ABSTRACT. In this article, we introduce and study Riesz bases in a separable quaternionic Hilbert spaces. Some results on Riesz bases in a separable quaternionic Hilbert spaces are proved. It is also proved that a Riesz basis in a separable quaternionic Hilbert space a frame for the quaternionic Hilbert space. Riesz sequences are defined and equivalence of a Riesz basis and a complete Riesz sequence in a separable quaternionic Hilbert space is proved.

1. Introduction

Frames for Hilbert spaces, which plays an important role in many applications, were introduced way back in 1952 by Duffin and Schaeffer [10] as a tool to study of non-harmonic Fourier series. Duffin and Schaeffer introduced frames for particular Hilbert spaces of the form $L^2[a, b]$. They defined a frame as

“A sequence $\{x_n\}_{n \in \mathbb{N}}$ in a Hilbert space $\mathcal{H}$ is said to be a frame for $\mathcal{H}$ if there exist constants $A$ and $B$ with $0 < A \leq B < \infty$ such that

$$A\|x\|^2 \leq \sum_{n=1}^{\infty} |\langle x, x_n \rangle|^2 \leq B\|x\|^2, \quad \text{for all } x \in \mathcal{H}. \quad (1.1)$$

Moreover, the positive constants $A$ and $B$, respectively, are called lower frame bound and upper frame bound, respectively, for the frame $\{x_n\}_{n \in \mathbb{N}}$. Collectively, these are referred as frame bounds for the frame $\{x_n\}_{n \in \mathbb{N}}$. The inequality (1.1) is called the frame inequality for the frame $\{x_n\}_{n \in \mathbb{N}}$. A sequence $\{x_n\}_{n \in \mathbb{N}} \subset \mathcal{H}$ is called a Bessel sequence if it satisfies upper frame inequality in (1.1) i.e. it has upper bound which satisfies the inequality. A frame $\{x_n\}_{n \in \mathbb{N}}$ in $\mathcal{H}$ is said to be

- **tight** if it is possible to choose $A$, $B$ with $A = B$ satisfying inequality (1.1).
- **Parseval** if it is possible to choose $A$, $B$ with $A = B = 1$ satisfying inequality (1.1).
- **exact** if removal of any $x_n$ leaves the collection $\{x_i\}_{i \neq n}$ no longer a frame for $\mathcal{H}$.

After more than thirty years, in 1986, Daubechies, Grossmann and Meyer [9], while studying frames, observed that frames can be used to approximate functions in $L^2(\mathbb{R})$. In abstract setting, they observed that a function in $L^2(\mathbb{R})$ can be represented as a series in terms of elements of frames, which is similar to bases. Then one can also consider frames as one of the generalizations of orthonormal bases in Hilbert spaces as redundant frames expansions are more useful and advantageous over basis expansions in a variety of practical applications. Now a days,
Frames are regarded as an important and integral tool to study various areas of applications like representation of signals, characterization of function spaces and other fields of applications such as signal and image processing [4], filter bank theory [3], wireless communications [12] and sigma-delta quantization [2]. For more literature on frame theory, one may refer to [5, 8].

In recent years, Khokulan, Thirulogasanthar and Srisatkunarajah [13] introduced and studied frames for finite dimensional quaternionic Hilbert spaces. Sharma and Virender [15] study some different types of dual frames of a given frame in a finite dimensional quaternionic Hilbert space and gave various types of reconstructions with the help of dual frame. Currently, a lot of work is being carried out in quaternionic Hilbert spaces related to the theory of frames. It is noted that the quaternionic Hilbert spaces are frequently used in applied physical sciences especially in physics.

