On particular diameter bounds for integral point sets in higher dimensions

Avdeev N.N. †, Zvolinsky R.E., Momot E.A.

November 27, 2019

1 Introduction

Definition 1. A planar integral point set (PIPS) is a set $\mathcal{P}$ of non-collinear points in plane $\mathbb{R}^2$ such that for any pair of points $P_1, P_2 \in \mathcal{P}$ the Euclidean distance $|P_1P_2|$ between points $P_1$ and $P_2$ is integral.

Definition 1 can be generalized as follows:

Definition 2. An integral point set $\mathcal{P}$ is a set of $n$ points in the $m$-dimensional Euclidean space $\mathbb{R}^m$ with pairwise integral distances.

How can we characterize an integral point set? First of all, we can look at its dimension; then, we can count the number of points in it, which is always finite [1, 2] and is further called the cardinality; finally, we can naturally define the diameter of a finite point set.

Definition 3. A diameter of the integral point set $\mathcal{P}$ is defined as

$$\text{diam}(\mathcal{P}) = \max_{P_1, P_2 \in \mathcal{P}} |P_1P_2|$$

Every integral point set also has a characteristic [3, 4].

Definition 4. The function $d(m, n)$ is the minimum possible diameter of the integral point set $\mathcal{P}$ of $n$ points in $m$-dimensional Euclidean space $\mathbb{R}^m$.

For the list of known bounds for $d(m, n)$, we refer the reader to [5, Theorem 1] or to [6]. We will discuss the following estimations presented at [5]:

$$d(m, 2m + 1) \leq 8$$
$$d(m, 2m + 2) \leq 13$$
$$d(m, 3m) \leq 109$$

and the following theorem [5, Theorem 2.1].

*This work was carried out at Voronezh State University and supported by the Russian Science Foundation grant 19-11-00197.

†nickkolok@mail.ru, avdeev@math.vsu.ru
Theorem 1. Let $\mathcal{P}$ be a planar integral point set consisting of $n - 2$ points on line $l_1$ and two points $P_1$ and $P_2$ on a parallel line $l_2$ with distance $r$ between $l_1$ and $l_2$. If there exist positive integers $v, w$ with $v^2 + v^2 = w^2$ and $v < 2r$, where $|P_1P_2| = f$, then

$$d(m, n + 2(m - 2)) \leq \max(w, \text{diam}(\mathcal{P}))$$

(5)

Firstly, we discuss the classification of planar integral point sets; then, we present some bounds for $d(m, n)$ based on planar integral point sets of particular types and provide some general constructions for such bounds.

2 Classification of planar integral point sets

2.1 Integral point sets situated in two straight lines

Definition 5. A planar integral point sets of $n$ points with $n - 1$ points on a straight line is called a facher set.

Facher sets are very dominating examples of planar integral point sets. In [7], facher sets of characteristic 1 are called semi-crabs. For $9 \leq n \leq 122$, the diameter $d(2, n)$ is reached on a facher point set [8].

For non-facher integral point sets situated in two straight lines, we can easily distinguish the following three cases:

Definition 6. A planar integral point sets situated in two parallel straight lines is called a rails set.

Among the rails sets, sets with 2 points on one line and all the other on another line dominate.

Definition 7. A planar integral point sets situated in two perpendicular straight lines is called a cross set.

Every cross set has characteristic 1; in [7], cross sets with only 2 points out of one of the lines are called crabs.

Definition 8. A planar integral point sets situated in two straight lines that are not parallel nor perpendicular, is called a scissors set.

There is an important subclass of scissors sets.

Definition 9. A scissors set with an axis of symmetry, which is the angle bisector for the straight lines, is called a pyramid set.

2.2 Other integral point sets

Definition 10. A planar integral point sets that is situated on a circle is called a circular point set.

Circular sets are very important examples of integral point sets [9—11].

Definition 11. A planar integral point sets that is situated on the conjunction of a circle with its center, is called a centered-circular point set.

These six classes dominate among all the known planar integral point sets; however, some sophisticated constructions are also known.
3 Bounds based on rails sets

Let \( i = 1, k \) denote the enumeration of all \( i \) from 1 to \( k \). Theorem \([5, \text{Theorem 2.1}]\) can be generalized as follows:

**Theorem 2.** Let \( \mathcal{P} \) be a planar integral point set consisting of \( n - k \) points on line \( l_1 \) and \( k \) points \( P_1, P_2, \ldots, P_k \) on a parallel line \( l_2 \) with distance \( r \) between \( l_1 \) and \( l_2 \). If there exist positive integers \( v, w_{ij} \), with \( f_{ij}^2 + v^2 = w_{ij}^2 \) and \( v < 2r \), where \( i = 1, k - 1, j = i + 1, k \), \( |P_i P_j| = f_{ij} \), then

\[
d(m, n + k(m - 2)) \leq \max(w_{1k}, \text{diam}(\mathcal{P}))
\]  

