j(2)^*C_j(2) = 1.
\]
Let
\[
|\beta|^2 = |a|^2 + \sum_{j=1}^m C_j(1)^*C_j(1).
\]
Since \( a = \theta(0) \neq 0 \), it follows that \( \beta \neq 0 \). Set
\[
\alpha = \frac{a}{\beta},
\]
and define
\[
V_1 = \begin{bmatrix}
\alpha & B(1) \\
\frac{1}{\beta}C_1(1) & D_1(1) \\
\vdots & \vdots \\
\frac{1}{\beta}C_m(1) & D_m(1)
\end{bmatrix}
\quad \text{and} \quad
V_2 = \begin{bmatrix}
\beta & \frac{1}{n}B(2) \\
C_{m+1}(2) & D_{m+1}(3) \\
\vdots & \vdots \\
C_n(2) & D_n(3)
\end{bmatrix}.
\]
Clearly \( V_1 \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_1, \mathbb{C} \oplus (\mathcal{H}_1)^n) \) and \( V_2 \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_2, \mathbb{C} \oplus (\mathcal{H}_2)^n) \). Now in view of (4.1), \( V_1 \) is an isometry if and only if
\[
\left\{ \begin{array}{l}
|\alpha|^2 + \sum_{j=1}^m \frac{1}{|\beta|^2} C_j(1)^*C_j(1) = 1 \\
\bar{\alpha}B(1) + \sum_{j=1}^m \frac{1}{\beta} C_j(1)^*D_j(1) = 0 \\
B(1)^*B(1) + \sum_{j=1}^m D_j(1)^*D_j(1) = I.
\end{array} \right.
\]
Here the first equality is a simple consequence of the definitions of \( \alpha \) and \( \beta \). The second and the third equalities follows from the isometric property of \( V \) applied to the equality (4.1). The proof of the fact that \( V_2 \) is an isometry is similar (but requires the fact that \( aD_j(2) = C_j(2)B(2) \) for all \( 1 \leq j \leq m \)) and left to the reader. Then
\[
\tau_{V_1} \in \mathcal{M}_1(H_m^2) \quad \text{and} \quad \tau_{V_2} \in \mathcal{M}_1(H_{n-m}^2).
\]
We set
\[
\varphi(z_1, \ldots, z_m) = \tau_{V_1}(z_1, \ldots, z_m) \quad \text{and} \quad \psi(z_{m+1}, \ldots, z_n) = \tau_{V_2}(z_{m+1}, \ldots, z_n),
\]
for all \( z \in \mathbb{B}^n \). Then
\[
\varphi(z_1, \ldots, z_m) = \alpha + \frac{1}{\beta} B(1) \left( 1 - \sum_{j=1}^m z_j D_j(1) \right)^{-1} \left( \sum_{j=1}^m z_j C_j(1) \right),
\]
for all \( z \in \mathbb{B}^n \). Then
\[ \psi(z_{m+1}, \ldots, z_n) = \beta + \frac{1}{\alpha} B(2) \left( 1 - \sum_{j=m+1}^{n} z_j D_j(3) \right)^{-1} \left( \sum_{j=m+1}^{n} z_j C_j(2) \right), \]

for all \( z \in \mathbb{B}^n \). It is now routine to check that this indeed defines the required factors of \( \theta \), that is

\[ \theta(z) = \varphi(z_1, \ldots, z_m) \psi(z_{m+1}, \ldots, z_n) \quad (z \in \mathbb{B}^n), \]

which completes the proof that (1) and (2) are equivalent. \( \blacksquare \)

The Drury-Arveson multipliers analog of Theorem 3.4, as stated below, also holds. We leave the similar verification, following the line of the proof of Theorem 3.4, to the reader.

