Abstract

A family $\mathcal{A}$ of sets is said to be intersecting if every two sets in $\mathcal{A}$ intersect. An intersecting family is said to be trivial if its sets have a common element. A graph $G$ is said to be $r$-EKR if at least one of the largest intersecting families of independent $r$-element sets of $G$ is trivial. Let $\alpha(G)$ and $\omega(G)$ denote the independence number and the clique number of $G$, respectively. Hilton and Spencer recently showed that if $G$ is the vertex-disjoint union of a cycle $\ast C$ raised to the power $k^*$ and $s$ cycles $1C, \ldots, _sC$ raised to the powers $k^*, k_1, \ldots, k_s$, respectively, $1 \leq r \leq \alpha(G)$, and

$$\min (\omega(1C^{k_1}), \ldots, \omega(_sC^{k_s})) \geq 2k^* + 1,$$

then $G$ is $r$-EKR. They had shown that the same holds if $\ast C$ is replaced by a path and the condition on the clique numbers is relaxed to

$$\min (\omega(1C^{k_1}), \ldots, \omega(_sC^{k_s})) \geq k^* + 1.$$

We use the classical Shadow Intersection Theorem of Katona to obtain a short proof of each result for the case where the inequality for the minimum clique number is strict.

1 Introduction

Unless stated otherwise, we shall use small letters such as $x$ to denote non-negative integers or elements of a set, capital letters such as $X$ to denote sets, and calligraphic
letters such as $\mathcal{F}$ to denote families (sets whose members are sets themselves). The set of positive integers is denoted by $\mathbb{N}$. The set $\{i \in \mathbb{N} : m \leq i \leq n\}$ is denoted by $[m, n]$, $[1, n]$ is abbreviated to $[n]$, and $[0]$ is taken to be the empty set $\emptyset$. For a set $X$, the power set of $X$ (that is, $\{A : A \subseteq X\}$) is denoted by $2^X$. The family of $r$-element subsets of $X$ is denoted by $\binom{X}{r}$. The family of $r$-element sets in a family $\mathcal{F}$ is denoted by $\mathcal{F}(r)$. If $\mathcal{F} \subseteq 2^X$ and $x \in X$, then the family $\{A \in \mathcal{F} : x \in A\}$ is denoted by $\mathcal{F}(x)$ and called a star of $\mathcal{F}$ with centre $x$.

A family $\mathcal{A}$ is said to be intersecting if for every $A, B \in \mathcal{A}$, $A$ and $B$ intersect (that is, $A \cap B \neq \emptyset$). The stars of a family $\mathcal{F}$ are the simplest intersecting subfamilies of $\mathcal{F}$. We say that $\mathcal{F}$ has the star property if at least one of the largest intersecting subfamilies of $\mathcal{F}$ is a star of $\mathcal{F}$.

Determining the size of a largest intersecting subfamily of a given family $\mathcal{F}$ is one of the most popular endeavours in extremal set theory. This started in [11], which features the classical result known as the Erdős–Ko–Rado (EKR) Theorem. The EKR Theorem states that if $r \leq n/2$ and $\mathcal{A}$ is an intersecting subfamily of $\binom{[n]}{r}$, then $|A| \leq \binom{n-1}{r-1}$. Thus, $\binom{[n]}{r}$ has the star property for $r \leq n/2$ (clearly, for $n/2 < r \leq n$, $\binom{[n]}{r}$ itself is intersecting). There are various proofs of the EKR Theorem (see [9, 16, 24, 25, 27]), two of which are particularly short and beautiful: Katona’s [23], which introduced the elegant cycle method, and Daykin’s [9], using the fundamental Kruskal–Katona Theorem [26, 28]. The EKR Theorem gave rise to some of the highlights in extremal set theory [10, 27, 30] and inspired many variants and generalizations; see [3, 10, 13, 15, 17, 21, 22].