1.1. Motivation and Recent Work. Frames are used in the study which deals with the construction of a vector from the elements of the frames. Frames produce the construction of a vector just like the bases produce, but with the relaxation of the uniqueness of the coefficients. Thus frames are used as generalizations of bases. Very recently, Sharma and Goel [14] introduced and studied frames for separable quaternionic Hilbert spaces and Chen, Dang and Qian [6] had studied frames for Hardy spaces in the contexts of the quaternionic space and the Euclidean space in the Clifford algebra. Sharma and Virender [15] study some different types of dual frames of a given frame in a finite dimensional quaternionic Hilbert space covering the dual part of frames in quaternionic Hilbert spaces. One of the classes of frames is a bit stronger and nicer for the purpose of the computations. Frames of this class are referred to as Riesz frames which are somewhat like Riesz bases. These frames are nicer for computations in applications and are related closely with the theory of bases. In the present paper, we explore this aspects of Riesz bases in quaternionic Hilbert spaces and try to list the concepts related to Riesz bases in the setup of quaternionic Hilbert spaces. It is arranged in simple and systematic manner which may be referred or may be used whenever there is a requirement.

1.2. Outline. The paper is organized as follows: In section 2, we give notations and terminology used in the context of quaternionic Hilbert spaces together with some basic theory related to quaternionic Hilbert spaces. In section 2.1, the notations and terminology is given. In section 2.2, some basic definitions and some basic introduction of quaternionic Hilbert spaces are provided. Some fundamental results of functional analysis are listed in the context of quaternionic Hilbert spaces. Section 2.3, frames in quaternionic Hilbert spaces, comprise the definition of frames and the results related to frames in quaternionic Hilbert spaces. Finally, Section 3 is devoted to the concept of the Riesz bases in separable quaternionic Hilbert spaces. The basic results related to Riesz bases are listed and proved in this section. This section covers the important aspects of Riesz bases in quaternionic Hilbert spaces. Proper references are provided at the end.

2. Preliminaries

2.1. Notation and Terminology. Since the quaternions are non-commutative in nature, we have two different types of quaternionic Hilbert spaces, the left quaternionic Hilbert space and the right quaternionic Hilbert space depending on positions of quaternions.

Throughout this paper, we will denote Ω to be a non-commutative field of quaternions, I be a non empty countable set of indices, $V_R(Ω)$ be a separable right quaternionic Hilbert space, by the term “right linear operator”, we mean a “right Ω-linear operator” and $B(λ)$ denotes the set of all bounded (right Ω-linear) operators of $V_R(Ω)$:

$$B(λ) := \{T: V_R(Ω) \rightarrow V_R(Ω) : \|T\| < \infty\}.$$
2.2. Quaternionic Hilbert space. The non-commutative field of quaternions $\mathbb{Q}$ is a four dimensional real algebra with unity. In $\mathbb{Q}$, 0 denotes the null element and 1 denotes the identity with respect to multiplication. It also includes three so-called imaginary units, denoted by $i, j, k$; i.e.,

$$\mathbb{Q} = \{x_0 + x_1 i + x_2 j + x_3 k : x_0, x_1, x_2, x_3 \in \mathbb{R}\}$$

where $i^2 = j^2 = k^2 = -1; \ ij = -ji = k; \ jk = -kj = i$ and $ki = -ik = j$. For each quaternion $q = x_0 + x_1 i + x_2 j + x_3 k \in \mathbb{Q}$, the conjugate of $q$ is denoted by $\overline{q}$ and is defined as

$$\overline{q} = x_0 - x_1 i - x_2 j - x_3 k \in \mathbb{Q}.$$ 

If $q = x_0 + x_1 i + x_2 j + x_3 k$ is a quaternion, then $x_0$ is called the real part of $q$ and $x_1 i + x_2 j + x_3 k$ is called the imaginary part of $q$. The modulus of a quaternion $q = x_0 + x_1 i + x_2 j + x_3 k$ is defined as

$$|q| = (\overline{q}q)^{1/2} = (q\overline{q})^{1/2} = \sqrt{x_0^2 + x_1^2 + x_2^2 + x_3^2}.$$ 

For every non-zero quaternion $q = x_0 + x_1 i + x_2 j + x_3 k \in \mathbb{Q}$, there exists a unique inverse $q^{-1}$ in $\mathbb{Q}$ as

$$q^{-1} = \frac{\overline{q}}{|q|^2} = \frac{x_0 - x_1 i - x_2 j - x_3 k}{x_0^2 + x_1^2 + x_2^2 + x_3^2}.$$ 

