Eight-dimensional Octonion-like but Associative Normed Division Algebra

Joy Christian
Einstein Centre for Local-Realistic Physics, 15 Thackley End, Oxford OX2 6LB, United Kingdom

We present an eight-dimensional even sub-algebra of the $2^4 = 16$-dimensional associative Clifford algebra $Cl_{4,0}$ and show that its eight-dimensional elements denoted as $X$ and $Y$ respect the norm relation $|XY| = ||X||\cdot||Y||$, thus forming an octonion-like but associative normed division algebra, where the norms are calculated using the fundamental geometric product instead of the usual scalar product. The corresponding 7-sphere has a topology that differs from that of octonionic 7-sphere.

Consider the following eight-dimensional vector space with graded Clifford-algebraic basis and orientation $\lambda = \pm 1$:

$$Cl^\lambda_{3,0} = \text{span}\{1, \lambda e_x, \lambda e_y, \lambda e_z, \lambda e_x e_y, \lambda e_x e_z, \lambda e_y e_z, \lambda e_x e_y e_z\}.$$  \hfill (1)

As we shall see, the choice of orientation, $\lambda = +1$ or $\lambda = -1$ does not affect our argument. In what follows we will use the language of Geometric Algebra, as used, for example, in Refs. 1 and 2. Accordingly, in the above definition $\{e_x, e_y, e_z\}$ is a set of anti-commuting orthonormal vectors in $\mathbb{R}^3$ such that $e_i e_j = -e_j e_i$ for any $i \neq j = x, y, z$.

In general the vectors $e_i$ satisfy the following geometric product in this associative but non-commutative algebra 1,2:

$$e_i e_j = e_i \cdot e_j + e_i \wedge e_j,$$  \hfill (2)

with

$$e_i \cdot e_j := \frac{1}{2} \{e_i e_j + e_j e_i\}$$  \hfill (3)

being the symmetric inner product and

$$e_i \wedge e_j := \frac{1}{2} \{e_i e_j - e_j e_i\}$$  \hfill (4)

being the anti-symmetric outer product, giving $(e_i \wedge e_j)^2 = -1$. There are thus basis elements of four different grades in this algebra: An identity element $e_0^2 = 1$ of grade-0, three orthonormal vectors $e_i$ of grade-1, three orthonormal bivectors $e_i e_k$ of grade-2, and a trivector $I_3 = e_x e_y e_z$ of grade-3 representing a volume element in $\mathbb{R}^3$. Since in $\mathbb{R}^3$ there are $2^3 = 8$ ways to combine the vectors $e_i$ using the geometric product (2) such that no two products are linearly dependent, the resulting algebra, $Cl^\lambda_{3,0}$, is a linear vector space of eight dimensions, spanned by these graded bases.

In this paper we are interested in a certain conformal completion 1 of this algebra, originally presented in Ref. 3. This is accomplished by using an additional vector, $e_\infty$, to close the lines and volumes of the Euclidean space, giving

$$\mathcal{K}^\lambda = \text{span}\{1, \lambda e_x e_y, \lambda e_x e_z, \lambda e_y e_z, \lambda e_x e_\infty, \lambda e_y e_\infty, \lambda e_z e_\infty, \lambda I_3 e_\infty\}.$$  \hfill (5)

With unit vector $e_\infty$, this is an eight-dimensional even sub-algebra of the $2^4 = 16$-dimensional Clifford algebra $Cl_{4,0}$. As an eight-dimensional linear vector space, $\mathcal{K}^\lambda$ has some remarkable properties 3. To begin with, it is closed under

*Electronic address: jjc@alum.bu.edu 1 The conformal space we are considering is an inhomogeneous version of the space usually studied in Conformal Geometric Algebra 2. It can be viewed as an 8-dimensional subspace of the 32-dimensional representation space postulated in Conformal Geometric Algebra. The larger representation space results from a homogeneous freedom of the origin within $\mathbb{R}^3$, which does not concern us in this paper.
In particular, this means that for any two unit vectors \( \mathbf{X} \) and \( \mathbf{Y} \) provided the norms are calculated employing the fundamental geometric product instead of the usual scalar product.