**Theorem 4.3.** Suppose \( \theta \in M_1(H_n^2) \) and \( \theta(0) \neq 0 \). Then the following are equivalent:

1. There exist \( \varphi \) and \( \psi \) in \( M_1(H_n^2) \) such that \( \theta = \varphi \psi \).
2. There exist Hilbert spaces \( H_1 \) and \( H_2 \) and isometric colligation
   \[ V = \begin{bmatrix} a & B \\ C & D \end{bmatrix} : \mathbb{C} \oplus (H_1 \oplus H_2) \to \mathbb{C} \oplus (H_1 \oplus H_2)^n, \]
   such that
   \[ \theta(z) = a + B(I_{H_1 \oplus H_2} - E_{(H_1 \oplus H_2)^n}(z) D)^{-1} E_{(H_1 \oplus H_2)^n}(z) C \quad (z \in \mathbb{B}^n), \]
   and writing \( B = [B(1) \quad B(2)] \), \( C = \begin{bmatrix} C_1 \\ \vdots \\ C_n \end{bmatrix} \), \( D = \begin{bmatrix} D_1 \\ \vdots \\ D_n \end{bmatrix} \) and
   \[ C_i = \begin{bmatrix} C_i(1) \\ C_i(2) \end{bmatrix} \quad \text{and} \quad D_i = \begin{bmatrix} D_i(1) \\ D_i(21) \\ D_i(2) \end{bmatrix}, \]
   one has
   \[ D_i(21) = 0 \quad \text{and} \quad aD_i(12) = C_i(1)B(2), \]
   for all \( i = 1, \ldots, n \).
Therefore
\[
\tilde{V}_1 = \begin{bmatrix} 0 & Q & 0 \\ R & S & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad \text{and} \quad \tilde{V}_2 = \begin{bmatrix} x & 0 & Y \\ 0 & 1 & 0 \\ Z & 0 & W \end{bmatrix},
\]
are isometries in $\mathcal{B}(\mathbb{C} \oplus (\mathcal{H}_1 \oplus \mathcal{H}_2))$. On defining $V := \tilde{V}_1 \tilde{V}_2$, we have the isometry
\[
(5.1) \quad V = \begin{bmatrix} 0 & B_1 & 0 \\ C_1 & D_1 & D_2 \\ C_2 & 0 & D_4 \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus (\mathcal{H}_1 \oplus \mathcal{H}_2)),
\]
where
\[
\begin{bmatrix} 0 & B_1 & 0 \\ C_1 & D_1 & D_2 \\ C_2 & 0 & D_4 \end{bmatrix} = \begin{bmatrix} 0 & Q & 0 \\ xR & S & RY \\ Z & 0 & W \end{bmatrix}.
\]
We then have $C_1 = xR$ and $D_2 = RY$, and consequently the condition $R^*R = 1$ yields
\[
C^*_1 C_1 D_2 = |x|^2 RR^* D_2 = |x|^2 RR^* RY = |x|^2 RY = |x|^2 D_2 = C_1^* C_1 D_2,
\]
as $C_1^* C_1 = |x|^2(>0)$. Moreover, with $V$ as in (5.1), we compute $\tau_V$ as:
\[
\tau_V(z) = [B_1 \ 0] \left( I - z \begin{bmatrix} D_1 & D_2 \\ 0 & D_4 \end{bmatrix} \right)^{-1} z \begin{bmatrix} C_1 \\ C_2 \end{bmatrix}
= z [B_1 \ 0] \left( (I - zD_1)^{-1} (I - zD_1)^{-1}zD_2(I - zD_4)^{-1} \right) \begin{bmatrix} C_1 \\ C_2 \end{bmatrix}
= z \begin{bmatrix} B_1(I - zD_1)^{-1} & zB_1 (I - zD_1)^{-1} zD_1 I - zD_4)^{-1} \end{bmatrix} \begin{bmatrix} C_1 \\ C_2 \end{bmatrix},
\]
and so
\[
(5.2) \quad \tau_V(z) = \left( zB_1(I - zD_1)^{-1} \right) \left( C_1 + zD_2(I - zD_4)^{-1} C_2 \right) \quad (z \in \mathbb{D}).
\]
Substituting the values of $B_i, C_i,$ and $D_j, i = 1, 2$ and $j = 2, 4$, we have
\[
\tau_V(z) = \left( zB_1(I - zD_1)^{-1} \right) \left( C_1 + zD_2(I - zD_4)^{-1} C_2 \right)
= \left( zQ(I - zD_1)^{-1} \right) \left( xR + zRY(I - zW)^{-1} Z \right)
= \left( zQ(I - zS)^{-1} R \right) \left( x + zY(I - zW)^{-1} Z \right),
\]
for all $z \in \mathbb{D}$, which implies that $\theta = \tau_V$. Thus, we have collected together all the necessary properties of the isometric colligation $V$ as:
\[
(5.3) \quad C_1^* C_1 D_2 = C_1^* C_1 D_2 \quad \text{and} \quad C_1^* C_1 > 0.
\]
Conversely, suppose $V$ is an isometric colligation as in (5.1), let $\theta = \tau_V$ and let $V$ satisfies the conditions in (5.3). Let $x$ be a non-zero scalar such that
\[
|x|^2 = C_1^* C_1.
Define $V_1 \in \mathcal{B}(C \oplus H_1)$ and $V_2 \in \mathcal{B}(C \oplus H_2)$ by
\[
V_1 = \begin{bmatrix} 0 & B_1 \\ \frac{x}{z}C_1 & D_1 \end{bmatrix} \quad \text{and} \quad V_2 = \begin{bmatrix} x & \frac{1}{z}C_1^*D_2 \\ C_2 & D_4 \end{bmatrix}.
\]
Note that $|x|^2 = 1 - C_1^*C_2 = C_1^*C_1$. A simple computation, following (4.1), then shows that $V_1$ and $V_2$ are isometric colligations. Now we compute
\[
\tau_V(z) = zB_1(1 - zD_1)^{-1}C_1 + z^2B_1(1 - zD_1)^{-1}D_2(1 - zD_4)^{-1}C_2,
\]
and
\[
\tau_{V_1}(z)\tau_{V_2}(z) = zB_1(1 - zD_1)^{-1}C_1 + z^2B_1(1 - zD_1)^{-1}\left\{ \frac{1}{|x|^2}C_1^*D_2 \right\}(1 - zD_4)^{-1}C_2.
\]
Thus, $\tau_V = \tau_{V_1}\tau_{V_2}$ where $\tau_V(0) = \tau_{V_1}(0) = 0$ and $\tau_{V_2}(0) \neq 0$.