A graph $G$ is a pair $(V(G), E(G))$, where $V(G)$ is a set, called the vertex set of $G$, and $E(G)$ is a subfamily of $\binom{V(G)}{2}$ and is called the edge set of $G$. A member of $V(G)$ is called a vertex of $G$, and a member of $E(G)$ is called an edge of $G$. We may represent an edge $\{v, w\}$ by $vw$. We say that $v$ is adjacent to $w$ (in $G$) if $vw$ is an edge of $G$. A subset $I$ of $V(G)$ is an independent set of $G$ if $vw \notin E(G)$ for every $v, w \in I$. Let $\mathcal{I}_G$ denote the family of independent sets of $G$. An independent set $J$ of $G$ is maximal if $J \notin I$ for each independent set $I$ of $G$ such that $I \neq J$. The size of a smallest maximal independent set of $G$ is denoted by $\mu(G)$. The size of a largest independent set of $G$ is denoted by $\alpha(G)$. A subset $X$ of $V(G)$ is a clique of $G$ if $vw \in E(G)$ for every $v, w \in X$. The size of a largest clique of $G$ is called the clique number of $G$ and denoted by $\omega(G)$.

Holroyd and Talbot introduced the problem of determining whether $\mathcal{I}_G^{(r)}$ has the star property for a given graph $G$ and an integer $r \geq 1$. Following their terminology, a graph $G$ is said to be $r$-EKR if $\mathcal{I}_G^{(r)}$ has the star property. The Holroyd–Talbot (HT) Conjecture [22, Conjecture 7] claims that $G$ is $r$-EKR if $\mu(G) \geq 2r$. This was verified by Borg [2] for $\mu(G)$ sufficiently large depending on $r$ (see also [3, Lemma 4.4 and Theorem 1.4]). By the EKR Theorem, the conjecture is true if $G$ has no edges.

The HT Conjecture has been verified for several classes of graphs [2, 3, 7, 8, 12, 13, 19, 20, 21, 22, 23, 29, 31]. As demonstrated in [8], for $r > \mu(G)/2$, whether $G$ is $r$-EKR or not depends on $G$ and $r$ (both cases are possible). Naturally, graphs $G$ of particular interest are those that are $r$-EKR for all $r \leq \alpha(G)$.

For $n \geq 1$, the graphs $([n], \binom{[n]}{2})$ and $([n], \{\{i, i + 1\} : i \in [n - 1]\})$ are denoted by $K_n$ and $P_n$, respectively. For $n \geq 3$, $([n], E(P_n) \cup \{n, 1\})$ is denoted by $C_n$. A
copy of $K_n$ is called a complete graph. A copy $P$ of $P_n$ is called an $n$-path or simply a path, and a vertex of $P$ is called an end-vertex if it is not adjacent to more than one vertex. A copy of $C_n$ is called an $n$-cycle or simply a cycle. If $H$ is a subgraph of a graph $G$ ($V(H) \subseteq V(G)$ and $E(H) \subseteq E(G)$), then we say that $G$ contains $H$. For $v, w \in V(G)$, the distance $d_G(v, w)$ is $\min\{k : v, w \in E(P) \text{ for some } k\text{-path } P \text{ contained by } G\}$. The $k$th power of $G$, denoted by $G^k$, is the graph with vertex set $V(G)$ and edge set $\{vw : v, w \in V(G), 1 \leq d_G(v, w) \leq k\}$; $G^k$ is also referred to as $G$ raised to the power $k$. Note that $P_n^k = K_n$ for $k \geq n - 1$, and $C_n^k = K_n$ for $k \geq n/2$.

The following remarkable analogue of the EKR theorem was obtained by Talbot [29].

**Theorem 1.1 (29)** For $1 \leq r \leq \alpha(C_n^k)$, $C_n^k$ is $r$-EKR.

Talbot introduced a compression technique to prove Theorem 1.1. In vague terms, his compression technique rotates anticlockwise the elements of the independent sets of the intersecting family which are distinct from a specified vertex (see Section 2).

