Smooth branch of travelling waves for the Gross-Pitaevskii equation in $\mathbb{R}^2$ for small speed

David Chiron and Eliot Pacherie
Université Côte d’Azur, CNRS, LJAD, France

Abstract
We construct a smooth branch of travelling wave solutions for the 2 dimensional Gross-Pitaevskii equations for small speed. These travelling waves exhibit two vortices far away from each other. We also compute the leading order term of the derivatives with respect to the speed. We construct these solutions by an implicit function type argument.

1 Introduction and statement of the result
We consider the Gross-Pitaevskii equation

$$0 = (GP)(u) := i\partial_t u + \Delta u - (|u|^2 - 1)u$$

in dimension 2 for $u : \mathbb{R}_t \times \mathbb{R}^2_x \rightarrow \mathbb{C}$. The Gross-Pitaevskii equation is a physical model for Bose-Einstein condensates [12], [19], and is associated with the Ginzburg-Landau energy

$$E(v) := \frac{1}{2} \int_{\mathbb{R}^2} |\nabla v|^2 + \frac{1}{4} \int_{\mathbb{R}^2} (1 - |v|^2)^2.$$ 

The condition at infinity for (GP) will be

$$|u| \rightarrow 1 \text{ as } |x| \rightarrow +\infty.$$ 

We look for travelling wave solutions of (GP):

$$u(t,x) = v(x_1, x_2 + ct)$$

where $x = (x_1, x_2)$ and $c > 0$ is the speed of the travelling wave, which moves along the direction $-\vec{e}_2$. The equation on $v$ is

$$0 = (TW_c)(v) := -ic\partial_{x_2} v - \Delta v - (1 - |v|^2)v.$$ 

We want to construct travelling waves for small speed that look like the product of two well-separated vortices. Vortices are stationary solutions of (GP) of degrees $n \in \mathbb{Z}^*$ (see [6] and [15]):

$$V_n(x) = \rho_n(r)e^{in\theta},$$

where $x = re^{i\theta}$, solving

$$\left\{ \begin{array}{l}
\Delta V_n - (|V_n|^2 - 1)V_n = 0 \\
|V_n| \rightarrow 1 \quad \text{as} \quad |x| \rightarrow \infty.
\end{array} \right.$$ 

A vortex alone in the plane is a stationary solution of (GP), and vortices might interact when there are several of them. It is expected that if they are far away from each other, their dynamic is governed, at least at first order, by the point vortex system (see [2] and references therein). In particular, a vortex $V_1$ of degree 1 with a vortex $V_{-1}$ of degree $-1$ should move at constant speed in the direction orthogonal to the line that connects their centers.

The main result of this paper is the construction of a branch of solution by perturbation of the product of two vortices at any small speed $c > 0$, and the fact that this branch of solution is $C^1$ with respect to the speed.
Theorem 1.1 There exists $c_0 > 0$ a small constant such that, for any $0 < c \leq c_0$, there exists a solution of $(\text{TW}_c)$ of the form
\[ Q_c = V_1(\cdot - d_c e_1) V_{-1}(\cdot + d_c e_1) + \Gamma_{c,d_c}, \]
where $d_c = \frac{1 + o_c(1)}{c^2}$ is a continuous function of $c$. This solution has finite energy ($E(Q_c) < +\infty$) and $Q_c \to 1$ when $|x| \to +\infty$.

Furthermore, for all $+\infty \geq p > 2$, there exists $c_0(p) > 0$ such that if $c < c_0(p)$, for the norm
\[ \|h\|_{X_p} := \|h\|_{L^p(\mathbb{R}^2)} + \|\nabla h\|_{L^{p-1}(\mathbb{R}^2)} \]
and the space $X_p := \{ f \in L^p(\mathbb{R}^2), \nabla f \in L^{p-1}(\mathbb{R}^2) \}$, one has
\[ \|\Gamma_{c,d_c}\|_{X_p} = o_{c \to 0}(1). \]
In addition,
\[ c \mapsto Q_c - 1 \in C^1([0,c_0(p)],X_p), \]
with the estimate
\[ \left\| \partial_c Q_c + \left( \frac{1 + o_c(1)}{c^2} \right) \partial_d (V_1(\cdot - d e_1) V_{-1}(\cdot + d e_1))_{d=d_c} \right\|_p = o_{c \to 0} \left( \frac{1}{c^2} \right). \]

Existence of travelling waves solutions for this equation with finite energy has already been proven for small speeds in [3] (see also [5] and [7] for results in dimension 2 and 3). Moreover, the decay at infinity conjectured in [16] has been established in [14]. Here, we use an implicit function argument to construct the solution, using techniques developed in [9] or [17] for instance, displaying a clear understanding of the shape of the solution (see Lemma 3.8 for instance). We show in addition that the constructed branch is $C^1$, which is, to the best of our knowledge, the first result of this kind in dimension larger than one.

In the Gross-Pitaevskii equation, vortices play the role of solitons (as we can see in NLS or other such equations). In particular here we show that two vortices interact at long range since the speed $c$ is of order $\frac{1}{r}$, the half distance between the vortices. This is due to the slow decay of the vortex: $\nabla V_1$ is of order $\frac{1}{r}$ at infinity due to the phase.

The formal method for this kind of construction is well known. It has been done rigorously in a bounded domain for the Ginzburg Landau equation with no speed ([9]). One of the difficulties here is to find the right functional setting to construct the $C^1$ branch, in particular with regards to the transport term $\imath c \partial_x v$. On the contrary of what is claim in [17], the transport term can not be treated perturbatively. This is why we use another functional setting than [17] or [18] (see Remark 2.14 for more details).

In this paper, we start by doing the construction of the solution to fill these gaps in the case of two vortices in (GP). This construction is also a good introduction to the proof of the differentiability of the branch, which uses many of the same ideas, but with a more technical setting.

We start by reducing the problem to a one dimensional one in section 2. The construction of the travelling wave $Q_c$ is completed in section 3. Furthermore, in subsection 3.2, we show that $Q_c$ has finite energy and we compute some estimates particular to the branch of solutions. Finally section 4 is devoted to the proof of the differentiability of the branch.

We use the scalar product for $f,g \in L^2(\mathbb{R}^2)$,
\[ \langle f,g \rangle := \Re \int_{\mathbb{R}^2} f \bar{g}, \]
For $X = (X_1,X_2), Y = (Y_1,Y_2) \in \mathfrak{C}^2$, we define
\[ X.Y := X_1 Y_1 + X_2 Y_2, \]
which is the scalar product if $X,Y \in \mathbb{R}^2$. We use the notation $B(x,r)$ to define the closed ball in $\mathbb{R}^2$ of center $x \in \mathbb{R}^2$ and radius $r > 0$ for the Euclidean norm. In the estimates, a constant $K > 0$ is a universal constant independent of any parameter of the problem.

2 Lyapunov-Schmidt reduction

The proof of Theorem 1.1 follows closely the construction done in [9] or [17]. The main idea is to use perturbation methods on an approximate solution.

In subsection 2.1 we define this approximate solution \( V \) which consists in two vortices at distance \( 2d \) from each other. We then look for a solution of (TW\(_c\)) as a perturbation of \( V \), with an additive perturbation close to the vortices and a multiplicative one far from them. This is computed in subsection 2.2. We define suitable spaces in subsection 2.3 that we will use to invert the linear part and use a contraction argument. We ask for an orthogonality on the perturbation, and the norms are a little better but more technical than the ones in Theorem 1.1. In particular \( \Gamma_{c,d} \), in Theorem 1.1 verifies better estimates which are discussed for instance in Corollary 2.24 and in Lemma 3.8. We invert the linearized operator in Proposition 2.16 and show that the perturbation is a fixed point of a contracting functional in Proposition 2.20. The orthogonality condition create a Lagragian multiplier (see subsection 2.6), which left us with a problem in one dimension. This multiplier will be cancelled for a good choice of the parameter \( d \) in section 3.

2.1 Estimates on vortices

From [15], we can find stationary solution of (GP):

\[
V_n(x) = \rho_n(r) e^{in\theta}
\]

where \( x = re^{i\theta}, n \in \mathbb{Z}^* \), solving

\[
\begin{cases}
\Delta V_n - (|V_n|^2 - 1)V_n = 0 \\
|V_n| \to 1 \quad \text{as} \quad |x| \to \infty.
\end{cases}
\]

These solutions are well understood and, in particular, we have some estimates (see [15] for instance) that we will use. We also know the kernel of the linearized operator around \( V_{\pm 1} \) ([8]), which we will need for inverting the linearized operator around the approximate solution \( V \) defined using these vortices

\[
V(x) := V_1(x - de_1) V_1(x + de_1)
\]

where \( d > 0, x = (x_1, x_2) \). The function \( V \) is the product of two vortices with opposite degrees at a distance \( 2d \) from each other. One vortex alone in \( \mathbb{R}^2 \) is a stationary solution, and it is expected that two vortices interact and translate at a constant speed of order \( c \approx \frac{1}{2d} \), see [2]. Hence for the two parameters of this problem \( c, d > 0 \), we let them be free from each other, but with the condition \( c \) is of order \( 1/d \) by imposing that \( \frac{1}{2c} < d < \frac{2}{c} \).

We will study in particular areas near the center of each vortices. We will use coordinates adapted to this problem:

\[
\begin{align*}
x &= (x_1, x_2) = re^{i\theta}, \\
y &= (y_1, y_2) := x - de_1 = r_1 e^{i\theta_1}, \\
z &= (z_1, z_2) := y + 2de_1 = x + de_1 = r_{-1} e^{i\theta_{-1}}, \\
\bar{r} &:= \min(r_1, r_{-1}).
\end{align*}
\]

Using y coordinate mean that we are centered around \( V_1 \), and z coordinate for around \( V_{-1} \). Note that we have

\[
V(x) = V_1(y) V_{-1}(z)
\]

using these notations. If it is not precised, \( V \) will be taken in \( x \), \( V_1 \) in \( y \) and \( V_{-1} \) in \( z \). If we compute (TW\(_c\)) for \( V \), i.e. \( -ic\partial_z V - \Delta V - (1 - |V|^2)V \), we get

\[
(TW_c)(V) = E - ic\partial_z V,
\]

where we defined

\[
E := -\Delta V - (1 - |V|^2)V.
\]

We have \( V = V_1 V_{-1} \) and, by using \( -\Delta V_\varepsilon = (1 - |V_\varepsilon|^2)V_\varepsilon \) for \( \varepsilon = \pm 1 \), we compute

\[
E = -2\nabla V_1 \cdot \nabla V_{-1} + V_1 V_{-1}(1 - |V_1|^2 + 1 - |V_{-1}|^2 - 1 + |V_1 V_{-1}|^2).
\]
Hence
\[ E = -2\nabla V_1, \nabla V_{-1} + (1 - |V_1|^2)(1 - |V_{-1}|^2)V_1 V_{-1}. \]  
(2.2)

The rest of this subsection is devoted to the computation of estimates on \( V, E, \partial_r V \) and \( i\partial_{x_2} V \) using estimates on \( V_1 \) and \( V_{-1} \). Let us start with the properties on \( V_{\pm 1} \) we need.

**Lemma 2.1** (15) \( V_1(x) = \rho_1(r)e^{i\theta} \) verifies \( V_1(0) = 0 \), and there exists a constant \( \kappa > 0 \) such that, for all \( r > 0 \), \( 0 < \rho_1(r) < 1 \), \( \rho_1'(r) > 0 \), and

\[
\rho_1(r) \sim_{r \to 0} \kappa r,
\]

\[
\rho_1'(r) = \mathcal{O}_{r \to \infty} \left( \frac{1}{r^2} \right),
\]

\[
1 - |V_1(x)| \geq \frac{1}{2r^2} + \mathcal{O}_{r \to \infty} \left( \frac{1}{r^3} \right),
\]

\[
\nabla V_1(x) = i V_1(x) \frac{x^+}{r^2} + \mathcal{O}_{r \to \infty} \left( \frac{1}{r^3} \right)
\]

where \( x^+ = (-x_2, x_1) \), \( x = re^{i\theta} \). Furthermore we have similar properties for \( V_{-1} \) since \( V_{-1}(x) = \overline{V_1(x)} \).

We will use the \( O \) notation for convergence independent of any other quantity. Now let us write all the derivatives of a vortex in polar coordinate, which will be useful all along the proof of the results.

**Lemma 2.2** We define \( u := \frac{\rho_1'(r_1)}{\rho_1(r_1)} \). Then,

\[
\partial_{x_1} V_1(y) = \left( \cos(\theta_1) u - \frac{i}{r_1} \sin(\theta_1) \right) V_1,
\]

\[
\partial_{x_2} V_1(y) = \left( \sin(\theta_1) u + \frac{i}{r_1} \cos(\theta_1) \right) V_1,
\]

\[
\partial_{x_1 x_1} V_1(y) = \left( \cos^2(\theta_1)(u^2 + u') + \sin^2(\theta_1) \left( \frac{u}{r_1} - \frac{1}{r_1^2} \right) + 2i \sin(\theta_1) \cos(\theta_1) \left( \frac{1}{r_1^2} - \frac{u}{r_1} \right) \right) V_1,
\]

\[
\partial_{x_1 x_2} V_1(y) = \left( \sin(\theta_1) \cos(\theta_1) \left( u^2 + u' + \frac{1}{r_1^2} - \frac{u}{r_1} \right) - i \cos(2\theta_1) \left( \frac{1}{r_1^2} - \frac{u}{r_1} \right) \right) V_1.
\]

We obtain the derivatives of \( V_{-1} \) by changing \( i \to -i \), \( y \to z \), \( \theta_1 \to \theta_{-1} \), \( r_1 \to r_{-1} \) and \( V_1 \to V_{-1} \). We remark in particular that the first derivatives are of first order \( \frac{1}{r_1} \) and the second derivatives are of first order \( \frac{1}{r_1^2} \) for large values of \( r_1 \). From [15], we can check that, more generally, we have

\[
|D^{(n)} V_1(y)| \leq \frac{K(n)}{(1 + r_1)^n},
\]

(2.3)

**Proof** With the notation of (2.1) in radial coordinate around \( dC_1 \), the center of \( V_1 \):

\[
\partial_{x_1} = \cos(\theta_1) \partial_r - \frac{\sin(\theta_1)}{r_1} \partial_{\theta_1},
\]

\[
\partial_{x_2} = \sin(\theta_1) \partial_r + \frac{\cos(\theta_1)}{r_1} \partial_{\theta_1},
\]

we compute directly the first two equalities of the lemma. Now, we compute

\[
\partial_{x_1 x_1} V_1 = \cos(\theta_1) \partial_r (\partial_{x_1} V_1) - \frac{\sin(\theta_1)}{r_1} \partial_{\theta_1} (\partial_{x_1} V_1)
\]
with
\[ \partial_r (\partial_{x_1} V_1) = \left( u \left( \cos(\theta_1)u - \frac{r_1}{r_1} \sin(\theta_1) \right) + \cos(\theta_1)u' + \frac{r_1}{r_1} \sin(\theta) \right) V_1 \]
and
\[ \partial_{\theta_1} (\partial_{x_1} V_1) = \left( i \cos(\theta_1)u + \frac{1}{r_1} \sin(\theta_1) - \sin(\theta_1)u - \frac{i}{r_1} \cos(\theta_1) \right) V_1 \]
for the third inequality. We use them also in
\[ \partial_{x_1 x_2} V_1 = \sin(\theta_1)\partial_{r_1} (\partial_{x_1} V_1) + \frac{\cos(\theta_1)}{r_1} \partial_{\theta_1} (\partial_{x_1} V_1) \]
for the fourth relation, with \( \cos^2(\theta_1) - \sin^2(\theta_1) = \cos(2\theta_1) \).
\[ \blacksquare \]

Now, we compute some basic estimates on \( V \).

**Lemma 2.3** There exists a universal constant \( K > 0 \) and a constant \( K(d) > 0 \) depending only on \( d > 1 \) such that
\[ |1 - V|^2 \leq \frac{K(d)}{(1 + r)^2}, \]
\[ 0 \leq 1 - |V|^2 \leq \frac{K}{(1 + \tilde{r})^2}, \]
and we have
\[ |\nabla V| \leq \frac{K}{(1 + \tilde{r})}, \]
as well as
\[ |\nabla V| \leq \frac{Kd}{(1 + \tilde{r})^2}, \]
where \( \tilde{r} = \min(r_1, r_{-1}) \).

**Proof** For the first inequality, we are at fixed \( d \). Since \( V = |V_{1-1}|e^{i(\theta_1 - \theta_{-1})} \) and \( \theta_1, \theta_{-1} \) are angles from points separated by \( 2d \), we infer
\[ e^{i(\theta_1 - \theta_{-1})} = 1 + O_{r-\to\infty} \left( \frac{1}{r} \right), \]
and \( |V_{1-1}| = 1 + O_{r-\to\infty} \left( \frac{1}{r} \right) \) from Lemma 2.1 where \( O_{r-\to\infty} \left( \frac{1}{r} \right) \) is a quantity that decay in \( \frac{1}{r} \) at fixed \( d \). Therefore,
\[ 1 - |V|^2 = |1 - |V_{1-1}|e^{i(\theta_1 - \theta_{-1})}|^2 = \left| K(d)O_{r-\to\infty} \left( \frac{1}{r_1} \right) \right|^2 \leq \frac{K(d)}{(1 + r)^2}. \]
From Lemma 2.1, we compute
\[ 1 - |V|^2 = 1 - |V_1|^2 + |V_1|^2(1 - |V_{-1}|^2) \leq K \left( \frac{1}{(1 + r_1)^2} + \frac{1}{(1 + r_{-1})^2} \right) \leq \frac{K}{(1 + \tilde{r})^2}. \]
We check that \( \nabla V = \nabla V_{1-1} + \nabla V_{-1} V_1 \), and therefore, with Lemma 2.2, we have
\[ |\nabla V| \leq \frac{K}{(1 + r_1)} + \frac{K}{(1 + r_{-1})} \leq \frac{K}{(1 + \tilde{r})}. \]
Furthermore, by Lemma 2.1,
\[ \nabla V_{\pm 1} = \frac{\pm i}{r_{\pm 1}} e_{\theta_{\pm 1}} + O_{r_{\pm 1}-\to\infty} \left( \frac{1}{r_{\pm 1}^3} \right). \]
For \( \hat{r} \geq 1 \) (the last estimate on \(|\nabla V|\) for \( \hat{r} \leq 1 \) is a consequence of \(|\nabla V| \leq \frac{K}{(1+\hat{r})^3} \)), since \( r_{\pm,1} e^{i\theta_{x,1}} = x \mp d\hat{e}_1 \),

\[
\left| \frac{\cos(\theta)}{r_1} - \frac{\cos(\theta_{-1})}{r_{-1}} \right| \leq \frac{x_1 - d}{(x_1 - d)^2 + x_2^2} - \frac{x_1 + d}{(x_1 + d)^2 + x_2^2}
\]

\[
\leq \left| \frac{2x_1}{r_1^2}r_{-1} - \frac{x_1}{(x_1 - d)^2 - (x_1 + d)^2} \right| + \frac{1}{r_1^2} \left| \frac{1}{r_1^2} + \frac{1}{r_{-1}^2} \right|
\]

\[
\leq \frac{4dx_1^2}{r_1^2r_{-1}^2} + \frac{2d}{r_1^2}
\]

\[
\leq \frac{Kd}{r_1^2},
\]

since \( \frac{x_1}{r_1r_{-1}} \leq \frac{1}{r} \) if \( \hat{r} \geq 1 \). With a similar estimation for \( \frac{\sin(\theta)}{r_1} - \frac{\sin(\theta_{-1})}{r_{-1}} \), we infer

\[
|\nabla V| \leq \left| \frac{\vec{e_{\theta_1}}}{r_1} - \frac{\vec{e_{\theta_{-1}}}}{r_{-1}} \right| + \frac{K}{(1+\hat{r})^3}
\]

\[
\leq \frac{Kd}{(1+\hat{r})^2} + \frac{K}{(1+\hat{r})^3}
\]

\[
\leq \frac{Kd}{(1+\hat{r})^2}.
\]

Now we look at the convergence of some quantities when we are near the center of \( V_1 \) and \( d \to \infty \). When we are close to the center of \( V_1 \) and \( d \) goes to infinity, we expect that the second vortex has no influence.

**Lemma 2.4** As \( d \to \infty \), we have, locally uniformly in \( \mathbb{R}^2 \),

\[
V(., + d\hat{e}_1) = V_1(., + 2d\hat{e}_1) \to V_1(.),
\]

\[
E(., + d\hat{e}_1) \to 0
\]

and

\[
\partial_d V(., + d\hat{e}_1) \to -\partial_{x_1} V_1(.).
\]

**Proof** In the limit \( d \to \infty \), for \( y \in \mathbb{R}^2 \),

\[
V(y + d\hat{e}_1) = V_1(y)e^{-i\theta_{x,1}} \left( 1 + O \left( \frac{1}{r_1^2} \right) \right)
\]

by Lemma 2.1, hence

\[
V(.) \to V_1(.)
\]

locally uniformly since \( \theta_{-1} \to 0, r_{-1} \to +\infty \) when \( d \to \infty \) locally uniformly. On the other hand, since \( V(x) = V_1(y)V_{-1}(y + 2d\hat{e}_1) \), we have

\[
(\partial_d V)(y + d\hat{e}_1) = -\partial_{x_1} V_1(y)V_{-1}(y + 2d\hat{e}_1) + V_1(y)\partial_{x_1} V_{-1}(y + 2d\hat{e}_1).
\]

Since \( \partial_{x_1} V_{-1}(y + 2d\hat{e}_1) = \nabla V_{-1}(y + 2d\hat{e}_1).\hat{e}_1 \to 0 \) locally uniformly as \( d \to \infty \), we have

\[
\partial_d V(.) \to -\partial_{x_1} V_1(.)
\]

locally uniformly. Finally, from (2.2), we have that

\[
E(x) = -2\nabla V_1(y).\nabla V_{-1}(z) + (1 - |V_1(y)|^2)(1 - |V_{-1}(z)|^2)V_1(y)V_{-1}(z)
\]

with the notations from (2.1), therefore, locally uniformly,

\[
E(., + d\hat{e}_1) \to 0
\]

as \( \nabla V_{-1} \to 0 \) and \( |V_{-1}| \to 1 \) locally uniformly when \( d \to \infty \). \( \square \)

We now do a precise computation on the term \( ic\partial_{x_2} V \), which appears in \((TW_c)(V)\).
Lemma 2.5 There exists a universal constant $C > 0$ (independent of $d$) such that if $r_1, r_{-1} \geq 1$,

$$\left| \frac{i \partial_{x_2} V}{V} - 2d \frac{x_1^2 - d^2 - x_2^2}{r_1^2 r_{-1}^2} \right| \leq C \left( \frac{1}{r_1^2} + \frac{1}{r_{-1}^2} \right).$$

Remark that this shows that the first order term of $i \partial_{x_2} V$ is real-valued and the dependence on $d$ of this term is explicit.

Proof Recall from Lemma 2.2 that for $\epsilon = \pm 1$,

$$\partial_{x_2} V_\epsilon = \frac{i \epsilon}{r_\epsilon} \cos(\theta_\epsilon) V_\epsilon + O_{r_1 \to \infty} \left( \frac{1}{r_1^2} \right).$$

We have

$$\frac{\partial_x V}{V} = \frac{\partial_x V_1}{V_1} + \frac{\partial_x V_{-1}}{V_{-1}},$$

and

$$\cos(\theta_\epsilon) = \frac{x_1 - \epsilon d}{r_\epsilon},$$

yielding

$$\frac{\partial_x V}{V} = i \left( \frac{x_1 - d}{r_1^2} - \frac{x_1 + d}{r_{-1}^2} \right)$$

$$= i \left( x_1 \left( \frac{1}{r_1^2} - \frac{1}{r_{-1}^2} \right) - d \left( \frac{1}{r_1^2} + \frac{1}{r_{-1}^2} \right) \right) + O_{r_1 \to \infty} \left( \frac{1}{r_1^2} \right) + O_{r_{-1} \to \infty} \left( \frac{1}{r_{-1}^2} \right).$$

We compute with (2.1) that

$$\frac{1}{r_1^2} - \frac{1}{r_{-1}^2} = \frac{(x_1 + d)^2 + x_2^2 - (x_1 - d)^2 - x_2^2}{r_1^2 r_{-1}^2} = \frac{4dx_1}{r_1^2 r_{-1}^2}$$

and

$$\frac{1}{r_1^2} + \frac{1}{r_{-1}^2} = \frac{(x_1 + d)^2 + x_2^2 + (x_1 - d)^2 + x_2^2}{r_1^2 r_{-1}^2} = \frac{2x_1^2 + d^2 + x_2^2}{r_1^2 r_{-1}^2},$$

yielding the estimate. \qed

Finally, we show an estimate on $\partial_d V = \partial_d (V_1(x - d e_1) V_{-1}(x + d e_1)) = -\partial_{x_1} V_1 V_{-1} + \partial_{x_1} V_{-1} V_1$.

|Lemma 2.6| There exists a constant $K > 0$ such that

$$|\partial_d V| \leq \frac{K}{1 + r},$$

$$|\nabla \partial_d V| \leq \frac{K}{(1 + r)^2}$$

and

$$|\Re(\bar{V} \partial_d V)| \leq \frac{K}{(1 + r)^3}.$$ 

Furthermore,

$$|\partial_d^2 V| \leq \frac{K}{(1 + r)^2}$$

and

$$|\partial_d^2 \nabla V| \leq \frac{K}{(1 + r)^3}.$$
Proof. We have that $\partial_d V = -\partial_{x_1} V_{11} + \partial_{x_1} V_{-1}$ and from Lemma 2.2,

$$|\partial_{x_1} V_1| \leq \frac{K}{(1 + r_1)} \leq \frac{K}{(1 + r)}.$$ 

Similarly, $|\partial_{x_1} V_{-1}| \leq \frac{K}{(1 + r)}$ and this proves the first inequality. Furthermore, for $\nabla \partial_d V$, every terms has two derivatives, each one bringing a $\frac{1}{(1 + r)}$ by Lemmas 2.1 and 2.2, this shows the second inequality. Finally, we compute

$$\Re(\bar{V} \partial_d V) = -|V_{-1}|^2 \Re(\bar{V}_1 \partial_{x_1} V_1) + |V_1|^2 \Re(\bar{V}_{-1} \partial_{x_1} V_{-1}).$$ 

From Lemma 2.1, $|\Re(V_1 \partial_{x_1} V_1)| \leq \frac{K}{(1 + r)} \leq \frac{K}{(1 + r)}$ and $|V_{-1}|^2 \leq 1$. Similarly we have

$$||V_1|^2 \Re(\bar{V}_{-1} \partial_{x_1} V_{-1})| \leq \frac{K}{(1 + r)^3}.$$

Furthermore, since $\partial_d^2 V = \partial_{x_1} V_{11} V_{-1} - 2 \partial_{x_1} V_{11} \partial_{x_1} V_{-1} + \partial_{x_1} V_{11} V_{-1} + \partial_{x_1} V_{11} V_{-1}$, with equation (2.3), we check easily the estimations on $\partial_d^2 V$ and $\partial_d^3 V$.

\[\square\]

2.2 Setup of the proof

In the same way as in [9] (see also [17]), we will look at a solution of $(\mathcal{T}_c)$ as a perturbation of $V$ of the form

$$v := \eta V(1 + \Psi) + (1 - \eta)V e^{\Psi}$$

where $\eta(x) = \tilde{\eta}(r_1) + \tilde{\eta}(r_{-1})$ and $\tilde{\eta}$ is a $C^\infty$ positive cutoff with $\tilde{\eta}(r) = 1$ if $r \leq 1$ and $0$ if $r \geq 2$. The perturbation is $\Psi$ and we will also use

$$\Phi := V \Psi.$$ 

We use such a perturbation because we want it to be additive (in $\Psi$) near the center of the vortices (where $v = V + \Psi$), and multiplicative (in $\Psi$) far from them (where $v = V e^{\Psi}$). We shall require $\Phi$ to be bounded (and small) near the vortices. The problem becomes an equation on $\Psi$, with the following Lemma 2.7, we shall write

$$\eta L(\Phi) + (1 - \eta)V L'(\Psi) + F(\Psi) = 0$$

where $L$ and $L'$ are linear. The main part of the proof of the construction consists of inverting the linearized operator $\eta L(\Phi) + (1 - \eta)V L'(\Psi)$ in suitable spaces, and then use a contraction argument by showing that $F$ is small and conclude on the existence of a solution $\Psi$ by a fixed point theorem.

Lemma 2.7 The function $v = \eta V(1 + \Psi) + (1 - \eta)V e^{\Psi}$ is solution of $(\mathcal{T}_c)$ if and only if

$$\eta L(\Phi) + (1 - \eta)V L'(\Psi) + F(\Psi) = 0,$$

where $\Phi = V \Psi$,

$$L'(\Psi) := -\Delta \Psi + 2 \nabla \Psi \cdot \nabla \Psi + 2 |V|^2 \Re(\Psi) - i c \partial_{x_2} \Psi,$$

$$L(\Phi) := -\Delta \Phi - (1 - |V|^2) \Phi + 2 \Re(\bar{V} \Phi) V - i c \partial_{x_2} \Phi,$$

$$F(\Psi) := E - i c \partial_{x_2} V + V(1 - \eta)(-\nabla \Psi \cdot \nabla \Psi + |V|^2 S(\Psi)) + R(\Psi),$$

with

$$E = -\Delta - (1 - |V|^2) V,$$

$$S(\Psi) := e^{2 \Re(\Psi)} - 1 - 2 \Re(\Psi)$$

and $R(\Psi)$ is a sum of terms at least cubic in $\Psi$ or $\Phi$ localized in the area where $\eta \neq 0$. Furthermore, there exists $C, C_0 > 0$ such that the estimate

$$|R(\Psi)| \leq C \|\Phi\|_{C^1\{\xi \leq 2\}}^2$$

holds if $\|\nabla \Psi\|_{L^\infty(\mathbb{R}^2)} + \|\Phi\|_{L^\infty(\mathbb{R}^2)} \leq C_0$ (a constant independent of $c$), where $\tilde{r} = \min(|x - d\mathbb{C}|, |x + d\mathbb{C}|)$ for $x \in \mathbb{R}^2$. Additionally, $L(\Phi)$ and $L'(\Psi)$ are related by

$$L(\Phi) = (E - i c \partial_{x_2} V)\Psi + V L'(\Psi).$$
The main reason for such a perturbation ansatz is because \( V(d\bar{\eta}^2) = V(-d\bar{\eta}^2) = 0 \), so we can not divide by \( V \) as done in \( L' \) for instance when we look near the vortices, therefore an additive perturbation is more suitable. But far from the vortices, the perturbation is easier to compute when written multiplicatively with a factorisation by \( V \). Remark also that this allows us to take \( \Phi \) to explode at \( d\bar{\eta}^2 \) and \(-d\bar{\eta}^2 \) as long as \( \Phi = V\Psi \) does not. This is needed for the norm we use in subsection 2.3.

As we look for \( \Phi \) small (it is a perturbation), the conditions \( \|\nabla \Phi\|_{L^\infty(\mathbb{R}^2)} + \|\Phi\|_{L^\infty(\mathbb{R}^2)} \leq C_0 \) will always be true. We need them because some of the error terms have an exponential contribution in \( \Psi \), and not only quadratic. We recall that, with our notations, \( \nabla \Psi \cdot \nabla \Psi \) is complex-valued.

Remark that the quantity \( F \) contains only nonlinear terms and the source term, which is \( E - ic\partial_{x_2} V \). Furthermore, contrary to the work [17], the transport term is in the linearized operator, and not considered as an error term in \( F \).

The rest of this subsection is devoted to the proof of Lemma 2.7.

**Proof** First we show that \( L(\Phi) = (E - ic\partial_{x_2} V)\Psi + L'(\Psi) V \). We use \( \Phi = V\Psi \) in \( L(\Phi) \) to compute

\[
L(\Phi) = -\Delta V \Psi - \Delta \Psi V - 2\nabla \Psi \cdot \nabla V - (1 - |V|^2) V\Psi + 2V^2 V \Re(\Psi) - ic V\partial_{x_2} \Psi - ic\partial_{x_2} V\Psi.
\]

We have that \( E = -\Delta V - (1 - |V|^2) V \) hence \( (E - ic\partial_{x_2} V)\Psi = -\Delta V \Psi - (1 - |V|^2) V\Psi - ic\partial_{x_2} V\Psi \) and the remaining terms are exactly equal to \( V L'(\Psi) \).

We denote \( \zeta := 1 + \Psi - e^\Psi \). Remark that \( \zeta \) is at least quadratic in \( \Psi \). We compute the different terms in \( (TW_\epsilon) \):

\[
-ic\partial_{x_2} v - \Delta v - (1 - |v|^2)v = 0
\]

with

\[
v = \eta V(1 + \Psi) + (1 - \eta)V e^\Psi.
\]

We have \( v = V + \Phi - (1 - \eta)\zeta \). In general, our goal in this computation is to factorize any term when possible by \( V(\eta + (1 - \eta)e^\Psi) \) and compute the other terms, which will be supported in the area \( \eta(1 - \eta) \neq 0 \). First compute

\[
\partial_{x_2} v = \eta(\partial_{x_2} V(1 + \Psi) + \partial_{x_2} \Psi V) + \partial_{x_2} \eta V(1 + \Psi) + (1 - \eta)e^\Psi(\partial_{x_2} V + \partial_{x_2} \Psi V) - \partial_{x_2} \eta V e^\Psi,
\]

therefore

\[
-ic\partial_{x_2} v = V(\eta + (1 - \eta)e^\Psi) \left(-ic\frac{\partial_{x_2} V}{V} - ic\partial_{x_2} \Psi\right) - ic\eta\partial_{x_2} V\Psi - ic\partial_{x_2} \eta V \zeta. \tag{2.4}
\]

For the second term, we compute

\[
\Delta v = \Delta \eta V(1 + \Psi - e^\Psi) + 2\nabla \eta \nabla (V(1 + \Psi - e^\Psi)) + \eta(\Delta V(1 + \Psi) + 2\nabla V . \nabla \Psi + V \Delta \Psi) + (1 - \eta)(\Delta V e^\Psi + 2\nabla V . \nabla e^\Psi + V(\Delta \Psi + \nabla \Psi . \nabla e^\Psi)),
\]

hence

\[
-\Delta v = V(\eta + (1 - \eta)e^\Psi) \left(-\frac{\Delta V}{V} - 2\frac{\nabla V}{V} \nabla \Psi - \Delta \Psi\right) - \eta \Delta V \Psi - (1 - \eta)V \nabla \Psi \cdot \nabla e^\Psi - V \Delta \eta \zeta - 2\nabla \eta \cdot \nabla (V \zeta). \tag{2.5}
\]

Finally, let us write \( A := V(1 + \Psi) \) and \( B := V e^\Psi \), so that \( v = \eta A + (1 - \eta)B \), and remark that \( V \zeta = A - B \). We then have

\[
(1 - |v|^2)v = (1 - \eta^2)|A|^2 - (1 - \eta)^2|B|^2 - 2\eta(1 - \eta)\Re(A\bar{B}))\eta A + (1 - \eta)B.
\]

We want to bring out the terms not related to the interaction between \( A \) and \( B \), namely \( \eta(1 - |A|^2)A + (1 - \eta)(1 - |B|^2)B \). We have

\[
(1 - |v|^2)v = \eta(1 - |A|^2)A + \eta A(1 - \eta^2)|A|^2 - (1 - \eta^2)|B|^2 - 2\eta(1 - \eta)\Re(A\bar{B}) + (1 - \eta)(1 - |B|^2)B + (1 - \eta)B[1 - (1 - \eta^2)|B|^2 - \eta^2|A|^2 - 2\eta(1 - \eta)\Re(A\bar{B})].
\]
Now, factorizing \( \eta(1 - \eta) \) we get

\[
(1 - |v|^2)v = \eta(1 - |A|^2)A + (1 - \eta)(1 - |B|^2)B + \eta(1 - \eta)(1 + \eta)A(1 - \eta)B[|B|^2 - 2\eta\text{Re}(AB)] + \eta(1 - \eta)(2 - \eta)B[|B|^2 - \etaB|A|^2 - 2(1 - \eta)B\text{Re}(AB)].
\]

Remark that the last two lines yield 0 if we take \( A = B \), since \( V\zeta = A - B \), we can write

\[
(1 - |v|^2)v = \eta(1 - |A|^2)A + (1 - \eta)(1 - |B|^2)B + \eta(1 - \eta)(V\zeta G(\Psi) + \bar{V}\zeta H(\Psi))
\]

where \( G, H \) are functions satisfying \( |H(\Psi)|, |G(\Psi)| \leq C(1 + |\Psi|^2 + |e^\Psi|) \) for some universal constant \( C > 0 \). We recall that \( A = V(1 + \Psi) \) hence

\[
(1 - |A|^2)A = (1 - |V|^2)|1 + \Psi|^2V(1 + \Psi),
\]

therefore we get a constant (in \( \Phi \), a linear and a nonlinear part in \( \Psi \):

\[
(1 - |A|^2)A = (1 - |V|^2)V + (1 - |V|^2)V\Psi - 2|V|^2V\text{Re}(\Psi)
\]

\[
- 2|V|^2V\text{Re}(\Psi)\Psi - |V|^2V(1 + \Psi).
\]

We have \( B = Ve^\Psi \), hence

\[
(1 - |B|^2)B = e^\Psi(1 - |V|^2)V - 2\text{Re}(\Psi)|V|^2V - |V|^2V S(\Psi),
\]

where \( S(\Psi) = e^{2\text{Re}(\Psi)} - 1 - 2\text{Re}(\Psi) \) is nonlinear in \( \Psi \). We add these relations and obtain

\[
\eta(1 - |A|^2)A + (1 - \eta)(1 - |B|^2)B = V(\eta + (1 - \eta)e^\Psi)((1 - |V|^2) - 2\text{Re}(\Psi)|V|^2) + \eta(1 - \eta)(V\zeta G(\Psi) + \bar{V}\zeta H(\Psi)) + \eta(1 - |V|^2)V\Psi - 2|V|^2V\text{Re}(\Psi)\Psi - |V|^2V(1 + \Psi)
\]

\[
- (1 - \eta)e^\Psi|V|^2V S(\Psi).
\]

Now adding the computations (2.4), (2.5) and (2.6) in \(-ic\partial_{x_2}v - \Delta v - (1 - |v|^2)v = 0\) yields

\[
V(\eta + (1 - \eta)e^\Psi)\left(\frac{\bar{E} - ic\partial_{x_2}V}{V} + L'(\Psi)\right)
\]

\[
+ \eta((E - ic\partial_{x_2}V)V + 2|V|^2V\text{Re}(\Psi)\Psi + |V|^2S(1 + \Psi))
\]

\[
+ V(1 - \eta)e^\Psi(|V|^2S(\Psi) - \nabla\Psi, \nabla\Psi)
\]

\[
- ic\partial_{x_2}\eta V\zeta - V\Delta\eta\zeta - 2\nabla\eta, \nabla(V\zeta) - (1 - \eta)(V\zeta G(Z) + \bar{V}\zeta H(\Psi)) = 0.
\]

We divide by \( \eta + (1 - \eta)e^\Psi \), which is allowed since \( \eta + (1 - \eta)e^\Psi = 1 + (1 - \eta)(e^\Psi - 1) \) and in \( \{ \eta \neq 1 \} \), \( |\Psi| \leq K\|\Psi\|_{L^\infty(\mathbb{R}^2)} \leq KC_0 \) by our assumption \( \|\Phi\|_{L^\infty(\mathbb{R}^2)} \leq C_0 \), therefore, choosing \( C_0 \) small enough, in \( \{ \eta \neq 1 \} \), we have \( |e^\Psi - 1| \leq 1/2 \). We also remark that

\[
\frac{(1 - \eta)e^\Psi}{(\eta + (1 - \eta)e^\Psi)} = (1 - \eta) + \eta(1 - \eta)\left(\frac{e^\Psi - 1}{\eta + (1 - \eta)e^\Psi}\right),
\]

therefore (2.7) become

\[
E - ic\partial_{x_2}V + VL'(\Psi)
\]

\[
+ V(1 - \eta)(-\nabla\Psi, \nabla\Psi + |V|^2S(\Psi))
\]

\[
+ \eta(\eta + (1 - \eta)e^\Psi)((E - ic\partial_{x_2}V)V + 2|V|^2V\text{Re}(\Psi)\Psi + |V|^2S(1 + \Psi)) + R_1(\Psi) = 0,
\]
where
\[
R_1(\Psi) := \frac{1}{(\eta + (1 - \eta)e^\Psi)}(-ic\partial_{x_2}\eta V\zeta - V\Delta\eta\zeta - 2\nabla\eta \cdot \nabla(V\zeta) - \eta(1 - \eta)(V\zeta G(Z) + \nabla\zeta H(\Psi))) + V\eta(1 - \eta) \frac{e^\Psi - 1}{\eta + (1 - \eta)e^\Psi}(-\nabla\Psi \cdot \nabla\Phi + |V|^2 S(\Psi)).
\]
Remark that $R_1(\Psi)$ is nonzero only in the rings where $\eta(1 - \eta) \neq 0$, i.e., $1 \leq \bar{r} \leq 2$, since every term has either $\partial_{x_2}\eta, \Delta\eta$ or $\eta(1 - \eta)$ as a factor. Furthermore they all have as an additional factor $\zeta, \nabla\zeta, Z$ or $\nabla\Psi \cdot \nabla\Phi$. Hence, if we suppose that $|\Psi|, |\nabla\Psi| \leq C_0$ in the rings, then those terms can be bounded by $C||\Psi||^2_{C^1((1 \leq \bar{r} \leq 2))}$. Therefore if $|\Psi|, |\nabla\Psi| \leq C_0$ in the rings, then
\[
|R_1(\Psi)| \leq K||\Psi||^2_{C^1((1 \leq \bar{r} \leq 2))} \leq K||\Phi||^2_{C^1((\bar{r} \leq 2))}
\]
for some universal constant $K > 0$, since in the rings, $V$ is bounded from below by a nonzero constant. Now, we use
\[
\eta \frac{1}{(\eta + (1 - \eta)e^\Psi)} = \eta + \eta(1 - \eta) \frac{1 - e^\Psi}{\eta + (1 - \eta)e^\Psi}
\]
to compute
\[
\eta \frac{1}{(\eta + (1 - \eta)e^\Psi)} (E - ic\partial_{x_2}V)\Psi = \eta(E - ic\partial_{x_2}V)\Psi + R_2(\Psi),
\]
where
\[
R_2(\Psi) := \eta(1 - \eta) \frac{(1 - e^\Psi)(E - ic\partial_{x_2}V)}{\eta + (1 - \eta)e^\Psi} \Psi.
\]
We show easily that $R_2(\Psi)$ satisfies the same estimates as $R_1(\Psi)$. Remark that, using $\Phi = V\Psi$,
\[
\left|\frac{\eta}{(\eta + (1 - \eta)e^\Psi)}(2|V|^2 V\Re(\Psi)\Psi + |V|^2 V(1 + \Psi))\right| = 
\left|\frac{\eta}{(\eta + (1 - \eta)e^\Psi)}(2\Re(\Phi V)\Phi + |\Phi|^2 (V + \Phi))\right| \leq K||\Phi||^2_{C^1((\bar{r} \leq 2))}
\]
if $||\Phi||_{L^\infty(R^2)} \leq C_0$ (so that the term in $e^\Psi$ is bounded) since $\eta \neq 0$ only if $\bar{r} \leq 2$. We define
\[
R(\Psi) := R_1(\Psi) + R_2(\Psi) + \frac{\eta}{(\eta + (1 - \eta)e^\Psi)}(2|V|^2 V\Re(\Psi)\Psi + |V|^2 V(1 + \Psi)),
\]
which satisfies
\[
|R(\Psi)| \leq K||\Phi||^2_{C^1((\bar{r} \leq 2))}
\]
for some universal constant $K > 0$, provided $||\nabla\Phi||_{L^\infty(R^2)} + ||\Phi||_{L^\infty(R^2)} \leq C_0$. The equation (2.7) then becomes
\[
E - ic\partial_{x_2}V + VL'(\Psi) + V(1 - \eta)(-\nabla\Psi \cdot \nabla\Psi + |V|^2 S(\Psi)) + \eta(E - ic\partial_{x_2}V)\Psi + R(\Psi) = 0.
\]
Now we finish by using $-icV\partial_{x_2}\Psi = -\eta icV\partial_{x_2}\Psi - (1 - \eta) icV\partial_{x_2}\Psi$ and
\[
\partial_{x_2}V\Psi + \partial_{x_2}V\Psi = \partial_{x_2}\Phi
\]
to obtain
\[
VL'(\Psi) + \eta(E - ic\partial_{x_2}V)\Psi - ic\eta\partial_{x_2}\Phi + V(1 - \eta)(-\nabla\Psi \cdot \nabla\Psi + |V|^2 S(\Psi)) + R(\Psi) = 0.
\]
Finally, since we have shown that $L(\Phi) = (E - ic\partial_{x_2}V)\Psi + L'(\Psi)V$, we infer
\[
VL'(\Psi) + \eta(E - ic\partial_{x_2}V)\Psi = \eta L(\Phi) + (1 - \eta)VL'(\Psi).
\]
The proof is complete. ☐
2.3 Setup of the norms

For a given $0 < \sigma < 1$, we define, similarly as in [9] and [17], for $\Psi = \Psi_1 + i\Psi_2$ and $h = h_1 + ih_2$, the norms

$$
\|\Psi\|_{*,\sigma,d} := \|V\Psi\|_{C^1(\{r \leq 3\})} + \|\bar{\partial}^{1+\sigma}\Psi_1\|_{L^\infty(\{\bar{r} \geq 2\})} + \|\bar{\partial}^{1+\sigma}\nabla\Psi_1\|_{L^\infty(\{\bar{r} \geq 2\})} + \|\bar{\partial}^{2+\sigma}\Psi_2\|_{L^\infty(\{\bar{r} \geq 2\})},
$$

$$
\|h\|_{**,\sigma,d} := \|Vh\|_{C^0(\{\bar{r} \leq 3\})} + \|\bar{\partial}^{1+\gamma(\sigma)}h_1\|_{L^\infty(\{\bar{r} \geq 2\})} + \|\bar{\partial}^{2+\gamma(\sigma)}h_2\|_{L^\infty(\{\bar{r} \geq 2\})},
$$

where $\bar{r} = \min(r_1, r_{-1})$ (which depends on $d$). We also define $\gamma(\sigma) := \min\left(2\sigma, \frac{1-\sigma}{2}\right)$, which satisfies $0 < \sigma < \gamma(\sigma) < 1$, and we will use the norm

$$
\|h\|_{**,\gamma(\sigma),d} = \|Vh\|_{C^0(\{\bar{r} \leq 3\})} + \|\bar{\partial}^{1+\gamma(\sigma)}h_1\|_{L^\infty(\{\bar{r} \geq 2\})} + \|\bar{\partial}^{2+\gamma(\sigma)}h_2\|_{L^\infty(\{\bar{r} \geq 2\})}.
$$

From now on, $\sigma$ is a constant independent of any other parameters, and its role is detailed in Corollary 2.24. These are the spaces we shall use for the inversion of the linear operator.

This norm is not the “natural” energy norm that we could expect, for instance:

$$
\|\Phi\|^2_{H^s} := \int_{\mathbb{R}^2} |\nabla \Phi|^2 + (1 - |V|^2)|\Phi|^2 + \Re(V\Phi)^2.
$$

In particular, we require different conditions on the decay at infinity (with, in a way, less decay). As a consequence, the decay we have in Theorem 1.1 is not optimal (see [14]). This decay will be recovered later on by showing that the solution has finite energy. The main advantage of the norms $\|\cdot\|_{*,\sigma,d}$ and $\|\cdot\|_{**,\sigma,d}$ is that they will allow us to have uniform estimates on the error, without constants depending on $c$ or $d$.

We are looking for a solution $\Psi$ on a space of symmetric functions: we suppose that

$$
\forall x = (x_1, x_2) \in \mathbb{R}^2, \Psi(x_1, x_2) = \overline{\Psi(x_1, -x_2)} = \Psi(-x_1, x_2)
$$

because $V$ and the equation has the same symmetries. With only those symmetries we will not be able to invert the linearized operator because it has a kernel, we also need an orthogonal condition. We define

$$
Z_d(x) := \partial_d V(x)(\tilde{v}(4r_1) + \tilde{v}(4r_{-1})),
$$

where $\tilde{v}$ is the same function as the one used for $v$: it is a $C^\infty$ non negative smooth cutoff with $\tilde{v}(r) = 1$ if $r \leq 1$ and 0 if $r \geq 2$. In particular $Z_d(x) = 0$ if $\bar{r} \geq 1/2$, which will make some computations easier. The other interest of the cutoff function is that without it

$$
\partial_d V(x) = -\partial_{x_1} V_{1} - 1 + \partial_{x_1} V_{-1} V_1
$$

is not integrable in all $\mathbb{R}^2$. We define the Banach spaces we shall use for inverting the linear part:

$$
\mathcal{E}_{*,\sigma,d} :=
$$

$$
\{ \Phi = V\Psi \in C^1(\mathbb{R}^2, \mathbb{C}), \|\Psi\|_{*,\sigma,d} < +\infty, (\Phi, Z_d) = 0; \forall x \in \mathbb{R}^2, \Psi(x_1, x_2) = \overline{\Psi(x_1, -x_2)} = \Psi(-x_1, x_2) \},
$$

$$
\mathcal{E}_{**,\sigma,d} := \{ Vh \in C^0(\mathbb{R}^2, \mathbb{C}), \|h\|_{**,\sigma,d} + \|h\|_{**,\gamma(\sigma),d} < +\infty \}.
$$

We shall omit the subscripts $\sigma, d$ in the construction and use only $\mathcal{E}_*, \mathcal{E}_{**,d}$. Remark that $\mathcal{E}_*$ contains an orthogonality condition as well as the symmetries. For $\mathcal{E}_{**,d}$, we have, for $Vh \in C^0(\mathbb{R}^2, \mathbb{C})$ that $\|h\|_{**,\sigma,d} \leq \|h\|_{**,\gamma(\sigma),d}$, but we will use both norms with different weights in $c$.

Our first goal is to invert the linearized operator. This is a difficult part, which requires a lot of computations and critical elliptic estimates. The next subsection is devoted to the proof of the elliptic tools use in the proof of the inversion. In particular, our paper diverges here from [17] (see Remark 2.14 thereafter).
2.4 Some elliptic estimates

In this subsection, we provide some tools for elliptic estimate adapted to $L^\infty$ norms. The first result is a slight improvement on the Gagliardo-Nirenberg inequality.

**Theorem 2.8 ([4])** There exists a constant $C > 0$ such that for any $f \in C^2(\mathbb{R}^2)$ with $\Delta f$ uniformly continuous on $\mathbb{R}^2$,
\[
\|\nabla f\|_{L^\infty(\mathbb{R}^2)} \leq C \|f\|_{L^1(\mathbb{R}^2)}^{1/2} \|\Delta f\|_{L^1(\mathbb{R}^2)}^{1/2}.
\]

2.4.1 Estimates for the Gross-Pitaevskii kernels

Now, for the study of the kernel of the linearized operator, we use some estimations computed in [13] on the kernels $K_j$, $j \in \{1, 2\}$, $0 < c < \sqrt{2}$, defined by their Fourier transforms (for $\xi = (\xi_1, \xi_2) \in \mathbb{R}^2$):
\[
\hat{K}_j(\xi) = \frac{\xi_j \xi_2}{(|\xi|^4 + 2|\xi|^2 - c^2 \xi_2^2)}.
\]

We remark that the denominator is strictly positive for $\xi \neq 0$ because $c < \sqrt{2}$.

**Theorem 2.9 ([13], Theorems 5 and 6)** For $j \in \{1, 2\}$, there exist a constant $K > 0$ such that, for any $0 < c < 1$,
\[
|K_j(x)| \leq \frac{K}{|x|^{1/2}(1+|x|)^{3/2}}
\]
and
\[
|\nabla K_j(x)| \leq \frac{K}{|x|^{3/2}(1+|x|)^{3/2}}.
\]

**Proof** This is the main result of Theorems 5 and 6 of [13]. We added the fact that the constant $K$ is uniform in $c$, given that $c$ is small. This can be easily shown by following the proof of Theorem 5 and 6 of [13], and verifying that the constants depend only on weighed $L^\infty$ norms on $\hat{K}_j$ and its first derivatives, which are uniforms in $c$ if $c$ is small (for instance $0 < c < 1$). The condition $c < 1$ is taken in order to avoid $c \to \sqrt{2}$, where this does not hold (the singularity near $\xi = 0$ of $\hat{K}_j$ changes of order at the limit). Furthermore, the factor $1/2$ for the growth near $x = 0$ is not at all optimal, but we will not require more here.

Remark that the speed in [13] is in the direction $e_1^*$, whereas it is in the direction $e_2^*$ in our case, which explains the swap between $\xi_2$ and $\xi_1$ in the two papers. \( \square \)

**Lemma 2.10** For $j \in \{1, 2\}$, for any $0 < \sigma < 1$, $\varepsilon > 0$, there exist $K(\sigma, \varepsilon) > 0$ such that, if a continuous function $f$ satisfies
\[
\forall x \in \mathbb{R}^2, \quad |f(x)| \leq \frac{1}{(1 + r)^{1+\sigma+\varepsilon}},
\]
then
\[
\forall x \in \mathbb{R}^2, \quad |(K_j * f)(x)| \leq \frac{K(\sigma, \varepsilon)}{(1 + r)^{1+\sigma}}.
\]

**Proof** Let us define $\alpha := 1 + \sigma + \varepsilon$. We decompose for $x \in \mathbb{R}^2$, using Theorem 2.9,
\[
|(K_j * f)(x)| \leq K \int_{\{y \geq 0\}} \frac{dY}{|x - Y|^{1/2}(1 + |x - Y|)^{3/2}(1 + \bar{r}(Y))^\alpha} + K \int_{\{y \leq 0\}} \frac{dY}{|x - Y|^{1/2}(1 + |x - Y|)^{3/2}(1 + \bar{r}(Y))^\alpha}.
\]
In \( \{ Y_1 \geq 0 \} \), we have \( \hat{r}(Y) = |Y - d\varepsilon_1^2| \), therefore we estimate

\[
\int_{\{ Y_1 > 0 \}} \frac{dY}{|x - Y|^{1/2}(1 + |x - Y|)^{3/2}(1 + \hat{r}(Y))^\alpha} 
\leq \int_{\mathbb{R}^2} \frac{dY}{|x - Y|^{1/2}(1 + |x - Y|)^{3/2}(1 + |Y - (x - d\varepsilon_1^2)|)^\alpha} 
\leq K \int_{\mathbb{R}^2} \frac{dY}{|Y|^{1/2}(1 + |Y|)^{3/2}(1 + |Y - (x - d\varepsilon_1^2)|)^\alpha}.
\]

If \( |x - d\varepsilon_1^2| \leq 1 \), then

\[
\int_{\mathbb{R}^2} \frac{dY}{|Y|^{1/2}(1 + |Y|)^{3/2}(1 + |Y - (x - d\varepsilon_1^2)|)^\alpha} \leq K \int_{\mathbb{R}^2} \frac{dY}{|Y|^{1/2}(1 + |Y|)^{3/2}(1 + |Y - (x - d\varepsilon_1^2)|)^\alpha}
\]

since \( \alpha > 0 \), which is enough to show the required estimate. We now suppose \( |x - d\varepsilon_1^2| \geq 1 \). We split \( \mathbb{R}^2 \) in three areas.

