LOCAL WELL-POSEDNESS IN SOBOLEV SPACES FOR FIRST-ORDER CONFORMAL CAUSAL RELATIVISTIC VISCOS HYDRODYNAMICS

FABIO S. BEMFICA*, MARCELO M. DISCONZI**, CASEY RODRIGUEZ***†, AND YUANZHEN SHAO****‡

Abstract. In this manuscript, we study the theory of conformal relativistic viscous hydrodynamics introduced in [4], which provided a causal and stable first-order theory of relativistic fluids with viscosity. The local well-posedness of its equations of motion has been previously established in Gevrey spaces. Here, we improve this result by proving local well-posedness in Sobolev spaces.

Keywords: relativistic viscous fluids; conformal symmetry; causality; local well-posedness.

1. Introduction

Relativistic hydrodynamics is an essential tool in several branches of physics, including high-energy nuclear physics [3], astrophysics [33], and cosmology [36], and it is also a fertile source of mathematical problems (see, e.g., the monographs [2, 9–11, 33] and references therein). This paper is concerned with the local well-posedness of the Cauchy problem to the equations of motion of relativistic viscous fluids.

More precisely, we consider the energy-momentum tensor for a relativistic conformal fluid given by

$$T_{\alpha\beta} = (\varepsilon + A)(u_\alpha u_\beta + \frac{1}{3}\Pi_{\alpha\beta}) - \eta \sigma_{\alpha\beta} + u_\alpha Q_\beta + u_\beta Q_\alpha,$$

where

$$A = 3\chi \left( \frac{1}{\theta} u^\mu \nabla_\mu \theta + \frac{1}{3} \nabla_\mu u^\mu \right),$$
$$Q_\alpha = \lambda \left( \frac{1}{\theta} \Pi_\alpha^\mu \nabla_\mu \theta + u^\mu \nabla_\mu u_\alpha \right),$$
$$\sigma_{\alpha\beta} = \Pi_\alpha^\mu \nabla_\mu u_\beta + \Pi_\beta^\mu \nabla_\mu u_\alpha - \frac{2}{3} \Pi_{\alpha\beta} \nabla_\mu u^\mu.$$

Above, $\varepsilon$ is the fluid’s energy density; $u$ is the fluid’s four-velocity, which satisfies the constraint

$$g_{\alpha\beta} u^\alpha u^\beta = -1,$$  \hspace{1cm} (1.2)

where $g$ is the spacetime metric\(^1\); $\Pi$ is the projection onto the space orthogonal to $u$, given by $\Pi_{\alpha\beta} = g_{\alpha\beta} + u_\alpha u_\beta$; $\theta$ is the temperature that satisfies $\varepsilon = \varepsilon_0 \theta^4$, where $\varepsilon_0 > 0$ a constant; $\eta$, $\chi$, and $\lambda$ are transport coefficients, which are known functions of $\varepsilon$ and model the viscous effects in the fluid; and $\nabla$ is the covariant derivative associated with the metric $g$. Indices are raised and lowered using the spacetime metric, lowercase Greek indices vary from 0 to 3, Latin indices vary from 1 to 3, repeated indices are summed over their range, and expressions such as $z_\alpha$, $w_{\alpha\beta}$, etc. represent the components of a vector or tensor with respect to a system of coordinates $\{x^\alpha\}_{\alpha=0}^3$ in spacetime, where the coordinates are always chosen so that $x^0 = t$ represents a time coordinate. We will consider the fluid dynamics in a fixed background, so that the metric $g$ is given.

The equations of motion are given by

$$\nabla_\alpha T^\alpha_\beta = 0$$ \hspace{1cm} (1.3)

supplemented by the constraint (1.2).

We now state our result. After the statement, we discuss our assumptions and provide some further context. We note that in view of (1.2), it suffices to provide the components of $u$ tangent to $\{t = 0\}$ as initial data; this explains the statement involving the projector $P$ in the Theorem.

**Theorem 1.1.** Let $g$ be the Minkowski metric on $\mathbb{R} \times \mathbb{T}^3$, where $\mathbb{T}^3$ is the three-dimensional torus. Let $\eta : (0, \infty) \to (0, \infty)$ be an analytic function, $\chi = a_1 \eta$, and $\lambda = a_2 \eta$, where $a_1$ and $a_2$ are positive constants satisfying $a_1 > 4$ and $a_2 \geq 3a_1/(a_1 - 1)$. Let $\varepsilon(0) \in H^r(\mathbb{T}^3, \mathbb{R})$, $\varepsilon(1) \in H^{r-1}(\mathbb{T}^3, \mathbb{R})$, $u(0) \in H^r(\mathbb{T}^3, \mathbb{R}^3)$, and $u(1) \in H^{r-1}(\mathbb{T}^3, \mathbb{R}^3)$ be given, where $H^r$ is the Sobolev space and $r > 7/2$. Assume that $\varepsilon(0) \geq C > 0$ for some constant $C$.

\(^1\)By “metric” we always mean a “Lorentzian metric.”
Then, there exists a $T > 0$, a function

$$
\varepsilon \in C^0([0, T), H^r(\mathbb{T}^3, \mathbb{R})) \cap C^1([0, T), H^{r-1}(\mathbb{T}^3, \mathbb{R})) \cap C^2([0, T), H^{r-2}(\mathbb{T}^3, \mathbb{R})),
$$

and a vector field

$$
u \in C^0([0, T), H^r(\mathbb{T}^3, \mathbb{R})) \cap C^1([0, T), H^{r-1}(\mathbb{T}^3, \mathbb{R})) \cap C^2([0, T), H^{r-2}(\mathbb{T}^3, \mathbb{R}))
$$
such that equations (1.2) and (1.3) hold on $[0, T) \times \mathbb{T}^3$, and satisfy $\varepsilon(0, \cdot) = \varepsilon(0, \cdot) = \varepsilon(0), \partial_\nu \varepsilon(0, \cdot) = \varepsilon(0)$, $\mathcal{P}u(0, \cdot) = u(0)$, and $\mathcal{P}\partial_\nu u(0, \cdot) = u(1)$, where $\partial_\nu$ is the derivative with respect to the first coordinate in $[0, T) \times \mathbb{T}^3$ and $\mathcal{P}$ is the canonical projection from the tangent bundle of $[0, T) \times \mathbb{T}^3$ onto the tangent bundle of $\mathbb{T}^3$. Moreover, $(\varepsilon, u)$ is the unique solution with the stated properties.

One of the main challenges in the theory of relativistic viscous hydrodynamics is to construct physically meaningful theories that respect causality, (linear) stability, and local well-posedness. The literature on this topic is vast and we refer the reader to [3, 16, 17, 22–24, 33–35] and references therein for discussion and background. Despite the importance of relativistic viscous hydrodynamics in the study, for example, of the quark-gluon-plasma that forms in heavy ion-collisions [3, 22] or in neutron star mergers [1], very few models have been showed to be causal, stable, and locally well-posed, and typical results of this nature have been only partial [5, 12, 13, 19, 26].

The energy-momentum (1.1) was introduced in [4], where a new approach to the formulation of relativistic viscous hydrodynamics was proposed for the case of a conformal fluid. The equations of motion derived from (1.1), i.e., (1.2) and (1.3), were showed to be causal, stable, and locally well-posed, and typical results of this nature have been studied in the directions parallel and orthogonal to $\mathbf{u}$.

We work on $\mathbb{T}^3$ for simplicity, since using the domain of dependence property (proved in [15]) one can adapt the proof to $\mathbb{R}^3$. The assumption $\varepsilon_0 \geq C > 0$, on the other hand, is crucial. Without it the equations can degenerate, resulting in a free-boundary dynamics, a problem that remains largely open even in the case of a relativistic perfect fluid [7, 8, 14, 18, 20, 21, 25, 30–32]

### 2. A new system of equations

In this section we derive a new system of equations that will allow us to establish Theorem 1.1. In order to do so, throughout this section, we assume to be given a sufficiently regular solution to (1.2)-(1.3).

Using (1.2) to decompose $\nabla_\nu T^\nu_\beta$ in the directions parallel and orthogonal to $\mathbf{u}$, we can rewrite (1.3) as

$$
\begin{align*}
\left. u^\alpha \nabla_\alpha A + \frac{4}{3} A \nabla_\alpha u^\alpha + \nabla_\alpha Q^\alpha + \dot{Q}_\alpha u^\lambda \nabla_\lambda u^\alpha - \frac{1}{2} \eta \sigma^\alpha\beta \sigma_{\alpha\beta} - \frac{4}{3 \chi} \varepsilon_0 \theta^4 A = 0, \quad (2.1a) \\
\frac{1}{3} \Sigma^\mu \nabla_\mu A + \frac{4}{3} A u^\alpha \nabla_\alpha u^\mu - \eta \nabla_\alpha \sigma^\alpha + \frac{\eta}{2} \sigma^\alpha\beta \sigma_{\alpha\beta} u^\mu + 3 \eta \sigma_{\mu\lambda} u^\alpha \nabla_\lambda u^\nu + u^\alpha \nabla_\alpha Q^\mu
\end{align*}
$$

However, only the case of a fixed background Minkowski metric is treated here, whereas in [4, 15] the coupling of (1.1) with Einstein’s equations has been studied.
\[-u_\mu Q^\lambda u^\alpha \nabla_\alpha u_\lambda + \nabla_\alpha u^\alpha Q_\mu + Q^\alpha \nabla_\alpha u_\mu + \frac{4\epsilon}{3\lambda} Q_\mu - \frac{3\eta}{\lambda} \sigma_{\mu\nu} Q^\nu = 0. \tag{2.1b}\]

