#### Abstract

This paper constructs a $t_{r}$-norm and a $t_{r}$-conorm on the set of all normal and convex functions from $[0,1]$ to $[0,1]$, which are not obtained by using the following two formulas on binary operations $\curlywedge$ and $\curlyvee$ : $$
\begin{aligned} & (f \curlywedge g)(x)=\sup \{f(y) * g(z) \mid y \Delta z=x\} \\ & (f \curlyvee g)(x)=\sup \{f(y) * g(z) \mid y \nabla z=x\} \end{aligned}
$$ where $f, g \in \operatorname{Map}([0,1],[0,1]), \Delta$ and $\nabla$ are respectively a $t$-norm and a $t$-conorm on $[0,1]$, and $*$ is a binary operation on $[0,1]$. This result answers affirmatively an open problem posed in [3]. Moreover, the duality between $t_{r}$-norms and $t_{r}$-conorms is obtained by the introduction of operations dual to binary operations on $\operatorname{Map}([0,1],[0,1])$.

Keywords: Normal and convex function, $t$-norm, $t$-conorm, $t_{r}$-norm, $t_{r}$-conorm, type- 2 fuzzy set.

## 1. Introduction

In 1975, Zadeh [15] introduced the notion of type-2 fuzzy sets (T2FSs), that is, a fuzzy set with fuzzy sets as truth values (simply, "fuzzy-fuzzy sets"), as an extension of type-1 fuzzy sets (FSs) and interval-valued fuzzy sets (IVFSs), which was then equivalently expressed in different forms by Mendel et al. $[4,5,7,8]$. The definitions of triangular norms (briefly $t$-norms) and triangular conorms (briefly $t$-conorms) on the real unit interval were introduced by Schweizer and Sklar [10] in the framework of probabilistic metric spaces. These definitions exploits the main idea of Menger [9] that extends the classical triangle inequality in metric spaces to probabilistic metric spaces. In 2006, Walker and Walker [12] extended $t$-norm and $t$-conorm on $I$ to the algebra of truth values on T2FSs and IVFSs. Then, Hernández et al. [3] modified Walker and Walker's definition and introduced the notions of a $t_{r}$-norm and a $t_{r}$-conorm by adding some "restrictive axioms" (see Definition 2.8 below). In particular, in [3] they proved that the binary operation $\curlywedge$ (resp., $\curlyvee$ ) on the set $\mathbf{L}$ of all normal and convex functions is a $t_{r}$-norm (resp., a $t_{r}$-conorm). They also proposed the following two open problems on the binary operations $\lambda$ and $\curlyvee$ (see Definition 2.5 below).

Question 1. [3] Apart from the $t$-norm, does there exist other binary operation ' $*$ ' on I such that ' $\curlywedge$ ' and ' $\gamma$ ' are, respectively, a $t_{r}$-norm and a $t_{r}$-conorm on $\mathbf{L}$ ?

Question 2. [3] Determine other binary operations, which are not obtained using the formulas given for the operations ' $\curlywedge$ ' and ' $\gamma$ ', that are either a $t_{r}$-norm or a $t_{r}$-conorm on $\mathbf{L}$.

Recently, in [13] we have answered negatively Question 1, proving that, if a binary operation $*$ ensures $\lambda$ be a $t_{r}$-norm on $\mathbf{L}$ or $\curlyvee$ be a $t_{r}$-conorm on $\mathbf{L}$, then $*$ is a $t$-norm. This paper is devoted to solving Question 2 by constructing a $t_{r}$-norm '* ' (see Section 4) and a $t_{r}$-conorm ' ' ${ }^{\prime}$ ' (see Section 6) on L, which cannot be obtained by the formulas defining the operations ' $\lambda$ ' and ' $r$ '.

[^0]
## 2. Preliminaries and basic concepts

Throughout this paper, let $I=[0,1], \operatorname{Map}(X, Y)$ be the set of all mappings from $X$ to $Y$, and ' $\leq$ ' denote the usual order relation in the lattice of real numbers, with $\mathbf{M}=M a p(I, I)$. Let $\vee$ and $\wedge$ be the maximum and minimum operations, respectively, on lattice $I$.

Definition 2.1. [14] A type- 1 fuzzy set $A$ in space $X$ is a mapping from $X$ to $I$, i.e., $A \in \operatorname{Map}(X, I)$.
Definition 2.2. [11] A type-2 fuzzy set $A$ in space $X$ is a mapping

$$
A: X \rightarrow \mathbf{M}
$$

i.e., $A \in \operatorname{Map}(X, \mathbf{M})$.

Definition 2.3. [11] A function $f \in \mathbf{M}$ is
(1) normal if $\sup \{f(x) \mid x \in I\}=1$;
(2) convex if, for any $0 \leq x \leq y \leq z \leq 1, f(y) \geq f(x) \wedge f(z)$.

Let $\mathbf{N}$ and $\mathbf{L}$ denote the set of all normal functions in $\mathbf{M}$ and the set of all normal and convex functions in $\mathbf{M}$, respectively.

For any subset $B$ of $X$, a special fuzzy set $\mathbf{1}_{B}$, called the characteristic function of $B$, is defined by

$$
\mathbf{1}_{B}(x)= \begin{cases}1, & x \in B \\ 0, & x \in X \backslash B .\end{cases}
$$

Let $\mathbf{J}=\left\{\mathbf{1}_{\{x\}} \mid x \in I\right\}$ and $\mathbf{K}=\left\{\mathbf{1}_{[a, b]} \mid 0 \leq a \leq b \leq 1\right\}$.
Definition 2.4. [6] A binary operation $*: I^{2} \rightarrow I$ is a $t$-norm on $I$ if it satisfies the following axioms:
(T1) (commutativity) $x * y=y * x$ for $x, y \in I$;
(T2) (associativity) $(x * y) * z=x *(y * z)$ for $x, y, z \in I$;
(T3) (monotonicity) $*$ is increasing in each argument;
(T4) (neutral element) $1 * x=x * 1=x$ for $x \in I$.
A binary operation $*: I^{2} \rightarrow I$ is a $t$-conorm on $I$ if it satisfies axioms (T1), (T2), and (T3) above; and axiom ( $\mathrm{T} 4^{\prime}$ ): $0 * x=x * 0=x$ for $x \in I$.

Definition 2.5. [3] Let $*$ be a binary operation on $I, \Delta$ be a $t$-norm on $I$, and $\nabla$ be a $t$-conorm on $I$. Define the binary operations $\lambda$ and $\curlyvee: \mathbf{M}^{2} \rightarrow \mathbf{M}$ as follows: for $f, g \in \mathbf{M}$,

$$
\begin{equation*}
(f \curlywedge g)(x)=\sup \{f(y) * g(z) \mid y \Delta z=x\} \tag{2.1}
\end{equation*}
$$

and

$$
\begin{equation*}
(f \curlyvee g)(x)=\sup \{f(y) * g(z) \mid y \nabla z=x\} . \tag{2.2}
\end{equation*}
$$

Definition 2.6. [11] The operations of $\sqcup$ (union), $\sqcap$ (intersection), $\neg$ (complementation) on $\mathbf{M}$ are defined as follows: for $f, g \in \mathbf{M}$,

$$
\begin{aligned}
& (f \sqcup g)(x)=\sup \{f(y) \wedge g(z) \mid y \vee z=x\}, \\
& (f \sqcap g)(x)=\sup \{f(y) \wedge g(z) \mid y \wedge z=x\},
\end{aligned}
$$

and

$$
(\neg f)(x)=\sup \{f(y) \mid 1-y=x\}=f(1-x)
$$

From [11], it follows that $\mathfrak{M}=\left(\mathbf{M}, \sqcup, \sqcap, \neg, \mathbf{1}_{\{0\}}, \mathbf{1}_{\{1\}}\right)$ does not have a lattice structure, although $\sqcup$ and $\Pi$ satisfy the De Morgan's laws with respect to the complementation $\neg$.

Walker and Walker [11] introduced the following partial orders $\sqsubseteq$ and $\preccurlyeq$ on $\mathbf{M}$.
Definition 2.7. [11] $f \sqsubseteq g$ if $f \sqcap g=f ; f \preccurlyeq g$ if $f \sqcup g=g$.
It follows from [11, Proposition 14] that both $\sqsubseteq$ and $\preccurlyeq$ are partial orders on M. Generally, the partial orders $\sqsubseteq$ and $\preccurlyeq$ do not coincide. In $[1,2,11]$, it was proved that $\sqsubseteq$ and $\preccurlyeq$ coincide on $\mathbf{L}$, and the subalgebra $\mathfrak{L}=\left(\mathbf{L}, \sqcup, \sqcap, \neg, \mathbf{1}_{\{0\}}, \mathbf{1}_{\{1\}}\right)$ is a bounded complete lattice. In particular, $\mathbf{1}_{\{0\}}$ and $\mathbf{1}_{\{1\}}$ are the minimum and the maximum of $\mathfrak{L}$, respectively.