If $G, G_1, \ldots, G_k$ are graphs such that the vertex sets of $G_1, \ldots, G_k$ are pairwise disjoint and $G = \left(\bigcup_{i=1}^{k} V(G_i)\right) \cup \left(\bigcup_{i=1}^{k} E(G_i)\right)$, then $G$ is said to be the disjoint union of $G_1, \ldots, G_k$, and $G_1, \ldots, G_k$ are said to be vertex-disjoint.

Inspired by the work of Talbot, Hilton and Spencer [19] went on to prove the following.

**Theorem 1.2 (19)** If $G$ is the disjoint union of one path $P$ raised to the power $k^\ast$ and $s$ cycles $C_1, \ldots, C_s$ raised to the powers $k_1, \ldots, k_s$, respectively, $1 \leq r \leq \alpha(G)$, and

$$\min \left( \omega_1(C^{k_1}), \ldots, \omega_s(C^{k_s}) \right) \geq \omega(P^{k^\ast}),$$

then $G$ is $r$-EKR. Moreover, for any end-vertex $x$ of $P$, $\mathcal{I}_G^{(r)}(x)$ is a largest intersecting subfamily of $\mathcal{I}_G^{(r)}$.

The ultimate aim, however, was to obtain a generalization of Theorem 1.1 and this was eventually achieved by Hilton and Spencer [20] in the following theorem.

**Theorem 1.3 (20)** If $G$ is the disjoint union of $s + 1$ cycles $C_1, C_2, \ldots, C_s$ raised to the powers $k^\ast, k_1, \ldots, k_s$, respectively, $1 \leq r \leq \alpha(G)$, and

$$\min \left( \omega_1(C^{k_1}), \ldots, \omega_s(C^{k_s}) \right) \geq 2k^\ast + 1,$$

then $G$ is $r$-EKR. Moreover, for any $x \in V(C)$, $\mathcal{I}_G^{(r)}(x)$ is a largest intersecting subfamily of $\mathcal{I}_G^{(r)}$.

The proof of Theorem 1.3 is also inspired by Talbot’s proof of Theorem 1.1. In particular, an essential ingredient in the proof of Theorem 1.3 is the use of Theorem 1.2 for the special case where $P$ is a complete graph as the base case of an induction argument.

In this paper, we give a short proof of Theorem 1.2 and of Theorem 1.3 except for the cases of equality in conditions (1) and (2), respectively. In other words, we prove the following two results.
Theorem 1.4  Theorem 1.2 is true if the inequality in (1) is strict.

Theorem 1.5  Theorem 1.3 is true if the inequality in (2) is strict.

Our argument is based on the Shadow Intersection Theorem of Katona [27], hence demonstrating yet another application of this classical and useful result in extremal set theory.

2  The new proof

Let $P, 1C, \ldots, sC$ be as in Theorem 1.2. Let $p = |V(P)|$ and $c_i = |V_i(C)|$. For $1 \leq i \leq s$, we label the vertices of $iC$ $1^i, 2^i, \ldots, c_i^i$ (the superscript $i$ is a label and not a power), where $E(C) = \{\{j^i, (j + 1)^i\} : j \in [c_i - 1]\} \cup \{n^i, 1^i\}$. We may assume that $P = P_p$, that is, $V(P) = [p]$ and $E(P) = \{\{i, i + 1\} : i \in [p - 1]\}$. Let $H$ be the union of $1C^{k_1}, \ldots, sC^{k_s}$, and let $f : V(H) \to V(H)$ be the bijection given by

$$f(n^i) = 1^i \text{ and } f(j^i) = (j + 1)^i \text{ for } 1 \leq i \leq s \text{ and } 1 \leq j \leq c_i.$$  

Let $f^1 = f$, and for any integer $t \geq 2$, let $f^t = f \circ f^{t-1}$ and $f^{-t} = f^{-1} \circ f^{-(t-1)}$. Note that for $t \geq 1$, one can think of $f^t$ as $t$ clockwise rotations, and of $f^{-t}$ as $t$ anticlockwise rotations. For $I \in \mathcal{I}_H$, we denote the set $\{f^t(x) : x \in I\}$ by $f^t(I)$, and for $\mathcal{A} \subseteq \mathcal{I}_H$, we denote the family $\{f^t(A) : A \in \mathcal{A}\}$ by $f^t(\mathcal{A})$. The notation $f^{-t}(I)$ and $f^{-t}(\mathcal{A})$ is defined similarly.