Case (ii) $\varphi(0) = \psi(0) = 0$: Suppose $\varphi = \tau_{V_1}$ and $\psi = \tau_{V_2}$ where
\[
V_1 = \begin{bmatrix} 0 & Q \\ R & S \end{bmatrix} \in \mathcal{B}(C \oplus H_1) \quad \text{and} \quad V_2 = \begin{bmatrix} 0 & Y \\ Z & W \end{bmatrix} \in \mathcal{B}(C \oplus H_2),
\]
are isometric colligations. We associate with $V_1$ and $V_2$ the isometric colligation
\[
V = \begin{bmatrix} 0 & Q & 0 \\ R & S & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 0 & 0 & Y \\ 0 & 1 & 0 \\ Z & 0 & W \end{bmatrix} = \begin{bmatrix} 0 & Q & 0 \\ 0 & S & RY \\ Z & 0 & W \end{bmatrix},
\]
in $\mathcal{B}(C \oplus H_1 \oplus H_2)$ and set
\[
(5.4) \quad V = \begin{bmatrix} 0 & B_1 & 0 \\ 0 & D_1 & D_2 \\ C_2 & 0 & D_4 \end{bmatrix}.
\]
Then, in view of (5.2), it follows that $\theta = \tau_V$. Also we pick the essential properties of the isometric colligation $V$ as
\[
(5.5) \quad X^*X = 1, \quad X^*D_1 = 0, \quad \text{and} \quad D_2 = XY,
\]
where $X = R$. Note that the first two equalities follows from the fact that $V_1$ is an isometry. To prove the converse, suppose $V$ is an isometric colligation as in (5.4), $\theta = \tau_V$, $X \in \mathcal{B}(C, H_2)$ is an isometry, $Y \in \mathcal{B}(H_2, C)$ and the conditions in (5.5) hold. Since $V^*V = I$, we have
\[
\begin{bmatrix}
C_2^*C_2 & 0 & C_2^*D_4 \\
0 & B_1B_1^* + D_1^*D_1 & D_1^*D_2 \\
D_4^*C_2 & D_2^*D_1 & D_2^*D_2 + D_4^*D_4
\end{bmatrix} = I_{C \oplus H_1 \oplus H_2},
\]
and hence $V_1 := \begin{bmatrix} 0 & B_1 \\ X & D_1 \end{bmatrix} \in \mathcal{B}(C \oplus H_1)$ is an isometric colligation. Since $D_2 = XY$, $D_2^*D_2 = Y^*Y$, and hence $D_2^*D_2 + D_4^*D_4 = I$ yields $Y^*Y + D_4^*D_4 = I$. Thus $V_2 := \begin{bmatrix} 0 & Y \\ C_2 & D_1 \end{bmatrix} \in \mathcal{B}(C \oplus H_2)$. 
is an isometric colligation. Notice that
\[ \tau_{\nu_1}(z)\tau_{\nu_2}(z) = z^2B_1(1 - zD_1)^{-1}XY(1 - zD_4)^{-1}C_2, \]
and, on the other hand, in view of (5.2), we have
\[ \tau_{\nu}(z) = z^2B_1(1 - zD_1)^{-1}D_2(1 - zD_4)^{-1}C_2, \]
for all \( z \in \mathbb{D} \). This and \( XY = D_2 \) implies that \( \theta = \tau_{\nu} = \tau_{\nu_1}\tau_{\nu_2} \).

Thus we have proved the following:

**Theorem 5.1.** Suppose \( \theta \in \mathcal{S}(\mathbb{D}) \) and \( \theta(0) = 0 \). Then:

1. \( \theta = \varphi\psi \) for some \( \varphi, \psi \in \mathcal{S}(\mathbb{D}) \) and \( \psi(0) \neq 0 \) if and only if there exists an isometric colligation
   \[
   V = \begin{bmatrix} 0 & B_1 & 0 \\ C_1 & D_1 & D_2 \\ C_2 & 0 & D_4 \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus (\mathcal{H}_1 \oplus \mathcal{H}_2)),
   \]
such that \( \theta = \tau_V \) and
   \[ C_1C_1^*D_2 = C_1^*C_1D_2 \quad \text{and} \quad C_1^*C_1 > 0. \]

2. \( \theta = \varphi\psi \) for some \( \varphi, \psi \in \mathcal{S}(\mathbb{D}) \) and \( \varphi(0) = 0 = \psi(0) \) if and only if there exists an isometric colligation
   \[
   V = \begin{bmatrix} 0 & B_1 & 0 \\ 0 & D_1 & D_2 \\ C_2 & 0 & D_4 \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus (\mathcal{H}_1 \oplus \mathcal{H}_2)),
   \]
such that \( \theta = \tau_V \) and
   \[ X^*D_1 = 0 \quad \text{and} \quad D_2 = XY, \]
for some isometry \( X \in \mathcal{B}(\mathbb{C}, \mathcal{H}_2) \) and bounded linear operator \( Y \in \mathcal{B}(\mathcal{H}_2, \mathbb{C}) \).