Introducing

\[S_{\alpha}^{\beta} = \Pi_\alpha^\nu \nabla_\nu u^\beta,\]
\[S^\alpha = u^\mu \nabla_\mu u^\alpha,\]

we find

\[u^\mu \nabla_\mu A + \nabla_\mu Q^\mu + r_1 = 0, \tag{2.2a}\]
\[\Pi^{\alpha\mu} \nabla_\mu A + 3u^\mu \nabla_\mu Q^\alpha + B_\nu^{\alpha\mu\lambda} \nabla_\lambda S_\nu^\alpha + r_2 = 0, \tag{2.2b}\]
\[-\frac{1}{\chi} \Pi^{\alpha\mu} \nabla_\mu A + \frac{3}{\lambda} u^\mu \nabla_\mu Q^\alpha - 3u^\mu \nabla_\mu S^\alpha + \Pi^{\alpha\mu} \nabla_\mu S_\nu^\nu + r_3 = 0, \tag{2.2c}\]
\[u^\mu \nabla_\mu S_{\alpha}^{\beta} - \Pi_\alpha^\nu \nabla_\nu S^\beta + r_4 = 0, \tag{2.2d}\]
\[\frac{1}{\theta} u^\mu \nabla_\mu \theta + \frac{1}{3} \nabla_\mu u^\mu + r_5 = 0, \tag{2.2e}\]
\[\frac{1}{\theta} \Pi^{\alpha\mu} \nabla_\mu \theta + u^\mu \nabla_\mu u^\alpha + r_6 = 0, \tag{2.2f}\]

where

\[B_\nu^{\alpha\mu\lambda} = -3\eta (\delta_\nu^\alpha \Pi^{\mu\lambda} + \delta_\mu^\lambda \Pi^{\alpha\nu} - \frac{2}{3} \delta_\nu^\nu \Pi^{\alpha\lambda}),\]

and \(r_i, i = 1, \ldots, 6\) are smooth functions of \(A, Q^\alpha, S^\alpha, S_{\alpha}^{\beta}, \theta,\) and \(u^\alpha;\) no derivative of such quantities appears in the \(r_i's.\) Above and throughout, \(\delta\) is the Kronecker delta.

The derivation of (2.2) is as follows: equations (2.2a) and (2.2b) are equations (2.1a) and (2.1b), respectively; equations (2.2e) and (2.2f) are simply the definition of \(A\) and \(Q^\alpha;\) equations (2.2c) and (2.2d) follow from contracting the identities

\[\nabla_\mu \nabla_\nu \theta - \nabla_\nu \nabla_\mu \theta = 0,\]
\[\nabla_\mu \nabla_\nu u^\alpha - \nabla_\nu \nabla_\mu u^\alpha = R^\mu_{\alpha\nu} u^\lambda = 0,\]

with \(u^\mu\) and then with \(\Pi_\nu^\nu.\) We also used the identities

\[\frac{1}{\theta} \nabla_\alpha \theta = -\frac{1}{3\chi} u_\alpha A + \frac{1}{\lambda} Q_\alpha + \frac{1}{3} u_\alpha S_\mu^\mu - \Pi_{\alpha\mu} S^\mu,\]
\[\nabla_\alpha u^\beta = -u_\alpha S^\beta + S_{\alpha}^{\beta}.\]

We write equations (2.2) as a quasilinear first order system for the the variable \(\Psi = (A, Q^\alpha, S^\alpha, S_0^\alpha, S_1^\alpha, S_2^\alpha, S_3^\alpha, \theta, u^\alpha)^T,\) with \(^T\) being the transpose, as

\[\mathcal{A}^\alpha \nabla_\alpha \Psi + \mathcal{R} = 0, \tag{2.3}\]
Equation (2.3) is the main equation we will use to derive estimates.

\[ A^\alpha = \begin{bmatrix} u^\alpha & \delta^\alpha_\nu & 0_{1\times 4} & 0_{1\times 4} & 0_{1\times 4} & 0_{1\times 4} & 0_{1\times 4} \\ \Pi^{\mu\alpha} & 3u^\alpha I_4 & 0_{1\times 4} & B_\nu^{\mu\alpha} & B_\nu^{\mu\alpha} & B_\nu^{\mu\alpha} & 0_{4\times 1} & 0_{4\times 4} \\ -\frac{\alpha}{\lambda} & 3u^\alpha I_4 & -3u^\alpha I_4 & -3u^\alpha I_4 & -3u^\alpha I_4 & -3u^\alpha I_4 & 0_{4\times 1} & 0_{4\times 4} \\ 0_{4\times 1} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} \\ 0_{4\times 1} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} \\ 0_{4\times 1} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} \\ 0_{4\times 1} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} \\ 0_{4\times 1} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} \\ \end{bmatrix} \]

\[ = m_1 m_2, \]

3. Diagonalization

Here, we show that under assumptions consistent with those of Theorem 1.1, we can diagonalize the principal part of (2.3).

**Proposition 3.1.** Let \( \xi \) be a timelike vector and assume that \( \chi > 4\eta > 0 \) and that \( \lambda \geq \frac{3\eta}{\chi - \eta} \). Then:

(i) \( \det(A^\alpha \xi_\alpha) \neq 0 \);

(ii) For any spacelike vector \( \zeta \), the eigenvalue problem \( A^\alpha(\zeta_\alpha + \Lambda \xi_\alpha)V = 0 \) has only real eigenvalues \( \Lambda \) and a complete set of eigenvectors \( V \).

**Remark 3.2.** In practice we will take \( \xi = (1, 0, 0, 0) \) and \( \zeta = (0, \zeta_1, \zeta_2, \zeta_3) \). We note that the assumptions on \( \chi, \lambda, \) and \( \eta \) on Theorem 1.1 imply the assumptions on these coefficients in the Proposition.

**Proof.** Let \( a \) and \( b \) be the projection of \( \zeta + \Lambda \xi \) on the direction orthogonal and parallel to \( u \), i.e., \( a^\alpha = \Pi^{\alpha\mu}(\zeta_\mu + \Lambda \xi_\mu) \) and \( b = (\zeta_\alpha + \Lambda \xi_\alpha)u^\alpha \). Then

\[ a^\alpha a_\mu = \Pi^{\alpha\mu}\Pi_{\alpha\nu}(\zeta_\mu + \Lambda \xi_\mu)(\zeta^\nu + \Lambda \xi^\nu) = (g^{\alpha\mu} + u^\alpha u^\mu)(\zeta_\mu + \Lambda \xi_\mu)(g_{\alpha\nu} + u_\alpha u_\nu)(\zeta^\nu + \Lambda \xi^\nu) \]

\[ = (\zeta_\alpha + \Lambda \xi_\alpha)(\zeta^\alpha + \Lambda \xi^\alpha) + b^2. \]

To simplify the notation, set \( \Xi_\alpha = \zeta_\alpha + \Lambda \xi_\alpha \). Then

\[ \det(\Xi_\alpha A^\alpha) = \det \begin{bmatrix} b & \Xi^T & 0_{1\times 4} & 0_{1\times 4} & 0_{1\times 4} & 0_{1\times 4} & 0_{1\times 4} & 0_{1\times 4} \\ a & 3b I_4 & 0_{4\times 4} & D_\nu^{\mu\alpha} & D_\nu^{\mu\alpha} & D_\nu^{\mu\alpha} & 0_{4\times 1} & 0_{4\times 4} \\ -\frac{\alpha}{\lambda} & 3b I_4 & -3b I_4 & \delta^\nu_\alpha a & \delta^\nu_\alpha a & \delta^\nu_\alpha a & 0_{4\times 1} & 0_{4\times 4} \\ 0_{4\times 1} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} \\ 0_{4\times 1} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} \\ 0_{4\times 1} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} \\ 0_{4\times 1} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} \\ 0_{4\times 1} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} & 0_{4\times 4} \\ \end{bmatrix} \]

\[ = m_1 m_2, \]
where we write $\Xi^T$ to emphasize that $\Xi^T$ represents a $1 \times 4$ piece, and $D_\nu^{\alpha\mu} = B_\nu^{\alpha\mu\lambda}\Xi_\lambda$. $m_2$ is given by

$$m_2 = \det \left[ \frac{\partial}{\partial \xi} \Xi^T \right] = \frac{b^3}{3\theta} (3b^2 - \Pi_{\alpha\beta}\Xi^\alpha\Xi^\beta),$$

whereas

$$m_1 = \det \begin{bmatrix} b & \Xi^T & 0_{1 \times 4} & 0_{1 \times 4} & 0_{1 \times 4} & 0_{1 \times 4} \\ a & 3bI_4 & 0_{4 \times 4} & D_\nu^{\alpha\mu} & D_\nu^{\beta\mu} & D_\nu^{\gamma\mu} \\ -\frac{a}{\theta} & \frac{3b^2I_4}{\lambda} & -3bI_4 & a\delta_\nu^{\alpha} & a\delta_\nu^{\beta} & a\delta_\nu^{\gamma} \\ 0_{4 \times 1} & 0_{4 \times 4} & -a_0I_4 & bI_4 & 0_{4 \times 4} & 0_{4 \times 4} \\ 0_{4 \times 1} & 0_{4 \times 4} & -a_1I_4 & bI_4 & 0_{4 \times 4} & 0_{4 \times 4} \\ 0_{4 \times 1} & 0_{4 \times 4} & -a_2I_4 & 0_{4 \times 4} & 0_{4 \times 4} & bI_4 \end{bmatrix}$$

$$= b^9 \det \begin{bmatrix} 1 & \Xi^T & 0_{1 \times 4} \\ a & 3b^2I_4 & D_\nu^{\alpha\mu}a_\alpha \\ -\frac{a}{\theta} & \frac{3b^2I_4}{\lambda} & -3b^2I_4 + a^\mu a_\nu \end{bmatrix}$$