Definition 2.8. [3] A binary operation $\widetilde{T}: \mathbf{L}^{2} \rightarrow \mathbf{L}$ is a $t_{r}$-norm ( $t$-norm according to the restrictive axioms), if
(O1) $\widetilde{T}$ is commutative, i.e., $\widetilde{T}(f, g)=\widetilde{T}(g, f)$ for $f, g \in \mathbf{L}$;
(O2) $\widetilde{T}$ is associative, i.e., $\widetilde{T}(\widetilde{T}(f, g), h)=\widetilde{T}(f, \widetilde{T}(g, h))$ for $f, g, h \in \mathbf{L}$;
(O3) $\widetilde{T}\left(f, \mathbf{1}_{\{1\}}\right)=f$ for $f \in \mathbf{L}$ (neutral element);
(O4) $\widetilde{T}$ is increasing, i.e., for $f, g, h \in \mathbf{L}$ such that $f \sqsubseteq g, \widetilde{T}(f, h) \sqsubseteq \widetilde{T}(g, h)$;
(O5) $\widetilde{T}\left(\mathbf{1}_{[0,1]}, \mathbf{1}_{[a, b]}\right)=\mathbf{1}_{[0, b]}$;
(O6) $\widetilde{T}$ is closed on $\mathbf{J}$;
(O7) $\widetilde{T}$ is closed on $\mathbf{K}$.
A binary operation $\widetilde{S}: \mathbf{L}^{2} \rightarrow \mathbf{L}$ is a $t_{r}$-conorm if it satisfies axioms (O1), (O2), (O4), (O6), and (O7) above; axiom $\left(\mathrm{O} 3^{\prime}\right): \widetilde{S}\left(f, \mathbf{1}_{\{0\}}\right)=f$; and axiom (O5 $\left.{ }^{\prime}\right): \widetilde{S}\left(\mathbf{1}_{[0,1]}, \mathbf{1}_{[a, b]}\right)=\mathbf{1}_{[a, 1]}$. Axioms (O1), (O2), (O3), (O3'), and (O4) are called "basic axioms", and an operation that complies with these axioms will be referred to as $t$-norm and $t$-conorm, respectively.

Definition 2.9. For $f \in \mathbf{M}$, define

$$
\begin{aligned}
f^{L}(x) & =\sup \{f(y) \mid y \leq x\}, \\
f^{L_{\mathrm{w}}}(x) & = \begin{cases}\sup \{f(y) \mid y<x\}, & x \in(0,1] \\
f(0), & x=0\end{cases}
\end{aligned}
$$

and

$$
\begin{aligned}
f^{R}(x) & =\sup \{f(y) \mid y \geq x\}, \\
f^{R_{\mathrm{w}}}(x) & = \begin{cases}\sup \{f(y) \mid y>x\}, & x \in[0,1), \\
f(1), & x=1\end{cases}
\end{aligned}
$$

Clearly, (1) $f^{L}$, $f^{L_{\mathrm{w}}}$ and $f^{R}, f^{R_{\mathrm{w}}}$ are increasing and decreasing, respectively; (2) $f^{L}(x) \vee f^{R}(x)=$ $f^{L}(x) \vee f^{R_{\mathrm{w}}}(x)=\sup _{z \in I}\{f(z)\}$ and $f^{R}(x) \vee f^{L_{\mathrm{w}}}(x)=\sup _{z \in I}\{f(z)\}$ for all $x \in I$. The following properties of $f^{L}$ and $f^{R}$ were obtained by Walker et al. [1, 2, 11].
Proposition 2.1. [11] For $f, g \in \mathbf{M}$,
(1) $f \leq f^{L} \wedge f^{R}$;
(2) $\left(f^{L}\right)^{L}=f^{L},\left(f^{R}\right)^{R}=f^{R}$;
(3) $(\neg f)^{L}=\neg\left(f^{R}\right),(\neg f)^{R}=\neg\left(f^{L}\right)$;
(4) $\left(f^{L}\right)^{R}=\left(f^{R}\right)^{L}=\sup _{x \in I}\{f(x)\}$;
(5) $f \sqsubseteq g$ if and only if $f^{R} \wedge g \leq f \leq g^{R}$;
(6) $f \preccurlyeq g$ if and only if $f \wedge g^{L} \leq g \leq f^{L}$;
(7) $f$ is convex if and only if $f=f^{L} \wedge f^{R}$.

Theorem 2.1. [1, 2] Let $f, g \in \mathbf{L}$. Then, $f \sqsubseteq g$ if and only if $f^{L} \geq g^{L}$ and $f^{R} \leq g^{R}$.
The following result follows from the definitions of $f^{L}$ and $f^{R}$.
Lemma 2.1. For $f \in \mathbf{M}, f^{L}(1)=f^{R}(0)=\sup _{x \in I}\{f(x)\}$.
Proposition 2.2. For $f \in \mathbf{M}, f^{L_{\mathrm{w}}}(x)=\sup _{t \in[0, x)}\left\{f^{L}(t)\right\}$ for all $x \in(0,1]$.

Proof. Fix any $x \in(0,1]$, noting that $f(t) \leq f^{L}(t)$ for all $t \in[0, x)$, we have

$$
f^{L_{\mathrm{w}}}(x)=\sup _{t \in[0, x)}\{f(t)\} \leq \sup _{t \in[0, x)}\left\{f^{L}(t)\right\} .
$$

Moreover, for any $t \in[0, x)$, it follows from $t<\frac{t+x}{2}<x$ that $f^{L}(t) \leq f^{L_{\mathrm{w}}}\left(\frac{t+x}{2}\right) \leq f^{L_{\mathrm{w}}}(x)$, implying that

$$
\sup _{t \in[0, x)}\left\{f^{L}(t)\right\} \leq f^{L_{\mathrm{w}}}(x) .
$$

Thus,

$$
f^{L_{\mathrm{w}}}(x)=\sup _{t \in[0, x)}\left\{f^{L}(t)\right\} .
$$

Lemma 2.2. For $f \in \mathbf{N}, \inf \left\{x \in I \mid f^{L}(x)=1\right\} \leq \sup \left\{x \in I \mid f^{R}(x)=1\right\}$.
Proof. From $f \in \mathbf{N}$ and Lemma 2.1, it follows that $f^{L}(1)=f^{R}(0)=\sup \{f(x) \mid x \in I\}=1$, which means that both $\left\{x \in I \mid f^{L}(x)=1\right\}$ and $\left\{x \in I \mid f^{R}(x)=1\right\}$ are nonempty sets. Denote $\eta=\inf \{x \in$ $\left.I \mid f^{L}(x)=1\right\}$ and $\xi=\sup \left\{x \in I \mid f^{R}(x)=1\right\}$. If $\eta=0$, this holds trivially. If $\eta>0$, then for any $0 \leq \alpha<\eta, f^{L}(\alpha)<1$. This, together with $f^{L}(\alpha) \vee f^{R}(\alpha)=\sup _{x \in I}\{f(x)\}=1$, implies that $f^{R}(\alpha)=1$. Thus, $\alpha \leq \xi$. Therefore,

$$
\xi \geq \sup \{\alpha \mid 0 \leq \alpha<\eta\}=\eta .
$$

## 3. Basic properties of $*$

In this section, basic properties of $*$ determined by the binary operations $\Delta, \nabla, \curlywedge$, and $\curlyvee$ are obtained.
Proposition 3.1. (1) Let $*$ be a t-norm on I. Then, $x * y=1$ if and only if $x=y=1$.
(2) Let $*$ be a t-conorm on I. Then, $x * y=0$ if and only if $x=y=0$.

Lemma 3.1. (1) Let $\Delta$ be at-norm on $I$ and $*$ be a binary operation on $I$. Then,

$$
(f \curlywedge g)(1)=f(1) * g(1) .
$$

(2) Let $\nabla$ be a t-conorm on $I$ and $*$ be a binary operation on $I$. Then,

$$
(f \curlyvee g)(0)=f(0) * g(0) .
$$

Proof. Since $\triangle$ is a $t$-norm, from Proposition 3.1, we have

$$
(f \curlywedge g)(1)=\sup \{f(y) * g(z) \mid y \Delta z=1\}=f(1) * g(1) .
$$

Similarly, we have

$$
(f \curlyvee g)(0)=\sup \{f(y) * g(z) \mid y \nabla z=1\}=f(0) * g(0) .
$$

Proposition 3.2. Let $\Delta$ be at-norm on $I$ and $*$ be a binary operation on $I$. If $\curlywedge$ is commutative on $\mathbf{L}$, then $*$ is commutative.

Proof. Suppose, on the contrary, that $*$ is not commutative. Then, there exist $u, v \in I$ such that $u * v \neq v * u$. Choose two functions $f, g \in \mathbf{M}$, as follows

$$
f(x)=(u-1) x+1,
$$

and

$$
g(x)=(v-1) x+1
$$

for $x \in I$. It can be verified that $f, g \in \mathbf{L}$, as both $f$ and $g$ are decreasing. Since $\lambda$ is commutative, Lemma 3.1 yields

$$
\begin{aligned}
& u * v=f(1) * g(1)=(f \curlywedge g)(1) \\
& =(g \curlywedge f)(1)=g(1) * f(1)=v * u,
\end{aligned}
$$

which is a contradiction. Therefore, * is commutative.

Proposition 3.3. Let $\Delta$ be at-norm on $I$ and $*$ be a binary operation on $I$. If $\curlywedge$ is at-norm on $\mathbf{L}$, then $0 * 0=0 * 1=1 * 0=0$ and $1 * 1=1$.

Proof. Since $\mathbf{1}_{\{1\}}$ is the neutral element of $\curlywedge$, from Lemma 3.1 and Proposition 3.2, it follows that

$$
\begin{aligned}
& 0=\mathbf{1}_{\{0\}}(1)=\left(\mathbf{1}_{\{1\}} \curlywedge \mathbf{1}_{\{0\}}\right)(1) \\
& \quad=\mathbf{1}_{\{1\}}(1) * \mathbf{1}_{\{0\}}(1) \\
& \quad=1 * 0=0 * 1 ; \\
& 0=\mathbf{1}_{\{0.5\}}(0)=\left(\mathbf{1}_{\{0.5\}} \curlywedge \mathbf{1}_{\{1\}}\right)(0) \\
& \geq \mathbf{1}_{\{0.5\}}(1) * \mathbf{1}_{\{1\}}(0)(\operatorname{as} 1 \Delta 0=0) \\
& =0 * 0
\end{aligned}
$$

and

$$
\begin{aligned}
1 & =\mathbf{1}_{\{1\}}(1)=\left(\mathbf{1}_{\{1\}} \curlywedge \mathbf{1}_{\{1\}}\right)(1) \\
& =\mathbf{1}_{\{1\}}(1) * \mathbf{1}_{\{1\}}(1)=1 * 1 .
\end{aligned}
$$

Proposition 3.4. Let $\nabla$ be a t-conorm on $I$ and $*$ be a binary operation on $I$. If $\curlyvee$ is at-conorm on $\mathbf{L}$, then $0 * 0=0 * 1=1 * 0=0$ and $1 * 1=1$.

