ABSTRACT. Let $K$ be a global field and let $S$ be a finite set of primes of $K$ containing the archimedean primes. We generalize the duality theorem established in [9] for the Néron $S$-class group of an abelian variety $A$ over $K$ by removing the hypothesis that the Tate-Shafarevich group of $A$ is finite. We also derive an exact sequence that relates the indicated group associated to the Jacobian variety of a proper, smooth and geometrically connected curve $X$ over $K$ to a certain finite subquotient of the Brauer group of $X$.

0. INTRODUCTION

Let $K$ be a global field and let $S$ be a finite set of primes of $K$ containing the archimedean primes. If $v \notin S$, we will write $K_v$ for the completion of $K$ at $v$, $\mathcal{O}_v$ for the ring of integers of $K_v$, $k(v)$ for the corresponding residue field and $K_v^{ur}$ for the maximal unramified extension of $K_v$ inside a fixed separable algebraic closure of $K_v$. Let $A$ be an abelian variety over $K$. The Néron $S$-class group of $A$, introduced in [9], is the finite abelian group

(0.1) \[ C_{A,S} = \operatorname{Coker}\left[ A(K) \xrightarrow{\rho} \bigoplus_{v \notin S} \Phi_v(A)(k(v)) \right], \]

where, for every prime $v \notin S$, $\Phi_v(A)$ is the étale $k(v)$-group scheme of connected components of the Néron model of $A_{K_v}$ over $\mathcal{O}_v$ and the $v$-component of the map $\rho$ is the canonical reduction map $A(K) \to \Phi_v(A)(k(v))$. The first objective of this paper is to extend the duality theorem established in [9] for the group (0.1) by removing from [op.cit.] the hypothesis that the Tate-Shafarevich group $\Sha^1(A)$ of $A$ is finite. To this end, we define in Section 2 a canonical map $\varphi_{A,S} : T\Sha^1(A)_{\text{div}} \to C_{A,S}$, where $T\Sha^1(A)_{\text{div}}$ is the total Tate module of the subgroup of divisible elements of $\Sha^1(A)$, and prove

Theorem 0.1. (=Corollary [2.5]) There exists a canonical perfect pairing of finite abelian groups

\[ C_{A,S}/\varphi_{A,S}(T^{\text{III}}(A)_{\text{div}}) \times C^{1}_{A',S} \to \mathbb{Q}/\mathbb{Z}, \]

where \( C^{1}_{A',S} \) is the group (1.6) attached to the abelian variety \( A' \) dual to \( A \).

The proof of Theorem 0.1 is completely different from and substantially simpler than the proof of [9, Theorem 4.9]. Its main ingredient is the generalized Cassels-Tate dual exact sequence established in [6].

In order to explain the second objective of this paper, we introduce the following notation.

Let \( X \) be a proper, smooth and geometrically connected curve over \( K \). If \( v \notin S \), let \( \delta'_v \) denote the period of \( X_{K_v} \), i.e., the least positive degree of a divisor class on \( X_{K_v} \), and let \( \delta'^{\text{nr}}_v \) denote the corresponding quantity associated to \( X_{K^{\text{nr}}_v} \). Set

\[ d_v = \frac{\delta'_v}{\delta'^{\text{nr}}_v} \]

and

\[ d = \prod_{v \notin S} d_v. \]

The structural morphism \( X_{K_v} \to \text{Spec} \ K_v \) induces a pullback homomorphism between the associated Brauer groups \( Br_{K_v} \to Br_{X_{K_v}} \) and we write

\[ Br_a X_{K_v} = \text{Coker}[Br_{K_v} \to Br_{X_{K_v}}]. \]

Next, the canonical morphism \( X_{K^{\text{nr}}_v} \to X_{K_v} \) induces a pullback homomorphism \( Br_a X_{K_v} \to Br_a X_{K^{\text{nr}}_v} \) and we define

\[ Br_a(X_{K^{\text{nr}}_v}/X_{K_v}) = \text{Ker}[Br_a X_{K_v} \to Br_a X_{K^{\text{nr}}_v}]. \]

It is shown in [3] that there exists a canonical exact sequence of finite abelian groups

\[ 0 \to \text{Hom}(Br_a X_{K^{\text{nr}}_v}/X_{K_v}), \mathbb{Q}/\mathbb{Z}) \to \Phi_v(J)(k(v)) \to \mathbb{Z}/d_v \mathbb{Z} \to 0, \]

where \( J \) is the Jacobian variety of \( X \) and \( d_v \) is the integer (0.2). In this paper we establish the following global analog of the above exact sequence.