Definition 2.1. A right quaternionic vector space $V_R(\mathbb{Q})$ is a vector space under right scalar multiplication over the field of quaternionic $\mathbb{Q}$, i.e.,

$$V_R(\mathbb{Q}) \times \mathbb{Q} \rightarrow V_R(\mathbb{Q})$$

$$(u, q) \rightarrow uq \quad (2.1)$$

and for each $u, v \in V_R(\mathbb{Q})$ and $p, q \in \mathbb{Q}$, the right scalar multiplication (2.1) satisfying the following properties:

$$(u + v)q = uq + vq$$
$$u(p + q) = up + uq$$
$$v(pq) = (vp)q.$$ 

Definition 2.2. A right quaternionic pre-Hilbert space or right quaternionic inner product space $V_R(\mathbb{Q})$ is a right quaternionic vector space together with the binary mapping $\langle .| . \rangle : V_R(\mathbb{Q}) \times V_R(\mathbb{Q}) \rightarrow \mathbb{Q}$ (called the Hermitian quaternionic inner product) which satisfies following properties:

(a) $\langle v_1|v_2 \rangle = \langle v_2|v_1 \rangle$ for all $v_1, v_2 \in V_R(\mathbb{Q})$.
(b) $\langle v|v \rangle > 0$ for all $0 \neq v \in V_R(\mathbb{Q})$.
(c) $\langle v|v_1 + v_2 \rangle = \langle v|v_1 \rangle + \langle v|v_2 \rangle$ for all $v, v_1, v_2 \in V_R(\mathbb{Q})$.
(d) $\langle v|uq \rangle = \langle v|u \rangle q$ for all $v, u \in V_R(\mathbb{Q})$ and $q \in \mathbb{Q}$.

Let $V_R(\mathbb{Q})$ be right quaternionic inner product space with the Hermitian inner product $\langle .| . \rangle$. Define the quaternionic norm $|| .|| : V_R(\mathbb{Q}) \rightarrow \mathbb{R}^+$ on $V_R(\mathbb{Q})$ by

$$||u|| = \sqrt{\langle u|u \rangle}; \ u \in V_R(\mathbb{Q}). \quad (2.2)$$

Definition 2.3. The right quaternionic pre-Hilbert space is called a right quaternionic Hilbert space, if it is complete with respect to the norm (2.2) and is denoted by $V_R(\mathbb{Q})$.

Theorem 2.4 ([1]) (The Cauchy-Schwarz Inequality). If $V_R(\mathbb{Q})$ is a right quaternionic Hilbert space then

$$|\langle u|v \rangle|^2 \leq \langle u|u \rangle \langle v|v \rangle; \ \text{for all} \ u, v \in V_R(\mathbb{Q}).$$

Moreover, a norm as defined in (2.2) satisfies the following properties:
Definition 2.8. Let \( V_R(\mathcal{Q}) \) be a right quaternionic Hilbert space and \( T \) be an operator on \( V_R(\mathcal{Q}) \). Then \( T \) is said to be

- **right \( \mathcal{Q} \)-linear** if \( T(v_1\alpha + v_2\beta) = T(v_1)\alpha + T(v_2)\beta \), for all \( v_1, v_2 \in V_R(\mathcal{Q}) \) and \( \alpha, \beta \in \mathcal{Q} \).
- **bounded** if there exist \( K \geq 0 \) such that \( \|T(v)\| \leq K\|v\| \), for all \( v \in V_R(\mathcal{Q}) \).