Proof. Since $\mathbf{1}_{\{0\}}$ is the neutral element of $\curlyvee$, from Lemma 3.1, it follows that

$$
\begin{align*}
0 & =\mathbf{1}_{\{1\}}(0)=\left(\mathbf{1}_{\{1\}} \curlyvee \mathbf{1}_{\{0\}}\right)(0)  \tag{3.1}\\
& =\mathbf{1}_{\{1\}}(0) * \mathbf{1}_{\{0\}}(0)=0 * 1 ; \\
0 & =\mathbf{1}_{\{1\}}(0)=\left(\mathbf{1}_{\{0\}} \curlyvee \mathbf{1}_{\{1\}}\right)(0)  \tag{3.2}\\
& =\mathbf{1}_{\{0\}}(0) * \mathbf{1}_{\{1\}}(0)=1 * 0 ;
\end{align*}
$$

and

$$
\begin{align*}
0 & =\mathbf{1}_{\{0.5\}}(1)=\left(\mathbf{1}_{\{0.5\}} \curlyvee \mathbf{1}_{\{0\}}\right)(1) \\
& \geq \mathbf{1}_{\{0.5\}}(0) * \mathbf{1}_{\{0\}}(1)(\text { as } 0 \nabla 1=1)  \tag{3.3}\\
& =0 * 0 .
\end{align*}
$$

It follows from (3.1)-(3.3) that, for $y, z \in I$, one has $\mathbf{1}_{\{1\}}(y) * \mathbf{1}_{\{0\}}(z) \in\{0,1 * 1\}$. This implies that

$$
\begin{aligned}
1 & =\mathbf{1}_{\{1\}}(1)=\left(\mathbf{1}_{\{1\}} \curlyvee \mathbf{1}_{\{0\}}\right)(1) \\
& =\sup \left\{0, \mathbf{1}_{\{1\}}(1) * \mathbf{1}_{\{0\}}(0)\right\}(\text { as } 1 \nabla 0=1) \\
& =1 * 1
\end{aligned}
$$

Proposition 3.5. Let $\Delta$ be a t-norm on $I$ and $*$ be a binary operation on $I$. If $\curlywedge$ is at-norm on $\mathbf{L}$, then, for $x_{1}, x_{2} \in I$, one has $\mathbf{1}_{\left\{x_{1}\right\}} \curlywedge \mathbf{1}_{\left\{x_{2}\right\}}=\mathbf{1}_{\left\{x_{1} \Delta x_{2}\right\}}$.
Proof. Proposition 3.3 yields
(a) for $y, z \in I, \mathbf{1}_{\left\{x_{1}\right\}}(y) * \mathbf{1}_{\left\{x_{2}\right\}}(z) \in\{0,1\}$;
(b) $\mathbf{1}_{\left\{x_{1}\right\}}(y) * \mathbf{1}_{\left\{x_{2}\right\}}(z)=1$ if and only if $y=x_{1}$ and $z=x_{2}$.

This, together with

$$
\left(\mathbf{1}_{\left\{x_{1}\right\}} \curlywedge \mathbf{1}_{\left\{x_{2}\right\}}\right)(x)=\sup \left\{\mathbf{1}_{\left\{x_{1}\right\}}(y) * \mathbf{1}_{\left\{x_{2}\right\}}(z) \mid y \Delta z=x\right\}
$$

implies that

$$
\mathbf{1}_{\left\{x_{1}\right\}} \curlywedge \mathbf{1}_{\left\{x_{2}\right\}}=\mathbf{1}_{\left\{x_{1} \Delta x_{2}\right\}}
$$

Proposition 3.6. Let $\nabla$ be a t-conorm on $I$ and $*$ be a binary operation on $I$. If $\curlyvee$ is a $t$-conorm, then, for $x_{1}, x_{2} \in I$, one has $\mathbf{1}_{\left\{x_{1}\right\}} \curlyvee \mathbf{1}_{\left\{x_{2}\right\}}=\mathbf{1}_{\left\{x_{1} \nabla x_{2}\right\}}$.

Proof．Proposition 3.4 yields
（a）for $y, z \in I, \mathbf{1}_{\left\{x_{1}\right\}}(y) * \mathbf{1}_{\left\{x_{2}\right\}}(z) \in\{0,1\}$ ；
（b） $\mathbf{1}_{\left\{x_{1}\right\}}(y) * \mathbf{1}_{\left\{x_{2}\right\}}(z)=1$ if and only if $y=x_{1}$ and $z=x_{2}$ ．
This，together with

$$
\left(\mathbf{1}_{\left\{x_{1}\right\}} \curlyvee \mathbf{1}_{\left\{x_{2}\right\}}\right)(x)=\sup \left\{\mathbf{1}_{\left\{x_{1}\right\}}(y) * \mathbf{1}_{\left\{x_{2}\right\}}(z) \mid y \nabla z=x\right\}
$$

implies that

$$
\mathbf{1}_{\left\{x_{1}\right\}} \curlyvee \mathbf{1}_{\left\{x_{2}\right\}}=\mathbf{1}_{\left\{x_{1} \nabla x_{2}\right\}} .
$$

## 4．Construction of a $t_{r}$－norm on L

For any $f, g \in \mathbf{L}$ ，let $\eta_{f, g}=\inf \left\{x \in I \mid f^{L}(x)=1\right\} \wedge \inf \left\{x \in I \mid g^{L}(x)=1\right\}$ and $\xi_{f, g}=\sup \{x \in I \mid$ $\left.f^{R}(x)=1\right\} \wedge \sup \left\{x \in I \mid g^{R}(x)=1\right\}$ ．By Lemma 2．2，we have $\eta_{f, g} \leq \xi_{f, g}$ ．

Definition 4．1．Define a binary operation $\underset{\aleph}{\boldsymbol{L}} \mathbf{L}^{2} \rightarrow \mathbf{M}$ as follows：for $f, g \in \mathbf{L}$ ，
（1）$f=\mathbf{1}_{\{1\}}, f$ 出 $g=g$ 出 $f=g$ ；
（2）$g=\mathbf{1}_{\{1\}}, f$＊$g=g$ 绻 $f=f$ ；
（3）$f \neq \mathbf{1}_{\{1\}}$ and $g \neq \mathbf{1}_{\{1\}}$ ，

$$
(f \text { 令 } g)(t)= \begin{cases}f^{L}(t) \vee g^{L}(t), & t \in\left[0, \eta_{f, g}\right),  \tag{4.1}\\ 1, & t \in\left[\eta_{f, g}, \xi_{f, g}\right), \\ f^{R}(\xi) \wedge g^{R}(\xi), & t=\xi_{f, g}, \\ 0, & t \in\left(\xi_{f, g}, 1\right] .\end{cases}
$$

Clearly，$f$ w $g$ is increasing on $\left[0, \xi_{f, g}\right)$ ．
Proposition 4．1．For $f, g \in \mathbf{L}$ ，$f$ 臼 $g$ is normal and convex，i．e．，$f$ 内 $g \in \mathbf{L}$ ．
Proof．Consider the following two cases：
（1）if $f=\mathbf{1}_{\{1\}}$ or $g=\mathbf{1}_{\{1\}}$ ，it is clear that $f$ 出 $g \in \mathbf{L}$ ；
（2）if $f \neq \mathbf{1}_{\{1\}}$ and $g \neq \mathbf{1}_{\{1\}}$ ，applying（4．1），it is easy to see that $f$ 出 $g$ is convex，since it is increasing on $\left[0, \xi_{f, g}\right)$ and decreasing on $\left[\xi_{f, g}, 1\right]$ ．It remains to show that $f$ 出 $g$ is normal．
（a）If $\eta_{f, g}<\xi_{f, g}$ ，then $(f$ 灾 $g)(t)=1$ for all $t \in\left[\eta_{f, g}, \xi_{f, g}\right)$ ；
（b）If $\eta_{f, g}=\xi_{f, g}$ ，consider the following two subcases：
（b．1）$\eta_{f, g}=0$ ．It follows from（4．1）that

$$
(f \text { 凶 } g)(t)= \begin{cases}f^{R}(0) \wedge g^{R}(0), & t=0, \\ 0, & t \in(0,1] .\end{cases}
$$

Since $f$ and $g$ are normal，from Lemma 2．1，it is clear that

$$
f^{R}(0) \wedge g^{R}(0)=\sup _{x \in I}\{f(x)\} \wedge \sup _{x \in I}\{g(x)\}=1
$$

（b．2）$\eta_{f, g}>0$ ．From Proposition 2．2，it follows that

$$
\begin{aligned}
& (f \text { 出 } g)^{L_{\mathrm{w}}}\left(\eta_{f, g}\right) \\
= & \sup _{t \in\left[0, \eta_{f, g}\right)}\{(f \text { 令 } g)(t)\} \\
= & \sup _{t \in\left[0, \eta_{f, g}\right)}\left\{f^{L}(t)\right\} \vee \sup _{t \in\left[0, \eta_{f, g}\right)}\left\{g^{L}(t)\right\} \\
= & f^{L_{\mathrm{w}}}\left(\eta_{f, g}\right) \vee g^{L_{\mathrm{w}}}\left(\eta_{f, g}\right) .
\end{aligned}
$$