The general case of functions vanishing at the origin in several variables (in \( \mathcal{SA}(\mathbb{D}^n) \) or \( \mathcal{M}_1(H^2_n) \)) can be studied using the technique developed in the proof of Theorem 5.1. In particular, similar arguments allow us to obtain also a similar classification of factorizations for functions in \( \mathcal{SA}(\mathbb{D}^n) \) vanishing at the origin. We only state the result in the setting of Section 3 and leave out the details to the reader.

**Theorem 5.2.** Suppose \( \theta \in \mathcal{SA}(\mathbb{D}^n) \) and \( \theta(0) = 0 \). Then:

1. \( \theta = \varphi\psi \) for some \( \varphi, \psi \in \mathcal{SA}(\mathbb{D}^n) \) and \( \psi(0) \neq 0 \) if and only if there exist Hilbert spaces \( \{\mathcal{H}_1\}_{i=1}^n \), \( \{\mathcal{M}_i\}_{i=1}^n \) and \( \{\mathcal{N}_i\}_{i=1}^n \) and an isometric colligation
   \[
   V = \begin{bmatrix} 0 & B \\ C & D \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus (\bigoplus_{i=1}^n \mathcal{H}_i))
   \]
such that \( \theta = \tau_V \) and \( \mathcal{H}_k = \mathcal{M}_k \oplus \mathcal{N}_k \), \( k = 1, \ldots, n \), and representing \( B_i, C_i \) and \( D_{ij} \) as
   \[ B_i = [B_i(1), B_i(2)] \in \mathcal{B}(\mathcal{M}_i \oplus \mathcal{N}_i, \mathbb{C}), \quad C_i = \begin{bmatrix} C_i(1) \\ C_i(2) \end{bmatrix} \in \mathcal{B}(\mathbb{C}, \mathcal{M}_i \oplus \mathcal{N}_i), \]

2. ...
and
\[
D_{ij} = \begin{bmatrix}
D_{ij}(1) & D_{ij}(12) \\
D_{ij}(21) & D_{ij}(2)
\end{bmatrix} \in \mathcal{B}(\mathcal{M}_j \oplus \mathcal{N}_j, \mathcal{M}_i \oplus \mathcal{N}_i),
\]

one has
\[
B_i(2) = 0, \quad D_{ij}(21) = 0, \quad C(1)C(1)^*D(12) = C(1)^*C(1)D(12) \quad \text{and} \quad C(1)^*C(1) > 0,
\]

where \(i, j = 1, \ldots, n\), and \(C(1) = \begin{bmatrix} C_1(1) \\ \vdots \\ C_n(1) \end{bmatrix} \in \mathcal{B}(\mathbb{C}, \bigoplus_{i=1}^n \mathcal{M}_i)\) and
\[
D(12) = [D_{ij}(12)]_{i,j=1}^n \in \mathcal{B}\left(\bigoplus_{p=1}^n \mathcal{N}_p, \bigoplus_{p=1}^n \mathcal{M}_p\right).
\]

So \(\theta = \varphi \psi\) for some \(\varphi, \psi \in \mathcal{SA}(\mathbb{D}^n)\) and \(\varphi(0) = 0 = \psi(0)\) if and only if there exist Hilbert spaces \(\{\mathcal{H}_i\}_{i=1}^n\), \(\{\mathcal{M}_i\}_{i=1}^n\) and \(\{\mathcal{N}_i\}_{i=1}^n\), an isometry \(X \in \mathcal{B}(\mathbb{C}, \bigoplus_{i=1}^n \mathcal{M}_i)\), a bounded linear operator \(Y \in \mathcal{B}(\bigoplus_{i=1}^n \mathcal{N}_i, \mathbb{C})\) and an isometric colligation
\[
V = \begin{bmatrix} 0 & B \\ C & D \end{bmatrix} \in \mathcal{B}\left(\mathbb{C} \oplus \bigoplus_{i=1}^n \mathcal{H}_i\right),
\]
such that \(\theta = \tau_V\) and \(\mathcal{H}_k = \mathcal{M}_k \oplus \mathcal{N}_k\), \(k = 1, \ldots, n\), and representing \(B_i, C_i\) an \(D_{ij}\) as
\[
B_i = [B_i(1), B_i(2)] \in \mathcal{B}\left(\mathcal{M}_i \oplus \mathcal{N}_i, \mathbb{C}\right), \quad C_i = \begin{bmatrix} C_i(1) \\ C_i(2) \end{bmatrix} \in \mathcal{B}\left(\mathbb{C}, \mathcal{M}_i \oplus \mathcal{N}_i\right),
\]

and
\[
D_{ij} = \begin{bmatrix} D_{ij}(1) & D_{ij}(12) \\
D_{ij}(21) & D_{ij}(2)\end{bmatrix} \in \mathcal{B}(\mathcal{M}_j \oplus \mathcal{N}_j, \mathcal{M}_i \oplus \mathcal{N}_i),
\]

one has
\[
B_i(2) = 0, \quad C_i(1) = 0, \quad D_{ij}(21) = 0,
\]
and
\[
D(12) = XY \quad \text{and} \quad X^*D(1) = 0,
\]

where
\[
D(1) = [D_{ij}(1)]_{i,j=1}^n \in \mathcal{B}\left(\bigoplus_{p=1}^n \mathcal{M}_p\right),
\]

and
\[
D(12) = [D_{ij}(12)]_{i,j=1}^n \in \mathcal{B}\left(\bigoplus_{p=1}^n \mathcal{N}_p, \bigoplus_{p=1}^n \mathcal{M}_p\right).
\]