Let

\[ B_{nr}(S, X) = \text{Ker} \left[ Br_a X \to \prod_{v \notin S} Br_a X_{K^{\text{nr}}_v} \times \prod_{v \in S} Br_a X_{K_v} \right], \]

where the \( v \)-component of the indicated map, for \( v \notin S \) (respectively, \( v \in S \)), is the pullback homomorphism \( Br_a X \to Br_a X_{K^{\text{nr}}_v} \) (respectively, \( Br_a X \to Br_a X_{K_v} \)) induced by the projection \( X_{K^{\text{nr}}_v} \to X \) (respectively, \( X_{K_v} \to X \)). Further, let

\[ B(X) = \text{Ker} \left[ Br_a X \to \prod_{v \notin S} Br_a X_{K_v} \right]. \]

Then the following holds.
Theorem 0.2. (=Theorem 3.4) Assume that the local periods $\delta'_v$ of $X$ are pairwise coprime. Then there exists a canonical exact sequence of finite abelian groups

$$0 \to \text{Hom}(B_{nr}(S,X)/B(X), \mathbb{Q}/\mathbb{Z}) \to C_{J,S}/\varphi_{J,S}(T_{\text{div}}(J)) \to \mathbb{Z}/d\mathbb{Z} \to 0,$$

where the groups $B_{nr}(S,X)$ and $B(X)$ are given by (0.5) and (0.6), respectively, $C_{J,S}$ is the Néron $S$-class group of the Jacobian variety $J$ of $X$ (0.1), $\varphi_{J,S}$ is the map (2.12) attached to $J$ and $d$ is the integer (0.3).

1. Preliminaries

If $B$ is a topological abelian group, its (Pontryagin) dual is the topological abelian group $B^* = \text{Hom}_{\text{cont.}}(B, \mathbb{Q}/\mathbb{Z})$ endowed with the compact-open topology, where $\mathbb{Q}/\mathbb{Z}$ is given the discrete topology. The dual of a morphism of topological abelian groups $f: B \to C$ will be denoted by $f^*: C^* \to B^*$. If $n$ is a positive integer, we will write $B_n$ for the $n$-torsion subgroup of $B$, $B/nB$ for $B/nB$ and $B_{\text{div}}$ for the subgroup of divisible elements of $B$. The total Tate module of $B$ is the group $TB = \lim_{\leftarrow} B_n = B_{\text{div}}$, where the inverse limit is taken over all positive integers ordered by divisibility.

Lemma 1.1. Let $A \overset{f}{\to} B \overset{g}{\to} C$ be morphisms in an abelian category $\mathcal{A}$. Then there exists a canonical exact sequence in $\mathcal{A}$

$$0 \to \ker f \to \ker (g \circ f) \to \ker g \to \coker f \to \coker (g \circ f) \to \coker g \to 0.$$

Proof. See, for example, [2, 1.2].

Recall from the Introduction the global field $K$ and the finite set of primes $S$. Now let $G$ be a commutative $K$-group scheme. If $L$ is a field containing $K$, we define

$$(1.1) \quad H^1(L,G) = H^1(L,G \times K L),$$

where the right-hand group is the first fppf cohomology group of the $L$-group scheme $G \times K L$. For every prime $v$ of $K$, let $K_v$ be the completion of $K$ at $v$. The image of a class $\xi \in H^1(K,G)$ under the restriction map $H^1(K,G) \to H^1(K_v,G)$ will be denoted by $\xi_v$. Now let $K^s$ be a fixed separable algebraic closure of $K$. For every $v \notin S$, we fix a prime $\mathfrak{p}$ of $K^s$ lying above $v$ and let $K^s_v$ be the completion of $K^s$ at $\mathfrak{p}$. Then $K^s_v$ is a separable algebraic closure of $K_v$ and we will write $K^s_v$ for the maximal unramified extension of $K_v$ inside $K^s_v$. Identifying $\text{Gal}(K^s_v/K)$ with a subgroup of $\text{Gal}(K^s/K)$ in the standard way, we obtain a restriction map $H^1(K_v,G) \to H^1(K^s_v,G)$ and define

$$(1.2) \quad H^1_{\text{nr}}(K_v,G) = \ker[H^1(K_v,G) \to H^1(K^s_v,G)].$$
Next we define