If $f^{L_{\mathrm{w}}}\left(\eta_{f, g}\right) \vee g^{L_{\mathrm{w}}}\left(\eta_{f, g}\right)=1$ ，then clearly $f$ ※ $g$ is normal．If $f^{L_{\mathrm{w}}}\left(\eta_{f, g}\right) \vee g^{L_{\mathrm{w}}}\left(\eta_{f, g}\right)<1$ ，noting that $1=\sup _{t \in I}\{f(t)\}=f^{L_{\mathrm{w}}}\left(\eta_{f, g}\right) \vee f^{R}\left(\eta_{f, g}\right)$ and $1=\sup _{t \in I}\{g(t)\}=g^{L_{\mathrm{w}}}\left(\eta_{f, g}\right) \vee g^{R}\left(\eta_{f, g}\right)$ ， we have

$$
f^{R}\left(\eta_{f, g}\right)=g^{R}\left(\eta_{f, g}\right)=1,
$$

which，together with $\eta_{f, g}=\xi_{f, g}$ ，implies that

$$
(f \text { ↔ } g)\left(\eta_{f, g}\right)=1 \text {. }
$$

Thus，$f$ 新 $g$ is normal．

Remark 1．（i）Proposition 4.1 shows that the binary operation is closed on $\mathbf{L}$ ，i．e．， $\boldsymbol{*}\left(\mathbf{L}^{2}\right) \subset \mathbf{L}$ ．
（ii）From the proof of Proposition 4．1，it follows that，for $f, g \in \mathbf{L}$ ，if $\eta_{f, g}=\xi_{f, g}$ ，then $(f \text { 出 } g)^{L_{\mathrm{w}}}\left(\xi_{f, g}\right)=1$ or $(f$ ฬ $g)\left(\xi_{f, g}\right)=1$ ．

Proposition 4．2．For $f, g \in \mathbf{L} \backslash\left\{\mathbf{1}_{\{1\}}\right\}$ ，

$$
\begin{align*}
(f \text { 灾 } g)^{L}(t) & = \begin{cases}f^{L}(t) \vee g^{L}(t), & t \in\left[0, \eta_{f, g}\right), \\
1, & t \in\left[\eta_{f, g}, 1\right],\end{cases}  \tag{4.2}\\
(f \star g)^{R}(t) & = \begin{cases}1, & t \in\left[0, \xi_{f, g}\right), \\
f^{R}\left(\xi_{f, g}\right) \wedge g^{R}\left(\xi_{f, g}\right), & t=\xi_{f, g}, \\
0, & t \in\left(\xi_{f, g}, 1\right] .\end{cases} \tag{4.3}
\end{align*}
$$

Proof．（1）If $\eta_{f, g}<\xi_{f, g}$ ，since $f^{L}(t) \vee g^{L}(t)$ is increasing，（4．1）evidently implies（4．2）and（4．3）．
（2）If $\eta_{f, g}=\xi_{f, g}$ ，the result follows from Remark 1 （ii）and（4．1）．
Theorem 4．1．＊satisfies（O1）．
Proof．For $f, g \in \mathbf{L}$ ，
（A．1）if $f=\mathbf{1}_{\{1\}}$ or $g=\mathbf{1}_{\{1\}}$ ，then clearly $f \star y=g$ 出 $f$ ；
（A．2）if $f \neq \mathbf{1}_{\{1\}}$ and $g \neq \mathbf{1}_{\{1\}}$ ，then

$$
(f \text { ※ } g)(t)= \begin{cases}f^{L}(t) \vee g^{L}(t), & t \in\left[0, \eta_{f, g}\right), \\ 1, & t \in\left[\eta_{f, g}, \xi_{f, g}\right), \\ f^{R}\left(\xi_{f, g}\right) \wedge g^{R}\left(\xi_{f, g}\right), & t=\xi_{f, g}, \\ 0, & t \in\left(\xi_{f, g}, 1\right],\end{cases}
$$

and the commutativity of $\boldsymbol{凶}$ follows from the commutativity of $\vee$ and $\wedge$ ．

Lemma 4．1．For $f, g \in \mathbf{L} \backslash\left\{\mathbf{1}_{\{1\}}\right\}$ ，$f$ 肉 $g \neq \mathbf{1}_{\{1\}}$ ．
Proof．Suppose on the contrary that $f$ 同 $g=\mathbf{1}_{\{1\}}$ ．Then，$\eta_{f, g}=\xi_{f, g}=1$ and $f^{L}(t) \vee g^{L}(t)=0$ for $t \in[0,1)$ ．Since $f^{L} \geq f$ and $g^{L} \geq g$ ，we have $f(t)=g(t)=0$ for $t \in[0,1)$ ．This，together with $f, g \in \mathbf{L}$ ， implies that

$$
f=g=\mathbf{1}_{\{1\}},
$$

which is a contradiction．

Theorem 4．2．＊satisfies（O2）．
Proof．For $f, g, h \in \mathbf{L}$ ，
（B．1）if one of $f, g$ ，and $h$ is equal to $\mathbf{1}_{\{1\}}$ ，then it is easy to verify that $(f$ 凶 $g)$ 国 $h=f$ 出 $(g$ 灾 $h)$ ；
（B．2）if none of $f, g$ ，and $h$ are equal to $\mathbf{1}_{\{1\}}$ ，then

$$
(f \rightsquigarrow g)(t)= \begin{cases}f^{L}(t) \vee g^{L}(t), & t \in\left[0, \eta_{f, g}\right), \\ 1, & t \in\left[\eta_{f, g}, \xi_{f, g}\right), \\ f^{R}\left(\xi_{f, g}\right) \wedge g^{R}\left(\xi_{f, g}\right), & t=\xi_{f, g}, \\ 0, & t \in\left(\xi_{f, g}, 1\right],\end{cases}
$$

and

$$
(g \text { 出 } h)(t)= \begin{cases}g^{L}(t) \vee h^{L}(t), & t \in\left[0, \eta_{g, h}\right), \\ 1, & t \in\left[\eta_{g, h}, \xi_{g, h}\right), \\ g^{R}\left(\xi_{g, h}\right) \wedge h^{R}\left(\xi_{g, h}\right), & t=\xi_{g, h}, \\ 0, & t \in\left(\xi_{g, h}, 1\right] .\end{cases}
$$

By Lemma 4．1，we have $f \star g \neq \mathbf{1}_{\{1\}}$ and $g$ 出 $h \neq \mathbf{1}_{\{1\}}$ ．
Proposition 4.2 implies that

$$
\begin{aligned}
& (f \text { 凶 } g)^{L}(t)= \begin{cases}f^{L}(t) \vee g^{L}(t), & t \in\left[0, \eta_{f, g}\right), \\
1, & t \in\left[\eta_{f, g}, 1\right],\end{cases} \\
& (f \star g)^{R}(t)= \begin{cases}1, & t \in\left[0, \xi_{f, g}\right), \\
f^{R}\left(\xi_{f, g}\right) \wedge g^{R}\left(\xi_{f, g}\right), & t=\xi_{f, g}, \\
0, & t \in\left(\xi_{f, g}, 1\right],\end{cases}
\end{aligned}
$$

and

$$
\begin{aligned}
(g \text { 出 } h)^{L}(t) & = \begin{cases}g^{L}(t) \vee h^{L}(t), & t \in\left[0, \eta_{g, h}\right), \\
1, & t \in\left[\eta_{g, h}, 1\right],\end{cases} \\
(g \text { * } h)^{R}(t) & = \begin{cases}1, & t \in\left[0, \xi_{g, h}\right), \\
g^{R}\left(\xi_{g, h}\right) \wedge h^{R}\left(\xi_{g, h}\right), & t=\xi_{g, h}, \\
0, & t \in\left(\xi_{g, h}, 1\right] .\end{cases}
\end{aligned}
$$

Since $f$ ※ $g, g$ 出 $h, f, h \in \mathbf{L} \backslash\left\{\mathbf{1}_{\{1\}}\right\}$ ，we have

$$
\begin{aligned}
& ((f \text { 会 } g) \text { 会 } h)(t)
\end{aligned}
$$

and

$$
\begin{aligned}
& (f \text { 出 }(g \text { 出 } h))(t)
\end{aligned}
$$

Clearly，

$$
\begin{aligned}
\eta: & =\eta_{f \text { か } g, h}=\eta_{f, g \text { 灰 } h} \\
= & \inf \left\{x \in I \mid f^{L}(x)=1\right\} \\
& \wedge \inf \left\{x \in I \mid g^{L}(x)=1\right\} \\
& \wedge \inf \left\{x \in I \mid h^{L}(x)=1\right\} \\
= & \eta_{f, g} \wedge \eta_{g, h},
\end{aligned}
$$

and

$$
\begin{aligned}
\xi: & =\xi_{f \bowtie g, h}=\xi_{f, g \bowtie h} \\
= & \sup \left\{x \in I \mid f^{R}(x)=1\right\} \\
& \wedge \sup \left\{x \in I \mid g^{R}(x)=1\right\} \\
& \wedge \sup \left\{x \in I \mid h^{R}(x)=1\right\} \\
= & \xi_{f, g} \wedge \xi_{g, h} .
\end{aligned}
$$

Thus，for $t \in[0, \eta)$ ，

$$
((f \text { 实 } g) \text { 安 } h)(t)=\left(f^{L}(t) \vee g^{L}(t)\right) \vee h^{L}(t),
$$

and

$$
(f \text { 灾 }(g \text { 出 } h))(t)=f^{L}(t) \vee\left(g^{L}(t) \vee h^{L}(t)\right),
$$

and the associativity holds．Clearly，for $t \in[\eta, \xi) \cup(\xi, 1]$ ，

$$
((f \text { 内 } g) \text { 国 } h)(t)=(f \text { 内 }(g \text { 灾 } h))(t) \text {. }
$$