$$= b^9 \det \begin{bmatrix} 3b^2I_4 & a & E_\nu^\mu \\ \frac{3b^2I_4}{\lambda} & 1 & 0_{1 \times 4} \\ -\frac{a}{\theta} & \frac{3b^2I_4}{\lambda} & -3b^2I_4 + a^\mu a_\nu \end{bmatrix}$$

$$= 27b^{15} \det \begin{bmatrix} 3b^2 - a^\mu a_\mu & -\Xi_\mu E_\nu^\mu \\ \frac{\lambda + \eta}{\lambda} a & 3b^2I_4 - a^\mu a_\nu + E_\nu^\mu \end{bmatrix}$$

$$= 27b^{15} \det \left[ \frac{F}{\epsilon^\mu} d_\nu^\mu \right] = \frac{27b^{15}}{F^3} \det (Fh_\nu^\mu - c^\mu d_\nu^\mu)$$

$$\frac{27b^{15}}{F^3} \det (FG\delta_\nu^\mu - H_\nu a^\mu) = 27b^{15}C^3(FG - H_\mu a^\mu)$$

$$= 27b^{15}C^3(FG - \frac{\lambda + \eta}{\lambda}F(a^\mu a_\mu) - \kappa).$$

We now detail how the computations (3.1)-(3.7) were carried out. These computations made successive use of the formula

$$\det \begin{bmatrix} M_1 & M_2 \\ M_3 & M_4 \end{bmatrix} = \det(M_1) \det(M_4 - M_3M_1^{-1}M_2)$$

$$= \det(M_1) \det(M_1 - M_2M_4^{-1}M_3)$$
when $M_1^{-1}$ or $M_4^{-1}$ exist, and we defined
\[ E_\nu^\mu = -3\eta(a^\alpha a_\alpha \delta^\mu_\nu + a^\mu \Xi_\nu - \frac{2}{3} a^\mu a_\nu), \]
\[ F = 3b^2 - a^\mu a_\mu, \]
\[ d_\nu = -2\eta a^\alpha a_\alpha (a_\nu - 3\Xi_\nu), \]
\[ c^\mu = \frac{\lambda + \chi}{\lambda \chi} a^\mu, \]
\[ h_\nu^\mu = 3b^2 \delta^\mu_\nu - a^\mu a_\nu + \frac{E_\nu^\mu}{\lambda}, \]
\[ G = 3(b^2 - \frac{a^\alpha a_\alpha \eta}{\lambda}), \]
\[ H_\nu = F\left(\frac{\lambda - 2\eta}{\lambda} a_\nu + \frac{3\eta}{\lambda} \Xi_\nu\right) + \frac{\lambda + \chi}{\lambda \chi} d_\nu, \]
\[ H_\mu a^\mu = \frac{\lambda + \eta}{\lambda} F(a^\mu a_\mu) + \kappa \]
\[ \kappa = c^\mu d_\mu = \frac{4\eta(\lambda + \chi)}{\lambda \chi} (a^\alpha a_\alpha)^2. \]

From (3.1) to (3.2) we used (3.8) by setting
\[ M_1 = \begin{bmatrix}
  b & \Xi^T & 0_{1\times 4} \\
  a & 3bI_4 & 0_{4\times 4} \\
 -\frac{a}{\chi} & \frac{3b}{\chi} I_4 & -3bI_4
\end{bmatrix} \]
with $M_2$, $M_3$, and $M_4$ following accordingly. Although $\det(M_4) = b^{16}$, we multiplied lines 2 to 9 by $b$ and divided column 1 by $b$. Then, the overall multiplicative factor was modified by $b^6 b^8 b^{-1} = b^9$, resulting in (3.2). After that, we performed the following permutations in (3.2): the fifth line was brought to the first line after 4 line permutations and the fifth column became the first column after 4 column permutations, obtaining (3.3), where $E^\mu$ was defined in (3.10). From (3.3) to (3.4) we made again use of (3.8) by setting $M_1 = 3b^2 I_4$, where $M_2$, $M_3$, and $M_4$ are chosen accordingly. The resulting matrix has the overall factor multiplied by $\det M_1 = 81 b^8$, but since we multiplied the first line of the resulting matrix by $3b^2$, it reduces to $27 b^6$ and, then, by changing the sign of the last 4 lines, Eq. (3.4) is obtained. The first equality in (3.5) corresponds to (3.4) with the definitions that appear in (3.10). In the second equality it was applied (3.9) with $M_1 = F$, where $M_2$, $M_3$, and $M_4$ are chosen accordingly. The $F^{-3}$ factor appears as we multiplied all lines by $F$, then $\det(M_1) F^{-4} = F^{-3}$. The first equality of (3.6) corresponds to the second equality in (3.5) by using the definitions in (3.10). From the first to the second equality in (3.6), we used the formula
\[ \det(A \delta^\mu_\nu + \alpha^\mu \beta_\nu) = A^4 + A^3 \alpha^\mu \beta_\nu \]
with $A = FG$, $\alpha^\mu = a^\mu$, and $\beta_\nu = -H_\nu$. Finally,
\[ \det(\Xi_\alpha A^\alpha) = m_1 m_2 = \frac{9b^{18}}{\theta} G^3 (3b^2 - a^\mu a_\mu)(FGF - F\frac{\lambda + \eta}{\lambda} a^\mu a_\mu - \kappa). \]
We set \( \det(\Xi_\alpha A^\alpha) \) equal to zero to find the eigenvalues and eigenvectors. Thus, we need to find the roots \( \Lambda \) of \( b = 0 \) with multiplicity 18, \( G = 0 \) (which gives a total of two roots with multiplicity 3), \( 3b^2 - a^\mu a_\mu \) (which gives a total of 2 roots with multiplicity 1), and \( FG - F^{\lambda+\mu} a^\mu a_\mu - \kappa = 0 \) (which gives a total of 4 roots with multiplicity 1), and the corresponding eigenvectors in all cases.

\( b^{18} = 0 \) gives

\[
\Lambda_1 = \frac{u^\alpha \xi_\alpha}{u^\beta \xi_\beta},
\]

There are 18 corresponding linearly independent eigenvectors given by

\[
\begin{bmatrix}
0 \\
\nu_a' \\
0_{25 \times 1}
\end{bmatrix},
\begin{bmatrix}
0_{20 \times 1} \\

f_3'
\end{bmatrix},
\begin{bmatrix}
\nu_a' \\
\nu_a' \\
\nu_a' \\
\nu_a'
\end{bmatrix},
\begin{bmatrix}
\eta \\
\eta \\
\eta \\
\eta
\end{bmatrix},
\begin{bmatrix}
\xi_\alpha' \\
\xi_\alpha' \\
\xi_\alpha' \\
\xi_\alpha'
\end{bmatrix}
\]

where \( \nu_a' = \{\nu_1' = \nu', \nu_2', \nu_3'\} \) are 3 linearly independent vectors orthogonal to \( \xi_\alpha + \Lambda_1 \xi_\lambda \), and \( f_\lambda^\lambda \) totals 16 components that define the entries in the last vector. However, since these 16 components are constrained by the 4 equations \( \chi f_\lambda^\lambda a^\mu + D^\nu_\mu f_\lambda^\nu = 0 \) (where \( a^\alpha \) is as above but with \( \Lambda = \Lambda_1 \)), we end up with 12 independent entries. Then, \( 3 + 3 + 12 = 18 \), which equals the multiplicity of the root \( \Lambda_1 \).

\[
3b^2 - a^\mu a_\mu = 0 \text{ can be written as } b^2 - \beta a^\mu a_\mu = 0, \text{ where } \beta = \frac{1}{3}. \text{ The roots are then}
\]

\[
\Lambda_{2,\pm} = \left(-u^\alpha \xi_\alpha u^\nu \xi_\nu + \beta \Pi_{\mu\nu} \xi_\mu \xi_\nu \pm \sqrt{\Delta}\right)/(\pm u^\alpha \xi_\alpha)^2 (1 - \beta) - \beta \xi_\alpha \xi_\beta,
\]

\[
\Delta = \beta((u^\alpha \xi_\alpha)^2 - \Pi_{\mu\nu} \xi_\mu \xi_\nu)((\Pi_{\alpha\beta} \xi_\alpha \xi_\beta - (u^\alpha \xi_\alpha)^2) + (u^\nu \xi_\nu \xi_\nu + \Pi_{\mu\nu} \xi_\mu \xi_\nu)^2)
\]

\[
+ (1 - \beta)(\Pi_{\mu\nu} \xi_\mu \xi_\nu \Pi_{\alpha\beta} \xi_\alpha \xi_\beta - (\Pi_{\mu\nu} \xi_\mu \xi_\nu)^2).
\]

We note that these roots are always real when \( 0 < \beta < 1 \) because \( \Pi_{\alpha\beta} \xi_\alpha \xi_\beta < (\xi_\alpha u^\alpha)^2 \), \( \Pi_{\alpha\beta} \xi_\alpha \xi_\beta > (\xi_\alpha u^\alpha)^2 \), and \( (\Pi_{\mu\nu} \xi_\mu \xi_\nu)^2 \leq \Pi_{\mu\nu} \xi_\mu \xi_\nu \Pi_{\alpha\beta} \xi_\alpha \xi_\beta \). Thus, \( \Lambda_{2,\pm} \) has two distinct roots giving two linearly independent eigenvectors.