The case of contractive multipliers of the Drury-Arveson space vanishing at the origin can be stated and proved in a similar way.
6. Examples and remarks

This section is devoted to some concrete examples, further results and general remarks concerning Schur-Agler class functions in $\mathcal{SA}(\mathbb{D}^n)$.

6.1. One variable factors. Our interest here is to analyze Schur-Agler class functions in $\mathcal{SA}(\mathbb{D}^n)$ which can be factored as a product of $n$ Schur functions. More specifically, let $\varphi \in \mathcal{SA}(\mathbb{D}^n)$ and let $\varphi(0) \neq 0$. Suppose

$$\varphi(z) = \prod_{i=1}^{n} \varphi_i(z_i) \quad (z \in \mathbb{D}^n),$$

for some $\varphi_i \in \mathcal{S}(\mathbb{D})$, $i = 1, \ldots, n$. Then there exist isometric colligations

$$V_i = \begin{bmatrix} a_i & \hat{B}_i \\ \hat{C}_i & \hat{D}_i \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_i),$$

such that

$$\varphi_i = \tau V_i,$$

for all $i = 1, \ldots, n$. Let

$$a = \prod_{i=1}^{n} a_i,$$

and define

$$\hat{V}_1 = \begin{bmatrix} a_1 & \hat{B}_1 & 0 \\ \hat{C}_1 & \hat{D}_1 & 0 \\ 0 & 0 & I \end{bmatrix} \quad \text{and} \quad \hat{V}_n = \begin{bmatrix} a_n & 0 & \hat{B}_n \\ 0 & I & 0 \\ \hat{C}_n & 0 & \hat{D}_n \end{bmatrix},$$

in $\mathcal{B}(\mathbb{C} \oplus \mathcal{H}_1 \oplus \mathcal{H}_2^n)$ and $\mathcal{B}(\mathbb{C} \oplus \mathcal{H}_1^{n-1} \oplus \mathcal{H}_n)$, respectively, and

$$\hat{V}_i = \begin{bmatrix} a_i & 0 & \hat{B}_i & 0 \\ 0 & I & 0 & 0 \\ \hat{C}_i & 0 & \hat{D}_i & 0 \\ 0 & 0 & 0 & I \end{bmatrix},$$

in $\mathcal{B}(\mathbb{C} \oplus \mathcal{H}_1^{i-1} \oplus \mathcal{H}_i \oplus \mathcal{H}_i^{n+1})$ for all $1 < i < n$. Then

$$V = \prod_{i=1}^{n} \hat{V}_i,$$

is an isometry in $\mathcal{B}(\mathbb{C} \oplus \mathcal{H}_n^n)$. Moreover, it follows that

$$V = \begin{bmatrix} a & B \\ C & D \end{bmatrix} = \begin{bmatrix} \begin{array}{c} B_1 & \cdots & B_n \\ C_1 & D_{11} & \cdots & D_{1n} \\ \vdots & \vdots & \ddots & \vdots \\ C_n & D_{n1} & \cdots & D_{nn} \end{array} \end{bmatrix} \quad (6.1)$$
where
\[ \hat{B}_i = \left( \prod_{k=1}^{i-1} a_k \right) \hat{B}_i, \quad \hat{C}_i = \left( \prod_{k=i+1}^{n} a_k \right) \hat{C}_i, \]
and
\[ D_{ij} = \begin{cases} \hat{D}_i & \text{if } i = j \\ 0 & \text{if } i > j \\ (a_{i+1} \cdots a_{j-1}) \hat{C}_i \hat{B}_j & \text{if } i < j. \end{cases} \]
Hence
\[ aD_{ij} = C_i B_j, \]
for all \(1 \leq i < j \leq n\). Then by repeated application of Theorem 2.2, we have
\[ \varphi = \tau_V. \]
The converse, as stated below, follows directly from repeated applications of Theorem 2.3.
We have thus proved the following theorem.