The new argument presented in this paper lies entirely in the proof of the following important case, which both Theorem 1.4 and Theorem 1.5 pivot on.

Lemma 2.1  Theorem 1.2 is true if $P^{k^*}$ is a complete graph and the inequality in (1) is strict.

Then, Theorem 1.4 follows immediately by applying the compression method in [21], and Theorem 1.5 follows by applying the same compression method of Talbot in [29].

We now work towards the proof of Lemma 2.1.

Let $\mathcal{A}$ be a family of $r$-element sets. The shadow of $\mathcal{A}$, denoted by $\partial \mathcal{A}$, is the family $\partial \mathcal{A} = \bigcup_{A \in \mathcal{A}} (\mathcal{A}^r - \mathcal{A}^i)$. A special case of Katona’s Shadow Intersection Theorem [27] is that

$$|\mathcal{A}| \leq |\partial \mathcal{A}| \text{ if } \mathcal{A} \text{ is intersecting.}$$  

(3)

Proof of Lemma 2.1. Suppose that $P^{k^*}$ is a complete graph. Then, $\omega(P^{k^*}) = p$. Suppose min $(\omega_1C^{k_1}, \ldots, \omega_sC^{k_s}) > p$. Note that this implies that for every $i \in [s]$, $c_i \geq p + 1$ and, for every $h, j \in [c_i]$ with $h \leq j$,

$$\text{if } j \in \{f^{-q}(h) : 1 \leq q \leq p\} \cup \{f^q(h) : 1 \leq q \leq p\}, \text{ then } h^i j^i \in E(iC^{k_i}).$$  

(4)

Let $\mathcal{A}$ be an intersecting subfamily of $\mathcal{I}_G^{(r)}$. Recall that $V(P^{k^*}) = [p]$. Let $\mathcal{A}_0 = \{A \in \mathcal{A} : A \cap [p] = \emptyset\}$ and $\mathcal{A}_i = \{A \in \mathcal{A} : A \cap [p] = \{i\}\}$ for $1 \leq i \leq p$. Since $P^{k^*}$ is a complete graph, $\mathcal{A}_0, \mathcal{A}_1, \ldots, \mathcal{A}_p$ partition $\mathcal{A}$. Let $\mathcal{A}'_0 = \mathcal{A}_0$ and $\mathcal{A}'_i = \{A \setminus \{i\} : A \in \mathcal{A}_i\}$ for $1 \leq i \leq p$. Since $\mathcal{A}$ is intersecting,

$$\text{for every } i, j \in \{0\} \cup [p] \text{ with } i \neq j, \text{ each set in } \mathcal{A}'_i \text{ intersects each set in } \mathcal{A}'_j.$$  

(5)
Claim 1 The families \( f(\partial A_0), A'_1, f^2(A'_2), \ldots, f^p(A'_p) \) are pairwise disjoint.

**Proof.** Suppose \( B \in f^i(A'_i) \cap f^j(A'_j) \) for some \( i, j \in [2, p] \) with \( i < j \). Then, \( B = f^i(A_i) = f^j(A_j) \) for some \( A_i \in A'_i \) and \( A_j \in A'_j \). Thus, \( A_i = f^{j-i}(A_j) \). Since \( 1 \leq j - i < p \), (1) gives us \( A_i \cap A_j = \emptyset \), but this contradicts (5). Similarly, if we assume that \( B \in A'_i \cap f^i(A'_j) \) for some \( i \in [2, p] \), then we obtain \( B \cap A_i = \emptyset \) for some \( A_i \in A'_i \), which again contradicts (5). Therefore, \( A'_1, f^2(A'_2), \ldots, f^p(A'_p) \) are pairwise disjoint.