Important, we shall soon see that for vectors \( \mathbf{K} \) thus \( \mathbf{X} \) and \( \mathbf{Y} \) they can be normalized as

\[
\mathbf{X} = X_0 + X_1 \mathbf{e}_x e_y + X_2 \mathbf{e}_z e_y + X_3 \mathbf{e}_y e_x + X_4 \mathbf{e}_y e_\infty + X_5 \mathbf{e}_y e_\infty + X_6 \mathbf{e}_\infty e_\infty + X_7 \lambda I_3 e_\infty
\]

and

\[
\mathbf{Y} = Y_0 + Y_1 \mathbf{e}_x e_y + Y_2 \mathbf{e}_z e_y + Y_3 \mathbf{e}_y e_x + Y_4 \mathbf{e}_y e_\infty + Y_5 \mathbf{e}_y e_\infty + Y_6 \mathbf{e}_\infty e_\infty + Y_7 \lambda I_3 e_\infty.
\]

And using the definition \( ||\mathbf{X}|| := \sqrt{\mathbf{X} \cdot \mathbf{X}^T} \) (where \( \cdot \) represents the reverse operation \( [1] \)) they can be normalized as

\[
||\mathbf{X}||^2 = \sum_{\mu = 0}^{7} X_\mu^2 = 1 \quad \text{and} \quad ||\mathbf{Y}||^2 = \sum_{\mu = 0}^{7} Y_\mu^2 = 1.
\]

Now it is evident from the multiplication table above (Table I) that if \( \mathbf{X}, \mathbf{Y} \in \mathbb{K}^\lambda \), then so is their product \( \mathbf{Z} = \mathbf{X} \mathbf{Y} \):

\[
\mathbf{Z} = Z_0 + Z_1 \mathbf{e}_x e_y + Z_2 \mathbf{e}_z e_y + Z_3 \mathbf{e}_y e_x + Z_4 \mathbf{e}_y e_\infty + Z_5 \mathbf{e}_y e_\infty + Z_6 \mathbf{e}_\infty e_\infty + Z_7 \lambda I_3 e_\infty = \mathbf{X} \mathbf{Y}.
\]

Thus \( \mathbb{K}^\lambda \) remains closed under arbitrary number of multiplications of its elements. This is a powerful property. More importantly, we shall soon see that for vectors \( \mathbf{X} \) and \( \mathbf{Y} \) in \( \mathbb{K}^\lambda \) (not necessarily unit) the following norm relation holds:

\[
||\mathbf{X} \mathbf{Y}|| = ||\mathbf{X}|| \cdot ||\mathbf{Y}||,
\]

provided the norms are calculated employing the fundamental geometric product instead of the usual scalar product.

In particular, this means that for any two unit vectors \( \mathbf{X} \) and \( \mathbf{Y} \) in \( \mathbb{K}^\lambda \) with the geometric product \( \mathbf{Z} = \mathbf{X} \mathbf{Y} \) we have

\[
||\mathbf{Z}||^2 = \sum_{\rho = 0}^{7} Z_\rho^2 = 1.
\]
Now, in order to prove the norm relation (10), it is convenient to express the elements of \( K^\lambda \) as dual quaternions. The idea of dual numbers, \( z \), analogous to complex numbers, was introduced by Clifford in his seminal work as follows:

\[
z = r + d \varepsilon, \quad \text{where } \varepsilon \neq 0 \text{ but } \varepsilon^2 = 0.
\]

Here \( \varepsilon \) is the dual operator, \( r \) is the real part, and \( d \) is the dual part. Similar to how the “imaginary” operator \( i \) is introduced in the complex number theory to distinguish the “real” and “imaginary” parts of a complex number, Clifford introduced the dual operator \( \varepsilon \) to distinguish the “real” and “dual” parts of a dual number. The dual number theory can be extended to numbers of higher grades, including to numbers of composite grades, such as quaternions:

\[
Q_z = q_r + q_d \varepsilon,
\]

where \( q_r \) and \( q_d \) are quaternions and \( Q_z \) is a dual-quaternion (or in Clifford’s terminology, \( Q_z \) is a bi-quaternion).