\( (1.3) \quad \text{III}_{nr}^1(S, G) = \text{Ker} \left[ H^1(K, G) \rightarrow \prod_{v \notin S} H^1(K_v, G) \times \prod_{v \in S} H^1(K_v, G) \right], \)

\( (1.4) \quad \text{III}_S^1(G) = \text{Ker} \left[ H^1(K, G) \rightarrow \prod_{v \in S} H^1(K_v, G) \right] \)

and let

\( (1.5) \quad \lambda_{G, S} : \text{III}_S^1(G) \rightarrow \prod_{v \notin S} H^1(K_v, G) \)

be the map whose \( v \)-component, for \( v \notin S \), is the restriction to \( \text{III}_S^1(G) \subset H^1(K, G) \) of the restriction map \( H^1(K, G) \rightarrow H^1(K_v, G) \). Clearly \( \text{III}_{nr}^1(S, G) \subset \text{III}_S^1(G) \) and \( \text{Ker} \lambda_{G, S} = \text{III}^1(G) \) is the Tate-Shafarevich group of \( G \). Next, set

\( (1.6) \quad \text{C}_{G, S}^1 = \left( \prod_{v \notin S} H^1_{nr}(K_v, G) \right) \cap \text{Im} \lambda_{G, S} \subset \prod_{v \notin S} H^1(K_v, G). \)

Since, for every \( v \in S \), the restriction map \( H^1(K, G) \rightarrow H^1(K_v, G) \) factors as \( H^1(K, G) \rightarrow H^1(K_v, G) \rightarrow H^1(K_{nr}, G) \), a class \( \xi \in \text{III}_S^1(G) \) lies in \( \text{III}_{nr}^1(S, G) \) if, and only if, \( \xi_v \in H^1_{nr}(K_v, G) \) for every \( v \in S \). Consequently, the restriction of \( \lambda_{G, S} \) to \( \text{III}_{nr}^1(S, G) \) defines a surjection \( \text{III}_{nr}^1(S, G) \twoheadrightarrow \text{C}_{G, S}^1 \) whose kernel is \( \text{III}^1(G) \). Consequently, the following holds

\textbf{Lemma 1.2.} The map \( \lambda_{G, S} \) \text{[1.5]} induces an isomorphism of abelian groups

\( \text{III}_{nr}^1(S, G)/\text{III}^1(G) \cong \text{C}_{G, S}^1, \)

where the groups \( \text{III}_{nr}^1(S, G) \) and \( \text{C}_{G, S}^1 \) are given by \text{[1.3]} and \text{[1.6]}, respectively. \( \square \)

\textbf{2. The Generalized Duality Theorem}

Recall from the Introduction the abelian variety \( A \). Now write

\( (2.1) \quad \mathcal{Q}^1(A) = \text{Coker} \left[ H^1(K, A) \rightarrow \bigoplus_{\text{all } v} H^1(K_v, A) \right] \)

and let

\( (2.2) \quad \beta_{A, S} : \bigoplus_{v \notin S} H^1_{nr}(K_v, A) \rightarrow \mathcal{Q}^1(A) \)

be the restriction to \( \bigoplus_{v \notin S} H^1_{nr}(K_v, A) \subset \bigoplus_{\text{all } v} H^1(K_v, A) \) of the canonical projection \( \bigoplus_{\text{all } v} H^1(K_v, A) \rightarrow \mathcal{Q}^1(A) \), where the groups \( H^1_{nr}(K_v, A) \) are defined by \text{[1.2]}. An application of Lemma \text{[1.1]} to the pair of maps

\( H^1(K, A) \rightarrow \bigoplus_{\text{all } v} H^1(K_v, A) \rightarrow \bigoplus_{v \notin S} H^1_{nr}(K_v, A) \times \bigoplus_{v \in S} H^1(K_v, A) \)
yields an exact sequence of abelian groups
\[ 0 \to \Sha^1(A) \to \Sha^1_{fr}(S, A) \to \bigoplus_{v \notin S} H^1_{fr}(K_v, A) \xrightarrow{\beta_{A,S}} \Sha^1(A). \]

Thus the following holds

**Lemma 2.1.** There exists a canonical isomorphism of abelian groups
\[ \Sha^1_{fr}(S, A)/\Sha^1(A) \cong \ker \left[ \bigoplus_{v \notin S} H^1_{fr}(K_v, A) \xrightarrow{\beta_{A,S}} \Sha^1(A) \right], \]
where \( \Sha^1_{fr}(S, A) \) is the group \((1.3)\) and \( \beta_{A,S} \) is the map \((2.2)\).