**Theorem 6.1.** Suppose \( \theta \in \mathcal{SA}(D^n) \) and \( \theta(0) \neq 0 \). Then
\[ \theta(z) = \prod_{i=1}^{n} \theta_i(z_i) \quad (z \in D^n), \]
for some Schur functions \( \{\theta_i\}_{i=1}^{n} \subseteq \mathcal{S}(D) \) if and only if there exist Hilbert spaces \( \mathcal{H}_1, \ldots, \mathcal{H}_n \) and an isometric colligation
\[
\begin{bmatrix} a & B \\ C & D \end{bmatrix} = \begin{bmatrix} a & B_1 & \cdots & B_n \\ \hat{C}_1 & D_{11} & \cdots & D_{1n} \\ \vdots & \vdots & \ddots & \vdots \\ \hat{C}_n & D_{n1} & \cdots & D_{nn} \end{bmatrix}
\]
on \( \mathbb{C} \oplus \left( \bigoplus_{i=1}^{n} \mathcal{H}_i \right) \) such that
\[ D_{ij} = \begin{cases} D_i & \text{if } i = j \\ 0 & \text{if } i > j \\ \frac{1}{a} C_i B_j & \text{if } i < j, \end{cases} \]
and
\[ \theta(z) = a + B \left( I_{\mathcal{H}_1} - E_{\mathcal{H}_1}(z) D \right)^{-1} E_{\mathcal{H}_1}(z) C \quad (z \in D^n). \]

6.2. **Examples.** Here we aim at applying our results to some concrete examples.

**Example 1:** First, we let \( \varphi \in \mathcal{S}(D) \) and \( \varphi = \tau_{V_0} \) for some isometric colligation
\[ V_0 = \begin{bmatrix} a & B \\ C & D \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}). \]
Now we consider $\psi(z) = z^m$, $z \in \mathbb{D}$ and $m \in \mathbb{N}$. One then shows that

$$V_m = \begin{bmatrix} 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \ddots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 1 \\ 1 & 0 & 0 & \cdots & 0 \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathbb{C}^m),$$

is an isometric colligation and $\psi = \tau_{V_m}$.

Set $\theta = \varphi\psi = \tau_{V_0}\tau_{V_m}$. Then by Theorem 3.2 (or more specifically, by (3.3)) it follows that $\tau_V(z) = z^m\varphi(z)$ ($z \in \mathbb{D}$), where $V \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H} \oplus \mathbb{C}^m)$ is an isometric colligation with the following representation

$$V = \begin{bmatrix} 0 & B & a & 0 & 0 & \cdots & 0 \\ 0 & D & C & 0 & 0 & \cdots & 0 \\ 0 & 0 & 0 & 1 & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & 0 & \cdots & 1 \\ 1 & 0 & 0 & 0 & 0 & \cdots & 0 \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus (\mathcal{H} \oplus \mathbb{C}) \oplus \mathbb{C}^{m-1}).$$

**Example 2:** Our second example concerns Blaschke factors: If $\lambda \in \mathbb{D}$, then the Blaschke factor $b_\lambda \in \text{Aut}(\mathbb{D})$ is defined by

$$b_\lambda(z) = \frac{z - \lambda}{1 - \overline{\lambda}z} \quad (z \in \mathbb{D}).$$

Now observe that, for each $\lambda \in \mathbb{D}$, the matrix

$$V_\lambda = \begin{bmatrix} -\lambda \\ \sqrt{1 - |\lambda|^2} \alpha \sqrt{1 - |\lambda|^2} \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathbb{C}),$$

is an isometric colligation and $b_\lambda = \tau_{V_\lambda}$.

Now, suppose $\alpha, \beta \in \mathbb{D}$ and

$$\theta(z) = b_\alpha(z_1)b_\beta(z_2) \quad (z \in \mathbb{D}^2).$$

Then Theorem 2.2 implies that $\theta = \tau_V$, where

$$V = \begin{bmatrix} \alpha \beta & \sqrt{1 - |\alpha|^2} & -\alpha \sqrt{1 - |\beta|^2} \\ -\beta \sqrt{1 - |\alpha|^2} & \alpha & \sqrt{1 - |\alpha|^2} \sqrt{1 - |\beta|^2} \\ \sqrt{1 - |\beta|^2} & 0 & \beta \end{bmatrix},$$

is an isometric colligation in $M_3(\mathbb{C})$. 
Example 3: Finally, we stress that for a given Schur function on $D^2$ (or on $D$), the choice of an isometric colligation (for instance, the one in Theorem 1.1) is neither unique nor canonical. In the following, we present an explicit construction of isometric colligation $V$ such that $\tau_V(z_1, z_2) = \tau_{V_1}(z_1) \tau_{V_2}(z_2)$ for all $(z_1, z_2) \in D^2$ but the representation of $V$ is far from the one constructed in Theorem 2.2.

We let $S$ denote the unilateral forward shift on $l^2$, and let $L : \mathbb{C} \to l^2$ denote the operator given by

\[
L(x) = \{ \frac{1}{\sqrt{2}} x, 0, 0, \ldots \} \quad (x \in \mathbb{C}).
\]

In particular

\[S^* L = 0.\]

Define

\[
V_0 = \begin{bmatrix} 0 & 0 & 1 \sqrt{2} \\ 0 & S & L \\ 1 & 0 & 0 \end{bmatrix} \in \mathcal{B} \left( \mathbb{C} \oplus (l^2 \oplus \mathbb{C}) \right).
\]

It is easy to verify that $V_0$ is an isometry. Moreover, $\tau_{V_0} \in \mathcal{S}(D)$ is given by

\[\tau_{V_0}(z) = \frac{1}{\sqrt{2}} z \quad (z \in D).\]