Recall that the set of unit quaternions is a 3-sphere, which can be normalized to a radius \( \bar{r} \) and written as the set

\[
S^3 = \left\{ q_r := q_0 + q_1 \lambda e_x e_y + q_2 \lambda e_z e_x + q_3 \lambda e_y e_z \mid ||q_r|| = \sqrt{q_r q_r^\dagger} = \bar{r} \right\}.
\]

Consider now a second, dual copy of the set of quaternions within \( K^\lambda \), corresponding to the fixed orientation \( \lambda = +1 \):

\[
S^3 = \left\{ q_d := -q_7 + q_6 e_x e_y + q_5 e_z e_x + q_4 e_y e_z \mid ||q_d|| = \sqrt{q_d q_d^\dagger} = \bar{d} \right\}.
\]

If we now identify \( \lambda I_3 e_\infty \) appearing in (5) as the duality operator \( -\varepsilon \), then (in the reverse additive order) we obtain

\[
\varepsilon \equiv -\lambda I_3 e_\infty \quad \text{with } \varepsilon^\dagger = \varepsilon \quad \text{and } \varepsilon^2 = +1 \quad (\text{since } e_\infty \text{ is a unit vector in } K^\lambda)
\]

and

\[
q_d \varepsilon = -q_d \lambda I_3 e_\infty = q_4 \lambda e_x e_\infty + q_5 \lambda e_z e_\infty + q_6 \lambda e_y e_\infty + q_7 \lambda I_3 e_\infty,
\]

which is a multi-vector “dual” to the quaternion \( q_d \). Note that we write \( \varepsilon \) as if it were a scalar because it commutes with all element of \( K^\lambda \) in (5). Comparing (13) and (17) with (5) we now wish to write \( K^\lambda \) as a set of paired quaternions,

\[
K^\lambda = \left\{ Q_z := q_r + q_d \varepsilon \mid ||Q_z|| = \sqrt{Q_z Q_z^\dagger} = \sqrt{\bar{r}^2 + \bar{d}^2}, \ 0 < \bar{r} < \infty, \ 0 < \bar{d} < \infty \right\}.
\]
in analogy with (14) or (15), with \( Q_z Q_z^\dagger \) being the geometric product between \( Q_z \) and \( Q_z^\dagger \) (instead of the inner product \( Q_z \cdot Q_z^\dagger \) used in (5) to calculate the value of \( ||Q_z|| \)). But this definition \( ||Q_z|| = \sqrt{Q_z Q_z^\dagger} = \sqrt{g_0^2 + g_2^2} \) for the norm is possible only if we require \( q_r q_r^\dagger + q_d q_d^\dagger = 0 \), rendering every \( q_r \) orthogonal to its dual \( q_d \) (cf. Fig. I). In other words,

\[
||Q_z|| = \sqrt{Q_z Q_z^\dagger} = \sqrt{g_0^2 + g_2^2} \iff q_r q_r^\dagger + q_d q_d^\dagger = 0,
\]

or equivalently, \( (q_r q_d^\dagger)_s = 0 \); i.e., \( q_r q_d^\dagger \) must be a pure quaternion (for a pedagogical discussion of (19) see section 7.1 of Ref. [4]). We can see this by working out the geometric product of \( Q_z \) with \( Q_z^\dagger \) while using \( \varepsilon^2 = +1 \), which gives

\[
Q_z Q_z^\dagger = (q_r q_r^\dagger + q_d q_d^\dagger) + (q_r q_d^\dagger + q_d q_r^\dagger) \varepsilon.
\]

Now, using definitions (14) and (15), it is easy to see that \( q_r q_r^\dagger = g_0^2 \) and \( q_d q_d^\dagger = g_2^2 \), reducing the above product to

\[
Q_z Q_z^\dagger = g_0^2 + g_2^2 + (q_r q_d^\dagger + q_d q_r^\dagger) \varepsilon.
\]

It is thus clear that for \( Q_z Q_z^\dagger \) to be a scalar \( q_r q_d^\dagger + q_d q_r^\dagger \) must vanish, or equivalently \( q_r \) must be orthogonal to \( q_d \).