First, in \( \{ |Y| \leq \frac{|x - d\varepsilon_1^2|}{2} \} \), we have \( |Y - (x - d\varepsilon_1^2)| \geq \frac{|x - d\varepsilon_1^2|}{2} \), therefore

\[
\int_{\{ |Y| \leq \frac{|x - d\varepsilon_1^2|}{2} \}} \frac{dY}{|Y|^{1/2}(1 + |Y|)^{3/2}(1 + |Y - (x - d\varepsilon_1^2)|)^\alpha} \leq \frac{K}{(1 + |x - d\varepsilon_1^2|)^\alpha} \int_{\{ |Y| \leq \frac{|x - d\varepsilon_1^2|}{2} \}} \frac{dY}{|Y|^{1/2}(1 + |Y|)^{3/2}}.
\]

Secondly, in \( \{ |Y - (x - d\varepsilon_1^2)| \leq \frac{|x - d\varepsilon_1^2|}{2} \} \), we have \( |Y| \geq \frac{|x - d\varepsilon_1^2|}{2} \), therefore

\[
\int_{\{ |Y - (x - d\varepsilon_1^2)| \leq \frac{|x - d\varepsilon_1^2|}{2} \}} \frac{dY}{(1 + |Y - (x - d\varepsilon_1^2)|)^\alpha} \leq \frac{K}{(1 + |x - d\varepsilon_1^2|)^\alpha} \int_{\{ |Y - (x - d\varepsilon_1^2)| \leq \frac{|x - d\varepsilon_1^2|}{2} \}} \frac{dY}{(1 + |Y - (x - d\varepsilon_1^2)|)^\alpha}.
\]

If \( \alpha = 2 \), then

\[
\int_{\{ |Y - (x - d\varepsilon_1^2)| \leq \frac{|x - d\varepsilon_1^2|}{2} \}} \frac{dY}{(1 + |Y - (x - d\varepsilon_1^2)|)^\alpha} \leq K \ln(2 + |x - d\varepsilon_1^2|) + 1),
\]

and if \( \alpha 
eq 2 \), which is equivalent to \( \varepsilon + \sigma 
eq 1 \),

\[
\int_{\{ |Y - (x - d\varepsilon_1^2)| \leq \frac{|x - d\varepsilon_1^2|}{2} \}} \frac{dY}{(1 + |Y - (x - d\varepsilon_1^2)|)^\alpha} \leq K(\sigma, \varepsilon)(1 + |x - d\varepsilon_1^2|)^{\max(0, 1 - \sigma - \varepsilon)},
\]

either way,

\[
\int_{\{ |Y - (x - d\varepsilon_1^2)| \leq \frac{|x - d\varepsilon_1^2|}{2} \}} \frac{dY}{dY} \leq \frac{K(\sigma, \varepsilon)}{(1 + |x - d\varepsilon_1^2|)^{1 + \sigma}}.
\]

Finally, in \( \mathbb{R}^2 \setminus \left( \left\{ |Y| \leq \frac{|x - d\varepsilon_1^2|}{2} \right\} \cup \left\{ |Y - (x - d\varepsilon_1^2)| \leq \frac{|x - d\varepsilon_1^2|}{2} \right\} \right) \), we have both \( |Y| \geq \frac{|x - d\varepsilon_1^2|}{2} \) and that
\[ |Y - (x - d\epsilon_1)| \geq \frac{|z - d\epsilon_1|}{2}, \text{ and we estimate by Cauchy-Schwarz} \]

\[
\int_{\mathbb{R}^2} \frac{dY}{|Y - (x - d\epsilon_1)|} \leq K(\alpha) \left( 1 + \frac{|z - d\epsilon_1|}{|Y - (x - d\epsilon_1)|} \right) \]
when \(|h| \to 0\). Then, for \(\varepsilon > 0\),
\[
\left| \frac{1}{2\pi} \int_{B(x,\varepsilon)} \ln(|x - Y|) \partial_\nu f(Y) dY \right| \leq K\varepsilon^2 \|\ln(\varepsilon)\| \|\nabla f\|_{L^\infty(\mathbb{R}^2)}
\]
and by integration by parts,
\[
\frac{1}{2\pi} \int_{\mathbb{R}^2 \setminus B(x,\varepsilon)} \ln(|x - Y|) \partial_\nu f(Y) dY = \frac{1}{2\pi} \int_{\mathbb{R}^2 \setminus B(x,\varepsilon)} \frac{x_j - Y_j}{|x - Y|^2} f(Y) dY - \frac{1}{2\pi} \int_{\partial B(x,\varepsilon)} \ln(|x - Y|) f(Y) e_j^2 \cdot \nu d\sigma
\]
and since \(\frac{1}{2\pi} \int_{\partial B(x,\varepsilon)} \ln(|x - Y|) f(Y) e_j^2 \cdot \nu d\sigma \leq K \|f\|_{L^\infty(\mathbb{R}^2)} \varepsilon \|\ln(\varepsilon)\|\), taking \(\varepsilon \to 0\) we deduce that
\[
\frac{\zeta(x + h e_j) - \zeta(x)}{|h|} \to \frac{1}{2\pi} \int_{\mathbb{R}^2} \ln(|x - Y|) \partial_\nu f(Y) dY = \frac{1}{2\pi} \int_{\mathbb{R}^2} \frac{x_j - Y_j}{|x - Y|^2} f(Y) dY
\]
when \(|h| \to 0\). This implies that, for \(f \in C_c^\infty(\mathbb{R}^2)\),
\[
\nabla \zeta(x) = \frac{1}{2\pi} \int_{\mathbb{R}^2} \frac{x - Y}{|x - Y|^2} f(Y) dY.
\]
Now, for \(f \in C^0(\mathbb{R}^2, \mathbb{C})\) such that \(\|f(x)(1 + \tilde{r})^{2+\alpha}\|_{L^\infty(\mathbb{R}^2)} < +\infty\), we take \(f_n \in C_c^\infty(\mathbb{R}^2, \mathbb{C})\) such that \(f_n \to f\) in \(L^2(\mathbb{R}^2)\) and \((1 + \tilde{r})^{\alpha/2} f_n \to f(1 + \tilde{r})^{\alpha/2} f\) in \(L^1(\mathbb{R}^2)\) (we check easily that \(f \in L^3(\mathbb{R}^2)\) and \((1 + \tilde{r})^{\alpha/2} f \in L^1(\mathbb{R}^2)\)). In particular, \(f_n \to f\) in \(L^1(\mathbb{R}^2)\). Then, for \(\zeta_n\) such that \(\Delta \zeta_n = f_n\), we check that, by Hölder inequality,
\[
\left| \nabla \zeta_n(x) - \frac{1}{2\pi} \int_{\mathbb{R}^2} \frac{x - Y}{|x - Y|^2} f(Y) dY \right| \leq \frac{1}{2\pi} \int_{\mathbb{R}^2} \frac{|f_n(Y) - f(Y)|}{|x - Y|} dY;
\]
\[
\int_{\{|x - Y| \leq 1\}} \frac{|f_n(Y) - f(Y)|}{|x - Y|} dY \leq \|f_n - f\|_{L^3(\mathbb{R}^2)} \left( \int_{\{|x - Y| \leq 1\}} \frac{dY}{|x - Y|^{3/2}} \right)^{2/3} \leq K \|f_n - f\|_{L^3(\mathbb{R}^2)}
\]
and
\[
\int_{\{|x - Y| \geq 1\}} \frac{|f_n(Y) - f(Y)|}{|x - Y|} dY \leq \|f_n - f\|_{L^1(\mathbb{R}^2)}
\]
therefore \(\nabla \zeta_n \to \frac{1}{2\pi} \int_{\mathbb{R}^2} \frac{x - Y}{|x - Y|^2} f(Y) dY\) uniformly in \(\mathbb{R}^2\).

Similarly, we estimate
\[
\left| \zeta_n(x) - \frac{1}{2\pi} \int_{\mathbb{R}^2} \ln(|x - Y|) f(Y) dY \right| \leq \frac{1}{2\pi} \int_{\mathbb{R}^2} |f_n(Y) - f(Y)| \ln(|x - Y|) dY;
\]
\[
\int_{\{|x - Y| \leq 1\}} |f_n(Y) - f(Y)| \ln(|x - Y|) dY \leq \|f_n - f\|_{L^3(\mathbb{R}^2)} \left( \int_{\{|x - Y| \leq 1\}} \ln(|x - Y|)^{3/2} dY \right)^{2/3} \leq K \|f_n - f\|_{L^3(\mathbb{R}^2)}
\]
and
\[
\int_{\{|x - Y| \geq 1\}} |f_n(Y) - f(Y)| \ln(|x - Y|) dY \leq K \|(1 + \tilde{r})^{\alpha/2} f_n - (1 + \tilde{r})^{\alpha/2} f\|_{L^1(\mathbb{R}^2)}
\]
thus \(\zeta_n \to G \ast f = \zeta\) uniformly in \(\mathbb{R}^2\), which implies by differentiation of a sequence of functions, that \(\zeta \in C^1(\mathbb{R}^2, \mathbb{C})\) and
\[
\nabla \zeta(x) = \frac{1}{2\pi} \int_{\mathbb{R}^2} \frac{x - Y}{|x - Y|^2} f(Y) dY.
\]
We check that $\zeta$ satisfies
\[ \Delta \zeta = f \]
in the distribution sense. Indeed, for $\varphi \in C_c^\infty(\mathbb{R}^2)$, (see [10], chapter 2, Theorem 1)
\[ \int_{\mathbb{R}^2} (G * f) \Delta \varphi = \int_{\mathbb{R}^2} f (G * \Delta \varphi) = \int_{\mathbb{R}^2} f \varphi. \]
It is also easy to check that
\[ \forall (x_1, x_2) \in \mathbb{R}^2, \quad \zeta(x_1, x_2) = -\zeta(x_1, -x_2). \]
Now, if $|x - d\bar{c}_1| \leq 1$, we check that
\[ |\nabla \zeta(x)| \leq K \int_{\mathbb{R}^2} \frac{1}{|Y|} |f(x - Y)| dY \leq K \varepsilon_{f, \alpha} \int_{\mathbb{R}^2} \frac{dY}{|Y|(1 + \tilde{r}(Y - x))^{2+\alpha}} \leq K \varepsilon_{f, \alpha}, \]
and similarly,
\[ |\zeta(x)| \leq K \varepsilon_{f, \alpha}, \]
which is enough to show the required estimate of this lemma for these values of $x$. We can make the same estimate if $|x + d\bar{c}_1| \leq 1$, we therefore suppose from now on that $|x - d\bar{c}_1|, |x + d\bar{c}_1| \geq 1$.

First, let us show that
\[ \int_{\{Y_1 \geq 0\}} f(Y) dY = \int_{\{Y_1 \leq 0\}} f(Y) dY = 0. \tag{2.8} \]
The integrals are well defined because $|f(x)| \leq \frac{\varepsilon_{f, \alpha}}{(1+|x|)^2}$ and therefore $f$ is integrable. Since $f$ is odd with respect to $x_2$, (2.8) holds. We deduce that
\[ |\nabla \zeta(x)| \leq \frac{1}{2\pi} \int_{\{Y_1 \geq 0\}} \left( \frac{x - Y}{|x - Y|^2} - \frac{x - d\bar{c}_1}{|x - d\bar{c}_1|^2} \right) f(Y) dY \]
\[ + \frac{1}{2\pi} \int_{\{Y_1 \leq 0\}} \left( \frac{x - Y}{|x - Y|^2} - \frac{x + d\bar{c}_1}{|x + d\bar{c}_1|^2} \right) f(Y) dY. \]

Now, using $|f(x)| \leq \frac{\varepsilon_{f, \alpha}}{(1+|x|)^2}$, we estimate
\[ 2\pi |\nabla \zeta(x)| \leq \varepsilon_{f, \alpha} \int_{\{Y_1 \geq 0\}} \left| \frac{x - Y}{|x - Y|^2} - \frac{x - d\bar{c}_1}{|x - d\bar{c}_1|^2} \right| \frac{dY}{(1 + \tilde{r}_1(Y))^{2+\alpha}} \]
\[ + \varepsilon_{f, \alpha} \int_{\{Y_1 \leq 0\}} \left| \frac{x - Y}{|x - Y|^2} - \frac{x + d\bar{c}_1}{|x + d\bar{c}_1|^2} \right| \frac{dY}{(1 + \tilde{r}_1(Y))^{2+\alpha}}. \]

By the change of variable $Y = Z + d\bar{c}_1$, we have
\[ \int_{\{Y_1 \geq 0\}} \left| \frac{x - Y}{|x - Y|^2} - \frac{x - d\bar{c}_1}{|x - d\bar{c}_1|^2} \right| \frac{dY}{(1 + \tilde{r}_1(Y))^{2+\alpha}} \]
\[ = \int_{\{Z_1 > -d\}} \left| \frac{(x - d\bar{c}_1) - Z}{|(x - d\bar{c}_1) - Z|^2} - \frac{x - d\bar{c}_1}{|x - d\bar{c}_1|^2} \right| \frac{dZ}{(1 + |Z|)^{2+\alpha}} \]
\[ \leq \int_{\mathbb{R}^2} \left| \frac{(x - d\bar{c}_1) - Z}{|(x - d\bar{c}_1) - Z|^2} - \frac{x - d\bar{c}_1}{|x - d\bar{c}_1|^2} \right| \frac{dZ}{(1 + |Z|)^{2+\alpha}}. \]

Now, if $|Z| \geq 2|x - d\bar{c}_1|$, by triangular inequality, we check that
\[ \left| \frac{(x - d\bar{c}_1) - Z}{|(x - d\bar{c}_1) - Z|^2} - \frac{x - d\bar{c}_1}{|x - d\bar{c}_1|^2} \right| \leq \frac{K}{|x - d\bar{c}_1|}, \]
hence
\[ \int_{|Z| \geq 2|x - d\bar{c}_1|} \left| \frac{(x - d\bar{c}_1) - Z}{|(x - d\bar{c}_1) - Z|^2} - \frac{x - d\bar{c}_1}{|x - d\bar{c}_1|^2} \right| \frac{dZ}{(1 + |Z|)^{2+\alpha}} \]
\[ \leq \frac{K}{|x - d\bar{c}_1|} \int_{|Z| \geq 2|x - d\bar{c}_1|} \frac{dZ}{(1 + |Z|)^{2+\alpha}} \leq K(\alpha) \frac{1}{|x - d\bar{c}_1|^{1+\alpha}}. \tag{2.9} \]
We now work for $|Z| \leq 2|x - d\bar{e}_1^1|$. We remark that

$$\left| \frac{(x - d\bar{e}_1^1) - Z}{(x - d\bar{e}_1^1) - \bar{Z}} \right| \leq \frac{|x - d\bar{e}_1^1|^2 (|x - d\bar{e}_1^1| - Z^2)}{x - d\bar{e}_1^1} \left| (x - d\bar{e}_1^1)^2 (|x - d\bar{e}_1^1| - Z^2) \right|^2$$

$$= |(x - d\bar{e}_1^1) (|x - d\bar{e}_1^1|^2 - (x - d\bar{e}_1^1)^2) - Z| (x - d\bar{e}_1^1)|^2| - Z^2| (x - d\bar{e}_1^1)|^2|$$

$$= |(x - d\bar{e}_1^1) (2(x - d\bar{e}_1^1) \bar{Z} - |Z|^2 - Z, \bar{Z} - |Z|^2 - Z)| (x - d\bar{e}_1^1)|^2|$$

$$= |(x - d\bar{e}_1^1) - Z|^2 |Z| \left( (x - d\bar{e}_1^1) - Z \right) \left( \frac{2(x - d\bar{e}_1^1) \bar{Z} - |Z|^2 - Z}{|Z|} - Z \right) - \frac{Z}{|Z|} |(x - d\bar{e}_1^1) - Z| \right|,$$

and we estimate

$$\leq 2|x - d\bar{e}_1^1| + \left| \frac{(x - d\bar{e}_1^1) - Z}{(x - d\bar{e}_1^1) - \bar{Z}} \left( -|Z| \right) - \frac{Z}{|Z|} |(x - d\bar{e}_1^1) - Z| \right|.$$

Furthermore,

$$\left| \frac{(x - d\bar{e}_1^1) - Z}{(x - d\bar{e}_1^1) - \bar{Z}} \right|^2 \leq \frac{3|Z|^2 (x - d\bar{e}_1^1) - Z^2}{(x - d\bar{e}_1^1) - Z}.$$

We deduce that

$$\int_{|Z| \leq 2|x - d\bar{e}_1^1|} \left| \frac{(x - d\bar{e}_1^1) - Z}{(x - d\bar{e}_1^1) - \bar{Z}} \right|^2 \left( \frac{x - d\bar{e}_1^1}{|x - d\bar{e}_1^1|} \right)^2 dZ \leq \frac{3|Z|^2}{(x - d\bar{e}_1^1) - Z} (1 + |Z|)^{2+\alpha}$$

We remark that, either $|(x - d\bar{e}_1^1) - Z| \geq \frac{|x - d\bar{e}_1^1|^2}{2}$, and then

$$\int_{|Z| \leq 2|x - d\bar{e}_1^1|} \left| \frac{(x - d\bar{e}_1^1) - Z}{(x - d\bar{e}_1^1) - \bar{Z}} \right|^2 \left( \frac{x - d\bar{e}_1^1}{|x - d\bar{e}_1^1|} \right)^2 dZ \leq \frac{|Z|^2 (1 + |Z|)^{2+\alpha}}{(x - d\bar{e}_1^1) - Z}$$

$$\leq \frac{2}{|x - d\bar{e}_1^1|} \int_{|Z| \leq 2|x - d\bar{e}_1^1|} \left| \frac{(x - d\bar{e}_1^1) - Z}{(x - d\bar{e}_1^1) - \bar{Z}} \right|^2 \left( \frac{x - d\bar{e}_1^1}{|x - d\bar{e}_1^1|} \right)^2 dZ \leq \frac{K(\alpha)}{|x - d\bar{e}_1^1|^{\alpha}}$$
since $\alpha < 1$, or $|(x - d\tilde{e}_1^\alpha) - Z| \leq \frac{|x - d\tilde{e}_1^-|}{2}$, and then $|Z| \geq \frac{|x - d\tilde{e}_1^-|}{2}$, therefore

$$\int_{(\{|Z|\leq 2|x - d\tilde{e}_1^\alpha|\} \cap \{|x - d\tilde{e}_1^\alpha| - |x - d\tilde{e}_1^-|\} \leq \frac{|x - d\tilde{e}_1^-|}{2})} \frac{|Z|dZ}{(x - d\tilde{e}_1^\alpha) - Z((1 + |Z|)^{2+\alpha} - |x - d\tilde{e}_1^\alpha| - Z|Z|dZ)\leq K\frac{|x - d\tilde{e}_1^-|}{2+\alpha}}$$

We conclude that

$$\int_{\{|Z|\leq 2|x - d\tilde{e}_1^\alpha|\}} \frac{(x - d\tilde{e}_1^\alpha) - Z}{|(x - d\tilde{e}_1^\alpha) - Z|^2} \frac{x - d\tilde{e}_1^-}{|x - d\tilde{e}_1^-|^2} \frac{dZ}{(1 + |Z|)^{2+\alpha}} \leq K(\alpha) \frac{|x - d\tilde{e}_1^-|}{|x - d\tilde{e}_1^\alpha|^{1+\alpha}}. \quad (2.10)$$

Combining (2.9) and (2.10), and by symmetry, we deduce that

$$\int_{Y_1 \geq 0} \left| \frac{x - Y}{|x - Y|^2} \right| \frac{x - d\tilde{e}_1^-}{|x - d\tilde{e}_1^-|^2} \frac{dY}{(1 + r(Y))^{2+\alpha}} + \int_{Y_1 \leq 0} \left| \frac{x - Y}{|x - Y|^2} \right| \frac{x + d\tilde{e}_1^-}{|x + d\tilde{e}_1^-|^2} \frac{dY}{(1 + r(Y))^{2+\alpha}} \leq K(\alpha) \frac{|x - d\tilde{e}_1^-|}{|x - d\tilde{e}_1^\alpha|^{1+\alpha}} + K(\alpha) \frac{dY}{r(Y)^{1+\alpha}}.$$

and therefore (recall that $|x - d\tilde{e}_1^\alpha|, |x + d\tilde{e}_1^-| \geq 1$),

$$|\nabla \zeta(x)| \leq \frac{K\varepsilon_{f,\alpha}}{(1 + \hat{r}(x))^{1+\alpha}}.$$

Now, let us show that $\zeta(x) \to 0$ when $|x| \to \infty$. We recall that

$$\zeta(x) = \frac{1}{2\pi} \int_{\mathbb{R}^2} \ln(|x - Y|) f(Y) dY,$$

and since $\int_{\mathbb{R}^2} f(Y) dY = 0$, for large values of $x$ (in particular $|x| \gg d$),

$$\zeta(x) = \frac{1}{2\pi} \int_{\mathbb{R}^2} \ln \left( \frac{|x - Y|}{|x|} \right) f(Y) dY.$$

If $|x - Y| \leq 1$, then $|f(Y)| \leq \frac{K\varepsilon_{f,\alpha}}{(1 + |x|)^{2+\sigma}}$, hence

$$\int_{|x - Y| \leq 1} \left| \ln \left( \frac{|x - Y|}{|x|} \right) f(Y) \right| \leq \frac{K\varepsilon_{f,\alpha}}{(1 + |x|)^{2+\sigma}} \int_{|x - Y| \leq 1} |\ln(|x - Y|) - \ln(|x|)| \leq \frac{K\varepsilon_{f,\alpha}(1 + \ln(|x|))}{(1 + |x|)^{2+\sigma}} \to 0$$

when $x \to \infty$. If $|x - Y| \geq 1$, then $\ln \left( \frac{|x - Y|}{|x|} \right) \to 0$ when $|x| \to \infty$ and we recall that $f$ is bounded in $L^\infty$. We have, for $|x| \geq 2$ that $|x - Y| \leq |x|(|y| + 2)$ and therefore, for $|x - Y| \geq 1, |x| \geq 2$, $\ln \left( \frac{|x - Y|}{|x|} \right) \leq K\ln(|y| + 2)$, hence

$$\left| 1_{|x - Y| \geq 1} \ln \left( \frac{|x - Y|}{|x|} \right) f(Y) \right| \leq K\ln(|y| + 2)f(Y) \in L^1(\mathbb{R}^2, \mathbb{C}).$$
By dominated convergence theorem, we deduce that $\zeta(x) \to 0$ when $|x| \to \infty$. Now, to estimate $\zeta$, we integrate from infinity. For instance, in the case $x_1 \geq 0, x_2 \geq 0$, we estimate

$$|\zeta(x)| \leq \left| \int_{x_2}^{+\infty} \partial_x \zeta(x_1,t) dt \right| \leq K \varepsilon_{f,\alpha} \int_{x_2}^{+\infty} \frac{dt}{(1 + |x - de^{-2}| + t)^{1+\alpha}} \leq \frac{K \varepsilon_{f,\alpha}}{\alpha (1 + \hat{r}(x))^{\alpha}}.$$ 

$\square$

2.4.3 Fundamental solution for $-\Delta + 2$

We will use the fundamental solution of $-\Delta + 1$ and its following properties.

**Lemma 2.12** ([1]) *The fundamental solution of $-\Delta + 1$ in $\mathbb{R}^2$ is $\frac{1}{2\pi} K_0(|.|)$, where $K_0$ is the modified Bessel function of second kind. It satisfies $K_0 \in C^\infty(\mathbb{R}^+)$ and

$$K_0(r) \sim_{r \to \infty} \sqrt{\frac{\pi}{2r}} e^{-r},$$

$$K_0(r) \sim_{r \to 0} -\ln(r),$$

$$K'_0(r) \sim_{r \to \infty} -\sqrt{\frac{\pi}{2r}} e^{-r},$$

$$K'_0(r) \sim_{r \to 0} -\frac{1}{r},$$

for all $r > 0$, $K_0(r) > 0$, $K'_0(r) < 0$ and $K''_0(r) > 0$.*

**Proof** The first three equivalents are respectively equations 9.7.2, 9.6.8 and 9.7.4 of [1]. The fourth one can be deduced from equations 9.6.27 and 9.6.9 of [1]. For $\nu \in \mathbb{N}$, $K_\nu$ is $C^\infty(\mathbb{R}, \mathbb{R})$ since it solves 9.6.1 of [1] and from the end of 9.6 of [1], we have that $K_\nu$ has no zeros. In particular with the asymptotics of 9.6.8, this implies that $K_\nu(r) > 0$. Furthermore, from 9.6.27 of [1], we have $K'_0 = -K_1 < 0$ and $K''_0 = -K_1' = -\frac{K_0 + K_2}{2} > 0$. $\square$

We end this subsection by the proof an elliptic estimate that will be used in the proof of Proposition 2.16.

**Lemma 2.13** There exists a universal constant $C > 0$ such that, for any $d > 1, \sigma > 0$, if two real-valued functions $\Psi \in C^1(\mathbb{R}^2), h \in C^0(\mathbb{R}^2)$ satisfy in the distribution sense

$$(-\Delta + 2)\Psi = h,$$

and

$$\|\nabla (1 + \hat{r})^{1+\sigma}\|_{L^\infty(\mathbb{R}^2)} + \|\nabla \Psi(1 + \hat{r})^{\sigma}\|_{L^\infty(\mathbb{R}^2)} + \|(1 + \hat{r})^{1+\sigma}h\|_{L^\infty(\mathbb{R}^2)} < +\infty,$$

then

$$|\Psi| + |\nabla \Psi| \leq C\frac{\|(1 + \hat{r})^{1+\sigma}h\|_{L^\infty(\mathbb{R}^2)}}{(1 + \hat{r})^{1+\sigma}}.$$ 

**Proof** The fundamental solution of $-\Delta + 2$ in $\mathbb{R}^2$ is $\frac{1}{2\pi} K_0(\sqrt{|.|})$ where $K_0$ is the modified Bessel function of the second kind with the properties described in Lemma 2.12. Since $|\Psi| + |\nabla \Psi| \leq \frac{K}{(1 + \hat{r})^{1+\sigma}}$ and the equation $-\Delta + 2$ is strictly elliptic, we have

$$\Psi = \frac{1}{2\pi} K_0(\sqrt{2|x|}) * h,$$

therefore (using $K_0 \geq 0$), for $x \in \mathbb{R}^2$,

$$|\Psi(x)| \leq K\|(1 + \hat{r})^{1+\sigma}h\|_{L^\infty(\mathbb{R}^2)} \int_{\mathbb{R}^2} K_0(\sqrt{2|x - Y|}) \frac{dY}{1 + \hat{r}(Y)^{1+\sigma}}.$$
If \(|x - d\vec{e}_1^2| \leq 1\) or \(|x + d\vec{e}_1^2| \leq 1\), we have
\[
\int_{\mathbb{R}^2} K_0 \left( \sqrt{2} |x - Y| \right) \frac{1}{1 + \tilde{r}(Y)^{1+\sigma}} dY \leq \int_{\mathbb{R}^2} K_0 \left( \sqrt{2} |x - Y| \right) dY \leq \int_{\mathbb{R}^2} K_0 \left( \sqrt{2} |Y| \right) dY \leq K,
\]
therefore the estimate holds. We now suppose that \(|x - d\vec{e}_1^2|, |x + d\vec{e}_1^2| \geq 1\). We decompose
\[
\int_{\mathbb{R}^2} K_0 \left( \sqrt{2} |x - Y| \right) \frac{1}{1 + \tilde{r}(Y)^{1+\sigma}} dY = \int_{\{Y \geq 0\}} K_0 \left( \sqrt{2} |x - Y| \right) \frac{dY}{(1 + \|Y - d\vec{e}_1^2\|^{1+\sigma})} + \int_{\{Y \leq 0\}} K_0 \left( \sqrt{2} |x - Y| \right) \frac{dY}{(1 + \|Y + d\vec{e}_1^2\|^{1+\sigma})},
\]
and we estimate, by a change of variable,
\[
\int_{\{Y \geq 0\}} K_0 \left( \sqrt{2} |x - Y| \right) \frac{dY}{(1 + \|Y - d\vec{e}_1^2\|^{1+\sigma})} \leq \int_{\mathbb{R}^2} K_0 \left( \sqrt{2} |Y| \right) \frac{dY}{(1 + \|x - d\vec{e}_1^2 - Y\|^{1+\sigma})}.
\]
Now, if \(|Y| \leq \frac{|x - d\vec{e}_1^2|}{2}\), by Lemma 2.12 we have
\[
\int_{\{Y \leq \frac{|x - d\vec{e}_1^2|}{2}\}} K_0 \left( \sqrt{2} |Y| \right) \frac{dY}{(1 + \|x - d\vec{e}_1^2 - Y\|^{1+\sigma})} \leq \frac{K}{(1 + \|x - d\vec{e}_1^2\|^{1+\sigma})} \int_{\{Y \leq \frac{|x - d\vec{e}_1^2|}{2}\}} K_0 \left( \sqrt{2} |Y| \right) dY.
\]
If \(|Y| \geq \frac{|x - d\vec{e}_1^2|}{2}\), by Lemma 2.12 we have
\[
\int_{\{Y \geq \frac{|x - d\vec{e}_1^2|}{2}\}} K_0 \left( \sqrt{2} |Y| \right) \frac{dY}{(1 + \|x - d\vec{e}_1^2 - Y\|^{1+\sigma})} \leq \frac{Ke^{-|x - d\vec{e}_1^2|/4}}{(1 + \|x - d\vec{e}_1^2\|^{1+\sigma})} \int_{\{Y \geq \frac{|x - d\vec{e}_1^2|}{2}\}} e^{-|Y|/4} dY \leq \frac{K}{(1 + \|x - d\vec{e}_1^2\|^{1+\sigma})}.
\]
By symmetry, we have
\[
\int_{\{Y \leq 0\}} K_0 \left( \sqrt{2} |x - Y| \right) \frac{dY}{(1 + \|Y + d\vec{e}_1^2\|^{1+\sigma})} \leq \frac{K}{(1 + \|x + d\vec{e}_1^2\|^{1+\sigma})},
\]
and this shows that
\[
|\Psi(x)| \leq \frac{K \|(1 + \tilde{r})^{1+\sigma} h\|_{L^\infty(\mathbb{R}^2)}}{(1 + \tilde{r}(x))^{1+\sigma}}.
\] (2.11)
For \(\nabla \Psi\), we have the similar integral form
\[
\nabla \Psi = \frac{1}{2\pi} \nabla \left( K_0 \left( \sqrt{2} |.| \right) \right) * h.
\]
Once again, we can show the estimate if \(|x - d\vec{e}_1^2| \leq 1\) or \(|x + d\vec{e}_1^2| \leq 1\), and otherwise, we estimate as previously
\[
|\nabla \Psi(x)| \leq K \|(1 + \tilde{r})^{1+\sigma} h\|_{L^\infty(\mathbb{R}^2)} \int_{\mathbb{R}^2} \left| \nabla K_0 \left( \sqrt{2} |x - Y| \right) \right| \frac{1}{(1 + \tilde{r}(Y))^{1+\sigma}} dY \leq K \|(1 + \tilde{r})^{1+\sigma} h\|_{L^\infty(\mathbb{R}^2)} \int_{\mathbb{R}^2} -K_0 \left( \sqrt{2} |x - Y| \right) \frac{1}{(1 + \tilde{r}(Y))^{1+\sigma}} dY.
\]
since $K'_0 < 0$ (from Lemma 2.12). Now, we can do the same computation as for the estimation of $|\Psi|$, using the properties of $K'_0$ instead of $K_0$ in Lemma 2.12. The same proof works, since the two main ingredients were the integrability near 0 and an exponential decay at infinity of $K_0$, and $-K'_0$ verifies this too. We deduce

$$|\nabla \Psi(x)| \leq \frac{K\| (1 + \tilde{r})^{1+\sigma} h \|_{L^\infty(\mathbb{R}^2)}}{(1 + \tilde{r}(x))^{1+\sigma}}. \quad (2.12)$$

\[ \square \]

**Remark 2.14** Lemma 2.13 is different from the equivalent one of [17] for the gradient, which is equation (5.21) there. They claim that:

for any $0 < \sigma < 1$, there exists $C > 0$ such that, if two real-valued functions $\Psi \in C^1(\mathbb{R}^2), h \in C^0(\mathbb{R}^2)$ satisfy

$$( - \Delta + 2) \Psi = h$$

in the distribution sense, and

$$\| \Psi (1 + \tilde{r})^{1+\sigma} \|_{L^\infty(\mathbb{R}^2)} + \| \nabla \Psi (1 + \tilde{r})^{2+\sigma} \|_{L^\infty(\mathbb{R}^2)} + \| (1 + \tilde{r})^{1+\sigma} h \|_{L^\infty(\mathbb{R}^2)} < +\infty,$$

then

$$|\Psi| \leq \frac{C\| (1 + \tilde{r})^{1+\sigma} h \|_{L^\infty(\mathbb{R}^2)}}{(1 + \tilde{r})^{1+\sigma}}$$

and

$$|\nabla \Psi| \leq \frac{C\| (1 + \tilde{r})^{1+\sigma} h \|_{L^\infty(\mathbb{R}^2)}}{(1 + \tilde{r})^{2+\sigma}}.$$

The main difference they claim would be a stronger decay for the gradient. However, such a result can not hold, because of the following counterexample:

$$\Psi_\varepsilon (x) = \begin{cases} 0 & \text{if } |x| \leq 1/\varepsilon \\ \sin^2(\varepsilon) & \text{if } |x| \geq 1/\varepsilon. \end{cases}$$

For $\varepsilon > 0$ small enough (in particular such that $\frac{1}{\varepsilon} \gg \frac{1}{\varepsilon}$, and such that $\frac{1}{\varepsilon}$ is an integer multiple of $\pi$, so that $\Psi_\varepsilon$ is $C^2$), we have

$$\| (1 + \tilde{r})^{1+\sigma} h(x) \|_{L^\infty(\mathbb{R}^2)} = \| (1 + \tilde{r})^{1+\sigma} (( - \Delta + 2) \Psi)(x) \|_{L^\infty(\mathbb{R}^2)} \leq K\varepsilon$$

and

$$\| (1 + \tilde{r})^{2+\sigma} |\nabla \Psi(x)| \|_{L^\infty(\mathbb{R}^2)} \geq 1/2.$$

Therefore, taking $\varepsilon \to 0$, we see that the estimate $|\nabla \Psi(x)| \leq \frac{C\| (1 + \tilde{r})^{1+\sigma} h \|_{L^\infty(\mathbb{R}^2)}}{(1 + \tilde{r})^{2+\sigma}}$ can not hold.

For our proof of the inversion of the linearized operator (Proposition 2.16 below), we did not choose the same norm $\| \cdot \|_{*,\sigma,d}$ as in [17] (at the beginning of subsection 2.3). In particular, we require less decay on the gradient of the real part. Our proof of the inversion of the linearized operator (the equivalent of Lemma 5.1 of [17]) will be different, and follow more closely the proof of [9].

### 2.5 Reduction of the problem

#### 2.5.1 Inversion of the linearized operator

One of the key element in the inversion of the linearized operator is the computation of the kernel for only one vortex. The kernel of the linearized operator around one vortex has been studied in [8], with the following result.

**Theorem 2.15 ([8])** Consider the linearized operator around one vortex of degree $\varepsilon = \pm 1$,

$$L_{V_\varepsilon}(\Phi) := -\Delta \Phi - (1 - |V_\varepsilon|^2)\Phi + 2\mathfrak{Re}(\overline{\nabla_\varepsilon \Phi}) \nabla_\varepsilon.$$

Suppose that
\[
\|\Phi\|^2_{H_{V_\varepsilon}} := \int_{\mathbb{R}^2} |\nabla \Phi|^2 + (1 - |V_\varepsilon|^2)|\Phi|^2 + 2\text{Re}(V_\varepsilon\Phi) < +\infty
\]
and
\[
L_{V_\varepsilon}(\Phi) = 0.
\]
Then, there exist two constants \(c_1, c_2 \in \mathbb{R}\) such that
\[
\Phi = c_1 \partial_{x_1} V_\varepsilon + c_2 \partial_{x_2} V_\varepsilon.
\]

This result describes the kernel of \(L_{V_\varepsilon}\) that will appear in the proof of Proposition 2.16. It shows that the kernel in \(H_{V_\varepsilon} := \{ \Phi \in HL_{V_\varepsilon}(\mathbb{R}^2), \|\Phi\|_{H_{V_\varepsilon}} < +\infty \}\) contains only the two elements we expect: \(\partial_{x_1} V_\varepsilon, \partial_{x_2} V_\varepsilon\), which are due to the invariance by translation of \((\text{GP})\). One of the directions will be killed by the symmetry and the other one by the orthogonality condition.

Now, we shall invert the linear part \(\eta L(\Phi) + (1 - \eta)VL'(\Psi)\). We recall that \(\Phi = V\Psi\). We first state an a priori estimate result. We recall the definitions
\[
\mathcal{E}_{\varepsilon, \sigma, d} := \{ \Phi = V\Psi \in C^1(\mathbb{R}^2, \mathbb{C}), \|\Psi\|_{*, \sigma, d} < +\infty; \langle \Phi, Z_d \rangle = 0; \forall x \in \mathbb{R}^2, \Psi(x_1, x_2) = \overline{\Psi(x_1, -x_2)} = \Psi(-x_1, x_2)\}
\]
and
\[
\mathcal{E}_{\varepsilon, \sigma, d} = \{ \Phi \in C^0(\mathbb{R}^2, \mathbb{C}), \|h\|_{*, \sigma, d} + \|\Phi\|_{**, \gamma(\sigma), d} < +\infty\},
\]
with \(\gamma(\sigma) = \min(2\sigma, \frac{1 - \sigma}{2})\),
\[
\|\Psi\|_{*, \sigma, d} = \|V\Psi\|_{C^1((\varepsilon \leq 3))} + \|\bar{\rho}^{1+\sigma}\bar{\psi}_1\|_{L^\infty((\varepsilon \geq 2))} + \|\bar{\rho}^{1+\sigma}\nabla\bar{\psi}_1\|_{L^\infty((\varepsilon \geq 2))} + \|\bar{\rho}^{1+\sigma}\bar{\psi}_2\|_{L^\infty((\varepsilon \geq 2))} + \|\bar{\rho}^{1+\sigma}\nabla\bar{\psi}_2\|_{L^\infty((\varepsilon \geq 2))} + \|\bar{\rho}^{2+\gamma}\bar{\psi}_1\|_{L^\infty((\varepsilon \geq 2))} + \|\bar{\rho}^{2+\gamma}\bar{\psi}_2\|_{L^\infty((\varepsilon \geq 2))}.
\]

Remark that \(Vh \in \mathcal{E}_{\varepsilon, \sigma, d}\) implies that \(\|h\|_{**, \gamma(\sigma), d} < +\infty\).

**Proposition 2.16** Consider the problem, in the distribution sense
\[
\begin{cases}
\eta L(\Phi) + (1 - \eta)VL'(\Psi) = Vh \\
\Phi = V\Psi \in \mathcal{E}_{\varepsilon}, Vh \in \mathcal{E}_{**}.
\end{cases}
\]

Then, there exist constants \(c_0(\sigma) > 0\) small and \(C(\sigma) > 0\) depending only on \(\sigma\), such that, for any solution of this problem with \(0 < c \leq c_0(\sigma)\), \(\frac{1}{2} < cd < 2\), it holds
\[
\|\Psi\|_{*, \sigma, d} \leq C(\sigma)(\|h\|_{**, \sigma, d} + c^{1-\sigma}\|h\|_{**, \gamma(\sigma), d}).
\]

We emphasize that, as already said in Remark 2.14, contrary to [17], we have a control by the norm \(\|h\|_{**, \sigma, d} + c^{1-\sigma}\|h\|_{**, \gamma(\sigma), d}\) and not only by \(\|h\|_{**, \sigma, d}\).

**Proof** This proof is similar to the ones done in [9] for the inversion of their linearized operator. The main difference is that we have a transport term. We argue by contradiction. Suppose that for a given \(0 < \sigma < 1\), there is no threshold \(c_0(\sigma) > 0\) such that, if \(c \leq c_0(\sigma)\) we have \(\|\Psi\|_{*, \sigma, d} \leq C(\sigma)(\|h\|_{**, \sigma, d} + c^{1-\sigma}\|h\|_{**, \gamma(\sigma), d})\). We can then find a sequence of \(c_n \to 0\) (and so \(d_n \to \infty\)), functions \(\Phi_n = V\Psi_n \in \mathcal{E}_{**}\) and \(Vh_n \in \mathcal{E}_{**}\) solutions of the problem and such that
\[
\|\Psi_n\|_{*, \sigma, d_n} = 1
\]
and
\[
\|h_n\|_{**, \sigma, d_n} + c_n^{1-\sigma}\|h_n\|_{**, \gamma(\sigma), d_n} \to 0.
\]
We look in the region \(\Sigma := \{ x_1 \geq 0 \}\) thanks to the symmetry \(\Psi(x_1, x_2) = \Psi(-x_1, x_2)\). The orthogonality condition of \(\mathcal{E}_{**}\) becomes \(2\text{Re}\int_{\Sigma} \overline{\nabla h_n} Z_{d_n} = 0\).
Step 1. Inner estimates.

The problem can be written (using $VL'(\Psi_n) = -(E - ic_n\partial_{x_2} V)\Psi_n + L(\Phi_n)$ from Lemma 2.7) as

$$Vh_n = L(\Phi_n) - (1 - \eta)(E - ic_n\partial_{x_2} V)\Psi_n.$$

First, we recall that $V$ and $E$ are depending on $n$. The sequence $(\Phi_n(. + d_n\bar{e_1}))_{n \in \mathbb{N}}$ is equicontinuous and bounded ($1 = \|\Psi_n\|_{*,\sigma,d}$ controls $\Phi_n$ and its derivatives in $L^\infty(\mathbb{R}^2)$ uniformly in $n$).

Such a function $\Phi_n$, as a solution of

$$\Delta \Phi_n = -(1 - |V|^2)\Phi_n + 2\Re(V\Phi_n) - ic\partial_{x_2} \Phi_n - (1 - \eta)(E - ic_n\partial_{x_2} V)\Psi_n - Vh_n
$$

(2.13)

in the distribution sense, by Theorem 8.8 of [11] is $H^{2}_{\text{loc}}(\mathbb{R}^2)$ (since the right hand side is $C^0(\mathbb{R}^2)$). Furthermore, still by Theorem 8.8 of [11], we have, for $x \in \mathbb{R}^2$, $$\|\Phi_n\|_{H^2(B(x,1))} \leq K(\|\Phi_n\|_{H^1(B(x,2))} + \|\Delta \Phi_n\|_{L^2(B(x,2))}).$$

By equation (2.13) and $\|\Psi_n\|_{*,\sigma,d} = 1$, the quantities $\|\Phi_n\|_{L^\infty(B(x,2))}$, $\|\nabla \Phi_n\|_{L^\infty(B(x,2))}$ and $\|\Delta \Phi_n\|_{L^\infty(B(x,2))}$ are bounded by a constant independent of $n$ (we can write $\Delta \Phi_n$ as a sum of terms depending on $\Phi_n, \nabla \Phi_n$ and $h_n$, and use $\|\Psi_n\|_{*,\sigma,d} = 1, \|h_n\|_{*,\sigma,d} \to 0$). Therefore, $(\Phi_n)_{n \in \mathbb{N}}$ is bounded in $H^{2}_\text{loc}(\mathbb{R}^2)$.

We deduce, by compact embedding, that there exists a function $\Phi$ such that $\Phi_n(. + d_n\bar{e_1}) \to \Phi$ in $H^1_{\text{loc}}(\mathbb{R}^2)$ (up to a subsequence).

Now, since $L(\Phi_n) = -\Delta \Phi_n - (1 - |V|^2)\Phi_n + 2\Re(V\Phi_n)V - ic\partial_{x_2} \Phi_n$, we have, in the weak sense,

$$\Delta \Phi_n + Vh_n = -(1 - |V|^2)\Phi_n + 2\Re(V\Phi_n)V - ic\partial_{x_2} \Phi_n - (1 - \eta)(E - ic_n\partial_{x_2} V)\Psi_n,$$

therefore $\Delta \Phi_n(. + d_n\bar{e_1}) + Vh_n(. + d_n\bar{e_1})$ is equicontinuous and bounded uniformly and then, by Ascoli’s Theorem, up to a subsequence converges to a limit in $C_{\text{loc}}(\mathbb{R}^2)$. Since $Vh_n(. + d_n\bar{e_1}) \to 0$ in $C_{\text{loc}}(\mathbb{R}^2)$ by $\|h_n\|_{*,\sigma,d} \to 0$ and $\Delta \Phi_n(. + d_n\bar{e_1}) \to \Delta \Phi$ in the distribution sense, this limit must be $\Delta \Phi$ (in the $H^{-1}_{\text{loc}}(\mathbb{R}^2)$ sense).

We have locally uniformly that $Vh_n(. + d_n^2\bar{e_1}) \to 0$ because $\|h_n\|_{*,\sigma,d} \to 0$ and $|V| \leq 1$, and we have, from Lemma 2.4, that $E(y + d_n\bar{e_1}) \to 0$ and $V(y + d_n\bar{e_1}) \to V_1(y)$ when $n \to \infty$ locally uniformly. Lastly, $\partial_{x_2} \Phi_n$ and $(1 - \eta)\partial_{x_2} V\Psi_n$ are uniformly bounded in $\mathbb{R}^2$ independently of $n$. Therefore when we take the locally uniform limit when $d_n \to \infty$ in

$$(Vh_n)(y + d_n\bar{e_1}) = (L(\Phi_n))(y + d_n\bar{e_1}) - ((1 - \eta)(E - ic_n\partial_{x_2} V)\Psi_n)(y + d_n\bar{e_1}),$$

we have (in the distribution sense)

$$L_{V_1}(\Phi) = 0.$$

Using $\partial_{\Sigma} V(. + d_n\bar{e_1}) \to -\partial_{x_1} V_1(.)$ locally uniformly from Lemma 2.4, we show that

$$0 = 2\Re \int_{\Sigma} \overline{\Phi_n} Z_d \to 2\{\Phi|\hat{n}|/4\} \partial_{x_1} V_1$$

since $Z_d$ is compactly supported around $0$ when we take the equation in $y + d_n\bar{e_1}$. The problem at the limit $n \to \infty$ becomes (in the $H^{-1}_{\text{loc}}(\mathbb{R}^2)$ sense)

$$\begin{cases}
L_{V_1}(\Phi) = 0 \\
\langle \Phi, \partial_{x_1} V_1 \rangle = 0,
\end{cases}$$

with $\Phi = V_1\Psi$ (since $V(y + d_n\bar{e_1}) \to V_1(y)$ from Lemma 2.4).

Let us show that $\|\Phi\|_{H_{V_1}} < +\infty$. For that, we will show that

$$\int_{B(d_n\bar{e_1},d_n^2/2)} \|\nabla \Phi_n\|^2 + \frac{|\Phi_n|^2}{1 + r_1^2} + 2\Re^2(V_1(. - d_n\bar{e_1})\Phi_n) \leq K(\sigma),$$

where $K(\sigma)$ is a constant depending only on $\sigma$. The proof involves estimates on $\Phi_n$ and $\nabla \Phi_n$ using Sobolev inequalities and a priori bounds on $\Phi_n$ and $\nabla \Phi_n$.
where \( K(\sigma) > 0 \) is independent of \( n \), which shall imply (by Lemma 2.3)
\[
\|\Phi\|^2_{H_{V_1}} \leq \limsup_{n \to \infty} \int_{B(d_n, e_1^2, d_n^{1/2})} |\nabla \Phi_n|^2 + \frac{|\Phi_n|^2}{(1 + r_1)^2} + \Re(\nabla (-d_n e_1^1) \Phi_n)^2 \leq K(\sigma) < +\infty.
\]

First, \( \Phi_n \in C^2(\mathbb{R}^2) \) hence \( \Phi_n \in H^{1,2}_{\text{loc}}(\mathbb{R}^2) \). We have
\[
|\nabla \Phi_n|^2 \leq 2|\nabla V_1|^2 |\Psi_n|^2 + 2|\nabla \Psi_n|^2 |V_1|^2,
\]
with \( |\nabla V_1|^2 = O_{r_1} \rightarrow \infty \left( \frac{1}{r_1} \right) \) by Lemma 2.2, and, in \( B(d_n, e_1^2, d_n^{1/2}) \), \( |\Psi_n|^2 \leq \frac{C}{(1 + r_1)^{\sigma}} \|\Psi_n\|^2_{*,\sigma,d} \), \( |\nabla \Psi_n|^2 \leq \frac{C}{(1 + r_1)^{\sigma+2}} \|\Psi_n\|^2_{*,\sigma,d} \). Therefore since \( \|\Psi_n\|^2_{*,\sigma,d} \leq 1 \),
\[
\int_{B(d_n, e_1^2, d_n^{1/2})} |\nabla \Phi_n|^2 \leq \int_{B(d_n, e_1^2, d_n^{1/2})} \frac{K}{(1 + r_1)^{2+2\sigma}} \leq K(\sigma).
\]
In addition, in \( B(d_n, e_1^2, d_n^{1/2}) \), \( |\Phi_n|^2 = |V_1|^2 |\Psi_n|^2 \leq \frac{C}{(1 + r_1)^{\sigma}} \|\Psi_n\|^2_{*,\sigma,d} \) hence \( \frac{|\Phi_n|^2}{(1 + r_1)^{\sigma+2}} \leq \frac{K}{(1 + r_1)^{2+2\sigma}} \) and
\[
\int_{B(d_n, e_1^2, d_n^{1/2})} |\Phi_n|^2 \leq \int_{B(d_n, e_1^2, d_n^{1/2})} \frac{K}{(1 + r_1)^{2+2\sigma}} \leq K(\sigma).
\]
Lastly, still in \( B(d_n, e_1^2, d_n^{1/2}) \), by Lemma 2.3,
\[
\Re(\nabla \Phi_n)^2 = |V_1|^4 \Re(\nabla \Psi_n)^2 \leq |V_1|^4 (\Re(\Psi_n)^2 + (1 - |V_1|^2) |\Psi_n|^2) \leq \frac{K}{(1 + r_1)^{2+2\sigma}},
\]
giving the same result. We then have \( \|\Phi\|_{H_{V_1}} < +\infty \), therefore, we can apply Theorem 2.15. We deduce that
\[
\Phi = c_1 \partial_x V_1 + c_2 \partial_y V_1
\]
for some constants \( c_1, c_2 \in \mathbb{R} \).

Since \( \forall x \in \mathbb{R}^2, \Psi_n(x_1, x_2) = \Psi_n(x_1, -x_2) \), we have \( \forall y \in \mathbb{R}^2, \Phi(y_1, y_2) = \Phi(y_1, -y_2) \). The function \( \partial_{x_1} V_1 \) enjoys also this symmetry, therefore so does \( c_2 \partial_{x_2} V_1 \). It is possible only if \( c_2 = 0 \). The orthogonality condition then imposes
\[
c_1 \int_\Sigma \partial_{x_1} V_1(y)^2 \frac{\eta}{4} \, dy = 0,
\]
implying that \( c_1 = 0 \). Hence
\[
\Phi_n(\cdot + d_n e_1^1) \to 0
\]
in \( C_{\text{loc}}^1(\mathbb{R}^2) \). The same proof works for the \( z \) coordinate (around the center of the \(-1\) vortex). As a consequence, for any \( R > 0 \), we have
\[
\|\Phi_n\|_{L^\infty((\tilde{r} \leq R))} + \|\nabla \Phi_n\|_{L^\infty((\tilde{r} \leq R))} \to 0 \quad (2.14)
\]
as \( n \to \infty \). With this result, to obtain a contradiction (which will be \( \|\Psi_n\|^2_{*,\sigma,d} \to 0 \)) we still need to have estimates near the infinity in space.

Step 2. Outer computations.