Definition 2.9. Let \( V_R(\mathcal{Q}) \) be a right quaternionic Hilbert space and \( T \) be an operator on \( V_R(\mathcal{Q}) \). Then the **adjoint operator** \( T^* \) of \( T \) is defined by

\[
\langle v | T u \rangle = \langle T^* v | u \rangle , \quad \text{for all } u, v \in V_R(\mathcal{Q}).
\]

Furthermore, \( T \) is said to be **self-adjoint** if \( T = T^* \).
**Theorem 2.10** ([1]). Let $V_R(\mathfrak{O})$ be a right quaternionic Hilbert space and $S$ and $T$ be two bounded right $\mathfrak{O}$-linear operators on $V_R(\mathfrak{O})$. Then

(a) $T + S$ and $TS \in \mathfrak{B}(V_R(\mathfrak{O}))$. Moreover:

$$\|T + S\| \leq \|T\| + \|S\| \quad \text{and} \quad \|TS\| \leq \|T\|\|S\|. $$

(b) $\langle Tv | u \rangle = \langle v | T^* u \rangle$.

(c) $(T + S)^* = T^* + S^*$.

(d) $(TS)^* = S^* T^*$.

(e) $(T^*)^* = T$.

(f) $I^* = I$, where $I$ is the identity operator on $V_R(\mathfrak{O})$.

(g) If $T$ is an invertible operator then $(T^{-1})^* = (T^*)^{-1}$.

### 2.3. Frames in quaternionic Hilbert spaces.

We begin this section with the following definition of frames in a separable right quaternionic Hilbert space $V_R(\mathfrak{O})$ as defined in [14]:

**Definition 2.11.** Let $V_R(\mathfrak{O})$ be a right quaternionic Hilbert space and $\{u_i\}_{i \in \mathbb{N}}$ be a sequence in $V_R(\mathfrak{O})$. Then $\{u_i\}_{i \in \mathbb{N}}$ is said to be a frame for $V_R(\mathfrak{O})$, if there exist two finite real quaternions $r_1$ and $r_2$ with $0 < r_1 \leq r_2$ such that

$$r_1 \|u\|^2 \leq \sum_{i \in \mathbb{N}} |\langle u_i | u \rangle|^2 \leq r_2 \|u\|^2,$$

for all $u \in V_R(\mathfrak{O})$. (2.4)

The finite positive real quaternions $r_1$ and $r_2$, respectively, are called *lower* and *upper* frame bounds for the frame $\{u_i\}_{i \in \mathbb{N}}$. The inequality (2.4) is called frame inequality for the frame $\{u_i\}_{i \in \mathbb{N}}$. A sequence $\{u_i\}_{i \in \mathbb{N}}$ is called a *Bessel sequence* for a right quaternionic Hilbert space $V_R(\mathfrak{O})$ with bound $r_2$, if $\{u_i\}_{i \in \mathbb{N}}$ satisfies the right hand side of the inequality (2.4). A frame $\{u_i\}_{i \in \mathbb{N}}$ for a right quaternionic Hilbert space $V_R(\mathfrak{O})$ is said to be

- **tight**, if it is possible to choose $r_1$ and $r_2$ satisfying inequality (3.1) with $r_1 = r_2$.
- **Parseval frame**, if it is tight with $r_1 = r_2 = 1$.
- **exact**, if it ceases to be a frame whenever any of its element is removed.

If $\{u_i\}_{i \in \mathbb{N}}$ is a Bessel sequence for a right quaternionic Hilbert space $V_R(\mathfrak{O})$. Then, the *(right) synthesis operator* for $\{u_i\}_{i \in \mathbb{N}}$ is a right linear operator $T : \ell_2(\mathfrak{O}) \to V_R(\mathfrak{O})$ defined by

$$T(\{q_i\}_{i \in \mathbb{N}}) = \sum_{i \in \mathbb{N}} u_i q_i, \quad \{q_i\}_{i \in \mathbb{N}} \in \ell_2(\mathfrak{O}).$$

The adjoint operator $T^*$ of right synthesis operator $T$ is called the *(right) analysis operator*. Further, the analysis operator $T^* : V_R(\mathfrak{O}) \to \ell_2(\mathfrak{O})$ is given by

$$T^*(u) = \{\langle u | v \rangle\}_{i \in \mathbb{N}}, \quad u \in V_R(\mathfrak{O}).$$