**Lemma 2.2.** For every \( v \notin S \), there exists a canonical isomorphism of finite abelian groups
\[ \Phi_v(A)(k(v)) \cong H^1_{fr}(K_v, A^t)^*. \]

**Proof.** By \([11] \) Thm. 4.8], Grothendieck’s pairing \( \Phi_v(A)(k(v)^s) \times \Phi_v(A^t)(k(v)^s) \to \mathbb{Q}/\mathbb{Z} \) induces an isomorphism \( \Phi_v(A)(k(v)) \cong H^1(k(v), \Phi_v(A^t))^* \). On the other hand, it is shown in \([14] \) proof of Proposition I.3.8, p. 47 that the reduction map \( A^t(K_v^m) \to \Phi_v(A^t)(k(v)^s) \) induces an isomorphism \( H^1(\text{Gal}(K_v^m/K_v), A^t(K_v^m)) \cong H^1(k(v), \Phi_v(A^t)) \). The composition of the preceding map and the inverse of the isomorphism \( H^1(\text{Gal}(K_v^m/K_v), A^t(K_v^m)) \cong H^1_{fr}(K_v, A^t) \) induced by the inflation map \([1] \) Proposition 4, p. 100] is an isomorphism \( H^1_{fr}(K_v, A^t) \cong H^1(k(v), \Phi_v(A^t)) \) whose dual is a map \( H^1(k(v), \Phi_v(A^t))^* \cong H^1_{fr}(K_v, A^t)^* \). The isomorphism of the lemma is the composition \( \Phi_v(A)(k(v)) \cong H^1(k(v), \Phi_v(A^t))^* \cong H^1_{fr}(K_v, A^t)^* \). \( \square \)

Now let
\[ A(K)^\wedge = \varprojlim_n A(K)/n \]
be the adic (equivalently, profinite \([16] [12]\) completion of \( A(K) \) and let
\[ T\text{Sel}(A) = \varprojlim_n \ker \left[ H^1(K, A_n) \to \prod_{v} H^1(K_v, A_n) \right] \]
be the pro-Selmer group of \( A \). By \([6] \) p. 298], there exists a canonical exact sequence of profinite abelian groups
\[ 0 \to A(K)^\wedge \to T\text{Sel}(A) \to T\Sha^1(A)_{\text{div}} \to 0, \]
where the first nontrivial map is induced by the connecting homomorphisms \( A(K) \to H^1(K, A_n) \) in fppf cohomology induced by the exact sequence of abelian fppf sheaves \( 0 \to A_n \to A \xrightarrow{n} A \to 0 \). Identifying \( A(K)^\wedge \) with its image in \( T\text{Sel}(A) \) under the first
nontrivial map in (2.6), the indicated sequence induces an isomorphism of profinite abelian groups

\[ T \sha (A)_{\text{div}} \sim T \Sel(A)/A(K)^\wedge. \]

Now, by [15, Proposition 3.2.5, p. 87], there exists a canonical isomorphism of finite abelian groups

\[ C_{A,S} \sim \text{Coker} \left[ A(K)^\wedge \xrightarrow{\hat{\rho}} \bigoplus_{v \notin S} \Phi_v(A)(k(v)) \right], \]

where \( C_{A,S} \) is the group (0.1) and \( \hat{\rho} \) is the profinite completion of the map \( \rho \) in (0.1).