Thanks to the previous step, we can take a cutoff to look only at the infinity in space. For \( R \geq 4 \), we define \( \chi_R \) a smooth cutoff function with value \( \chi_R(x) = 1 \) if \( \tilde{r} \geq R \) and \( \chi_R(x) = 0 \) if \( \tilde{r} \leq \frac{R}{2} \), with \( |\nabla \chi_R| \leq \frac{4}{R} \). We then define
\[
\bar{\Psi}_n := \chi_R \Psi_n,
\]
\[
\bar{h}_n := \chi_R h_n.
\]
We compute on \( \mathbb{R}^2 \setminus (B(d_n e_1^2, R) \cup B(-d_n e_1^1, R)) \):
\[
\nabla \bar{\Psi}_n = \nabla \chi_R \Psi_n + \chi_R \nabla \Psi_n = \nabla \Psi_n,
\]

25
\[ \Delta \tilde{\Psi}_n = \Delta \chi_R \Psi_n + 2 \nabla \chi_R \nabla \Psi_n + \chi_R \Delta \Psi_n = \Delta \Psi_n, \]
\[ \hat{h}_n = \chi_R h_n = h_n. \]

Since \( \chi_R = 1 \) on \( \mathbb{R}^2 \setminus (B(\bar{d}_n e_1, R) \cup B(-d_n e_1, R)) \), we have there
\[ \hat{h}_n = L'(\tilde{\Psi}_n). \]

Furthermore, \( \tilde{\Psi}_n = 0 \) on \( B(\bar{d}_n e_1, \frac{R}{2}) \cup B(-d_n e_1, \frac{R}{2}) \) and
\[ \| \tilde{\Psi}_n \|_{s, \sigma, d_n} \leq 5. \]

Indeed, on the one hand, \( |\Re(\tilde{\Psi}_n)| \leq |\Psi_1, n|, |\Im(\tilde{\Psi}_n)| \leq |\Psi_2, n|. \) On the other hand if \( \tilde{r} \leq R \), then
\[ |\tilde{r}^{2+\sigma} \nabla \Re(\tilde{\Psi}_n)| \leq |\tilde{r}^{2+\sigma} \nabla \Re(\Psi_n)| + |\nabla \chi_R| \times |\tilde{r}^{2+\sigma} \Re(\Psi_n)| \]
\[ \leq \| \Psi_n \|_{s, \sigma, d} + \frac{4\tilde{r}}{R} \| \nabla \chi_R \| \nabla \Re(\Psi_n) \| \leq 5 \| \Psi_n \|_{s, \sigma, d} \leq 5 \]
and similarly, if \( \tilde{r} \leq R \) we have \( |\tilde{r}^{2+\sigma} \nabla \Im(\tilde{\Psi}_n)| \leq 5. \) If \( \tilde{r} \geq R \) then \( \tilde{r}_n = \Psi_n \) and the estimate holds. Similarly, we check that \( \| h_n \|_{s, \gamma, d_n} \leq 5 \| h_n \|_{s, \gamma, d_n} \) and \( \| h_n \|_{s, \gamma, d_n} \leq 5 \| h_n \|_{s, \gamma, d_n} . \)

We focus now on writing the equation
\[ h = L'(\Psi) = -\Delta \Psi - 2 \nabla V \cdot \nabla \Psi + 2 |V|^2 \Re(\Psi) - ic\partial_{x_2} \Psi \]

in real and imaginary parts. This is the equation of the problem in the area where \( \eta \equiv 0 \), i.e., far from both vortices. In particular, this equation is satisfied by \( \hat{h} = h_n \) and \( \hat{\Psi} = \tilde{\Psi}_n \) (and we will omit the subscript from now on, and do the same thing for \( d_n \) and \( c_n \)). Writing \( \hat{h} = \hat{h}_1 + i\hat{h}_2 \) and \( \hat{\Psi} = \hat{\Psi}_1 + i\hat{\Psi}_2 \), multiplying the equation \( h = L'(\Psi) \) by \( \chi_R \), we have the system (in real and imaginary parts)
\[
\begin{cases}
\Delta \hat{\Psi}_1 - 2 |V|^2 \hat{\Psi}_1 = -\hat{h}_1 - 2 \Re \left( \frac{\nabla V}{V} \cdot \nabla \hat{\Psi} \right) + c \partial_{x_2} \hat{\Psi}_2 + \text{Loc}_1(\Psi) \\
\Delta \hat{\Psi}_2 + c \partial_{x_2} \hat{\Psi}_1 = -\hat{h}_2 - 2 \Im \left( \frac{\nabla V}{V} \cdot \nabla \hat{\Psi} \right) + \text{Loc}_2(\Psi),
\end{cases}
\]
(2.15)

where \( \text{Loc}_1(\Psi) \) and \( \text{Loc}_2(\Psi) \) are real-valued terms coming from the cutoff:
\[
\text{Loc}_1(\Psi) + ic \text{Loc}_2(\Psi) := 2 \nabla \Psi \cdot \nabla \chi_R + \left( \Delta \chi_R - \frac{2 \nabla V}{V} \cdot \nabla \chi_R - ic \partial_{x_2} \chi_R \right) \Psi.
\]

In particular, they are compactly supported in \( (B(d \bar{e_1}^\perp, R) \cup B(-d \bar{e_1}^\perp, R)) \setminus ((B(d \bar{e_1}^\perp, R/2) \cup B(-d \bar{e_1}^\perp, R/2)) \), and, with (2.14), we have
\[
\| \text{Loc}_1(\Psi) \|_{L^\infty(\mathbb{R}^2)} + \| \text{Loc}_2(\Psi) \|_{L^\infty(\mathbb{R}^2)} \leq o_{n \to \infty}(1),
\]
where \( o_{n \to \infty}(1) \) is a quantity going to 0 when \( n \to \infty \) at fixed \( R \). We compute
\[
\frac{\nabla V}{V}(x) = \frac{\nabla V_1}{V_1}(y) + \frac{\nabla V_1}{V_1}(z),
\]
and recall, by Lemma 2.1, that \( \nabla V_\varepsilon(x) = i \varepsilon V_\varepsilon(x) \frac{\bar{x}}{r^2_\varepsilon} + O \left( \frac{1}{r^3_\varepsilon} \right) \) for \( \varepsilon = \pm 1 \). We deduce that, far from the vortices (for instance on \( \mathbb{R}^2 \setminus (B(d \bar{e_1}^\perp, 4) \cup B(-d \bar{e_1}^\perp, 4)) \)), we have
\[
\nabla V(x) = i \left( \frac{y^\perp}{r_1^2} - \frac{z^\perp}{r_1^2} \right) + O_{r_1 \to \infty} \left( \frac{1}{r_1^3} \right) + O_{r_1 \to \infty} \left( \frac{1}{r_1^3} \right).
\]
(2.16)

In particular, the first order of \( \nabla V \) is purely imaginary, and the next term is of order \( \frac{1}{r^3_1} + \frac{1}{r^3_2} \).

First, we look at the first equation of system (2.15). Recall that \( \tilde{\Psi} = 0 \) on \( B(\bar{d}_1^\perp, \frac{R}{2}) \cup B(-d_1^\perp, \frac{R}{2}) \), thanks to the cutoff. From equation (2.16), together with \( \| \nabla \tilde{\Psi} \| \leq \frac{K\| \tilde{\Psi} \|_{s, \sigma, d_n}}{1 + (\tilde{r})^{1+\sigma}} \) and \( \| \tilde{\Psi} \|_{s, \sigma, d_n} \leq 5 \), we deduce that
\[
\| \Re \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\Psi} \right) + c \partial_{x_2} \tilde{\Psi}_2 \| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + \tilde{r})^{1+\sigma}}.
\]
Now, with the estimate $|\tilde{h}_1| \leq K \frac{\|\tilde{h}\|_{\ast, \sigma, d}}{(1 + \tilde{r})^{1+\sigma}}$, we have

$$|\Delta \tilde{\Psi}_1 - 2|V|^2 \tilde{\Psi}_1| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1) + K \|\tilde{h}\|_{\ast, \sigma, d}}{(1 + \tilde{r})^{1+\sigma}}.$$  

Now, using Lemma 2.3, (2.14) and $\|	ilde{\Psi}\|_{\ast, \sigma, d} \leq 5$, we infer

$$|(1 - |V|^2)\tilde{\Psi}_1| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + \tilde{r})^{1+\sigma}},$$  

hence

$$\Delta \Psi_1 - 2\Psi_1 \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1) + K \|\tilde{h}\|_{\ast, \sigma, d}}{(1 + \tilde{r})^{1+\sigma}} \quad (2.17)$$

From Lemma 2.13, we deduce that

$$|\tilde{\Psi}_1| + |\nabla \tilde{\Psi}_1| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1) + K \|\tilde{h}\|_{\ast, \sigma, d}}{(1 + \tilde{r})^{1+\sigma}}, \quad (2.18)$$

which will be enough on the real part to get the contradiction.

Now, we focus on the imaginary part. We define

$$f_1 := -\tilde{h}_1 - 2\Re \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\Psi} \right) - 2(1 - |V|^2)\tilde{\Psi}_1 + \text{Loc}_1(\Psi)$$

and

$$f_2 := -\tilde{h}_2 - 2\Im \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\Psi} \right) + \text{Loc}_2(\Psi),$$

so that the system (2.16) becomes

$$\begin{align*}
\Delta \tilde{\Psi}_1 - 2\tilde{\Psi}_1 - c\partial_{x_2} \tilde{\Psi}_2 &= f_1 \\
\Delta \tilde{\Psi}_2 + c\partial_{x_2} \tilde{\Psi}_1 &= f_2.
\end{align*}$$

We check, thanks to $\|	ilde{\Psi}\|_{\ast, \sigma, d} \leq 5$, (2.16) and (2.18), that

$$|f_2| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1) + K \|\tilde{h}\|_{\ast, \sigma, d}}{(1 + \tilde{r})^{1+\sigma}}.$$  

From Lemma 2.11, we can therefore construct the function $\zeta$ associated to $f_2$, which is odd in $x_2$, and for $\alpha = \sigma$. We define

$$\tilde{\Psi}'_2 := \tilde{\Psi}_2 - \zeta$$

and

$$f' := f_1 - c\partial_{x_2} \zeta.$$  

The system (2.16) becomes

$$\begin{align*}
\Delta \tilde{\Psi}_1 - 2\tilde{\Psi}_1 - c\partial_{x_2} \tilde{\Psi}_2' &= f' \\
\Delta \tilde{\Psi}_2' + c\partial_{x_2} \tilde{\Psi}_1 &= 0.
\end{align*}$$

Taking the Fourier transform of the first equation, we infer (in the distribution sense)

$$\hat{\tilde{\Psi}}_1 = \frac{-1}{2 + |\xi|^2} (ic\xi_2 \hat{\tilde{\Psi}}_2' + \hat{f'}).$$

Now, we differentiate the second equation with respect to $x_j$, $j \in \{1, 2\}$. Then, taking the Fourier transform, we have

$$|\xi|^2 \partial_{x_j} \hat{\tilde{\Psi}}_2' + c\xi_2 \xi_j \hat{\tilde{\Psi}}_1 = 0.$$
Replacing $\hat{\Psi}_1$ from the previous equation, and using $\hat{\partial}_{x_j} \hat{\Psi}_2 = i\xi_j \hat{\Psi}_2$ we get

$$\hat{\partial}_{x_j} \hat{\Psi}_2 ' \left( |\xi|^2 - \frac{c^2 \xi_j^2}{2 + |\xi|^2} \right) = \frac{c \xi_j \xi_j}{2 + |\xi|^2} \hat{f}',$$

and this leads to (recall the definition of $\hat{K}_j$ in subsection 2.4.1, and using $\hat{\partial}_{x_j} \hat{\Psi}_2 \in L^2(\mathbb{R}^2)$ to justify the division by $|\xi|^2 + 2|\xi|^2 - c^2 \xi_j^2$)

$$\hat{\partial}_{x_j} \hat{\Psi}_2 ' = \frac{c \xi_j \xi_j}{|\xi|^2 + 2|\xi|^2 - c^2 \xi_j^2} \hat{f}' = c\hat{K}_j \hat{f}'.$$

We deduce that

$$\hat{\partial}_{x_j} \hat{\Psi}_2 ' = cK_j * f'$$

since $\hat{\partial}_{x_j} \hat{\Psi}_2', K_j, f' \in L^2(\mathbb{R}^2)$ by Theorem 2.9, (2.17), $\|\hat{\Psi}'\|_{s, \sigma, d} \leq 5$ and Lemma 2.11. From the definition of $f'$ and $f_1$, we have

$$c f' = -\hat{c}h_1 - 2c \Re \left( \frac{\nabla V}{V} \nabla \hat{\Psi} \right) - c(1 - |V|^2) \hat{\Psi}_1 + c \Loc_1(\Psi) - c^2 \partial_{x_2} \zeta.$$

Since $\|(1 + \hat{r})^{-\gamma} \hat{h}_1\|_{L^\infty(\mathbb{R}^2)} \rightarrow 0$ from Lemma 2.10 we deduce that, taking $\varepsilon = \gamma(\sigma) - \sigma > 0$,

$$c|K_j * \hat{h}_1| \leq K(\sigma) e^{-\varepsilon} \frac{K(\sigma)}{(1 + \hat{r})^{1+\sigma}} = \frac{o_n(1)}{(1 + \hat{r})^{1+\sigma}}.$$

This estimate is the part where we used the norm $\|\cdot\|_{s, \gamma(\sigma), d}$, and it is not enough to use here $\|\cdot\|_{s, \sigma, d}$ (it would yield $\varepsilon = 0$). Furthermore, from Lemma 2.3 and (2.16), we estimate

$$\left| 2c \Re \left( \frac{\nabla V}{V} \nabla \hat{\Psi} \right) - (1 - |V|^2) \hat{\Psi}_1 \right| \leq \frac{cK + o_{n \rightarrow \infty}(1) + o_{n \rightarrow \infty}(1)}{(1 + \hat{r})^{2+\sigma}},$$

thus, since $c = o_{n \rightarrow \infty}(1)$, by Lemma 2.10 (for $\varepsilon = 1$),

$$|K_j * \hat{\Psi}_1| \leq \frac{o_{n \rightarrow \infty}(1) + o_{n \rightarrow \infty}(1)}{(1 + \hat{r})^{1+\sigma}}.$$

We recall that $\Loc_1(\Psi)$ is compactly supported in a domain with size depending only on $R$, hence, by Lemma 2.10 (for $\varepsilon = 1$ for instance, any value works here),

$$|K_j * \Loc_1(\Psi)| \leq \frac{o_{n \rightarrow \infty}(1) + o_{n \rightarrow \infty}(1)}{(1 + \hat{r})^{1+\sigma}}.$$

Finally, recall that $\Delta \zeta = f_2 = -\hat{h}_2 - 23m \left( \frac{\nabla V}{V} \nabla \hat{\Psi} \right)$. From Lemma 2.3, we have both $|\nabla V| \leq K(\hat{r})$ and $|\nabla V| \leq \frac{Kd}{(1 + \hat{r})^{2+\sigma}}$, therefore

$$\left| \frac{\nabla V}{V} \right| \leq \frac{Kd^{1-\sigma}}{(1 + \hat{r})^{1+\sigma}} \leq \frac{K}{c^{1-\sigma}(1 + \hat{r})^{1+\sigma}},$$

and thus, with $\|\hat{\Psi}\|_{s, \sigma, d} \leq 5$,

$$c^{1-\sigma} \left| 23m \left( \frac{\nabla V}{V} \nabla \hat{\Psi} \right) \right| \leq \frac{K}{(1 + \hat{r})^{2+2\sigma}}.$$

With this estimate and Lemma 2.11, with regards $\|(1 + \hat{r})^{2+\gamma(\sigma)} \hat{h}_2\|_{L^\infty(\mathbb{R}^2)} \leq \|\hat{h}_2\|_{s, \gamma(\sigma), d} \leq \frac{K}{c^{1-\sigma}}$, we estimate

$$c^{1-\sigma} |\partial_{x_2} \zeta| \leq \frac{K}{(1 + \hat{r})^{2+2\sigma}}.$$

Therefore, by Lemma 2.10 (for $\varepsilon = \sigma > 0$),

$$|K_j * c^2 \partial_{x_2} \zeta| \leq \frac{K(\sigma)c^{1+\sigma}}{(1 + \hat{r})^{1+\sigma}} = \frac{o_{n \rightarrow \infty}(1)}{(1 + \hat{r})^{1+\sigma}}.$$
We deduce that, for \( j \in \{1, 2\} \),
\[
|\partial_{x_j} \tilde{\Psi}'_j| = |cK_j \ast f'| = |cK_j \ast (f_1 - c\partial_{x_2} \zeta)| \leq \frac{o_{n \to \infty}(1) + o_{R \to \infty}(1)}{(1 + \tilde{r})^{1+\sigma}},
\]
and by integration from infinity (at fixed \( x_1 \) for instance), since \( \tilde{\Psi}'_2 \) goes to 0 at infinity, we have
\[
|\tilde{\Psi}'_2| \leq \frac{o_{n \to \infty}(1) + o_{R \to \infty}(1)}{(1 + \tilde{r})^{\sigma}}.
\]
From Lemma 2.11, we know that
\[
|\zeta| \leq \frac{o_{n \to \infty}(1) + o_{R \to \infty}(1) + K \|h\|_{\ast, \sigma, d}}{(1 + \tilde{r})^{\sigma}}
\]
and
\[
|\nabla \zeta| \leq \frac{o_{n \to \infty}(1) + o_{R \to \infty}(1) + K \|h\|_{\ast, \sigma, d}}{(1 + \tilde{r})^{1+\sigma}},
\]
therefore
\[
|\tilde{\Psi}_2| = |\tilde{\Psi}'_2 + \zeta| \leq \frac{o_{n \to \infty}(1) + o_{R \to \infty}(1) + K \|h\|_{\ast, \sigma, d}}{(1 + \tilde{r})^{\sigma}} \tag{2.20}
\]
and
\[
|\nabla \tilde{\Psi}_2| = |\nabla \tilde{\Psi}'_2 + \nabla \zeta| \leq \frac{o_{n \to \infty}(1) + o_{R \to \infty}(1) + K \|h\|_{\ast, \sigma, d}}{(1 + \tilde{r})^{\sigma}} \tag{2.21}
\]

Step 3. Conclusion.

We have \( \|\tilde{\Psi}_n\|_{\ast, \sigma, d_n} \leq K(R)(\|\Phi_n\|_{L^\infty(\{\tilde{r} \leq R\})} + \|\nabla \Phi_n\|_{L^\infty(\{\tilde{r} \leq R\})}) + K\|\tilde{\Psi}_n\|_{\ast, \sigma, d_n} \). With the estimates of step 2 ((2.18), (2.20) and (2.21)), if we take \( R \) large enough so that \( o_{R \to \infty}(1) \leq 1/20 \) and then \( n \) large enough (depending on \( R \)) so that \( o_{n \to \infty}(1) + K \|h\|_{\ast, \sigma, d} \leq 1/20 \) (using \( \|h_n\|_{\ast, \sigma, d_n} \to 0 \) when \( n \to \infty \)), we have, for \( n \) large, \( \|\tilde{\Psi}_n\|_{\ast, \sigma, d_n} \leq 1/10 \). Furthermore, by (2.14) we have
\[
\|\Phi_n\|_{L^\infty(\{\tilde{r} \leq R\})} + \|\nabla \Phi_n\|_{L^\infty(\{\tilde{r} \leq R\})} \to n \to \infty 0,
\]
which, with \( \|\tilde{\Psi}_n\|_{\ast, \sigma, d_n} \leq 1/10 \), is in contradiction with
\[
\|\tilde{\Psi}_n\|_{\ast, \sigma, d_n} = 1.
\]
\( \square \)

2.5.2 Existence of a solution

At this point, we do not have existence of a solution to the linear problem
\[
\begin{cases} 
\eta L(\Phi) + (1 - \eta) V L'(\Psi) = V h \\
\Phi \in \mathcal{E}_*, V h \in \mathcal{E}_{**},
\end{cases}
\]
only an a priori estimate. The existence of a solution is done in Proposition 2.19, its proof being the purpose of this subsection. In [9], the existence proof is done using mainly the fact that the domain is bounded. We provide here a proof of existence by approximation on balls of large radii for a particular Hilbertian norm. Given \( c > 0 \) and \( a > 10/c^2 \), we define
\[
H_a :=
\left\{ \Phi = Q_c \Psi \in H^1_{\text{loc}}(B(0, a)), \|\Phi\|_{H_a}^2 := \|\Phi\|_{H^1 \cap \{r \leq 3\}}^2 + \int_{\{r \geq 2\} \cap \{r \leq a\}} |\nabla \Psi|^2 + 2 \Re^2(\Psi) + \frac{2m^2(\Psi)}{(1 + r)^{5/2}} \right\},
\]
and we also allow \( a = +\infty \). We first state a result on functions in \( H_\infty \).
Lemma 2.17 There exists $c_0 > 0$ such that, for $0 < c < c_0$, $0 < \sigma < 1$, $Vh \in \mathcal{E}_{**}$, if a function $\Phi \in H_\infty \cap C^1(\mathbb{R}^2)$ satisfies, in the weak sense,
\[ \eta L(\Phi) + (1 - \eta)VL'(\Psi) = Vh, \]
and $\Phi = V\Psi$, $(V\Psi, Z_\alpha) = 0$; for $x \in \mathbb{R}^2, \Psi(x_1, x_2) = \overline{\Psi(x_1, -x_2)} = \Psi(-x_1, x_2)$, then
\[ \Phi \in \mathcal{E}_{**}. \]

Proof First, we check that, as a solution of $\eta L(\Phi) + (1 - \eta)VL'(\Psi) = Vh$, $\Phi \in C^1_{\text{loc}}(\mathbb{R}^2)$ and
\[ \|\Phi\|_{L^\infty((r < 10c^2))} + \|\nabla \Phi\|_{L^\infty((r < 10c^2))} \leq K(c, \|\Phi\|_{H_\infty}, \|h\|_{**}) < +\infty. \]

Since $\Phi \in C^1_{\text{loc}}(\mathbb{R}^2)$ and satisfies the symmetries and the orthogonality condition, to show that $\Phi \in \mathcal{E}_{**}$, we only have to show that $\|\Psi\|_{*,\sigma,d} < +\infty$. Now, similarly as in the proof of Proposition 2.16, we add a cutoff function $\chi_R$, but this time its value is 1 if $r \geq 10/c^2$ and 0 if $r \leq 5/c^2$. In particular, its support is far from both vortices. We check similarly that, with the same notations, we obtain the system (2.15):
\[
\begin{align*}
\Delta \tilde{\psi}_1 - 2|V|^2 \tilde{\psi}_1 &= -\tilde{h}_1 - 29\Re \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\psi}_1 \right) + c\partial_{x_2} \tilde{\psi}_2 + \text{Loc}_1(\Psi), \\
\Delta \tilde{\psi}_2 + c\partial_{x_2} \tilde{\psi}_1 &= -\tilde{h}_2 - 23\Im \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\psi}_1 \right) + \text{Loc}_2(\Psi),
\end{align*}
\]
but this time the local terms are in $\{5/c^2 \leq r \leq 10/c^2\}$. Recall that $\tilde{\Psi} = 0$ on $\{r \leq 5/c^2 \}$. In particular, we look only at values of $x$ such that $|x| \geq 1$. Now, we define similarly as in the proof of Proposition 2.16 a function $\zeta$, solution of $\Delta \zeta = -\tilde{h}_2 - 23\Im \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\psi}_1 \right) + \text{Loc}_2(\Psi)$. With Lemma 2.3 and $\nabla \tilde{\psi} \in L^2(\mathbb{R}^2)$ (since $\Phi \in H_\infty$), we have $Y \mapsto \left( \frac{\nabla \tilde{\psi}(Y)}{V(Y)} \right)$ is in $L^3(\mathbb{R}^2)$ and thus $\zeta$ is well defined. By Hölder inequality, we can check that $\Im \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\psi}_1 \right) \in L^3(\mathbb{R}^2)$. We check, with the same computations as in the proof of Proposition 2.16 and Lemma 2.11 (with $\alpha = 1/10$ in the computations), that $\zeta \in C^1(\mathbb{R}^2)$ and that we have
\[ |\nabla \zeta(x)| \leq \frac{1}{2\pi} \int_{\mathbb{R}^2} \left| \frac{1}{|x - Y|} \right| \left| -\tilde{h}_2 - 23\Im \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\psi}_1 \right) + \text{Loc}_2(\Psi) \right| (Y)dY, \]
under the condition that $\nabla \tilde{\psi} \in L^2(\mathbb{R}^2) \cap L^3(\mathbb{R}^2)$. With the upcoming estimates, we will check in particular that this condition is satisfied. From the proof of Lemma 2.11, we check that, since $Vh \in \mathcal{E}_{**}$,
\[ \sup_{x \in \mathbb{R}^2} (1 + |x|)^{1+\frac{\sigma}{2}} \int_{\mathbb{R}^2} \left| \frac{1}{|x - Y|} \right| - \tilde{h}_2 + \text{Loc}_2(\Psi)(Y)dY \right| < +\infty \]
(here, its size may depend on $c, R, \|\Phi\|_{H_\infty}$ and $\|h\|_{**}$). Now, from Lemma 2.3, we have, outside of $\{\chi_R = 0\}$ that $|\nabla V| \leq \frac{K(c)}{(1+|x|)^2}$. We deduce
\[ \int_{\mathbb{R}^2} \frac{1}{|x - Y|} \left| 3\Im \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\psi}_1 \right) \right| (Y)dY \leq K(c, R) \int_{\mathbb{R}^2} \frac{|\nabla \tilde{\psi}_1(Y)|}{|x - Y|(1 + |Y|)^2}dY. \]
We focus now on the estimation of $\int_{\mathbb{R}^2} |\nabla \tilde{\psi}_1(Y)|dY$. From [11], Theorem 8.8, we check that $\|\nabla \tilde{\psi}_1\|_{L^1(\mathbb{R}^2)} \leq K(c, R, \|\Phi\|_{H_\infty}, \|h\|_{**})$. In particular, by Sobolev embedding, $\|\nabla \tilde{\psi}_1\|_{L^3(\mathbb{R}^2)} \leq K(c, R, \|\Phi\|_{H_\infty}, \|h\|_{**})$. In the area $\{|x - Y| \leq 1\}$, we have $(1 + |Y|)^2 \geq K(1 + |x|)^2$ and therefore, by Hölder inequality,
\[ \int_{\{|x - Y| \leq 1\}} \frac{|\nabla \tilde{\psi}_1(Y)|}{|x - Y|(1 + |Y|)^2}dY \leq K \int_{\{|x - y| \leq 1\}} \frac{|\nabla \tilde{\psi}_1(Y)|}{|x - Y|}dY \]
\[ \leq K \|\nabla \tilde{\psi}_1\|_{L^3(\mathbb{R}^2)} \left( \int_{\{|x - Y| \leq 1\}} \frac{dY}{|x - Y|^{3/2}} \right)^{2/3} \]
\[ \leq K(c, R, \|\Phi\|_{H_\infty}, \|h\|_{**}). \]
In the area \( \{1 \leq |x - Y| \leq |x|/2\} \), we have \( |Y| \geq |x| - |x|/2 \), therefore, by Cauchy-Schwarz,

\[
\int_{\{1 \leq |x - Y| \leq |x|/2\}} \frac{|\nabla \tilde{\Psi}(Y)| dY}{|x - Y|(1 + |Y|)^2} \leq \frac{K(c, R)}{(1 + |x|)^{1/2}} \int_{\{1 \leq |x - Y| \leq |x|/2\}} \frac{|\nabla \tilde{\Psi}| dY}{|x - Y|(1 + |x|)^2 - (1 + |Y|)^2} \leq \frac{K(c, R)}{(1 + |x|)^{1/2}} \int_{\{1 \leq |x - Y| \leq |x|/2\}} \frac{|\nabla \tilde{\Psi}|^2 dY}{|x - Y|^2} \int_{\{1 \leq |x - Y| \leq |x|/2\}} \frac{dY}{|x - Y|^3} \leq \frac{K(c, R, \sigma, \|\Phi\|_{H_\infty})}{(1 + |x|)^{1/2}}.
\]

Finally, in the area \( \{|x - Y| \geq |x|/2\} \), we estimate by Cauchy-Schwarz that

\[
\int_{\{|x - Y| \geq |x|/2\}} \frac{|\nabla \tilde{\Psi}(Y)| dY}{|x - Y|(1 + |Y|)^2} \leq \frac{K}{1 + |x|} \int_{\{|x - Y| \geq |x|/2\}} \frac{|\nabla \tilde{\Psi}|^2}{(1 + |Y|)^4} dY \leq \frac{K(\|\Phi\|_{H_\infty})}{1 + |x|}.
\]

Combining these estimates, we conclude that

\[
|\nabla \zeta|(x) \leq \frac{K(c, R, \sigma, \|\Phi\|_{H_\infty}, \|h\|_{\ast, \sigma})}{(1 + |x|)^{1/2}}.
\]

Now, we write as previously \( \tilde{\Psi}_2 = \tilde{\Psi}_2 - \zeta \), and the system becomes

\[
\begin{cases}
\Delta \Psi_1 - 2\tilde{\Psi}_1 - c\partial_{x_2} \tilde{\Psi}_2 = -\tilde{h}_1 - 2\Re \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\Psi} \right) - \text{Loc}_1(\Psi) - c\partial_{x_2} \zeta - 2(1 - |V|^2) \tilde{\Psi}_1 \\
\Delta \tilde{\Psi}_2 + c\partial_{x_2} \tilde{\Psi}_1 = 0.
\end{cases}
\]

We deduce, as for (2.19), that for \( j \in \{1, 2\} \),

\[
\partial_{x_j} \tilde{\Psi}_2 = cK_j \left( -\tilde{h}_1 - 2\Re \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\Psi} \right) - \text{Loc}_1(\Psi) - c\partial_{x_2} \zeta - 2(1 - |V|^2) \tilde{\Psi}_1 \right).
\]

We check that, with the same computations as in the proof of Lemma 2.10,

\[
|K_j (-\tilde{h}_1 + \text{Loc}_1(\Psi) - c\partial_{x_2} \zeta)| \leq \frac{K(c, R, \sigma, \|\Phi\|_{H_\infty}, \|h\|_{\ast, \sigma})}{(1 + |x|)^{1/2}},
\]

since

\[
|\tilde{h}_1 + \text{Loc}_1(\Psi) - c\partial_{x_2} \zeta| \leq \frac{K(c, R, \sigma, \|\Phi\|_{H_\infty}, \|h\|_{\ast, \sigma})}{(1 + |x|)^{1/2}}.
\]

Furthermore, from Lemma 2.3, outside of \( \{\chi_R = 0\} \), \( |\nabla V| \leq \frac{K(c)}{(1 + r)^2} \). We check, with Theorem 2.9, that on \( \{|x - Y| \leq |x|/2\} \), we have \( |Y| \geq |x|/2 \) and

\[
\int_{\{|x - Y| \leq |x|/2\}} K_j(x - Y) \Re \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\Psi} \right)(Y) dY \leq \frac{K(c, R)}{(1 + |x|)^2} \int_{\{|x - Y| \leq |x|/2\}} \frac{|\nabla \tilde{\Psi}(Y)| dY}{|x - Y|^2(1 + |x - Y|)^{3/2}}.
\]
By Cauchy-Schwarz, we estimate
\[
\int_{\{x - Y| \leq |x|/2\}} \frac{|\nabla \hat{\Psi}(Y)|dY}{|x - Y|^{1/2}(1 + |x - Y|)^{3/2}} \leq \|\nabla \hat{\Psi}\|_{L^2(\mathbb{R}^2)} \sqrt{\int_{\{x - Y| \leq |x|/2\}} \frac{dY}{|x - Y|^{1/2}(1 + |x - Y|)^{3/2}}}
\]
\[
< + \infty,
\]
and in \(|x - Y| \geq |x|/2\), we estimate
\[
\int_{\{|x - Y| \geq |x|/2\}} \left| K_j(x - Y) \Re \left( \frac{\nabla V}{V} \cdot \nabla \hat{\Psi} \right)(Y) \right| \leq \frac{K(c, R)}{(1 + |x|)^2} \int_{\{x - Y| \leq |x|/2\}} \frac{|\nabla \hat{\Psi}|(Y)dY}{(1 + |Y|)^2},
\]
and we conclude by Cauchy-Schwarz that
\[
\int_{\{|x - Y| \geq |x|/2\}} \left| K_j(x - Y) \Re \left( \frac{\nabla V}{V} \cdot \nabla \hat{\Psi} \right)(Y) \right| dY \leq \frac{K(c, R, \|\Phi\|_{H^\infty})}{(1 + |x|)^2}.
\]
Since \(|\hat{\Psi}_1|_{L^2(\mathbb{R}^2)} \leq K(c, R, \|\Phi\|_{H^\infty})\), we estimate similarly
\[
\int_{\mathbb{R}^2} |K_j(x - Y)(1 - |V|^2)\hat{\Psi}_1(Y)|dY \leq \frac{K(c, R, \|\Phi\|_{H^\infty})}{(1 + |x|)^2},
\]
and we conclude that \(|\partial_{x_j} \hat{\Psi}_2| \leq \frac{K(c, R, \|\Phi\|_{H^\infty})}{(1 + |x|)^\sigma}\). Therefore, since \(\hat{\Psi}_2 = \zeta + \hat{\Psi}_2\),
\[
|\nabla \hat{\Psi}_2| \leq \frac{K(c, R, \|\Phi\|_{H^\infty})}{(1 + |x|)^\sigma}.
\]
With this estimate and the equation \(\Delta \hat{\Psi}_1 - 2|V|^2\hat{\Psi}_1 = -\hat{h}_1 - 2\Re \left( \frac{\nabla V}{V} \cdot \nabla \hat{\Psi} \right) + c\partial_{x_2} \hat{\Psi}_2 + \text{Loc}_1(\Psi)\), we check (by Lemma 2.12) that
\[
|\hat{\Psi}_1| + |\nabla \hat{\Psi}_1| \leq \frac{K(c, R, \|\Phi\|_{H^\infty})}{(1 + |x|)^\sigma}
\]
(where the estimation for the term \(\Re \left( \frac{\nabla V}{V} \cdot \nabla \hat{\Psi} \right)\) is similar to what has already been done since we only have \(\nabla \hat{\Psi} \in L^2(\mathbb{R}^2)\)). With this first set of estimates, we have enough to show that
\[
|\Delta \hat{\Psi}_1 - 2\hat{\Psi}_1 - c\partial_{x_2} \hat{\Psi}_2| \leq \frac{K(c, R, \sigma, \|\Phi\|_{H^\infty})}{(1 + |x|)^{1+\sigma}}
\]
and
\[
|\Delta \hat{\Psi}_2 + c\partial_{x_2} \hat{\Psi}_1| \leq \frac{K(c, R, \sigma, \|\Phi\|_{H^\infty})}{(1 + |x|)^{2+\sigma}}.
\]
We can therefore bootstrap our estimates, and in particular show, now following the proof of Proposition 2.16, step 2, that for any \(0 < \sigma' < 1\), taking \(\sigma > \sigma'\),
\[
\|(1 + r)^{1+\sigma'} \nabla \hat{\Psi}_2\|_{L^\infty(\mathbb{R}^2)} + \|(1 + r)^{1+\sigma'} \hat{\Psi}_1\|_{L^\infty(\mathbb{R}^2)} + \|(1 + r)^{1+\sigma'} \nabla \hat{\Psi}_1\|_{L^\infty(\mathbb{R}^2)} < +\infty.
\]
Using these better estimates, \(|h|_{**\gamma(\sigma)} < +\infty\) and Lemma 2.3, we have now
\[
|\Delta \hat{\Psi}_1 - 2\hat{\Psi}_1 - c\partial_{x_2} \hat{\Psi}_2| \leq \frac{K(c, R, \sigma, \|\Phi\|_{H^\infty}, \|h|_{**\gamma(\sigma)})}{(1 + |x|)^2}
\]
and
\[
|\Delta \hat{\Psi}_2 + c\partial_{x_2} \hat{\Psi}_1| \leq \frac{K(c, R, \sigma, \|\Phi\|_{H^\infty}, \|h|_{**\gamma(\sigma)})}{(1 + |x|)^2},
\]

and following the proof of Proposition 2.16, step 2, we deduce
\[ \| (1 + r)^{\alpha} \nabla \tilde{\Psi}_2 \|_{L^\infty(\mathbb{R}^2)} + \| (1 + r)^{\alpha} \tilde{\Psi}_1 \|_{L^\infty(\mathbb{R}^2)} + \| (1 + r)^{\alpha} \nabla \tilde{\Psi}_1 \|_{L^\infty(\mathbb{R}^2)} < +\infty. \]

Finally, since \( \tilde{\Psi}_2(x_1, x_2) = -\tilde{\Psi}_2(x_1, -x_2) \) by the symmetry, we have \( \tilde{\Psi}_2(x_1, 0) = 0 \). For \( x \in \mathbb{R}^2 \), we integrate from \( \{|x|, 0\} \) to \( x \) on the arc \( \{r = |x|\} \), and we have
\[ \| (1 + r)^{\alpha} \tilde{\Psi}_2 \|_{L^\infty(\mathbb{R}^2)} < +\infty, \]
and therefore \( \Phi \in E_* \).

The next step is to construct a solution on a large ball in the space \( H_a \).

**Lemma 2.18** For \( 0 < \alpha < 1 \), there exists \( c_0(\alpha) > 0 \) such that, for \( 0 < c < c_0(\alpha), \) there exists \( a_0(c, \alpha) > \frac{10}{c^2} \) such that, for \( Vh \in E_* \), \( a > a_0(c, \alpha) \), the problem
\[
\begin{align*}
\eta H(\Phi) + (1 - \eta) V L(\Psi) &= Vh \quad \text{in } B(0, a) \\
\Phi &= \Phi = V \Psi, \langle V \Psi, Z_d \rangle = 0; \forall x \in B(0, a), \Phi(x_1, x_2) = \Psi(x_1, -x_2) = \Psi(-x_1, x_2) \\
\Phi &= 0 \quad \text{on } \partial B(0, a) \\
(Vh, Z_d) &= 0
\end{align*}
\]

admits a unique solution, and furthermore, there exists \( K(\sigma, c) > 0 \) independent of \( a \) such that
\[ \| \Phi \|_{H_*} \leq K(\sigma, c) \| h \|_{*, \sigma}. \]

Here, \( a > 10/c^2 \) is not necessary, the condition \( a > 10/c \) should be enough. However, this simplifies some estimates in the proof, and it will be enough for us here. Here, we require \( \langle Vh, Z_d \rangle = 0 \) in order to apply the Fredholm alternative in \( \{ \phi \in H_*^2(B(0, a)), \langle \phi, Z_d \rangle = 0 \} \) to show the existence of a solution.

**Proof** We argue by contradiction on the estimation. Assuming the existence, take any \( 0 < \alpha < 1 \), and choose \( c_0(\alpha) > 0 \) smaller than the one from Proposition 2.16, and \( 0 < c < c_0(\alpha) \). Suppose that there exists a sequence \( a_n > \frac{10}{c^2}, a_n \to \infty \), functions \( \Phi_n \in H_{a_n}, \Phi_n = 0 \) on \( \partial B(0, a_n) \) and \( Vh_n \in E_* \) such that \( \| \Phi_n \|_{H_{a_n}} = 1, \| h_n \|_{*, \sigma} \to 0 \) and \( \eta L(\Phi_n) + (1 - \eta) V L(\Psi_n) = Vh_n \) on \( B(0, a_n) \). In particular, remark here that \( c \) is independent of \( n \), only the size of the ball grows. Our goal is to show that \( \| \Phi_n \|_{H_{a_n}} = o_{n \to \infty}(1) \), which leads to the contradiction.

Following the same arguments as in step 1 of the proof of Proposition 2.16, we check that \( \Phi_n \to \Phi C_1^{\text{loc}}(\mathbb{R}^2) \) and \( \eta L(\Phi) + (1 - \eta) V L(\Psi) = 0 \) in \( \mathbb{R}^2 \). Furthermore, it is easy to check that, since \( \| \Phi_n \|_{H_{a_n}} = 1, \| h_n \|_{*, \sigma} \leq 1 \). Then, by Lemma 2.17, since the orthogonality and the symmetries pass at the limit, this implies that \( \Phi \in E_* \), and therefore, by Proposition 2.16, \( \Phi = 0 \).

We deduce that \( \| \Phi_n \|_{C^1(B(0, 10/c^2))} = o_{n \to \infty}(1) \), where \( o_{n \to \infty}(1) \) is a quantity going to 0 when \( n \to \infty \) at fixed \( c \). Now, we use the same cutoff as in the proof of Lemma 2.17, and we have the system on \( \Psi_n = \Psi_1 + i \Psi_2 \):
\[
\begin{align*}
\Delta \Psi_1 - 2 \Psi_1 - c \partial_{x_2} \Psi_2 &= -\hat{h}_1 - 29\text{Re} \left( \frac{\nabla V \nabla \Psi_n}{V} \right) + \text{Loc}_1(\Psi_n) - 2(1 - |V|^2) \Psi_1 \\
\Delta \Psi_2 + c \partial_{x_2} \Psi_1 &= -\hat{h}_2 - 23\text{Im} \left( \frac{\nabla V \nabla \Psi_n}{V} \right) + \text{Loc}_2(\Psi_n).
\end{align*}
\]

Now, multiplying the first equation by \( \Psi_1 \) and integrating on \( \Omega = B(0, a) \setminus B(0, 5/c^2) \), we have
\[
\int_{\Omega} (\Delta \Psi_1 - 2 \Psi_1) \Psi_1 =
\]
\[
\int_{\Omega} \left( c \partial_{x_2} \Psi_2 - \hat{h}_1 - 29\text{Re} \left( \frac{\nabla V \nabla \Psi_n}{V} \right) + \text{Loc}_1(\Psi_n) - 2(1 - |V|^2) \Psi_1 \right) \Psi_1. \tag{2.22}
\]

We integrate by parts. Recall that \( \| \Phi_n \|_{C^1(B(0, 10/c^2))} = o_{n \to \infty}(1) \) and \( \Phi_n = V \Psi_n = 0 \) on \( \partial B(0, a_n) \), thus
\[
\int_{\Omega} \Delta \Psi_1 \Psi_1 = -\int_{\Omega} |\nabla \Psi_1|^2 + o_{n \to \infty}(1).
\]
Furthermore, since $Vh_n \in \mathcal{E}_*$, we check easily that $\|h_1\|_{L^2(\Omega)} \leq K(\sigma)o_{c \to 0}(1)$, and we compute with Lemma 2.3 and $\|\Phi_n\|_{C^1(B(0,10/c^2))} = o_{n \to \infty}(1)$ that, since for $x \in \Omega, r \geq 5/c^2$, 

$$\left\| \frac{\nabla V}{V} \right\|_{L^\infty(\Omega)} + \|\text{Loc}_1(\Psi_n)\|_{L^\infty(\Omega)} + \|\text{Loc}_2(\Psi_n)\|_{L^\infty(\Omega)} + \|(1 - |V|^2)\|_{L^\infty(\Omega)} \leq o_{c \to 0}(1) + o_{n \to \infty}(1).$$

This allows us to estimate the right hand side of (2.22): by Cauchy-Schwarz,

$$\|\nabla \bar{\Psi}_2\|^2_{L^2(\Omega)} + 2\|\bar{\Psi}_1\|^2_{L^2(\Omega)} \leq c\|\nabla \bar{\Psi}_2\|_{L^2(\Omega)}||\bar{\Psi}_1\|_{L^2(\Omega)} + (o_{c \to 0}(1) + o_{n \to \infty}(1))\|\nabla \bar{\Psi}_2\|_{L^2(\Omega)} + \|\bar{\Psi}_1\|_{L^2(\Omega)} + o_{n \to \infty}(1).$$

Now, we multiply the second equation by $\bar{\Psi}_2$, and we integrate on $\Omega$. By integration by parts, we check

$$\|\nabla \bar{\Psi}_2\|^2_{L^2(\Omega)} \leq c\left| \int_\Omega \partial_{x_2} \bar{\Psi}_1 \bar{\Psi}_2 \right| + \int_\Omega h_2 \bar{\Psi}_2 + 2 \int_\Omega \text{Im}\left( \frac{\nabla V}{V} \nabla \bar{\Psi}_n \right) \bar{\Psi}_2 \right| + \int_\Omega \|\text{Loc}_2(\Psi_n)\|_{L^2(\Omega)} + o_{n \to \infty}(1).$$

By integration by parts, since $\|\Phi_n\|_{C^1(B(0,10/c^2))} = o_{n \to \infty}(1)$ and $\Phi_n = 0$ on $\partial B(0,a_n)$, we have

$$c\left| \int_\Omega \partial_{x_2} \bar{\Psi}_1 \bar{\Psi}_2 \right| \leq o_{n \to \infty}(1) + c\left| \int_\Omega \bar{\Psi}_1 \partial_{x_2} \bar{\Psi}_2 \right| \leq o_{n \to \infty}(1) + c\|\bar{\Psi}_1\|_{L^2(\Omega)}\|\nabla \bar{\Psi}_2\|_{L^2(\Omega)}.$$ 

We recall that $|\bar{\Psi}_2| = o_{n \to \infty}(1)$ on $\partial B(0,5/c^2)$, therefore

$$\int_{r=5/c^2}^{a} \frac{|\bar{\Psi}_2|^2}{r^{2+\sigma}} r dr = -\frac{1}{\sigma} \int_{r=5/c^2}^{a} \partial_r \left( \frac{1}{r^{2+\sigma}} \right) |\bar{\Psi}_2|^2 r dr \leq \frac{K(\sigma)}{\sigma} |\bar{\Psi}_2|^2 |(5/c^2)^{2+\sigma}| + \frac{2}{\sigma} \int_{r=5/c^2}^{a} \frac{1}{r^{2+\sigma}} \|\nabla \bar{\Psi}_2\|_{L^2(\Omega)} |dr| \leq o_{n \to \infty}(1) + \frac{2}{\sigma} \sqrt{\int_{r=5/c^2}^{a} \|\nabla \bar{\Psi}_2\|_{L^2(\Omega)}^2 r^{2+\sigma} r dr.}$$

We deduce that

$$\int_{r=5/c^2}^{a} |\bar{\Psi}_2|^2 r^{2+\sigma} r dr \leq o_{n \to \infty}(1) \frac{K}{\sigma} \int_{r=5/c^2}^{a} |\nabla \bar{\Psi}_2|^2 r dr,$$

and therefore

$$\left| \int_\Omega \frac{|\bar{\Psi}_2|^2}{(1 + |x|)^{2+\sigma}} \right| \leq o_{n \to \infty}(1) + \frac{K}{\sigma} |\nabla \bar{\Psi}_2|_{L^2(\Omega)}^2.$$ 

Since $Vh_n \in \mathcal{E}_*$, we estimate, by Cauchy-Schwarz, that

$$\left| \int_\Omega h_2 \bar{\Psi}_2 \right| \leq o_{c \to 0}(1) \sqrt{\int_\Omega \frac{|\bar{\Psi}_2|^2}{(1 + |x|)^{2+\sigma}}} \leq \frac{o_{c \to 0}(1)}{\|\nabla \bar{\Psi}_2\|_{L^2(\Omega)}} + o_{n \to \infty}(1).$$

Furthermore, since $\text{Loc}_2(\Psi_n)$ is supported in $B(0,10/c^2)$ and $\|\Phi_n\|_{C^1(B(0,10/c^2))} = o_{n \to \infty}(1)$, we check that

$$\int_\Omega \|\text{Loc}_2(\Psi_n)\|_{L^2(\Omega)} \leq o_{n \to \infty}(1).$$

Finally, from Lemma 2.2, we check that, in $\mathbb{R}^2$,

$$\left| \frac{\nabla V}{V} \right| \leq K \left( \frac{y^+}{|y|^2} - \frac{z^+}{|z|^2} \right) + \frac{K}{c(1 + |x|^2)} \leq \frac{K}{c(1 + |x|^2)}.$$ 

34
and thus, by Cauchy-Schwarz,
\[
\int_{\Omega} \left| \Im \left( \frac{\nabla V}{V}, \nabla \tilde{\Psi}_2 \right) \right| \leq \| \nabla \tilde{\Psi}_n \|_{L^2(\Omega)} \sqrt{\int_{\Omega} \left| \frac{\nabla V}{V} \right|^2} \leq \frac{K \| \nabla \tilde{\Psi}_n \|_{L^2(\Omega)}}{c} \sqrt{\int_{\Omega} \frac{|\tilde{\Psi}_2|^2}{(1+|x|)^4}}.
\]

In $\Omega$, $|x| \geq 5/c^2$, thus
\[
\int_{\Omega} \frac{|\tilde{\Psi}_2|^2}{(1+|x|)^4} \leq c^{2(2-\sigma)} \int_{\Omega} \frac{|\tilde{\Psi}_2|^2}{(1+|x|)^{2+\sigma}} \leq c^{2(2-\sigma)} K(\sigma) \| \nabla \tilde{\Psi}_2 \|_{L^2(\Omega)}^2 + o_{n \to \infty}(1),
\]
hence
\[
\int_{\Omega} \left| \Im \left( \frac{\nabla V}{V}, \nabla \tilde{\Psi}_n \right) \right| \leq o_{c \to 0}(1) \| \nabla \tilde{\Psi}_2 \|_{L^2(\Omega)} + o_{n \to \infty}(1).
\]
We conclude that
\[
\| \nabla \tilde{\Psi}_1 \|_{L^2(\Omega)}^2 + 2 \| \tilde{\Psi}_1 \|_{L^2(\Omega)}^2 \leq c \| \nabla \tilde{\Psi}_2 \|_{L^2(\Omega)} \| \tilde{\Psi}_1 \|_{L^2(\Omega)} + (o_{c \to 0}(1) + o_{n \to \infty}(1)) \| \nabla \tilde{\Psi}_n \|_{L^2(\Omega)} + \| \tilde{\Psi}_1 \|_{L^2(\Omega)} + o_{n \to \infty}(1),
\]
and
\[
\| \nabla \tilde{\Psi}_2 \|_{L^2(\Omega)}^2 \leq o_{n \to \infty}(1) + c \| \tilde{\Psi}_1 \|_{L^2(\Omega)} \| \nabla \tilde{\Psi}_2 \|_{L^2(\Omega)} + o_{c \to 0}(1) \| \nabla \tilde{\Psi}_2 \|_{L^2(\Omega)},
\]
therefore
\[
\| \nabla \tilde{\Psi}_1 \|_{L^2(\Omega)} + \| \tilde{\Psi}_1 \|_{L^2(\Omega)} + \| \nabla \tilde{\Psi}_2 \|_{L^2(\Omega)} \leq o_{n \to \infty}(1) + o_{c \to 0}(1).
\]
We have shown that for any $\sigma > 0$,
\[
\left| \int_{\Omega} \frac{|\tilde{\Psi}_2|^2}{(1+|x|)^{2+\sigma}} \right| \leq \left( o_{n \to \infty}(1) + \frac{K \sigma}{c} \right) \| \nabla \tilde{\Psi}_2 \|_{L^2(\Omega)}^2 ,
\]
thus
\[
\left| \int_{\Omega} \frac{|\tilde{\Psi}_2|^2}{(1+|x|)^{5/2}} \right| \leq o_{n \to \infty}(1) + o_{c \to 0}(1).
\]
Together with $\| \Phi_n \|_{C^1(B(0,1/c^2))} = o_{n \to \infty}(1)$, this is in contradiction with $\| \Phi_n \|_{H_n} = 1$.

This concludes the proof of the estimation. Now, for the existence, we argue by Fredholm’s alternative in $\{ \varphi \in H_0^1(B(0,a)), \langle \varphi, Z_d \rangle = 0 \}$, and we remark that the norms $\| \cdot \|_{H_n}$ and $\| \cdot \|_{H_0}$ are equivalent on $B(0,a)$. By Riesz’s representation theorem, the elliptic equation $\eta L(\Phi) + (1-\eta) V L'(\Psi) = V h$ can be rewritten in the operational form $\Phi + K(\Phi) = S(h)$ where $K$ is a compact operator in $H_0^1(B(0,a))$, and it has no kernel in $H_n$ (i.e. in $\{ \varphi \in H_0^1(B(0,a)), \langle \varphi, Z_d \rangle = 0 \}$) by the estimation we just showed. Therefore, there exists a unique solution $\Phi \in H_n$, and it then satisfies
\[
\| \Phi \|_{H_n} \leq K(\sigma, c) \| h \|_{*,\sigma}.
\]
\[\Box\]

**Proposition 2.19** Consider the problem
\[
\begin{cases}
\eta L(\Phi) + (1-\eta) V L'(\Psi) = V h \\
V h \in \mathcal{E}_\sigma \iff \langle V h, Z_d \rangle = 0.
\end{cases}
\]

Then, there exist constants $c_0(\sigma) > 0$ small and $C(\sigma) > 0$ depending only on $\sigma$, such that, for $0 < c \leq c_0(\sigma)$ and $V h \in \mathcal{E}_\sigma$ with $\langle V h, Z_d \rangle = 0$, there exists $\Phi \in \mathcal{E}_\sigma$, $\Phi = V \Psi$ solution of this problem, with
\[
\| \Psi \|_{*,\sigma,d} \leq C(\sigma)(\| h \|_{*,\sigma,d} + c^{1-\sigma} \| h \|_{*,\gamma(\sigma),d}).
\]
Proof By Lemma 2.18, for \( a > a_0(c, \sigma) \), there exists a solution to the problem

\[
\begin{align*}
\eta L(\Phi_a) + (1 - \eta)VL'(\Psi_a) &= Vh \quad \text{on } B(0, a) \\
\Phi_a &\in H_\alpha, \Phi_a = V \Psi_a, (V \Psi_a, Z_d) = 0 \quad \forall x \in B(0, a), \Psi_a(x_1, x_2) = \Psi_a(x_1, -x_2) = \Psi(-x_1, x_2) \\
\Phi_a &= 0 \quad \text{on } \partial B(0, a) \\
\langle h, Z_d \rangle &= 0
\end{align*}
\]

with \( \|\Phi_a\|_{H_n} \leq K(\sigma, c)\|h\|_{*,\sigma} \).

Taking a sequence of values \( a_n > a_0 \) going to infinity, we can construct by a diagonal argument a function \( \Phi \in H^1_{loc}(\mathbb{R}^2) \) which satisfies in the distribution sense

\[
\eta L(\Phi) + (1 - \eta)VL'(\Phi) = Vh
\]

(hence \( \Phi \in C^1(\mathbb{R}^2) \) by standard elliptic arguments), such that

\[
\|\Phi\|_{H^\infty} \leq \limsup_{n \to \infty} \|\Phi_n\|_{H_{a_n}} \leq K(\sigma, c)\|h\|_{*,\sigma},
\]

thus \( \Phi \in H^\infty \), and \( \Phi = V \Psi, (V \Psi, Z_d) = 0; \forall x \in \mathbb{R}^2, \Psi(x_1, x_2) = \Psi(-x_1, x_2) \). From Lemma 2.17, we deduce that \( \Phi \in \mathcal{E}_\ast \), and is thus a solution to the problem. Furthermore, by Proposition 2.16, \( \|\Psi\|_{*,\sigma,d} \leq C(\sigma)(\|h\|_{*,\sigma,d} + c^{1-\sigma}\|h\|_{*,\gamma(\sigma),d}) \). Still by Proposition 2.16, this solution is unique in \( \mathcal{E}_\ast \). \( \square \)

2.5.3 Estimates for the contraction in the orthogonal space

We showed in Proposition 2.19 that the operator \( \eta L(.) + (1 - \eta)VL'(. / V) \) is invertible from \( \mathcal{E}_{*,\sigma,d} \cap \{., Z_d \} = 0 \) to \( \mathcal{E}_{*,\sigma,d} \). The operator \( \eta L(.) + (1 - \eta)VL'(. / V)^{-1} \) is the one that, for a given \( Vh \in \mathcal{E}_{*,\sigma,d} \) such that \( \langle Vh, Z_d \rangle = 0 \), returns the unique function \( \Phi = V \Psi \in \mathcal{E}_{*,\sigma,d} \) such that \( \eta L(\Phi) + (1 - \eta)VL'(\Psi) = Vh \) in the distribution sense, and this function satisfies the estimate \( \|\Psi\|_{*,\sigma,d} \leq C(\sigma)(\|h\|_{*,\sigma,d} + c^{1-\sigma}\|h\|_{*,\gamma(\sigma),d}) \).