But there is more to the normalization condition \( q_r q_d^\dagger + q_d q_r^\dagger = 0 \) than meets the eye. It also leads to the crucial norm relation (10), which is at the heart of the only possible four normed division algebras \( \mathbb{R}, \mathbb{C}, \mathbb{H} \) and \( \mathbb{O} \) associated with the four parallelizable spheres \( S^0, S^1, S^3 \) and \( S^7 \), with octonions forming a non-associative algebra in addition to forming a non-commutative algebra \( \mathbb{C} \). However, before we prove the norm relation (10), let us take a closer look at definition (19) within Geometric Algebra. In (8) we used the following definition of norm for a general multivector:

\[
||X|| = \sqrt{X \cdot X^\dagger}.
\]

The left-hand side of this equation — by definition — is a scalar number; namely, \( ||X|| \). But what is important to recognize for our purpose of proving (10) is that there are two equivalent ways to work out this scalar number:

(a) \( ||X|| = \) square root of the scalar part \( X \cdot X^\dagger \) of the geometric product \( XX^\dagger \) between \( X \) and \( X^\dagger \),

or

(b) \( ||X|| = \) square root of the geometric product \( XX^\dagger \) with the non-scalar part of \( XX^\dagger \) set to zero.

The above two definitions of the norm \( ||X|| \) are entirely equivalent. They give one and the same scalar value for the norm. Moreover, in general, given a product denoted by \( * \), the quantity \( X^\dagger \) is said to be the conjugate of \( X \) if \( X \ast X^\dagger \) happens to be equal to unity, \( X \ast X^\dagger = 1 \), as in the case of quaternionic products in (14) and (15). On the other hand, in Geometric Algebra the fundamental product between any two multivectors \( X \) and \( Y \) is the geometric product, \( XY \), not the scalar product \( X \cdot Y \) (or the wedge product \( X \wedge Y \) for that matter). Therefore the product that must be used in computing the norm \( ||X|| \) that preserves the Clifford algebraic structure of \( \mathcal{K} \) is the geometric product \( XX^\dagger \), not the scalar product \( X \cdot X^\dagger \). To be sure, in practice, if one is interested only in working out the value of the norm \( ||X|| \), then it is often convenient to use the definition (a) above. However, our primary purpose here in working out the norms of \( X \) and \( Y \) is to preserve the algebraic structure of the space \( \mathcal{K} \) in the fundamental relation (10), and therefore the definition of the norm we must use is necessarily the second definition stated above; i.e., definition (b).
With the above comments in mind, we are now ready to prove the norm relation (10). To this end, suppose the multivectors $X$ and $Y$ belonging to $\mathcal{K}^\lambda$ as spelled out in (3) and (7) are normalized using the definition (b) as follows:

$$||X|| = \sqrt{XX^\dagger} = \varrho_X$$  \hspace{1cm} (23)

and

$$||Y|| = \sqrt{YY^\dagger} = \varrho_Y$$  \hspace{1cm} (24)

where $\varrho_X$ and $\varrho_Y$ are fixed scalars. Then, according to (9), their product $XY$ in $\mathcal{K}^\lambda$ is another multivector, giving

$$||XY|| = \sqrt{(XY)(XY)^\dagger}$$  \hspace{1cm} (25)

$$= \sqrt{XXY^\dagger Y^\dagger}$$  \hspace{1cm} (26)

$$= \sqrt{XX} \varrho_Y$$  \hspace{1cm} (27)

$$= \varrho_X \varrho_Y$$  \hspace{1cm} (28)

$$= ||X|| ||Y||.$$  \hspace{1cm} (29)

Thus, at first sight, the norm relation (10) appears to be trivially true. However, the above simple proof is not quite satisfactory because we have assumed that $X$ and $Y$ are normalized using the definition (b), which requires us to set the non-scalar parts of the geometric products $XX^\dagger$ and $YY^\dagger$ equal to zero. That is not difficult to do for both $X$ and $Y$, but what is involved in the above proof is the geometric product $XY$ and its conjugate $(XY)^\dagger$, which makes the proof less convincing. It is therefore important to spell out the proof in full detail without resorting to shortcuts.