Infact, for $u \in V_R(\mathfrak{O})$ and $\{q_i\}_{i \in \mathbb{N}} \in \ell_2(\mathfrak{O})$, we have

$$\langle T^*(u) | \{q_i\}_{i \in \mathbb{N}} \rangle = \langle u | T(\{q_i\}_{i \in \mathbb{N}}) \rangle = \left\langle u \left| \sum_{i \in \mathbb{N}} u_i q_i \right\rangle = \sum_{i \in \mathbb{N}} \langle u | u_i \rangle q_i = \left\langle \{u_i \} | \{q_i \} \right\rangle.$$}

Thus, we get

$$T^*(u) = \{\langle u_i | u \rangle\}_{i \in \mathbb{N}}, \quad u \in V_R(\mathfrak{O}).$$
Let $V_R(\Omega)$ be a right quaternionic Hilbert space and $\{u_i\}_{i \in \mathbb{N}}$ be a frame for $V_R(\Omega)$. Then, the (right) frame operator $S : V_R(\Omega) \to V_R(\Omega)$ for the frame $\{u_i\}_{i \in \mathbb{N}}$ is a right linear operator given by
\[ S(u) = TT^*(u) = \sum_{i \in \mathbb{N}} u_i \langle u_i | u \rangle, \quad u \in V_R(\Omega). \]

3. Riesz Basis in Quaternionic Hilbert Spaces

One may recall that, if $N, N' \subset V_R(\Omega)$ are Hilbert bases, then there exists a bounded unitary right linear operator $U$ such that $U(N) = N'$. Moreover, if $V$ is a bounded unitary right linear operator, then $\{V(z) \in V_R(\Omega) : z \in N\}$ is a Hilbert basis of $H$. We have the following modification of the definition of Riesz basis in a separable right quaternionic Hilbert space

**Definition 3.1.** Let $V_R(\Omega)$ be a right quaternionic Hilbert space. Then, a Riesz basis for $V_R(\Omega)$ is a family of the form $U(N) = \{U(e_n)\}_{n \in \mathbb{N}}$, where $N = \{e_n\}_{n \in \mathbb{N}}$ is an orthonormal basis or Hilbert basis for $V_R(\Omega)$ and $U : V_R(\Omega) \to V_R(\Omega)$ is a bounded right linear bijective operator.

In the next result, we prove that a Riesz basis produces another unique Riesz basis which is used in the reconstruction of a vector of the space.

**Theorem 3.2.** Let $V_R(\Omega)$ be a right quaternionic Hilbert space and $X = \{x_n\}_{n \in \mathbb{N}}$ be a Riesz basis for $V_R(\Omega)$. Then $X$ is a Bessel sequence. Further, there exists a unique sequence $Y = \{y_n\}_{n \in \mathbb{N}} \subset V_R(\Omega)$ such that
\[ u = \sum_{n \in \mathbb{N}} x_n \langle y_n | u \rangle, \quad \text{for all } u \in V_R(\Omega). \] (3.5)

The sequence $Y$ is also a Riesz basis, and the series \( \sum_{n \in \mathbb{N}} \) converges unconditionally for every $u \in V_R(\Omega)$.

**Proof.** As $X$ is a Riesz basis, $X = \{x_n\}_{n \in \mathbb{N}} = \{U(e_n)\}_{n \in \mathbb{N}}$, where $\{e_n\}_{n \in \mathbb{N}}$ is an orthonormal basis for $V_R(\Omega)$ and $U : V_R(\Omega) \to V_R(\Omega)$ is a bounded right linear bijective operator. So, for every $u \in V_R(\Omega)$, we have
\[ U^{-1}(u) = \sum_{n \in \mathbb{N}} e_n \langle e_n | U^{-1}(u) \rangle \]

Define $Y = \{y_n\}_{n \in \mathbb{N}} = \{(U^{-1})^* e_n\}_{n \in \mathbb{N}}$. Then, we compute
\[ u = UU^{-1}u = \sum_{n \in \mathbb{N}} U(e_n) \langle (U^{-1})^* e_n | u \rangle = \sum_{n \in \mathbb{N}} x_n \langle y_n | u \rangle. \]