Now, we define (for \( \Phi \in C^0(\mathbb{R}^2) \))

\[
\Pi_d^\perp(\Phi) := \Phi - \langle \Phi, Z_d \rangle \frac{Z_d}{\|Z_d\|^2_{L^2(\mathbb{R}^2)}},
\]

the projection on the orthogonal of \( Z_d \). We want to apply a fixed-point theorem on the functional

\[
(\eta L(.) + (1 - \eta)VL'(. / V)^{-1}(\Pi_d^\perp(-F(\cdot / V)))) : \mathcal{E}_\ast \to \mathcal{E}_\ast,
\]

and for that we need some estimates on the function \( \Pi_d^\perp o F(\cdot / V) : \mathcal{E}_\ast \to \{Vh \in \mathcal{E}_{*,\sigma}, \langle Vh, Z_d \rangle = 0 \} \). The function \( F \) contains the source term \( E - icd\xi_3 V \) and nonlinear terms. The source term requires a precise computation (see Lemma 2.21) to show its smallness in the spaces of invertibility. The nonlinear terms will be small if we do the contraction in an area with small \( \Psi \) (which is the case since we will do it in the space of function \( \Phi = V \Psi \in \mathcal{E}_\ast \) such that \( \|\Psi\|_{*,\sigma,d} \leq K_0(\sigma)c_1\sigma \) for a well chosen constant \( K_0(\sigma) \)). This subsection is devoted to the proof of the following result.

Proposition 2.20 For \( 0 < \sigma < 1 \), there exist constants \( K_0(\sigma), c_0(\sigma) > 0 \) depending only on \( \sigma \) such that for \( 0 < c < c_0(\sigma) \), the function (from \( \mathcal{E}_{*,\sigma,d} \) to \( \mathcal{E}_{*,\sigma,d} \))

\[
\Phi \mapsto (\eta L(.) + (1 - \eta)VL'(. / V)^{-1}(\Pi_d^\perp(-F(\Phi / V))))
\]

is a contraction in the space of functions \( \Phi \in \mathcal{E}_{*,\sigma,d} \) such that \( \|\Psi\|_{*,\sigma,d} \leq K_0(\sigma)c^{1-\sigma} \). As such, by the contraction mapping theorem, it admits a unique fixed point \( \Phi \in \mathcal{E}_{*,\sigma,d} \) in \( \{\Phi \in \mathcal{E}_{*,\sigma,d}, \|\Psi\|_{*,\sigma,d} \leq K_0(\sigma)c^{1-\sigma}\} \), and there exists \( \lambda(c, d) \in \mathbb{R} \) such that

\[
\eta L(\Phi) + (1 - \eta)VL'(\Phi) + F(\Psi) = \lambda(c, d)Z_d
\]

in the distribution sense.

We recall that, from the definition of \( \mathcal{E}_{*,\sigma,d} \) in subsection 2.3, \( \Phi \in \mathcal{E}_{*,\sigma,d} \) implies that \( \langle \Phi, Z_d \rangle = 0 \), which is the origin of the fact that \( \eta L(\Phi) + (1 - \eta)VL'(\Phi) + F(\Psi) \) is not zero, but only proportional to \( Z_d \).

We start with some estimates on the terms contained in \( F(\Psi) \). These are done in the following three lemmas.
Lemma 2.21 For $0 < \sigma < 1$, there exists a constant $C_1(\sigma) > 0$ depending only on $\sigma$ such that

$$\left\| \frac{ic\partial_x V}{V} \right\|_{**,\sigma,d} + \left\| E \right\|_{**,\sigma,d} \leq C_1(\sigma)c^{1-\sigma}$$

and

$$\left\| \frac{ic\partial_x V}{V} \right\|_{**,\gamma(\sigma),d} + \left\| E \right\|_{**,\gamma(\sigma),d} \leq C_1(\sigma).$$

Proof We have defined the norms

$$\| h \|_{**,\sigma,d} = \| Vh \|_{C^0(\{ r \lesssim 3 \})} + \| \bar{r}^{1+\sigma} h_1 \|_{L^\infty(\{ \bar{r} \gtrsim 2 \})} + \| \bar{r}^{2+\sigma} h_2 \|_{L^\infty(\{ \bar{r} \gtrsim 2 \})}$$

and

$$\| h \|_{**,\gamma(\sigma),d} = \| Vh \|_{C^0(\{ r \lesssim 3 \})} + \| \bar{r}^{1+\gamma(\sigma)} h_1 \|_{L^\infty(\{ \bar{r} \gtrsim 2 \})} + \| \bar{r}^{2+\gamma(\sigma)} h_2 \|_{L^\infty(\{ \bar{r} \gtrsim 2 \})},$$

thus we separate two areas for the computation: the first one is where $\bar{r} \lesssim 3$ which will be easy and then far from the vortices, i.e. in $\{ \bar{r} \gtrsim 2 \}$, where the division by $V$ is not a problem. We will show the estimate only on $\| h \|_{**,\sigma,d}$ for any $0 < \sigma < 1$. Applied to $\gamma(\sigma)$ instead of $\sigma$, it yields the second estimate with some margin.

Step 1. Estimates for $E$.

In (2.2), we showed that

$$E = (1 - |V_1|^2)(1 - |V_{-1}|^2)V_1 V_{-1} - 2\nabla V_1 \nabla V_{-1}.$$ 

Near $V_1$, i.e. in $B(d\bar{r}_1^2, 3)$, we have from Lemma 2.1,

$$\| (1 - |V_1|^2) \|_{L^\infty(\{ r_1 \lesssim 3 \})} \leq Kc^2 \quad \text{and} \quad \| \nabla V_{-1} \|_{L^\infty(\{ r_1 \lesssim 3 \})} \leq Kc,$$

hence

$$\left\| E \right\|_{C^0(\{ r_1 \lesssim 3 \})} \leq Kc \leq o_{c \rightarrow 0}(1)c^{1-\sigma}. \quad (2.23)$$

By symmetry, the result holds in the area where $\bar{r} \lesssim 3$.

We now turn to the estimates for $\bar{r} \gtrsim 2$. The first term $(1 - |V_1|^2)(1 - |V_{-1}|^2)$ of $E$ is real valued. Using the definition of $r_1$ and $r_{-1}$ from (2.1), in the right half-plane, where $r_1 \lesssim r_{-1}$ and $r_{-1} \geq d \geq K$, we have from Lemma 2.1

$$\| r_1^{1+\sigma}(1 - |V_1|^2)(1 - |V_{-1}|^2) \|_{L^\infty(\{ 2 \lesssim r_1 \lesssim r_{-1} \})} \leq K \left\| \frac{1}{r_1^{1-\sigma}} \frac{1}{r_{-1}^{2}} \right\|_{L^\infty(\{ 2 \lesssim r_1 \lesssim r_{-1} \})}$$

and

$$\| r_1^{1+\sigma}(1 - |V_1|^2)(1 - |V_{-1}|^2) \|_{L^\infty(\{ 2 \lesssim r_1 \lesssim r_{-1} \})} \leq K.$$ 

In this area, $\frac{1}{r_{-1}} \leq Kc^2$ and $\frac{1}{r_1^{1-\sigma}} \leq \frac{1}{2^{1-\sigma}}$, thus

$$\| r_1^{1+\sigma}(1 - |V_1|^2)(1 - |V_{-1}|^2) \|_{L^\infty(\{ 2 \lesssim r_1 \lesssim r_{-1} \})} \leq Kc^2 \leq o_{c \rightarrow 0}(1)c^{1-\sigma}.$$ 

By symmetry, the same result holds for the other half-plane, hence

$$\| \bar{r}^{1+\sigma}(1 - |V_1|^2)(1 - |V_{-1}|^2) \|_{L^\infty(\{ \bar{r} \gtrsim 2 \})} \leq o_{c \rightarrow 0}(1)c^{1-\sigma}. \quad (2.24)$$

From Lemma 2.1, we have

$$\nabla V_\varepsilon(x) = i\varepsilon V_\varepsilon(x) \frac{x_1}{r^2} + O \left( \frac{1}{r^3} \right),$$

hence

$$\nabla V_1 V_{-1} \frac{\nabla V_{-1}}{V_1 V_{-1}} = \frac{y_1 \cdot z_1}{r_1^2 r_{-1}^2} + O \left( \frac{1}{r_1^3 r_{-1}} \right) + O \left( \frac{1}{r_1^2 r_{-1}^3} \right).$$
Remark that the first term is real-valued. We compute first in the right half-plane, where \( r_1 \leq r_{-1} \) and \( r_{-1} \geq d \geq \frac{K}{c_2} \),

\[
\left\| \frac{r_1^{1+\sigma} y^2 \frac{z^2}{r_1^2}}{r_1^{1+\sigma}} \right\|_{L^\infty(\{2 \leq r_1 \leq r_{-1}\})} \leq \left\| \frac{r_1^{1+\sigma}}{r_1 r_{-1}} \right\|_{L^\infty(\{2 \leq r_1 \leq r_{-1}\})}.
\]

Since

\[
\frac{r_1^{1+\sigma}}{r_1 r_{-1}} = \left( \frac{r_1}{r_{-1}} \right)^{\sigma} \frac{1}{r_{-1}^{1-\sigma}} \leq K c^{1-\sigma}
\]

for a universal constant \( K \), we deduce

\[
\left\| \frac{r_1^{1+\sigma} y^2 \frac{z^2}{r_1^2}}{r_1^{1+\sigma}} \right\|_{L^\infty(\{2 \leq r_1 \leq r_{-1}\})} \leq K c^{1-\sigma}
\]

and by symmetry,

\[
\left\| \frac{r_{-1}^{1+\sigma} y^2 \frac{z^2}{r_{-1}^2}}{r_{-1}^{1+\sigma}} \right\|_{L^\infty(\{r_{-1} \geq 2\})} \leq K c^{1-\sigma}.
\] (2.25)

For the last two terms \( O \left( \frac{1}{r_1 r_{-1}} \right) + O \left( \frac{1}{r_{-1} r_1} \right) \), we will show that in the right half-plane

\[
\left\| \frac{r_1^{2+\sigma}}{r_1^{3 r_{-1}}} \right\|_{L^\infty(\{2 \leq r_1 \leq r_{-1}\})} + \left\| \frac{r_{-1}^{2+\sigma}}{r_{-1}^{3 r_1}} \right\|_{L^\infty(\{2 \leq r_1 \leq r_{-1}\})} \leq o_{c \to 0}(1)c^{1-\sigma}.
\] (2.26)

This immediately implies

\[
\left\| \frac{r_1^{1+\sigma}}{r_1^{3 r_{-1}}} \right\|_{L^\infty(\{2 \leq r_1 \leq r_{-1}\})} + \left\| \frac{r_{-1}^{1+\sigma}}{r_{-1}^{3 r_1}} \right\|_{L^\infty(\{2 \leq r_1 \leq r_{-1}\})} \leq o_{c \to 0}(1)c^{1-\sigma}.
\] (2.27)

We compute in the right half-plane where \( r_1 \leq r_{-1} \) and \( r_{-1} \geq d \geq \frac{K}{c_2} \), \( \frac{1}{r_{-1}} \leq K c \) and \( \frac{1}{r_1} \leq K \) for a universal constant \( K \), thus

\[
r_1^{2+\sigma} \frac{1}{r_1^{3 r_{-1}}} = \frac{1}{r_1^{1-\sigma} r_{-1}} \leq K c \leq o_{c \to 0}(1)c^{1-\sigma}.
\]

Furthermore, still in the right half-plane,

\[
r_1^{2+\sigma} \frac{1}{r_1^{3 r_{-1}}} = \left( \frac{r_1}{r_{-1}} \right)^{1+\sigma} \frac{1}{r_1^{2-\sigma}} \leq K c^{2-\sigma} \leq o_{c \to 0}(1)c^{1-\sigma}.
\]

Gathering (2.26), (2.27) and using the symmetry for the left half-plane, we deduce with the previous estimates (2.23), (2.24), (2.25) that for any \( 0 < \sigma < 1 \), we can find \( C'_i(\sigma) > 0 \) such that

\[
\left\| \frac{E}{V} \right\|_{\text{**}, \sigma, d} \leq C'_i(\sigma)c^{1-\sigma}.
\]

Step 2. Estimates for \( ic \frac{\partial_{z^2} V}{V} \).

First, near the vortices, we have \( |\partial_{z^2} V| \leq K \) a universal constant, therefore

\[
\left\| ic \frac{\partial_{z^2} V}{V} \right\|_{C^0(\{|\tilde{r}| \geq 3\})} \leq K c \leq o_{c \to 0}(1)c^{1-\sigma}.
\]

We now turn to the estimate for \( \tilde{r} \geq 2 \). Recall Lemma 2.5, stating that for a universal constant \( C > 0 \), since \( r_1, r_{-1} \geq 2 \),

\[
\left| ic \frac{\partial_{z^2} V}{V} - 2 c d \frac{x_1^2 - d^2 - x_2^2}{r_1^2 r_{-1}^2} \right| \leq C \left( \frac{c}{r_1} + \frac{c}{r_{-1}} \right).
\]
Remark that $2cd\frac{x_1^2 - d^2 - x_2^2}{r_1}^2$ is real-valued. Using that $cd \leq 2$, that

$$|x_1^2 - d^2| = |(x_1 - d)(x_1 + d)| \leq r_1 r_1$$

and also that $x_2^2 \leq r_1 r_1$, we deduce that in the right half-plane, where $r_1 \leq r_1$ and $r_1 > d > \frac{K}{c}$,

$$\left\|1 + \sigma \frac{2cdx_1^2 - d^2 - x_2^2}{r_1}^2 \right\|_{L^\infty((2 \leq r_1 \leq r_1))} \leq K \frac{r_1^{\frac{r_1}{r_1}}}{r_1^{r_1}} \frac{1}{r_1^{r_1}} \leq Kc^{-\sigma},$$

and since we have

$$\frac{r_1^{\frac{r_1}{r_1}}}{r_1^{r_1}} = \left(\frac{r_1}{r_1}ight) \frac{1}{r_1^{r_1}} \leq Kc^{-\sigma},$$

we infer

$$\left\|2r_1^{\frac{r_1}{r_1}} \frac{2cdx_1^2 - d^2 - x_2^2}{r_1^{r_1}} \right\|_{L^\infty((2 \leq r_1 \leq r_1))} \leq Kc^{-\sigma}$$

for some universal constant $K > 0$. It is easy to check that in the right half-plane

$$r_1^{\frac{r_1}{r_1}} \left(\frac{c}{r_1} + \frac{c}{r_1}ight) \leq Kc \leq o_{c \to 0}(1)c^{-1},$$

and therefore by symmetry for the left half-plane, there exists $C_1''(\sigma) > 0$ such that

$$\left\|\frac{ic\partial V}{\Phi} \right\|_{+,\sigma,d} \leq C_1''(\sigma)c^{-\sigma}.$$

We conclude by taking $C_1(\sigma) = \max(C_1'(\sigma), C_1''(\sigma))$ and $C_1 = \max(C_1', C_1'')$. 

\textbf{Lemma 2.22} For $0 < \sigma < 1$, for $\Phi = V\Psi, \Phi' = V\Psi' \in E_{*,\sigma,d}$ such that $\left\|\Psi\right\|_{*,\sigma,d}, \left\|\Psi'\right\|_{*,\sigma,d} \leq C_0$ with $C_0$ defined in Lemma 2.7, if there exists $K(\sigma) > 0$ such that $\left\|\Psi\right\|_{*,\sigma,d}, \left\|\Psi'\right\|_{*,\sigma,d} \leq K(\sigma)c^{-\sigma}$, we have

$$\left\|\frac{R(\Psi)}{V} \right\|_{*,\sigma,d} \leq o_{c \to 0}(1)c^{-\sigma}$$

and

$$\left\|\frac{R(\Psi') - R(\Psi)}{V} \right\|_{*,\sigma,d} \leq o_{c \to 0}(1)||\Psi' - \Psi||_{*,\sigma,d},$$

where the $o_{c \to 0}(1)$ depends on $\sigma$.

Since $R(\Psi)$ is compactly supported in $\eta \neq 0$, this lemma implies in particular that there exists a constant $C_2(\sigma) > 0$ such that

$$\left\|\frac{R(\Psi)}{V} \right\|_{*,\sigma,\gamma(\sigma),d} \leq C_2(\sigma).$$

Furthermore, we want to highlight the fact that the $o_{c \to 0}(1)$ are not uniform in $\sigma$.

\textbf{Proof} Since $\eta \neq 0$ only in the domain where $\left\|\right\|_{*,\sigma,d} = \left\|V\right\|_{C^0(\{r \leq 3\})}$ and $\left\|\right\|_{*,\sigma,d} = \left\|V\right\|_{C^1(\{r \leq 3\})}$, we will work only with these two norms. Recall from Lemma 2.7 that $R(\Psi)$ is supported in $\{\eta \neq 0\}$ and

$$\left\|R(\Psi)\right\| \leq K\left\|\Phi\right\|_{C^1(\{r \leq 3\})}^2$$

since $\left\|\Psi\right\|_{*,\sigma,d} \leq C_0$. We deduce

$$\left\|\frac{R(\Psi)}{V} \right\|_{*,\sigma,d} = \left\|R(\Psi)\right\|_{C^0(\{r \leq 3\})} \leq K(\sigma)c^{2-2\sigma} \leq o_{c \to 0}(1)c^{-\sigma}.$$
Furthermore, using the definition of $R(Ψ)$ in the proof of Lemma 2.7 we check that every term is at least quadratic in $Ψ$ (or its real or imaginary part), therefore $R(Ψ′) − R(Ψ)$ can be estimated by

$$\left\| \frac{R(Ψ′) − R(Ψ)}{V} \right\|_{*,σ,d} = \left\| R(Ψ′) − R(Ψ) \right\|_{C^0(\{r \leq 3\})} \leq o_{c→0}(1)\left\| Ψ′ − Ψ \right\|_{*,σ,d}. $$

\[\square\]

**Lemma 2.23** For $0 < σ < 1$, for $Ψ = VΨ, Ψ′ = VΨ′ ∈ E_{*,σ,d}$ such that $\left\| Ψ \right\|_{*,σ,d}, \left\| Ψ′ \right\|_{*,σ,d} ≤ C_0$ with $C_0$ defined in Lemma 2.7, if there exists $K(σ) > 0$ such that $\left\| Ψ \right\|_{*,σ,d}, \left\| Ψ′ \right\|_{*,σ,d} ≤ K(σ)c^{1−σ}$, we have

$$\left\| (1−η)(−∇Ψ.∇Ψ + |V|^2S(Ψ)) \right\|_{*,σ,d} ≤ o_{c→0}(1)c^{1−σ},$$

$$\left\| (1−η)(−∇Ψ′.∇Ψ′ + ∇Ψ.∇Ψ + |V|^2(S(Ψ′) − S(Ψ))) \right\|_{*,σ,d} ≤ o_{c→0}(1)\left\| Ψ′ − Ψ \right\|_{*,σ,d}.$$ 

**Furthermore, there exists a constant $C_3(σ) > 0$ such that**

$$\left\| (1−η)(−∇Ψ.∇Ψ + |V|^2S(Ψ)) \right\|_{*,γ(σ),d} ≤ C_3(σ).$$

**Proof** As done in Lemma 2.22, we check easily that

$$\left\| (1−η)(−∇Ψ.∇Ψ + |V|^2S(Ψ))V \right\|_{C^0(\{r \leq 3\})} \leq o_{c→0}(1)c^{1−σ}\left\| Ψ \right\|_{C^1(\{r \leq 3\})},$$

since in the area where $(1−η) ≠ 0, C_1 ≤ |V| ≤ 1$ for a universal constant $C_1 > 0, Ψ = VΨ$ and for the nonlinear terms using $\left\| VΨ \right\|_{C^1(\{r \leq 3\})} ≤ K(σ)c^{1−σ}$.

We then look at

$$\left\| \tilde{r}^{1+2σ}2\Re(-∇Ψ.∇Ψ + |V|^2S(Ψ)) \right\|_{L^∞(\{r ≥ 2\})}$$

and

$$\left\| \tilde{r}^{2+2σ}2\Im(-∇Ψ.∇Ψ + |V|^2S(Ψ)) \right\|_{L^∞(\{r ≥ 2\})}.$$ 

**Concerning the term $∇Ψ.∇Ψ$**, remark that for $r ≥ 2$,

$$|r^{2+2σ}∇Ψ.∇Ψ| \leq \left\| Ψ \right\|^{2}_{*,σ,d},$$

since

$$\left\| r^{1+σ}∇Ψ \right\| \leq \left\| Ψ \right\|_{*,σ,d}.$$ 

Finally, recall that

$$S(Ψ) = e^{2\Re(Ψ)} − 1 − 2\Re(Ψ).$$

Moreover, $e^{2\Re(Ψ)} − 1 − 2\Re(Ψ)$ is real valued and for $r ≥ 2$, if $\left\| Ψ \right\|_{*,σ,d} ≤ C_0$,

$$\left\| \tilde{r}^{2+2σ}(e^{2\Re(Ψ)} − 1 − 2\Re(Ψ)) \right\| \leq K\left\| Ψ \right\|^{2}_{*,σ,d},$$

thus

$$\left\| −∇Ψ.∇Ψ + |V|^2S(Ψ) \right\|_{*,γ(σ),d} \leq \left\| −∇Ψ.∇Ψ + |V|^2S(Ψ) \right\|_{*,σ,d} ≤ K\left\| Ψ \right\|^{2}_{*,σ,d}.$$ 

We deduce from this inequality that $\left\| (1−η)(−∇Ψ.∇Ψ + |V|^2S(Ψ)) \right\|_{*,σ,d} ≤ o_{c→0}(1)c^{1−σ}$ and

$$\left\| (1−η)(−∇Ψ′.∇Ψ′ + ∇Ψ.∇Ψ + |V|^2(S(Ψ′) − S(Ψ))) \right\|_{*,σ,d} ≤ o_{c→0}(1)\left\| Ψ′ − Ψ \right\|_{*,σ,d}.$$ 

\[\square\]

Now, we end the proof of Proposition 2.20.

**Proof** [of Proposition 2.20] We take the constants $C(σ)$ defined in Proposition 2.16 and $C_1(σ)$ from Lemma 2.21. We then define $K_0(σ) := C(σ)(C_1(σ) + 1)$. 

40
To apply the contraction mapping theorem, we need to show that for \( \Phi = V\Psi, \Phi' = V\Psi' \in \mathcal{E}_{*, \sigma, d} \) with
\[
\|\Phi\|_{*, \sigma, d}, \|\Phi'\|_{*, \sigma, d} \leq K_0(\sigma)c^{1-\sigma},
\]
we have for small \( c > 0 \)
\[
\left\| \frac{F(\Phi)}{V} \right\|_{s, \gamma(\sigma), d} \leq C_1(\sigma) + C_2(\sigma) + C_3(\sigma),
\]
\[
\left\| \frac{F(\Phi)}{V} \right\|_{s, \sigma, d} \leq \frac{K_0(\sigma)}{C(\sigma)}c^{1-\sigma}
\]
(2.28)
and
\[
\left\| \frac{F(\Phi') - F(\Phi)}{V} \right\|_{s, \sigma, d} \leq o_c^\sigma(1)\|\Psi' - \Psi\|_{*, \sigma, d}.
\]
(2.29)
If these estimates hold, using Proposition 2.16, we have that the closed ball \( B_{\|\cdot\|_{*, \sigma, d}} (0, K_0(\sigma)c^{1-\sigma}) \) is stable by \( \Phi \mapsto V(\eta L(V) + (1 - \eta)V L'(\cdot/ V))^{-1}(\Pi_{d}^{\tau}(-F(\Phi/V))) \) and this operator is a contraction in the ball (for \( c \) small enough, depending on \( \sigma \)), hence we can apply the contraction mapping theorem.

From Lemma 2.7, we have
\[
F(\Psi) = E - ic\partial_{x}V + V(1 - \eta)(-\nabla\Psi, \nabla\Psi + |V|^2 S(\Psi)) + R(\Psi).
\]
By Lemmas 2.21 to 2.23, we check that the estimate on \( \left\| \frac{F(\Phi)}{V} \right\|_{s, \gamma(\sigma), d} \) holds, and that we have, given that \( c \) is small enough (depending only on \( \sigma \)), that both (2.28) and (2.29) hold. Therefore, defining \( c_0(\sigma) > 0 \) small enough such that all the required conditions on \( c \) are satisfied if \( c < c_0(\sigma) \), we end the proof of Proposition 2.20.

We have therefore constructed a function \( \Phi = V\Psi \in \mathcal{E}_{*, \sigma, d} \) such that
\[
\Phi = (\eta L(V) + (1 - \eta)V L'(\cdot/ V))^{-1}(\Pi_{d}^{\tau}(-F(\Phi/V))).
\]
Therefore, by definition of the operator \( (\eta L(V) + (1 - \eta)V L'(\cdot/ V))^{-1} \), we have, in the distribution sense,
\[
\eta L(\Phi) + (1 - \eta)V L'(\Psi) = \Pi_{d}^{\tau}(-F(\Phi/V)),
\]
and thus, there exists \( \lambda(c, d) \in \mathbb{R} \) such that
\[
\eta L(\Phi) + (1 - \eta)V L'(\Psi) + F(\Phi) = \lambda(c, d)Z_d.
\]
\( \square \)

At this point, we have the existence of a function \( \Phi = V\Psi \in \mathcal{E}_{*, \sigma, d} \) depending on \( c, d \) and a priori \( \sigma \), such that
\[
\|\Psi\|_{*, \sigma, d} \leq K(\sigma)c^{1-\sigma}
\]
and
\[
\eta L(\Phi) + (1 - \eta)V L'(\Psi) + F(\Phi) = \lambda(c, d)Z_d
\]
(2.30)
in the distribution sense for some \( \lambda(c, d) \in \mathbb{R} \). By using elliptic regularity, we show easily that \( \Phi \in C^\infty(\mathbb{R}^2, \mathcal{C}) \) and that (2.30) is verified in the strong sense. The goal is now to show that we can take \( \lambda(c, d) = 0 \) for a good choice of \( d \), but first we need a better estimate on \( \Phi \) using the parameter \( \sigma \). We denote by \( \Psi_\sigma \) the solution obtained by Proposition 2.20 for the value \( \sigma \).

**Corollary 2.24** For \( 0 < \sigma_1, \sigma_2 < 1 \), there exists \( c_0(\sigma_1, \sigma_2) > 0 \) such that for \( 0 < c < c_0(\sigma_1, \sigma_2) \), \( \Psi_\sigma_1 = \Psi_\sigma_2 \). We can thus take any value of \( \sigma \) and the estimate
\[
\|\Psi\|_{*, \sigma, d} \leq K(\sigma)c^{1-\sigma}
\]
holds for \( 0 < c < c_0(\sigma) \). In particular, for \( c \) small enough,
\[
\|\Phi\|_{C^1(\mathcal{F} \in \mathcal{C})} \leq Kc^{3/4}.
\]
**Proof** This is because for \( \sigma < \sigma', \mathcal{E}_{*, \sigma'} \subset \mathcal{E}_{*, \sigma} \) hence the fixed point for \( \sigma' \) yields the same value of \( \Psi \) as the fixed point for \( \sigma \) for \( c \) small enough. In particular, this implies also that \( \lambda(c, d) \) is independent of \( \sigma \) (for \( c \) small enough). \( \square \)
2.6 Estimation on the Lagrange multiplier \(\lambda(c, d)\)

To finish the construction of a solution of \((TW_ε)\), we need to find a link between \(d\) and \(c\) such that \(\lambda(c, d) = 0\) in (2.30). Here, we give an estimate of \(\lambda(c, d)\) for small values of \(c\).

**Proposition 2.25** For \(\lambda(c, d)\) defined in the equation of Proposition 2.20, namely

\[
\eta L(\Phi) + (1 - \eta)VL'(\Psi) + F(\Psi) = \lambda(c, d)Z_d,
\]

we have, for any \(0 < \sigma < 1\),

\[
\lambda(c, d) \int_{\mathbb{R}^2} |\partial_d V|^2 \eta = \pi \left( \frac{1}{d} - c \right) + O_{\varepsilon \to 0}(c^{2-\sigma}).
\]

We will take the scalar product of \(\eta L(\Phi) + (1 - \eta)VL'(\Psi) + F(\Psi) - \lambda(c, d)Z_d\) with \(\partial_d V\). We will show in the proof that in the term \(\langle \eta L(\Phi) + (1 - \eta)VL'(\Psi) + F(\Psi), \partial_d V \rangle\), the largest contribution come from the source term \(E - ic\partial_{x_2}V\) in \(F(\Psi)\). We will show that \(\langle E, \partial_d V \rangle \simeq \frac{\pi}{\varepsilon}\), \(\langle -ic\partial_{x_2}V, \partial_d V \rangle \simeq -\pi c\), so that, at the leading order, \(\lambda(c, d) \sim K\left( \frac{1}{d} - c \right)\). In the proof, steps 1, 2 and 7 show that the terms other than \(E - ic\partial_{x_2}V\) are of lower order, and steps 3-6 compute exactly the contribution of these leading order terms.

**Proof** Recall from Lemma 2.7 that \(L(\Phi) = (E - ic\partial_{x_2}V)\Psi + VL'(\Psi)\), hence we write the equation under the form

\[
L(\Phi) - (1 - \eta)(E - ic\partial_{x_2}V)\Psi + F(\Psi) = \lambda(c, d)Z_d.
\]

We want to take the scalar product with \(\partial_d V\). We will compute the terms \((1 - \eta)E\Psi\) (step 1), \(F(\Psi)\) (steps 2 to 6) and in step 7 we will show that we can do an integration by parts for \(\langle L(\Phi), Z_d \rangle\) and compute its contribution.

We have by definition \(Z_d = \eta \partial_d V\), hence

\[
\langle Z_d, \partial_d V \rangle = \int_{\mathbb{R}^2} |\partial_d V|^2 \eta
\]

which is finite and independent of \(d\) since \(\eta = 0\) outside \(\{ \varepsilon \leq 2 \}\). Recall that \(\|\Psi\|_{*, \sigma} \lesssim K(\sigma)c^{1-\sigma}\) where

\[
\|\Psi\|_{*, \sigma, d} = \|V\Psi\|_{C^1(\{\varepsilon \leq 2\})} + \|\partial_{x_2}^\sigma \Psi\|_{L^\infty(\{\varepsilon \geq 2\})} + \|\partial_{x_2}^{1+\sigma} \Psi\|_{L^\infty(\{\varepsilon \geq 2\})}
\]

which we will heavily use with several values of \(\sigma\) in the following computations.

Step 1. We have \(\langle (1 - \eta)(E - ic\partial_{x_2}V)\Psi, \partial_d V \rangle = O_{\varepsilon \to 0}(c^{2-\sigma})\).

From Lemma 2.6, we have

\[
|\partial_d V| \lesssim \frac{K}{1 + \varepsilon}.
\]

In (2.2), we showed that

\[
E = -2\nabla V_1 \cdot \nabla V_{-1} + (1 - |V_1|^2)(1 - |V_{-1}|^2)V_1 V_{-1},
\]

hence, with Lemmas 2.1 and 2.5 (estimating \(ic\partial_{x_2}V\) as in step 2 of the proof of Lemma 2.21), we have

\[
|E - ic\partial_{x_2}V| \lesssim \frac{Kc}{1 + \varepsilon}
\]

by using \(|\nabla V_1| \lesssim \frac{K}{\varepsilon}, |\nabla V_{-1}| \lesssim \frac{K}{\varepsilon} \leq Kc\) and \(|1 - |V_{-1}|^2| \leq Kc^2\) in the right half-plane and the symmetric estimate in the other one. We also have, in \(\{ 1 - \eta \neq 0 \}\),

\[
|\Psi| \lesssim K \frac{\|\Psi\|_{*, \sigma, d}}{(1 + \varepsilon)^\sigma} \lesssim K(\sigma)c^{1-\sigma},
\]

hence

\[
|\langle (1 - \eta)(E - ic\partial_{x_2}V)\Psi, \partial_d V \rangle| \lesssim K(\sigma) \int_{\mathbb{R}^2} \frac{c^{2-\sigma}}{(1 + \varepsilon)^{2+\sigma}} = O_{\varepsilon \to 0}(c^{2-\sigma}).
\]
Step 2. We have $\langle F(\Psi), \partial_d V \rangle = \langle E - ic\partial_x V, \partial_d V \rangle + O^\sigma_{c \to 0}(c^{2-\sigma})$.

In this step, we want to show that the nonlinear terms in $F(\Psi)$ are negligible. Recall that

$$F(\Psi) = E - ic\partial_x V + R(\Psi) + V(1 - \eta)(-\nabla \Psi \cdot \nabla \Psi + |V|^2 S(\Psi)).$$

We first show that

$$\langle R(\Psi), \partial_d V \rangle = O^\sigma_{c \to 0}(c^{2-\sigma}).$$

Indeed, $R(\Psi)$ is localized in $\{ \tilde{r} \leq 2 \}$ and $|\langle R(\Psi) \rangle| \leq C|\Phi|^2_{C^1(\{ \tilde{r} \leq 3 \})}$ (since $|\Phi|, |\Phi|_{\sigma, d} \leq C_0$, see Lemma 2.7), and using that in $\{ \tilde{r} \leq 3 \}$, $|\Phi| + |\nabla \Phi| \leq K(\sigma)c^{1-\sigma/2}$ yields

$$|\langle R(\Psi) \rangle| \leq c|\partial_x \Phi|_{C^0(\{ \tilde{r} \leq 3 \})} + C|\Phi|^2_{C^1(\{ \tilde{r} \leq 3 \})} = O^\sigma_{c \to 0}(c^{2-\sigma}).$$

Now, we use $\|\Phi\|_{\sigma, \sigma} \leq K(\sigma)c^{1-\sigma/2}$ to estimate, in $\{ 1 - \eta \neq 0 \}$,

$$|\nabla \Psi \cdot \nabla \Psi| \leq \frac{K\|\Phi\|^2_{\sigma, \sigma}}{(1 + \tilde{r})^{2+2\sigma}} \leq \frac{K(\sigma)c^{2-\sigma}}{(1 + \tilde{r})^{2+2\sigma}}.$$

therefore

$$|\langle -\nabla \Psi \cdot \nabla \Psi V(1 - \eta), \partial_d V \rangle| \leq Kc^{2-\sigma} \int_{\mathbb{R}^2} \frac{1}{(1 + \tilde{r})^{3+2\sigma}} = O^\sigma_{c \to 0}(c^{2-\sigma}).$$

The same argument can be made for

$$|\langle -|V|^2 S(\Psi)V(1 - \eta), \partial_d V \rangle| = O^\sigma_{c \to 0}(c^{2-\sigma})$$

by using $S(\Psi) = e^{2\text{Re}(\Psi)} - 1 - 2\text{Re}(\Psi)$ and the fact that it is real-valued.

Step 3. We have $\langle E - ic\partial_x V, \partial_d V \rangle = -2 \int_{\{ x_1 \geq 0 \}} \text{Re}((E - ic\partial_x V)\partial_{x_1}V_1\bar{V}_1) + O^\sigma_{c \to 0}(c^{2-\sigma})$.

The goal of this step is to simplify the computation by using the symmetry. By symmetry, we can only look in the right half-plane:

$$\langle E - ic\partial_x V, \partial_d V \rangle = 2 \int_{\{ x_1 \geq 0 \}} \text{Re}((E - ic\partial_x V)\partial_{x_1}V_1\bar{V}_1).$$

Recall that $\partial_d V = -\partial_{x_1}V_1 + \partial_{x_2}V_2V_1$, hence we need to show that

$$\int_{\{ x_1 \geq 0 \}} \text{Re}((E - ic\partial_x V)\partial_{x_1}V_1\bar{V}_1) = O^\sigma_{c \to 0}(c^{2-\sigma}).$$

We compute

$$\int_{\{ x_1 \geq 0 \}} \text{Re}((E - ic\partial_x V)\partial_{x_1}V_1\bar{V}_1) = \int_{\{ x_1 \geq 0 \}} \text{Re} \left( \frac{E - ic\partial_x V}{V} |V|^2 \frac{\partial_{x_1}V_1}{V_1} \right)$$

$$= \int_{\{ x_1 \geq 0 \}} \text{Re} \left( \frac{E - ic\partial_x V}{V} |V|^2 \text{Re} \left( \frac{\partial_{x_1}V_1}{V_1} \right) \right)$$

$$+ \int_{\{ x_1 \geq 0 \}} \text{Im} \left( \frac{E - ic\partial_x V}{V} |V|^2 \text{Im} \left( \frac{\partial_{x_1}V_1}{V_1} \right) \right).$$

In the right half-plane, we have $d \leq r_1$ and $\tilde{r} \leq r_1$, hence

$$\left| \text{Re} \left( \frac{\partial_{x_1}V_1}{V_1} \right) \right| \leq \frac{K}{r_1^{3+\sigma/2}} \leq \frac{Kc^{1-\sigma/2}}{(1 + \tilde{r})^{2+\sigma/2}},$$

$$\left| \text{Im} \left( \frac{\partial_{x_1}V_1}{V_1} \right) \right| \leq \frac{K}{r_1^{3+\sigma/2}} \leq \frac{Kc^{1-\sigma/2}}{(1 + \tilde{r})^{2+\sigma/2}}.$$
from Lemma 2.1. Moreover,
\[ | \text{Re} \left( \frac{E - ic \partial_{x_2} V}{V} \right) | \leq \frac{Ke^{1-\sigma/2}}{(1 + \tilde{r})^{1+\sigma/2}}, \]
\[ | \text{Im} \left( \frac{E - ic \partial_{x_2} V}{V} \right) | \leq \frac{Ke^{1-\sigma/2}}{(1 + \tilde{r})^{2+\sigma/2}}, \]
from Lemma 2.21. We thus deduce that
\[ \left| \int_{\{x_1 \geq 0\}} \text{Re} \left( (E - ic \partial_{x_2} V) \overline{\partial_{x_1} V - V_1} \right) \right| \leq Ke^{1-\sigma/2} \int_{\mathbb{R}^+} \frac{c^{1-\sigma/2}}{(1 + \tilde{r})^{2+\sigma}} = O_{c \to 0}(c^{2-\sigma}). \]

Step 4. We have
\[ \int_{\{x_1 \geq 0\}} \text{Re} \left( E \overline{\partial_{x_1} V V - V_1} \right) = -2 \int_{\{x_1 \geq 0\}} \text{Re} \left( \partial_{x_2} V_1 \overline{\partial_{x_2} V_1 \partial_{x_2} V - V_1} \right) + O_{c \to 0}(c^{2-\sigma}). \]

The goal of this step is to compute the part of \( E \) that produces the higher order term. Recall from (2.2) that
\[ E = -2 \nabla V_1 \cdot \nabla V - (1 - |V_1|^2)(1 - |V - 1|^2)V_1 V - 1 \]
and since
\[ |(1 - |V_1|^2)(1 - |V - 1|^2)| \leq \frac{Kc^2}{(1 + \tilde{r})^2} \]
by Lemma 2.1, we deduce
\[ \int_{\{x_1 \geq 0\}} \text{Re} \left( (1 - |V_1|^2)(1 - |V - 1|^2)V_1 V - 1 \overline{\partial_{x_1} V V - V_1} \right) = O_{c \to 0}(c^{2-\sigma}). \]

Now we compute the first contribution from \(-2 \nabla V_1 \cdot \nabla V = -2 \partial_{x_1} V_1 \partial_{x_1} V - 1 - 2 \partial_{x_2} V_1 \partial_{x_2} V - 1,\)
\[ \int_{\{x_1 \geq 0\}} \text{Re} \left( \overline{(2 \partial_{x_1} V_1 \partial_{x_1} V - 1) \partial_{x_1} V_1 V - 1} \right) = -2 \int_{\{x_1 \geq 0\}} |\partial_{x_1} V_1|^2 \text{Re}(\partial_{x_1} V_1 V - 1). \]

From Lemma 2.1 we have
\[ \text{Re}(\partial_{x_1} V_1 V - 1) = O \left( \frac{1}{r_{-1}} \right) \]
since the main part in \( \partial_{x_1} V_1 V - 1 \) is purely imaginary. Using \( r_1 \leq r_{-1} \) and \( r_{-1} \geq d \geq \frac{K}{c} \) in the right half-plane, we have \( \frac{1}{r_{-1}} \leq \frac{Kc^{2-\sigma}}{(1 + \tilde{r})^{3+\sigma}} \) and, noting that \( |\partial_{x_1} V_1|^2 \leq \frac{K}{(1 + \tilde{r})^{2+\sigma}}, \) we obtain
\[ \int_{\{x_1 \geq 0\}} |\partial_{x_1} V_1|^2 |\text{Re}(\partial_{x_1} V_1 V - 1)| | \leq Kc^{2-\sigma} \int_{\{x_1 \geq 0\}} \frac{1}{(1 + \tilde{r})^{3+\sigma}} = O_{c \to 0}(c^{5/4}). \]

Finally, the second contribution from \(-2 \nabla V_1 \cdot \nabla V =\)
\[ \int_{\{x_1 \geq 0\}} \text{Re} \left( \overline{(2 \partial_{x_2} V_1 \partial_{x_2} V - 1) \partial_{x_1} V_1 V - 1} \right) = -2 \int_{\{x_1 \geq 0\}} \text{Re}(\partial_{x_2} V_1 \overline{\partial_{x_2} V_1 \partial_{x_2} V - 1 V - 1}) \]
which concludes the proof of this step.

Step 5. We have \( \int_{\{x_1 \geq 0\}} \text{Re} \left( E \overline{\partial_{x_1} V V - V_1} \right) = \frac{\pi}{\sigma} + O_{c \to 0}(c^{2-\sigma}). \)
By Lemma 2.1, we have
\[ \partial_{x_2} V_{-1} \mathbf{V}_{-1} = -i|V_{-1}|^2 y_1 + \frac{2d}{r_{-1}^2} + O\left(\frac{1}{r_{-1}^{\sigma}}\right). \]

The \( O\left(\frac{1}{r_{-1}^{\sigma}}\right) \) yielding a term which is a \( O_{c\to0}(c^{2-\sigma}) \) as in step 4, therefore
\[
\int_{\{x_1 \geq 0\}} \Re\left( (-2\partial_{x_2} V_1 \partial_{x_2} V_{-1}) \partial_{x_1} V_{-1} \right) = 2 \int_{\{x_1 \geq 0\}} \Re\left( i\partial_{x_2} V_1 \partial_{x_2} V_{-1} \right) |V_{-1}|^2 \frac{y_1 + \frac{2d}{r_{-1}^2}}{r_{-1}^2} + O_{c\to0}(c^{2-\sigma}).
\]

Now we compute in polar coordinate around \( d e_1 \), writing \( V_1 = \rho_1(r_1)e^{i\theta_1} \). From Lemma 2.2, we have
\[
\partial_{x_1} V_1 = -\left( \frac{\cos(\theta_1)\rho_1'(r_1)}{\rho_1(r_1)} - \frac{i}{r_1} \sin(\theta_1) \right) V_1,
\]
\[
\partial_{x_2} V_1 = \left( \frac{\sin(\theta_1)\rho_1'(r_1)}{\rho_1(r_1)} + \frac{i}{r_1} \cos(\theta_1) \right) V_1.
\]

We then compute
\[
\Re\left( i\partial_{x_2} V_1 \partial_{x_2} V_{-1} \right) = -|V_1|^2 \left( \cos^2(\theta_1)\frac{\rho_1'(r_1)}{\rho_1(r_1)} + \frac{\sin^2(\theta_1)}{\rho_1(r_1)} \right) = -|V_1|^2 \frac{\rho_1'}{\rho_1(r_1)}.
\]

From Lemma 2.1, we have \( \rho_1'(r_1) = O_{r_1 \to \infty}\left(\frac{1}{r_1}\right) \). As a consequence
\[
\int_{\{x_1 \geq 0\}} |V_1|^2 \frac{\rho_1'}{\rho_1(r_1)} |V_{-1}|^2 \frac{y_1 + \frac{2d}{r_{-1}^2}}{r_{-1}^2} - \int_{\{r_1 \leq d^{1/2}\}} |V_1|^2 \frac{\rho_1'}{\rho_1(r_1)} |V_{-1}|^2 \frac{y_1 + \frac{2d}{r_{-1}^2}}{r_{-1}^2}
\leq K c^{2-\sigma} \int_{\{r_1 \geq d^{1/2}\}} \frac{1}{(1 + r)^{2+2\sigma}}
\]

because when \( x_1 \geq 0 \) and \( r_1 \geq d^{1/2} \), we have \( |V_1|^2 \frac{\rho_1'}{\rho_1(r_1)} |V_{-1}|^2 \frac{y_1 + \frac{2d}{r_{-1}^2}}{r_{-1}^2} \leq \frac{K c^{2-\sigma}}{(1 + r)^{2+2\sigma}}. \) We deduce that
\[
\int_{\{x_1 \geq 0\}} |V_1|^2 \frac{\rho_1'}{\rho_1(r_1)} |V_{-1}|^2 \frac{y_1 + \frac{2d}{r_{-1}^2}}{r_{-1}^2} = \int_{\{r_1 \leq d^{1/2}\}} |V_1|^2 \frac{\rho_1'}{\rho_1(r_1)} |V_{-1}|^2 \frac{y_1 + \frac{2d}{r_{-1}^2}}{r_{-1}^2} + O_{c\to0}(c^{2-\sigma}).
\]

In the ball \( \{r_1 \leq d^{1/2}\} \), we have
\[
r_{-1}^2 = 4d^2 \left(1 + O_{d \to \infty}\left(\frac{1}{d}\right)\right) \quad \text{and} \quad |V_{-1}|^2 = 1 + O\left(\frac{1}{d^2}\right)
\]

therefore
\[
\int_{\{x_1 \geq 0\}} |V_1|^2 \frac{\rho_1'}{\rho_1(r_1)} |V_{-1}|^2 \frac{y_1 + \frac{2d}{r_{-1}^2}}{r_{-1}^2} = \frac{1}{4d^2} \int_{\{r_1 \leq d^{1/2}\}} |V_1|^2 \frac{\rho_1'}{\rho_1(r_1)} (y_1 + 2d) + O_{c\to0}(c^{2-\sigma}).
\]

Since \( y_1 = r_1 \cos(\theta_1) \), by integration in polar coordinates we have
\[
\int_{\{r_1 \leq d^{1/2}\}} |V_1|^2 \frac{\rho_1'}{\rho_1(r_1)} y_1 = 0
\]

hence
\[
\int_{\{x_1 \geq 0\}} \Re\left( E \partial_{x_1} V_1 V_{-1} \right) = \frac{1}{d} \int_{\{r_1 \leq d^{1/2}\}} |V_1|^2 \frac{\rho_1'}{\rho_1(r_1)} + O_{c\to0}(c^{2-\sigma}).
\]

Remark that \( |V_1|^2 = \rho_1^2 \) hence
\[
\int_{\{r_1 \leq d^{1/2}\}} |V_1|^2 \frac{\rho_1'}{\rho_1(r_1)} = 2\pi \int_0^{d^{1/2}} \rho_1 \rho_1' dr_1 = \pi |\rho_1|^2 r_0^{1/2} = \pi + O_{d \to \infty}\left(\frac{1}{d}\right)
\]

45
Since \( \rho_1 = 1 + O\left( \frac{1}{r_1} \right) \) when \( r_1 \to \infty \) and \( \rho_1(0) = 0 \) by Lemma 2.1. Therefore, as claimed,

\[
\int_{\{x_1 \geq 0\}} \Re \left( E \overline{\partial_{x_1} V_1} V_{-1} \right) = \frac{\pi}{d} + O_{c \to 0}^\sigma (c^{2-\sigma}).
\]

Notice that we have shown in particular that

\[
\int_{\mathbb{R}^2} \Re \left( i \partial_{x_2} V_1 \overline{\partial_{x_1} V_1} \right) |V_{-1}|^2 = -\pi + O_{c \to 0}^\sigma (c^{1-\sigma}). \tag{2.32}
\]

Step 6. We have \( \int_{\{x_1 \geq 0\}} \Re \left( -i c \partial_{x_2} V \overline{\partial_{x_1} V_1} \right) = -\pi c + O_{c \to 0}^\sigma (c^{2-\sigma}). \)

We are left with the computation of

\[
\int_{\{x_1 \geq 0\}} \Re \left( -i c \partial_{x_2} V \overline{\partial_{x_1} V_1} \right) =
\int_{\{x_1 \geq 0\}} \Re \left( -i c \partial_{x_2} V_1 \overline{\partial_{x_1} V_1} \right) - \int_{\{x_1 \geq 0\}} \Re \left( -i c \partial_{x_2} V_1 \overline{\partial_{x_1} V_1} \right)
\]

(2.33) since \( \partial_{x_2} V = \partial_{x_2} V_1 V_{-1} + \partial_{x_2} V_1 V_1 \). For the second term in (2.33), we compute

\[
-c \int_{\{x_1 \geq 0\}} \Re \left( i \partial_{x_2} V_1 \overline{\partial_{x_1} V_1} \right) = c \int_{\{x_1 \geq 0\}} \Re \left( \partial_{x_1} V_1 V_{-1} \overline{\partial_{x_1} V_1} \right) |V_{-1}|^2 \frac{y_1 + 2d}{r_{-1}^2} + O_{c \to 0}^\sigma (c^{2-\sigma})
\]

in view of the relation

\[
i \partial_{x_2} V_1 V_{-1} = -|V_{-1}|^2 \frac{y_1 + 2d}{r_{-1}^2} + O \left( \frac{1}{r_{-1}^2} \right)
\]

from Lemma 2.1 and the fact that \( \int_{\{x_1 \geq 0\}} c O \left( \frac{1}{r_{-1}} \right) = O_{c \to 0} (c^{2-\sigma}) \) (as in step 4). Now recall from Lemma 2.2 that

\[
\partial_{x_1} V_1 = \left( \cos(\theta_1) \frac{\rho_1'(r_1)}{\rho_1(r_1)} - \frac{i}{r_1} \sin(\theta_1) \right) V_1
\]

therefore

\[
\Re \left( \partial_{x_1} V_1 \right) = c \left( \cos(\theta_1) \frac{\rho_1'}{\rho_1} |V_1|^2 \right).
\]

In particular, \( |\Re \left( \partial_{x_1} V_1 \right)| \leq \frac{K}{1 + r_1} \) is integrable. Furthermore, \( |V_{-1}|^2 \frac{y_1 + 2d}{r_{-1}^2} = O_{c \to 0} (c^2) \) in the right half-plane, therefore

\[
-c \int_{\{x_1 \geq 0\}} \Re \left( i \partial_{x_2} V_1 \overline{\partial_{x_1} V_1} \right) = O_{c \to 0} (c^2) = O_{c \to 0} (c^{2-\sigma})
\]

The first contribution in (2.33) is

\[
c \int_{\{x_1 \geq 0\}} \Re \left( i \partial_{x_2} V_1 \overline{\partial_{x_1} V_1} \right) |V_{-1}|^2 = c \int_{\{x_1 \geq 0\}} \Re \left( i \partial_{x_2} V_1 \partial_{x_1} V_1 \right) + O_{c \to 0} (c^{2-\sigma})
\]

using that \( |V_{-1}|^2 = 1 + O \left( \frac{1}{r_{-1}} \right) \). From (2.32), we have

\[
\int_{\{x_1 \geq 0\}} \Re \left( i \partial_{x_2} V_1 \partial_{x_1} V_1 \right) = -\pi + O_{c \to 0} (c^{1-\sigma}).
\]

This conclude the proof of step 6, and combining step 4, 5 and 6 we deduce

\[
\int_{\{x_1 \geq 0\}} \Re \left( (E - i c \partial_{x_2} V) \partial_{x_1} V_1 \overline{V_{-1}} \right) = \pi \left( \frac{1}{d} - c \right) + O_{c \to 0} (c^{2-\sigma}).
\]
Step 7. We have \( \langle L(\Phi), \partial_d V \rangle = O_{c \to 0}^\sigma(e^{2-\sigma}) \).

We want to compute, by integration by parts, that
\[
\langle L(\Phi), \partial_d V \rangle = \langle \Phi, L(\partial_d V) \rangle.
\]

First, we recall that the left hand side is well defined, because we showed in the previous steps that all the other terms are bounded, therefore this one is also bounded. We have
\[
\int_{B(0,R)} \mathbb{R}(\Delta \Phi) \partial_d V) = \int_{\partial B(0,R)} \mathbb{R}(\nabla \Phi) \partial_d V).n - \mathbb{R}(\Phi) \nabla \partial_d V).n + \int_{B(0,R)} \mathbb{R}(\Phi) \Delta \partial_d V),
\]
and
\[
|\mathbb{R}(\Phi) \nabla \partial_d V)| + |\mathbb{R}(\Phi) \nabla \partial_d V)| \leq \frac{K}{(1 + \rho)^{2+\sigma}},
\]
therefore
\[
\int_{\partial B(0,R)} \mathbb{R}(\Phi) \nabla \partial_d V).n - \mathbb{R}(\Phi) \nabla \partial_d V).n = o_{R \to \infty}(1)
\]
and the integration by parts holds.