To that end, we first work out the right-hand side of the norm relation (10) in the notations of the condition (19):

$$||Q_{z1}|| ||Q_{z2}|| = \left(\sqrt{\varrho_{r1}^2 + \varrho_{d1}^2}\right) \left(\sqrt{\varrho_{r2}^2 + \varrho_{d2}^2}\right) = \sqrt{\varrho_{r1}^2 \varrho_{r2}^2 + \varrho_{r1}^2 \varrho_{d2}^2 + \varrho_{d1}^2 \varrho_{r2}^2 + \varrho_{d1}^2 \varrho_{d2}^2}.$$  \hspace{1cm} (31)

Now, to verify the left-hand side of the norm relation (10), consider a product of two distinct members of the set $\mathcal{K}^\lambda$,

$$Q_{z1} Q_{z2} = (q_{r1} q_{r2} + q_{d1} q_{d2}) + (q_{r1} q_{d2} + q_{d1} q_{r2}) \varepsilon,$$  \hspace{1cm} (32)

together with their individual definitions

$$Q_{z1} = q_{r1} + q_{d1} \varepsilon \hspace{1cm} \text{and} \hspace{1cm} Q_{z2} = q_{r2} + q_{d2} \varepsilon.$$  \hspace{1cm} (33)

If we now use the fact that $\varepsilon$, along with $\varepsilon^\dagger = \varepsilon$ and $\varepsilon^2 = 1$, commutes with every element of $\mathcal{K}^\lambda$ defined in (5) and consequently with all $q_{r}$, $q_{d}^\dagger$, $q_{d}$ and $q_{d}^\dagger$, and work out $Q_{z1}^\dagger$, $Q_{z2}^\dagger$ and the products $Q_{z1} Q_{z1}^\dagger$, $Q_{z2} Q_{z2}^\dagger$ and $(Q_{z1} Q_{z2})^\dagger$ as

$$Q_{z1}^\dagger = q_{r1}^\dagger + q_{d1}^\dagger \varepsilon,$$  \hspace{1cm} (34)

$$Q_{z2}^\dagger = q_{r2}^\dagger + q_{d2}^\dagger \varepsilon,$$  \hspace{1cm} (35)

$$Q_{z1} Q_{z1}^\dagger = \left(q_{r1} q_{r1}^\dagger + q_{d1} q_{d1}^\dagger\right) + \left(q_{r1} q_{d1} + q_{d1} q_{r1}\right) \varepsilon,$$  \hspace{1cm} (36)

$$Q_{z2} Q_{z2}^\dagger = \left(q_{r2} q_{r2}^\dagger + q_{d2} q_{d2}^\dagger\right) + \left(q_{r2} q_{d2} + q_{d2} q_{r2}\right) \varepsilon,$$  \hspace{1cm} (37)

and

$$(Q_{z1} Q_{z2})^\dagger = \left(q_{r2} q_{r1}^\dagger + q_{d2} q_{d1}^\dagger\right) + \left(q_{d2} q_{r1} + q_{r2} q_{d1}\right) \varepsilon,$$  \hspace{1cm} (38)

$$||Q_{z1}|| ||Q_{z2}|| = \sqrt{\varrho_{r1}^2 + \varrho_{d1}^2} \sqrt{\varrho_{r2}^2 + \varrho_{d2}^2} = \varrho_{r1} \varrho_{r2} + \varrho_{d1} \varrho_{d2}.$$  \hspace{1cm} (39)
then, using the same normalization condition $q_r q_d^\dagger + q_d q_r^\dagger = 0$ of (19), the norm relation (10) is not difficult to verify. To that end, we first work out the geometric product $(Q_{z1} Q_{z2})(Q_{z1} Q_{z2})^\dagger$ using expressions (32) and (38), which gives

$$(Q_{z1} Q_{z2})(Q_{z1} Q_{z2})^\dagger = \left\{ (q_{r1} q_{d2} + q_{d1} q_{d2} ) \left( q_{r2} q_{d1}^\dagger + q_{d2} q_{d1}^\dagger \right) + (q_{r1} q_{d2} + q_{d1} q_{d2} ) \left( q_{r2} q_{d1}^\dagger + q_{d2} q_{d1}^\dagger \right) \right\} \varepsilon .$$

(39)