To finish the proof we have to show that $((f$ 出 $g)$ 出 $h)(\xi)=(f$ 出 $(g$ 灾 $h))(\xi)$ ．
Consider the following three cases：
（B．2．1）If $\xi_{f, g}=\xi_{g, h}$ ，then $\xi=\xi_{f, g}=\xi_{g, h}$ ，implying that

$$
(f \text { ゅ } g)^{R}(\xi)=f^{R}(\xi) \wedge g^{R}(\xi),
$$

and

$$
(g \text { 安 } h)^{R}(\xi)=g^{R}(\xi) \wedge h^{R}(\xi) \text {. }
$$

Then，（4．4）and（4．5）yield

$$
((f \text { ※ } g) \text { ※ } h)(\xi)=f^{R}(\xi) \wedge g^{R}(\xi) \wedge h^{R}(\xi)=(f \text { ※ }(g \text { 灾 } h))(\xi) \text {. }
$$

（B．2．2）If $\xi_{f, g}<\xi_{g, h}$ ，then $\xi_{f, g}=\sup \left\{x \in I \mid f^{R}(x)=1\right\}<\sup \left\{x \in I \mid g^{R}(x)=1\right\}($ as $\sup \{x \in I \mid$ $\left.f^{R}(x)=1\right\} \geq \sup \left\{x \in I \mid g^{R}(x)=1\right\}$ implies that $\xi_{f, g}=\sup \left\{x \in I \mid g^{R}(x)=1\right\} \geq \sup \left\{x \in I \mid g^{R}(x)=\right.$ $\left.1\} \wedge \sup \left\{x \in I \mid h^{R}(x)=1\right\}=\xi_{g, h}\right)$ ，which means that there exists $\hat{x}>\xi_{f, g}$ such that $g^{R}(\hat{x})=1$ ．Thus，

$$
g^{R}\left(\xi_{f, g}\right) \geq g^{R}(\hat{x})=1
$$

Therefore，since $\xi=\xi_{f, g} \wedge \xi_{g, h}=\xi_{f, g}$ ，we get

$$
\begin{equation*}
(f \text { 灾 } g)^{R}(\xi)=(f \text { 安 } g)^{R}\left(\xi_{f, g}\right)=f^{R}\left(\xi_{f, g}\right) \wedge g^{R}\left(\xi_{f, g}\right)=f^{R}\left(\xi_{f, g}\right) \text {. } \tag{4.6}
\end{equation*}
$$

From $\xi_{f, g}<\xi_{g, h} \leq \sup \left\{x \in I \mid h^{R}(x)=1\right\}$ ，it follows that there exists $x^{\prime}>\xi_{f, g}$ such that $h^{R}\left(x^{\prime}\right)=1$ ， implying that

$$
\begin{equation*}
h^{R}(\xi)=h^{R}\left(\xi_{f, g}\right) \geq h^{R}\left(x^{\prime}\right)=1 \tag{4.7}
\end{equation*}
$$

（4．7）together with（4．4）and（4．6）implies that

$$
((f \text { ฬ } g) \text { ※ } h)(\xi)=f^{R}(\xi) \text {. }
$$

Since $\xi=\xi_{f, g}<\xi_{g, h}$ ，then we have $(g \text { 宛 } h)^{R}(\xi)=1$ ，which together with（4．5）implies that

$$
(f \text { ๗ }(g \text { ※ } h))(\xi)=f^{R}(\xi) \wedge(g \text { 出 } h)^{R}(\xi)=f^{R}(\xi) \text {. }
$$

Therefore，

$$
((f \text { 凶 } g) \text { 灾 } h)(\xi)=(f \text { ※ }(g \text { 安 } h))(\xi)=f^{R}(\xi) \text {. }
$$

（B．2．3）If $\xi_{f, g}>\xi_{g, h}$ ，then similarly as in the previous case we can show that

$$
((f \text { 实 } g) \text { 安 } h)(\xi)=(f \text { 安 }(g \text { 实 } h))(\xi)=h^{R}(\xi) \text {. }
$$

Summing up（B．2．1）－（B．2．3），we have

$$
((f \text { ฬ } g) \text { 出 } h)(\xi)=(f \text { ※ }(g \text { ※ } h))(\xi) \text {. }
$$

Theorem 4．3．＊satisfies（O3）．
Proof．This follows directly from（1）and（2）of Definition 4．1．
Theorem 4．4．satisfies（O4）．

Proof．We have to show that，for $f, g, h \in \mathbf{L}$ with $f \sqsubseteq g, f$ w $h \sqsubseteq g$ w $h$ ．There are the following possible cases：
（D．1）if $h=\mathbf{1}_{\{1\}}$ ，then $f$ 出 $h=f \sqsubseteq g=g$ 出 $h$ ；
（D．2）if $f=\mathbf{1}_{\{1\}}$ ，then $g=\mathbf{1}_{\{1\}}($ as $f \sqsubseteq g)$ ，implying that $f$ 灾 $h=h \sqsubseteq h=g$ 出 $h$ ；
（D．3）if $g=\mathbf{1}_{\{1\}}$ and $f \neq \mathbf{1}_{\{1\}} \neq h$ ，then

$$
(f \text { 凶 } h)(t)= \begin{cases}f^{L}(t) \vee h^{L}(t), & t \in\left[0, \eta_{f, h}\right) \\ 1, & t \in\left[\eta_{f, h}, \xi_{f, h}\right), \\ f^{R}\left(\xi_{f, h}\right) \wedge h^{R}\left(\xi_{f, h}\right), & t=\xi_{f, h}, \\ 0, & t \in\left(\xi_{f, h}, 1\right]\end{cases}
$$

By Proposition 4．2，one has

$$
(f \text { ※ } h)^{L}(t)= \begin{cases}f^{L}(t) \vee h^{L}(t), & t \in\left[0, \eta_{f, h}\right),  \tag{4.8}\\ 1, & t \in\left[\eta_{f, h}, 1\right],\end{cases}
$$

and

$$
(f \text { 凶 } h)^{R}(t)= \begin{cases}1, & t \in\left[0, \xi_{f, h}\right),  \tag{4.9}\\ f^{R}\left(\xi_{f, h}\right) \wedge h^{R}\left(\xi_{f, h}\right), & t=\xi_{f, h}, \\ 0, & t \in\left(\xi_{f, h}, 1\right]\end{cases}
$$

Clearly，

$$
(f \text { 安 } h)^{L} \geq h^{L},
$$

and

$$
\begin{equation*}
(f \text { 內 } h)^{R}\left(\xi_{f, h}\right) \leq h^{R}\left(\xi_{f, h}\right) . \tag{4.10}
\end{equation*}
$$

Additionally，for $t<\xi_{f, h}$ ，it follows from $\xi_{f, h} \leq \sup \left\{x \in I \mid h^{R}(x)=1\right\}$ that there exists $t<\hat{x} \leq \xi$ such that $h^{R}(\hat{x})=1$ ．Thus，$h^{R}(t) \geq h^{R}(\hat{x})=1$ since $h^{R}$ is decreasing，implying that，for $t \in[0, \xi)$ ，

$$
\begin{equation*}
(f \aleph h)^{R}(t) \leq 1=h^{R}(t) . \tag{4.11}
\end{equation*}
$$

（4．11）together with（4．10）and（4．9）implies that

$$
(f \text { 凶 } h)^{R} \leq h^{R} \text {. }
$$

By Theorem 2.1 there is

$$
f \text { 安 } h \sqsubseteq h=g \text { 出 } h \text {. }
$$

（D．4）If $f \neq \mathbf{1}_{\{1\}}, g \neq \mathbf{1}_{\{1\}}$ ，and $h \neq \mathbf{1}_{\{1\}}$ ，then from the definition of $\boldsymbol{*}$ ，it follows that

$$
(f \text { 凶 } h)(t)= \begin{cases}f^{L}(t) \vee h^{L}(t), & t \in\left[0, \eta_{f, h}\right), \\ 1, & t \in\left[\eta_{f, h}, \eta_{f, h}\right), \\ f^{R}\left(\eta_{f, h}\right) \wedge h^{R}\left(\eta_{f, h}\right), & t=\eta_{f, h}, \\ 0, & t \in\left(\eta_{f, h}, 1\right],\end{cases}
$$

and

$$
(g \text { ฬ } h)(t)= \begin{cases}g^{L}(t) \vee h^{L}(t), & t \in\left[0, \eta_{g, h}\right), \\ 1, & t \in\left[\eta_{g, h}, \eta_{g, h}\right), \\ g^{R}\left(\eta_{g, h}\right) \wedge h^{R}\left(\eta_{g, h}\right), & t=\eta_{g, h}, \\ 0, & t \in\left(\eta_{g, h}, 1\right] .\end{cases}
$$

From $f \sqsubseteq g$ and Theorem 2．1，it follows that $f^{L} \geq g^{L}$ and $f^{R} \leq g^{R}$ ．Therefore，

$$
\left\{x \in I \mid g^{L}(x)=1\right\} \subseteq\left\{x \in I \mid f^{L}(x)=1\right\}
$$

and

$$
\left\{x \in I \mid f^{R}(x)=1\right\} \subseteq\left\{x \in I \mid g^{R}(x)=1\right\}
$$

implying that

$$
\inf \left\{x \in I \mid g^{L}(x)=1\right\} \geq \inf \left\{x \in I \mid f^{L}(x)=1\right\}
$$

and

$$
\sup \left\{x \in I \mid f^{R}(x)=1\right\} \leq \sup \left\{x \in I \mid g^{R}(x)=1\right\}
$$