Let $V_1 = V_2 = V_0$. Then $\tau_{V_1}(z_1) = \frac{1}{\sqrt{2}} z_1$ and $\tau_{V_2}(z_2) = \frac{1}{\sqrt{2}} z_2$ for all $z \in D^2$. On the other hand, it is easy to check that

\[
V = \begin{bmatrix} 0 & B \\ C & D \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \sqrt{2} & 0 \\ 0 & S & L & 0 \\ 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \end{bmatrix} \in \mathcal{B} \left( (\mathbb{C} \oplus (l^2 \oplus \mathbb{C}) \oplus \mathbb{C}) \right),
\]

is an isometric colligation. Moreover, the transfer function $\tau_V \in \mathcal{S}(D^2)$ is given by

\[\tau_V(z) = \frac{1}{2} z_1 z_2 \quad (z \in D^2).\]

Therefore, $\tau_V(z) = \tau_{V_1}(z_1) \tau_{V_2}(z_2)$ for all $z \in D^2$.

It is worth mentioning here that the functions $z \mapsto \frac{1}{\sqrt{2}} z$ and $(z_1, z_2) \mapsto \frac{1}{2} z_1 z_2$ on $D$ and $D^2$, respectively, are not inner functions. In this case the corresponding isometric colligations must act on infinite dimensional Hilbert spaces.

6.3. On $F_m(n)$ and $F(n)$. Let $1 \leq m < n$. Suppose $V \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_1^m \oplus \mathcal{H}_m^{n+1})$ satisfies property $F_m(n)$. On account of Theorem 2.3 we have

\[\tau_V(z) = \tau_{V_1}(z_1, \ldots, z_m) \tau_{V_2}(z_{m+1}, \ldots, z_n) \quad (z \in D^n),\]

for some isometric colligations $V_1 \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_1^m)$ and $V_2 \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_m^{n+1})$. Note that $\tau_{V_1} \in \mathcal{SA}(D^m)$ and $\tau_{V_2} \in \mathcal{SA}(D^{n-m})$. The above factorization and Theorem 3.4 further implies that

\[\tau_V = \tau_{\tilde{V}},\]
for some isometric colligation $\tilde{V} \in \mathcal{B}(\mathbb{C} \oplus \left( \bigoplus_{i=1}^{n}(\mathcal{M}_i \oplus \mathcal{N}_i) \right))$ satisfying property $\mathcal{F}(n)$. It is then natural to ask to what extent one can recover $\tilde{V}$ from $V$. To determine the isometric colligation $\tilde{V}$, we proceed as follows: First, we let

$$V = \begin{bmatrix}
    a & B_1 & \cdots & B_n \\
    C_1 & D_{11} & \cdots & D_{1n} \\
    \vdots & \vdots & \ddots & \vdots \\
    C_n & D_{n1} & \cdots & D_{nn}
\end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{H}_1^n),$$

where $D_{ij} = 0$ for $i = m + 1, \ldots, n$ and $j = 1, \ldots, m$; $a D_{ij} = C_i B_j$ for $i = 1, \ldots, m$ and $j = m + 1, \ldots, n$. Let $\mathcal{L}$ be a Hilbert space. Set

$$\mathcal{K}_i = \begin{cases}
    \mathcal{H}_i \oplus \mathcal{L} & \text{if } 1 \leq i \leq m \\
    \mathcal{L} \oplus \mathcal{H}_i & \text{if } m + 1 \leq i \leq n.
\end{cases}$$

We now define

$$Y_i = \begin{cases}
    B_i & \text{if } 1 \leq i \leq m \\
    0 & \text{if } m + 1 \leq i \leq n.
\end{cases} \quad Z_i = \begin{cases}
    C_i & \text{if } 1 \leq i \leq m \\
    0 & \text{if } m + 1 \leq i \leq n.
\end{cases}$$

and

$$W_{ij} = \begin{cases}
    D_{ij} & \text{if } 1 \leq i, j \leq m \\
    \delta_{ij} I_\mathcal{L} & \text{if } m + 1 \leq i, j \leq n,
\end{cases}$$

and

$$W_{ij} = \begin{cases}
    0 & \text{if } 1 \leq i \leq m, m + 1 \leq j \leq n \\
    D_{ij} & \text{if } m + 1 \leq i \leq n, 1 \leq j \leq n.
\end{cases}$$

Then, after some manipulations, it follows that the isometric colligation

$$\tilde{V} := \begin{bmatrix}
    a & Y_1 & \cdots & Y_n \\
    Z_1 & W_{11} & \cdots & W_{1n} \\
    \vdots & \vdots & \ddots & \vdots \\
    Z_n & W_{n1} & \cdots & W_{nn}
\end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \mathcal{K}_1^n),$$
satisfies property $\mathcal{F}(n)$ and $\tau_{\tilde{V}} = \tau_V$. More specifically, we have proved the following:

**Theorem 6.2.** Suppose $1 \leq m < n$ and let $V$ satisfies property $\mathcal{F}_m(n)$. If the representation of $V$ is given by (6.2), then

$$\tau_V = \tau_{\tilde{V}},$$

where $\tilde{V}$ is given by (6.3) and satisfies property $\mathcal{F}(n)$.