(6)

Below we give the planar integral point sets and the corresponding estimates of the function \( d(m, n) \) for \( n = 2m + k, 3 \leq k \leq 36 \). For convenience, we use the notation \([6; 12; 13]: \sqrt{p}/q \ast \{(x_1, y_1), \ldots, (x_n, y_n)\}\), which means that each abscissa is multiplied by \( 1/q \) and each ordinate is multiplied by \( \sqrt{p}/q \), i.e.

\[
\sqrt{p}/q \ast \{(x_1, y_1), \ldots, (x_n, y_n)\} = \left\{ \left(\frac{x_1}{q}, \frac{y_1\sqrt{p}}{q}\right), \ldots, \left(\frac{x_n}{q}, \frac{y_n\sqrt{p}}{q}\right) \right\}.
\]

  \( f = 8, v = 6, w = 10, \text{diam}(\mathcal{P}) = 17 \), which gives \( d(m, 2m + 3) \leq 17 \).

- \( \mathcal{P} = \sqrt{315}/2 \ast \{(13, 1), (29, 1), (0, 0), (10, 0), (16, 0), (26, 0), (32, 0), (42, 0)\} \) (Figure 2)
  
  \( f = 8, v = 6, w = 10, \text{diam}(\mathcal{P}) = 21 \), which gives \( d(m, 2m + 4) \leq 21 \).

- \( \mathcal{P} = \sqrt{70}/1 \ast \{(-44, 12), (78, 0), (-62, 0), (-55, 0), (10, 0)\} \) (Figure 3)
  
  \( f = 88, v = 66, w = 110, \text{diam}(\mathcal{P}) = 158 \), which gives \( d(m, 2m + 5) \leq 158 \).

- \( \mathcal{P} = \sqrt{70}/1 \ast \{(44, 12), (78, 0), (62, 0), (55, 0), (10, 0)\} \) (Figure 4)
  
  \( f = 88, v = 66, w = 110, \text{diam}(\mathcal{P}) = 158 \), which gives \( d(m, 2m + 6) \leq 158 \).
Figure 3: PIPS of cardinality 9 and diameter 158

Figure 4: PIPS of cardinality 10 and diameter 158

\( \mathcal{P} = \sqrt{70}/2 \times \{(\pm 99, 24), (\pm 207, 0), (\pm 145, 0), (\pm 63, 0), (\pm 25, 0), (-297, 0)\} \) (Figure 5).

\( f = 99, v = 20, w = 101, \text{diam}(\mathcal{P}) = 252, \)

which gives \( d(m, 2m + 7) \leq 252. \)

Figure 5: PIPS of cardinality 11 and diameter 252

Figure 6: PIPS of cardinality 12 and diameter 297

\( \mathcal{P} = \sqrt{70}/2 \times \{(\pm 99, 24), (\pm 297, 0), (\pm 207, 0), (\pm 145, 0), (\pm 63, 0), (\pm 25, 0)\} \) (Figure 6).

\( f = 99, v = 20, w = 101, \text{diam}(\mathcal{P}) = 297, \)

which gives \( d(m, 2m + 8) \leq 297. \)

\( \mathcal{P} = \sqrt{19019}/2 \times \{(\pm 200, 3), (\pm 873, 0), (\pm 615, 0), (\pm 377, 0), (\pm 215, 0), (\pm 23, 0), (-1273, 0)\} \) (Figure 7).

\( f = 200, v = 45, w = 205, \text{diam}(\mathcal{P}) = 1073, \)

which gives \( d(m, 2m + 9) \leq 1073. \)

Figure 7: PIPS of cardinality 13 and diameter 1073
$\mathcal{P} = \sqrt{19019/2} \times \{(\pm 200, 3), (\pm 1273, 0), (\pm 873, 0), (\pm 615, 0), (\pm 377, 0), (\pm 215, 0), (\pm 23, 0)\}$ (Figure 8).

$f = 200, \nu = 45, w = 205, \text{diam}(\mathcal{P}) = 1273,$

which gives $d(m, 2m + 10) \leq 1273.$

$\mathcal{P} = \sqrt{385/2} \times \{(\pm 1105, 48), (\pm 1587, 0), (\pm 1269, 0), (\pm 763, 0), (\pm 623, 0), (\pm 529, 0), (\pm 339, 0), (-2189, 0)\}$ (Figure 9).