Thus，

$$
\eta_{f, h} \leq \eta_{g, h} \text { and } \eta_{f, h} \leq \eta_{g, h}
$$

Further，by Proposition 4.2 there is

$$
\begin{aligned}
(f \text { ฬ } h)^{L}(t) & = \begin{cases}f^{L}(t) \vee h^{L}(t), & t \in\left[0, \eta_{f, h}\right), \\
1, & t \in\left[\eta_{f, h}, 1\right],\end{cases} \\
(f \text { ऊ } h)^{R}(t) & = \begin{cases}1, & t \in\left[0, \eta_{f, h}\right), \\
f^{R}\left(\eta_{f, h}\right) \wedge h^{R}\left(\eta_{f, h}\right), & t=\eta_{f, h}, \\
0, & t \in\left(\eta_{f, h}, 1\right]\end{cases}
\end{aligned}
$$

and

$$
\begin{aligned}
& (g \text { 出 } h)^{L}(t)= \begin{cases}g^{L}(t) \vee h^{L}(t), & t \in\left[0, \eta_{g, h}\right), \\
1, & t \in\left[\eta_{g, h}, 1\right],\end{cases} \\
& (g \text { 出 } h)^{R}(t)= \begin{cases}1, & t \in\left[0, \eta_{g, h}\right), \\
g^{R}\left(\eta_{g, h}\right) \wedge h^{R}\left(\eta_{g, h}\right), & t=\eta_{g, h}, \\
0, & t \in\left(\eta_{g, h}, 1\right] .\end{cases}
\end{aligned}
$$

From $f^{R} \leq g^{R}$ ，it follows that

$$
\begin{equation*}
(f \text { 凶 } h)^{R} \leq(g \text { 凶 } h)^{R} \text {. } \tag{4.12}
\end{equation*}
$$

From $f^{L} \geq g^{L}$ ，it follows that，for $t \in\left[0, \eta_{f, h}\right)$ ，

$$
(f \text { 灾 } h)^{L}(t) \geq(g \text { 灾 } h)^{L}(t) .
$$

It is clear that，for $t \in\left[\eta_{f, h}, 1\right]$ ，

$$
(f \text { 出 } h)^{L}(t)=1 \geq(g \text { ※ } h)^{L}(t) .
$$

Thus，

$$
\begin{equation*}
(f \text { 出 } h)^{L} \geq(g \text { 灾 } h)^{L} \text {. } \tag{4.13}
\end{equation*}
$$

（4．13）together with（4．12）and Theorem 2.1 implies that

$$
f \text { 出 } h \sqsubseteq g \text { 図 } h .
$$

Theorem 4．5．＊satisfies（O5）．
Proof．Assume $0 \leq a \leq b \leq 1$ ．Then we can distinguish the following cases：
（E．1）If $a=1$ ，then $\mathbf{1}_{[0,1]} \mathbf{1}_{[a, b]}=\mathbf{1}_{[0,1]} \mathbf{1}_{\{1\}}=\mathbf{1}_{[0,1]}$ ；
（E．2）If $a<1$ ，then

$$
\begin{gathered}
\mathbf{1}_{[0,1]}^{L} \equiv 1, \\
\mathbf{1}_{[0,1]}^{R} \equiv 1, \\
\mathbf{1}_{[a, b]}^{L}(x)= \begin{cases}0, & x \in[0, a), \\
1, & x \in[a, 1],\end{cases}
\end{gathered}
$$

and

$$
\mathbf{1}_{[a, b]}^{R}(x)= \begin{cases}1, & x \in[0, b] \\ 0, & x \in(b, 1]\end{cases}
$$

which implies that $\inf \left\{x \in I \mid \mathbf{1}_{[0,1]}^{L}(x)=1\right\} \wedge \inf \left\{x \in I \mid \mathbf{1}_{[a, b]}^{L}(x)=1\right\}=0$ and $\sup \left\{x \in I \mid \mathbf{1}_{[0,1]}^{R}(x)=\right.$ $1\} \wedge \sup \left\{x \in I \mid \mathbf{1}_{[a, b]}^{R}(x)=1\right\}=b$ ．

Consider the following two subcases：
(E.2.1) If $b=0$, we have

$$
\left(\mathbf{1}_{[0,1]} \mathbf{1}_{[a, b]}\right)(t)= \begin{cases}\mathbf{1}_{[0,1]}^{L}(t) \vee \mathbf{1}_{[a, b]}^{L}(t), & t \in[0,0) \\ 1, & t=0, \\ 0, & t \in(0,1]\end{cases}
$$

implying that $\mathbf{1}_{[0,1]} \boldsymbol{\aleph} \mathbf{1}_{[a, b]}=\mathbf{1}_{[0,0]}=\mathbf{1}_{[0, b]}$ as $[0,0)=\emptyset$.
(E.2.2) If $b>0$, we have

$$
\left(\mathbf{1}_{[0,1]} \mathbf{1}_{[a, b]}\right)(t)= \begin{cases}\mathbf{1}_{[0,1]}^{L}(t) \vee \mathbf{1}_{[a, b]}^{L}(t), & t \in[0,0),  \tag{4.14}\\ 1, & t \in[0, b), \\ \mathbf{1}_{[0,1]}^{R}(b) \wedge \mathbf{1}_{[a, b]}^{R}(b), & t=b, \\ 0, & t \in(b, 1] .\end{cases}
$$

(4.14) together with $\mathbf{1}_{[0,1]}^{R}(b) \wedge \mathbf{1}_{[a, b]}^{R}(b)=1$ implies that $\mathbf{1}_{[0,1]} \boldsymbol{w}_{[a, b]}=\mathbf{1}_{[0, b]}$.

Theorem 4.6. For $x_{1}, x_{2} \in I, \mathbf{1}_{\left\{x_{1}\right\}} \boldsymbol{\wedge}_{\left\{x_{2}\right\}}=\mathbf{1}_{\left\{x_{1} \wedge x_{2}\right\}}$. In particular, * satisfies (O6).
Proof. Clearly, $\mathbf{1}_{\left\{x_{1}\right\}} \boldsymbol{\omega} \mathbf{1}_{\left\{x_{2}\right\}}=\mathbf{1}_{\left\{x_{1}\right\}}$ when $x_{2}=1$ by Theorem 4.3.
Moreover, for $x \in I$,

$$
\mathbf{1}_{\{x\}}^{L}(t)= \begin{cases}0, & t \in[0, x) \\ 1, & t \in[x, 1]\end{cases}
$$

and

$$
\mathbf{1}_{\{x\}}^{R}(t)= \begin{cases}1, & t \in[0, x] \\ 0, & t \in(x, 1]\end{cases}
$$

Then, for $0 \leq x_{1} \leq x_{2}<1, \inf \left\{x \in I \mid \mathbf{1}_{\left\{x_{1}\right\}}^{L}(x)=1\right\} \wedge \inf \left\{x \in I \mid \mathbf{1}_{\left\{x_{2}\right\}}^{L}(x)=1\right\}=x_{1}$ and $\sup \left\{x \in I \mid \mathbf{1}_{\left\{x_{1}\right\}}^{R}(x)=1\right\} \wedge \sup \left\{x \in I \mid \mathbf{1}_{\left\{x_{2}\right\}}^{R}(x)=1\right\}=x_{1}$. Clearly, $\left(\mathbf{1}_{\left\{x_{1}\right\}} \boldsymbol{\wedge}_{\boldsymbol{*}} \mathbf{1}_{\left\{x_{2}\right\}}\right)^{L_{\mathrm{w}}}\left(x_{1}\right)=0$. From Remark 1 (ii), it follows that

$$
\left(\mathbf{1}_{\left\{x_{1}\right\}} \mathbf{1}_{\left\{x_{2}\right\}}\right)(t)= \begin{cases}0, & t \in\left[0, x_{1}\right) \\ 1, & t=x_{1}, \\ 0, & t \in\left(x_{1}, 1\right]\end{cases}
$$

which, together with the commutativity of $\boldsymbol{*}$, implies that

$$
\mathbf{1}_{\left\{x_{1}\right\}} \boldsymbol{\mathbf { 1 } _ { \{ x _ { 2 } \} }}=\mathbf{1}_{\left\{x_{2}\right\}} \boldsymbol{*} \mathbf{1}_{\left\{x_{1}\right\}}=\mathbf{1}_{\left\{x_{1}\right\}} \in \mathbf{J} .
$$

Theorem 4.7. For $\left[a_{1}, b_{1}\right]$, $\left[a_{2}, b_{2}\right] \subset I, \mathbf{1}_{\left[a_{1}, b_{1}\right]} \oiint \mathbf{1}_{\left[a_{2}, b_{2}\right]}=\mathbf{1}_{\left[a_{1} \wedge a_{2}, b_{1} \wedge b_{2}\right]}$. In particular, satisfies (O7). Proof. Clearly, $\mathbf{1}_{\left[a_{1}, b_{1}\right]} \mathbf{1}_{\left[a_{2}, b_{2}\right]}=\mathbf{1}_{\left[a_{2}, b_{2}\right]} \boldsymbol{\sim} \mathbf{1}_{\left[a_{1}, b_{1}\right]} \in \mathbf{K}$ when $\left[a_{1}, b_{1}\right]=\{1\}$ or $\left[a_{2}, b_{2}\right]=\{1\}$ by Theorem 4.3.