Suppose \( B \in f(\partial A_0) \cap f^i(A'_i) \) for some \( i \in [2, p] \). Then, \( B = f(A_0) = f^i(A_i) \) for some \( A_0 \in \partial A_0 \) and \( A_i \in A'_i \). Thus, \( f^{-1}(A_i) = A_0 \setminus \{x\} \) for some \( x \in C \in A_0 \). Since \( 1 \leq i - 1 < p \), (1) gives us \( A_i \cap C = \emptyset \), but this contradicts (5). Similarly, if we assume that \( B \in f(\partial A_0) \cap A'_i \), then we obtain \( B \cap C = \emptyset \) for some \( C \in A_0 \), which again contradicts (5). The claim follows. \( \square \)

Let \( A^*_0 = \{A \cup \{1\} : A \in f(\partial A_0)\}, A^*_1 = A_1, \) and \( A^*_i = \{A \cup \{1\} : A \in f^i(A'_i)\} \) for \( 2 \leq i \leq p \). For \( 0 \leq i \leq p \), \( A^*_i \subseteq \mathcal{I}_G^{i \circ}(1) \). By Claim (1), \( \sum_{i=0}^{p} |A^*_i| \leq |\mathcal{I}_G^{i \circ}(1)| \). By (3), \( |A_0| \leq |\partial(A_0)| = |A^*_0| \). We have

\[
|A| = \sum_{i=0}^{p} |A_i| = |A_0| + \sum_{i=1}^{p} |A^*_i| \leq \sum_{i=0}^{p} |A^*_i| \leq |\mathcal{I}_G^{(\circ)(1)}|,
\]

and the lemma is proved. \( \square \)

The full Theorem is now obtained by the line of argument laid out in [21], hence making use of established facts regarding compressions on independent sets.

For any edge \( uv \) of a graph \( G \), let \( \delta_{u,v} : \mathcal{I}_G \rightarrow \mathcal{I}_G \) be defined by

\[
\delta_{u,v}(A) = \begin{cases} (A \setminus \{v\}) \cup \{u\} & \text{if } v \in A, u \notin A, \text{ and } (A \setminus \{v\}) \cup \{u\} \in \mathcal{I}_G; \\ A & \text{otherwise}, \end{cases}
\]

and let \( \Delta_{u,v} : 2^{2^{\mathcal{I}_G}} \rightarrow 2^{2^{\mathcal{I}_G}} \) be the compression operation defined by

\[
\Delta_{u,v}(A) = \{\delta_{u,v}(A) : A \in \mathcal{A}\} \cup \{A \in \mathcal{A} : \delta_{u,v}(A) \in \mathcal{A}\}.
\]

It is well-known, and easy to see, that

\[
|\Delta_{u,v}(A)| = |A|.
\]

For any \( x \in V(G) \), let \( N_G(x) \) denote the set \( \{y \in V(G) : xy \in E(G)\} \). The following is given by [8, Lemma 2.1] (which is actually stated for \( \mathcal{I}_G^{\circ}(1) \) but proved for \( \mathcal{I}_G \)) and essentially originated in [21].

**Lemma 2.2** ([8, 21]) If \( G \) is a graph, \( uv \in E(G) \), \( \mathcal{A} \) is an intersecting subfamily of \( \mathcal{I}_G \), \( \mathcal{B} = \Delta_{u,v}(\mathcal{A}) \), \( \mathcal{B}_0 = \{B \in \mathcal{B} : v \notin B\} \), \( \mathcal{B}_1 = \{B \in \mathcal{B} : v \in B\} \), and \( \mathcal{B}'_i = \{B \setminus \{v\} : B \in \mathcal{B}_i\} \), then:

(i) \( \mathcal{B}_0 \) is intersecting;
(ii) if \( |N_G(u) \setminus (\{v\} \cup N_G(v))| \leq 1 \), then \( \mathcal{B}'_0 \) is intersecting;
(iii) if \( N_G(u) \setminus (\{v\} \cup N_G(v)) = \emptyset \), then \( \mathcal{B}_0 \cup \mathcal{B}'_1 \) is intersecting.
For a vertex $v$ of a graph $G$, let $G - v$ denote the graph obtained by deleting $v$ (that is, $G - v = (V(G) \setminus \{v\}, \{xy \in E(G): x, y \notin \{v\}\})$, and let $G \downarrow v$ be the graph obtained by deleting $v$ and the vertices adjacent to $v$ (that is, $G \downarrow v = (V(G) \setminus \{v\} \cup N_G(v)), \{xy \in E(G): x, y \notin \{v\} \cup N_G(v)\})$).

**Proof of Theorem 1.4.** We use induction on $p$. If $P^{k^*}$ is a complete graph, then the result is given by Lemma 2.1. Note that this captures the base case $p = 1$. Now suppose that $P^{k^*}$ is not a complete graph. Then, $p \geq k^* + 2$. If $r = 1$, then the result is trivial. Suppose $r > 1$. Let $A$ be an intersecting subfamily of $\mathcal{I}_G^{(r)}$. Let $u = p - 1$ and $v = p$. Let $B = \Delta_{u,v}(A), B_0 = \{B \in B: v \notin B\}, B_1 = \{B \in B: v \in B\}$, and $B'_1 = \{B \setminus \{v\}: B \in B_1\}$. By Lemma 2.2 (i), $B_0$ is intersecting. We have $N_G(u) \setminus \{\{v\} \cup N_G(v)\} = \{p - k^* - 1\}$, so, by Lemma 2.2 (ii), $B'_1$ is intersecting. Let $H_0 = P_{p-1}$ and $H_1 = P_{p-k^*-1}$. Clearly, $B_0 \subseteq \mathcal{I}_{G-v}^{(r)}, B'_1 \subseteq \mathcal{I}_{G-v}^{(r)}$. $G - v$ is the union of $H_0^{k^*}$ and $1C^{k_1}, \ldots, sC^{k_s}$, and $G \downarrow v$ is the union of $H_1^{k^*}$ and $1C^{k_1}, \ldots, sC^{k_s}$. The condition $\min(\omega(1C^{k_1}), \ldots, \omega(sC^{k_s})) > \omega(P^{k^*})$ in the theorem gives us $\omega(H_0^{k^*}) \geq \omega(H_1^{k^*})$. By the induction hypothesis, $|B_0| \leq |\mathcal{I}_{G-v}^{(r)}(1)|$ and $|B'_1| \leq |\mathcal{I}_{G-v}^{(r-1)}(1)|$. We have

$$|A| = |B| = |B_0| + |B'_1| \leq |\mathcal{I}_{G-v}^{(r)}(1)| + |\mathcal{I}_{G-v}^{(r-1)}(1)| = |\{A \in \mathcal{I}_G^{(r)}: 1 \in A, v \notin A\}| + |\{A \in \mathcal{I}_G^{(r)}: 1, v \in A\}| = |\mathcal{I}_G^{(r)}(1)|,$$

as required.

We now work towards the proof of Theorem 1.5.

Let $G$ consist of the disjoint union of one cycle $\mathcal{C}$ raised to the power $k^*$ and $s$ cycles $1C, \ldots, sC$ raised to the powers $k_1, \ldots, k_s$, respectively. Let $c^* = \lvert V(\mathcal{C}) \rvert, c_i = \lvert V(iC) \rvert$ for $1 \leq i \leq s$, and $n = c^* + \sum_{i=1}^{s} c_i = \lvert V(G) \rvert$. As before, for $1 \leq i \leq s$, we label the vertices of $\mathcal{C} 1^i, 2^i, \ldots, c_i^i$, where $E(iC) = \{\{j^i, (j + 1)^i\}: j \in [c_i - 1]\} \cup \{n^i, 1^i\}$. We shall assume that $\mathcal{C} = C_c^*$, that is, $V(\mathcal{C}) = \{c^*\}$ and $E(\mathcal{C}) = \{\{i, i + 1\}: i \in [c^* - 1]\} \cup \{c^*, 1\}$.