\( G^3 = 0 \) can also be written as \( b^2 - \beta a^\mu a_\mu = 0, \text{ where } \beta = \frac{\kappa}{\lambda}. \text{ The roots are written the same way as } \Lambda_{2,\pm} \text{ with the particularity that now each one has multiplicity 3. We note that these roots are real because } 0 < \beta < 1. \text{ The corresponding eigenvectors are}

\[
\begin{bmatrix}
C_{\pm} \\
D_{\pm} \\
e_{\pm} \\
a_{\pm} \\
b_{\pm} \\
c_{\pm}
\end{bmatrix},
\]

and
where $a_\pm$ is as $a$ above but with $\Lambda = \Lambda_{3, \pm}$, $b_\pm$ is as $b$ above but with $\Lambda = \Lambda_{3, \pm}$ (so that $b_\pm^2 = \beta (a_\pm)\mu (a_\pm)_\mu$),

$$C_\pm = -\frac{\lambda}{\lambda + \chi} ((2\lambda + \chi)(e_\pm)^\mu (\Xi_\pm)_\mu - \frac{\lambda}{3\eta}(2\eta + \chi)(a_\pm)^\mu (e_\pm)_\mu),$$

$$D_\mu^\pm = \frac{\lambda + \chi}{3b_\pm^2\chi} ((a_\pm)^\nu (a_\pm)_\nu - 3b_\pm^2\chi (e_\pm)^\mu - (e_\pm)^\nu D_\nu^\mu (a_\pm)_\nu),$$

where $\Xi_\pm$ is as $\Xi$ above but with $\Lambda = \Lambda_{3, \pm}$, and $e_\pm$ obeys the following constraint

$$\frac{\lambda + \chi}{\lambda \chi} c_\pm b_\pm - \frac{3\eta}{\lambda}(\Xi_\pm)^\mu (e_\pm)_\mu + \frac{2\eta - \lambda}{\lambda} (a_\pm)^\mu (e_\pm)_\mu = 0.$$ 

Thus, the eigenvectors are written in terms of 3 independent components of $e^\mu$ for each root, giving a total of 6 eigenvectors.

This is a quadratic equation for $b_\pm^2$ that has positive discriminant, i.e.,

$$(a_\pm^\nu a_\mu)^2 \eta \chi (\lambda^2 + \eta \chi + \lambda \chi) > 0.$$ 

In order to obtain real roots $\Lambda$, we need

$$0 < \frac{b_\pm^2}{a_\pm^\nu a_\mu} = \frac{2\chi(\lambda + \eta) \pm \sqrt{\eta \chi (\lambda^2 + \eta \chi + \lambda \chi)}}{3\lambda \chi} \leq 1.$$ 

This gives the condition

$$2\chi(\lambda + \eta) - \sqrt{\eta \chi (\lambda^2 + \eta \chi + \lambda \chi)} > 0,$$

which is satisfied in view of $\chi > 4\lambda$, and

$$2\chi(\lambda + \eta) + \sqrt{\eta \chi (\lambda^2 + \eta \chi + \lambda \chi)} \leq 1,$$

which is satisfied in view of $\lambda \geq \frac{3\chi \lambda}{\chi - \eta}$. We also observe that these four roots are distinct, so that we obtain four linearly independent eigenvectors.

Finally, we notice that condition $(i)$ can be verified upon setting $\zeta = 0$ in the above computations.

From the above Proposition, we immediately obtain:

**Corollary 3.3.** Assume that $\chi > 4\eta > 0$ and that $\lambda \geq \frac{3\chi \eta}{\chi - \eta}$. Then, the system (2.3) can be written as

$$\nabla_0 \Psi + \bar{A}^i \nabla_i \Psi = \bar{R},$$

where $\bar{A}^i = (A^0)^{-1} A^i$ and $\bar{R} = -(A^0)^{-1} R$, and the eigenvalue problem $(\bar{A}^i \xi_i - \Lambda I)V = 0$ possesses only real eigenvalues $\Lambda$ and a set of complete eigenvectors $V$. 

4. Energy estimates

4.1. Preliminaries. We first set down some notations. Let $I = [0,T]$ for some $T > 0$. We use $\mathcal{X} : \mathbb{R}_+ \rightarrow \mathbb{R}_+$ to denote a continuous function which may vary from line to line. Similarly, $\mathcal{X}_t : \mathbb{R}_+ \rightarrow \mathbb{R}_+$ denotes a continuous function depending on $I$. Further, the notation $\mathfrak{R}$ always denotes a pseudodifferential operator (ΨDO) whose mapping property may vary from line to line. We denote the $L^2$ based Sobolev space of order $r$ by $H^r$, with norm $\| \cdot \|_r$.

Due to the quasilinear nature of our equations, we will need to employ a pseudodifferential calculus for symbols with limited smoothness. Such a calculus can be found in [27–29], to which we will refer frequently. We denote the class of symbols on $\mathbb{T}^3$ of order $\mathfrak{r}$ with Sobolev regularity $k$ by $\mathcal{S}_\mathfrak{r}^k(\mathbb{T}^3)$. Given $a \in \mathcal{S}_\mathfrak{r}^k(\mathbb{T}^3)$, we denote the left quantization of $a$ by $\text{Op}(a)$ and the resulting space of $\mathfrak{r}$th order ΨDO’s by $\text{OPS}_\mathfrak{r}^k$. For the reader’s convenience, we recall the definition of these symbols and quantizations on $\mathbb{R}^3$ which then yield a ΨDO calculus on any smooth closed manifold by the coordinate invariance of the definition and standard arguments (see [29, Theorem 5.1, Corollary 5.2]).

Definition 4.1. [29] Let $r \in \mathbb{R}$ and $k > 3/2$. Define $\mathcal{S}_\mathfrak{r}^k(\mathbb{R}^3) = \mathcal{S}_\mathfrak{r}^k(\mathbb{R}^3, \mathbb{C})$ to be the space of all symbols $a : \mathbb{R}^3 \times \mathbb{R}^3 \rightarrow \mathbb{C}$ such that for all spatial multi-indices $\alpha = (\alpha_1, \alpha_2, \alpha_3)$

$$|\partial_\alpha^2 a(x, \zeta)| \leq C_\alpha (1 + |\zeta|)^r - |\alpha|,$$

$$\|\partial_\alpha^2 a(x, \zeta)\|_{H^k} \leq C_\alpha (1 + |\zeta|)^r - |\alpha|.$$ 

For a matrix-valued symbol $a : \mathbb{R}^3 \times \mathbb{R}^3 \rightarrow \mathbb{C}^{h \times l}$ with $h, l \in \mathbb{N}$, we say $a \in \mathcal{S}_\mathfrak{r}^k(\mathbb{R}^3, \mathbb{C}^{h \times l})$ if all the entries of $a$ belong to $\mathcal{S}_\mathfrak{r}^k(\mathbb{R}^3, \mathbb{C})$. The left quantization, $\text{Op}(a)$, of a symbol $a \in \mathcal{S}_\mathfrak{r}^k(\mathbb{R}^3, \mathbb{C}^{h \times l})$ is defined by

$$\text{Op}(a)f(x) := \frac{1}{(2\pi)^n} \int_{\mathbb{R}^3} e^{ix \cdot \zeta}a(x, \zeta)\hat{f}(\zeta) \, d\zeta$$

for $f \in \mathcal{S}(\mathbb{R}^3, \mathbb{C}^l)$, the space of Schwartz functions in $\mathbb{R}^3$.

Since we will be working exclusively on $\mathbb{T}^3$, we will simply write $\mathcal{S}_\mathfrak{r}^k(\mathbb{T}^3)$ instead of $\mathcal{S}_\mathfrak{r}^k(\mathbb{R}^3, \mathbb{C}^{h \times l})$, and we will not typically specify if the symbol is scalar or matrix valued since the context will be clear. The (flat) Laplacian on $\mathbb{T}^3$ is denoted by $\Delta$, and we define

$$\langle \nabla \rangle := (1 - \Delta)^{\frac{3}{2}},$$

an element of $\text{OPS}_\mathfrak{r}^1(\mathbb{R}^3)$ for every $k \in \mathbb{R}$. Finally, we recall that

$$\| \cdot \|_r \simeq \| \langle \nabla \rangle^r \cdot \|_0.$$ 

4.2. Main estimates. We consider the linear system associated with (3.11). Given $\tilde{v}$, we define the operator $\mathcal{F}(\tilde{v})$ by

$$\mathcal{F}(\tilde{v}) \tilde{u} = \partial_t \tilde{u} + \tilde{A}^i(\tilde{v}) \nabla_i \tilde{u},$$

where $\tilde{A}^i(\tilde{v})$ corresponds to the matrix $\tilde{A}^i = (A^0)^{-1} A^i$ of Corollary 3.3, but with the entries of the matrix computed using $\tilde{v}$. Then the first order system (2.3), or, equivalently, the system (3.11), can be written as

$$\mathcal{F}(\tilde{u}) \tilde{u} = \mathcal{R}(\tilde{u}), \quad \tilde{u}(0) = \tilde{u}_0,$$

(4.1)
where \( \mathcal{R}(\tilde{u}) = -(\mathcal{A}^0)^{-1}(r_1, \ldots, r_6)^T \). Above and in what follows, we make the following change of notation. We will use \( \tilde{u} \) for a solution of (4.1) (and \( \tilde{v} \) for the coefficients of the corresponding linear system) instead of \( \Psi \). This is because at this point we will think of a solution in abstract terms, i.e., as a map from a time interval to a suitable function space, and so we use a different notation to highlight this point of view.

The goal of this section is to prove the following energy estimates.