Moreover, for $0 \leq a \leq b \leq 1$,

$$
\mathbf{1}_{[a, b]}^{L}(t)= \begin{cases}0, & t \in[0, a) \\ 1, & t \in[a, 1]\end{cases}
$$

and

$$
\mathbf{1}_{[a, b]}^{R}(t)= \begin{cases}1, & t \in[0, b] \\ 0, & t \in(b, 1]\end{cases}
$$

Then, for $\left[a_{1}, b_{1}\right],\left[a_{2}, b_{2}\right] \subset I$ with $\left[a_{1}, b_{1}\right] \neq\{1\}$ and $\left[a_{2}, b_{2}\right] \neq\{1\}$, we have $\inf \left\{x \in I \mid \mathbf{1}_{\left[a_{1}, b_{1}\right]}^{L}(x)=\right.$ $1\} \wedge \inf \left\{x \in I \mid \mathbf{1}_{\left[a_{2}, b_{2}\right]}^{L}(x)=1\right\}=a_{1} \wedge a_{2}$ and $\sup \left\{x \in I \mid \mathbf{1}_{\left[a_{1}, b_{1}\right]}^{R}(x)=1\right\} \wedge \sup \left\{x \in I \mid \mathbf{1}_{\left[a_{2}, b_{2}\right]}^{R}(x)=1\right\}=$
$b_{1} \wedge b_{2}$ ．From（4．1），it follows that

$$
\begin{aligned}
& \left(\mathbf{1}_{\left[a_{1}, b_{1}\right]} \mathbf{1}_{\left[a_{2}, b_{2}\right]}\right)(t) \\
= & \begin{cases}\mathbf{1}_{\left[a_{1}, b_{1}\right]}^{L}(t) \vee \mathbf{1}_{\left[a_{2}, b_{2}\right]}^{L}(t), & t \in\left[0, a_{1} \wedge a_{2}\right), \\
1, & t \in\left[a_{1} \wedge a_{2}, b_{1} \wedge b_{2}\right), \\
\mathbf{1}_{\left[a_{1}, b_{1}\right]}^{R}(t) \wedge \mathbf{1}_{\left[a_{2}, b_{2}\right]}^{R}(t), & t=b_{1} \wedge b_{2}, \\
0, & t \in\left(b_{1} \wedge b_{2}, 1\right],\end{cases} \\
= & \begin{cases}0, & t \in\left[0, a_{1} \wedge a_{2}\right), \\
1, & t \in\left[a_{1} \wedge a_{2}, b_{1} \wedge b_{2}\right], \\
0, & t \in\left(b_{1} \wedge b_{2}, 1\right],\end{cases}
\end{aligned}
$$

which，together with the commutativity of implies that

Theorems 4．1－4．7 imply the following result．
Theorem 4．8．The binary operation＊is a $t_{r}$－norm on $\mathbf{L}$ ．

## 5．$\leftrightarrow$ cannot be obtained by $\curlywedge$ and $\curlyvee$

This section shows that the $t_{r}$－norm $\boldsymbol{*}$ constructed in Section 4 cannot be obtained by operations $\boldsymbol{\lambda}$ or $\curlyvee$ ．

The following theorem provides a sufficient condition ensuring that $*$ is a $t$－norm on $I$ ．
Theorem 5．1．［13，Theorem 21］Let $\Delta$ be a continuous $t$－norm on $I$ and $*$ be a binary operation on $I$ ． If $\curlywedge$ is a $t$－norm on $\mathbf{L}$ ，then $*$ is a $t$－norm．

Theorem 5．2．For any binary operation $*$ on $I$ and any $t$－norm $\Delta$ on $I$ ，there exist $f, g \in \mathbf{L}$ such that $f$ 㐫 $g \neq f \curlywedge g$ ，i．e．， cannot be obtained by $\curlywedge$ ．

Proof．Suppose，on the contrary，that there exist a binary operation $*$ on $I$ and a $t$－norm $\triangle$ on $I$ such that，for any $f, g \in \mathbf{L}$ ，one has $f$ 安 $g=f \curlywedge g$ ．

First we will show that $\Delta=\wedge$ ．
For $x_{1}, x_{2} \in I$ ，Theorem 4.6 gives

$$
\mathbf{1}_{\left\{x_{1}\right\}} \boldsymbol{*} \mathbf{1}_{\left\{x_{2}\right\}}=\mathbf{1}_{\left\{x_{1} \wedge x_{2}\right\}} .
$$

Further，Theorem 4.8 and Proposition 3.5 yield

$$
\mathbf{1}_{\left\{x_{1}\right\}} \mathbf{1}_{\left\{x_{2}\right\}}=\mathbf{1}_{\left\{x_{1}\right\}} \curlywedge \mathbf{1}_{\left\{x_{2}\right\}}=\mathbf{1}_{\left\{x_{1} \Delta x_{2}\right\}}
$$

Thus，

$$
x_{1} \wedge x_{2}=x_{1} \Delta x_{2} \text { for all } x_{1}, x_{2} \in I, \text { i.e., } \Delta=\wedge
$$

Clearly，$\Delta=\wedge$ is a continuous $t$－norm on $I$ ．From Theorem 4.8 and Theorem 5．1，it follows that $*$ is a $t$－norm on $I$ and

$$
\begin{equation*}
(f \text { 出 } g)(x)=\sup \{f(y) * g(z) \mid y \wedge z=x\} \text {. } \tag{5.1}
\end{equation*}
$$

Choose a function $\psi \in \mathbf{L}$ by

$$
\psi(x)= \begin{cases}1, & x \in[0,0.75] \\ 0.5, & x \in(0.75,1]\end{cases}
$$

Figure 1: The function $\psi$.

Then,

$$
\begin{gathered}
\psi^{L}(x) \equiv 1, \\
\psi^{R}(x)= \begin{cases}1, & x \in[0,0.75], \\
0.5, & x \in(0.75,1],\end{cases} \\
\mathbf{1}_{\{0.8\}}^{L}(x)= \begin{cases}0, & x \in[0,0.8), \\
1, & x \in[0.8,1],\end{cases}
\end{gathered}
$$

and

$$
\mathbf{1}_{\{0.8\}}^{R}(x)= \begin{cases}1, & x \in[0,0.8] \\ 0, & x \in(0.8,1]\end{cases}
$$

From (4.1), we have

$$
(\psi \text { 片 } \mathbb{1 0 . 8 \}})(t)= \begin{cases}1, & x \in[0,0.75] \\ 0, & x \in(0.75,1] .\end{cases}
$$

In particular,

$$
\begin{equation*}
\left(\psi \boldsymbol{\aleph} \mathbf{1}_{\{0.8\}}\right)(0.8)=0 . \tag{5.2}
\end{equation*}
$$

(5.2) together with (5.1) and the fact that $*$ is a $t$-norm implies that

$$
\begin{aligned}
0 & =\left(\psi \boldsymbol{1}_{\{0.8\}}\right)(0.8) \\
& =\sup \left\{\psi(y) * \mathbf{1}_{\{0.8\}}(z) \mid y \wedge z=0.8\right\} \\
& \geq \psi(0.8) * \mathbf{1}_{\{0.8\}}(0.8)=0.5 * 1=0.5,
\end{aligned}
$$

which is a contradiction.
Theorem 5.3. Let * be a binary operation on $I, \Delta$ be at-norm on $I$, and $\nabla$ be $a t$-conorm on $I$. Then, we have
(1) the binary operation $\curlyvee$ defined by (2.2) is not a $t$-norm on $\mathbf{L}$;
(2) the binary operation $\lambda$ defined by (2.1) is not a t-conorm on $\mathbf{L}$.

Proof. (1) Suppose on the contrary that $\curlyvee$ is a $t$-norm on $\mathbf{L}$. Then, we have $f \curlyvee \mathbf{1}_{\{1\}}=f$ for any $f \in \mathbf{L}$ as $\mathbf{1}_{\{1\}}$ is the neutral element of $\curlyvee$. For $0 \leq \zeta \leq 1$, take $f_{\zeta}: I \rightarrow I$ as $f_{\zeta}(x)=(1-\zeta) x+\zeta$. Clearly, $f_{\zeta} \in \mathbf{L}$, which together with Lemma 3.1 implies that

$$
\begin{equation*}
\zeta=f_{\zeta}(0)=\left(f_{\zeta} \curlyvee \mathbf{1}_{\{1\}}\right)(0)=f_{\zeta}(0) * \mathbf{1}_{\{1\}}(0)=\zeta * 0 \tag{5.3}
\end{equation*}
$$

Similarly, we have $0 * \zeta=\zeta$. Moreover, for $g \in \mathbf{L}$ with $g(x)=1-x(x \in I)$, we have

$$
\begin{aligned}
0.5 & =g(0.5)=\left(g \curlyvee \mathbf{1}_{\{1\}}\right)(0.5) \\
& =\sup \left\{g(y) * \mathbf{1}_{\{1\}}(z) \mid y \nabla z=0.5\right\} \\
& \geq g(0) * \mathbf{1}_{\{1\}}(0.5)(\text { as } 0 \nabla 0.5=0.5) \\
& =g(0) * 0=1(\text { by }(5.3)),
\end{aligned}
$$

which is a contradiction.
(2) Similarly as in the previous case we can prove that $\lambda$ is not a $t$-conorm on $\mathbf{L}$.

Theorems 4.8 and 5.3 imply the following result.
Corollary 5.1. The $t_{r}$-norm cannot be obtained by $\curlyvee$.

Remark 2. Theorems 4.8 and 5.2 , and Corollary 5.1 show that there exists a $t_{r}$-norm $\boldsymbol{*}$ on $\mathbf{L}$, which cannot be obtained using the formulas defining the operations $\lambda$ and $\gamma$. This gives a positive answer to Question 2.

## 6. A $\boldsymbol{t}_{r}$-conorm that is not obtained by $\curlywedge$ and $\curlyvee$

This section introduces the dual operation for every binary operation on $\mathbf{M}$ and proves the duality between $t_{r}$-norm and $t_{r}$-conorm, also between $\lambda$ and $\curlyvee$. As an application, a $t_{r}$-conorm on $\mathbf{L}$, which cannot be obtained by $\lambda$ and $\curlyvee$, is obtained.