Since the operator $(U^{-1})^*$ is a bounded right linear bijective operator, $Y$ is also a Riesz basis. Further, for each $u \in V_R(\Omega)$, we have
\[ \sum_{n \in \mathbb{N}} |\langle x_n | u \rangle|^2 = \sum_{n \in \mathbb{N}} |\langle U(e_n) | u \rangle|^2 = \|U^*(u)\|^2 \leq \|U\|^2 \|u\|^2. \] (3.6)
So, $X$ is a Bessel sequence. Thus, the series $\{3.5\}$ converges unconditionally.

Further, as $U^{-1}$ is a right linear bounded operator and $\{e_n\}_{n \in \mathbb{N}}$ is an orthonormal basis, every Riesz basis in $V_R(\Omega)$ is also a basis for $V_R(\Omega)$. Therefore, if $\{y_n\}_{n \in \mathbb{N}}$ and $\{z_n\}_{n \in \mathbb{N}}$ are sequences in $V_R(\Omega)$ such that for every $u \in V_R(\Omega)$

$$u = \sum_{n \in \mathbb{N}} x_n \langle y_n | u \rangle = \sum_{n \in \mathbb{N}} x_n \langle z_n | u \rangle,$$

then $\{y_n\}_{n \in \mathbb{N}} = \{z_n\}_{n \in \mathbb{N}}$. □

The unique sequence $Y = \{y_n\}_{n \in \mathbb{N}} = \{(U^{-1})^* e_n\}_{n \in \mathbb{N}} \subset V_R(\Omega)$ satisfying $\{3.6\}$ is called the dual Riesz basis of $X = \{x_n\}_{n \in \mathbb{N}} = \{U(e_n)\}_{n \in \mathbb{N}}$. Similarly, the dual of $Y$ is

$$\left\{ \left( (U^{-1})^* \right)^* e_n \right\}_{n \in \mathbb{N}} = \{U(e_n)\}_{n \in \mathbb{N}} = X.$$

Therefore, $X$ and $Y$ are duals of each other. So, we call them a pair of dual Riesz bases in $V_R(\Omega)$.

Related to pair of dual Riesz bases, we give the following result.

**Theorem 3.3.** Let $X = \{x_n\}_{n \in \mathbb{N}}$ and $Y = \{y_n\}_{n \in \mathbb{N}}$ be a pair of dual Riesz basis for a quaternionic Hilbert space $V_R(\Omega)$. Then

(a) $X$ and $Y$ forms a biorthogonal system.

(b) For every $u \in V_R(\Omega)$,

$$u = \sum_{n \in \mathbb{N}} x_n \langle y_n | u \rangle = \sum_{n \in \mathbb{N}} y_n \langle x_n | u \rangle.$$

**Proof.** (a). As $X$ and $Y$ are Riesz bases, $X = \{U(e_n)\}_{n \in \mathbb{N}}$ and $Y = \{(U^{-1})^* e_n\}_{n \in \mathbb{N}}$, where $U : V_R(\Omega) \to V_R(\Omega)$ is a bounded right linear bijective operator. Then, we have

$$\langle x_i | y_j \rangle = \langle U(e_i) | (U^{-1})^* e_j \rangle = \langle U^{-1} U(e_i) | e_j \rangle = \langle e_i | e_j \rangle = \delta_{ij}, \text{ for each } i, j \in \mathbb{N}.$$

(b). Straight forward. □

In the next result, we show that every Riesz basis in a quaternionic Hilbert space $V_R(\Omega)$ is a frame for $V_R(\Omega)$.

**Theorem 3.4.** If $V_R(\Omega)$ is a right quaternionic Hilbert space and $X = \{x_n\}_{n \in \mathbb{N}}$ be a Riesz basis for $V_R(\Omega)$, then $X$ is a frame for $V_R(\Omega)$.