$f = 1105, \nu = 300, w = 1145, \text{diam}(\mathcal{P}) = 1888,$

which gives $d(m, 2m + 11) \leq 1888.$

$\mathcal{P} = \sqrt{385/2} \times \{(\pm 1105, 48), (\pm 2189, 0), (\pm 1587, 0), (\pm 1269, 0), (\pm 763, 0), (\pm 623, 0), (\pm 529, 0), (\pm 339, 0)\}$ (Figure 10).

$f = 1105, \nu = 300, w = 1145, \text{diam}(\mathcal{P}) = 2189,$

which gives $d(m, 2m + 12) \leq 2189.$

$\mathcal{P} = \sqrt{154/1} \times \{(\pm 874, 60), (\pm 1376, 0), (\pm 1036, 0), (\pm 899, 0), (\pm 849, 0), (\pm 613, 0), (\pm 576, 0), (\pm 100, 0), (-1848, 0)\}$ (Figure 11).

$f = 1748, \nu = 336, w = 1780, \text{diam}(\mathcal{P}) = 3224,$

which gives $d(m, 2m + 13) \leq 3224.$
• $P = \sqrt{154/1} * \{(\pm874, 60), (\pm1848, 0), (\pm1376, 0), (\pm1036, 0), (\pm899, 0), (\pm849, 0), (\pm613, 0), (\pm576, 0), (\pm100, 0)\}$ (Figure 12).

$f = 1748$, $v = 336$, $w = 1780$, $\text{diam}(P) = 3696$,
which gives $d(m, 2m + 14) \leq 3696$.

• $P = \sqrt{154/1} * \{(\pm874, 60), (\pm1848, 0), (\pm1376, 0), (\pm1036, 0), (\pm899, 0), (\pm849, 0), (\pm613, 0), (\pm576, 0), (\pm100, 0), (\pm3293, 0)\}$ (Figure 13).

$f = 1748$, $v = 336$, $w = 1780$, $\text{diam}(P) = 5141$,
which gives $d(m, 2m + 15) \leq 5141$.
\( P = \sqrt{\frac{154}{1}} \times \{(\pm 2622, 180), (\pm 6148, 0), (\pm 5544, 0), (\pm 4128, 0), (\pm 3108, 0), (\pm 2697, 0), (\pm 2547, 0), (\pm 1839, 0), (\pm 1728, 0), (\pm 904, 0), (\pm 300, 0)\} \) (Figure 16).

\( f = 5244, v = 1008, w = 5340, \text{diam}(P) = 12296, \)

which gives \( d(m, 2m + 18) \leq 12296. \)

\( P = \sqrt{\frac{154}{1}} \times \{(\pm 2622, 180), (\pm 6148, 0), (\pm 5544, 0), (\pm 4128, 0), (\pm 3108, 0), (\pm 2697, 0), (\pm 2547, 0), (\pm 1839, 0), (\pm 1728, 0), (\pm 904, 0), (\pm 300, 0), (-9879, 0)\} \) (Figure 17).

\( f = 5244, v = 1008, w = 5340, \text{diam}(P) = 16027, \)

which gives \( d(m, 2m + 19) \leq 16027. \)

\( P = \sqrt{\frac{154}{1}} \times \{(\pm 2622, 180), (\pm 9879, 0), (\pm 6148, 0), (\pm 5544, 0), (\pm 4128, 0), (\pm 3108, 0), (\pm 2697, 0), (\pm 2547, 0), (\pm 1839, 0), (\pm 1728, 0), (\pm 904, 0), (\pm 300, 0)\} \) (Figure 18).

\( f = 5244, v = 1008, w = 5340, \text{diam}(P) = 19758, \)

which gives \( d(m, 2m + 20) \leq 19758. \)
\[ P = \sqrt{154}/1 \times \{(\pm 5244, 360), (\pm 12296, 0), (\pm 11088, 0), (\pm 8579, 0), (\pm 8256, 0), (\pm 6216, 0), (\pm 5394, 0), (\pm 5094, 0), (\pm 3678, 0), (\pm 3456, 0), (\pm 1808, 0), (\pm 600, 0), (-19758, 0)\} \] (Figure 19).

which gives \(d(m, 2m + 33) \leq 26431951.\)

Figure 31: PIPS of cardinality 37 and diameter 26431951
\( \mathcal{P} = \sqrt{154}/1 \times \{(±13440856, 0), (±12991095, 0), (±8989890, 0), (±7543770, 0), (±5594680, 0), (±5045040, 0), (±3903445, 0), (±3756480, 0), (±3694845, 0), (±2828280, 0), (±2454270, 0), (±2386020, 163800), (±2317770, 0), (±1673490, 0), (±1572480, 0), (±822640, 0), (±7543770, 0), (±6289920, 0), (±4006275, 0), (±3290560, 0), (±273000, 0), (±145912, 0) \} \) (Figure 32).