**Proof of Theorem 1.5.** We use induction on $c^*$. If $\mathcal{C}^{k^*}$ is a complete graph, then the result is given by Lemma 2.1. Note that this captures the base case $c^* = 1$. Now suppose that $\mathcal{C}^{k^*}$ is not a complete graph. Then, $c^* \geq 2k^* + 2$. If $r = 1$, then the result is trivial. Suppose $r > 1$. Let $A$ be an intersecting subfamily of $\mathcal{I}_G^{(r)}$.

Let $f: V(G) \rightarrow V(G)$ be the Talbot compression [20, 29] given by

$$f(v) = v \text{ for } v \in V(G) \setminus V(\mathcal{C}),$$

$$f(1) = 1, \text{ and } f(1 + j) = 1 + j - 1 \text{ for } 1 \leq j \leq c^* - 1.$$

For $X \subseteq \mathcal{I}_G$ and $X \subseteq \mathcal{I}_G$, we use the notation $f^t(X)$ and $f^t(X)$ similarly to the way it is used above. Let $F$ be the union of $C_{c-1}^{k^*}$ and $1C^{k_1}, \ldots, sC^{k_s}$. Let $H$ be the union
of \(C_{c^* - k^* - 1}^{k^*}\) and \(\{C^{k_1}, \ldots, sC^{k_s}\}\). Let

\[
\begin{align*}
\mathcal{B} &= \{A \in \mathcal{A} : 1 \not\in A, f(A) \in \mathcal{I}_F^{(r)}\}, \\
\mathcal{C} &= \{A \in \mathcal{A} : 1 \in A, f(A) \in \mathcal{I}_F^{(r)}\}, \\
\mathcal{D}_0 &= \{A \in \mathcal{A} : 1, k^* + 2 \in A\}, \\
\mathcal{D}_i &= \{A \in \mathcal{A} : 1 + c^*-i, k^* + 2 - i \in A\} \quad \text{for } 1 \leq i \leq k^*.
\end{align*}
\]

Note that these families partition \(\mathcal{A}\). Let

\[
\mathcal{F} = (f^{k^*-1}(\mathcal{E}) - \{1\}) \cup \bigcup_{i=0}^{k^*}(f^{k^*}(\mathcal{D}_i) - \{1\}),
\]

where \(\mathcal{E} = f(\mathcal{B}) \cap f(\mathcal{C})\) and, for any family \(\mathcal{G}\), \(\mathcal{G} - \{1\} = \{G \backslash \{1\} : G \in \mathcal{G}\}\).

**Claim 2** (see \cite{20, 29}) *The following hold:*

1. \(|A| = |f(\mathcal{B} \cup \mathcal{C})| + |\mathcal{F}|;
2. \(f(\mathcal{B} \cup \mathcal{C})\) is an intersecting subfamily of \(\mathcal{I}_F^{(r)}\);
3. \(\mathcal{F}\) is an intersecting subfamily of \(\mathcal{I}_H^{(r-1)}\);
4. \(|\mathcal{I}_G^{(r)}(1)| = |\mathcal{I}_F^{(r)}(1)| + |\mathcal{I}_H^{(r-1)}(1)|\).

By the induction hypothesis and Claim 2 (ii)–(iii), \(|f(\mathcal{B} \cup \mathcal{C})| \leq |\mathcal{I}_F^{(r)}(1)|\) and \(|\mathcal{F}| \leq |\mathcal{I}_H^{(r-1)}(1)|\). Thus, by Claim 2 (i) and Claim 2 (iv), we have

\[
|A| = |f(\mathcal{B} \cup \mathcal{C})| + |\mathcal{F}| \leq |\mathcal{I}_F^{(r)}(1)| + |\mathcal{I}_H^{(r-1)}(1)| = |\mathcal{I}_G^{(r)}(1)|,
\]

and the theorem is proved.