Next we define a map

\[ \gamma_{A,S}: T \Sel(A) \rightarrow \bigoplus_{v \notin S} \Phi_v(A)(k(v)) \]

as the composition of canonical maps

\[ T \Sel(A) \sim \Psi^1(A^t)^* \xrightarrow{\beta_{A,S}} \prod_{v \notin S} H^1_{\text{nr}}(K_v, A^t)^* = \bigoplus_{v \notin S} H^1_{\text{nr}}(K_v, A^t)^* \sim \bigoplus_{v \notin S} \Phi_v(A)(k(v)), \]

where the first map \( T \Sel(A) \sim \Psi^1(A^t)^* \) is the composition

\[ T \Sel(A) \sim \text{Ker} \left[ \prod_{\text{all } v} H^0(K_v^, A) \rightarrow H^1(K, A)^* \right] \sim \Psi^1(A^t)^*, \]

where the first map is defined in [8] Remark 3.4] and shown to be an isomorphism in [6] Main Theorem] and the second map is induced by the Tate local duality isomorphisms \( H^0(K_v^, A) \sim H^1(K_v, A)^* \). See also [7] Remark 1.2] and note that \( H^0(K_v, A) = H^0(K_v, A)^\wedge \) for every \( v \) since \( H^0(K_v, A) \) is profinite (if \( v \) is archimedean, \( H^0(K_v, A) \) denotes the group of connected components of \( A(K_v) \)).

The second map in (2.10)] is the dual of the map \( \beta_{A,S} \) (2.2). The last map in (2.10)] is the direct sum over \( v \notin S \) of the inverses of the isomorphisms \( \Phi_v(A)(k(v)) \sim H^1_{\text{nr}}(K_v^, A^t)^* \) defined explicitly in the proof of Lemma (2.2). A laborious verification, using the explicit descriptions of all the maps involved, shows that the left-hand square in the diagram

\[ \begin{array}{ccc}
A(K)^\wedge & \xrightarrow{\gamma_{A,S}} & T \Sel(A) \\
\downarrow & & \downarrow \\
A(K)^\wedge & \xrightarrow{\hat{\rho}} & \bigoplus_{v \notin S} \Phi_v(A)(k(v)) \\
\end{array} \]

\[ \begin{array}{ccc}
T \Sel(A)/A(K)^\wedge & \xrightarrow{\gamma_{A,S}} & T \Sel(A)/A(K)^\wedge \\
\downarrow & & \downarrow \\
0 & \xrightarrow{=} & 0 \\
\end{array} \]

commutes, where the first map on the top row of the above diagram is that appearing in (2.6). Consequently, there exists a canonical map \( \gamma_{A,S}: T \Sel(A)/A(K)^\wedge \rightarrow \)
Coker $\hat{\rho}$ such that the full diagram (2.11) commutes. Further, as an immediate consequence of Lemma 2.1 (for $A'$) and the definition of $\gamma_{A,S}$ (2.9), we have

**Lemma 2.3.** There exists a canonical isomorphism of finite abelian groups

$$\text{Coker} \left[ T\text{Sel}(A) \xrightarrow{\gamma_{A,S}} \bigoplus_{v \notin S} \Phi_v(A)(k(v)) \right] \cong (\mathbb{III}^1_{nr}(S, A')/\mathbb{III}^1(A'))^*, $$

where $\mathbb{III}^1_{nr}(S, A')$ is the group (1.3) and $\gamma_{A,S}$ is the map (2.9).

Next, let

$$\varphi_{A,S}: T\mathbb{III}^1(A)_{\text{div}} \to C_{A,S}$$

be the composition

$$T\mathbb{III}^1(A)_{\text{div}} \xrightarrow{\sim} T\text{Sel}(A)/A(K)^\wedge \xrightarrow{\gamma_{A,S}} \text{Coker} \hat{\rho} \xrightarrow{\sim} C_{A,S},$$

where the first map is the isomorphism (2.7), the second map is the right-hand vertical map in diagram (2.11) and the last map is the inverse of the isomorphism (2.8). Further, let

$$\psi_{A,S}: C_{A,S} \to \text{Coker} \gamma_{A,S}$$

be the composition

$$C_{A,S} \xrightarrow{\sim} \text{Coker} \hat{\rho} \to \text{Coker} \gamma_{A,S},$$

where the first map is the isomorphism (2.3) and the second (canonical) map exists since $\text{Im} \hat{\rho} \subset \text{Im} \gamma_{A,S}$ by the commutativity of the left-hand square in diagram (2.11).