Recall that
\[
L(h) = -\Delta h - (1 - |V|^2)h + 2\mathbb{R}(\Phi) h - ic\partial_x h
\]
and
\[
L_{V_1}(h) = -\Delta h - (1 - |V_1|^2)h + 2\mathbb{R}(\Phi_1) h V_1.
\]

From Lemma 2.6 and \( ||\Phi||_{e,\sigma} \leq K(\sigma) e^{1-\sigma} \), we check easily that
\[
|\langle \Phi, -ic\partial_x \partial_d V \rangle| \leq \int_{R^2} \frac{K(\sigma)e^{2-\sigma}}{(1 + \rho)^{2+\sigma}} = O_{c \to 0}^\sigma(e^{2-\sigma}).
\]

We therefore focus on the remaining part, with the operator
\[
\tilde{L}(h) := -\Delta h - (1 - |V|^2)h + 2\mathbb{R}(\Phi) h - ic\partial_x h.
\]

We remark that we have \( L_{V_1}(\partial_x V_1) = 0 \), since \( \partial_x V_1(\partial_x V_1 - (1 - |V_1|^2)V_1) = 0 \). Recall that \( \partial_d V = -\partial_x V_1 V_{-1} + \partial_x V_1 V_{-1} V_1 \) and let us compute
\[
\tilde{L}(V_{-1} h) = L_{V_1}(V_{-1} h - \Delta h V_{-1} + \Delta h V_{-1} + (|V|^2 - |V_1|^2)h V_{-1} + 2\mathbb{R}(\Phi_1) h V_{-1} (1 - |V_{-1}|^2) V_1,
\]
therefore, using the equation or \( V_{-1} \),
\[
\tilde{L}(V_{-1} h) = L_{V_1}(V_{-1} h - 2\nabla V_{-1}, \nabla h + (1 - |V_{-1}|^2)(1 - |V|^2) h V_{-1} V_1 + 2\mathbb{R}(\Phi_1) h V_{-1} (1 - |V_{-1}|^2) V_1.
\]

Taking \( h = \partial_x V_1 \) then yields
\[
\tilde{L}(V_{-1} \partial_x V_1) = -2\nabla V_{-1}, \nabla \partial_x V_1 + (1 - |V_{-1}|^2)(1 - |V|^2) V_{-1} \partial_x V_1 + 2\mathbb{R}(\Phi_1) h V_{-1} V_1 (1 - |V_{-1}|^2) V_1.
\]

Remark that \( |\nabla V_{-1}, \nabla \partial_x V_1| \leq \frac{K}{(1 + \rho)(1 + \rho)^{2+\sigma}}, |(1 - |V_{-1}|^2)(1 - |V|^2) \partial_x V_1 V_{-1}| \leq \frac{K}{(1 + \rho)(1 + \rho)^{2+\sigma}} \) and \( |2\mathbb{R}(\Phi_1) h V_{-1} V_1 (1 - |V_{-1}|^2) V_1| \leq \frac{K}{(1 + \rho)(1 + \rho)^{2+\sigma}} \) for a universal constant \( K > 0 \) by Lemma 2.1, therefore
\[
\langle \Phi, \tilde{L}(\partial_x V_1 V_{-1}) \rangle = O_{c \to 0}^\sigma(e^{2-\sigma}).
\]

Exchanging the roles of \( V_1 \) and \( V_{-1} \), we have similarly
\[
\tilde{L}(V_1 \partial_x V_{-1}) = -2\nabla V_1, \nabla \partial_x V_{-1} + (1 - |V_{-1}|^2)(1 - |V|^2) V_{-1} \partial_x V_{-1}.
\]

We then conclude that
\[
\langle \tilde{L}(\Phi), \partial_d V \rangle = O_{c \to 0}^\sigma(e^{2-\sigma}),
\]
and, for \( x \), therefor, by applying several times Theorem 2.27 and Sobolev imbedding, we check that, for
\[
|L(\partial_d V)| \leq \frac{Kc}{(1 + \rho)^2}
\] (2.34)
which end the proof of this step. Notice that we have shown
\[
|L(\partial_d V)| \leq \frac{Kc}{(1 + \rho)^2}
\]
because \( \frac{1}{(1 + \rho_1)(1 + \rho_2)} \leq \frac{Kc}{(1 + \rho)^2} \) in the whole space.

Step 8. Conclusion.

Adding all the results obtained in steps 1 to 7, we deduce
\[
\lambda(c, d) \int |\partial_d V|^2 \eta = \pi \left( \frac{1}{d} - c \right) + O_{c \to 0}^\sigma (c^{2-\sigma}).
\]
\[
\Box
\]
At this point, we cannot conclude that there exists \( d \) such that \( \lambda(c, d) = 0 \). For that, we need to show that the \( O_{c \to 0}^\sigma (c^{2-\sigma}) \) is continuous with respect to \( c \) and \( d \). This will be shown in section 3.

2.7 Estimates on higher order derivatives of \( \Phi_{c,d} \)

In this subsection, we look for estimates on \( \Phi_{c,d} \) on higher derivatives. Since \( \Phi_{c,d} = V\Psi_{c,d} \) satisfies \( \eta L(\Phi_{c,d}) + (1 - \eta)V' L'(\Phi_{c,d}) + F(\Phi_{c,d}) = \lambda(c, d)Z_d \), we have, by standard elliptic regularity, that \( \Phi_{c,d} \in C^\infty(\mathbb{R}^2) \). In particular, this implies that \( \Psi_{c,d} \in C^\infty(\{r \geq 1\}) \). Now, we will do some bootstrap arguments to get better estimates on the space derivatives of \( \Psi_{c,d} \). For that, we will use classical elliptic estimates:

**Theorem 2.26 ([11], Theorem 4.6)** For \( 0 < \alpha < 1 \), there exists a constant \( C(\alpha) > 0 \) such that, for \( x \in \mathbb{R}^2, R > 0 \) and a function \( u \in C^2(\mathbb{R}^2), \) we have
\[
|D^2 u(x)| \leq C(\alpha) \left( \frac{1}{R^2} \|u\|_{L^\infty(B(x, R))} + \|\Delta u\|_{C^{0,\alpha}(B(x, R))} \right).
\]

**Theorem 2.27 ([11], Theorems 8.8 and 8.10)** For the elliptic operators \( L = \Delta \) or \( L = \Delta - 2 \), given smooth bounded domains \( \Omega, \Omega' \) with \( \Omega' \subset \subset \Omega \), and \( u \in W^{1,2}(\Omega), f \in W^{k,2}, k \geq 0 \) such that \( u \) is a weak solution of \( Lu = f \) in \( \Omega \), there exists a constant \( K(k, \Omega, \Omega') > 0 \) such that
\[
\|u\|_{W^{k+2,2}(\Omega')} \leq K(k, \Omega, \Omega')(\|u\|_{W^{1,2}(\Omega)} + \|f\|_{W^{k,2}(\Omega)}).
\]

Here, we take \( W^{0,2}(\Omega) = L^2(\Omega) \). We start with a first non optimal estimate on the second derivatives.

**Lemma 2.28** For \( 0 < \sigma < 1 \), there exists \( K(\sigma), c_0(\sigma) > 0 \) such that, for \( 0 < c < c_0(\sigma), \frac{1}{12} < d < \frac{2}{c} \),
\[
\|D^2 \Phi_{c,d}\|_{L^\infty(\{r \leq 3\})} \leq K(\sigma)c^{1-\sigma}
\]
and, for \( x \in \mathbb{R}^2 \) such that \( \hat{r} \geq 2 \),
\[
|D^2 \Phi_{c,d}| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \hat{r})^{1+\sigma}}.
\] (2.35)

**Proof** From the equation \( \eta L(\Phi_{c,d}) + (1 - \eta)V' L'(\Phi_{c,d}) + F(\Phi_{c,d}) = \lambda(c, d)Z_d \) and \( |\lambda(c, d)| \leq K(\sigma)c \), we check that
\[
|\Delta \Phi_{c,d}|_{L^\infty(\{r \leq 4\})} \leq K(\sigma)c^{1-\sigma},
\]
therefore, by applying several times Theorem 2.27 and Sobolev imbedding, we check that, for \( x \in \mathbb{R}^2 \) such that \( \hat{r} \leq 3 \),
\[
|D^2 \Phi_{c,d}(x)| \leq K \|\Phi_{c,d}\|_{W^{1,2}(\{r \leq 3\})} \leq K(\|\Phi_{c,d}\|_{C^1(\{r \leq 4\})} + |\Delta \Phi_{c,d}|_{L^\infty(\{r \leq 4\})}) \leq K(\sigma)c^{1-\sigma}.
\]

We now look at estimates in \( \{r \geq 3\} \). We recall that we have
\[
F(\Psi_{c,d}) = E - ic\partial_{x_2} V + V(1 - \eta)(-\nabla \Psi_{c,d} \cdot \nabla \Psi_{c,d} + |V|^2 S(\Psi_{c,d})) + R(\Psi_{c,d}).
\]

48
From (2.28), we have
\[ \| F(\Psi_{c,d}) \|_{**} \leq K(\sigma) c^{1-\sigma}. \] (2.36)
We recall that \( \lambda(c,d)Z_d \) is compactly supported in \( \{ \eta \neq 0 \} \) and, since \( |\lambda(c,d)| \leq K(\sigma)c \) by Proposition 2.25, we have \( \| \lambda(c,d)Z_d \|_{**} \leq K(\sigma)c \) for any \( 0 < \sigma < 1 \). From the proof of Proposition 2.16, writing \( F(\Psi) = h_1 + ih_2 \) we have the system, on \( \Psi_{c,d} = \Psi_1 + i\Psi_2 \) (in the area \( \{ \eta = 0 \} \)),
\[
\begin{align*}
\Delta \Psi_1 - 2|V|^2 \Psi_1 &= -h_1 - 2\Re \left( \frac{\nabla V}{V} \nabla \Psi_{c,d} \right) + c \partial_{x_2} \Psi_2 \\
\Delta \Psi_2 &= -h_2 - 2\Im \left( \frac{\nabla V}{V} \nabla \Psi_{c,d} \right) - c \partial_{x_2} \Psi_1.
\end{align*}
\]
We compute \( \frac{\nabla V}{V} \nabla \Psi_{c,d} \) in real and imaginary parts as in the proof of Proposition 2.16, which leads to, in \( \{ \tilde{r} \geq 3 \}, \)
\[
\| \Psi_{c,d} \|_{**} \leq K(\sigma)c^{1-\sigma}.
\]
and
\[
\frac{\nabla V}{V} \nabla \Psi_{c,d} - c \partial_{x_2} \Psi_1 \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}},
\]
since \( \| \Psi_{c,d} \|_{**} \leq K(\sigma)c^{1-\sigma} \). We have
\[
\| h_1 + ih_2 \|_{**} \leq K(\sigma)c^{1-\sigma}
\]
from (2.36), therefore
\[
|\Delta \Psi_2| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}}
\] (2.37)
and
\[
|\Delta \Psi_1 - 2\Psi_1| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}}.
\] (2.38)
Now, for \( x \in \mathbb{R}^2 \) such that \( \tilde{r} \geq 2 \), taking \( \Omega = B(x,1) \), we apply several times Theorem 2.27 similarly as for the estimate on \( \Phi_{c,d} \), which yields, with \( \| \Psi_{c,d} \|_{**} \leq K(\sigma)c^{1-\sigma} \) that
\[
|D^2 \Psi_1| \leq K(\| \Psi_1 \|_{C^1(B(x,1))} + \| \Delta \Psi_1 - 2\Psi_1 \|_{L^\infty(B(x,1))}) \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}},
\] (2.39)
which is what we wanted to show on the real part. For the imaginary part, this yields
\[
|D^2 \Psi_2| \leq K(\| \Psi_2 \|_{C^1(B(x,1))} + \| \Delta \Psi_2 \|_{L^\infty(B(x,1))}) \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}},
\] (2.40)
and this is not the expected decay due to the term \( \| \Psi_2 \|_{C^1(B(x,1))} \). We shall give better estimates on the derivatives. Let us then compute, for \( x \in \mathbb{R}^2, \tilde{r} \geq 2 \), the quantity \( \| \Delta \Psi_2 \|_{C^1(B(x,\tilde{r}/2))} \). We recall that
\[
\Delta \Psi_2 = -h_2 - 2\Im \left( \frac{\nabla V}{V} \nabla \Psi_{c,d} \right) - c \partial_{x_2} \Psi_1,
\]
and we check, with (2.39) and (2.40), that
\[
\left| \nabla \left( 2\Im \left( \frac{\nabla V}{V} \nabla \Psi_{c,d} \right) - c \partial_{x_2} \Psi_1 \right) \right| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}}.
\]
Furthermore, for the estimate on \( \nabla h_2 \), we check in particular that
\[
|\nabla (\nabla \Psi_{c,d} \cdot \nabla \Psi_{c,d})| \leq 2|\nabla \Psi_{c,d} \times |D^2 \Psi_{c,d}| |
\leq K(\sigma) \left( \frac{c^{1-\frac{1}{2+\sigma}}}{(1 + \tilde{r})^{1+\frac{1}{2+\sigma}}} \right) \left( \frac{c^{1-\frac{1}{2+\sigma}}}{(1 + \tilde{r})^{\frac{1}{2+\sigma}}} \right)
\leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}.
\]
and
\[
|\nabla S(\Psi_{c,d})| = 2|\nabla \Re(\Psi_{c,d})(e^{2\sigma_0(\Psi_{c,d})} - 1)| \\
\leq K|\nabla \Re(\Psi_{c,d})| \times |\Re(\Psi_{c,d})| \\
\leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}
\]
and we can then check easily that \( |\nabla h| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}. \) With (2.37) and (2.39), we conclude that
\[
\|\Delta \Psi_2\|_{C^1(B(\tilde{x},\tilde{r}/2))} \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}}.
\]
To conclude, we use Theorem 2.26 for \( x \in \mathbb{R}^2, \tilde{r} \geq 2, \Omega = B(x, \tilde{r}/2), \alpha = 1/2 \) for instance, which yields
\[
|D^2\Psi_2| \leq K\left(\frac{1}{r^2} \|\Psi_2\|_{L^\infty(B(x,\tilde{r}/2))} + \|\Delta \Psi_2\|_{C^1(B(\tilde{x},\tilde{r}/2))}\right) \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}}
\]
since points in \( B(x, \tilde{r}/2) \) are at distance bigger than \( \tilde{r}/2 \) from the vortices. \(\square\)

We now show an improvement of the decay given in Lemma 2.28.

**Lemma 2.29** For \( 0 < \sigma < 1 \), there exists \( K(\sigma), c_0(\sigma) > 0 \) such that, for \( 0 < c < c_0(\sigma) \), if \( \tilde{r} \geq 2 \) then
\[
|D^2\Im(\Psi_{c,d})| + |\nabla \Re(\Psi_{c,d})| + |\nabla^2 \Re(\Psi_{c,d})| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}.
\]  

**Proof** In the area \( \{\eta \neq 0\} \), these estimates are a consequence of \( \|\Psi_{c,d}\|_{1,\sigma,d} \leq K(\sigma)c^{1-\sigma} \) and Lemma 2.28. Therefore, we define \( \tilde{\Psi} = (1 - \eta)\Psi_{c,d} \), and the system becomes on \( \tilde{\Psi} = \tilde{\Psi}_1 + i\tilde{\Psi}_2 \)
\[
\left\{ \begin{array}{l}
\Delta \tilde{\Psi}_1 - 2\tilde{\Psi}_1 = -h_1 - 2\Re\left(\frac{\nabla V \cdot \nabla \tilde{\Psi}}{V}\right) + c\partial_{x_2} \tilde{\Psi}_2 - 2(1 - |V|^2)\tilde{\Psi}_1 + \text{Loc}_1(\tilde{\Psi}, \eta) \\
\Delta \tilde{\Psi}_2 = -h_2 - 2\Im\left(\frac{\nabla V \cdot \nabla \tilde{\Psi}}{V}\right) - c\partial_{x_2} \tilde{\Psi}_1 + \text{Loc}_2(\tilde{\Psi}, \eta),
\end{array} \right.
\]
where \( \text{Loc}_1(\tilde{\Psi}, \eta) \) and \( \text{Loc}_2(\tilde{\Psi}, \eta) \) are smooth compactly supported terms. Since \( \|\Psi_{c,d}\|_{1,\sigma,d} \leq K(\sigma)c^{1-\sigma} \), it is enough to show that
\[
|D^2\tilde{\Psi}_2| + |\nabla \tilde{\Psi}_1| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}.
\]
First, we want to show that, for \( \tilde{r} \geq 2 \),
\[
|\nabla h| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}.
\]  

**Recall that**
\[
h = E - \frac{ic\partial_{x_2}V}{V} + (1 - \eta)(-\nabla \Psi_{c,d} \cdot \nabla \Psi_{c,d} + |V|^2 S(\Psi_{c,d}) + R(\Psi_{c,d})).
\]

For the nonlinear terms in \( \Psi_{c,d} \), from \( \|\Psi_{c,d}\|_{1,\sigma,d} \leq K(\sigma)c^{1-\sigma} \) and equation (2.35) (taken in \( \frac{1+\sigma}{2} \in [0,1] \)), we check easily that
\[
|\nabla ((1 - \eta)(-\nabla \Psi_{c,d} \cdot \nabla \Psi_{c,d} + |V|^2 S(\Psi_{c,d}) + R(\Psi_{c,d}))| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}.
\]

Now, we recall that \( E = -2\nabla V_1 \cdot \nabla V_1 + (1 - |V_1|^2)(1 - |V_1 - V'|_2^2) V_1 V_1 \) (from (2.2)), and with Lemma 2.3 and equation (2.3), we see that \( \nabla \left( \frac{E}{\Psi} \right) \) can be bounded in \( \{\tilde{r} \geq 2\} \) by a sum of terms of the form
\[
\frac{K}{(1 + r_1)^\alpha(1 + r_1)^{2\gamma}}.
\]

50
with $\alpha, \beta \geq 1$ and $\alpha + \beta \geq 3$. We deduce with arguments from the proof of Lemma 2.21 that, in $\{ \tilde{r} \geq 2 \}$, we have

$$\left| \nabla \left( \frac{E}{V} \right) \right| \leq \frac{K(\sigma)c^{1-\sigma}}{(1+\tilde{r})^{2+\sigma}}.$$  

Similarly, using Lemma 2.5 and equation (2.3), we show that, in $\{ \tilde{r} = 2 \}$,

$$\left| \nabla \left( \frac{c\partial_{x_2} V}{V} \right) \right| \leq \frac{K(\sigma)c^{1-\sigma}}{(1+\tilde{r})^{2+\sigma}}.$$  

This concludes the proof of estimate (2.42).

Now, as in the proof of Proposition 2.16, we introduce the function $\zeta$ defined in Lemma 2.11 such that, in the weak sense,

$$\Delta \zeta = -h_2 - 2\Re \left( \frac{\nabla V}{V} \nabla \Psi_{c,d} \right) + \text{Loc}_2(\Psi, \eta).$$

The function $\zeta$ is well defined since the source term satisfies

$$\left| -h_2 - 2\Re \left( \frac{\nabla V}{V} \nabla \Psi_{c,d} \right) + \text{Loc}_2(\Psi, \eta) \right| \leq \frac{K(\sigma)c^{1-\sigma}}{(1+\tilde{r})^{2+\sigma}}$$

and is odd in $x_2$. Since the right hand side is in $C^\infty(\mathbb{R}^2)$ (thanks to the cutoff), we have $\zeta \in C^\infty(\mathbb{R}^2)$. With Lemma 2.11, we estimate

$$|\zeta| \leq \frac{K(\sigma)c^{1-\sigma}}{(1+\tilde{r})^{1+\sigma}}$$

and

$$|\nabla \zeta| \leq \frac{K(\sigma)c^{1-\sigma}}{(1+\tilde{r})^{1+\sigma}} \quad (2.43)$$

Furthermore, with (2.42) and Lemma 2.28, we check that

$$|\nabla (\Delta \zeta)| = \left| \nabla h_2 + 2\nabla \Re \left( \frac{\nabla V}{V} \nabla \Psi_{c,d} \right) + \nabla (\text{Loc}_2(\Psi, \eta)) \right| \leq \frac{K(\sigma)c^{1-\sigma}}{(1+\tilde{r})^{2+\sigma}},$$

therefore, by Theorem 2.26, for $x \in \mathbb{R}^2$, $\tilde{r} \geq 2$, for $\alpha = 1/2$ for instance, $\Omega = B(x, \tilde{r}/2)$, we have

$$|D^2 \zeta|(x) \leq K \left( \frac{1}{\tilde{r}^2} \| \zeta \|_{L^\infty(B(x, \tilde{r}/2))} + \| \Delta \zeta \|_{C^1(B(x, \tilde{r}/2))} \right) \leq \frac{K(\sigma)c^{1-\sigma}}{(1+\tilde{r})^{2+\sigma}} \quad (2.44)$$

Now, we introduce the function $\tilde{\Psi}_2 := \Psi_2 - \zeta$, and the system become

$$\begin{cases} 
\Delta \tilde{\Psi}_1 - 2\tilde{\Psi}_1 = \tilde{h}_1 + c\partial_{x_2} \tilde{\Psi}_2 \\
\Delta \tilde{\Psi}_2 = -c\partial_{x_2} \tilde{\Psi}_1,
\end{cases}$$

with

$$\tilde{h}_1 := -h_1 - 2\Re \left( \frac{\nabla V}{V} \nabla \Psi \right) - 2(1-|V|^2)\tilde{\Psi}_1 + \text{Loc}_1(\tilde{\Psi}, \eta) + c\partial_{x_2} \zeta.$$  

With $\|h\|_{*,*; \sigma, d_c} \leq K(\sigma)c^{1-\sigma}$, $\|\Psi_{c,d_c}\|_{*,*; \sigma, d_c} \leq K(\sigma)c^{1-\sigma}$, (2.35), (2.42) and (2.43) we check that

$$|\tilde{h}_1| \leq \frac{K(\sigma)c^{1-\sigma}}{(1+\tilde{r})^{1+\sigma}}$$

and

$$|\nabla \tilde{h}_1| \leq \frac{K(\sigma)c^{1-\sigma}}{(1+\tilde{r})^{2+\sigma}}.$$  

We introduce the function

$$\varrho := K_0 \left( \sqrt{2|1|} \right) \ast \tilde{h}_1.$$  

51
This function is in $C^\infty(\mathbb{R}^2)$, satisfies $(\Delta - 2)(\varrho) = \tilde{h}_1$, and, by Lemma 2.13, we have

$$|\varrho| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}}.$$

Furthermore, by Theorem 2.26, since $|\nabla \tilde{h}_1| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}$, we deduce from Lemma 2.13 and then Theorem 2.26 that

$$|D^2 \varrho| + |\nabla \varrho| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}.$$

Remark that since $\tilde{h}_1$ is even in $x_2$, $\varrho$ is even in $x_2$. We now introduce the function $\tilde{\Psi^1} = \tilde{\Psi}_1 - \varrho$, and the system becomes

$$\begin{align*}
\Delta \tilde{\Psi}^1 - 2\tilde{\Psi}^1 &= c\partial_{x_2} \tilde{\Psi}^1 \\
\Delta \tilde{\Psi}^2 &= -c\partial_{x_2} \tilde{\Psi}^1 - c\partial_{x_2} \varrho.
\end{align*}$$

We introduce $\zeta^{(2)} \in C^\infty(\mathbb{R}^2)$ such that $\Delta \zeta^2 = -c\partial_{x_2} \varrho$. With the estimates on $\varrho$, we show that $\zeta^{(2)}$ satisfies the same estimations as $\zeta$, but with an additional factor $c^2$ ($\varrho$ is even in $x_2$ therefore $\partial_{x_2} \varrho$ is odd in $x_2$). We can therefore continue this method, and introduce two infinite sequences of functions $\zeta^{(n)}$, $\varrho^{(n)}$ which satisfy, for $n \geq 1$,

$$|\zeta^{(n)}| \leq \frac{K(\sigma)n^2c^{2n-1-\sigma}}{(1 + \tilde{r})^{1+\sigma}},$$

$$|\nabla \zeta^{(n)}| \leq \frac{K(\sigma)n^2c^{2n-1-\sigma}}{(1 + \tilde{r})^{1+\sigma}},$$

and

$$|D^2 \zeta^{(n)}| \leq \frac{K(\sigma)n^2c^{2n-1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}$$

for $\zeta^{(n)}$, and

$$|\varrho^{(n)}| \leq \frac{K(\sigma)n^2c^{2n-1-\sigma}}{(1 + \tilde{r})^{1+\sigma}},$$

$$|\nabla \varrho^{(n)}| + |D^2 \varrho^{(n)}| \leq \frac{K(\sigma)n^2c^{2n-1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}$$

for $\varrho^{(n)}$. Then, we define the functions

$$A_1 := \tilde{\Psi}_1 - \sum_{n \geq 1} \varrho^{(n)}$$

and

$$A_2 := \tilde{\Psi}_2 - \sum_{n \geq 1} \zeta^{(n)},$$

the sums being well defined for $c$ small enough (depending on $\sigma$), and belonging to the Banach space $E$. The system becomes, in $\mathbb{R}^2$,

$$\begin{align*}
\Delta A_1 - 2A_1 - c\partial_{x_2} A_2 &= 0 \\
\Delta A_2 + c\partial_{x_2} A_1 &= 0.
\end{align*}$$

Let us show that this system has only $A = 0$ for solution, which, with the estimates on $\varrho_n$ and $\zeta_n$, allows us to conclude that

$$|D^2 \tilde{\Psi}_2| + |\nabla \tilde{\Psi}_1| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}.$$

We see that $A_1, \nabla A_1, \nabla A_2 \in L^2(\mathbb{R}^2)$, and these quantities go to 0 at infinity. Therefore, taking the scalar product of the first equation with $A_1$, we have

$$\|\nabla A_1\|^2_{L^2(\mathbb{R}^2)} + 2\|A_1\|^2_{L^2(\mathbb{R}^2)} = -\langle c\partial_{x_2} A_2, A_1 \rangle \leq c\|\nabla A_2\|_{L^2(\mathbb{R}^2)}\|A_1\|_{L^2(\mathbb{R}^2)}.$$
Now, taking the scalar product of the second equation with $A_2$, we check
\[ \| \nabla A_2 \|_{L^2(\mathbb{R}^2)}^2 \leq c |\langle \partial_{x_2} A_1, A_2 \rangle| = c |A_1, \partial_{x_2} A_2| \leq c \| \nabla A_2 \|_{L^2(\mathbb{R}^2)} \| A_1 \|_{L^2(\mathbb{R}^2)}, \]
therefore $\| \nabla A_2 \|_{L^2(\mathbb{R}^2)} \leq c \| A_1 \|_{L^2(\mathbb{R}^2)}$, thus
\[ \| \nabla A_1 \|_{L^2(\mathbb{R}^2)}^2 + 2\| A_1 \|_{L^2(\mathbb{R}^2)}^2 \leq c^2 \| A_1 \|_{L^2(\mathbb{R}^2)}^2, \]
and since $0 < c < \sqrt{2}$, we conclude that $\| \nabla A \|_{L^2(\mathbb{R}^2)} + \| A_1 \|_{L^2(\mathbb{R}^2)} = 0$, and since $A_2 \to 0$ at infinity, $A_1 = A_2 = 0$, thus $\Psi_1 = \sum_{n \in \mathbb{N}} q_n$ and $\Psi_2 = \sum_{n \in \mathbb{N}} \zeta_n$.

Finally, we have to check that, for $\tilde{r} \geq 2$ $|\nabla^2 \Re(\Psi_{c,d})| \leq \frac{K(\sigma')c^{1-\sigma'}}{(1+\tilde{r})^{2+\sigma'}}$ for $0 < \sigma' < 1$. By Lemma 2.28, we only look at the problem at infinity, where, as previously,
\[ \Delta \tilde{\Psi}_1 - 2\tilde{\Psi}_1 = -h_1 - 2\Re \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\Psi} \right) + c \partial_{x_2} \tilde{\Psi}_2 - 2(1-|V|^2)\tilde{\Psi}_1 + \text{Loc}(\tilde{\Psi}, \eta), \]
and thus
\[ \Delta(\nabla \tilde{\Psi}_1) - 2(\nabla \tilde{\Psi}_1) = -h_1 - 2\nabla \Re \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\Psi} \right) + c \partial_{x_2} \nabla \tilde{\Psi}_2 - 2\nabla((1-|V|^2)\tilde{\Psi}_1) + \nabla(\text{Loc}(\tilde{\Psi}, \eta)) \]
From Lemma 2.13 applied to $\nabla \tilde{\Psi}_1$ (and for $\sigma = 1 + \sigma' > 0$), since
\[ \left| -h_1 - 2\nabla \Re \left( \frac{\nabla V}{V} \cdot \nabla \tilde{\Psi} \right) + c \partial_{x_2} \nabla \tilde{\Psi}_2 - 2\nabla((1-|V|^2)\tilde{\Psi}_1) + \nabla(\text{Loc}(\tilde{\Psi}, \eta)) \right| \leq \frac{K(\sigma')c^{1-\sigma'}}{(1+\tilde{r})^{2+\sigma'}} \]
by (2.42), Lemma 2.28 and the previous results of this proof, we check that
\[ |\nabla^2 \Re(\Psi_{c,d})| \leq \frac{K(\sigma')c^{1-\sigma'}}{(1+\tilde{r})^{2+\sigma'}}, \]
which ends the proof of the lemma. \hfill \Box

3 Construction and properties of the travelling wave

With equation (2.30) and Proposition 2.25, if we show that $\Phi_{c,d}$ is a continuous function of $c$ and $d$, then there exists $c_0 > 0$ such that, for $0 < c < c_0$, by the intermediate value theorem, there exists $d_c > 0$ such that $\lambda(c, d_c) = 0$. This would conclude the construction of the travelling wave, and is done in subsection 3.1. In subsection 3.2, we compute some estimates on $Q_c$ which will be usefull for understanding the linearized operator around $Q_c$. We also show there that $Q_c$ is a travelling wave solution with finite energy.

3.1 Proof that $\Phi_{c,d}$ is a $C^1$ function of $c$ and $d$

To end the construction of the travelling wave, we only need the continuity of $\Phi_{c,d}$ with respect to $c$ and $d$. But for the construction of the $C^1$ branch of travelling wave in section 4, we need its differentiability.

3.1.1 Setup of the problem

From Proposition 2.20, the function $\Phi_{c,d}$ is defined by the implicit equation on $\mathcal{E}_{\ast \ast, \sigma, d}$
\[ (\eta L(\cdot) + (1-\eta)V L(\cdot/V))^{-1}(\Pi_\Delta (-F(\Phi_{c,d}/V))) + \Phi_{c,d} = 0, \]
where $(\eta L(\cdot) + (1-\eta)V L(\cdot/V))^{-1}$ is the linear operator from $\mathcal{E}_{\ast \ast, \sigma, d} \cap \{ \cdot, Z_d \} = 0$ to $\mathcal{E}_{\ast \ast, \sigma, d}$, that, for a function $V h \in \mathcal{E}_{\ast \ast, \sigma, d}$ with $(V h, Z_d) = 0$, yields the unique function $\Phi = V \Psi \in \mathcal{E}_{\ast \ast, \sigma, d}$ such that
\[ \eta L(\Phi) + (1-\eta)V L'(\Psi) = V h \]
in the distribution sense. We recall the quantity $Z_d(x) = \partial_d V(x)(\tilde{\eta}(4r_1) + \tilde{\eta}(4r_{-1}))$ defined in subsection 2.3 and we have defined the projection

$$\Pi_d^1(\Phi) = \Phi - \langle \Phi, Z_d \rangle \frac{Z_d}{\|Z_d\|_{L^2(\mathbb{R}^2)}}.$$ 

We want to show that $(c,d) \mapsto \Phi_{c,d}$ is of class $C^1$ from values of $c,d$ such that $0 < c < c_0(\sigma)$ and $\frac{1}{2m} < c < \frac{2}{d}$ to $\mathcal{E}_{*,\sigma,d}$. The first obstacle is that $\mathcal{E}_{*,\sigma,d}$ depends on $d$ (through $\tilde{r}$), both in the weights in $\|\|_{*,\sigma,d}$ and in the orthogonality required: $(\Phi, Z_d) = 0$. To be able to use the implicit function theorem, we first need to write an equation on $\Phi$ in a space that does not depend on $d$. The norm $\|\|_{*,\sigma,d}$ depends on $d$ (through $\tilde{r}$):

$$\|\Psi\|_{*,\sigma,d} = \|V\Psi\|_{C^1((\tilde{r} < 3))} + \|\tilde{r}^{1+\sigma} \partial_\sigma \Psi \|_{L^\infty((\tilde{r} \geq 2))} + \|\tilde{r}^{1+\sigma} \nabla \Psi \|_{L^\infty((\tilde{r} \geq 2))} + \|\tilde{r}^{2+\sigma} \partial_\sigma \nabla \Psi \|_{L^\infty((\tilde{r} \geq 2))} + \|\tilde{r}^{2+\sigma} \nabla \nabla \Psi \|_{L^\infty((\tilde{r} \geq 2))}.$$

For $d_\sigma \in \mathbb{R}, d_\sigma \geq 10$ and $d \in \mathbb{R}$ such that $|d - d_\sigma| < \delta$ for some small $\delta > 0$ (that we will fix later on), we define

$$\|\Phi\|_{\Theta,\sigma,d_\sigma} := \|\Phi\|_{C^1((\tilde{r} < 3))} + \|\tilde{r}^{1+\sigma} \partial_\sigma \Phi \|_{L^\infty((\tilde{r} \geq 2))} + \|\tilde{r}^{1+\sigma} \nabla \Phi \|_{L^\infty((\tilde{r} \geq 2))} + \|\tilde{r}^{2+\sigma} \nabla \nabla \Phi \|_{L^\infty((\tilde{r} \geq 2))},$$

where $V_\Theta = V_1(x - d_\sigma \vec{e}_1) - V_1(x + d_\sigma \vec{e}_1)$ and $\tilde{r}_\sigma = \min(r_{1,\Theta}, r_{-1,\Theta})$ with $r_{1,\Theta} = |x - d_\sigma \vec{e}_1|, r_{-1,\Theta} = |x + d_\sigma \vec{e}_1|$. Then, for $\Phi = V\Psi \in \mathcal{E}_{*,\sigma,d}(V$ taken in $d)$,

$$K_1 \|\Psi\|_{*,\sigma,d} \leq \|\Phi\|_{\Theta,\sigma,d_\sigma} \leq K_2 \|\Psi\|_{*,\sigma,d} \tag{3.1}$$

where $K_{1,2} > 0$ are absolute when $|d - d_\sigma| < \delta$. Indeed, we check with simple geometric arguments that if $\tilde{r}_\Theta \geq 1$, $V$ taken in $d$, then $\tilde{r} \geq 1/2$ and we have

$$\left| \frac{V}{\tilde{r}_\Theta} - 1 \right| \leq \frac{K}{(1 + \tilde{r})^2} \quad \text{and} \quad \left| \nabla \left( \frac{V}{\tilde{r}_\Theta} \right) \right| \leq \frac{K}{(1 + \tilde{r})^2} \tag{3.2}$$

for a universal constant $K$. Moreover, we have, for instance, if $\tilde{r}_\Theta \geq 2$ (hence $\tilde{r}_\Theta \leq 2\tilde{r}$),

$$\left| \tilde{r}^{1+\sigma} \partial_\sigma \Phi \left( \frac{V}{\tilde{r}_\Theta} \right) \right| \leq \left| \tilde{r}^{1+\sigma} \partial_\sigma \Phi \left( \frac{V}{\tilde{r}_\Theta} \right) \right| + \left| \tilde{r}^{1+\sigma} \partial_\sigma \Phi \left( \frac{V}{\tilde{r}_\Theta} - 1 \right) \right| \leq K \|\Psi\|_{*,\sigma,d} + K \left| \tilde{r}_\Theta \partial_\sigma \Phi \right| \leq K \|\Psi\|_{*,\sigma,d}.$$

Using (3.2), we can estimate similarly all the terms in (3.1).

We define similarly, for $g = V_\Theta(g_1 + ig_2) \in C^0(\mathbb{R}^2)$,

$$\|g\|_{\Theta,\sigma,d_\sigma} := \|g\|_{C^0((\tilde{r} \leq 3))} + \|\tilde{r}^{1+\sigma} g_1 \|_{L^\infty((\tilde{r} \geq 2))} + \|\tilde{r}^{2+\sigma} g_2 \|_{L^\infty((\tilde{r} \geq 2))}$$

and we will use, for $\gamma(\sigma) = \min\left(2\sigma, \frac{1+\sigma}{2}, \frac{1+2\sigma}{2}\right) > \sigma$,

$$\|g\|_{\Theta,\sigma,\gamma(\sigma),d_\sigma} := \|g\|_{C^0((\tilde{r} \leq 3))} + \|\tilde{r}^{1+\gamma(\sigma)} g_1 \|_{L^\infty((\tilde{r} \geq 2))} + \|\tilde{r}^{2+\gamma(\sigma)} g_2 \|_{L^\infty((\tilde{r} \geq 2))}.$$

We have that there exist $C_1, C_2 > 0$ universal constants such that, for $0 < \sigma < 1$ and any $d, d_\sigma \geq 10$ with $|d - d_\sigma| < \delta$, for any $Vh \in \mathcal{E}_{**,\sigma,d}, g = Vh$,

$$C_1 \|h\|_{**,\sigma,d} \leq \|g\|_{\Theta,\sigma,d_\sigma} \leq C_2 \|h\|_{**,\sigma,d}$$

and, since $0 < \gamma(\sigma) < 1$ for $0 < \sigma < 1$,

$$C_1 \|h\|_{**,\gamma(\sigma),d} \leq \|g\|_{\Theta,\sigma,\gamma(\sigma),d_\sigma} \leq C_2 \|h\|_{**,\gamma(\sigma),d}.$$

We define the spaces

$$\mathcal{E}_{\Theta,\sigma,d_\sigma} :=$$
\( \{ \Phi \in C^1(\mathbb{R}^2, \mathbb{C}), \| \Phi \|_{\sigma, \sigma, d_0} < +\infty, (\Phi, Z_{d_0}) = 0, \forall \Phi \in \mathbb{R}^2, \Phi(x_1, x_2) = \Phi(x_1, -x_2) = \Phi(-x_1, x_2) \} \)

and

\[
\mathcal{E}_{\sigma, \sigma, d_0} := \{ g \in C^0(\mathbb{R}^2, \mathbb{C}), \| g \|_{\sigma, \sigma, d_0} + \| g \|_{\sigma, \sigma, \sigma} < +\infty \}.
\]

We infer that, from Proposition 2.16, that the operator

\[
(\eta L(\cdot) + (1 - \eta)V L'(\cdot/V))^{-1} o_{\mathcal{I} \sigma}^d
\]

goes from \( \mathcal{E}_{\sigma, \sigma, d_0} \) to \( \mathcal{E}_{\sigma, \sigma, d_0} \), and that

\[
\| (\eta L(\cdot) + (1 - \eta)V L'(\cdot/V))^{-1} o_{\mathcal{I} \sigma}^d \| \mathcal{E}_{\sigma, \sigma, d_0} \rightarrow \mathcal{E}_{\sigma, \sigma, d_0}
\]

is bounded independently of \( c, d \) and \( d_0 \) if \( |d - d_0| < \delta \) (for the norm \( \| \cdot \|_{\sigma, \sigma, d_0} + C_{\sigma}^{-\delta} \| \cdot \|_{\sigma, \sigma, \sigma} \) on \( \mathcal{E}_{\sigma, \sigma, d_0} \)). Indeed, the norms \( \| \cdot \|_{\sigma, \sigma, d_0} \) and \( \| \cdot \|_{\sigma, \sigma, d_0} \) are equivalent, as well as the norms \( \| \cdot \|_{\sigma, \sigma, d_0} \) and \( \| \cdot \|_{\sigma, \sigma, d_0} \) for any \( \sigma > 0 \). About the orthogonality condition, we replaced \( (\Phi, Z_{d_0}) = 0 \). This does not change the proof of Proposition 2.16, since when we argue by contradiction, if for a universal constant \( |\lambda| \leq \delta \) we took the orthogonality condition \( (\Phi, Z_{d_0+\lambda}) = 0 \) instead of \( (\Phi, Z_{d_0}) = 0 \), the proof does not change, given that \( \delta \) is small enough (independently of \( d_0 \)). To be specific, we have to take \( \delta \) small enough such that \( (\delta x_1, V_1, \delta x_1, V_1(\cdot + \lambda)) > 0 \) for all \( \lambda \in [-\delta, \delta] \).

Therefore, we take a sequence \( D^{(n)} > 0 \) going to infinity such that \( |D^{(n+1)} - D^{(n)}| < \delta/2 \), and for any given \( d \) large enough, there exists \( k(d) \) such that \( d \in D^{(k(d))} - \delta/2, D^{(k(d))} + \delta/2 \), and the proof of Proposition 2.16 holds with the orthogonality \( (\Phi, Z_{d_0+k(d)}) = 0 \) for any value of \( d \) in \( |D^{(k(d))} - \delta/2, D^{(k(d))} + \delta/2 | \). We denote \( D^{(k(d))} = d_0 \). The inversion of the linearized operator then holds for \( d \in |D^{(n)} - \delta/2, D^{(n)} + \delta/2 | \) with \( D^{(n)} = d_0 \), for all \( n \in \mathbb{N} \) large enough.

In the proof of Proposition 2.16, we were at fixed \( \sigma \), but now we have estimates for any values of \( 0 < \sigma < 1 \). Furthermore, the contraction arguments given in the proof of Proposition 2.20 still hold (because the norms are equivalent), hence we can define \( \Phi_{c,d} \) by a fixed point argument if \( \sqrt{\frac{d}{2}} \leq c \leq \frac{\delta}{\sqrt{2}} \) and \( |d - d_0| < \delta \) in the space \( \mathcal{E}_{\sigma, \sigma, d_0} \) that does not depend on \( d \).

We want to emphasize the fact that we change a little the definition of the spaces compared to section 2. In particular, for \( \Phi = V \Psi \), the norm \( \| \cdot \|_{\sigma, \sigma, d_0} \) is on the function \( \Phi \), and before, for \( \| \cdot \|_{\sigma, \sigma, d_0} \) it was on \( \Psi \). This is because \( V \) depends on \( d_0 \), and we want to remove any dependence on \( d_0 \). The same remark holds for \( \| \cdot \|_{\sigma, \sigma, d_0} \) and \( \| \cdot \|_{\sigma, \sigma, d_0} \) (with \( g = V h \)).

We continue, and we define

\[
H(\Phi, c, d) := (\eta L(\cdot) + (1 - \eta)V L'(\cdot/V))^{-1}(-\Pi_1^d(F(\Phi/V))) + \Phi.
\]

The function \( \Phi_{c,d} \in \mathcal{E}_{\sigma, \sigma, d_0} \) is defined, for \( \frac{1}{2d} < c < \frac{\delta}{\sqrt{2}} \) and \( |d - d_0| < \delta \), by being the only solution in a ball of \( \mathcal{E}_{\sigma, \sigma, d_0} \) (with a radius depending on \( \sigma \) and \( d_0 \) but not \( d \)) to the implicit equation on \( \Phi \): \( H(\Phi, c, d) = 0 \). This means that we shall be able to use the implicit function theorem in the space \( \mathcal{E}_{\sigma, \sigma, d_0} \) on the equation \( H(\Phi, c, d) = 0 \) to show that \( \Phi_{c,d} \) is a \( C^1 \) function of \( d \) in \( \mathcal{E}_{\sigma, \sigma, d_0} \) (for values of \( d_0 \) such that \( \frac{1}{2d} < c < \frac{\delta}{\sqrt{2}} \) and \( |d - d_0| < \delta \)). We will not be able to use the implicit function theorem for \( c \to \Phi_{c,d} \) (it is not obvious that \( \partial_c H(\Phi, d, c) \in \mathcal{E}_{\sigma, \sigma, c_0} \) because of the term \( \partial_c(i\sigma \partial_x \Phi) = i\partial_x \Phi = \partial_x \Phi \in \mathcal{E}_{\sigma, \sigma, d_0} \) (a priori), and we will show the differentiability with respect to \( c \) by another way. We do not have this issue for \( d \to \Phi_{c,d} \), since the derivative of the transport term \( i\sigma \partial_x \Phi \) with respect to \( d \) is 0 (at fixed \( \Phi \)). We want to differentiate this equation with respect to \( \Phi \) at a fixed \( c \) and \( d \), and show that we can invert the operator obtained when we take \( \Phi \) close to \( \Phi_{c,d} \). Since \( (\eta L(\cdot) + (1 - \eta)V L'(\cdot/V))^{-1} \) and \( \Pi_1^d \) are linear operators that do not depend on \( \Phi \), it is easy to check that \( H(\Phi, c, d) \) is differentiable with respect to \( \Phi \), and we compute

\[
d_\Phi H(\Phi, c, d)(\varphi) = (\eta L(\cdot) + (1 - \eta)V L'(\cdot/V))^{-1}\Pi_1^d(\varphi (V(\cdot/V))) + \varphi.
\]

To show that \( d_\Phi H(\Phi, c, d) : \mathcal{E}_{\sigma, \sigma, d_0} \to \mathcal{E}_{\sigma, \sigma, d_0} \) and that it is invertible, it is enough to check that

\[
\| (\eta L(\cdot) + (1 - \eta)V L'(\cdot/V))^{-1}\Pi_1^d(d_\Phi F(\varphi (V(\cdot/V)))) \| \mathcal{E}_{\sigma, \sigma, d_0} \to \mathcal{E}_{\sigma, \sigma, d_0} = o_{\mathcal{I} \sigma}^d (1),
\]

which implies that \( d_\Phi H(\Phi, c, d) \) is a small perturbation of \( -\Id \) for small values of \( c \) (at fixed \( \sigma \)). From Proposition 2.16, we have that \( \| (\eta L(\cdot) + (1 - \eta)V L'(\cdot/V))^{-1} o_{\mathcal{I} \sigma}^d \| \mathcal{E}_{\sigma, \sigma, d_0} \to \mathcal{E}_{\sigma, \sigma, d_0} \) is bounded independently of \( d \) and \( d_0 \) if \( |d - d_0| < \delta \), thus it is enough to check that

\[
\| d_\Phi F(\cdot) \| \mathcal{E}_{\sigma, \sigma, d_0} \to \mathcal{E}_{\sigma, \sigma, d_0} = o_{\mathcal{I} \sigma}^d (1).
\]

55
for the norm \( \| \|_{*|\mathbb{R}, \sigma} + \frac{1}{\gamma} \| \|_{*|\mathbb{R}, \gamma} \) on \( \mathcal{E}_{*|\mathbb{R}, \sigma, d} \). This is a consequence of the following lemma (for functions \( \Phi = V\Psi \) such that \( \| \Psi \|_{*, \sigma, d} = o^{2}_{*|\mathbb{R}}(1) \), which is the case if \( \Phi \) is near \( \Phi_{c, d} \)), and where we do the computations with the *-norms since they are equivalent, with uniform constants, to the \( \circ \)-norms.

**Lemma 3.1** There exists \( C > 0 \) such that, for \( 0 < \sigma < 1 \) and functions \( \Phi = V\Psi, \varphi = V\psi \in \mathcal{E}_{*|\mathbb{R}, \sigma, d} \), if \( \frac{1}{2|d|} < c < \frac{2}{|d|} \) and \( \| \Psi \|_{*, \sigma, d} \leq 1 \), then

\[
\| d\Phi F(\psi) \|_{*, \sigma, d} + \| d\Phi F(\psi) \|_{*, \gamma(\sigma), d} \leq C \| \Psi \|_{*, \sigma, d} \| \psi \|_{*, \sigma, d}.
\]

**Proof** Recall from Lemma 2.7 that

\[
F(\Psi) = E - ic\partial_{\zeta}V + V(1 - \eta)(-\nabla \Psi, \nabla \Psi) + |V|^{2}S(\Psi) + R(\Psi)
\]

with \( S(\Psi) = e^{2\Re(\Psi)} - 1 - 2\Re(\Psi) \) and \( R(\Psi) \) at least quadratic in \( \Phi \) and supported in \( \{ \tilde{r} \leq 2 \} \). We compute

\[
d\Phi F(\psi) = V(1 - \eta)(-2\nabla \Psi, \psi) + |V|^{2}dS(\psi) + d\Phi R(\psi).
\]

We recall the condition \( \frac{1}{2|d|} < c < \frac{2}{|d|} \). For the term \( d\Phi R(\psi) \), since \( R \) is a sum of terms at least quadratic in \( \Phi \) and is supported in \( \{ \tilde{r} \leq 2 \} \) (see the proof of Lemma 2.7), when we differentiate, every term has \( \Psi \) or \( \nabla \Psi \) as a factor. Therefore,

\[
\| d\Phi R(\psi) \|_{*, \sigma, d} + \| d\Phi R(\psi) \|_{*, \gamma(\sigma), d} \leq K \| \Phi \|_{C^{1}((\tilde{r} \leq 2))} \| \Psi \|_{C^{1}((\tilde{r} \leq 2))} \\
\leq K \| \Psi \|_{*, \sigma, d} \| \psi \|_{*, \sigma, d}.
\]

Now, for \( \Re(\nabla \Psi, \nabla \psi) \), we have

\[
\| \tilde{r}^{1+\gamma} \Re(\nabla \Psi, \nabla \psi) \|_{L^{\infty}((\tilde{r} \geq 2))} \leq \| \tilde{r}^{1+2\gamma} \nabla \Re(\Psi, \nabla \Psi) \|_{L^{\infty}((\tilde{r} \geq 2))} + \| \tilde{r}^{1+2\gamma} \Im(\nabla \Psi, \nabla \psi) \|_{L^{\infty}((\tilde{r} \geq 2))} \\
\leq K \| \Psi \|_{*, \sigma, d} \| \psi \|_{*, \sigma, d}.
\]

Similarly,

\[
\| \tilde{r}^{2+\gamma} \Im(\nabla \Psi, \nabla \psi) \|_{L^{\infty}((\tilde{r} \geq 2))} \leq \| \tilde{r}^{2+2\gamma} \nabla \Re(\Psi, \nabla \psi) \|_{L^{\infty}((\tilde{r} \geq 2))} + \| \tilde{r}^{2+2\gamma} \Im(\nabla \Psi, \nabla \psi) \|_{L^{\infty}((\tilde{r} \geq 2))} \\
\leq K \| \Psi \|_{*, \sigma, d} \| \psi \|_{*, \sigma, d}.
\]

Finally, we have

\[
d\Phi S(\psi) = 2\Re(\psi)(e^{2\Re(\psi)} - 1),
\]

a real-valued term, and since \( \| \Psi \|_{*, \sigma, d} \leq 1, \gamma(\sigma) \leq 2\sigma \),

\[
\| \tilde{r}^{1+\gamma(\sigma)} \Re(\psi)(e^{2\Re(\psi, \varphi)} - 1) \|_{L^{\infty}((\tilde{r} \geq 2))} \leq K \| \psi \|_{*, \sigma, d} \| \tilde{r}^{\sigma} e^{2\Re(\psi, \varphi)} - 1 \|_{L^{\infty}((\tilde{r} \geq 2))} \\
\leq K \| \Psi_{c, d} \|_{*, \sigma, d} \| \psi \|_{*, \sigma, d}.
\]

These estimates imply

\[
\| d\Phi F(\psi) \|_{*, \sigma, d} + \| d\Phi F(\psi) \|_{*, \gamma(\sigma), d} \leq C \| \Psi_{c, d} \|_{*, \sigma, d} \| \psi \|_{*, \sigma, d}.
\]

\[ \square \]

### 3.1.2 Proof of the differentiability of \( \Phi_{c, d} \) with respect to \( c \) and \( d \)

We shall now show that \( c \mapsto \Phi_{c, d} \) is \( C^{1} \) and compute estimates on \( \partial_{c}\Phi_{c, d} \) at fixed \( d \), and then show that \( d \mapsto \Phi_{c, d} \) is \( C^{1} \) at fixed \( c \) and estimate \( \partial_{d}\Phi_{c, d} \). These estimates will be useful in subsection 4.6. For \( d \mapsto \Phi_{c, d} \), we use the implicit function theorem (see Lemma 3.3), but we start here with the derivation with respect to \( c \).

**Lemma 3.2** For \( 0 < \sigma < 1 \), there exists \( c_{0}(\sigma) > 0 \) such that, at fixed \( d > \frac{1}{2c_{0}(\sigma)} \),

\[
c \mapsto \Phi_{c, d} \in C^{1} \left( \frac{1}{2|d|}, \left[ \frac{2}{|d|}, \infty \right) \right) \cap [0, c_{0}(\sigma[, \mathcal{E}_{*|\mathbb{R}, \sigma, d})].
\]
Remark that, at fixed $d$, $\partial_c \Psi_{c,d} = V \partial_c \Psi_{c,d}$.