**Proof.** In view of (3.6) it is clear that, $X = \{U(e_n)\}_{n \in \mathbb{N}}$ is a Bessel sequence with bound $\|U\|^2$, where $U : V_R(\Omega) \to V_R(\Omega)$ is a bounded right linear bijective operator. Also

$$\|u\| = \| (U^*)^{-1} U^* (u) \| \leq \| (U^*)^{-1} \| \| U^* (u) \| = \| U^{-1} \| \| U^* (u) \|.$$

Thus, $X$ is the frame with the largest possible lower frame bound and the smallest possible upper frame bound $\frac{1}{\|U^{-1}\|^2}$ and $\|U\|^2$, respectively. Thus, Riesz bases produce frames for quaternionic Hilbert spaces. □

Next result is related to regarding Bessel sequences in quaternionic Hilbert spaces.
Theorem 3.5. Let $V_R(\Omega), W_R(\Omega)$ be right quaternionic Hilbert spaces and let $X = \{x_n\}_{n \in \mathbb{N}} \subset V_R(\Omega)$, $Y = \{y_n\}_{n \in \mathbb{N}} \subset W_R(\Omega)$. Assume that $Y$ is a Bessel sequence in $W_R(\Omega)$ with bound $B$, $X$ is complete in $V_R(\Omega)$, and there exists a positive constant $A$ such that

$$A \sum_{n \in \mathbb{N}} |q_n|^2 \leq \left\| \sum_{n \in \mathbb{N}} x_n q_n \right\|^2$$

for all eventually zero sequences of quaternions $\{q_n\}_{n \in \mathbb{N}}$. Then $U : \text{span} \ X \to \text{span} \ Y$ defined by

$$U \left( \sum_{n \in \mathbb{N}} x_n q_n \right) = \sum_{n \in \mathbb{N}} y_n q_n,$$

is a bounded right linear operator with a unique extension to a bounded operator from $V_R(\Omega)$ into $W_R(\Omega)$, the norm of $U$ as well as its extension is at most $\sqrt{\frac{B}{A}}$.

Proof. For every $x \in \text{span} \ X$, there exist a unique sequence of eventually zero quaternions $\{q_n\}_{n \in \mathbb{N}}$ such that $x = \sum_{n \in \mathbb{N}} x_n q_n$. Therefore, $U : \text{span} \ X \to \text{span} \ Y$ defined by

$$U \left( \sum_{n \in \mathbb{N}} x_n q_n \right) = \sum_{n \in \mathbb{N}} y_n q_n,$$

is well-defined and right linear. Further, for an eventually zero quaternions $\{q_n\}_{n \in \mathbb{N}}$, we have

$$\left\| U \left( \sum_{n \in \mathbb{N}} x_n q_n \right) \right\|^2 = \left\| \sum_{n \in \mathbb{N}} x_n q_n \right\|^2 \leq B \sum_{n \in \mathbb{N}} |q_n|^2 \leq \frac{B}{A} \left\| \sum_{n \in \mathbb{N}} y_n q_n \right\|^2.$$

Thus, $U$ is bounded. Furthermore, as $X$ is complete, $U$ has an unique extension to a bounded operator on $V_R(\Omega)$ into $W_R(\Omega)$. \qed

Next, we define a Riesz sequence as follows:

Definition 3.6. Let $V_R(\Omega)$ be a right quaternionic Hilbert space and $X = \{x_n\}_{n \in \mathbb{N}}$ be a sequence in $V_R(\Omega)$. Then $X$ is said to be a Riesz sequence in $V_R(\Omega)$ if there exists positive real quaternions $A$ and $B$ such that

$$A \sum_{n \in \mathbb{N}} |q_n|^2 \leq \left\| \sum_{n \in \mathbb{N}} x_n q_n \right\|^2 \leq B \sum_{n \in \mathbb{N}} |q_n|^2,$$

for all eventually zero sequences of quaternions $\{q_n\}_{n \in \mathbb{N}}$.

The next theorem gives an equivalent condition for a Riesz basis in terms of a complete Riesz sequence.