Now the “real” part of the above product simplifies to (42) as follows:

$$\left\{ (Q_{z1} Q_{z2})(Q_{z1} Q_{z2})^\dagger \right\}_{\text{real}} = q_{r1} q_{r2} q_{d1} q_{d1}^\dagger + q_{d1} q_{d2} q_{r1} q_{d1}^\dagger + q_{r1} q_{r2} q_{d2} q_{d1}^\dagger + q_{d1} q_{d2} q_{r1} q_{d1}^\dagger \nonumber$$

$$+ q_{r1} q_{r2} q_{d1} q_{d1}^\dagger + q_{d1} q_{d2} q_{r1} q_{d1}^\dagger + q_{r1} q_{r2} q_{d2} q_{d1}^\dagger + q_{d1} q_{d2} q_{r1} q_{d1}^\dagger = q_{r1} q_{d2} q_{r2} q_{d1}^\dagger + q_{d1} q_{d2} q_{r1} q_{d1}^\dagger + q_{r1} q_{d2} q_{r2} q_{d1}^\dagger + q_{d1} q_{d2} q_{r1} q_{d1}^\dagger \nonumber$$

$$= \varepsilon r_2 \varepsilon^2_2 + \varepsilon q_1 \varepsilon^2_1 + \varepsilon^2_2 \varepsilon r_2 + \varepsilon^2_1 \varepsilon r_2 .$$

(40)

Here (41) follows from (40) upon inserting the normalization condition (19) in the form $q_r q_d^\dagger = -q_d q_r^\dagger$ into the second and third terms of (40), which then cancel out with the sixth and seventh terms of (40), respectively; and (42) follows from (41) upon inserting the normalization conditions $||q||^2 = q q^\dagger = \varepsilon^2$ for the real and dual quaternions specified in (14) and (15), for each of the four terms of (41). Similarly, the “dual” part of the product (39) simplifies to

$$\left\{ (Q_{z1} Q_{z2})(Q_{z1} Q_{z2})^\dagger \right\}_{\text{dual}} = q_{r1} q_{d2} q_{r2} q_{r1} + q_{d1} q_{d2} q_{r2} q_{r1} + q_{r1} q_{d2} q_{d2} q_{d1} + q_{d1} q_{d2} q_{r2} q_{d1} \nonumber$$

$$+ q_{r1} q_{r2} q_{d2} q_{r1} + q_{d1} q_{d2} q_{r2} q_{r1} + q_{r1} q_{d2} q_{d2} q_{d1} + q_{d1} q_{d2} q_{r2} q_{d1} = 0 .$$

(43)

We can see this again by inserting into (43) the normalization condition (19) in the form $q_r q_d^\dagger = -q_d q_r^\dagger$ and the normalization conditions $||q||^2 = q q^\dagger = \varepsilon^2$ for the quaternions in (14) and (15), which cancels out the first four terms of (43) with the last four. Consequently, combining the results of (42) and (43), for the left-hand side of (10) we have

$$||Q_{z1} Q_{z2}|| = \sqrt{\varepsilon r_2 \varepsilon^2_1 + \varepsilon q_1 \varepsilon^2_1 + \varepsilon^2_2 \varepsilon r_2 + \varepsilon^2_1 \varepsilon r_2} .$$

(44)

Thus, comparing the results in (45) and (41), we finally arrive at the relation

$$||Q_{z1} Q_{z2}|| = ||Q_{z1}|| ||Q_{z2}|| ,$$

(46)

which is evidently the same as the norm relation (10) in every respect apart from the appropriate change in notation. Without loss of generality we can now restrict $K^\lambda$ in (18) to a unit 7-sphere by setting the radii $r_1$ and $q_d$ to $\frac{1}{\sqrt{2}}$:

$$K^\lambda \supset S^7 := \left\{ Q_z := q_r + q_d \varepsilon \left| ||Q_z|| = 1 \text{ and } q_r q_d^\dagger + q_d q_r^\dagger = 0 \right\} \right\} ,$$

(47)

where $\varepsilon = -\lambda I_3 e_\infty, \varepsilon^\dagger = \varepsilon, \varepsilon^2 = e_\infty^2 = +1, q_r = q_0 + q_1 \lambda e_x e_y + q_2 \lambda e_z e_x + q_3 \lambda e_y e_z, \text{ and } q_d = -q_7 + q_6 e_z e_y + q_5 e_z e_x + q_4 e_y e_x ,$$