**Proposition 4.2.** Let \( r > 7/2, I \subset \mathbb{R} \) and

\[
\mathcal{E}_1(I) = C(I; H^r) \cap C^1(I; H^{r-1}).
\]

There exist increasing functions \( \tilde{M}, \omega : [0, \infty) \rightarrow (0, \infty) \) such that if \( \tilde{u}, \tilde{v} \in C^\infty(I \times \mathbb{T}^3) \) satisfy

\[
\mathcal{F}(\tilde{v}) \tilde{u} = \mathcal{R}(\tilde{v}), \quad \text{on } I \times \mathbb{T}^3,
\]

then for all \( t \in I, \)

\[
\|\tilde{u}(t)\|_r^2 \leq \tilde{M}(\|\tilde{v}\|_{L^\infty(I; H^{r-1})}) e^{\omega(\|\tilde{v}\|_{\mathcal{E}_1(I)})} \left[ \|\tilde{u}_0\|_r^2 + \int_0^t \|\mathcal{R}(\tilde{v}(s))\|_r^2 \, ds \right]
\]  

for all \( \tilde{u}_0 \in C(I) \).

**Proof.** For \( \tilde{u}_0 \) is homogeneous in \( \tilde{v} \) of degree zero, we can derive that

\[
\|\tilde{u}_0\|_r \leq C(1 + |\tilde{v}|),
\]

for some \( C = C(\|\tilde{v}\|_r) \). By the homogeneity of \( \tilde{u}_0 \), we can derive that

\[
\|\tilde{u}_0\|_r \leq C(1 + |\tilde{v}|),
\]

for all \( \tilde{v} \) and some \( C = C(\|\tilde{v}\|_r) \). Differentiating the characteristic polynomial of \( \tilde{A} \) with respect to \( \tilde{v} \) and using induction immediately yield

\[
\|\tilde{D}^\xi \tilde{A}(\tilde{v}, \tilde{\xi})\|_r \leq C(1 + |\tilde{v}|)^{1-|\tilde{\alpha}|},
\]

for all \( \tilde{v} \) and some \( C = C(\|\tilde{v}\|_r) \). By Sobolev embedding, this implies that \( \Lambda_k \in S^1_0(r, 2) \) and thus

\[
\tilde{O} \in OSPS^1_0(r, 2).
\]

The projection onto the eigenspace associated to the eigenvalue \( \Lambda_k \) is given by

\[
P_k = P_k(\tilde{v}, \tilde{\xi}) = \frac{1}{2\pi i} \int_{\gamma_k} (z - \tilde{A}(\tilde{v}, \tilde{\xi}))^{-1} dz,
\]

where \( \gamma_k \) is a smooth contour enclosing only one pole \( \Lambda_k \). Note that with properly chosen contours \( \gamma_k \), we can always make the eigenvalues \( \tilde{\Lambda}_{i}(z, \tilde{v}, \tilde{\xi}) \) of \( (z - \tilde{A}(\tilde{v}, \tilde{\xi}))^{-1} \) satisfy

\[
\|\tilde{\Lambda}_{i}(z, \tilde{v}, \tilde{\xi})\|_r \leq C = C(\|\tilde{v}\|_r), \quad |\tilde{\xi}| \leq 1, \quad z \in \gamma_k
\]
for all \( k \). From the homogeneity of \( \tilde{A} \) and \( \Lambda_k \), we infer that \( P_k \) is homogeneous of degree 0 in \( \zeta \). Combining with (4.4) and (4.5), we can derive that
\[
\| P_k(\tilde{v}, \zeta) \|_{H^r} \leq C = C(\| \tilde{v} \|_r), \quad | \zeta | = 1.
\]
In view of the homogeneity of \( P_k(\tilde{v}, \cdot) \), this implies for all \( \zeta \)
\[
\| P_k(\tilde{v}, \zeta) \|_{H^r} \leq C = C(\| \tilde{v} \|_r).
\]
Note that, for a given pair of \( (\tilde{v}, \zeta) \), we can choose the contour \( \gamma_k \) in (4.5) to be fixed in a neighborhood of \( (\tilde{v}, \zeta) \). Applying a similar argument to the \( \zeta \)-derivatives of \( P_k \) and using the homogeneity of \( \partial_\zeta^2 \tilde{A} \), direct computations lead to \( P_k \in S^0_0(\mathbb{R}, 2) \). This implies that
\[
S = S(\tilde{v}, \zeta) \in S^0_0(\mathbb{R}, 2) \quad (4.6)
\]
and thus
\[
\tilde{S} = \tilde{S}(\tilde{v}) \in OP S^0_0(\mathbb{R}, 2)
\]
with norm depending on \( \| \tilde{v} \|_r \).

Then it follows from [29, Corollary 3.4] that
\[
\tilde{S} u = \tilde{D} S + \mathcal{R}
\]
with
\[
\mathcal{R} \in \mathcal{L}(H^s, H^s), \quad 1 - r < s \leq r - 2.
\]
We write \( \mathcal{U} = i \mathfrak{A}(\nabla) \). Let \( \mathcal{A} = \mathcal{A}(\zeta) \) denote the symbol of \( \mathfrak{A} \), i.e. \( \mathcal{A} = -i\tilde{A}/(1 + |\zeta|^2)^{1/2} \). Hence \( \mathfrak{A} \in OP S^0_0(\mathbb{R}, 2) \). Then there exists a \( \Psi DO \) \( \mathcal{D} \) with symbol \( \mathcal{D} \in S^0_0(\mathbb{R}, 2) \) such that
\[
\mathcal{S} \mathcal{A} = \mathcal{D} S
\]
and thus
\[
\tilde{S} \mathfrak{A} = \tilde{D} S + \mathcal{R}
\]
with
\[
\mathcal{R} \in \mathcal{L}(H^{s-1}, H^{s}), \quad 1 - r < s \leq r - 1. \quad (4.7)
\]
We rewrite (4.2) as
\[
\partial_t \tilde{u} = i \mathfrak{A}(\tilde{v})(\nabla) \tilde{u} + \tilde{\mathcal{R}}(\tilde{v}),
\]
or
\[
\partial_t \tilde{u} = \mathcal{U}(\tilde{v}) \tilde{u} + \tilde{\mathcal{R}}(\tilde{v}).
\]
Denote by \( S^* \) the conjugate transpose matrix of \( S \). We further set \( \tilde{\mathcal{S}} := Op(S^*) \). Note that \( \tilde{\mathcal{S}} = \tilde{\mathcal{S}}(v) \in OP S^0_0(\mathbb{R}, 2) \). Since \( S \) is homogeneous of degree 0 in \( \zeta \), combining with the discussion in Section 3, we infer that
\[
\tilde{u}^T S^*(v, \zeta) S(v, \zeta) \tilde{u} \geq C_0 | \tilde{u} |^2
\]
for some \( C_0 = C_0(\| \tilde{v} \|_\infty) > 0 \). Let \( \mathcal{B} = \mathcal{B}(\tilde{v}, \zeta) = \sqrt{S^*(\tilde{v}, \zeta) S(\tilde{v}, \zeta) - \mathcal{Q} / 2} I \) and \( \mathfrak{B} = Op(\mathcal{B}) \).

Here \( I \) is the identity matrix and, for a positive definite matrix \( A \), \( B = \sqrt{A} \) denotes the square-root matrix of \( A \), i.e. \( B^* B = A \). It is not hard to conclude that \( \mathcal{B} \in S^0_0(\mathbb{R}, 2) \) via the
Cholesky algorithm. Putting $\mathfrak{B} = \text{Op}(B^*) \in \text{OPS}_0^0(r, 2)$, it follows from [29, Corollaries 3.4 and 3.6] that

$$\mathfrak{R} = \mathfrak{S} \circ \mathfrak{S} - \frac{C_0}{2} I - \mathfrak{B}^* \mathfrak{B}$$

$$= [(\mathfrak{S} \circ \mathfrak{S} - \frac{C_0}{2} I) - \mathfrak{B} \circ \mathfrak{B}] + (\mathfrak{B} \circ \mathfrak{B} - \mathfrak{B} \mathfrak{B}) + (\mathfrak{B} \mathfrak{B} - \mathfrak{B}^* \mathfrak{B}) \in \mathcal{L}(H^{s-1}, H^s) \quad (4.8)$$

for all $1 - r < s < r$. Define

$$N_r(t) := \langle \nabla \rangle^r (\frac{C_0}{2} I + \mathfrak{B}^* \mathfrak{B}) \langle \nabla \rangle^r.$$ 

It is an immediately conclusion from its definition that

$$(N_r(t) \tilde{u}, \tilde{u}) \geq \frac{C_0}{2} \|\tilde{u}\|_r^2. \quad (4.9)$$

We have

$$N_r = \langle \nabla \rangle^r (\frac{C_0}{2} I + \mathfrak{B}^* \mathfrak{B} - \mathfrak{S} \circ \mathfrak{S})(\nabla \rangle^r + \langle \nabla \rangle^r (\mathfrak{S} \circ \mathfrak{S} - \mathfrak{B} \mathfrak{B}) (\nabla \rangle^r$$

$$+ \langle \nabla \rangle^r (\mathfrak{S} - \mathfrak{S}^*) \mathfrak{S} (\nabla \rangle^r + \langle \nabla \rangle^r \mathfrak{S}^* \mathfrak{S} (\nabla \rangle^r.$$ 

It follows from [29, Corollary 3.4] that

$$\mathfrak{S} \circ \mathfrak{S} - \mathfrak{B} \mathfrak{B} \in \mathcal{L}(H^{s-1}, H^s), \quad 1 - r < s \leq r, \quad (4.10)$$

and from [29, Corollary 3.6] that

$$\mathfrak{S} - \mathfrak{S}^* \in \mathcal{L}(H^{s-1}, H^s), \quad 1 - r < s < r, \quad (4.11)$$