**Proof** In this proof, we consider a fixed $d > \frac{1}{2 c_0(\sigma)}$. We define, for $c \in \mathbb{R}$ such that $\frac{1}{2d} < c < \frac{2}{d}$ and $0 < c < c_0(\sigma)$, the operator

$$\mathbb{H}_c : \Phi \mapsto (\eta L(.) + (1 - \eta)V L'(.)/V)^{-1} (\Pi^c_{\sigma} (F(\Phi/V)))$$

from $E_{\oplus, \sigma, d_\oplus}$ to $E_{\oplus, \sigma, d_\oplus}$. The dependency on $c$ is coming from both $F$ and $(\eta L(.) + (1 - \eta)V L'(.)/V)^{-1}$, and in this proof, we will add a subscript on these functions giving the value of $c$ where it is taken. Take $c' \in \mathbb{R}$ such that $\frac{1}{2d} < c' < \frac{2}{d}$ and $0 < c' < c_0(\sigma)$, and let us show that

$$\|\mathbb{H}_{c+\varepsilon}(\Phi_{c',d}) - \mathbb{H}_c(\Phi_{c',d})\|_{\oplus, \sigma, d_\oplus} = o^{c,c}_{c_\rightarrow 0}(1).$$

In particular, remark that we look for a convergence uniform in $c'$. By definition of the operator $(\eta L(.) + (1 - \eta)V L'(.)/V)^{-1}$, the function $\mathbb{H}_{c+\varepsilon}(\Phi_{c',d})$ is such that, in the distribution sense,

$$(\eta L(.) + (1 - \eta)V L'(.))_{c+\varepsilon} (\mathbb{H}_{c+\varepsilon}(\Phi_{c',d})) = \Pi^c_{\sigma} (F_{c+\varepsilon}(\Phi_{c',d}/V)).$$

Since $\Phi_{c',d} \in C^\infty(\mathbb{R}^2)$, we have that $\mathbb{H}_{c+\varepsilon}(\Phi_{c',d}) \in C^\infty(\mathbb{R}^2)$ and the equation is satisfied in the strong sense. We check, following the proofs of Lemmas 2.28 and 2.29 that

$$\left\| e^{2+\sigma} \nabla \Re \left( \frac{\mathbb{H}_{c+\varepsilon}(\Phi_{c',d})}{V} \right) \right\|_{L^\infty(\mathbb{R}^2)} \leq K(\sigma)((c + \varepsilon)^{1-\sigma} + c^{1-\sigma}) \leq K(\sigma) c_0(\sigma)^{1-\sigma}.$$

Indeed, the estimates on $h$ in Lemmas 2.28 and 2.29 are identical, and we simply have to change $\Phi = V \Psi$ by $\mathbb{H}_{c+\varepsilon}(\Phi_{c',d})/V$ in the computations. This does not hold if we only had taken $\Phi \in E_{\oplus, \sigma, d_\oplus}$ instead of $\Phi_{c',d}$, and this is the main reason why it is not obvious to do an implicit function theorem for the differentiability with respect to $c$. We check similarly that

$$(\eta L(.) + (1 - \eta)V L'(.))_{c} (\mathbb{H}_c(\Phi_{c',d})) = \Pi^c_{\sigma} (F_c(\Phi_{c',d}/V)).$$

Now, from the definitions of $L$ and $L'$ from Lemma 2.7, we have

$$\left( (\eta L(.) + (1 - \eta)V L'(.))_{c+\varepsilon} \right)_{c+\varepsilon} (\mathbb{H}_{c+\varepsilon}(\Phi_{c',d})) = \left( (\eta L(.) + (1 - \eta)V L'(.))_{c} \right)_{c} (\mathbb{H}_{c}(\Phi_{c',d}))$$

and therefore

$$\left( (\eta L(.) + (1 - \eta)V L'(.))_{c} \right)_{c} (\mathbb{H}_{c+\varepsilon}(\Phi_{c',d}) - \mathbb{H}_c(\Phi_{c',d})) = -(\Pi^c_{\sigma} (F_{c+\varepsilon}(\Phi_{c',d}/V) - F_c(\Phi_{c',d}/V)))$$

$$- i\varepsilon (\eta \partial_{x_2} \mathbb{H}_{c+\varepsilon}(\Phi_{c',d}) + (1 - \eta)V \partial_{x_2} \left( \frac{\mathbb{H}_{c+\varepsilon}(\Phi_{c',d})}{V} \right)).$$

We check, since $\mathbb{H}_{c+\varepsilon}(\Phi_{c',d}) \in E_{\oplus, \sigma, d_\oplus}$ and with the estimate

$$\left\| e^{2+\sigma} \nabla \Re \left( \frac{\mathbb{H}_{c+\varepsilon}(\Phi_{c',d})}{V} \right) \right\|_{L^\infty(\mathbb{R}^2)} \leq K(\sigma) c_0(\sigma)^{1-\sigma}$$

for any $0 < \sigma < 1$, that the right hand side is in $E_{\oplus, \sigma, d_\oplus}$. In particular, by Proposition 2.16 (from $E_{\oplus, \sigma, d_\oplus}$ to $E_{\oplus, \sigma, d_\oplus}$), we have

$$\|\mathbb{H}_{c+\varepsilon}(\Phi_{c',d}) - \mathbb{H}_c(\Phi_{c',d})\|_{\oplus, \sigma, d_\oplus} \leq K(\sigma) c_0(\sigma)^{1-\sigma}$$

$$+ K(\sigma) \varepsilon.$$
We recall that
\[ F_c(\Psi) = E - ic\partial_{x_2} V + V(1 - \eta)(-\nabla\Psi \cdot \nabla\Psi + |V|^2 S(\Psi)) + R_c(\Psi), \]
therefore
\[ F_{c+\varepsilon}(\Phi_{c',d}/V) - F_c(\Phi_{c',d}/V) = -ic\partial_{x_2} V + R_{c+\varepsilon}(\Phi_{c',d}/V) - R_c(\Phi_{c',d}/V). \]

By Lemma 2.5 (for \( i\partial_{x_2} V \)) and the definition of \( R_c \) (in the proof of Lemma 2.7), we check that, for any \( 0 < \sigma < 1 \), since \( \|\Psi_{c',d}\|_{s,\sigma} \leq K(\sigma)c_0(\sigma)^{1-\sigma} \),
\[ \|\Pi^d_\varepsilon(F_{c+\varepsilon}(\Phi_{c',d}/V) - F_c(\Phi_{c',d}/V))\|_{s,\sigma, d_\emptyset} \leq K(\sigma)c_0(\sigma)^{1-\sigma}. \]

We conclude that
\[ \|\Pi^d_\varepsilon(\Phi_{c',d}) - \Pi^d_\varepsilon(\Phi_{c',d})\|_{s,\sigma, d_\emptyset} = o_{\varepsilon\to 0}(1), \]
thus \( \Pi^d_{c+\varepsilon}(\Phi_{c',d}) \to \Pi^d_{c}(\Phi_{c',d}) \) when \( \varepsilon \to 0 \) in \( \mathcal{E}_{s,\sigma, d_\emptyset} \) uniformly in \( c' \). We remark that it is also uniform in \( d \) in any compact set of \( 0, c_0(\sigma) \).

The next step is to show that \( c \to \Phi_{c,d} \) is a continuous function in \( \mathcal{E}_{s,\sigma, d} \). Take \( \varepsilon_n \) a sequence such that \( \varepsilon_n \to 0 \) when \( n \to \infty \), then \( \|\Phi_{c+\varepsilon_n, d}\|_{s,\sigma, d} \leq K_0(\sigma)(c + \varepsilon_n)^{-\sigma} \) (for \( K_0(\sigma) \) the constant in Proposition 2.20), and (in the strong sense)
\[ \left( \eta L(.) + (1 - \eta)VL'\left(\frac{\Psi}{V}\right) \right)_{\varepsilon + \varepsilon_n} (\Phi_{c+\varepsilon_n, d} + \Pi^d_{c+\varepsilon_n}(F_{c+\varepsilon_n}(\Phi_{c+\varepsilon_n,d}/V)) = 0. \]

With the same arguments as in step 1 of the proof of Proposition 2.16, we check that, up to a subsequence, \( \Phi_{c+\varepsilon_n} \to \Phi \) locally uniformly in \( \mathbb{R}^2 \) for some function \( \Phi \in \mathcal{E}_{s,\sigma, d} \) such that \( \|\Phi\|_{s,\sigma, d} \leq K_0(\sigma)c_0(\sigma)^{1-\sigma} \). Then, since
\[ \Pi^d_{c+\varepsilon_n}\Phi_{c+\varepsilon_n,d} + \Phi_{c+\varepsilon_n,d} = 0, \]
by taking the limit when \( n \to \infty \), up to a subsequence, since \( \Pi^d_{c+\varepsilon}(\Phi_{c',d}) \to \Pi^d_{c}(\Phi_{c',d}) \) when \( \varepsilon \to 0 \) in \( \mathcal{E}_{s,\sigma, d} \) (the norm is equivalent to the one of \( \mathcal{E}_{s,\sigma, d_\emptyset} \)) uniformly in \( c' \), we have
\[ \Pi^d_{c}(\Phi) + \Phi = 0. \]

But then, \( \Phi \in \mathcal{E}_{s,\sigma, d}, \|\Phi\|_{s,\sigma, d} \leq K_0(\sigma)c_0(\sigma)^{1-\sigma} \) and \( \Pi^d_{c}(\Phi) + \Phi = H(\Phi, c, d) = 0 \). By Proposition 2.20, this implies that \( \Phi = \Phi_{c,d} \), therefore \( \Phi_{c,d} \) is an accumulation point of \( \Phi_{c+\varepsilon_n,d} \). It is the only accumulation point, since any other will also satisfy \( \Phi \in \mathcal{E}_{s,\sigma, d}, \|\Phi\|_{s,\sigma, d} \leq K_0(\sigma)c_0(\sigma)^{1-\sigma} \) and \( H(\Phi, c, d) = 0 \). Therefore, \( \Phi_{c+\varepsilon_n,d} \to \Phi_{c,d} \) in \( \mathcal{E}_{s,\sigma, d} \), hence \( c \to \Phi_{c,d} \) is a continuous function in \( \mathcal{E}_{s,\sigma, d} \).

Now, let us show that it is a \( C^1 \) function in \( \mathcal{E}_{s,\sigma, d} \). Since \( \Pi^d_{c}(\Phi_{c,d}) + \Phi_{c,d} = 0 \), we have
\[ \left( \eta L(.) + (1 - \eta)VL'\left(\frac{\Psi}{V}\right) \right)_{c} (\Phi_{c+\varepsilon,d} - \Phi_{c,d}) = -\Pi^d_{c}(F_c(\Phi_{c',d}/V) - F_c(\Phi_{c,d}/V)) \]
\[ - ic \left( \eta \partial_{x_2} \Phi_{c+\varepsilon,d} + (1 - \eta)V \partial_{x_2} \left( \frac{\Phi_{c+\varepsilon,d}}{V} \right) \right). \]

Furthermore, from \( \|\Pi^d_{c}(F_{c+\varepsilon}(\Phi_{c',d}/V) - F_c(\Phi_{c',d}/V))\|_{s,\sigma, d_\emptyset} \leq K(\sigma,c)\varepsilon \) and
\[ \left\| i \left( \eta \partial_{x_2} \Phi_{c+\varepsilon,d} + (1 - \eta)V \partial_{x_2} \left( \frac{\Phi_{c+\varepsilon,d}}{V} \right) \right) \right\|_{s,\sigma, d_\emptyset} \leq K(\sigma,c)\varepsilon, \]
we deduce that \( \|\Phi_{c+\varepsilon,d} - \Phi_{c,d}\|_{s,\sigma, d_\emptyset} \leq K(\sigma,c)\varepsilon / \varepsilon_n \).

From the definition of \( F \), we infer that, for any \( 0 < \sigma < 1 \),
\[ F_{c+\varepsilon}(\Phi_{c+\varepsilon,d}/V) - F_c(\Phi_{c,d}/V) = -ic\partial_{x_2} V \]
\[ + V(1 - \eta)(\nabla\Psi_{c+\varepsilon,d} \cdot \nabla\Psi_{c+\varepsilon,d} + \nabla\Psi_{c,d} \cdot \nabla\Psi_{c,d}) \]
\[ + V(1 - \eta)|V|^2 (S(\Psi_{c+\varepsilon,d}) - S(\Psi_{c,d})) \]
\[ + R_{c+\varepsilon}(\Psi_{c+\varepsilon,d}) - R_c(\Psi_{c,d}). \]
We deduce that 
\[ \Pi^\perp_d (F_{c+d}(\Phi_{c+d})/V) = \Pi^\perp_d (d\Phi F_{c}(\Phi_{c+d})/V) + \varepsilon \Pi^\perp_d (-i\partial x_2 V) + O^\sigma_{\|\cdot\|,\sigma,d}^c (\varepsilon^2). \]

We deduce that 
\[ \left( \text{Id} + (\eta L(.) + (1 - \eta)VL'(.\varepsilon)\right)^{-1} \Pi^\perp_d (d\Phi F_{c}(\Phi_{c+d})/V) = \left( \eta L(.) + (1 - \eta)VL'(.\varepsilon)\right)^{-1} \left( -\varepsilon \Pi^\perp_d (-i\partial x_2 V) - i\varepsilon \left( \eta \partial x_2 \Phi_{c+d} + (1 - \eta) V \partial x_2 \left( \Pi^\perp_d \frac{\Phi_{c+d}}{V} \right) \right) \right) \]
and we have shown that \( \left( \text{Id} + (\eta L(.) + (1 - \eta)VL'(.\varepsilon)\right)^{-1} \Pi^\perp_d (d\Phi F_{c}(\Phi_{c+d})/V) \) is invertible from \( \mathcal{E}_{\|\cdot\|,\sigma,d} \) to \( \mathcal{E}_{\|\cdot\|,\sigma,d} \)
(with an operator norm equal to \( 1 + o_{\epsilon,d}(1) \)) if taken in \( \Phi = \Phi_{c,d} \), see Lemma 3.1). Furthermore, \( \Phi_{c,d} \) is continuous with respect to \( c \) in \( \mathcal{E}_{\|\cdot\|,\sigma,d} \), therefore 
\[ \eta \partial x_2 \Phi_{c+d} + (1 - \eta) V \partial x_2 \left( \Pi^\perp_d \frac{\Phi_{c+d}}{V} \right) \] in \( \mathcal{E}_{\|\cdot\|,\sigma,d} \) when \( \epsilon \to 0 \). We deduce that \( c \mapsto \Phi_{c,d} \) is \( C^1 \) in \( \mathcal{E}_{\|\cdot\|,\sigma,d} \) (and therefore in \( \mathcal{E}_{\|\cdot\|,\sigma,d} \)).

Now, we show the differentiability of \( \Phi_{c,d} \) with respect to \( d \).

**Lemma 3.3** For \( 0 < \sigma < 1 \), there exists \( c_0(\sigma) > 0 \) such that, for \( 0 < c < c_0(\sigma) \),
\[ d \mapsto \Phi_{c,d} \in C^1 \left( \left[ \frac{1}{2c}, \frac{2}{c} \right] \cap \left[ \frac{1}{2c_0}, \frac{2}{c_0} \right], \mathcal{E}_{\|\cdot\|,\sigma,d} \right), \]

We recall that \( \varepsilon > 0 \) is defined at the beginning of this subsection.

**Proof** We fix \( 0 < c < c_0(\sigma) \). We define, for \( d \in \left[ \frac{1}{2c}, \frac{2}{c} \right] \cap \left[ \frac{1}{2c_0}, \frac{2}{c_0} \right], \) the function 
\[ H_d : \Phi \mapsto (\eta L(.) + (1 - \eta)VL'(.\varepsilon))^{-1} \left( \Pi^\perp_d (\Phi_{c,d} / V) \right) \]
from \( \mathcal{E}_{\|\cdot\|,\sigma,d} \) to \( \mathcal{E}_{\|\cdot\|,\sigma,d} \), so that 
\[ H(\Phi, c, d) = H_d(\Phi) + \Phi. \]
We took the same convention as in the proof of Lemma 3.2: we added a subscript in \( d \) in the operators to describe at which values of \( d \) this operator is taken.

Step 1. Differentiability of \( H_d \) with respect to \( d \).

To apply the implicit function theorem, we have to check that \( H(\Phi, c, d) \) (or, equivalently \( H_d(\Phi) \)) is differentiable with respect to \( d \), and that \( \partial_d H(\Phi, c, d) \in \mathcal{E}_{\|\cdot\|,\sigma,d} \). By definition of the operator \( \eta L(.) + (1 - \eta)VL'(.\varepsilon)^{-1} \), we have, in the distribution sense,
\[ \left( \eta L(\Pi_{d+\varepsilon} H_d(\Phi)) + (1 - \eta)VL' \left( \frac{\Pi_{d+\varepsilon} H_d(\Phi)}{V} \right) \right)_{d+\varepsilon} + \Pi_{d+\varepsilon}^\perp (\Phi_{V_{d+\varepsilon}}) = 0 \]
and 
\[ \left( \eta L(\Pi_d(\Phi)) + (1 - \eta)VL' \left( \frac{\Pi_d(\Phi)}{V} \right) \right) + \Pi^\perp_d (\Phi_{V_d}) = 0. \]
From Lemma 2.7, we have, for any \( \Phi = V_d \Psi \in \mathcal{E}_{\theta, \sigma, d_\delta} \) that

\[
\left( \eta L(\cdot) + (1 - \eta)VL\left(\frac{x}{V}\right) \right)_d (\Phi) = L_d(\Phi) - (1 - \eta_d)(E - i c \partial_{x_2} V)_d \Psi,
\]
and with the definition of \( L_d \) (in Lemma 2.7), we check that, for any \( \Phi \in \mathcal{E}_{\theta, \sigma, d_\delta} \), in the distribution sense,

\[
\left( \left( \eta L(\cdot) + (1 - \eta)VL\left(\frac{x}{V}\right) \right)_d \right)(\Phi) = (|V_{d+\varepsilon}|^2 - |V_d|^2)\Phi + 2\Re(\overline{V_{d+\varepsilon}} V_d) - 2\Re(\overline{V_d} V_{d+\varepsilon}) V_d
d + (1 - \eta_d + \varepsilon) (E - i c \partial_{x_2} V)_{d+\varepsilon} + (1 - \eta_d)(E - i c \partial_{x_2} V)_d.
\]

We therefore compute that, in the distribution sense,

\[
\left( \left( \eta L(\cdot) + (1 - \eta)VL\left(\frac{x}{V}\right) \right)_d \right)(\Phi) = \left(\frac{\partial^2}{\partial x_1^2} + \frac{\partial^2}{\partial x_1 \partial x_2} + \frac{\partial^2}{\partial x_2^2} \right)V_{d+\varepsilon} \Phi - \left(\frac{\partial^2}{\partial x_1^2} + \frac{\partial^2}{\partial x_1 \partial x_2} + \frac{\partial^2}{\partial x_2^2} \right)V_d \Phi
\]

with Lemmas 2.1, 2.6 and equation (2.3), we check easily that

\[
|V_{d+\varepsilon}|^2 - |V_d|^2 = \varepsilon \partial_d(|V|^2) + \frac{O^\varepsilon_{\varepsilon \rightarrow 0}(\varepsilon^2)}{(1 + \varepsilon)^3}.
\]

It implies in particular that \((|V_{d+\varepsilon}|^2 - |V_d|^2)H_{d+\varepsilon} \Phi \in \mathcal{E}_{\theta, \sigma, d_\delta} \), with

\[
||(|V_{d+\varepsilon}|^2 - |V_d|^2)H_{d+\varepsilon} \Phi \||_{\theta, \sigma, d_\delta} + ||(|V_{d+\varepsilon}|^2 - |V_d|^2)H_{d+\varepsilon} \Phi \||_{\theta, \gamma(\sigma), d_\delta} \rightarrow 0
\]

when \( \varepsilon \rightarrow 0 \). We check similarly

\[
2\Re(\overline{V_{d+\varepsilon}} H_{d+\varepsilon} \Phi)V_d + 2\Re(\overline{V_d} H_{d+\varepsilon} \Phi)V_d
\]

and that \( 2\Re(\overline{\partial_d V} H_{d+\varepsilon} \Phi)D - 2\Re(\overline{V_d} H_{d+\varepsilon} \Phi)D_d \Phi \)

and that \( 2\Re(\overline{\partial_d V} H_{d+\varepsilon} \Phi)D - 2\Re(\overline{V_d} H_{d+\varepsilon} \Phi)D_d \Phi \)

and that \( \partial_d(|V_{d+\varepsilon}|^2 - |V_d|^2)H_{d+\varepsilon} \Phi \in \mathcal{E}_{\theta, \sigma, d_\delta} \). We continue, still with Lemmas 2.1, 2.6 and equation (2.3), we infer

\[
((1 - \eta_d + \varepsilon) (E - i c \partial_{x_2} V)_{d+\varepsilon} - (1 - \eta_d)(E - i c \partial_{x_2} V)_d)H_{d+\varepsilon} \Phi
\]

and that \( \partial_d(|V_{d+\varepsilon}|^2 - |V_d|^2)H_{d+\varepsilon} \Phi \in \mathcal{E}_{\theta, \sigma, d_\delta} \). Finally, we recall that

\[
F_d(\Psi) = (E - i c \partial_{x_2} V)_d + V_d(1 - \eta)(-\nabla \Psi, \nabla \Psi + |V|^2 S(\Psi)) + R_d(\Psi),
\]

and we check similarly that

\[
\Pi^\perp_{d+\varepsilon}(F_d(\Phi/V_d)) - \Pi^\perp_d(F_d(\Phi/V_d)) = \varepsilon \partial_d(\Pi^\perp_d(F_d(\Phi/V_d))) + O^{\varepsilon, d}_{\theta, \sigma, d_\delta + \theta, \gamma(\sigma), d_\delta}(\varepsilon^2).
\]

We have

\[
\partial_d(\Pi^\perp_d(F_d(\Phi/V_d))) = (\partial_d \Pi^\perp_d)(F_d(\Phi/V_d)) + \Pi^\perp_d(\partial_d(F_d(\Phi/V_d))),
\]

and since \( (\partial_d \Pi^\perp_d)(F_d(\Phi/V)) \) is compactly supported, \( (\partial_d \Pi^\perp_d)(F_d(\Phi/V)) \in \mathcal{E}_{\theta, \sigma, d_\delta} \). We will check in the next step that \( \partial_d(F_d(\Phi/V_d)) \in \mathcal{E}_{\theta, \sigma, d_\delta} \). Let us suppose this result for now and finish the proof of the differentiability.
Combining the different estimates, we have in particular that
\[
\left(\eta L(\cdot) + (1 - \eta)V L'\left(\frac{\cdot}{V}\right)\right)_d (\mathbb{H}_{d+\varepsilon}(\Phi) - \mathbb{H}_d(\Phi)) \to 0
\]
in \(\mathcal{E}_{\oplus, \sigma, d}\) when \(\varepsilon \to 0\). By Proposition 2.16 (from \(\mathcal{E}_{\oplus, \sigma, d}\) to \(\mathcal{E}_{\oplus, \sigma, d}\)), this implies that
\[
\mathbb{H}_{d+\varepsilon}(\Phi) \to \mathbb{H}_d(\Phi)
\]
in \(\mathcal{E}_{\oplus, \sigma, d}\) when \(\varepsilon \to 0\). Now, taking the equation
\[
\left(\eta L(\cdot) + (1 - \eta)V L'\left(\frac{\cdot}{V}\right)\right)_d (\mathbb{H}_{d+\varepsilon}(\Phi) - \mathbb{H}_d(\Phi)) = -(V_{d+\varepsilon}^2 - |V_d|^2)\mathbb{H}_{d+\varepsilon}(\Phi) + 2\Re\left(V_{d+\varepsilon} \mathbb{H}_{d+\varepsilon}(\Phi)\right)V_{d+\varepsilon} - 2\Re\left(V_d \mathbb{H}_{d+\varepsilon}(\Phi)\right) V_d + ((1 - \eta_{d+\varepsilon})(E - i\sigma_{d+\varepsilon} V_{d+\varepsilon}) - (1 - \eta_d)(E - i\sigma_d V_d)) \mathbb{H}_{d+\varepsilon}(\Phi) - (\Pi_{d+\varepsilon}(F_d(V_{d+\varepsilon})) - \Pi_d(F_d(V_d)))
\]
and dividing it by \(\varepsilon\), and then taking \(\varepsilon \to 0\), we check that \(d \mapsto \mathbb{H}_d(\Phi)\) is a \(C^1\) function in \(\mathcal{E}_{\oplus, \sigma, d}\), with
\[
\partial_d H(\Phi, c, d) = \partial_d \mathbb{H}_d(\Phi) = \left(\eta L(\cdot) + (1 - \eta)V L'\left(\frac{\cdot}{V}\right)\right)^{-1}(G(d, \Phi)),
\]
with
\[
G(d, \Phi) := \partial_d(|V|^2) \mathbb{H}_d(\Phi) + 2\Re\left(\partial_d V \mathbb{H}_d(\Phi)\right)V_d + 2\Re\left(\partial_d \mathbb{H}_d(\Phi)\right) \partial_d V_d + \partial_d((1 - \eta_d)(E - i\sigma_{d+\varepsilon} V_{d+\varepsilon} + (1 - \eta_d)(E - i\sigma_d V_d)) \mathbb{H}_d(\Phi) - \partial_d(\Pi_d(F_d(V_d))).
\]
By the implicit function theorem, with Lemma 3.1, since \(\|\Psi_{c,d}\|_{*,\sigma,d} \leq K(\sigma)c^1-\sigma\) this implies that, for \(c\) small enough, \(d \mapsto \Phi_{c,d}\) is a \(C^1\) function, and
\[
\partial_d \Phi_{c,d} = -d_k H^{-1}(\partial_d H(\Phi_{c,d}, d, c)).
\]
Now, let us check that indeed \(\partial_d(F_d(\Phi/V_d)) \in \mathcal{E}_{\oplus, \sigma, d}\) for \(\Phi \in \mathcal{E}_{\oplus, \sigma, d}\).

Step 2. Proof of \(\|\partial_d(F_d(\Phi/V_d))\|_{*,\sigma,d} \leq K(\sigma)c^1-\sigma + K\|\Psi\|_{*,\sigma,d}\). By the equivalence of the * and \(\oplus\)-norms, these estimates imply that \(\partial_d(F_d(\Phi/V_d)) \in \mathcal{E}_{\oplus, \sigma, d}\). We suppose from now on that \(\|\Psi\|_{*,\sigma,d} \leq 1\). From Lemma 2.7, we have
\[
F_d\left(\frac{\Phi}{V_d}\right) = (E - i\sigma_{d+\varepsilon} V_{d+\varepsilon}) + R_d\left(\frac{\Phi}{V_d}\right) + V_d(1 - \eta_d)\left(-\nabla\left(\frac{\Phi}{V_d}\right) \cdot \nabla\left(\frac{\Phi}{V_d}\right) + |V_d|^2 S\left(\frac{\Phi}{V_d}\right)\right).
\]
It is easy to check that at fixed \(\Phi, c,\)
\[
\left\|\partial_d\left(R_d\left(\frac{\Phi}{V_d}\right)\right)\right\|_{*,\sigma,d} \leq K(\sigma)c^1-\sigma + K\|\Psi\|_{*,\sigma,d},
\]
since it is localized near the vortices. For the nonlinear part, we have
\[
\frac{\partial_d (V(1 - \eta) (-\nabla\left(\frac{\Phi}{V}\right) \cdot \nabla\left(\frac{\Phi}{V}\right) + |V|^2 S\left(\frac{\Phi}{V}\right)))}{V} = \frac{\partial_d V}{V} (1 - \eta) (-\nabla\Phi \cdot \nabla\Psi + |V|^2 S(\Psi)) - \partial_d\eta (-\nabla\Phi \cdot \nabla\Psi + |V|^2 S(\Psi)) + (1 - \eta) (-2\nabla\Phi \cdot \partial_d \left(\nabla\left(\frac{\Phi}{V_d}\right)\right)) + (1 - \eta) 2\Re\left(\partial_d V \Psi S(\Psi) + (1 - \eta) |V|^2 \partial_d \left(S\left(\frac{\Phi}{V_d}\right)\right).
For the first line, from Lemma 2.6, \( \| \Psi \|_{*,\sigma,d} \leq 1 \) and the definition of \( \| . \|_{*,\sigma,d} \), we have
\[
\left| \frac{\partial_d V}{V} (1 - \eta) \left( -\nabla \Psi \cdot \nabla \Psi + |V|^2 S(\Psi) \right) \right| \leq \frac{K \| \Psi \|_{*,\sigma,d}^2}{(1 + \tilde{r})^3} \leq \frac{K \| \Psi \|_{*,\sigma,d}^2}{(1 + \tilde{r})^3},
\]
which is enough for both estimates. Similarly, since \( \partial_d \eta \) is compactly supported, we have
\[
|\partial_d \eta (-\nabla \Psi \cdot \nabla \Psi + |V|^2 S(\Psi))| \leq \frac{K \| \Psi \|_{*,\sigma,d}^2}{(1 + \tilde{r})^3} \leq \frac{K \| \Psi \|_{*,\sigma,d}^2}{(1 + \tilde{r})^3}.
\]
Now, we develop
\[
\partial_d \left( \nabla \left( \frac{\Phi}{V} \right) \right) = -\frac{\partial_d V \nabla \Phi}{V^2} - \frac{\nabla \partial_d V \Phi}{V^2} + \frac{\partial_d V \Phi \nabla V}{V^3},
\]
and we check, with Lemma 2.6, that
\[
\left| (1 - \eta) \left( -2\nabla \Psi \cdot \partial_d \left( \nabla \left( \frac{\Phi}{V_d} \right) \right) \right) \right| \leq \frac{K \| \Psi \|_{*,\sigma,d}^2}{(1 + \tilde{r})^3} \leq \frac{K \| \Psi \|_{*,\sigma,d}^2}{(1 + \tilde{r})^3}.
\]
Since \( |\Re(\bar{V} \partial_d V)| \leq \frac{K}{(1 + \tilde{r})} \) from Lemma 2.6 and \( |S(\Psi)| \leq K |\Re(\Psi)| \) (since \( \| \Psi \|_{*,\sigma,d} \leq 1 \)), we have similarly
\[
|(1 - \eta) 2\Re(\bar{V} \partial_d V) S(\Psi)| \leq \frac{K \| \Psi \|_{*,\sigma,d}^2}{(1 + \tilde{r})^3},
\]
and finally, since
\[
\partial_d \left( \frac{S \left( \frac{\Phi}{V_d} \right) }{V} \right) = -2\Re \left( \frac{\Phi \partial_d V}{V^2} \right) (e^{2\Re(\Psi)} - 1)
\]
is real-valued, we check that
\[
\left| \partial_d \left( \frac{S \left( \frac{\Phi}{V_d} \right) }{V} \right) \right| \leq \frac{K \| \Psi \|_{*,\sigma,d}^2}{(1 + \tilde{r})^{2+2\sigma}},
\]
and this is enough for both estimates. Finally, we will show that
\[
\left\| \frac{\partial_d (E - i\sigma \partial_{x_1} V)}{V} \right\|_{*,\sigma,d} \leq K(\sigma) c^{1-\sigma},
\]
which would conclude the proof of this step.

Let us show first that
\[
|\partial_d | E| \leq \frac{K c^{1-\sigma}}{(1 + \tilde{r})^{2+2\sigma}}. \tag{3.4}
\]
We have from (2.2) that
\[
E = -2\nabla V_1 \cdot \nabla V_{-1} + (1 - |V_1|^2)(1 - |V_{-1}|^2)V_1 V_{-1},
\]
hence, by Lemma 4.2,
\[
\partial_d E = 2\nabla \partial_{x_1} V_1 \cdot \nabla V_{-1} - 2\nabla V_1 \cdot \nabla \partial_{x_1} V_{-1} + \partial_d ((1 - |V_1|^2)(1 - |V_{-1}|^2)V_1 V_{-1}).
\]
With Lemmas 2.1 and 2.2, we easily check that
\[
|\nabla \partial_{x_1} V_1 \cdot \nabla V_{-1}| \leq \frac{K}{(1 + r_1)^2(1 + r_{-1})},
\]
\[
|\nabla V_1 \cdot \nabla \partial_{x_1} V_{-1}| \leq \frac{K}{(1 + r_1)(1 + r_{-1})^2}
\]
and
\[
|\partial_d ((1 - |V_1|^2)(1 - |V_{-1}|^2)V_1 V_{-1})| \leq \frac{K}{(1 + r_1)^3(1 + r_{-1})^2} + \frac{K}{(1 + r_1)^2(1 + r_{-1})^3}.
\]
In the right half-plane, where \( r_1 \leq r - 1 \) and \( r - 1 \geq d \), we use
\[
\frac{1}{(1 + r - 1)^{1-\sigma}} \leq Ke^{-\sigma}
\]
and
\[
\frac{1}{(1 + r_1)^{\alpha}} + \frac{1}{(1 + r - 1)^{\alpha}} \leq \frac{2}{(1 + \tilde{r})^\alpha}
\]
for \( \alpha > 0 \) on the three previous estimates to show that
\[
|\partial_d E| \leq \frac{Kc^{1-\sigma}}{(1 + \tilde{r})^{2+\sigma}}
\]
in the right half-plane. Similarly, the result holds in the left half-plane, and this proves (3.4). From it, with the fact that \( \|h\|_{**.\sigma,dc} \leq K\|(1 + \tilde{r}^{2+\sigma})h\|_{L^\infty(\mathbb{R}^2)} \), we estimate
\[
\left\| \frac{\partial_d E}{V} \right\|_{**.\sigma,dc} \leq K(\sigma)c^{1-\sigma}.
\]
Let us now prove that
\[
\left\| \frac{\partial_d (ic\partial_{x_2} V)}{V} \right\|_{**.\sigma,dc} \leq K(\sigma)c^{1-\sigma}. \tag{3.5}
\]
We show easily that
\[
\|ic\partial_{x_2} \partial_d V\|_{L^\infty(\{\tilde{r} \leq 3\})} \leq Kc \leq Kc^{1-\sigma},
\]
and since \( \partial_x \partial_d V = -\partial_{x_1}x_2 V_{-1} + \partial_{x_1}x_2 V_{-1} \partial_{x_1}x_2 V_{-1} + \partial_{x_1}x_2 V_{-1} \partial_{x_2} V_{1} \), by Lemma 2.2 we have
\[
|\partial_{x_2} \partial_d V| \leq \frac{K}{(1 + \tilde{r})^2},
\]
therefore
\[
\left\| \tilde{r}^{1+\sigma} \mathfrak{R} \left( \frac{ic\partial_{x_2} \partial_d V}{V} \right) \right\|_{L^\infty(\{\tilde{r} \geq 2\})} \leq Kc \leq Kc^{1-\sigma}.
\]
This proves that (3.5) is true for the real part contribution. We are left with the proof of
\[
\left\| cr^{2+\sigma} \mathfrak{Im} \left( \frac{ic\partial_{x_2} \partial_d V}{V} \right) \right\|_{L^\infty(\{\tilde{r} \geq 2\})} \leq K(\sigma)c^{1-\sigma},
\]
which is more delicate and relies on some cancelations. We compute
\[
\mathfrak{Im} \left( \frac{ic\partial_{x_2} \partial_d V}{V} \right) = -\mathfrak{R} \left( \frac{- \partial_{x_1}x_2 V_{1}}{V_{1}} + \frac{\partial_{x_1}x_2 V_{-1}}{V_{-1}} \right) - \mathfrak{R} \left( \frac{- \partial_{x_1}x_2 V_{1}}{V_{1}} \partial_{x_2} V_{-1} + \partial_{x_2} V_{-1} \partial_{x_2} V_{1} \right).
\]
From Lemma 2.2, we have
\[
\frac{\partial_{x_1}x_2 V_{1}}{V_{1}} = -\frac{i}{r_1} \sin(\theta_1) + O_{r_1 \to \infty} \left( \frac{1}{r_1^3} \right)
\]
and the part in \( O_{r_1 \to \infty} \left( \frac{1}{r_1^3} \right) \) can be estimated as in the proof of Lemma 2.21 for \( \|ic\partial_{x_2} V\|_{**.\sigma,dc} \). In particular, we will just compute the terms of order less than \( \frac{1}{r_1} \) or \( \frac{1}{r_{-1}} \). From Lemma 2.2, we have also
\[
\frac{\partial_{x_2} V_{1}}{V_{1}} = -\frac{i}{r_1} \cos(\theta_1) + O_{r_1 \to \infty} \left( \frac{1}{r_1^3} \right)
\]
and
\[
\mathfrak{R} \left( \frac{- \partial_{x_1}x_2 V_{1}}{V_{1}} \partial_{x_2} V_{-1} + \partial_{x_2} V_{-1} \partial_{x_2} V_{1} \right) = \cos(\theta_1) \sin(\theta_1) \frac{1}{r_1^3} + O_{r_1 \to \infty} \left( \frac{1}{r_1^3} \right).
\]
These two estimates hold by changing $i \to -i$, $\theta_1 \to \theta_{-1}$, $r_1 \to r_{-1}$ and $V_1 \to V_{-1}$. We then deduce that

\[
\text{Im}\left(\frac{i\partial_{z_2}\partial_d V}{V}\right) = -\left(\frac{-\cos(\theta_1)\sin(\theta_1)}{r_1^2} + \frac{\cos(\theta_{-1})\sin(\theta_{-1})}{r_{-1}^2}\right) - \left(\frac{-\sin(\theta_1)\cos(\theta_{-1})}{r_1} + \frac{\sin(\theta_{-1})\cos(\theta_1)}{r_{-1}}\right) + O_{r_1 \to \infty}\left(\frac{1}{r_1^2}\right) + O_{r_{-1} \to \infty}\left(\frac{1}{r_{-1}^3}\right).
\]

(3.6)

We start with the second term of (3.6) which is the easiest one. We use for $\varepsilon = \pm 1$ that

\[
\cos(\theta_{\varepsilon}) = \frac{x_1 - d\varepsilon}{r_{\varepsilon}} \quad \text{and} \quad \sin(\theta_{\varepsilon}) = \frac{x_2}{r_{\varepsilon}}
\]
to compute

\[
\sin(\theta_1)\cos(\theta_{-1}) = \frac{(x_1 + d)x_2}{r_1r_{-1}},
\]

and

\[
\sin(\theta_{-1})\cos(\theta_1) = \frac{(x_1 - d)x_2}{r_1r_{-1}}.
\]

therefore

\[
-\frac{\sin(\theta_1)\cos(\theta_{-1})}{r_1} + \frac{\sin(\theta_{-1})\cos(\theta_1)}{r_{-1}} = \frac{2dx_2}{(r_1r_{-1})^2}.
\]

We have, in the right half-plane, where $r_1 \leq r_{-1}$ and $r_{-1} \geq d \geq \frac{K}{\varepsilon}$,

\[
\left|ce^{2+\sigma}\frac{2dx_2}{(r_1r_{-1})^2}\right| = 2\left|cd\frac{2+\sigma}{r_1^2r_{-1}^2}x_2\frac{1}{r_1r_{-1}^\sigma}\right| \leq Kc^{1-\sigma}
\]

since $\frac{r_2+\sigma}{r_1r_{-1}} \leq 1$, $\frac{|x_1|}{r_{-1}} \leq 1$ and $cd \leq K$. Similarly, we have the same estimate in the left half-plane.

Now for the first term of (3.6), we have, for $\varepsilon = \pm 1$,

\[
\sin(\theta_{\varepsilon})\cos(\theta_{\varepsilon}) = \frac{(x_1 - d\varepsilon)x_2}{r_{\varepsilon}^2}.
\]

Therefore,

\[
-\frac{\cos(\theta_1)\sin(\theta_1)}{r_1^2} + \frac{\cos(\theta_{-1})\sin(\theta_{-1})}{r_{-1}^2} = \frac{x_2}{(r_1r_{-1})^2}(r_1^4(x_1 + d) - r_{-1}^4(x_1 - d)).
\]

We compute, for $\varepsilon = \pm 1$,

\[
r_{\varepsilon}^4 = ((x_1 - \varepsilon d)^2 + x_2^2)^2 = (x_1 - \varepsilon d)^4 + 2(x_1 - \varepsilon d)^2x_2^2 + x_2^4,
\]

hence

\[
-\frac{\cos(\theta_1)\sin(\theta_1)}{r_1^2} + \frac{\cos(\theta_{-1})\sin(\theta_{-1})}{r_{-1}^2}
= \frac{x_2}{(r_1r_{-1})^4}(x_1 - d)(x_1 + d)((x_1 - d)^3 - (x_1 + d)^3 + 2x_2^2((x_1 - d) - (x_1 + d)))
+ \frac{x_2}{(r_1r_{-1})^4}\varepsilon_2^4(x_1 + d - (x_1 - d)).
\]

We simplify this equation to

\[
-\frac{\cos(\theta_1)\sin(\theta_1)}{r_1^2} + \frac{\cos(\theta_{-1})\sin(\theta_{-1})}{r_{-1}^2} = \frac{-x_2(x_1 - d)(x_1 + d)}{(r_1r_{-1})^4}(2d^3 + 6x_2^2d - 4x_2^2d) + \frac{2x_2^3d}{(r_1r_{-1})^4}.
\]

(3.7)
We now estimate separately each contribution of (3.7). We have, in the right half-plane, where \( r_1 \leq r_{-1} \) and \( r_{-1} \geq d \geq \frac{N}{r_1} \),

\[
\left| cr^{2+\sigma} \frac{2x_2^3d}{(r_1 r_{-1})^4} \right| = 2 \left| cd \frac{x_2^2}{r_1^2 r_{-1}^2} \frac{\hat{x}^{2+\sigma}}{r_{-1}^2} \frac{1}{r_{-1}^2} \right| \leq K c^{1-\sigma}
\]

since \( |x_2| \leq r_1, |x_2| \leq r_{-1} \) and \( \frac{\hat{x}^{2+\sigma}}{r_{-1}^2} \leq 1 \). Still in the right half-plane,

\[
\left| cr^{2+\sigma} \frac{x_2(x_1 - d)(x_1 + d)}{(r_1 r_{-1})^4} 2d^3 \right| = 2 \left| cd \frac{d^2}{r_1^2 r_{-1}^2} \frac{(x_1 - d)(x_1 + d)}{r_{-1}^2} \frac{x_2}{r_1^2 r_{-1}^2} \frac{\hat{x}^{2+\sigma}}{r_{-1}^2} \frac{1}{r_{-1}^2} \right| \leq K c^{1-\sigma}
\]

since \( d \leq K r_{-1}, |x_1 - d| \leq r_1 \) and \( |x_1 + d| \leq r_{-1} \). For the next term, we write \( x_1^2 = x_1^2 - d^2 + d^2 \) in

\[
\frac{x_2(x_1 - d)(x_1 + d)}{(r_1 r_{-1})^4} 6x_2^2d = \frac{x_2(x_1 - d)(x_1 + d)}{(r_1 r_{-1})^4} 6(x_1^2 - d^2)d + \frac{x_2(x_1 - d)(x_1 + d)}{(r_1 r_{-1})^4} 6d^3.
\]

In the right half-plane, using \( x_1^2 - d^2 = (x_1 - d)(x_1 + d) \),

\[
\left| cr^{2+\sigma} \frac{x_2(x_1 - d)(x_1 + d)}{(r_1 r_{-1})^4} 6(x_1^2 - d^2)d \right| = 6 \left| cd \frac{(x_1 - d)(x_1 + d)}{r_1^2} \frac{x_2}{r_1^2 r_{-1}^2} \frac{\hat{x}^{2+\sigma}}{r_{-1}^2} \frac{1}{r_{-1}^2} \right| \leq K c^{1-\sigma}
\]

using previous estimates. We continue in the right half-plane with

\[
\left| cr^{2+\sigma} \frac{x_2(x_1 - d)(x_1 + d)}{(r_1 r_{-1})^4} 6d^3 \right| = 6 \left| cd \frac{(x_1 - d)(x_1 + d)}{r_1^2} \frac{d^2}{r_{-1}^2} \frac{x_2}{r_1^2 r_{-1}^2} \frac{\hat{x}^{2+\sigma}}{r_{-1}^2} \frac{1}{r_{-1}^2} \right| \leq K c^{1-\sigma}
\]

and

\[
\left| cr^{2+\sigma} \frac{x_2(x_1 - d)(x_1 + d)}{(r_1 r_{-1})^4} 4x_2^2d \right| = 4 \left| cd \frac{(x_1 - d)(x_1 + d)}{r_1^2} \frac{x_2}{r_1^2 r_{-1}^2} \frac{\hat{x}^{2+\sigma}}{r_{-1}^2} \frac{1}{r_{-1}^2} \right| \leq K c^{1-\sigma}
\]

using previous estimates. Similarly, all these estimates hold in the left half-plane, which ends the proof of

\[
\left\| \frac{\partial_d (ic \partial_x V)}{V} \right\|_{\ast, \sigma, d_c} \leq K c^{1-\sigma}.
\]

□

We check easily by standard elliptic regularity arguments that \( \partial_c \Phi_{c,d} \in C^\infty(\mathbb{R}^2, \mathbb{C}) \). Furthermore, \( c \mapsto \Phi_{c,d} \) is \( C^1 \) with values in \( E_{\ast, \sigma, d_c} \), therefore \( \partial_c \nabla \Phi_{c,d} \) is well defined (in \( C^0(\mathbb{R}^2, \mathbb{C}) \)). Let us show that it is equal to \( \nabla \partial_c \Phi_{c,d} \).

For \( \varphi \in C^\infty_c(\mathbb{R}^2, \mathbb{C}) \), we have, by derivation under an integral, that

\[
\int_{\mathbb{R}^2} \partial_c \nabla \Phi_{c,d} \varphi = \partial_c \int_{\mathbb{R}^2} \nabla \Phi_{c,d} \varphi = -\partial_c \int_{\mathbb{R}^2} \Phi_{c,d} \nabla \varphi = -\int_{\mathbb{R}^2} \partial_c \Phi_{c,d} \nabla \varphi = \int_{\mathbb{R}^2} \nabla \partial_c \Phi_{c,d} \varphi.
\]

Therefore \( \partial_c \nabla \Phi_{c,d} = \nabla \partial_c \Phi_{c,d} \) in the distribution sense, and thus in the strong sense. Furthermore, thanks to the equation \( \eta L(\Phi_{c,d}) + (1 - \eta) V L(\Phi_{c,d}) + F(\Phi_{c,d}) = \lambda(c, d) Z_d \), we can isolate \( \Delta \Phi_{c,d} \) as in (2.13), and show in particular that it is a \( C^1 \) function of \( c \). By similar arguments as for the gradient, we can show that \( \partial_c \Delta \Phi_{c,d} = \Delta \partial_c \Phi_{c,d} \).

Furthermore, the same proof holds if we differentiate \( \Phi_{c,d} \) with respect to \( d \). We can therefore inverse derivatives in position and derivatives with respect to \( c \) or \( d \) on \( \Phi_{c,d} \).

65
Let us also show that \((c, d) \mapsto \partial_2 \Phi_{c,d}\) is a continuous function from \(\Omega := \{(c, d) \in \mathbb{R}^2, 0 < c < c_0(\sigma), \frac{1}{c^2} < d < \frac{2}{c}\}\) to \(\mathcal{E}_{*,\sigma,d}\). With the same compactness argument used in the proof of the continuity of \(c \mapsto \Phi_{c,d}\), we can show that \((c, d) \mapsto \Phi_{c,d}\) is continuous from \(\Omega\) to \(\mathcal{E}_{*,\sigma,d}\). From the proof of Lemma 3.2, we have that

\[
\begin{align*}
\left(\text{Id} + \left(\eta L(\cdot) + (1 - \eta)V V' \left(\frac{\cdot}{V}\right)^{-1} \left(\Pi_{\mathcal{A}}^+ (d \Phi(\cdot)/V))\right)\right) \Phi = \Pi_{\mathcal{A}}^+ (\partial_2 F(\Phi_{c,d}/V)) - i \eta \partial_{x_2} \Phi_{c,d} + (1 - \eta)V \partial_{x_2} \left(\frac{\Phi_{c,d}}{V}\right).
\end{align*}
\]

Since \((c, d) \mapsto \Phi_{c,d}\) is continuous from \(\Omega\) to \(\mathcal{E}_{*,\sigma,d}\), and that the dependence on \((c, d)\) of the other terms of the right-hand side is explicit, we check that \(\Pi_{\mathcal{A}}^+ (\partial_2 F(\Phi_{c,d}/V)) - i \eta \partial_{x_2} \Phi_{c,d} + (1 - \eta)V \partial_{x_2} \left(\frac{\Phi_{c,d}}{V}\right)\) is continuous from \(\Omega\) to \(\mathcal{E}_{*,\sigma,d}\). We check also that \((c, d) \mapsto \left(\text{Id} + \left(\eta L(\cdot) + (1 - \eta)V V' \left(\frac{\cdot}{V}\right)^{-1} \left(\Pi_{\mathcal{A}}^+ (d \Phi(\cdot)/V))\right)\right) \Phi = \Pi_{\mathcal{A}}^+ (\partial_2 F(\Phi_{c,d}/V)) - i \eta \partial_{x_2} \Phi_{c,d} + (1 - \eta)V \partial_{x_2} \left(\frac{\Phi_{c,d}}{V}\right)\) is continuous from \(\Omega\) to \(\mathcal{E}_{*,\sigma,d}\), and thus \((c, d) \mapsto \partial_2 \Phi_{c,d}\) is a continuous function from \(\Omega\) to \(\mathcal{E}_{*,\sigma,d}\). The same proof holds for \((c, d) \mapsto \partial_2 \Phi_{c,d}\).

We end this subsection with the symmetries of \(\partial_2 \Phi_{c,d}\).

**Lemma 3.4** The function \(\partial_2 \Phi_{c,d}\) satisfies the symmetries: for \(x = (x_1, x_2) \in \mathbb{R}^2\),

\[
\partial_2 \Phi_{c,d}(x_1, x_2) = \partial_2 \Phi_{c,d}(x_2, x_1) = \partial_2 \Phi_{c,d}(x_1, -x_2).
\]

**Proof** From subsection 2.3,

\[
\forall x = (x_1, x_2) \in \mathbb{R}^2, \Psi_{c,d}(x_1, x_2) = \Psi_{c,d}(x_2, x_1) = \Psi_{c,d}(x_1, -x_2)
\]

and \(V\) enjoys the same symmetries, therefore for all \(d \in \mathbb{R}\) such that \(\frac{1}{c^2} < d < \frac{2}{c}\),

\[
\Phi_{c,d}(x_1, x_2) = \Phi_{c,d}(x_2, x_1) = \Phi_{c,d}(x_1, -x_2).
\]

Since

\[
\partial_2 \Phi_{c,d} = \lim_{\varepsilon \to 0} \frac{\Phi_{c,d+\varepsilon} - \Phi_{c,d}}{\varepsilon},
\]

these symmetries also hold for \(\partial_2 \Phi_{c,d}\).

### 3.2 End of the construction and properties of \(Q_c\)

A consequence of equation (2.30) and Proposition 2.25 is that, for \(0 < \sigma < 1\), there exists \(c_0(\sigma) > 0\) such that, for \(0 < c < c_0(\sigma)\),

\[
\eta L(\Phi_{c,d}) + (1 - \eta)V V' (\Psi_{c,d} + F(\Psi_{c,d}) = \lambda(c, d) Z_d
\]

with

\[
\lambda(c, d) \int_{\mathbb{R}^2} |\partial_2 V| \eta = \pi \left(\frac{1}{d} - c\right) + O_{\varepsilon \to 0}^\sigma(c^{2-\sigma}).
\]

Following the proof of Proposition 2.25, with Lemmas 3.2 and 3.3, we can check that the \(O_{\varepsilon \to 0}^\sigma(c^{2-\sigma})\) is continuous with respect of \(c\) and \(d\). Therefore, by the intermediate value theorem, there exists \(d_c > 0\) such that \(\lambda(c, d_c) = 0\), with

\[
d_c = \frac{1}{c} + O_{\varepsilon \to 0}^\sigma(c^{-\sigma}),
\]

for \(c > 0\) small enough. Then, for the function \(\Phi_{c,d_c} = V \Psi_{c,d_c}\) with \(\|\Psi_{c,d_c}\|_{*,\sigma,d_c} \leq K(\sigma)c^{1-\sigma}\), we have

\[
\eta L(\Phi_{c,d_c}) + (1 - \eta)V V' (\Psi_{c,d_c} + F(\Psi_{c,d_c}) = 0,
\]

meaning that if we define

\[
Q_c := \eta V (1 + \Psi_{c,d_c}) + (1 - \eta)V e^{\Psi_{c,d_c}},
\]

then \(Q_c\) solves \((\text{TW}_c)\).
3.2.1 Behaviour at infinity and energy estimation

Lemma 3.5 The function $Q_c$ satisfies $Q_c(x) \to 1$ when $|x| \to \infty$.

Proof From $\|\Psi_{c,d,c}\|_{*,\sigma,d,c} \leq K(\sigma)c^{1-\sigma}$ we have $\Psi_{c,d,c}(x) \to 0$ when $|x| \to \infty$. Furthermore $|1 - V|^2 \leq \frac{C(d_c)}{1+r}$ by Lemma 2.3 and $Q_c = V e^{\Psi_{c,d,c}}$ for large values of $|x|$, hence $Q_c(x) \to 1$ when $|x| \to \infty$. 

In the statement of Theorem 1.1, we have set $Q_c = V + \Gamma_{c,d,c}$, we therefore define

$$\Gamma_{c,d,c} := \eta V \Psi_{c,d,c} + (1-\eta)V (e^{\Psi_{c,d,c}} - 1).$$

We compute that

$$\left\| \frac{\Gamma_{c,d,c}}{V} \right\|_{*,\sigma,d,c} \leq K \|\Psi_{c,d,c}\|_{*,\sigma,d,c} + \|(1-\eta)(e^{\Psi_{c,d,c}} - 1 - \Psi_{c,d,c})\|_{*,\sigma,d,c},$$

and since $\|\Psi_{c,d,c}\|_{*,\sigma,d,c} \leq 1$ for $c$ small enough (depending on $\sigma$), we have

$$\left\| (1-\eta)(e^{\Psi_{c,d,c}} - 1 - \Psi_{c,d,c}) \right\|_{*,\sigma,d,c} \leq K \| (1-\eta) \Psi_{c,d,c}^2 \sum_{n=2}^{+\infty} \frac{\Psi_{c,d,c}^{-2}}{n!} \|_{*,\sigma,d,c}.$$

Now, taking $\sigma' = \frac{1+\sigma}{2}$, we have

$$|\Psi_{c,d,c}| \leq K(\sigma)c^{1-\sigma} \quad \text{and} \quad |\nabla \Psi_{c,d,c}| \leq K(\sigma)c^{1-\sigma},$$

therefore

$$|\Psi_{c,d,c}|^2 \leq K(\sigma)c^{c-1}\frac{c}{1+c} + \|\nabla \Psi_{c,d,c}|^2 \leq K(\sigma)c^{c-1}\frac{c}{1+c}$$

thus, we check that

$$\left\| (1-\eta) \Psi_{c,d,c}^2 \sum_{n=2}^{+\infty} \frac{\Psi_{c,d,c}^{-2}}{n!} \|_{*,\sigma,d,c} \leq K(\sigma)c^{c-1}. $$

Combining this result with $\|\Psi_{c,d,c}\|_{*,\sigma,d,c} \leq K(\sigma)c^{1-\sigma}$, we deduce that

$$\left\| \frac{\Gamma_{c,d,c}}{V} \right\|_{*,\sigma,d,c} \leq K(\sigma)c^{c-1}. $$

In particular, we have, for any $0 < \sigma < 1$, $0 < c < c_0(\sigma)$, that

$$|\Gamma_{c,d,c}| \leq \frac{K(\sigma)c^{1-\sigma}}{1+c} \quad \text{and} \quad |\text{Re} \left( \frac{\Gamma_{c,d,c}}{V} \right) \leq \frac{K(\sigma)c^{1-\sigma}}{1+c},$$

and, if $\tilde{r} \geq 2$,

$$|\nabla \Gamma_{c,d,c}| \leq |\nabla (\frac{\Gamma_{c,d,c}}{V})| + |\nabla V| \times \frac{|\Gamma_{c,d,c}|}{V},$$

therefore, using $|\nabla V| \leq \frac{K}{1+c}$ from Lemma 2.1, we have

$$|\nabla \Gamma_{c,d,c}| \leq \frac{K(\sigma)c^{1-\sigma}}{1+c}.$$

Estimate (3.12) remains true in $\{\tilde{r} \leq 2\}$ since $\|\Gamma_{c,d,c}\|_{C^1(\{\tilde{r} \leq 2\})} \leq \|\Gamma_{c,d,c}\|_{*,\sigma,d,c} \leq K(\sigma)c^{1-\sigma}$. We now show the estimates on $\Gamma_{c,d,c}$ of Theorem 1.1.
Lemma 3.6 For $+\infty \geq p > 2$, there exists $c_0(p) > 0$ such that if $0 < c < c_0(p)$, we have $\Gamma_{c,d,c} \in L^p(\mathbb{R}^2)$, $\nabla \Gamma_{c,d,c} \in L^{p-1}(\mathbb{R}^2)$ and
$$
\|\Gamma_{c,d,c}\|_{L^p(\mathbb{R}^2)} + \|\nabla \Gamma_{c,d,c}\|_{L^{p-1}(\mathbb{R}^2)} = o_{c \to 0}(1).
$$

Proof If $p = +\infty$, using (3.10) and (3.12), we infer
$$
\|\Gamma_{c,d,c}\|_{L^\infty(\mathbb{R}^2)} \leq K(\sigma)c^{1-\sigma},
$$
$$
\|\nabla \Gamma_{c,d,c}\|_{L^\infty(\mathbb{R}^2)} \leq K(\sigma)c^{1-\sigma},
$$
hence the result holds. If $2 < p < +\infty$ then, by (3.10),
$$
\int_{\mathbb{R}^2}|\Gamma_{c,d,c}|^p \leq \int_{\mathbb{R}^2}\frac{\|\Gamma_{c,d,c}\|_{L^\infty(\mathbb{R}^2)}^p}{(1 + \bar{r})^p}dx \leq \int_{\mathbb{R}^2}\frac{K(\sigma)c^{1-\sigma}p}{(1 + \bar{r})^p}dx.
$$
Taking $0 < \sigma < 1$ such that $p\sigma > 2$ then gives the result. Furthermore, by (3.12),
$$
\int_{\mathbb{R}^2}|\nabla \Gamma_{c,d,c}|^p \leq \int_{\mathbb{R}^2}\frac{K(\sigma)c^{1-\sigma}p}{(1 + \bar{r})^{p(\sigma+1)}}dx,
$$
so for $p > 1$ we can take $0 < \sigma < 1$ such that $p(\sigma + 1) > 2$ and we have the result. \[\square\]

Remark that we can have better estimates on $\Gamma_{c,d,c}$, in particular if we look at real and imaginary parts of $\frac{\Gamma_{c,d,c}}{V}$. For instance it is possible to show that
$$
\left\|\Re\left(\frac{\Gamma_{c,d,c}}{V}\right)\right\|_{L^p(\bar{r} \geq 1)} = o_{c \to 0}(1)
$$
for $p > 1$ instead of $p > 2$. This estimate does not hold for $\bar{r}$ small since it is not clear that $\Psi_{c,d,c}$ is bounded there (but $\Phi_{c,d,c}$ is). This is due to the fact that the zeros of $Q_c$ are not exactly those of $V$.