\( f = 4772040, \ v = 41678, \ w = 4772222, \ \text{diam}(\mathcal{P}) = 26881712, \)
which gives \( d(m, 2m + 34) \leq 26881712. \)

\( \mathcal{P} = \sqrt{154}/1 \times \{(±51964380, 0), (±35959560, 0), (±30175080, 0), (±22378720, 0), (±20180160, 0), (±15613780, 0), (±15025920, 0), (±14779380, 0), (±11313120, 0), (±9817080, 0), (±9544080, 655200), (±9271080, 0), (±6693960, 0), (±6289920, 0), (±4006275, 0), (±3290560, 0), (±1938720, 0), (±1092000, 0), (±583648, 0), (−53763424, 0) \} \) (Figure 33).

\( f = 19088160, \ v = 8738, \ w = 19088162, \ \text{diam}(\mathcal{P}) = 105727804, \)
which gives \( d(m, 2m + 35) \leq 105727804. \)
\[ f = 19088160, \quad v = 8738, \quad w = 19088162, \quad \text{diam}(P) = 107526848, \]

which gives \( d(m, 2m+36) \leq 107526848. \)

**Remark 1.** For all the examples above, maximum in the right part of (3) evaluates to the diameter of the system. The following example shows that the maximum can be evaluated to \( w \):

- \( P = \sqrt{2}/1 \times \{(\pm 76, 60), (\pm 62, 0), (\pm 29, 0), (\pm 6, 0)\} \) (Figure 35).
  
  \[ f = 152, \quad v = 114, \quad w = 190, \quad \text{diam}(P) = 162. \]

  We can obtain the estimate \( d(m, 2m+2) \leq 190 \) (which is worse than known one (2)).

Guy gives [14, p. D 20] a system of 8 points located on two parallel lines. The points of the system form a rectangle (Figure 37):

- \( P = \sqrt{1}/1 \times \{(0, \pm 60), (182, \pm 60), (209, \pm 60), (391, \pm 60)\} \) (Figure 36),

  where \( n = 8, \) \( \text{diam}(P) = 409. \) Using the “blowing up” construction, we obtain

\[
d(m, 4m) \leq 409
\]  

(7)

Figure 39 shows an example for \( m = 3. \)
4 Bounds based on pyramid sets

**Theorem 3.** Let $\mathcal{P}$ be a planar integral point set consisting of $k$ points on the line $l_1$ and $k$ points on the line $l_2$. Besides, these points are symmetric with respect to one of the bisectors of the angles formed by the intersection of lines $l_1$ and $l_2$, then

$$d(m, (k - \alpha)m + \alpha) \leq \text{diam}(\mathcal{P}),$$

where

$$\alpha = \begin{cases} 1, & \text{when the intersection point } \in \mathcal{P}, \\ 0, & \text{when the intersection point } \notin \mathcal{P}. \end{cases}$$

**Remark 2.** The angles can be acute or obtuse. Figure 38 shows that the intersection angle of the lines $l_1$ and $l_2$ cannot be equal to $\pi/2$.

Below we give the planar integral point sets and the corresponding estimates of the function $d(m,n)$ for $n = 3m+1$ and $n = 4m+1$.

- $\mathcal{P} = \sqrt{3}/2 \times \{ (\pm 56, 0), (14, 0), (-34, 0), (-10, 24), (-21, 35), (35, -21) \}$ (Figure 40),
  where $n = 7$, diam($\mathcal{P}$) = 56. Using the “blowing up” construction, we obtain
  $$d(m, 3m + 1) \leq 56$$

The resulting estimate improves the estimate for $d(m,3m)$, which is presented in [3]. Figure 42 shows an example for $m = 3$.

- $\mathcal{P} = \sqrt{39}/8 \times \{ (\pm 5040, 0), (1911, 315), (2352, 0), (944, 0), (336, 0), (2940, -420), (2044, 220), (735, 1155) \}$ (Figure 41),
  where $n = 9$, diam($\mathcal{P}$) = 1260. Using the “blowing up” construction, we obtain
  $$d(m, 4m + 1) \leq 1260$$

Figure 43 shows an example for $m = 3$. 

Figure 39: IPS of cardinality 12 and diameter 409
5 Final remarks

All the given PIPSs were obtained through a combination of computer search an intuition of the authors; so, the further search may lead to better bounds employing the same constructions.

There is still no general construction for a rails or scissors PIPS of given cardinality. For rails PIPSs, we can conjecture that there exists a set of arbitrary cardinality with 2 points on...
one line and all the rest on the other; on the other hand, we still have not found any rails PIPSs with 4 and 5 points on the lines.

As for today, we have found pyramid PIPS of cardinality at most 9.