We compute

$$\frac{d}{dt} (N_r \tilde{u}, \tilde{u}) = (N_r \frac{d}{dt} \tilde{u}, \tilde{u}) + (N_r \tilde{u}, \frac{d}{dt} \tilde{u}) + (N_r' \tilde{u}, \tilde{u})$$

$$= (N_r \mathfrak{U} \tilde{u}, \tilde{u}) + (N_r \mathfrak{R}, \tilde{u}) + (N_r \tilde{u}, \mathfrak{U} \tilde{u}) + (N_r \tilde{u}, \mathfrak{R}) + (N_r' \tilde{u}, \tilde{u})$$

$$= ((N_r \mathfrak{U} + \mathfrak{U}^* N_r) \tilde{u}, \tilde{u}) + (N_r \mathfrak{R}, \tilde{u}) + (N_r \tilde{u}, \mathfrak{R}) + (N_r' \tilde{u}, \tilde{u}),$$

where $' = \frac{d}{dt}$. We have

$$N_r \mathfrak{U} + \mathfrak{U}^* N_r = [\langle \nabla \rangle^r (\frac{C_0}{2} I + \mathfrak{B}^* \mathfrak{B}) (\nabla \rangle^r i \mathfrak{A} (\nabla$$

$$- i \langle \nabla \rangle^r \mathfrak{A}^* [\langle \nabla \rangle^r (\frac{C_0}{2} I + \mathfrak{B}^* \mathfrak{B}) (\nabla \rangle^r$$

$$= i \langle \nabla \rangle^r (\frac{C_0}{2} I + \mathfrak{B}^* \mathfrak{B}) (\nabla \rangle^r$$

Note that $\langle \nabla \rangle^r \in \text{OPS}_0^0(k, 2)$ for any $k$. We can infer from (4.8), (4.10) and (4.11) that

$$N_r \mathfrak{U} = i N_r \mathfrak{A} (\nabla)$$

$$= i \langle \nabla \rangle^r \mathfrak{S}^* \mathfrak{S} (\nabla \rangle^r \mathfrak{A} (\nabla) + \mathfrak{R},$$

where $\mathfrak{R} = \mathfrak{R}(v) \in \mathcal{L}(H^r, H^{-r})$. 

To estimate the first term in the second line, we first notice that [29, Corollary 3.4] implies 
\[ b = b(\tilde{v}) := [⟨\nabla⟩^s,A(\tilde{v})] \in \mathcal{L}(H^{r-1},H^{0}), \]
and again, its norm depends on \( \|\tilde{v}\|_r \). Thus we have that 
\[ ⟨\nabla⟩^rS^*S⟨\nabla⟩^rA(\nabla) = ⟨\nabla⟩^rS^*SΑ⟨\nabla⟩⟨\nabla⟩^r + R, \]
where \( R = R(\tilde{v}) \in \mathcal{L}(H^r,H^{-r}). \) Now observe that by (4.7) 
\[ SΑ⟨\nabla⟩ = ΩS⟨\nabla⟩ + R \]
\[ = Ω⟨\nabla⟩S + R, \]
where in the second equality we used [29, Corollary 3.4]. Here and below the operator \( R \) may vary from line to line, but all these \( R \) satisfy 
\[ R = R(\tilde{v}) \in \mathcal{L}(H^r,H^s) \text{ for all } -r+1 < s \leq r-1. \]
Therefore, 
\[ N_sΜ = i⟨\nabla⟩^rS^*Ω⟨\nabla⟩S⟨\nabla⟩^r + R, \]
where \( Μ = Μ(\tilde{v}) \in \mathcal{L}(H^r,H^{-r}) \) and its norm depends on \( \|\tilde{v}\|_r \).

We can carry out a similar analysis for the term Μ*N_r. More precisely, first notice that 
\[ Μ^*N_r = -i⟨\nabla⟩Α^*[⟨\nabla⟩^rS^*S⟨\nabla⟩^r \]
\[ - i⟨\nabla⟩Α^*[⟨\nabla⟩^r(C_0/2I + Μ^*Μ - S ◦ S)⟨\nabla⟩^r \]
\[ + ⟨\nabla⟩^r(S ◦ S - S ◦ S)S⟨\nabla⟩^r] \]
\[ + ⟨\nabla⟩^r(S ◦ S - S ◦ S)S⟨\nabla⟩^r. \]
Using (4.8), (4.10), (4.11) and [29, Theorem 2.4], we infer that the last three terms on the right-hand side belong to \( \mathcal{L}(H^r,H^{-r}). \) As 
\[ -i⟨\nabla⟩Α^*[⟨\nabla⟩^rS^*S⟨\nabla⟩^r] = [i⟨\nabla⟩^rS^*S⟨\nabla⟩^rΑ(⟨\nabla⟩)]^*, \]
we conclude that 
\[ N_sΜ + Μ^*N_r = i[⟨\nabla⟩^rS^*Ω⟨\nabla⟩S⟨\nabla⟩^r \]
\[ - ⟨⟨\nabla⟩^rS^*⟨\nabla⟩ΩS⟨\nabla⟩^r⟩^r + R_0, \]
\[ = i⟨\nabla⟩^rS^*[Ω⟨\nabla⟩ - ⟨⟨\nabla⟩^rΩS⟩⟩^r + R_0, \]
where \( R_0 = R_0(\tilde{v}) \in \mathcal{L}(H^r,H^{-r}) \) with norm depending on \( \|\tilde{v}\|_r \). The term in the parenthesis is bounded in \( \mathcal{L}(H^0) \) due to [29, Corollary 3.6]. We thus have 
\[ \frac{d}{dt}(N_s\tilde{v},\tilde{u}) = i[⟨\nabla⟩^r [S^*Ω⟨\nabla⟩S - S^*⟨\nabla⟩ΩS]⟨\nabla⟩^r,\tilde{u}] \]
\[ + (R_0\tilde{u},\tilde{u}) + (N_s\tilde{R},\tilde{u}) + (N_r\tilde{R},\tilde{R}) + (N_s\tilde{u},\tilde{u}). \]
(4.12)
We have 
\[ |i⟨\nabla⟩^r [S^*Ω⟨\nabla⟩S - S^*⟨\nabla⟩ΩS]⟨\nabla⟩^r,\tilde{u}]| \leq C_1\|\tilde{u}\|^2_r, \]
\[ |(R_0\tilde{u},\tilde{u})| \leq C_2\|R_0\tilde{u}\|_{-r}\|\tilde{u}\|_r \leq C_2\|\tilde{u}\|^2_r, \]
\[ |(N_s\tilde{R},\tilde{u})| + |(N_r\tilde{u},\tilde{R})| \leq C_3\|\tilde{u}\|_r\|\tilde{R}\|_r \leq C_4\|\tilde{u}\|^2_r + \frac{1}{2}\|\tilde{R}\|^2_r. \]
Here the constants $C_i$ all depend on $\|\tilde v\|_r$. To estimate the last term in (4.12), observe that
\[
N'(t) = \langle \nabla \rangle^r \partial [\mathcal{B}^*(\tilde v)\mathcal{B}_r(\tilde v)] \tilde v' \langle \nabla \rangle^r.
\]
Here $\partial$ stands for the Fréchet derivative. From (4.5) and (4.6), it is not hard to see that
\[
\partial \mathcal{B}_r(\tilde v) \tilde v' \in \mathcal{S}_0^0(r - 1, 2).
\]
Hence [29, Theorem 2.3] implies that
\[
\partial \mathcal{B}_r(\tilde v) \tilde v' = \text{Op}(\partial \mathcal{B}_r(\tilde v) \tilde v') \in \mathcal{L}(H^0).
\]
As $\partial \mathcal{B}^*_r(\tilde v) \tilde v' = [\partial \mathcal{B}_r(\tilde v) \tilde v']^*$, we immediately conclude that
\[
\partial [\mathcal{B}^*_r(\tilde v)\mathcal{B}_r(\tilde v)] \tilde v' \in \mathcal{L}(H^0).
\]
Now it follows that
\[
|(N'_r \tilde u, \tilde u)| \leq C_6 \|N'_r \tilde u\|_{-r} \|\tilde u\|_r \leq C_6 \|\tilde u\|_r^2,
\]
where $C_6$ depends on $\|\tilde v\|_{E_1(t)}$. In summary,
\[
\frac{d}{dt}(N_r \tilde u, \tilde u) \leq C_7 \|\tilde u\|_r^2 + C_5 \|\vec{R}\|_r^2
\]
with $C_7 = C_7(\|\tilde v\|_{E_1(t)})$. As a direct conclusion from (4.9) and Grönwall’s inequality, we have
\[
\|\tilde u(t)\|_r^2 \leq \tilde M e^{\omega(\|\tilde v\|_{E_1(t)})} \left[ \|\tilde u_0\|_r^2 + \int_0^t \|\vec{R}(\tilde v(s))\|_r^2 ds \right]
\]
where $\tilde M$ is a constant argument depending on $\|\tilde v\|_\infty$, and thus, on $\|\tilde v\|_{r-1}$ by Sobolev embedding. \qed

5. Local existence and uniqueness

In this section, we use the energy estimate of Proposition 4.2 to establish local well-posedness for the system (2.3), which in turn will imply Theorem 1.1.