An application of Lemma 1.1 to the pair of maps

$$A(K)^\wedge \xhookrightarrow{\sim} T\text{Sel}(A) \xrightarrow{\gamma_{A,S}} \bigoplus_{v \notin S} \Phi_v(A)(k(v)),$$

whose composition is the map $\hat{\rho}$ by the commutativity of the left-hand square in (2.11), yields an exact sequence of profinite abelian groups

$$T\mathbb{III}^1(A)_{\text{div}} \xrightarrow{\varphi_{A,S}} C_{A,S} \xrightarrow{\psi_{A,S}} \text{Coker} \gamma_{A,S} \to 0,$$

where $\varphi_{A,S}$ and $\psi_{A,S}$ are the maps (2.12) and (2.13), respectively. Consequently, the map $\psi_{A,S}$ (2.13) induces an isomorphism of finite abelian groups

$$C_{A,S}/\varphi_{A,S}(T\mathbb{III}^1(A)_{\text{div}}) \xrightarrow{\sim} \text{Coker} \gamma_{A,S}.$$

Composing the preceding map with the isomorphism of Lemma 2.3 we obtain an isomorphism of finite abelian groups

$$C_{A,S}/\varphi_{A,S}(T\mathbb{III}^1(A)_{\text{div}}) \xrightarrow{\sim} (\mathbb{III}^1_{nr}(S, A')/\mathbb{III}^1(A'))^*.$$

Thus the following holds.
Theorem 2.4. Let $A$ be an abelian variety over $K$ with dual abelian variety $A'$. Then there exists a canonical perfect pairing of finite abelian groups

$$C_{A,S}/\varphi_{A,S}(T\Theta^1(A)_{\text{div}}) \times \Theta^1_{\text{nr}}(S,A')/\Theta^1(A') \to \mathbb{Q}/\mathbb{Z},$$

where $C_{A,S}$ is the group (0.1), $\varphi_{A,S}$ is the map (2.12) and $\Theta^1_{\text{nr}}(S,A')$ is the group (1.3).

The following statement, which generalizes [9, Theorem 4.9], is an immediate consequence of the above theorem and Lemma 1.2.

Corollary 2.5. There exists a canonical perfect pairing of finite abelian groups

$$C_{A,S}/\varphi_{A,S}(T\Theta^1(A)_{\text{div}}) \times C^1_{A',S} \to \mathbb{Q}/\mathbb{Z},$$

where $C^1_{A',S}$ is the group (1.6) attached to $A'$.

3. Jacobian varieties

Recall from the Introduction the curve $X$ over $K$. Let

$$P = \text{Pic}_{X/K}$$

be the Picard scheme of $X$ over $K$. Then $P$ is a smooth and commutative $K$-group scheme whose identity component

$$J = \text{Pic}^0_{X/K}$$

is an abelian variety over $K$ [4, Proposition 3, p. 244]. There exists a canonical exact sequence of abelian sheaves for the étale topology on $K$

$$0 \to J \to P^{\text{deg}} \to \mathbb{Z}_K \to 0. \tag{3.1}$$

Now recall that the index of $X$ over $K$ is the least positive degree $\delta$ of a divisor on $X$. If $L$ is a field containing $K$, then the index (respectively, period) of $X_L = X \times_K L$ divides the index (respectively, period) of $X$. Further, $\delta'|\delta$ and (3.1) induces an exact sequence of abelian groups

$$0 \to \mathbb{Z}/\delta'\mathbb{Z} \to H^1(K,J) \to H^1(K,P) \to 0. \tag{3.2}$$

For every prime $v$ of $K$, we will write $\delta_v$ for the index of $X_{K_v}$. By [10, Remark 1.6, p. 249], $\delta_v = 1$ for all but finitely many primes $v$ of $K$. If $v \notin S$, $\delta'_v$ will denote the index of $X_{K_v}$. Note that $\delta_v|\delta$ and $\delta'_v|\delta'$ for every $v$. Further, $\delta'_v|\delta_v$ and $\delta''_v|\delta'_v$ for every $v \notin S$.