Theorem 3.7. Let $V_R(\Omega)$ be a right quaternionic Hilbert space. Then $X = \{x_n\}_{n \in \mathbb{N}}$ is a Riesz basis for $V_R(\Omega)$ if and only if $X$ is complete Riesz sequence in $V_R(\Omega)$.
Proof. As $X$ is a Riesz basis, $X = \{x_n\}_{n \in \mathbb{N}} = \{U(e_n) : n \in \mathbb{N}\}$, where $\{e_n\}_{n \in \mathbb{N}}$ is an orthonormal basis for $V_R(\mathcal{Q})$ and $U : V_R(\mathcal{Q}) \to V_R(\mathcal{Q})$ is a bounded right linear bijective operator. So, in view of Theorem 3.7, $X$ is complete in $V_R(\mathcal{Q})$. Further, for any eventually zero sequences $\{q_n\}_{n \in \mathbb{N}} \subset \mathcal{Q}$, we have

$$\left\| \sum_{n \in \mathbb{N}} x_n q_n \right\|^2 = \left\| U \left( \sum_{n \in \mathbb{N}} x_n q_n \right) \right\|^2 \leq \|U\|^2 \left\| \sum_{n \in \mathbb{N}} x_n q_n \right\|^2 = B \sum_{n \in \mathbb{N}} |q_n|^2. \quad (3.8)$$

Further, we compute

$$\sum_{n \in \mathbb{N}} |q_n|^2 = \left\| \sum_{n \in \mathbb{N}} e_n q_n \right\|^2 = \left\| U^{-1} U \left( \sum_{n \in \mathbb{N}} e_n q_n \right) \right\|^2 \leq \|U^{-1}\|^2 \left\| \sum_{n \in \mathbb{N}} x_n q_n \right\|^2. \quad (3.9)$$

Thus, in view of (3.8) and (3.9), we get

$$\frac{1}{\|U^{-1}\|^2} \sum_{n \in \mathbb{N}} |q_n|^2 \leq \left\| \sum_{n \in \mathbb{N}} x_n q_n \right\|^2 \leq \|U\|^2 \sum_{n \in \mathbb{N}} |q_n|^2.$$

Conversely, for each $i \in \mathbb{N}$, define $U_i : \ell_2(\mathcal{Q}) \to V_R(\mathcal{Q})$ as

$$U_i(\{q_n\}_{n \in \mathbb{N}}) = \sum_{n \leq i} x_n q_n$$

and $U : \ell_2(\mathcal{Q}) \to V_R(\mathcal{Q})$ as

$$U(\{q_n\}_{n \in \mathbb{N}}) = \sum_{n \in \mathbb{N}} x_n q_n.$$

Then by (3.7), each $U_n$ and $U$ are bounded right linear operators and $\{U_n\} \to U$. Then by uniform boundedness principle, (3.7) is true for all $\{q_n\}_{n \in \mathbb{N}} \in \ell^2(\mathcal{Q})$. This implies that $X$ is a Bessel sequence with bound $B$. Next, choosing an orthonormal basis $\{e_n\}_{n \in \mathbb{N}}$ for $V_R(\mathcal{Q})$, then by Theorem 3.5 there exist unique extensions of the mappings $U(e_n) = x_n$, $n \in \mathbb{N}$ and $V(x_n) = e_n$, $n \in \mathbb{N}$ to bounded operators on $V_R(\mathcal{Q})$. Then, $VU = UV = I$. So $U$ is invertible. Thus, $X$ is a Riesz basis for $V_R(\mathcal{Q})$. □

Corollary 3.8. Let $V_R(\mathcal{Q})$ be a right quaternionic Hilbert space and $X$ be a Riesz sequence in $V_R(\mathcal{Q})$. Then $X$ is a Riesz basis for $\text{span} \; X$.

Proof. Straight forward. □

Corollary 3.9. Let $V_R(\mathcal{Q})$ be a right quaternionic Hilbert space. Then every subfamily of a Riesz sequence is a Riesz sequence.
Proof. Straight forward. □
