ON A CONJECTURE OF LYNCH

ANURAG K. SINGH AND ULI WALTHER

The following conjecture has recently attracted attention, e.g., [BE1, BE2, DSZ, HJ]:

**Conjecture 1.** [Ly, Conjecture 1.2] Let \( R \) be a local ring, and \( I \) an ideal of \( R \). If the cohomological dimension of \( I \) is a positive integer \( c \), then

\[
\dim R / \text{ann}_R H^c_I(R) = \dim R / H^0_I(R).
\]

The conjecture is known to be false: the first counterexamples were constructed in [Ba]; these are nonequidimensional, with \( \dim R \geq 5 \). We present here a modification—with a short, elementary proof—that serves as a counterexample with \( \dim R = 3 \). This is a counterexample, as well, to [Ly, Proposition 4.3] and to [Ly, Theorem 4.4]; the error there is in the chain of inequalities in the proof of Proposition 4.3, [Ly, page 550], in the reduction from a complete local ring to a complete local unmixed ring: the cohomological dimension may change under the reduction step.

**Example 2.** Let \( k \) be a field, and set \( R := k[x, y, z_1, z_2] / (xyz_1, xyz_2) \). Consider the local cohomology module \( H^2_{(x, y)}(R) \). Using a Čech complex on \( x \) and \( y \), one sees that

\[
H^2_{(x, y)}(R) = R_{xy} / \text{image}(R_x + R_y).
\]

The images of \( z_1 \) and \( z_2 \) are zero in \( R_{xy} \), so the local cohomology module above agrees with \( S_{xy} / \text{image}(S_x + S_y) \), where \( S := R / (z_1, z_2) \) is isomorphic to the polynomial ring \( k[x, y] \). Hence \( H^2_{(x, y)}(R) \) is a nonzero \( R \)-module, with annihilator \( (z_1, z_2) \). On the other hand, since the ideal \( (x, y) \) contains nonzerodivisors, \( H^0_{(x, y)}(R) = 0 \). Hence one has

\[
\dim R / \text{ann}_R H^2_{(x, y)}(R) = 2 \quad \text{whereas} \quad \dim R / H^0_{(x, y)}(R) = 3.
\]