Next let

$$D: \mathbb{Z}/\delta'\mathbb{Z} \to \prod_{\text{all } v} \mathbb{Z}/\delta'_v\mathbb{Z} \tag{3.3}$$

be the natural diagonal map and set

$$\Delta' = \text{l.c.m.}\{\delta'_v\}. \tag{3.4}$$
Then \( \text{Ker } D = \Delta'/\delta' \mathbb{Z} \) and \( \text{Coker } D \) is a finite abelian group of order

\[
|\text{Coker } D| = \left( \prod \delta'_v \right)/\Delta'.
\]

An application of the snake lemma to the exact and commutative diagram

\[
\begin{array}{cccccc}
0 & \rightarrow & \mathbb{Z}/\delta' \mathbb{Z} & \rightarrow & H^1(K, J) & \rightarrow & H^1(K, P) & \rightarrow & 0 \\
& & \downarrow D & & \downarrow & & \downarrow & & \\
0 & \rightarrow & \prod_{v} \mathbb{Z}/\delta'_v \mathbb{Z} & \rightarrow & \prod_{v} H^1(K_v, J) & \rightarrow & \prod_{v} H^1(K_v, P) & \rightarrow & 0,
\end{array}
\]

whose rows are induced by (3.2), yields an exact sequence of abelian groups

\[
0 \rightarrow \Delta'/\delta' \mathbb{Z} \rightarrow \Pi^1(J) \rightarrow \Pi^1(P) \rightarrow \text{Coker } D.
\]

Similarly, let

\[
D_S : \mathbb{Z}/\delta' \mathbb{Z} \rightarrow \prod_{v \notin S} \mathbb{Z}/\delta'_v \mathbb{Z} \times \prod_{v \in S} \mathbb{Z}/\delta'_v \mathbb{Z}
\]

be the natural diagonal map and let

\[
\Delta'' = \text{l.c.m.}\{\delta''_v, v \notin S, \delta'_v, v \in S\}.
\]

Then there exists a canonical exact sequence of abelian groups

\[
0 \rightarrow \Delta''/\delta' \mathbb{Z} \rightarrow \Pi^1_{nr}(S, J) \rightarrow \Pi^1_{nr}(S, P) \rightarrow \text{Coker } D_S,
\]

where the groups \( \Pi^1_{nr}(S, J) \) and \( \Pi^1_{nr}(S, P) \) are given by (1.3).

The groups \( \text{Coker } D \) and \( \text{Coker } D_S \) are related as follows.

**Lemma 3.1.** There exists a canonical exact sequence of finite abelian groups

\[
0 \rightarrow \Delta''/\Delta' \mathbb{Z} \rightarrow \prod_{v \notin S} \mathbb{Z}/d_v \mathbb{Z} \rightarrow \text{Coker } D \rightarrow \text{Coker } D_S \rightarrow 0,
\]

where the integers \( \Delta'', \Delta' \) and \( d_v \) are given by (3.4), (3.9) and (0.2), respectively, and the maps \( D \) and \( D_S \) are given by (3.3) and (3.8), respectively.

**Proof.** This follows by applying Lemma 1.1 to the pair of maps

\[
\mathbb{Z}/\delta' \mathbb{Z} \xrightarrow{D} \prod_{v \notin S} \mathbb{Z}/\delta'_v \mathbb{Z} \rightarrow \prod_{v \notin S} \mathbb{Z}/\delta''_v \mathbb{Z} \times \prod_{v \in S} \mathbb{Z}/\delta'_v \mathbb{Z}
\]

whose composition is the map \( D_S \). \( \square \)
Proposition 3.2. Assume that the integers $\delta_v'$ are pairwise coprime. Then there exists a canonical exact sequence of finite abelian groups

$$0 \to \mathbb{Z}/d\mathbb{Z} \to \prod_{nr}^1(S, J)/\prod^1(J) \to \prod_{nr}^1(S, P)/\prod^1(P) \to 0,$$

where $d$ is the integer (0.3) and the groups $\prod_{nr}^1(S, J)$ and $\prod_{nr}^1(S, P)$ are given by (0.2).

Proof. The hypothesis and (3.5) show that $\text{Coker} \ D = 0$. Now Lemma 3.1 shows that $\text{Coker} \ D^S = 0$ as well. Thus there exists a canonical exact and commutative diagram of abelian groups

$$0 \to \Delta' \mathbb{Z}/\delta' \mathbb{Z} \to \prod^1(J) \to \prod^1(P) \to 0 \quad \text{and} \quad 0 \to \Delta'' \mathbb{Z}/\delta'' \mathbb{Z} \to \prod^1_{nr}(S, J) \to \prod^1_{nr}(S, P) \to 0$$

whose top and bottom rows are the sequences (3.7) and (3.10), respectively. An application of the snake lemma to the above diagram yields an exact sequence of finite abelian groups

$$0 \to \Delta'' \mathbb{Z}/\Delta' \mathbb{Z} \to \prod^1_{nr}(S, J)/\prod^1(J) \to \prod^1_{nr}(S, P)/\prod^1(P) \to 0.$$