Lemma 3.7 The travelling wave $Q_c$ has finite energy, that is:
$$
E(Q_c) = \frac{1}{2}\int_{\mathbb{R}^2} |\nabla Q_c|^2 + \frac{1}{4}\int_{\mathbb{R}^2} (1 - |Q_c|^2)^2 < +\infty.
$$

Proof Far from the vortices, $\nabla Q_c = \nabla (V_1V_{-1})e^{\Psi_{c,d,c}} + \nabla \Psi_{c,d,c}V_1V_{-1}e^{\Psi_{c,d,c}}$. We know that, for $\bar{r} \geq 1$,
$$
|\nabla \Psi_{c,d,c}| \leq \frac{K(\sigma)}{\bar{r}^{1+\sigma}}
$$
and (by Lemma 2.3)
$$
|\nabla (V_1V_{-1})| \leq \frac{K(c)}{\bar{r}^2},
$$
hence
$$
|\nabla Q_c|^2 \leq \frac{K(c)}{\bar{r}^2+2\sigma}
$$
and is therefore integrable. On the other hand,
$$
|1 - |Q_c|^2| = |1 - |V_1V_{-1}|^2e^{2\Re(\Psi_{c,d,c})}| \leq K(1 - |V_1V_{-1}|^2 + |V_1V_{-1}|^2|\Re(\Psi_{c,d,c})|),
$$
and we have
$$
1 - |V_1V_{-1}|^2 = O\left(\frac{1}{\bar{r}^2}\right) \quad \text{and} \quad \Re(\Psi_{c,d,c}) = O\left(\frac{1}{\bar{r}^{1+\sigma}}\right),
$$
therefore
$$
(1 - |Q_c|^2)^2 = O\left(\frac{1}{\bar{r}^2+2\sigma}\right)
$$
and is integrable. \[\square\]

At this point, we have finished the proof of the construction of $Q_c$. In the next two subsection, we add some estimates on $Q_c$ that will be useful for the differentiability of the branch, and others that are interesting in themselves.

68
3.2.2 A set of estimations on $Q_c$

The next Lemma gives additional estimates on $Q_c$ which are more precise but more technical than the ones in Theorem 1.1.

**Lemma 3.8** For any $0 < \sigma < 1$, there exist $c_0(\sigma), K(\sigma) > 0$ such that for $0 < c < c_0(\sigma)$ we have

\[
||\Psi_{c,d_c}||_{*,\sigma,d_c} \leq K(\sigma)c^{1-\sigma},
\]

(3.13)

\[
|1 - |Q_c|| \leq \frac{K(\sigma)}{(1 + \tilde{r})^{1+\sigma}},
\]

(3.14)

\[
|Q_c - V| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^\sigma},
\]

(3.15)

\[
||Q_c|^2 - |V|^2| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}}.
\]

(3.16)

\[
|\mathfrak{Re}(\nabla Q_c Q_c^\dagger)| \leq \frac{K(\sigma)}{(1 + \tilde{r})^{1+\sigma}},
\]

(3.17)

\[
|\mathfrak{Im}(\nabla Q_c Q_c^\dagger)| \leq \frac{K}{1 + \tilde{r}}.
\]

(3.18)

**Proof** The first estimate comes from the construction of the solution, and the other ones are a consequence of it. The estimate (3.14) is clear if $\tilde{r} \leq 3$. If $\tilde{r} \geq 3$, then $Q_c = Ve^{\Psi_{c,d_c}}$ and, for $c$ small enough (depending on $\sigma$), $|\mathfrak{Re}(\Psi_{c,d_c})| \leq 1$, thus

\[
|1 - |Q_c|| = \left|1 - |V| - |V| \left(e^{\mathfrak{Re}(\Psi_{c,d_c})} - 1\right)\right|
\]

\[
\leq |1 - |V|| + K|\mathfrak{Re}(\Psi_{c,d_c})|
\]

\[
\leq \frac{K}{(1 + \tilde{r})^2} + \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}}
\]

by Lemma 2.3 and $||\Psi_{c,d_c}||_{*,\sigma,d_c} \leq K(\sigma)c^{1-\sigma}$. For (3.15), if $\tilde{r} \geq 3$, we compute

\[
|Q_c - V| = |V| \times |e^{\Psi_{c,d_c}} - 1| \leq C|\Psi_{c,d_c}| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^\sigma}
\]

and if $\tilde{r} \leq 3$, $|Q_c - V| \leq C||\Psi_{c,d_c}||_{*,\sigma,d_c}$ and the estimate (3.15) holds. Similarly, for $\tilde{r} \geq 3$,

\[
||Q_c|^2 - |V|^2| \leq |V|^2 \left|e^{2\mathfrak{Re}(\Psi_{c,d_c})} - 1\right| \leq \frac{K(\sigma)c^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}}
\]

and for the same reason if $\tilde{r} \leq 3$ the estimate (3.16) holds. Inequalities (3.17) and (3.18) are clear if $\tilde{r} \leq 3$ and we compute, for $\tilde{r} \geq 3$,

\[
\nabla Q_c Q_c = \nabla \left(V e^{\Psi_{c,d_c}} \right) \tilde{V} e^{\Psi_{c,d_c}} = \nabla \tilde{V} e^{2\mathfrak{Re}(\Psi_{c,d_c})} + |V|^2 \nabla \Psi_{c,d_c} e^{2\mathfrak{Re}(\Psi_{c,d_c})}.
\]

We have $|e^{2\mathfrak{Re}(\Psi_{c,d_c})}| \leq 1$ for $c$ small enough and by Lemma 2.1 we have $|\mathfrak{Im}(\nabla V \tilde{V})| \leq \frac{K}{1 + \tilde{r}}$ and $|\mathfrak{Re}(\nabla V \tilde{V})| \leq \frac{K}{1 + \tilde{r}}$. Combining it with $|\nabla \Psi_{c,d_c}| \leq \frac{K(c)^{1-\sigma}}{(1 + \tilde{r})^{1+\sigma}}$ from $||\Psi_{c,d_c}||_{*,\sigma,d_c} \leq K(\sigma)c^{1-\sigma}$, estimates (3.17) and (3.18) hold. \qed
3.2.3 Estimations on derivatives of $\Phi_{c,d}$ with respect to $c$ and $d$ at $d = d_c$.

We cannot easily compute $\partial_{d}\Psi_{c,d|d=d_c}$ because of issues locally around the vortices (due to the fact that $\Psi_{c,d}$ is unbounded near $i = 0$, and changing $d$ change the position of the vortices). We shall prove here instead an estimate on $\partial_{d}\Phi_{c,d|d=d_c}$ as well as an estimate on $\partial_{c}\Phi_{c,d|d=d_c}$.

Lemma 3.9 For any $c \in \mathbb{R}$ such that $\frac{1}{2d} < c < \frac{1}{2}$ and $0 < c < c_0(\sigma)$, we have

$$\|\partial_{c}\Psi_{c,d|d=d_c}\|_{*,\sigma,d} \leq K(\sigma)c^{-\sigma}$$

and

$$\left\|\frac{\partial_{d}\Phi_{c,d}}{V}\right\|_{*,\sigma,d} \leq K(\sigma)c^{1-\sigma},$$

with $K(\sigma) > 0$ depending only on $\sigma$.

Proof From the proof (and with the notations) of Lemma 3.2,

$$\left(\text{Id} + (\eta L(\cdot) + (1 - \eta)Vl'(\frac{x}{V}))^{-1}(\Pi_{d}^{*}(d\Phi F_{c,d}/V))\right)(\Phi_{c+\varepsilon,d} - \Phi_{c,d}) = (\eta L(\cdot) + (1 - \eta)Vl'(\frac{x}{V}))^{-1}\left(-c\Pi_{d}^{*}(-i\partial_{d}V) - i\varepsilon \left(\partial_{x_{2}}\Phi_{c+\varepsilon,d} + (1 - \eta)V\partial_{x_{2}}\left(\frac{\Phi_{c,d}}{V}\right)\right)\right)$$

thus, taking $\varepsilon \to 0$, we deduce that (with Lemma 3.2)

$$\left(\text{Id} + (\eta L(\cdot) + (1 - \eta)Vl'(\frac{x}{V}))^{-1}(\Pi_{d}^{*}(d\Phi F_{c,d}/V))\right)(\partial_{c}\Phi_{c,d}) = (\eta L(\cdot) + (1 - \eta)Vl'(\frac{x}{V}))^{-1}\left(-\Pi_{d}^{*}(\partial_{c}F(\Phi_{c,d}/V)) - i\delta_{x_{2}}\Phi_{c,d} + (1 - \eta)V\partial_{x_{2}}\left(\frac{\Phi_{c,d}}{V}\right)\right).$$

Since at $d = d_c$, $\lambda(c, d_c) = 0$, we have

$$\Pi_{d}^{*}(\partial_{c}F(\Phi_{c,d}/V)) - i\delta_{x_{2}}\Phi_{c,d} + (1 - \eta)V\partial_{x_{2}}\left(\frac{\Phi_{c,d}}{V}\right)|_{d=d_c} = -i\delta_{x_{2}}Q_c.$$

hence, with Proposition 2.16,

$$\|\partial_{c}\Psi_{c,d|d=d_c}\|_{*,\sigma,d} \leq K\|\partial_{c}\Phi_{c,d|d=d_c}\|_{*,\sigma,d} \leq K(\sigma)\left(\left\|\frac{i\delta_{x_{2}}Q_c}{V}\right\|_{\otimes,\gamma,\sigma,d} + c^{1-\sigma}\left\|\frac{i\delta_{x_{2}}Q_c}{V}\right\|_{\otimes,\gamma(\sigma),d}\right).$$

We will conclude by showing that

$$\left\|\frac{i\delta_{x_{2}}Q_c}{V}\right\|_{\otimes,\gamma,\sigma,d} \leq K(\sigma)c^{-\sigma}$$

and

$$\left\|\frac{i\delta_{x_{2}}Q_c}{V}\right\|_{\otimes,\gamma,\sigma,d} \leq K(\sigma)c^{-\sigma}.$$

By Lemma 2.21, we have

$$\left\|\frac{i\delta_{x_{2}}V}{V}\right\|_{\otimes,\gamma,\sigma,d} \leq K(\sigma)c^{-\sigma},$$

and using $\|\Psi_{c,d}\|_{*,\sigma,d} \leq K(\sigma)c^{1-\sigma}$ with Lemma 2.3 and equation (2.41), we check easily that, for $c$ small enough,

$$\left\|\frac{i\delta_{x_{2}}Q_c}{V}\right\|_{\otimes,\gamma,\sigma,d} \leq K(\sigma)c^{-\sigma},$$

70
and (for $\sigma' = \frac{1+\eta}{2}$ in Lemma 2.3 and equation (2.41)),
\[
\left\| \frac{i\partial_x Q_c}{V} \right\|_{\oplus, \gamma, c, \Phi} \leq K(\sigma) c.
\]

We now focus on the estimation of $\partial_d \Phi_{c,d|d=d_c}$. At the end of step 1 of the proof of Lemma 3.3, we have shown that
\[
\partial_d \Phi_{c,d|d=d_c} = -d\Phi H^{-1}(\partial_d \Phi_{c,d|c, d_c}).
\]
From Lemma 3.1, we have that, at $d = d_c$, $\Phi = \Phi_{c,d|c}$, the operator $d\Phi H^{-1}$ is invertible from $E_{\oplus, \sigma, d\Phi}$ to $E_{\oplus, \sigma, \Phi}$, with an operator norm with size $1 + o_\sigma^2(1)$. We therefore only have to check that
\[
\left\| \partial_d H(\Phi_{c,d|c, d_c}) \right\|_{\ominus, \sigma, d, \Phi} \leq K(\sigma)c^1-\sigma.
\]
Since $\partial_d H(\Phi_{c,d|c, d_c}) = (\eta L(\cdot) + (1 - \eta)V'L(\cdot))^{-1}(G(d_c, \Phi_{c,d|c}))$, By Proposition 2.16 (from $E_{\oplus, \sigma, \Phi}$ to $E_{\oplus, \sigma, \Phi}$), it will be a consequence of
\[
\left\| \frac{G(d_c, \Phi_{c,d|c})}{V} \right\|_{\ominus, \sigma, d} \leq K(\sigma)c^1-\sigma
\]
for any $0 < \sigma < 1$.

We have, since $\Pi_{d_c}(\Phi_{c,d|c}) = \Phi_{c,d|c}$, that
\[
\frac{G(d_c, \Phi_{c,d|c})}{V} = \partial_d (|V|^2 \frac{\Phi_{c,d|c}}{V}) + 2\Re(\partial_d \overline{V} \Phi_{c,d|c}) + 2\Re(\overline{V} \Phi_{c,d|c}) \frac{\partial_d V}{V} +\partial_d ((1 - \eta)(E - ic\partial_x V)|_{d=d_c} \frac{\Phi_{c,d|c}}{V} - \frac{1}{V} \partial_d (\Pi_d^+ (F_d(\Phi/V)))|_{d=d_c}).
\]
Since $\partial_d (|V|^2) = 2\Re(\partial_d V \overline{V})$, we check, with Lemma 2.6 that
\[
\left| \partial_d (|V|^2 \frac{\Phi_{c,d|c}}{V}) + 2\Re(\overline{V} \Phi_{c,d|c}) \frac{\partial_d V}{V} \right| \leq K(\sigma)c^1-\sigma
\]
and
\[
\left| \Re(\partial_d \overline{V} \Phi_{c,d|c}) \right| \leq \frac{K(\sigma)c^1-\sigma}{(1+r)^{1+\sigma}},
\]
but this estimate a real valued quantity. From step 2 of the proof of Lemma 3.3, we have
\[
\left\| \frac{1}{V} \partial_d ((1 - \eta)(E - ic\partial_x V)) \right\|_{\ominus, \sigma, d} \leq K(\sigma)c^1-\sigma,
\]
which is enough to show that
\[
\left\| \partial_d ((1 - \eta)(E - ic\partial_x V)|_{d=d_c} \frac{\Phi_{c,d|c}}{V} \right\|_{\ominus, \sigma, d} \leq K(\sigma)c^1-\sigma.
\]
Finally, in step 2 of the proof of Lemma 3.3, we have shown that (taking the estimate for $\Phi = \Phi_{c,d|c}$)
\[
\left\| \frac{1}{V} \partial_d (\Pi_d^+ (F_d(\Phi/V)))|_{d=d_c} \right\|_{\ominus, \sigma, d} \leq K(\sigma)c^1-\sigma,
\]
which conclude the proof of this lemma.

\section{Differentiability of the branch $c \mapsto Q_c$}

The goal of this section is to prove that the constructed branch is $C^1$, and to give the leading order term of $\partial_c Q_c$ as $c \to 0$. The result is the following one.
Proposition 4.1 For any $+\infty \geq p > 2$, there exists $c_0(p) > 0$ such that
\[ c \mapsto Q_c - 1 \in C^1([0, c_0(p)], X_p), \]
with the estimate
\[ \left\| \partial_c Q_c + \left(1 + \frac{a_{c_0}(1)}{c^2}\right) \partial_d V_1(-x - d\epsilon_1^2)V_1(-x - d\epsilon_1^2) \right\|_{X_p} = a_{c_0}(1) \left(1 + \frac{1}{c^2}\right). \]

Proposition 4.1, together with subsection 3.2, ends the proof of Theorem 1.1. Subsections 4.1 to 4.7 are devoted to the proof of Proposition 4.1.

In this section, to make the dependences on $c$ and $d$ clear, we use the following notations. We denote $\Phi_{c,d}, \Psi_{c,d}$ and $\Gamma_{c,d}$ in order to emphasize the dependence of $\Phi, \Psi$ and $\Gamma$ in Proposition 2.20 on $c$ and $d$. A value of $d$ that makes $\lambda(c, d) = 0$ in Proposition 2.25 is written $d_c$. We will show later on that there exist one and only one value of $d_c$ satisfying this in $\left] \frac{\epsilon}{2}, 2c \right[. \text{ With these notations}, Q_c = V_1(-x - d_c\epsilon_1^2)V_1(-x - d_c\epsilon_1^2) + \Gamma_{c,d}$ is the solution of $(\text{TW}_c)$ we constructed in section 3.

In subsection 3.1 we showed that $\Phi_{c,d}$ is a $C^1$ function of both $c$ and $d$. We also have computed estimates for the derivatives of $\Phi_{c,d}$ with respect to $c$ and $d$ in Lemma 3.9, that will be useful here.

The goal is to show that $d_c$ is a $C^1$ function of $c$. We will do this by the implicit function theorem, but this requires a lot of computations. In particular, in Proposition 2.25, $d_c$ was chosen so that
\[ \langle L(\Phi_{c,d}) - (1 - \eta)(E - ic\partial_{x_2}V)\Psi_{c,d} + F(\Psi_{c,d}), \partial_d V \rangle = 0, \]
but we may equivalently define it by the implicit equation
\[ \int_{B(d\epsilon_1^2,d')} \text{Re}((L(\Phi_{c,d}) - (1 - \eta)E\Psi_{c,d} + F(\Psi_{c,d}))\overline{\partial_d V}) = 0. \]

This is the same equation but the scalar product is not taken on the whole space but only on $B(d\epsilon_1^2, d') \cup B(-d\epsilon_1^2, d')$ for some $0 < \epsilon' < 1$ (we will take $\epsilon' = 13/24$ but this value is purely technical, other values are possible). The only reason why we take it in the whole space in Lemma 2.25 was because of the boundary terms that will appear in the integration by parts when we write
\[ \langle L(\Phi), \partial_d V \rangle = \langle \Phi, L(\partial_d V) \rangle. \]

With the boundary terms on the boundary of $B(\pm d\epsilon_1^2, d')$, $\epsilon' > 0$, we are far enough from the vortices to make them small enough for our estimations. Thanks to this we can separate what happens near the vortex $V_1$ from what happens near the vortex $V_{-1}$ because now the integrals are in two well separated domain, one around each vortex. We use this in subsection 4.1. We need to differentiate the equation with respect to $d$. If we write $Q_{c,d} = V + \Gamma_{c,d}$, then $\partial_d Q_c = \partial_d V + \partial_d \Gamma_{c,d}$. The term $\partial_d V$ is easy to compute and to understand: we just move both vortices in opposite direction. But $\partial_d \Gamma_{c,d}$ is very difficult to understand, and our estimations on $\Gamma_{c,d}$ are not enough to compute easily what happens with sufficient precision to control its contribution. We would rather write $Q_{c,d}$ under the form
\[ Q_{c,d}(x) = (V_1(x - d\epsilon_1^2) + \tilde{\Gamma}_1(x - d\epsilon_1^2)) + (V_{-1}(x + d\epsilon_1^2) + \tilde{\Gamma}_{-1}(x + d\epsilon_1^2)) + \text{Err} \]
where $\tilde{\Gamma}_1(x - d\epsilon_1^2)$ is centered near $V_1$, is small and is here because of the existence of $V_{-1}$ far away. Then the term we understand is
\[ \partial_{x_1 + d}(V_1(x - d\epsilon_1^2) + \tilde{\Gamma}_1(x - d\epsilon_1^2)) \]
which is what changes near the center of $V_1$ when we move only the other vortex. This can be computed more easily and that is what we do in subsection 4.3. This term is easy to compute only near the vortex $V_1$, and that is one of the reasons we work only on $B(d\epsilon_1^2, d')$. The main contribution to the variation of the position of $V_{-1}$ is as expected from the source term $E - ic\partial_{x_2}V$. This is the computation of subsection 4.4.

Furthermore, most estimations boils down to what happen near each vortex, see for instance the contribution of $E$ in step 5 of the proof of Proposition 2.25, where we separate the contribution far from both vortices and close to them. By integrating only on $B(d\epsilon_1^2, d')$ we reduce the number of estimations we need to do. Moreover, in such a ball the contribution of the vortex $V_{-1}$ and its derivatives are easy to compute, see subsection 4.2.
Subsection 4.5 gathers all the estimations needed to show that only the contribution from the source term is of leading order. Subsection 4.6 and 4.7 are easy computations using previous subsections to compute the first order term of $\partial_d Q_c$.

The main and most difficult part is subsection 4.3. We want to show that $\partial_{x_1+d}(\tilde{\Gamma}_1(x - d\overline{e_1})))$ is much smaller than $\tilde{\Gamma}_1(x - d\overline{e_1})$, i.e. that the derivative with respect to $x_1 + d$ gives us additional smallness in $c$. For this we do a proof by contradiction which follows closely what was done in the proof of Proposition 2.16.

We define the following differential operators:

\[ \partial_{y_1} := \partial_{x_1} - \partial_d, \]
\[ \partial_{z_1} := \partial_{x_1} + \partial_d. \]

These notations follow the definitions of $y_1 = x_1 - d$ and $z_1 = x_1 + d$ from (2.1). The derivative in $d$ is taken at fixed $c$. The function $\partial_d \Phi_{c,d}$ is the derivative of $\Phi$ with respect to $d$ at fixed $c$ and we shall use the notation

\[ \partial_d \Phi_{c,d_c} := \partial_d \Phi_{c,d=d_c}, \]

and similarly for $\partial_d \Gamma_{c,d_c}$ and $\partial_d \Psi_{c,d_c}$. The derivatives $\partial_{y_1}$ and $\partial_{z_1}$ behave naturally on function depending on $x$ and $d$ only through $y$ or $z$, as shown in the following lemma.

**Lemma 4.2** For any $\mathfrak{F} \in C^1(\mathbb{R}^2, \mathbb{C})$, we have

\[ \partial_{y_1}(\mathfrak{F}(z)) = \partial_{z_1}(\mathfrak{F}(y)) = 0 \]

and

\[ \partial_{y_1}(\mathfrak{F}(y)) = 2\partial_{x_1}\mathfrak{F}(y), \]
\[ \partial_{z_1}(\mathfrak{F}(z)) = 2\partial_{x_1}\mathfrak{F}(z). \]

**Proof** We compute

\[ \partial_{y_1}(\mathfrak{F}(z)) = \partial_{x_1}(\mathfrak{F}(x_1 + d, x_2)) - \partial_d(\mathfrak{F}(x_1 + d, x_2)) = \partial_{x_1}\mathfrak{F}(z) - \partial_{x_1}\mathfrak{F}(z) = 0. \]

Similarly we have $\partial_{z_1}(\mathfrak{F}(y)) = 0$. Moreover,

\[ \partial_{y_1}(\mathfrak{F}(y)) = \partial_{x_1}(\mathfrak{F}(x_1 - d, x_2)) - \partial_d(\mathfrak{F}(x_1 - d, x_2)) = \partial_{x_1}\mathfrak{F}(y) + \partial_{x_1}\mathfrak{F}(y) = 2\partial_{x_1}\mathfrak{F}(y) \]

and similarly, $\partial_{z_1}(\mathfrak{F}(z)) = 2\partial_{x_1}\mathfrak{F}(z)$. \(\square\)

We have an estimate on $\partial_d \Phi_{c,d,d=d_c}$, but it is not enough to show that $d_c$ is a $C^1$ function of $c$. The main idea of the proof is to compute an estimate on $\partial_{z_1} \Phi_{c,d_c} = \partial_{x_1} \Phi_{c,d_c} + \partial_d \Phi_{c,d_c}$ near the vortex $V_1$ which is better than the ones on $\partial_{x_1} \Phi_{c,d_c}$ and $\partial_d \Phi_{c,d_c}$. In particular we will have $\partial_{z_1} \Phi_{c,d_c} = o_{c \rightarrow 0}(c^{1-\sigma})$ for some $\lambda > 0$ instead of $o_{c \rightarrow 0}(c^{1-\sigma})$ for $\sigma > 0$. This estimate is done in Proposition 4.5. First, we compute a first rough estimate on $\partial_{z_1} \Psi_{c,d}$ which is a corollary of Lemma 3.3.

**Corollary 4.3** For $\chi$ a smooth cutoff function with value $1$ in $\{r-1 \geq 3\}$ and $0$ in $\{r-1 \leq 2\}$, for $0 < \sigma < 1$, there exist $c_0(\sigma) > 0$ such that, for $0 < c < c_0(\sigma)$, we have

\[ \| \chi \partial_{z_1} \Psi_{c,d,d=d_c} \|_{*,\sigma,d_c} \leq K(\sigma)c^{1-\sigma}. \]

**Proof** Remark that $V_1 \partial_d \Psi_{c,d}$ might not be bounded near $d\overline{e_1}$, but $V_1 \partial_{z_1} \Psi_{c,d}$ is, since, by Lemma 4.2, $\partial_{z_1} V_1 = 0$ hence

\[ V_1 \partial_{z_1} \Psi_{c,d} = \partial_{z_1} \Phi_{c,d} = \partial_d \Phi_{c,d} + \partial_{z_1} \Phi_{c,d}, \]

with $\partial_d \Phi_{c,d}$ bounded by Lemma 3.3. We take a cutoff $\chi$ to avoid the fact that $V_{-1} \partial_{z_1} \Psi_{c,d}$ is not necessarily bounded near $-d\overline{e_1}$. In particular, with these remarks, we easily check, with Lemma 3.3, that

\[ \| V_{-1} \partial_{z_1} \Psi_{c,d,d=d_c} \|_{C^1(\{r \leq 3\})} \leq K(\sigma)c^{1-\sigma}. \]

73
We now focus on the region \( \{ \tilde{r} \geq 2 \} \). From the definition of \( \partial_{z_1} \), we have that
\[
\partial_{z_1} \Psi_{c.d} = \partial_d \Psi_{c,d} + \partial_{z_1} \Psi_{c,d}.
\]
We compute
\[
\partial_d \Psi_{c,d} = \frac{\partial_d \Phi_{c,d}}{V} + \frac{\partial_d V}{V} \Psi_{c,d},
\]
and from Lemma 3.3, we have
\[
\left\| \frac{\partial_d \Phi_{c,d}}{V} \right\|_{* \sigma,d} \leq K(\sigma)c^{1-\sigma}.
\]
From Lemma 2.6, we have
\[
|\partial_d V| \leq \frac{K}{1 + \tilde{r}},
\]
and
\[
|\nabla \partial_d V| \leq \frac{K}{(1 + \tilde{r})^2},
\]
and together with \( \|\Psi_{c,d}\|_{* \sigma,d} \leq K(\sigma)c^{1-\sigma} \), we check that
\[
\begin{align*}
\|\tilde{\tau}^{1+\sigma} \eta \Re \left( \frac{\partial_d V}{V} \Psi_{c,d} \right) \|_{L^\infty((\tilde{r} \geq 2))} &+ \|\tilde{\tau}^{1+\sigma} \eta \nabla \Re \left( \frac{\partial_d V}{V} \Psi_{c,d} \right) \|_{L^\infty((\tilde{r} \geq 2))} \\
\|\tilde{\tau}^\sigma \eta \Im \left( \frac{\partial_d V}{V} \Psi_{c,d} \right) \|_{L^\infty((\tilde{r} \geq 2))} &+ \|\tilde{\tau}^{1+\sigma} \eta \nabla \Im \left( \frac{\partial_d V}{V} \Psi_{c,d} \right) \|_{L^\infty((\tilde{r} \geq 2))}
\end{align*}
\]
\[
\leq K(\sigma)c^{1-\sigma}.
\]
Finally, for the contribution of \( \partial_{z_1} \Psi_{c,d} \), using \( \|\Psi_{c,d}\|_{* \sigma,d} \leq K(\sigma)c^{1-\sigma} \) and equation (2.35), we show that
\[
\begin{align*}
\|\tilde{\tau}^{1+\sigma} \eta \Re \left( \partial_{z_1} \Psi_{c,d} \right) \|_{L^\infty((\tilde{r} \geq 2))} &+ \|\tilde{\tau}^{1+\sigma} \eta \nabla \Re \left( \partial_{z_1} \Psi_{c,d} \right) \|_{L^\infty((\tilde{r} \geq 2))} \\
\|\tilde{\tau}^\sigma \eta \Im \left( \partial_{z_1} \Psi_{c,d} \right) \|_{L^\infty((\tilde{r} \geq 2))} &+ \|\tilde{\tau}^{1+\sigma} \eta \nabla \Im \left( \partial_{z_1} \Psi_{c,d} \right) \|_{L^\infty((\tilde{r} \geq 2))}
\end{align*}
\]
\[
\leq K(\sigma)c^{1-\sigma},
\]
which ends the proof of this corollary. \( \square \)

4.1 Recasting the implicit equation defining \( d_c \)

At this point, we do not know if \( d_c \) is uniquely defined for \( c > 0 \). We denote by \( d_c \) a value defined by the implicit equation on \( d \):
\[
\langle \text{TW}_c(Q_{c,d}), \partial_d V \rangle = 0,
\]
where
\[
Q_{c,d} := V + \Gamma_{c,d},
\]
with \( \Gamma_{c,d} = \eta V \Psi_{c,d} + (1 - \eta)V(e^{\Psi_{c,d}} - 1) \), which is a \( C^1 \) function of \( d \) and \( c \) in \( E_{* \sigma,d} \) thanks to subsection 3.1. Remark that \( d_c \) is also defined by the implicit equation for \( 0 < \varepsilon' < 1 \):
\[
\int_{B(d \tilde{r}^2, d \tilde{r}')} B(-d \tilde{r}^2, d \tilde{r}') \Re \left( \partial_d V \text{TW}_c(Q_{c,d}) \right) = 0,
\]
that we will use instead because of the reasons explained at the beginning of section 4. We can check easily that \( \partial_d Q_{c,d}, \partial_c Q_{c,d} \in C^\infty(\mathbb{R}^2) \) (by looking at the equations they satisfy in the distribution sense and using standard elliptic regularity arguments), and furthermore, that \( d \mapsto \partial_d Q_{c,d} \) and \( c \mapsto \partial_c Q_{c} \) are continuous functions (on their domain of definition in \( C^\infty(\mathbb{R}^2) \) for instance). From now on, we take any \( 0 < \varepsilon' < 1 \), but we will fix its value later on. We want to differentiate this quantity with respect to \( d \) and take the result at a value \( d_c \) such that \( \text{TW}_c(Q_{c,d_c}) = 0 \) in \( \mathbb{R}^2 \). In particular, we have
\[
\frac{\partial}{\partial d} \int_{B(d \tilde{r}^2, d \tilde{r}')} B(-d \tilde{r}^2, d \tilde{r}') \Re \left( \partial_d V \text{TW}_c(Q_{c,d}) \right) \mid_{d=d_c} =
\]
74
4.2 Estimates on the derivatives of $V_{-1}$ in $B(\overline{dc^2_1}, d^\varepsilon)$

**Lemma 4.4** For $0 < \varepsilon < 1$, in $B(\overline{dc^2_1}, d^\varepsilon)$, with the $O(.)$ being always real valued, we have

\[
\begin{align*}
\partial_{x_1} V_{-1} &= \left( O_{d \to 1} \left( \frac{1}{d^3} \right) + i O_{d \to 1} \left( \frac{1}{d^2 - \varepsilon} \right) \right) V_{-1}, \\
\partial_{x_2} V_{-1} &= \left( O_{d \to 1} \left( \frac{1}{d^3 - \varepsilon} \right) + i O_{d \to 1} \left( \frac{1}{d} \right) \right) V_{-1}, \\
\partial_{x_1 x_1} V_{-1} &= \left( O_{d \to 1} \left( \frac{1}{d^4 - 2\varepsilon} \right) + i O_{d \to 1} \left( \frac{1}{d^3 - \varepsilon} \right) \right) V_{-1}, \\
\partial_{x_1 x_2} V_{-1} &= \left( O_{d \to 1} \left( \frac{1}{d^4 - \varepsilon} \right) + i \frac{1}{4d^2} \left( 1 + O_{d \to 1} \left( \frac{1}{d^{1 - \varepsilon}} \right) \right) \right) V_{-1}.
\end{align*}
\]
**Proof** Recall from Lemma 2.2 that, with \( u = \frac{\rho_{-1}(r-1)}{\rho_{-1}(r-1)} \),

\[
\partial_{x_1} V_{-1} = \left( \cos(\theta_{-1}) u + \frac{i}{r_{-1}} \sin(\theta_{-1}) \right) V_{-1},
\]

\[
\partial_{x_2} V_{-1} = \left( \sin(\theta_{-1}) u - \frac{i}{r_{-1}} \cos(\theta_{-1}) \right) V_{-1},
\]

\[
\partial_{x_1 x_1} V_{-1} = \left( \cos^2(\theta_{-1})(u^2 + u') + \sin^2(\theta_{-1}) \left( \frac{u}{r_{-1}} - \frac{1}{r_{-1}^2} \right) - 2i \sin(\theta_{-1}) \cos(\theta_{-1}) \left( \frac{1}{r_{-1}^2} - \frac{u}{r_{-1}} \right) \right) V_{-1}
\]

and

\[
\partial_{x_1 x_2} V_{-1} = \left( \sin(\theta_{-1}) \cos(\theta_{-1}) \left( u^2 + u' + \frac{1}{r_{-1}^2} - \frac{u}{r_{-1}} \right) + i \cos(2\theta_{-1}) \left( \frac{1}{r_{-1}^2} - \frac{u}{r_{-1}} \right) \right) V_{-1}.
\]

In the ball \( B(d\overline{e}_1^1, d^r) \), we have, by Lemma 2.1, that \( \frac{1}{r_{-1}} \leq K \),

\[
u = O_{d \to \infty} \left( \frac{1}{d^3} \right) \quad \text{and} \quad \sin(\theta_{-1}) = O_{d \to \infty} \left( \frac{1}{d^{1-\varepsilon}} \right),
\]

the last one is because for \((y_1, y_2) \in B(d\overline{e}_1^1, d^r)\), we have \(|y_2| \leq d^r\) hence

\[
|\sin(\theta_{-1})| = \frac{|y_2|}{r_{-1}} \leq \frac{K}{d^{1-\varepsilon}}.
\]

We also compute in the same way that

\[
\cos(\theta_{-1}) = \sqrt{1 - \sin^2(\theta_{-1})} = 1 + O_{d \to \infty} \left( \frac{1}{d^{2-2\varepsilon}} \right).
\]

With the equation on \( \rho_{-1} \) coming from

\[-\Delta V_{-1} - (1 - |V_{-1}|^2)V_{-1} = 0,
\]

we check easily that

\[
u' = O_{d \to \infty} \left( \frac{1}{d^4} \right)
\]

as well (or see [15]). Finally, we estimate

\[
\cos(2\theta_{-1}) = 1 - 2\sin^2(\theta_{-1}) = 1 + O_{d \to \infty} \left( \frac{1}{d^{2-2\varepsilon}} \right)
\]

and

\[
\frac{1}{r_{-1}^2} = \left( 2d + O_{d \to \infty}(d^r) \right)^{-2} = \frac{1}{4d^2} + O_{d \to \infty} \left( \frac{1}{d^{3-\varepsilon}} \right).
\]

With this estimations, we end the proof of the lemma.

\[\square\]

### 4.3 Estimate on \( \partial_{x_1} \Psi_{c,d} \) in \( B(d\overline{e}_1^1, d^r) \)

We define the following norms for \( \Psi = \Psi_1 + i\Psi_2 \) and \( h = h_1 + ih_2 \), \( 0 < \alpha < 1, 0 < \varepsilon' < \varepsilon < 1 \):

\[
\|\Psi\|_{\ast, B_d} := \|V\Psi\|_{C^1((r_1 \leq 2))}
\]

\[
+ \|r_1^{1-\alpha} \Psi_1\|_{L^\infty((d^r \geq r_1 \geq 2)} \|r_1^{1-\alpha} \nabla \Psi_1\|_{L^\infty((d^r \geq r_1 \geq 2)}} \]

\[
+ \|r_1^{-\alpha} \Psi_2\|_{L^\infty((d^r \geq r_1 \geq 2))} \|r_1^{-\alpha} \nabla \Psi_2\|_{L^\infty((d^r \geq r_1 \geq 2))}
\]

and

\[
\|h\|_{\ast, B_d} := \|Vh\|_{C^0((r_1 \leq 3))}
\]

\[
+ \|r_1^{1-\alpha} h_1\|_{L^\infty((d^r \geq r_1 \geq 2))} \|r_1^{2-\alpha} h_2\|_{L^\infty((d^r \geq r_1 \geq 2))}.
\]
They are the norms $\|\cdot\|_{*,\alpha,d}$ and $\|\cdot\|_{*,\alpha,d}$ of subsection 2.3, but only on $B'_d = B(d\bar{e}_1, d\varepsilon')$ for $\|\cdot\|_{*,B'_d}$ and on $B_d := B(d\bar{e}_1, d\varepsilon)$ for $\|\cdot\|_{*,B_d}$. The main difference with the previous norms is that we require less decay (we take $-\alpha < 0$ instead of $\sigma > 0$ in the decay) in space, which here, since the norms are only in $\{r_1 \leq d\}$, can be compensated by some smallness in $c$. For this reason, here we do not need a $**$-norm in $\gamma(\alpha)$ for instance.

From Corollary 4.3, we have that $\|\partial_z \Psi_{c,d}\|_{*,B'_d} < +\infty$. We want to show the following proposition.

**Proposition 4.5** For $0 < \alpha < 1, 0 < \varepsilon' < \varepsilon < 1, 0 < \lambda < 1$, if

$$\lambda < (1 + \alpha)\varepsilon'$$

and

$$\lambda + (1 - \alpha)\varepsilon' < 2\varepsilon - \varepsilon'$$

we have

$$\|\partial_z \Psi_{c,d}|_{d=d_0}\|_{*,B'_d} = o_{c \to 0}(e^{1+\lambda}).$$

Such a choice of parameters $\lambda, \alpha, \varepsilon, \varepsilon'$ exists, we can take for instance $\alpha = 1/2, \lambda = 3/4, \varepsilon = 19/24$ and $\varepsilon' = 13/24$. Furthermore, with this particular choice of parameters, we also have

$$\lambda + (1 - \alpha)\varepsilon' > 1,$$

(4.2)

which will be useful later on. These conditions are bounds on how much additional smallness we can have on $\partial_z \Psi_{c,d}$ near $d_0\bar{e}_1$.

The main goal of this proposition is to have a decay in $c$ better than $O_{c \to 0}(c)$, which is not obvious from the estimates we have done until now. From Corollary 4.3, we have simply that $\|\partial_z \Psi_{c,d}|_{d=d_0}\|_{*,\sigma,d_0} \leq K(\sigma)c^{1-\sigma}$, which will not be enough in the computation of $\partial_z d_0$ for the nonlinear terms. The proof of Proposition 4.5 follows closely the proof of the invertibility of the linearized operator in Proposition 2.16. We want to invert the same linearized operator, but with a different norm, which is better locally around the vortex $V_1$.

The reason why we take $B_d$ a little bigger than $B'_d$ is to make the elliptic estimates of step 3 in Proposition 2.16 work here too. The main idea of this proposition is to show that if we move $V_{-1}$ a little, then locally around $V_1$ the change is very small. We now start the proof of Proposition 4.5.

**Proof** First, we remark that in $B_d$, since $\varepsilon < 1$, $\tilde{r} = r_1$.

**Step 1.** Computation of the equation on $\partial_z \Psi_{c,d}$.

Recall that $\Phi_{c,d}$ solves the equation (with $\Phi_{c,d} = V \Psi_{c,d}$)

$$\eta L(\Phi_{c,d}) + (1 - \eta)VL'(\Psi_{c,d}) + F(\Psi_{c,d}) = \lambda(c,d)Z_d,$$

and we recall that $\lambda(c,d) = \frac{(F(\Psi_{c,d}), Z_d)}{\|Z_d\|_{L^2(\mathbb{R}^2)}}$, and we check easily, with Lemma 3.3, that it is a $C^1$ function of $d$. The equation on $\Phi_{c,d}$ holds for any $x \in \mathbb{R}^2$ and any $d \in \mathbb{R}$, $\frac{1}{2d} < c < \frac{2}{3d}$, hence

$$\partial_z (\eta L(\Phi_{c,d}) + (1 - \eta)VL'(\Psi_{c,d}) + \Pi d (F(\Psi_{c,d})) - \lambda(c,d)Z_d) = 0.$$

We compute

$$\partial_z (\lambda(c,d)Z_d) = (\partial_x + \partial_y)(\lambda(c,d)Z_d) = \partial_y \lambda(c,d)Z_d + \lambda(c,d)\partial_z Z_d,$$

and we recall, from the proof of Proposition 2.25 that

$$\lambda(c,d) \int_{\mathbb{R}^2} |\partial_y V|^2 \eta^2 = \pi \left(\frac{1}{d} - c\right) + O_{c \to 0}(c^{2-\sigma}).$$

77
With Lemma 3.3 and Corollary 4.3, as well as Lemma 2.6, we infer that the terms contributing to the $O_{c \to 0}^\varepsilon(c^{2-\sigma})$ are such that, when differentiated with respect to $d$, their contributions are still a $O_{c \to 0}^\varepsilon(c^{2-\sigma})$. Indeed, if the derivative with respect to $d$ fall on a $\Psi_{c,d}$, then by Lemma 3.3 and Corollary 4.3, the same estimates used in the proof of Proposition 2.25 still hold. If the derivative fall on a term depending on $V$, by Lemma 2.6, we gain some decay in the integrals. We deduce that, since $\lambda(c, d_c) = 0$,

$$\partial_d \lambda(c, d)|_{d = d_c} = -\frac{\pi}{d_c^2} + O_{c \to 0}^\varepsilon(c^{2-\sigma}) = O_{c \to 0}^\varepsilon(c^{2-\sigma}).$$

Here, we see why the fact that $d$ is differentiable with respect to $c$ is not obvious. The main contribution is at this point not enough to beat the error terms. Therefore, showing that $\partial_d \lambda(c, d) \neq 0$ is not simple here. This is why we need improved estimations on $\partial_z \Psi_{c,d}$, that will give us the fact that the error terms are a $O_{c \to 0}^\varepsilon(c^{2+\varepsilon})$ for some $\varepsilon > 0$.

Now, writing

$$TW_c(Q_{c,d}) = \eta L(\Phi_{c,d}) + (1 - \eta)VL'(\Psi_{c,d}) + F(\Psi_{c,d}),$$

(with the notations of Lemma 2.7), we have (since $\lambda(c, d_c) = 0$)

$$(\partial_{z_1}(TW_c(Q_{c,d}))) - \partial_d \lambda(c, d)Z_d)|_{d = d_c} = 0.$$

We recall that

$$F(\Psi_{c,d}) = E - ic\partial_{x_2}V + V(1 - \eta)(-\nabla \Psi_{c,d} \cdot \nabla \Psi_{c,d} + |V|^2 S(\Psi_{c,d})) + R(\Psi_{c,d}),$$

where $R(\Psi_{c,d})$ is a sum of terms at least quadratic in $\Psi_{c,d}$ or $\Phi_{c,d}$ localized in the area where $\eta \neq 0$.

We compute

$$\partial_{z_1}(TW_c(Q_{c,d})) = \eta L(V \partial_{z_1} \Psi_{c,d}) + (1 - \eta)VL'(\partial_{z_1} \Psi_{c,d})$$
$$+ \eta \partial_{z_1} L(\Phi_{c,d}) + (1 - \eta)V \partial_{z_1} L'(\Psi_{c,d}) + \partial_{z_1}(E - ic\partial_{x_2}V)$$
$$+ \eta L(\partial_{z_1} V \Psi_{c,d}) + (1 - \eta)\partial_{z_1} VL'(\Psi_{c,d})$$
$$+ \partial_{z,1} \eta (L(\Phi_{c,d}) - V L'(\Psi_{c,d}) - ic\partial_{x_2} \Phi_{c,d})$$
$$- \partial_{z_1} \eta V(-ic\partial_{x_2} \Psi_{c,d} - \nabla \Psi_{c,d} \cdot \nabla \Psi_{c,d} + |V|^2 S(\Psi_{c,d}))$$
$$+ \partial_{z_1}(R(\Psi_{c,d}))$$
$$+ \partial_{z_1} V(1 - \eta)(-ic\partial_{x_2} \Psi_{c,d} - \nabla \Psi_{c,d} \cdot \nabla \Psi_{c,d} + |V|^2 S(\Psi_{c,d}))$$
$$+ V(1 - \eta)\partial_{z_1}(-ic\partial_{x_2} \Psi_{c,d} - \nabla \Psi_{c,d} \cdot \nabla \Psi_{c,d} + |V|^2 S(\Psi_{c,d})).$$

We regroup the terms in the following way. We define

$$\mathcal{L}(\partial_{z_1} \Psi_{c,d}) := \eta L(V \partial_{z_1} \Psi_{c,d}) + (1 - \eta)VL'(\partial_{z_1} \Psi_{c,d}),$$

which is the same linearized operator we have inverted in Proposition 2.16 (taken in $\partial_{z_1} \Psi_{c,d}$), and we define the operator

$$\mathcal{L}_{\partial_{z_1}} (\Psi_{c,d}) := \eta \partial_{z_1} L(\Phi_{c,d}) + (1 - \eta) V \partial_{z_1} L'(\Psi_{c,d}) + \eta L(\partial_{z_1} V \Psi_{c,d}) + (1 - \eta) \partial_{z_1} VL'(\Psi_{c,d}).$$

We already have $TW_c(V) = E - ic\partial_{x_2}V$, therefore

$$\partial_{z_1}(TW_c(V)) = \partial_{z_1}(E - ic\partial_{x_2}V).$$

We define the local error

$$\text{Err}_\text{loc} := \partial_{z_1}(R(\Psi_{c,d})) - \partial_d \lambda(c, d)Z_d,$$

the far away error

$$\text{Err}_\text{far} := \partial_{z_1} V(1 - \eta)(-\nabla \Psi_{c,d} \cdot \nabla \Psi_{c,d} + |V|^2 S(\Psi))$$

and the nonlinear terms

$$\text{NL}_{\partial_{z_1}}(\Psi_{c,d}) := V(1 - \eta)\partial_{z_1}(-\nabla \Psi_{c,d} \cdot \nabla \Psi_{c,d} + |V|^2 S(\Psi_{c,d}))).$$
Finally, we write the cutoff error
\[ \text{Err}_{\text{cut}} := \partial_{z_1} \eta (L(\Psi_{c,d}) - VL'(\Psi_{c,d}) + ic \partial_{z_2} \Psi_{c,d} + \nabla \Psi_{c,d} \cdot \nabla \Psi_{c,d} - |V|^2 S(\Psi_{c,d})) \]
which is supported in the area \( \{2 \leq r < 3\} \), and in particular is zero in \( B(d_c, d_c') \). With these definitions, we have, at \( d = d_c \),
\[
\begin{align*}
& (\partial_{z_1} (\eta L(\Psi_{c,d}) + (1 - \eta) VL'(\Psi_{c,d}) + F(\Psi_{c,d})) - \partial_d \lambda(c,d) Z_d) |_{d=d_c} \\
= & \quad L(\partial_{z_1} \Psi_{c,d}) |_{d=d_c} \\
+ & \quad (\partial_{z_2} (TW_c(V)) + \partial_{z_1} (\Psi_{c,d}) + NL \partial_{z_1} (\Psi_{c,d})) |_{d=d_c} \\
+ & \quad (\text{Err}_{\text{loc}} + \text{Err}_{\text{far}} + \text{Err}_{\text{cut}}) |_{d=d_c}.
\end{align*}
\]
The equation satisfied by \( \partial_{z_1} \Psi_{c,d} \) at \( d = d_c \) is therefore
\[
(\mathcal{L}(\partial_{z_1} \Psi_n) + \partial_{z_1} (TW_{c_n}(V)) + \mathcal{L}(\partial_{z_1} \Psi_n) + NL \partial_{z_1} (\Psi_n) + \text{Err}_{\text{loc}} + \text{Err}_{\text{far}} + \text{Err}_{\text{cut}} = 0.
\]
Step 2. Beginning of the contradiction argument.

Now, suppose that the result of Proposition 4.5 is false. The scheme of this proof is the same as in Proposition 2.16. Then, there exist an absolute constant \( \delta > 0 \) and sequences \( \partial_{z_1} \Psi_n, c_n \to 0, d_n \to \infty \) such that
\[
d_{n}^{1+\lambda} \|\partial_{z_1} \Psi_n|_{d=d_n} \|_{*B_{d_n}'} \geq \delta,
\]
where we write \( d_n = d_{c_n} \) (a value such that \( \lambda(c_n, d_n) = 0 \) in Proposition 2.25). We have just shown that \( \Psi_n \) (where we omit the subscripts in \( d_n, c_n \)) satisfies
\[
\mathcal{L}(\partial_{z_1} \Psi_n) + \partial_{z_1} (TW_{c_n}(V)) + \mathcal{L}(\partial_{z_1} \Psi_n) + NL \partial_{z_1} (\Psi_n) + \text{Err}_{\text{loc}} + \text{Err}_{\text{far}} + \text{Err}_{\text{cut}} = 0.
\]
The function
\[
\frac{(V \partial_{z_1} \Psi_n)(\cdot, - d_n c_1)}{\|\partial_{z_1} \Psi_n\|_{*B_{d_n}''}}
\]
converges locally uniformly up to a subsequence to a limit \( \Phi_c \), since it is bounded in \( \|\cdot\|_{*, B'_{d_n}} \) for any \( \lambda > 0 \) (for the same reasons that \( \Psi_n \to \Psi \) locally uniformly in the beginning of the proof of Proposition 2.16).

The equation on \( \partial_{z_1} \Psi_n \) is
\[
\mathcal{L}(\partial_{z_1} \Psi_n) + V h_n = 0, \tag{4.3}
\]
with
\[
V h_n := \partial_{z_1} (TW_{c_n}(V)) + \mathcal{L}(\partial_{z_1} \Psi_n) + NL \partial_{z_1} (\Psi_n) + \text{Err}_{\text{loc}} + \text{Err}_{\text{far}} + \text{Err}_{\text{cut}}.
\]
The goal of Proposition 2.16 was to estimate \( \|\Psi\|_{*, \sigma, d} \) with \( \|h\|_{*, \sigma, d} + c_1^{-\sigma} \|h\|_{*, \sigma, d} \) for the equation \( \mathcal{L}(\Psi) = h \) if \( d \) is large enough (given an orthogonality condition on \( \Psi \)). Here we do the same thing, but localized in space, and with a very particular \( h_n \) that we will estimate. To continue as in the proof of Proposition 2.16, we want to show that
\[
\frac{h_n(\cdot, - d_n c_1)}{\|\partial_{z_1} \Psi_n\|_{*B_{d_n}''}} \to 0
\]
in \( C^0_{\text{loc}} \) so that we get at the limit (following the +1 vortex) in (4.3)
\[
\mathcal{L}_{\psi_1}(\Phi) = 0,
\]
using the same techniques as in the proof of Proposition 2.16. It will be enough for that to show that
\[
\frac{h_n}{\|\partial_{z_1} \Psi_n\|_{*B_{d_n}''}} \to 0 \quad (4.4)
\]
and we will also use this estimate later on. Remark that here, the problem is no longer symmetric in \( x_1 \), in particular, we cannot use the same argument near the \(-1\) vortex, but it is not needed.
Step 3. Proof of (4.4).