(48)

so that

$$Q_z = q_0 + q_1 \lambda e_x e_y + q_2 \lambda e_z e_x + q_3 \lambda e_y e_z + q_4 \lambda e_x e_\infty + q_5 \lambda e_y e_\infty + q_6 \lambda e_z e_\infty + q_7 \lambda I_3 e_\infty .$$

(49)
Needless to say, since all Clifford algebras are associative division algebras by definition, unlike the non-associative octonionic algebra the 7-sphere we have constructed here corresponds to an associative (but non-commutative) algebra.

Note that in terms of the components of \( q_r \) and \( q_d \) the condition \( q_r q_d^\dagger + q_d q_r^\dagger = 0 \) is equivalent to the constraint

\[
f_c = q_0 q + q_1 q_6 + q_2 q_5 + q_3 q_4 = 0.
\]  

(50)

This constraint reduces the space \( \mathcal{K}^\lambda \) to the sphere \( S^7 \), thereby reducing the 8 dimensions of \( \mathcal{K}^\lambda \) to the 7 dimensions of \( S^7 \) defined in [17]. But the 7-sphere thus constructed has a topology [7] that is different from that of the octonionic 7-sphere, and the difference between the two is captured by the difference in the corresponding normalizing constraints

\[
f(q_0, q_1, q_2, q_3, q_4, q_5, q_6, q_7) = 0.
\]  

(51)

More precisely, the two normalizing constraints giving rise to the two topologically distinct 7-spheres of radius \( \rho \) are:

\[
f_c = q_0^2 + q_1^2 + q_2^2 + q_3^2 + q_4^2 + q_5^2 + q_6^2 - \rho^2 = 0,
\]  

(52)

which reduces the set \( \mathcal{O} \) of unit octonions to the sphere \( S^7 \) made up of eight-dimensional vectors of fixed length \( \rho \), and

\[
f_c = q_0 q + q_1 q_6 + q_2 q_5 + q_3 q_4 = 0,
\]  

(53)

which reduces the set \( \mathcal{K}^\lambda \) to the sphere \( S^7 \) made up of a different collection of eight-dimensional vectors of fixed length \( \rho = \sqrt{d^2 + d^2}_d \). This difference arises because we have used the geometric product \( \mathbf{X} \mathbf{X}^\dagger \) rather than the scalar product to derive the constraint \( f_c = 0 \). But both constraints give an identical result for the norms \( ||\mathbf{X}|| \), as explained above.

We may now view the four associative normed division algebras in the only possible dimensions 1, 2, 4 and 8, respectively, as even sub-algebras of the Clifford algebras

\[
Cl^1_{1,0} = \text{span}\{ 1, \lambda e_x \},
\]  

(54)

\[
Cl^2_{1,0} = \text{span}\{ 1, \lambda e_x, \lambda e_y, \lambda e_x e_y \},
\]  

(55)

\[
Cl^2_{3,0} = \text{span}\{ 1, \lambda e_x, \lambda e_y, \lambda e_z, \lambda e_x e_y, \lambda e_x e_z, \lambda e_y e_z, \lambda e_x e_y e_z \},
\]  

(56)

and

\[
Cl^2_{4,0} = \text{span}\{ 1, \lambda e_x, \lambda e_y, \lambda e_z, \lambda e_{\infty}, \lambda e_x e_y, \lambda e_x e_z, \lambda e_y e_z, \lambda e_{\infty}, \lambda e_x e_{\infty}, \lambda e_y e_{\infty}, \lambda e_z e_{\infty}, \lambda e_x e_y e_{\infty}, \lambda e_x e_z e_{\infty}, \lambda e_y e_z e_{\infty}, \lambda e_x e_y e_z e_{\infty} \}.
\]  

(57)

It is easy to verify that the even subalgebras of \( Cl^1_{1,0}, Cl^2_{1,0} \) and \( Cl^2_{3,0} \) are indeed isomorphic to \( \mathbb{R}, \mathbb{C} \) and \( \mathbb{H} \), respectively.