Now, since $\text{Coker} \ D = 0$, Lemma 3.1 shows that $\Delta'' \mathbb{Z}/\Delta' \mathbb{Z}$ is canonically isomorphic to $\prod_{\nu \in S} \mathbb{Z}/d_v \mathbb{Z}$. Further, since the integers $\delta_v'$ are pairwise coprime, so also are the integers $d_v$ (0.2). Thus the Chinese Remainder Theorem yields a canonical isomorphism $\prod_{\nu \in S} \mathbb{Z}/d_v \mathbb{Z} \cong \mathbb{Z}/d \mathbb{Z}$, whence the proposition follows. □

Next, there exists a canonical exact sequence of abelian groups (see [5, pp. 400-401])

$$0 \to \text{Pic} \ X \to P(K) \to \text{Br} \ K \to \text{Br} \ X \to H^1(K, P) \to 0.$$

The above sequence induces a functorial isomorphism of abelian groups

(3.11) \[ \text{Br}^a X \cong H^1(K, P), \]

where $\text{Br}^a X$ is the group (0.1) over $K$. If $L = K_v$ or $K_v^{nr}$, where $v$ is a prime of $K$, there exists a commutative diagram of abelian groups

(3.12) \[ \text{Br}^a X \cong H^1(L, P), \]

where the horizontal arrows are the maps (3.11) over $K$ and over $L$, the left-hand vertical arrow is induced by the pullback homomorphisms $\text{Br} K \to \text{Br} L$ and $\text{Br} X \to \text{Br} X_L$ and the right-hand vertical map is the restriction map in Galois cohomology.
By the commutativity of diagram (3.12), the map (3.11) and its analogs over \( K_v \) for every \( v \) and over \( K_{nr}^v \) for every \( v \notin S \) yield isomorphisms of abelian groups
\[
\begin{align*}
\mathcal{B}_{nr}(S, X) & \xrightarrow{\sim} \mathcal{III}_{nr}^1(S, P) \\
\mathcal{B}(X) & \xrightarrow{\sim} \mathcal{III}^1(P),
\end{align*}
\]
where the groups \( \mathcal{B}_{nr}(S, X) \) and \( \mathcal{B}(X) \) are given by (0.5) and (0.6), respectively, and the group \( \mathcal{III}_{nr}^1(S, P) \) is defined by (1.3).

**Proposition 3.3.** Assume that the integers \( \delta_v' \) are pairwise coprime. Then there exists a canonical exact sequence of finite abelian groups
\[
0 \to \mathbb{Z}/d\mathbb{Z} \to \mathcal{III}_{nr}^1(S, J)/\mathcal{III}^1(J) \to \mathcal{B}_{nr}(S, X)/\mathcal{B}(X) \to 0,
\]
where \( d \) is the integer (0.3), \( \mathcal{III}_{nr}^1(S, J) \) is given by (1.3) and the groups \( \mathcal{B}_{nr}(S, X) \) and \( \mathcal{B}(X) \) are given by (0.5) and (0.6), respectively.

**Proof.** This is immediate from Proposition 3.2 using the isomorphisms (3.13) and (3.14). \( \square \)

Via the autoduality of the Jacobian [13, Theorem 6.6], the preceding proposition and Theorem 2.4 yield the second main result of this paper.

**Theorem 3.4.** Assume that the integers \( \delta_v' \) are pairwise coprime. Then there exists a canonical exact sequence of finite abelian groups
\[
0 \to \text{Hom}(\mathcal{B}_{nr}(S, X)/\mathcal{B}(X), \mathbb{Q}/\mathbb{Z}) \to C_{J, S}/\varphi_{J, S}(T\mathcal{III}^1(J)_{\text{div}}) \to \mathbb{Z}/d\mathbb{Z} \to 0,
\]
where \( C_{J, S} \) is the Néron \( S \)-class group of \( J \) (0.1), \( \varphi_{J, S} \) is the map (2.12) and \( d \) is the integer (0.3).