6.4. **Reversibility of factorizations.** A natural question to ask in connection with Theorem 3.4 is whether the canonical constructions of the colligation $V$ (out of a pair of isometric colligations $V_1$ and $V_2$) satisfying property $\mathcal{F}(n)$ as in (3.3) and $V_1$ and $V_2$ (out of an isometric colligation $V$ satisfying property $\mathcal{F}(n)$) as in (3.12) are reversible.

To answer this, we proceed as follows: Given $n \in \mathbb{N}$, we let $C(n)$ denote the set of all isometric colligations of the form

$$\begin{bmatrix} a & B \\ C & D \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \bigoplus_{i=1}^{n} \mathcal{H}_i)$$

for some Hilbert spaces $\{\mathcal{H}_i\}_{i=1}^{n}$, and let $F(n)$ denote the set of all isometric colligations satisfying property $\mathcal{F}(n)$. Define $\pi : C(n) \times C(n) \to F(n)$ by

$$\pi(V_1, V_2) = V \quad (V_1, V_2 \in C(n)),$$

where $V$ is as in (3.3) (or Theorem 3.2). Also define $\kappa : F(n) \to C(n) \times C(n)$ by

$$\kappa(V) = (V_1, V_2) \quad (V \in F(n)),$$

where $V_1$ and $V_2$ are as in (3.12). Given $V_1$ and $V_2$ in $C(n)$, the aim here is to compare $\kappa(\pi(V_1, V_2))$ with $(V_1, V_2)$. Suppose $V_1 = \begin{bmatrix} \alpha & B \\ C & D \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \bigoplus_{i=1}^{n} \mathcal{M}_i)$ and $V_2 = \begin{bmatrix} \beta & F \\ G & H \end{bmatrix} \in \mathcal{B}(\mathbb{C} \oplus \bigoplus_{i=1}^{n} \mathcal{N}_i)$ are isometric colligations and $a = \alpha \beta \neq 0$. Then by (3.3), it follows that

$$\pi(V_1, V_2) \in \mathcal{B}(\mathbb{C} \oplus \bigoplus_{i=1}^{n} (\mathcal{M}_i \oplus \mathcal{N}_i)),$$

and

$$\pi(V_1, V_2) = \begin{bmatrix} \alpha \beta & \hat{B}_1 & \cdots & \hat{B}_n \\ \hat{C}_1 & \hat{D}_{11} & \cdots & \hat{D}_{1n} \\ \vdots & \vdots & \ddots & \vdots \\ \hat{C}_n & \hat{D}_{n1} & \cdots & \hat{D}_{nn} \end{bmatrix},$$

where $\hat{B}_i$, $\hat{C}_i$ and $\hat{D}_{ij}$, $i, j = 1, \ldots, n$, are given by as in (3.4) and (3.5). Since $\pi(V_1, V_2)$ satisfies property $\mathcal{F}(n)$, in view of (3.12), it follows that

$$\kappa(\pi(V_1, V_2)) = (\tilde{V}_1, \tilde{V}_2),$$
where
\[ \tilde{V}_1 = \begin{bmatrix} \tilde{\alpha} & B_1 & \cdots & B_n \\ \beta & C_1 & D_{11} & \cdots & D_{1n} \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ \beta & C_n & D_{n1} & \cdots & D_{nn} \end{bmatrix} \quad \text{and} \quad \tilde{V}_2 = \begin{bmatrix} \tilde{\beta} & \frac{\alpha}{\alpha} F_1 & \cdots & \frac{\alpha}{\alpha} F_n \\ \frac{\beta}{\alpha} F_1 & H_{11} & \cdots & H_{1n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\beta}{\alpha} F_n & H_{n1} & \cdots & H_{nn} \end{bmatrix}, \]
and \( \tilde{\alpha} \) and \( \tilde{\beta} \) are non-zero scalars satisfying the following relations (see (3.13) and (3.14))
\[ |\tilde{\beta}|^2 = |\alpha|^2 |\beta|^2 + |\beta|^2 \left( \sum_{i=1}^{n} C_i^* C_i \right) \quad \text{and} \quad \tilde{\alpha} = \frac{\alpha \beta}{\beta}. \]

But we know from \( V_1^* V_1 = I \) that \( |\alpha|^2 + C^* C = 1 \), that is
\[ |\alpha|^2 + \sum_{i=1}^{n} C_i^* C_i = 1. \]
So \( \tilde{\beta} = \varepsilon \beta \) and \( \tilde{\alpha} = \varepsilon \alpha \) for some unimodular constant \( \varepsilon \). Hence
\[ \kappa \circ \pi \left( \begin{bmatrix} \alpha & B \\ C & D \end{bmatrix}, \begin{bmatrix} \beta & F \\ G & H \end{bmatrix} \right) = \left( \begin{bmatrix} \varepsilon \alpha & B \\ \varepsilon C & D \end{bmatrix}, \begin{bmatrix} \varepsilon \beta & \varepsilon F \\ G & H \end{bmatrix} \right), \]
where \( \varepsilon \) is an unimodular constant.

One could equally consider the same question for Theorem 2.4. The answer is similar and we leave the details to the reader.