5.1. Approximating sequence. We take a sequence of smooth initial data $\tilde u_{0,n} \to \tilde u_0$ in $H^r$ with $r > 7/2$. Then we inductively study
\[
\mathcal{F}(\tilde u_{n-1}) \tilde u_n = \vec{R}(\tilde u_{n-1}), \quad \tilde u_n(0) = \tilde u_{0,n}.
\]
Let $\|\tilde u_0\|_r^2 \leq K$. We may assume
\[
\|\tilde u_{0,n}\|_r^2 \leq K + 1.
\]
Further, we define continuous functions $\mathcal{H}_i : \mathbb{R} \to \mathbb{R}$ with $i = 1, 2$ such that
\[
\|\mathcal{A}(\tilde v)\|_{\mathcal{L}(H_1)} \leq \mathcal{H}_1(\|\tilde v\|_r)
\]
and
\[
\|\vec{R}(\tilde v)\|_s \leq \mathcal{H}_2(\|\tilde v\|_s), \quad s = r - 1, r.
\]
We next make the inductive assumption
\[
H(n - 1) : \|\tilde u_k\|_{C(I; H^1)} \leq C_1 \text{ and } \|\partial_t \tilde u_k\|_{C(I; H^{r-1})} \leq C_2 \text{ for } k = 1, 2, \ldots, n - 1.
\]
Note that it follows from $H(n - 1)$ and (5.2) that by choosing $T$ small enough, we have
\[
\|\tilde v_k(t)\|_{r-1} \leq M, \quad k = 1, 2, \ldots, n - 1 \text{ and } t \in [0, T]
\]
for some sufficiently large uniform constant $M$ independent of $C_i$. As a direct consequence, we can take the constant $\tilde{M}$ in (4.3) to be uniform in the following iteration argument.

Furthermore, we choose $C_i$ in $H(n - 1)$ large enough so that

$$\sqrt{\tilde{M}(2K + 4)} \leq C_1$$

and

$$M'\mathcal{K}_1(C_1)C_1 + \mathcal{K}_2(C_1) \leq C_2,$$

where $M' = \|\langle \nabla \rangle \|_{L(\mathcal{H}^r, \mathcal{H}^{r-1})}$. Now we will use (4.3) to estimate

$$\|\tilde{u}_n(t)\|_{r}^2 \leq \tilde{M}e^{\omega t} \|\tilde{u}_0\|_{E(\mathcal{I}, I)}^2 + \int_0^t \|\tilde{R}(\tilde{u}_{n-1}(s))\|_{r}^2 ds \leq \tilde{M}e^{\omega(t + C_2)} [K + 1 + t\mathcal{K}_2(C_1)],$$

By choosing $T$ small enough, we can control

$$\|\tilde{u}_n(t)\|_{r}^2 \leq \tilde{M}(2K + 4) \quad \text{for all } t \in [0, T],$$

which gives

$$\|\tilde{u}_n\|_{C(\mathcal{I}, H^r)} \leq C_1.$$

We plug this estimate into (5.1) and thus obtain

$$\|\partial_t \tilde{u}_n(t)\|_{r-1} \leq M'\mathcal{K}_1(C_1)C_1 + \mathcal{K}_2(C_1) \leq C_2.$$

This completes the verification of $H(n)$. One thus infers that

$$\|\tilde{u}_n\|_{E_1(\mathcal{I})} \leq C$$

for all $n$ and some $C > 0$.

5.2. **Energy estimate for the difference of two solutions.** For $i = 1, 2$, we consider

$$\mathcal{F}(\tilde{v}_i)\tilde{w}_i = \tilde{\mathcal{R}}(\tilde{v}_i), \quad \tilde{w}_i(0) = \tilde{w}_{0,i}.$$ 

Set $\tilde{v} = \tilde{v}_2 - \tilde{v}_1$ and $\tilde{w} = \tilde{w}_2 - \tilde{w}_1$. Taking the difference of the above two systems, we obtain

$$\partial_t \tilde{w} = \Omega(\tilde{v}_2)\tilde{w} + [\Omega(\tilde{v}_1) - \Omega(\tilde{v}_2)]\tilde{w}_1 + \tilde{\mathcal{R}}(\tilde{v}_2) - \tilde{\mathcal{R}}(\tilde{v}_1), \quad \tilde{w}(0) = \tilde{w}_{0,2} - \tilde{w}_{0,1}. \quad (5.4)$$

Let

$$\mathcal{F} = [\Omega(\tilde{v}_1) - \Omega(\tilde{v}_2)]\tilde{w}_1 + \tilde{\mathcal{R}}(\tilde{v}_2) - \tilde{\mathcal{R}}(\tilde{v}_1)$$

and

$$\mathcal{E}_0(I) := C(I; H^{r-1}) \cap C^1(I; H^{r-2}).$$

By (4.3), we have

$$\|\tilde{w}(t)\|_{r-1}^2 \leq \tilde{M}e^{\omega t}\|\tilde{w}_{0,2} - \tilde{w}_{0,1}\|_{r-1}^2 + \int_0^t \|\mathcal{F}(s)\|_{r-1}^2 ds.$$
Here $\tilde{M} = M(\|\tilde{v}_2\|_{r-2})$ and $\omega = \omega(\|\tilde{v}_2\|_{E_0(t)})$. We estimate
\[
\| [\mathbf{U}(\tilde{v}_1) - \mathbf{U}(\tilde{v}_2)] \tilde{w}_1 \|_{r-1} \leq \int_0^1 \| \partial \mathbf{U}(s\tilde{v}_1 + (1 - s)\tilde{v}_2)(\tilde{v}) \tilde{w}_1 \|_{r-1} ds \\
\leq \int_0^1 \| \partial \mathbf{U}(s\tilde{v}_1 + (1 - s)\tilde{v}_2)(\nabla) \tilde{w}_1 \|_{r-1} ds \\
\leq \mathcal{K}(\|\tilde{v}_1\|_{r-1} + \|\tilde{v}_2\|_{r-1}) \|\tilde{v}\|_{r-1} \|\tilde{w}_1\|_r.
\]
Similarly,
\[
\| \tilde{\mathcal{R}}(\tilde{v}_2) - \tilde{\mathcal{R}}(\tilde{v}_1) \|_{r-1} \leq \mathcal{K}(\|\tilde{v}_1\|_{r-1} + \|\tilde{v}_2\|_{r-1}) \|\tilde{v}\|_{r-1}.
\]
This yields
\[
\| \tilde{w}(t) \|_{r-1}^2 \leq \tilde{M} e^{\omega t} [\|\tilde{w}_0,2 - \tilde{w}_0,1\|_{r-1}^2 \\
+ t(1 + \|\tilde{v}_1\|_{r-1}^2) \mathcal{K}(\|\tilde{v}_1\|_{r-1} + \|\tilde{v}_2\|_{r-1}) \|\tilde{v}\|_{r-1}^2]. \tag{5.5}
\]
Using (5.4), we further have
\[
\| \partial_t \tilde{w} \|_{r-2} \leq \mathcal{K}(\|\tilde{v}_2\|_{r-2}) \|\tilde{w}\|_{r-1} + \|\tilde{\mathcal{F}}\|_{r-2}. \tag{5.6}
\]
5.3. **Convergence.** Now we choose $\tilde{v}_2 = \tilde{w}_1 = \tilde{u}_{n-1}, \tilde{v}_1 = \tilde{u}_{n-2}$ and $\tilde{w}_2 = \tilde{u}_n$. Note that as in Section 5.1, the constant $\tilde{M}$ in (5.5) can be taken to be independent of $n$. (5.5) and (5.6) show that
\[
\| \tilde{u}_n - \tilde{u}_{n-1} \|_{E_0(t)} \\
\leq \sqrt{\tilde{M}} e^{\frac{\omega}{2}(C)} [\|\tilde{u}_{0,n} - \tilde{u}_{0,n-1}\|_{r-1} + \sqrt{T}(1 + C) \mathcal{K}(C) \|\tilde{u}_{n-1} - \tilde{u}_{n-2}\|_{E_0(t)}] \\
+ \mathcal{K}(C) \sqrt{\tilde{M}} e^{\frac{\omega}{2}(C)} [\|\tilde{u}_{0,n} - \tilde{u}_{0,n-1}\|_{r-1} + \sqrt{T}(1 + C) \mathcal{K}(C) \|\tilde{u}_{n-1} - \tilde{u}_{n-2}\|_{E_0(t)}] \\
+ \mathcal{K}(C) \sup_{t \in I} \|\tilde{u}_{n-1}(t) - \tilde{u}_{n-2}(t)\|_{r-2}.
\]
In the last line, we can use (5.5) once more to obtain
\[
\sup_{t \in I} \|\tilde{u}_{n-1}(t) - \tilde{u}_{n-2}(t)\|_{r-1} \\
\leq \sqrt{\tilde{M}} e^{\frac{\omega}{2}(C)} [\|\tilde{u}_{0,n-1} - \tilde{u}_{0,n-2}\|_{r-1} + \sqrt{T}(1 + C) \mathcal{K}(C) \|\tilde{u}_{n-2} - \tilde{u}_{n-3}\|_{E_0(t)}] \\
\sqrt{\tilde{M}} e^{\frac{\omega}{2}(C)} \sqrt{T}(1 + C) \mathcal{K}^2(C) \leq 1/16,
\]
and
\[
\sqrt{\tilde{M}} e^{\frac{\omega}{2}(C)} \sqrt{T}(1 + C) (\mathcal{K}^2(C) + \mathcal{K}(C)) \leq 1/4,
\]
Putting $a_n = \|\tilde{u}_n - \tilde{u}_{n-1}\|_{E_0(t)}$. We thus infer that
\[
a_n \leq 2^{-n} + a_{n-1}/4 + a_{n-2}/16.
\]
By induction, one can show that
\[
a_n \leq \frac{s_n}{2^{2n-3}} + \frac{F_n}{2^{2n-4}} a_2 + \frac{F_{n-1}}{2^{2n-2}} a_1, \tag{5.7}
\]
where $F_n$ is the $n$-th term of Fibonacci sequence (starting from 0) and

$$s_n = 2^{n-3} + s_{n-1} + s_{n-2}.$$  

Let $b = (1 - \sqrt{5})/2$. Then

$$s_n - bs_{n-1} = 2^{n-3} + (1 - b)(s_{n-1} - bs_{n-2})$$

$$b(s_{n-1} - bs_{n-2}) = 2^{n-4}b + b(1 - b)(s_{n-2} - bs_{n-3})$$

$$\vdots$$

$$b^{n-3}(s_3 - bs_2) = b^{n-3} + b^{n-3}(1 - b)(s_2 - bs_1).$$

We sum these expressions to conclude

$$s_n - b^{n-2}s_2 = \sum_{k=0}^{n-3} 2^k b^{n-3-k} + (1 - b)(s_{n-1} - b^{n-2} s_1).$$