Definition 6.1. Let $\diamond$ be a binary operation on M. Define the dual operation $\diamond^{\complement}$ of $\diamond$ as follows: for $f, g \in \mathbf{M}$,

$$
f \diamond^{\complement} g=\neg((\neg f) \diamond(\neg g)) .
$$

Proposition 6.1. For a binary operation $\diamond$ on $\mathbf{M},\left(\diamond^{\complement}\right)^{\complement}=\diamond$.
Proof. For $f, g \in \mathbf{M}$, from Definition 6.1, it follows that $f\left(\diamond^{\complement}\right)^{\complement} g=\neg\left((\neg f) \diamond^{\complement}(\neg g)\right)=\neg(\neg(f \diamond g))=$ $f \diamond g$.
Theorem 6.1. Let $\diamond$ be a binary operation on $\mathbf{M}$ such that $\diamond\left(\mathbf{L}^{2}\right) \subset \mathbf{L}$, i.e., $\diamond$ is closed on $\mathbf{L}$. Then, $\left.\diamond\right|_{\mathbf{L}^{2}}$ is a $t_{r}$-norm (resp., t-norm) on $\mathbf{L}$ if and only if $\left.\diamond^{\complement}\right|_{\mathbf{L}^{2}}$ is a $t_{r}$-conorm (resp., $t$-conorm) on $\mathbf{L}$.
Proof. Clearly, $\nabla^{\complement}$ is closed on L. By Proposition 6.1, it suffices to show that $\left.\nabla^{\complement}\right|_{\mathbf{L}^{2}}$ is a $t_{r}$-conorm provided that $\left.\diamond\right|_{\mathbf{L}^{2}}$ is a $t_{r}$-norm.
(i) $\diamond^{\complement}$ satisfies (O1).

For $f, g \in \mathbf{L}$, since $\diamond$ satisfies (O1), we have $f \diamond^{\complement} g=\neg((\neg f) \diamond(\neg g))=\neg((\neg g) \diamond(\neg f))=g \diamond^{\complement} f$.
(ii) $\diamond^{\complement}$ satisfies (O2).

For $f, g, h \in \mathbf{L}$, we get

$$
\left(f \diamond^{\complement} g\right) \diamond^{\complement} h=\neg\left(\left(\neg\left(f \diamond^{\complement} g\right)\right) \diamond(\neg h)\right)=\neg(((\neg f) \diamond(\neg g)) \diamond(\neg h)),
$$

and

$$
f \diamond^{\complement}\left(g \diamond^{\complement} h\right)=\neg\left((\neg f) \diamond\left(\neg\left(g \diamond^{\complement} h\right)\right)\right)=\neg((\neg f) \diamond((\neg g) \diamond(\neg h))),
$$

and the associativity of $\diamond^{\complement}$ follows from the associativity of $\diamond$.
(iii) $\diamond^{\complement}$ satisfies ( $\mathrm{O} 3^{\prime}$ ).

For $f \in \mathbf{L}$, since $\mathbf{1}_{\{1\}}$ is the neutral element of $\diamond$, we have

$$
f \diamond^{\complement} \mathbf{1}_{\{0\}}=\neg\left((\neg f) \diamond\left(\neg \mathbf{1}_{\{0\}}\right)\right)=\neg\left((\neg f) \diamond \mathbf{1}_{\{1\}}\right)=\neg(\neg f)=f .
$$

(iv) $\diamond^{\complement}$ satisfies (O4).

For $f, g, h \in \mathbf{L}$ with $f \sqsubseteq g$, Proposition 2.1 and Theorem 2.1 yield

$$
(\neg f)^{L}(x)=\left(\neg\left(f^{R}\right)\right)(x)=f^{R}(1-x) \leq g^{R}(1-x)=\left(\neg\left(g^{R}\right)\right)(x)=(\neg g)^{L}(x),
$$

and

$$
(\neg f)^{R}(x)=\left(\neg\left(f^{L}\right)\right)(x)=f^{L}(1-x) \geq g^{L}(1-x)=\left(\neg\left(g^{L}\right)\right)(x)=(\neg g)^{R}(x)
$$

Applying again Theorem 2.1, we obtain $\neg g \sqsubseteq \neg f$. Since $\diamond$ satisfies (O4), we have

$$
(\neg g) \diamond(\neg h) \sqsubseteq(\neg f) \diamond(\neg h) .
$$

Thus,

$$
f \diamond^{\complement} h=\neg((\neg f) \diamond(\neg h)) \sqsubseteq \neg((\neg g) \diamond(\neg h))=g \diamond^{\complement} h .
$$

(v) $\diamond^{C}$ satisfies $\left(O 5^{\prime}\right)$.

Since $\diamond$ satisfies (O5), it follows that

$$
\begin{aligned}
& \mathbf{1}_{[0,1]} \diamond^{\complement} \mathbf{1}_{[a, b]} \\
= & \neg\left(\left(\neg \mathbf{1}_{[0,1]}\right) \diamond\left(\neg \mathbf{1}_{[a, b]}\right)\right) \\
= & \neg\left(\mathbf{1}_{[0,1]} \diamond \mathbf{1}_{[1-b, 1-a]}\right) \\
= & \neg \mathbf{1}_{[0,1-a]}=\mathbf{1}_{[a, 1]} .
\end{aligned}
$$

(vi) $\diamond^{\complement}$ satisfies (O6).

For $x_{1}, x_{2} \in I$, since $\diamond$ satisfies $(O 6)$, then there exists $x_{3} \in I$ such that $\mathbf{1}_{\left\{1-x_{1}\right\}} \diamond \mathbf{1}_{\left\{1-x_{2}\right\}}=\mathbf{1}_{\left\{x_{3}\right\}}$, implying that

$$
\begin{aligned}
& \mathbf{1}_{\left\{x_{1}\right\}} \diamond^{\complement} \mathbf{1}_{\left\{x_{2}\right\}} \\
= & \neg\left(\left(\neg \mathbf{1}_{\left\{x_{1}\right\}}\right) \diamond\left(\neg \mathbf{1}_{\left\{x_{2}\right\}}\right)\right) \\
= & \neg\left(\mathbf{1}_{\left\{1-x_{1}\right\}} \diamond \mathbf{1}_{\left\{1-x_{2}\right\}}\right) \\
= & \neg \mathbf{1}_{\left\{x_{3}\right\}}=\mathbf{1}_{\left\{1-x_{3}\right\}} \in \mathbf{J} .
\end{aligned}
$$

(vii) $\diamond^{\complement}$ satisfies (O7).

For $\left[a_{1}, b_{1}\right],\left[a_{2}, b_{2}\right] \subset I$, since $\diamond$ satisfies $(\mathrm{O} 7)$, then there exist $\left[a_{3}, b_{3}\right] \subset I$ such that $\left.\mathbf{1}_{\left[1-b_{1}, 1-a_{1}\right]}\right\rangle \mathbf{1}_{\left[1-b_{2}, 1-a_{2}\right]}=$ $\mathbf{1}_{\left[a_{3}, b_{3}\right]}$, implying that

$$
\begin{aligned}
& \mathbf{1}_{\left[a_{1}, b_{1}\right]} \diamond^{\complement} \mathbf{1}_{\left[a_{2}, b_{2}\right]} \\
= & \neg\left(\left(\neg \mathbf{1}_{\left[a_{1}, b_{1}\right]}\right) \diamond\left(\neg \mathbf{1}_{\left[a_{2}, b_{2}\right]}\right)\right) \\
= & \neg\left(\mathbf{1}_{\left[1-b_{1}, 1-a_{1}\right]} \diamond \mathbf{1}_{\left[1-b_{2}, 1-a_{2}\right]}\right) \\
= & \neg \mathbf{1}_{\left[a_{3}, b_{3}\right]}=\mathbf{1}_{\left[1-b_{3}, 1-a_{3}\right]} \in \mathbf{K} .
\end{aligned}
$$

Theorem 6.2. A binary operation on $\mathbf{M}$ is obtained by $\curlywedge$ if and only if its dual operation is obtained by r.

Proof. By Proposition 6.1, it suffices to prove the necessity. Assume that $\lambda$ is a binary operation satisfying that there exist a binary operation $*$ on $I$ and a $t$-norm $\Delta$ on $I$ such that, for $f, g \in \mathbf{M},(f \curlywedge g)(x)=$ $\sup \{f(y) * g(z) \mid y \Delta z=x\}$. Take $\nabla: I^{2} \rightarrow I$ as $x \nabla y=1-(1-x) \Delta(1-y)$ for any $(x, y) \in I^{2}$. Clearly, $\nabla$ is a $t$-conorm on $I$. For any $f, g \in \mathbf{M}$ and $x \in I$, we have

$$
\begin{aligned}
\left(f \curlywedge^{\complement} g\right)(x) & =(\neg((\neg f) \curlywedge(\neg g)))(x) \\
& =((\neg f) \curlywedge(\neg g))(1-x) \\
& =\sup \{(\neg f)(y) *(\neg g)(z) \mid y \Delta z=1-x\} \\
& =\sup \{f(1-y) * g(1-z) \mid y \Delta z=1-x\} \\
& =\sup \{f(y) * g(z) \mid y \nabla z=x\},
\end{aligned}
$$

implying that $\Lambda^{\complement}$ can be obtained by $\curlyvee$.
Theorems 4.8, 6.1, and 6.2 imply the following result.

(1) $\star$ is a $t_{r}$-conorm on $\mathbf{L}$;
(2) $\star$ cannot be obtained by $\curlywedge$ and $\curlyvee$.

## 7. Conclusion

Employing the functions $f^{L}$ and $f^{R}$, we have constructed in this paper two binary operations $\boldsymbol{m}^{\boldsymbol{*}}$ and $\boldsymbol{*}^{*}=\boldsymbol{*}^{\mathrm{C}}$ on $\mathbf{L}$ (see Definitions 4.1 and 6.1) and proved that is a $t_{r}$-norm on $\mathbf{L}$ and $\boldsymbol{x}^{2}$ is a $t_{r}$-conorm on $\mathbf{L}$. Both $\boldsymbol{*}_{\boldsymbol{*}}$ and cannot be obtained by using the formulas defining the operations $\curlywedge$ and $\curlyvee$. These results give a positive answer to an open problem (see Question 2) in [3]. Combining this result with our main results in [13], the two open problems posed by Hernández et al. [3] are completely solved.