We perform a similar computation and sum to obtain

$$s_n - (1 - b)s_{n-1} = \sum_{k=0}^{n-3} 2^k b^{n-3-k} + b^{n-2}s_2 - (1 - b)b^{n-2}s_1$$

$$(1 - b)(s_{n-1} - (1 - b)s_{n-2}) = (1 - b) \sum_{k=0}^{n-2} 2^k b^{n-2-k} + (1 - b)b^{n-3}s_2 - (1 - b)^2 b^{n-3}s_1$$

$$\vdots$$

$$(1 - b)^n(s_3 - (1 - b)s_2) = (1 - b)^n + (1 - b)^n b s_2 - (1 - b)^{n-2} b s_1$$

This yields

$$s_n - (1 - b)^{n-2}s_2 = \sum_{k=0}^{n-3} 2^k b^{n-3-k} + (1 - b) \sum_{k=0}^{n-2} 2^k b^{n-2-k} + (1 - b)^{n-3}$$

$$+ s_2 \sum_{k=1}^{n-2} b^k (1 - b)^{n-2-k} + s_1 \sum_{k=1}^{n-2} b^{n-1-k}(1 - b)^k$$

and thus

$$s_n \leq (n - 2)2^{n-2} + 2^{n-2}s_2 + 2^{n-1}s_1.$$  

Plug this expression into (5.7). We infer

$$a_n \leq \frac{n - 2}{2^{n-1}} + \frac{s_1}{2^{n-1}} + \frac{s_1}{2^{n-1}} + \frac{a_2}{2^{n-4}} + \frac{a_1}{2^{n-2}}.$$  

Then

$$\|\tilde{u}_n - \tilde{u}_{n+j}\|_{E_0(I)} \leq \|\tilde{u}_n - \tilde{u}_{n+1}\|_{E_0(I)} + \cdots + \|\tilde{u}_{n+j-1} - \tilde{u}_{n+j}\|_{E_0(I)}$$

can be made arbitrarily small by taking $n$ large. We conclude that $(\tilde{u}_n)$ is Cauchy in $C(I; H^{r-1}) \cap C^1(I; H^{r-2})$ and thus converges in this space.

We denote the limit by $\tilde{u} \in C(I; H^{r-1}) \cap C^1(I; H^{r-2})$. We can let $n \to \infty$ in (5.1) and thus $\tilde{u}$ satisfies

$$\mathcal{F}(\tilde{u})\tilde{u} = \tilde{R}(\tilde{u}), \quad \tilde{u}(0) = \tilde{u}_0.$$
Next, notice that it follows from (5.3) that
\[ \| \tilde{u}(t) \|_r + \| \partial_\tau \tilde{u}(t) \|_{r-1} \leq C, \quad t \in [0, T]. \]
We remark that since we have an estimate for the difference of two solutions, uniqueness also follows from the above arguments.

5.4. **Continuity of solution.** The weak continuity of the solution \( \tilde{u} \) can be proved by a similar argument to that of quasilinear wave equations, since in that proof the structure of the equation is not necessary but only the convergence \( \tilde{u}_n \to \tilde{u} \) in \( C(I; H^{r-1}) \cap C^1(I; H^{r-2}) \) and an estimate of the form (5.3) matter.

We put
\[ K(t) = \sqrt{\frac{C_n}{2} I + (\mathcal{B}(\tilde{u}(t)))^* \mathcal{B}(\tilde{u}(t))} \]
and
\[ A_r(t) = A_r(\tilde{u}(t)) = K(t) \langle \nabla \rangle^r. \]
Hence
\[ N_r(t) = N_r(\tilde{u}(t)) = A_r(\tilde{u}(t))^* A_r(\tilde{u}(t)). \]
Recall that \( \mathcal{B} \in OPS^0_r(r, 2) \). It follows from [29, Theorems 2.2 and 2.4] that
\[ K(t) \in \mathcal{L}(H^s), \quad -r < s < r - 1. \] (5.8)
Fix \( t_0 \in [0, T] \), let us first show that \( A_r(t_0) \tilde{u}(t) \) is weakly continuous in \( H^0 \). Given any \( \epsilon > 0 \) and \( \phi \in H^0 \), take a sequence of Schwartz functions \( \phi_j \to \phi \) in \( H^0 \). Then
\[ (A_r(t_0) \tilde{u}(t) - A_r(t_0) \tilde{u}(t_0), \phi_j) \]
\[ = (A_r(t_0) \tilde{u}(t) - A_r(t_0) \tilde{u}(t_0), \phi - \phi_j) + (A_r(t_0) \tilde{u}(t) - A_r(t_0) \tilde{u}(t_0), \phi_j) \]
The first term is bounded by
\[ |(A_r(t_0) \tilde{u}(t) - A_r(t_0) \tilde{u}(t_0), \phi - \phi_j)| \leq K(t) \| \phi - \phi_j \|_0 \]
in view of (5.3). By choosing \( j \) large enough, we can make this term less than \( \epsilon/2 \). Then fixing \( j \) in the second term, we have
\[ |(A_r(t_0) \tilde{u}(t) - A_r(t_0) \tilde{u}(t_0), \phi_j)| \]
\[ = |(\langle \nabla \rangle^{-1} (\tilde{u}(t) - \tilde{u}(t_0)), \langle \nabla \rangle \mathcal{K}(t) \phi_j)| \]
Since \( \tilde{u}_n \to \tilde{u} \) in \( C(I; H^{r-1}) \), taking into consideration [29, Theorem 2.4] and (5.8), we have
\[ |(A_r(t_0) \tilde{u}(t) - A_r(t_0) \tilde{u}(t_0), \phi_j)| < \epsilon/2 \]
for all \( n \geq n_0 \) with some large enough \( n_0 \). In sum,
\[ |(A_r(t_0) \tilde{u}(t) - A_r(t_0) \tilde{u}_n(t), \phi)| < \epsilon \quad \text{for all } n \geq n_0 \text{ and } t \in [0, T]. \]
This shows that \( A_r(t_0) \tilde{u}_n(t) \) converges to \( A_r(t_0) \tilde{u}(t) \) uniformly in \( t \) in the weak topology. Thus, \( A_r(t_0) \tilde{u}(t) \) is weakly continuous in \( t \) with respect to the norm of \( H^0 \).

In the next step, we will show \( u(t) \in C(I; H^r) \). In view of the weak continuity of \( u(t) \), it suffices to demonstrate that the map
\[ t \mapsto \| \tilde{u}(t) \|_r \]
is continuous.

Applying (4.13) to (4.1) and in view of (5.3), we infer that
\[ \frac{d}{dt} \| \mathcal{A}_r(t) \tilde{u}(t) \|^2_0 \leq \mathcal{K}(C). \]
This implies that
\[ \| \mathcal{A}_r(t) \tilde{u}(t) \|^2_0 =: Y(t) \text{ is Lipschitz continuous in } t. \]  
(5.9)
Now consider
\[ \| \mathcal{A}_r(t_0) \tilde{u}(t) \|^2_0 - \| \mathcal{A}_r(t_0) \tilde{u}(t_0) \|^2_0 \]
\[ = (\| \mathcal{A}_r(t_0) \tilde{u}(t) \|^2_0 - \| \mathcal{A}_r(t) \tilde{u}(t) \|^2_0) + (\| \mathcal{A}_r(t) \tilde{u}(t) \|^2_0 - \| \mathcal{A}_r(t_0) \tilde{u}(t_0) \|^2_0). \]
The first term on the RHS can be estimated as follows.
\[ \leq \mathcal{K}(C) \| (\mathcal{R}(t) - \mathcal{R}(t_0)) (\nabla^r \tilde{u}(t)) \|_0 \]
\[ \leq \mathcal{K}(C) \| \mathcal{R}(t) - \mathcal{R}(t_0) \|_{\mathcal{L}(H^0)}. \]
As elements in \( \mathcal{L}(H^0) \), it is not hard to check that \( \mathcal{R}(\tilde{u}) \) depends continuously on \( \| \tilde{u} \|_{-1} \). Combining with (5.9), this observation shows that \([ t \mapsto \| \mathcal{A}_r(t_0) \tilde{u}(t) \|_0 \] is continuous at \( t_0 \); and thus
\[ \mathcal{A}_r(t_0) \tilde{u}(t) \text{ is continuous in } t \text{ at } t_0 \text{ w.r.t. } H^0. \]
Since \( t_0 \) is arbitrary, from
\[ \| \tilde{u}(t) - \tilde{u}(t_0) \|^2 \leq C \| \mathcal{A}_r(t_0) \tilde{u}(t) - \mathcal{A}_r(t_0) \tilde{u}(t_0) \|^2_0, \]
we infer that \( \tilde{u} \in C(I; H^r) \). Using this fact and equation (5.1), we immediately conclude that
\[ \tilde{u} \in C(I; H^r) \cap C^1(I, H^{r-1}). \]

5.5. Solution to the original system. For Gevrey-regular data, equations (1.2) and (1.3) admit a unique Gevrey-regular solution \([4, 15]\). Solution to (1.2) and (1.3) for Sobolev regular data, as in Theorem 1.1, thus follows by a standard approximation argument, applying our energy estimates to the approximating Gevrey solutions.