Recall the definition of \( \| h \|_{**_d_n} \):
\[
\| h \|_{**_d_n} = \| Vh \|_{C^0(\Omega)} + \| r_1^{-\alpha} h_1 \|_{L^\infty(\{d_n \geq r_1 \geq 2\})} + \| r_1^{2-\alpha} h_2 \|_{L^\infty(\{d_n \geq r_1 \geq 2\})}.
\]

Since
\[
d_1^{1+\lambda} \| \partial_x (\Psi_n) \|_{**_d_n} \geq \delta,
\]
we have
\[
\frac{1}{\| \partial_x (\Psi_n) \|_{**_d_n}} \leq \frac{1}{\delta_1^{1+\lambda}},
\]
therefore it is enough to show that
\[
\| h_n \|_{**_d_n} = o_{c_n \to 0}(c_n^{1+\lambda})
\]
to have (4.4). We recall that
\[
Vh_n = \partial_x (TW_{c_n}(V)) + L_{\partial_x} (\Psi_n) + NL_{\partial_x}(\Psi_n) + Err_{loc} + Err_{far} + Err_{cut}.
\]
The contribution of \( \partial_x (TW_{c_n}(V)) \) will be established in step 3.1, \( L_{\partial_x} (\Psi_n) \) in step 3.2, \( NL_{\partial_x}(\Psi_n) \) in step 3.3, and finally, \( Err_{loc} + Err_{far} + Err_{cut} \) in step 3.4.

Step 3.1. Proof of \( \| \frac{\partial_x (TW_{c_n}(V))}{V} \|_{**_d_n} = o_{c_n \to 0}(c_n^{1+\lambda}) \).

Recall from (2.2) that
\[
TW_c(V) = E - ic\partial_x V = -2\nabla V_1 \cdot \nabla V_1 + (1 - |V_1|^2)(1 - |V_1|^2)V_1 V_1 - ic\partial_x V;
\]
therefore, with Lemma 4.2, we have
\[
\partial_x (TW_c(V)) = -4\nabla V_1 \cdot \nabla \partial_x V_1 + 2(1 - |V_1|^2)V_1 \partial_x ((1 - |V_1|^2)V_1) - 2ic\partial_x (V_1 \partial_x V_1).
\]
We now estimate this quantity at \( d = d_n \). We have
\[
|\partial_x (TW_c(V))| \leq \frac{K}{1 + r_1} \times \frac{1}{d_n^3},
\]
and using \( \lambda < 1, \alpha > 0 \), we deduce
\[
\left\| \frac{(1 - |V_1|^2)V_1 \partial_x ((1 - |V_1|^2)V_1)}{V} \right\|_{**_d_n} = o_{c_n \to 0}(c_n^{1+\lambda}).
\]

We compute with Lemmas 2.2 and 4.4 that
\[
\Re \left( \frac{4\nabla V_1 \cdot \nabla \partial_x V_1}{V} \right) = 4\Re \left( \frac{\nabla V_1}{V_1} \right) \Re \left( \frac{\nabla \partial_x V_1}{V_1} \right) - 4\Im \left( \frac{\nabla V_1}{V_1} \right) \Im \left( \frac{\nabla \partial_x V_1}{V_1} \right),
\]
leading to
\[
\left\| \Re \left( \frac{4\nabla V_1 \cdot \nabla \partial_x V_1}{V} \right) \right\| \leq \frac{K}{(1 + r_1)d_n^{-\varepsilon}} + \frac{K}{(1 + r_1)d_n}
\]
for a universal constant \( K \). Since \( \lambda < 1 \) and \( \alpha > 0 \), we have
\[
\left\| \Re \left( \frac{4\nabla V_1 \cdot \nabla \partial_x V_1}{V} \right) \right\|_{**_d_n} = o_{c_n \to 0}(c_n^{1+\lambda}).
\]
Similarly, we have
\[
\left\| \Im \left( \frac{4\nabla V_1 \cdot \nabla \partial_x V_1}{V} \right) \right\| \leq \frac{K}{(1 + r_1)d_n^2} + \frac{K}{(1 + r_1)d_n^{1-\varepsilon}}.
\]
Therefore, using
\[ \frac{1}{d_n} \leq \frac{K}{(1 + r_1)^{1/\varepsilon}}, \]
since we are in \( B_{d_n} = B(d_n e_1, d_n) \), and
\[ \lambda < 2 - \varepsilon(2 - \alpha), \]
which is one of the hypothesis of the lemma, we have
\[ \left\| i\Re \left( \frac{4\nabla V_1, \nabla \partial_{x_1} V_1}{V} \right) \right\|_{**; B_{d_n}} = o(c_n \to 0(c_n^{1+\lambda})). \]

Now, for \( 2ic_n \partial_{x_2}(V_1 \partial_{x_1} V_1) = 2ic_n \partial_{x_2} V_1 \partial_{x_1} V_1 + 2ic_n \partial_{x_1} V_1 V_1 \), we estimate (still using Lemma 2.2 and 4.4)
\[ \left\| 2ic_n \partial_{x_2} V_1 \partial_{x_1} V_1 \right\|_{**; B_{d_n}} = o(c_n \to 0(c_n^{1+\lambda})). \]

We then compute (still using Lemma 2.2 and 4.4)
\[ \left\| \Re \left( \frac{ic_n \partial_{x_2} V_1 \partial_{x_1} V_1}{V} \right) \right\| \leq \frac{K}{d_n^3}, \]
\[ \left\| \Im \left( \frac{ic_n \partial_{x_2} \partial_{x_1} V_1}{V} \right) \right\| \leq \frac{K}{d_n^{3-\varepsilon}}, \]
therefore, using \( \frac{1}{d_n} \leq \frac{K}{(1 + r_1)^{1/\varepsilon}} \), we have, under the conditions
\[ \lambda < 2 - \varepsilon(1 - \alpha) \quad \text{and} \quad \lambda < 3 - \varepsilon(3 - \alpha), \]
which are met since
\[ \lambda < 2 - \varepsilon(2 - \alpha) = 2 - \varepsilon(1 - \alpha) - \varepsilon < 2 - \varepsilon(1 - \alpha), \]
and \( \lambda < 2 - \varepsilon(2 - \alpha) = 3 - \varepsilon(3 - \alpha) - 1 + \varepsilon < 3 - \varepsilon(3 - \alpha), \)
that
\[ \left\| ic_n \partial_{x_2} (V_1 \partial_{x_1} V_1) \right\|_{**; B_{d_n}} = o(c_n \to 0(c_n^{1+\lambda})). \]

This concludes the proof of step 3.1.

Step 3.2. Proof of \( \left\| L_{\partial_{x_1}}(\Psi_n) \right\|_{**; B_{d_n}} = o(c_n \to 0(c_n^{1+\lambda})). \)

We have defined
\[ L_{\partial_{x_1}}(\Psi_n) = \eta(\partial_{x_1} L)(\Phi_n) + (1 - \eta)V(\partial_{x_1} L')(\Psi_n) + \eta L((\partial_{x_1} V)\Psi_n) + (1 - \eta)\partial_{x_1} V L'(\Psi_n). \]
We recall from Lemma 2.7 that
\[ L'(\Psi_n) = -\Delta \Psi_n - 2\frac{\nabla V}{V} \cdot \nabla \Psi_n + 2|V|^2 \Re(\Psi_n) - ic_n \partial_{x_2} \Psi_n, \]

81
\[ L(\Phi_n) = -\Delta \Phi_n - (1 - |V|^2) \Phi_n + 2\Re(\overline{V} \Phi_n)V - ic_n \partial_{x_2} \Phi_n, \]

hence

\[ (\partial_{x_2} L)(\Phi_n) = 4\Re(V_1 \partial_{x_1} V_1 \Phi_n + 4\Re(\overline{\partial_{x_1} V_1} V \Phi_n)V + 4\Re(\overline{V} \Phi_n)V_1 \partial_{x_1} V_{-1}. \]

We shall now estimate all these terms one by one.

Finally, we estimate

\[ \| \eta \partial_{x_2} L(\Phi_n) \|_{**B_{d_n}} = o_{c_n \to 0}(c_n^{1+\lambda}). \]

With the same arguments and Lemma 2.29, we also check that

\[ \| \eta L(\partial_{x_2} V \Psi_n) \|_{**B_{d_n}} = o_{c_n \to 0}(c_n^{1+\lambda}). \]

Now, with Lemma 2.29 and \( \| \Psi_n \|_{*,, \sigma, d_n} \leq K(\sigma)c_1^{1-\sigma}, \) we check that for any \( 0 < \sigma < 1, \)

\[ |L'(\Psi_n)| \leq \frac{K(\sigma)}{(1 + r_1)^{1+\sigma} d_n^{\lambda - \sigma}}, \]

therefore, with Lemma 4.4, we have

\[ |(1 - \eta) \partial_{x_2} V L'(\Psi_n)| \leq \frac{K(\sigma)}{(1 + r_1)^{1+\sigma} d_n^{\lambda - \sigma}}. \]

In particular, we check that if

\[ \lambda < 2 - \varepsilon(2 - \alpha), \]

we can take \( \sigma \) such that \( 0 < \sigma < \frac{2 - \varepsilon(2 - \alpha) - \lambda}{1 - \varepsilon}, \) hence

\[ \| (1 - \eta) \partial_{x_2} V L'(\Psi_n) \|_{**B_{d_n}} = o_{c_n \to 0}(c_n^{1+\lambda}). \]

Finally, we estimate

\[ |\partial_{x_2} L'(\Psi_n)| \leq K \cdot |\partial_{x_1} \nabla V_1 \nabla \Psi_n| + K|\Re(\partial_{x_1} V_1 \nabla \Psi_n)|. \]

With Lemma 4.4 and \( \| \Psi_n \|_{*,, \sigma, d_n} \leq K(\sigma)c_1^{1-\sigma} \) (from (3.13)), we check that

\[ |(1 - \eta) V \partial_{x_2} L'(\Psi_n)| \leq \frac{K(\sigma)(1 - \eta)}{r_1^{1+\sigma} d_n^{\lambda - \varepsilon - \sigma}}, \]

therefore, with the same condition as for the previous term, namely

\[ \lambda < 2 - (2 - \alpha)\varepsilon, \]

we infer, taking \( \sigma \) small enough,

\[ \| (1 - \eta) V \partial_{x_2} L'(\Psi_n) \|_{**B_{d_n}} = o_{c_n \to 0}(c_n^{1+\lambda}). \]

This concludes the proof of step 3.2.

Step 3.3. Proof of \( \| S L_{d_n}(\Psi_n) \|_{**B_{d_n}} = o_{c_n \to 0}(c_n^{1+\lambda}). \)
We recall
\[ \text{NL}_{\partial_1}(\Psi_n) = V(1 - \eta)\partial_1(-\nabla \Psi_n, \nabla \Psi_n + |V|^2S(\Psi_n)), \]
with \( S(\Psi_n) = e^{2\text{Re}(\Psi_n)} - 1 - 2\text{Re}(\Psi_n). \) We compute
\[
\partial_1(-\nabla \Psi_n, \nabla \Psi_n + |V|^2S(\Psi_n)) = -2\nabla \partial_1\Psi_n, \nabla \Psi_n + 4\text{Re}(\partial_{x_1}V_1\bar{V_1})S(\Psi_n) + |V|^2\partial_1S(\Psi_n).
\]

Now, with Corollary 4.3 and (3.13), we check that, for any \( 0 < \sigma < 1, r_1 \geq 2, \)
\[
|\nabla \partial_1\Psi_n, \nabla \Psi_n| \leq \frac{K(\sigma)}{r_1^{1+2\sigma}d_n^{2-2\sigma}},
\]
\[
|4\text{Re}(\partial_{x_1}V_1\bar{V_1})S(\Psi_n) + |V|^2\partial_1S(\Psi_n)| \leq \frac{K(\sigma)}{r_1^{1+2\sigma}d_n^{2-2\sigma}},
\]
therefore, taking \( \sigma < \frac{1-\lambda}{2}, \) we check that
\[
\|(1 - \eta)(-2\nabla \partial_1\Psi_n, \nabla \Psi_n + 4\text{Re}(\partial_{x_1}V_1\bar{V_1})S(\Psi_n) + |V|^2\partial_1S(\Psi_n))\|_{**B_{d_n}} = o_{c_n \to 0}(c_n^{1+\lambda}).
\]
The proof of step 3.3 is complete.

Step 3.4. Proof of \( \|\text{Err}_{\text{loc}} + \text{Err}_{\text{far}} + \text{Err}_{\text{cut}}\|_{**B_{d_n}} = o_{c_n \to 0}(c_n^{1+\lambda}). \)

We recall
\[
\text{Err}_{\text{cut}} = \partial_1\eta(L(\Psi_n) - V'L(\Psi_n) + ic\partial_{x_2}\Psi_n + \nabla \Psi_n, \nabla \Psi_n - |V|^2S(\Psi_n)),
\]
\[
\text{Err}_{\text{loc}} = \partial_1(R(\Psi_n)) - \partial_{\lambda}\lambda(c_n, d_n)Z_{d_n},
\]
\[
\text{Err}_{\text{far}} = \partial_1 V(1 - \eta)(-\nabla \Psi_n, \nabla \Psi_n + |V|^2S(\Psi_n)).
\]
\text{Err}_{\text{cut}} is compactly supported in \( \{r_{-1} \leq 2\}, \) therefore \( \text{Err}_{\text{cut}} = 0 \) in \( B_{d_n}, \) hence
\[
\|\text{Err}_{\text{cut}}\|_{V} = 0.
\]

Now, \( \text{Err}_{\text{loc}} \) is supported in \( \{r_{1} \leq 2\}, \) and from Lemma 2.7, we know that \( R(\Psi_n) \) is a sum of terms at least quadratic in \( \Psi_n \) or \( \Psi_n \) localized in the area where \( \eta \neq 0. \) Therefore, from Corollary 4.3 and (3.13), we check that
\[
|\partial_1(R(\Psi_n))| \leq \frac{K(\sigma)}{d_n^{1-2\sigma}},
\]
and we have check in step 1 that \( |\partial_{\lambda}\lambda(c_n, d_n)| = O_{c_n \to 0}(c_n^{2-\sigma}). \) Thus, taking \( \sigma < \frac{1-\lambda}{2}, \)
\[
\|\text{Err}_{\text{loc}}\|_{V} = o_{c_n \to 0}(c_n^{1+\lambda}).
\]

From (3.13), we check that, for any \( 1 > \sigma > 0, \)
\[
| - \nabla \Psi_n, \nabla \Psi_n + |V|^2S(\Psi_n)| \leq \frac{K(\sigma)}{1 + r_1^{2+2\sigma}d_n^{2-2\sigma}},
\]
and from Lemma 4.4, we have
\[
|\partial_1 V| \leq \frac{K(\sigma)}{d_n^{1-\sigma}},
\]
therefore, choosing \( \sigma \) small enough, we have
\[
\|\partial_1 V(1 - \eta)(-\nabla \Psi_n, \nabla \Psi_n + |V|^2S(\Psi_n))\|_{**B_{d_n}} = o_{c_n \to 0}(c_n^{1+\lambda}).
\]
This ends the proof of step 3.4 and hence of (4.4).
Step 4. Three additional estimates on $h_n$.

This step is devoted to the proof of the following three estimates:

$$\|h_n\|_{\ast\ast, \sigma, d_n} \leq K(\sigma)c_n^{1-\sigma}$$  \hspace{1cm} (4.6)

(which is an estimate in $\mathbb{R}^2$). In the right half-plane, we want to show that

$$|h_n| \leq \frac{K(\sigma)c_n^{1+\sigma}}{(1 + r_1)},$$  \hspace{1cm} (4.7)

and, in the left half-plane,

$$|h_n| \leq \frac{K(\sigma)c_n^{1-\sigma}}{(1 + r_1)^2}.$$  \hspace{1cm} (4.8)

Observe that $h_n$ is not symmetrical with respect to $x_1$ because of the cutoff. Recall that

$$V h_n = \partial_{z_1}(TW_{c_n}(V)) + L_{\partial_{z_1}}(\Psi_n) + N L_{\partial_{z_1}}(\Psi_n) + Err_{\text{loc}} + Err_{\text{far}} + Err_{\text{cut}}.$$  

We complete estimates done in the previous step to show that (4.6), (4.7) and (4.8) hold.

Step 4.1. Estimates for $\partial_{z_1}(TW_{c_n}(V))$.

From Step 3.1, we have

$$\partial_{z_1}(TW_{c}(V)) = -4V_1 \nabla \partial_{x_1} V_{-1} + 2(1 - |V_1|^2)V_1 \partial_{x_1}((1 - |V_{-1}|^2)V_{-1}) - 2i \partial_{x_2}(V_1 \partial_{x_1} V_{-1}).$$

In view of Lemma 2.1, equation (2.3) and the estimate $(1 + r_1)(1 + r_1) \geq d_n(1 + \tilde{r})$, we have

$$\|\partial_{z_1}(TW_{c}(V))/V\|_{\ast\ast, \sigma, d_n} \leq K(\sigma)c_n^{1-\sigma}.$$  

Furthermore, in the left half-plane, with Lemma 2.1 and equation (2.3), we check easily that

$$|\partial_{z_1}(TW_{c}(V))| \leq \frac{Kc_n}{(1 + r_1)^2}.$$  

Furthermore, in the right half-plane, we have $\frac{1}{(1 + r_1)} \leq Kc_n$, therefore, still using Lemma 2.1 and equation (2.3), we check that

$$|\partial_{z_1}(TW_{c}(V))| \leq \frac{Kc_n^2}{(1 + r_1)}.$$  

Step 4.2. Estimates for $L_{\partial_{z_1}}(\Psi_n)$.

We have, from Step 3.2, that

$$L_{\partial_{z_1}}(\Psi_n) = \eta \partial_{z_1} L(\Phi_n) + (1 - \eta)V \partial_{z_1} L'(\Psi_n) + \eta L(\partial_{z_1} V \Psi_n) + (1 - \eta) \partial_{z_1} V L'(\Psi_n),$$

with

$$(\partial_{z_1} L)(\Psi_n) = 4 \Re(V_1 \partial_{x_1} V_{-1}) \Phi_n + 4 \Re(\partial_{x_1} V_{-1} V_1 \Phi_n) - 4 \Re(\overline{\Phi_n} V_1 \partial_{x_1} V_{-1}),$$

and

$$L'(\Psi_n) = -\Delta \Psi_n - 2 \overline{V_1} \nabla \Psi_n + 2|V|^2 \Re(\Psi_n) - i c_n \partial_{x_2} \Psi_n.$$

and

$$|\partial_{z_1} L'(\Psi_n)| \leq K \left| \partial_{z_1} \frac{V_{-1}}{V_1} \nabla \Psi_n \right| + K |\Re(\partial_{x_1} V_{-1} \overline{V_1}) \Re(\Psi_n)|.$$  \hspace{1cm} (4.9)

Similarly as in Step 4.1, every local term (in the area $\{ \eta \neq 0 \}$) satisfies the two estimates, using $\|\Psi_n\|_{\ast, 1-\sigma, d_n} \leq K(\sigma)c_n^{\sigma}$. The two nonlocal terms are $(1 - \eta)V \partial_{z_1} L'(\Psi_n)$ and $(1 - \eta) \partial_{z_1} V L'(\Psi_n)$. For the first term, in view of Lemma 2.1, equations (2.3) and (4.9) and $\|\Psi_n\|_{\ast, \sigma, d_n} \leq K(\sigma)c_n^{1-\sigma}$, we check that

$$\|(1 - \eta) \partial_{z_1} L'(\Psi_n)\|_{\ast\ast, \sigma, d_n} \leq K(\sigma)c_n^{1-\sigma}$$

84
and, in the left-half plane,

$$|(1 - \eta)V\partial_z L'(\Psi_n)| \leq \frac{K(\sigma)C_n^{1-\sigma}}{(1 + r_1)^2}$$

Furthermore, using now $$\|\Psi_n\|_{*,1-\sigma,d_n} \leq K(\sigma)c^\sigma$$, we check that, in the right half-plane,

$$|(1 - \eta)V\partial_z L'(\Psi_n)| \leq \frac{K(\sigma)c_n^{1+\sigma}}{(1 + r_1)}.$$  

Finally, for the term $$(1 - \eta)\partial_z V L'(\Psi_n)$$, we use equations (2.35), (2.41) and $$\|\Psi_n\|_{*,\sigma,d_n} \leq K(\sigma)c_n^{1-\sigma}$$ to check that

$$|L'(\Psi_n)| \leq \frac{K(\sigma)c_n^{1-\sigma}}{(1 + r_1)^{1+\sigma}}.$$  

Combining this estimate with $$|\partial_z V| \leq \frac{K}{(1 + r)}$$, we show that

$$\left\|(1 - \eta)\frac{\partial_z V}{V} L'(\Psi_n)\right\|_{*,\sigma,d_n} \leq (1 + r)^{2+\sigma} \left(1 - \eta\right)\frac{\partial_z V}{V} L'(\Psi_n) \right\|_{L^\infty(\mathbb{R}^2)} \leq \frac{K(\sigma)c_n^{1-\sigma}}{,\sigma,d_n}$$

and, in the left half-plane,

$$|(1 - \eta)\partial_z V L'(\Psi_n)| \leq \frac{K(\sigma)c_n^{1-\sigma}}{(1 + r_1)^2}.$$  

Furtherore, using $$\|\Psi_n\|_{*,1-\sigma,d_n} \leq K(\sigma)c_n^\sigma$$, we also have the estimate

$$|L'(\Psi_n)| \leq \frac{K(\sigma)c_n^\sigma}{(1 + r)}$$

and using $$|\partial_z V| \leq Kc_n$$ in the right half-plane, we estimate in this same area that

$$|(1 - \eta)\partial_z V L'(\Psi_n)| \leq \frac{K(\sigma)c_n^{1+\sigma}}{(1 + r)}.$$

Step 4.3. Estimates for $$\text{NL}_{\partial_z} (\Psi_n)$$.

From Step 3.3,

$$\text{NL}_{\partial_z} (\Psi_n) = V(1 - \eta)\partial_z (\Psi_n - \nabla \Psi_n, \nabla \Psi_n + |V|^2 S(\Psi_n)).$$

Using $$\|\Psi_n\|_{*,\frac{1-\sigma}{2},d_n} \leq K(\sigma)c_n^{\frac{1-\sigma}{2}}$$ and Corollary 4.3 (also for $$\frac{1+\sigma}{2}$$), we check without difficulties that

$$|\text{NL}_{\partial_z} (\Psi_n)/V|_{*,\sigma,d_n} \leq K(\sigma)c_n^{1-\sigma},$$

and, with, some margin, that in the left half-plane,

$$|\text{NL}_{\partial_z} (\Psi_n)| \leq \frac{K(\sigma)c_n^{1-\sigma}}{(1 + r_1)^2}.$$  

Now, using $$\|\Psi_n\|_{*,\frac{1-\sigma}{2},d_n} \leq K(\sigma)c_n^{\frac{1+\sigma}{2}}$$ and Corollary 4.3 (also for $$\frac{1+\sigma}{2}$$), we have, in the right half-plane,

$$|\text{NL}_{\partial_z} (\Psi_n)| \leq \frac{K(\sigma)c_n^{1+\sigma}}{(1 + r)}.$$  

Step 4.4. Estimates for $$\text{Err}_{\text{loc}} + \text{Err}_{\text{far}} + \text{Err}_{\text{cut}}$$.  

85
For \( \text{Err}_{\text{loc}} = \partial_{z_{1}} (R(\Psi_{n})) - \partial_{d} (c_{n}, d_{n}) Z_{d_{n}} \), the same computations as in Step 4.3 yield the estimates (because this term is compactly supported in the area \( \{ \eta \neq 0 \} \) needed for (4.6) to (4.8).

For \( \text{Err}_{\text{cut}} = \partial_{z_{1}} \eta (L(\Phi_{n}) - V' (\Psi_{n}) + ic \partial_{x_{2}} \Psi_{n} + \nabla \Psi_{n} \cdot \nabla \Psi_{n} - |V|^{2} S(\Psi_{n})) \), this term is compactly supported near the vortex \(-1\), hence is 0 in the right half-plane. Furthermore, using (2.35), (2.41) and \( \| \Psi_{n} \| \leq K(\sigma) c_{n}^{1-\sigma} \), we check easily that

\[
\| \text{Err}_{\text{cut}} / V \|_{s, \sigma, d_{n}} \leq K(\sigma) c_{n}^{1-\sigma}
\]

and, since it is compactly supported, in the left half-plane,

\[
| \text{Err}_{\text{cut}} | \leq \frac{K(\sigma) c_{n}^{1-\sigma}}{(1 + r_{-})^2}
\]

Finally, for \( \text{Err}_{\text{fat}} = \partial_{z_{1}} V (1 - \eta) (\nabla \Psi_{n}, \nabla \Psi_{n} + |V|^{2} S(\Psi_{n})) \), from \( \| \Psi_{n} \| \leq K(\sigma) c_{n}^{1-\sigma} \) we have

\[
\| (1 - \eta) (\nabla \Psi_{n}, \nabla \Psi_{n} + |V|^{2} S(\Psi_{n})) \| \leq \frac{K(\sigma) c_{n}^{1-\sigma}}{(1 + r_{-})^{2+\sigma}},
\]

and we conclude as in Step 4.2.

This concludes the proof of estimates (4.6), (4.7) and (4.8).

Step 5. Inner estimates.

By the estimation we have just proved, we have in particular

\[
\frac{h_{n} (\cdot, - d_{n} c_{1}^{1})}{\| \partial_{z_{1}} \Psi_{n} \|_{s, B_{1}^{1}}} \to 0
\]

in \( C_{0}^{1} \) (which corresponds to follow the \(+1\) vortex). Therefore, at the limit, in the distribution sense,

\[
L_{V_{1}} (\Theta) = 0
\]

in all \( \mathbb{R}^{2} \). If we show that \( \langle \Theta, \chi \partial_{z_{1}} V_{1} \rangle = 0 \) for \( \chi \) a cutoff near 0, we can then use Theorem 2.15 to show, similarly as in the proof of Proposition 2.16, that \( \Theta = 0 \) since

\[
\| \Theta \|_{H_{V_{1}}} < +\infty.
\]

We recall that, by construction, we have \( \langle \Phi_{c, d}, Z_{d} \rangle = 0 \). By symmetry, this implies that \( \langle \Phi_{c, d}, \eta (y) \partial_{d} V \rangle = 0 \). Both \( \Phi_{c, d} \) and \( \eta (y) \partial_{d} V \) are \( C^{1} \) with respect to \( d \), and therefore

\[
0 = \partial_{d} \langle \Phi_{c, d}, \eta (y) \partial_{d} V \rangle = \langle \partial_{d} \Phi_{c, d}, \eta (y) \partial_{d} V \rangle + \langle \Phi_{c, d}, \partial_{d} (\eta (y) \partial_{d} V) \rangle.
\]

Furthermore, \( \langle \partial_{x_{2}} \Phi_{c, d}, \eta (y) \partial_{d} V \rangle = - \langle \Phi_{c, d}, \partial_{x_{2}} \eta (y) \partial_{d} V \rangle \), thus

\[
\langle \partial_{x_{2}} \Phi_{c, d}, \eta (y) \partial_{d} V \rangle = - \langle \Phi_{c, d}, \eta (y) \partial_{x_{2}} \partial_{d} V \rangle,
\]

and we check easily that \( |\eta (y) \partial_{x_{2}} \partial_{d} V| \leq K \eta (y) \), therefore, since \( \| \Phi_{c, d} \|_{s, \sigma, d} \leq K(\sigma) c_{n}^{1-\sigma} \), we have \( |\langle \partial_{x_{2}} \Phi_{c, d}, \eta (y) \partial_{d} V \rangle| \leq K(\sigma) c_{n}^{2-\sigma} \), and thus, taking \( 0 < \sigma < 1 - \lambda \), for \( c_{n} \) and \( d_{n}, n \to \infty \), we infer that \( \langle \Theta, \eta \partial_{z_{1}} V_{1} \rangle = 0 \).

We continue as in the proof of Proposition 2.16. The fact that \( \Theta = 0 \) gives us that for any \( R > 0 \), we have

\[
\frac{\| V \partial_{z_{1}} \Psi_{n} \|_{L^{\infty} (\{ r_{1} \leq R \})} + \| \nabla (V \partial_{z_{1}} \Psi_{n}) \|_{L^{\infty} (\{ r_{1} \leq R \})}}{\| \partial_{z_{1}} \Psi_{n} \|_{s, B_{1}^{1}}} \to 0.
\]

Step 6. Outer computations.
We have the same outer computations as in step 2 of the proof of Proposition 2.16, but with $\mathcal{Y}_n = \frac{\partial \varphi_n}{\partial_{x_1} \varphi_n \mid_{B_{d_n}}}^h$ playing the role of $\Psi_n$ and $\mathcal{H}_n = \frac{h_n}{\|\partial_{x_1} \varphi_n\| \cdot B_{d_n}}$ playing the role of $h_n$, since they satisfy the same equation. We showed in (4.4) that
$$
\|\mathcal{H}_n\|_{**,B_{d_n}} = o_{n \to \infty}(1),
$$
and the system of equation is, with $\mathcal{Y}_n = \mathcal{Y}_1 + i\mathcal{Y}_2$ and $\mathcal{H}_n = \mathcal{H}_1 + i\mathcal{H}_2$,
$$
\begin{align*}
\Delta \mathcal{Y}_1 - 2|\nabla|^2 \mathcal{Y}_1 &= -\mathcal{H}_1 - 2\Re\left(\nabla \mathcal{Y}_n\right) + c\partial_{x_2} \mathcal{Y}_2 \\
\Delta \mathcal{Y}_2 + c\partial_{x_2} \mathcal{Y}_1 &= -\mathcal{H}_2 - 2\Im\left(\nabla \mathcal{Y}_n\right).
\end{align*}
$$
Recall the two balls $B_{d_n} = B(d_n, \varepsilon')$ and $B'_{d_n} = B(d_n, \varepsilon)$ and $B''_{d_n} = B(d_n, \varepsilon')$. We have, as in the proof of Proposition 2.16, outside $\{r_1 \leq R\}$ but in $B'_{d_n}$, that $\|\mathcal{Y}_n\|_{**,B_{d_n}} = 1$ and $\|\mathcal{H}_n\|_{**,B_{d_n}} = o_{n \to \infty}(1)$, therefore
$$
|\Delta \mathcal{Y}_1 - 2\mathcal{Y}_1| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + r_1)^{1 - \sigma}} (4.10)
$$
and
$$
|\Delta \mathcal{Y}_2 + c\partial_{x_2} \mathcal{Y}_1| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + r_1)^{2 - \sigma}} (4.11)
$$
We want to extend these estimates in $B_{d_n} = B(d_n, \varepsilon')$ and not only on $B'_{d_n} = B(d_n, \varepsilon')$. Since $\|\mathcal{H}_n\|_{**,B_{d_n}} = o_{n \to \infty}(1)$ from (4.4), the estimates on $\mathcal{H}_1$ and $\mathcal{H}_2$ are already on $B_{d_n}$, leaving $c\partial_{x_2} \mathcal{Y}_2$ and the real and imaginary parts of $\nabla \mathcal{Y}_n$ to estimate.

First, we check that, in $B_{d_n} \setminus B'_{d_n}$,
$$
|c_n \partial_{x_2} \mathcal{Y}_2| \leq \frac{d_n^{1 + \lambda} \varepsilon'}{(1 + r_1)^{1 - \sigma}} = \frac{o_{n \to \infty}(1)}{(1 + r_1)^{1 - \sigma}}
$$
taking $\sigma > 0$ small enough. We use $\mathcal{Y}_n = \frac{\partial \varphi_n}{\|\partial_{x_1} \varphi_n\| \cdot B_{d_n}}$, $\|\partial_{x_1} \varphi_n\| \cdot B_{d_n} \leq K\varepsilon'$. Hence, for any $1 > \sigma > 0$,
$$
\Re\left(\nabla \mathcal{Y}_n\right) \leq \frac{\nabla \mathcal{Y}_n}{V} \times |\nabla \mathcal{Y}_n| \leq \frac{K(\varepsilon') d_n^{1 + \lambda}}{(1 + r_1)^{2 - \sigma}} \leq \frac{K(\varepsilon') d_n^{1 + \lambda}}{d_n^{2 - \sigma}}.
$$
In $B_{d_n} \setminus B'_{d_n}$, we have $r_1 \geq \varepsilon'$, therefore
$$
\Re\left(\nabla \mathcal{Y}_n\right) \leq \frac{K(\varepsilon')}{r_1^{1 - \sigma} d_n^{2 - \sigma - \lambda}}.
$$
Since we assume
$$
\lambda < (1 + \alpha)\varepsilon',
$$
then we can choose $\sigma > 0$ small such that $-\sigma - \lambda + (1 + \alpha + \sigma)\varepsilon' > 0$ and deduce, in $B_{d_n} \setminus B'_{d_n}$, that
$$
\Re\left(\nabla \mathcal{Y}_n\right) \leq o_{n \to \infty}(1).
$$
This result shows that (4.10) holds on $B_{d_n}$. Now, we compute
$$
\Im\left(\nabla \mathcal{Y}_n\right) \leq \Re\left(\nabla \mathcal{Y}_n\right) \cdot \Im(\nabla \mathcal{Y}_n) + \Re(\nabla \mathcal{Y}_n) \cdot \Im\left(\nabla \mathcal{Y}_n\right),
$$
and with Corollary 4.3, Lemma 2.2 and 4.4, we estimate
$$
\Re\left(\nabla \mathcal{Y}_n\right) \cdot \Im(\nabla \mathcal{Y}_n) \leq K(\varepsilon') \left(\frac{1}{d_n} + \frac{1}{r_1}\right) \frac{d_n^{1 + \lambda}}{r_1^{1 + \sigma} d_n^{2 - \sigma}}.
$$
and
\[
\left| \Re(\nabla \mathcal{Y}_n) \cdot \Im \left( \frac{\nabla V}{V} \right) \right| \leq K(\sigma) \frac{d_n^{1+\lambda}}{r_1^{1+\sigma} d_n^{1-\sigma}} \left( \frac{1}{d_n^2} + \frac{1}{r_1} \right).
\]

In \( B_{d_n} \setminus B'_{d_n} \), we have \( d_n' \geq r_1 \geq d_n'' \), and with similar estimates as for the previous term, we check that, since \( \lambda < (1 + \alpha)\varepsilon' \), we have
\[
\lambda < (2 + \alpha)\varepsilon',
\]
for the first term, and
\[
\lambda < (1 + \alpha)\varepsilon'
\]
for the second one. We can find \( \sigma > 0 \) such that
\[
\left| \Im \left( \frac{\nabla V}{V} \cdot \nabla \mathcal{Y}_n \right) \right| \leq \frac{o_{n \to \infty}(1)}{(1 + r_1)^{2-\alpha}}
\]
in \( B_{d_n} \setminus B'_{d_n} \). We deduce that (4.11) holds on \( B_{d_n} \). Additionally, we will use (from Lemma 3.3 Corollary 4.3) for \( 0 < \sigma < 1 \),
\[
\| \mathcal{Y}_n \|_{s,\sigma,d} \leq K\|\partial_z \Psi_n\|_{s,\sigma,d} d_n^{1+\lambda} \leq K(\sigma) d_n^{\lambda+\sigma}
\]
and from (4.6),
\[
\| \mathcal{H}_n \|_{s,\sigma,d} \leq K\| h_n\|_{s,\sigma,d} d_n^{1+\lambda} \leq K(\sigma) d_n^{\lambda+\sigma}
\]
to do estimates outside of \( B_{d_n} \). These estimates are not optimal (in particular in the smallness in \( c_n \)) but we will only use them on parts far away from the center of \( V_1 \). Thanks to (4.7), we have a slightly better estimate in the right half-plane, that is, for \( 0 < \sigma < 1 \),
\[
|\mathcal{H}_n| \leq K|h_n|d_n^{1+\lambda} \leq \frac{K(\sigma) d_n^{\lambda-\sigma}}{(1 + r_1)}.
\]

Step 7. Elliptic estimates.

We follow the proof of Proposition 2.16. At this point, we have on \( \mathcal{Y}_n \) that \( \| \mathcal{Y}_n \|_{s,B'_{d_n}} = 1, \| V \mathcal{Y}_n \|_{L^\infty(r_1 \leq R)} + \| \nabla(V \mathcal{Y}_n) \|_{L^\infty(r_1 \leq R)} \to 0 \) as \( n \to \infty \) for any \( R > 1 \), and with \( \mathcal{Y}_n = \mathcal{Y}_1 + i \mathcal{Y}_2 \),
\[
|\Delta \mathcal{Y}_2 + c \partial_{x_2} \mathcal{Y}_1| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + r_1)^{2-\alpha}},
\]
\[
|\Delta \mathcal{Y}_1 - 2|V|^2 \mathcal{Y}_1| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + r_1)^{1-\alpha}}.
\]
We want to show that \( \| \mathcal{Y}_n \|_{s,B'_{d_n}} = o_{R \to \infty}(1) + o_{n \to \infty}(1) \). We want to use similar elliptic estimates as in the proof of Proposition 2.16, but we have to show that they still work if we only have the estimate in \( B_{d_n} = B(d_n c_1^2, d_n') \) and we want the final estimates in \( B'_{d_n} = B(d_n c_1^2, d_n'') \), with \( \varepsilon' < \varepsilon \).

Step 7.1. Elliptic estimate for \( \mathcal{Y}_2 \).

We start by solving the following problem in \( \mathbb{R}^2 \):
\[
\Delta \zeta = f,
\]
with
\[
f := -\mathcal{H}_2 - 2 \Im \left( \frac{\nabla V}{V} \cdot \nabla \mathcal{Y}_n \right),
\]
which is odd in \( x_2 \) (the derivation with respect to \( z_1 \) breaks the symmetry on \( x_1 \), but not on \( x_2 \)) and satisfies
\[
|f| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + r_1)^{2-\alpha}}.
\]
in $B_{d_n} = B(d_n e_1, d_n')$, and, from (4.12) and (4.13),
\[
|f| \leq \frac{K(\sigma) d_n^{\alpha+\sigma}}{(1 + \varphi)^{2+\sigma}}
\] (4.15)
in $\mathbb{R}^2$, for any $1 > \sigma > 0$. Similarly as in the proof of Lemma 2.11, we write, for $x \in B(d_n e_1, d_n')$,
\[
\nabla \zeta(x) = \frac{1}{2\pi} \int_{\mathbb{R}^2} \frac{x - Y}{|x - Y|^2} f(Y) dY.
\] (4.16)
Furthermore, we have the same local result, that is, if $|x - d_n e_1|^2 \leq 1$,
\[
|\nabla \zeta(x)| \leq o_{R \to \infty}(1) + o_{n \to \infty}(1).
\]
By symmetry (see in particular Lemma 3.4), we have
\[
\int_{B(d_n e_1, 2|x - d_n e_1|)} f(Y) dY = 0,
\]
hence
\[
\int_{B(d_n e_1, d_n')} \frac{x - Y}{|x - Y|^2} f(Y) dY = \int_{B(d_n e_1, d_n')} f(Y) \left( \frac{x - Y}{|x - Y|^2} - 1_{\{|Y - d_n e_1|^2 \leq 2|x - d_n e_1|\}} \frac{x - d_n e_1}{|x - d_n e_1|^2} \right) dY,
\]
and then we infer
\[
\frac{1}{2\pi} \int_{B(d_n e_1, d_n')} f(Y) \left( \frac{x - Y}{|x - Y|^2} - 1_{\{|Y - d_n e_1|^2 \leq 2|x - d_n e_1|\}} \frac{x - d_n e_1}{|x - d_n e_1|^2} \right) dY
\leq \int_{B(d_n e_1, d_n')} (o_{R \to \infty}(1) + o_{n \to \infty}(1)) \left( \frac{x - Y}{|x - Y|^2} - 1_{\{|Y - d_n e_1|^2 \leq 2|x - d_n e_1|\}} \frac{x - d_n e_1}{|x - d_n e_1|^2} \right) dY.
\]
We do the same change of variable $Z = Y - d_n e_1$ as in the proof of lemma 2.11, and we are now at
\[
\frac{1}{2\pi} \int_{B(0, d_n')} f(Y) \left( \frac{x - Y}{|x - Y|^2} - 1_{\{|Y - d_n e_1| \leq 2|x - d_n e_1|\}} \frac{x - d_n e_1}{|x - d_n e_1|^2} \right) dY
\leq \int_{B(0, d_n')} \frac{(o_{R \to \infty}(1) + o_{n \to \infty}(1))}{(1 + |Z|)^{2-\alpha}} \left( \frac{x - d_n e_1}{|x - d_n e_1|^2} \right) dZ
\leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + |Z|)^{2-\alpha}|Z|} dZ
\leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + |x - d_n e_1|)^{1-\alpha}}.
\]
Then, in $\{|Z| \leq 2x - d_n e_1\}$, we follow exactly the same computation as in the proof of the proof of Lemma 2.11 for the remaining part of the integral, and we conclude that
\[
\frac{1}{2\pi} \int_{B(d_n e_1, d_n')} f(Y) \left( \frac{x - Y}{|x - Y|^2} - 1_{\{|Y - d_n e_1|^2 \leq 2|x - d_n e_1|\}} \frac{x - d_n e_1}{|x - d_n e_1|^2} \right) dY
\leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + |x - d_n e_1|)^{1-\alpha}}.
\]
We are left with the estimation of (after a translation)

\[
\int_{\mathbb{R}^2 \setminus B(0,d_n^c)} \frac{|f(Z + d_n e_1^1)|}{|Z - (x - d_n e_1)|} dZ.
\]

By symmetry (see Lemma 3.4), we have

\[
\int_{\mathbb{R}^2 \setminus B(0,d_n^c)} \frac{f(Z + d_n e_1^1)}{|Z|} dZ = 0,
\]

therefore

\[
\left| \int_{\mathbb{R}^2 \setminus B(0,d_n^c)} \frac{f(Z + d_n e_1^1)}{|Z - (x - d_n e_1)|} dZ \right| = \left| \int_{\mathbb{R}^2 \setminus B(0,d_n^c)} f(Z + d_n e_1^1) \left( \frac{1}{|Z - (x - d_n e_1)|} - \frac{1}{|Z|} \right) dZ \right|.
\]

Since \(|x - d_n e_1| \leq d_n^c \ll d_n \leq |Z|\), we have, for \(Z \in \mathbb{R}^2 \setminus B(0,d_n^c)\),

\[
\left| \frac{1}{|Z - (x - d_n e_1)|} - \frac{1}{|Z|} \right| \leq \frac{K|x - d_n e_1|}{|Z|^2} \leq \frac{Kd_n^c}{d_n^c},
\]

thus, with (4.15),

\[
\left| \int_{\mathbb{R}^2 \setminus B(0,d_n^c)} f(Z + d_n e_1^1) \left( \frac{1}{|Z - (x - d_n e_1)|} - \frac{1}{|Z|} \right) dZ \right| \leq \frac{K(\sigma)d_n^{c+\lambda+\sigma}}{d_n^{2c}} \int_{\mathbb{R}^2 \setminus B(d_n e_1^1,d_n^c)} \frac{1}{(1 + \tilde{r})^{2c+\sigma}} \leq K(\sigma)d_n^{c+\lambda-2c+\sigma}.
\]

In particular, we have

\[
\left| \int_{\mathbb{R}^2 \setminus B(0,d_n^c)} f(Y + d_n e_1^1) \left( \frac{1}{|Y - (x - d_n e_1)|} - \frac{1}{|Y|} \right) dY \right| \leq \frac{o_{n \to \infty}(1)}{(1 + |x - d_n e_1|)^{1-\alpha}}
\]

if, since \(|x - d_n e_1| \leq d_n^c\),

\[
K(\sigma)d_n^{c+\lambda-2c+\sigma} \leq \frac{o_{n \to \infty}(1)}{d_n^{c(1-\alpha)}},
\]

hence, since we make the assumption

\[
\lambda + \varepsilon(1 - \alpha) < 2\varepsilon - \varepsilon',
\]

we can find \(\sigma > 0\) such that, for \(x \in B(d_n e_1^1,d_n^c)\),

\[
|\nabla \zeta(x)| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + |x - d_n e_1|)^{1-\alpha}}. \tag{4.17}
\]

Using Lemma 2.11 and (4.15), we also have, in all \(\mathbb{R}^2\) this time, that

\[
|\nabla \zeta(x)| \leq \frac{K(\sigma)d_n^{c+\sigma}}{(1 + \tilde{r})^{1+\sigma}}. \tag{4.18}
\]

Here, we cannot integrate from infinity (since the estimate is only on a ball) to get an estimation on \(\zeta\), but this will be dealt with later on.

Now, following the proof of Proposition 2.16, we define \(\mathcal{Y}_2' := \mathcal{Y}_2 - \zeta\), and we have, for \(j \in \{1, 2\}\),

\[
\partial_x \mathcal{Y}_2' = K_j \ast f',
\]

90
where
\[
f' := -\mathcal{H}_1 - 2\Re \left( \frac{\nabla V}{V} \nabla \mathcal{Y}_1 \right) - (1 - |V|^2) \mathcal{Y}_1 - c \partial_{x_2} \zeta.
\]

We first estimate the convolution in \( B(d_n \overrightarrow{e_1}, d_n') \). With \( \|\mathcal{Y}_n\|_{s,B_n} = 1 \), we check that, with some margin in \( B(d_n \overrightarrow{e_1}, d_n') \),
\[
|2\Re \left( \frac{\nabla V}{V} \nabla \mathcal{Y}_n \right) - (1 - |V|^2) \mathcal{Y}_1| \leq \frac{o_{R \to \infty}(1)}{(1 + r_1)^{3/2 - \alpha}}.
\]

Now, we have shown in step 6 that
\[
|\Re \left( \frac{\nabla V}{V} \nabla \mathcal{Y}_n \right)| \leq \frac{o_{n \to \infty}(1)}{r_1^{1 - \alpha + \sigma'}}
\]
for some \( \sigma' > 0 \). In \( B(d_n \overrightarrow{e_1}, d_n') \setminus B(d_n \overrightarrow{e_1}, d_n') \), we have
\[
|(1 - |V|^2) \mathcal{Y}_1| \leq \frac{d_n^{\lambda + \sigma}}{r_1^{1 - \alpha + \sigma'}} \leq \frac{d_n^{\lambda + \sigma - (2 + \alpha') \epsilon'}}{r_1^{1 - \alpha + \sigma'}} = \frac{o_{n \to \infty}(1)}{r_1^{1 - \alpha + \sigma'}}
\]
given that \( \sigma \) and \( \sigma' \) are small enough since \( \lambda - (2 + \alpha') \epsilon' < 0 \). Therefore, following the proof of Lemma 2.10 (only changing the integral from \( \mathbb{R}^2 \) to \( B(d_n \overrightarrow{e_1}, d_n') \)), we check with the same computations (since we have some margin \( \sigma' > 0 \) on the decay) that
\[
\left| \int_{B(d_n \overrightarrow{e_1}, d_n')} K_j(x - Y) \left( 2\Re \left( \frac{\nabla V}{V} \nabla \mathcal{Y}_1 \right) - (1 - |V|^2) \mathcal{Y}_1 \right)(Y) \,dY \right| \leq \frac{o_{R \to \infty}(1)}{(1 + r_1)^{1 - \alpha}}.
\]

Now, using (4.17), we check that, following the proof of Lemma 2.10 (using Hölder inequality instead of Cauchy-Schwarz in the last estimate to make sure that the two integrals are well defined, this does not change the final estimate),
\[
\left| \int_{B(d_n \overrightarrow{e_1}, d_n')} K_j(x - Y)(c \partial_{x_2} \zeta)(Y) \,dY \right| \leq \frac{c(o_{R \to \infty}(1) + o_{n \to \infty}(1))}{(1 + r_1)^{1 - \alpha - 1/10}}.
\]

And, since \( x \in B(d_n \overrightarrow{e_1}, d_n') \), \( c(1 + r_1)^{1/10} \leq K \), therefore
\[
\left| \int_{B(d_n \overrightarrow{e_1}, d_n')} K_j(x - Y)(c \partial_{x_2} \zeta)(Y) \,dY \right| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + r_1)^{1 - \alpha}}.
\]

For the last remaining term, we use (4.7) with \( \sigma = \frac{\lambda + \sigma}{2} \) to estimate
\[
|\mathcal{H}_1| \leq \frac{o_{n \to \infty}(1)}{(1 + r_1)^{1}},
\]
and then, from Lemma 2.10 (only changing the integral from \( \mathbb{R}^2 \) to \( B(d_n \overrightarrow{e_1}, d_n') \) in the proof), we infer
\[
\left| \int_{B(d_n \overrightarrow{e_1}, d_n')} K_j(x - Y)\mathcal{H}_1(Y) \,dY \right| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + r_1)^{1 - \alpha}}.
\]

Combining these estimates, we have shown that
\[
\left| \int_{B(d_n \overrightarrow{e_1}, d_n')} K_j(x - Y)f'(Y) \,dY \right| \leq \frac{o_{R \to \infty}(1) + o_{n \to \infty}(1)}{(1 + r_1)^{1 - \alpha}}.
\]

Now, we focus on the left half-plane. From (4.8), we have
\[
|\mathcal{H}_1| \leq \frac{K(\sigma) d_n^{1 - \sigma} d_n^2}{(1 + r_1)^2}.
\]
Furthermore, we check, using (4.12) and (4.18) that, in the left half-plane,
\[ -2\Re \left( \frac{\nabla V}{V} \cdot \nabla \mathcal{H}_1 \right) - (1 - |V|^2) \mathcal{H}_1 \leq \frac{K(\sigma) d_n^{\lambda+\sigma} c_n^{1-\sigma}}{(1 + r_1)^{2+\sigma}} \]

and
\[ |c_n \partial_{x_2} \zeta| \leq \frac{K(\sigma) d_n^{\lambda+\sigma} c_n}{(1 + r_1)^{1+\sigma}}. \]

We have by Theorem 2.9 (since \( x \in B(d_n e_1^1, d_n^\epsilon) \)) that \( |K_j(x - Y)| \leq \frac{K}{d_n^{(1+\bar{\epsilon}(Y))^{2-\sigma}}} \) for \( Y \) in the left half-plane, for any \( 0 \leq \beta \leq 2 \). Therefore, taking \( \beta = 2 - \sigma \), we have
\[ \left| \int_{\{y_1 \leq 0\}} K_j(x - Y) \mathcal{H}_1(Y) dY \right| \leq \int_{\mathbb{R}^2} \frac{K(\sigma) d_n^{\lambda+2\sigma-2}}{(1 + \bar{\epsilon})^{2+\sigma}} \leq \frac{K(\sigma) d_n^{\lambda+2\sigma-2+(1-\alpha)\varepsilon'}}{(1 + |x - d_n e_1^1|)^{1-\alpha}}. \]

Taking \( \beta = 2 \), we have
\[ \left| \int_{\{y_1 \leq 0\}} K_j(x - Y) \left( -2\Re \left( \frac{\nabla V}{V} \cdot \nabla \mathcal{H}_1 \right) - (1 - |V|^2) \mathcal{H}_1 \right) (Y) dY \right| \leq \int_{\mathbb{R}^2} \frac{K(\sigma) d_n^{\lambda+\sigma-2}}{(1 + \bar{\epsilon})^{2+\sigma}} \leq \frac{K(\sigma) d_n^{\lambda+\sigma-2+(1-\alpha)\varepsilon'}}{(1 + |x - d_n e_1^1|)^{1-\alpha}}. \]

and finally, taking \( \beta = 1 \), we estimate
\[ \left| \int_{\{y_1 \leq 0\}} K_j(x - Y) c_n \partial_{x_2} \zeta(Y) dY \right| \leq \int_{\mathbb{R}^2} \frac{K(\sigma) d_n^{\lambda+\sigma-2}}{(1 + \bar{\epsilon})^{2+\sigma}} \leq \frac{K(\sigma) d_n^{\lambda+\sigma-2+(1-\alpha)\varepsilon'}}{(1 + |x - d_n e_1^1|)^{1-\alpha}}. \]

Thus, taking \( \sigma > 0 \) small enough, since \( \lambda - 2 + (1 - \alpha)\varepsilon' < 0 \), we have
\[ \left| \int_{\{y_1 \leq 0\}} K_j(x - Y) f'(Y) dY \right| \leq \frac{o_{n \to 0}(1)}{(1 + |x - d_n e_1^1|)^{1-\alpha}}. \]

We are left with the estimation in \( \Omega := \{y_1 > 0\} \setminus B(d_n e_1^1, d_n^\epsilon) \). We infer that, in \( \Omega \), we have, for \( 0 < \sigma, \sigma' < 1 \)
\[ |f'| \leq \frac{K(\sigma') d_n^{\lambda_{\sigma'}}}{(1 + r_1)} + \frac{K(\sigma) d_n^{\lambda + \sigma}}{(1 + r_1)^{2+\sigma}}. \]

Indeed, from equation (4.14) and (4.18), we have \( |\mathcal{H}_1 - c \partial_{x_2} \zeta| \leq \frac{K(\sigma) d_n^{\lambda+\sigma}}{(1 + r_1)^{1+\sigma}} \), and using (4.12), we check that
\[ 2\Re \left( \frac{\nabla V}{V} \cdot \nabla \mathcal{H}_1 \right) - (1 - |V|^2) \mathcal{H}_1 \leq \frac{K(\sigma) d_n^{\lambda+\sigma}}{(1 + \bar{\epsilon})^{2+\sigma}}. \]

Now, for \( y \in \Omega, x \in B(d_n e_1^1, d_n^\epsilon) \), we have from Theorem 2.9 that
\[ |K_j(x - Y)| \leq \frac{K}{d_n^\epsilon} \]

and
\[ |K_j(x - Y)| \leq \frac{K}{(1 + \bar{\epsilon}(Y))^{3/2} d_n^{\epsilon/2}}. \]
We deduce that, for \( x \in B(d_n \sigma_1^d, d_n^d) \),
\[
\int_\Omega |K_j(x - Y)| \frac{K(\sigma')d_n^{\frac{-\lambda'}{2}}}{(1 + r_1(Y))} dY \leq K(\sigma')d_n^{\frac{\lambda - \sigma - \varepsilon}{2}} \int_{\mathbb{R}^2} \frac{K}{(1 + \tilde{r}(Y))^{5/2}} dY
\]
\[
\leq \frac{K(\sigma')d_n^{\lambda - \sigma - (1 - \alpha)\varepsilon - \varepsilon/2}}{(1 + |x - d_n \sigma_1^d|)^{1 - \alpha}} = \frac{o_n(0)}{(1 + |x - d_n \sigma_1^d|)^{1 - \alpha}}
\]
taking \( \sigma' < 1 \) large enough (since \( \lambda + (1 - \alpha)\varepsilon' - 1 - \varepsilon/2 < 0 \)), and
\[
\int_\Omega |K_j(x - Y)| \frac{K(\sigma)d_n^{\lambda + \sigma}}{(1 + \tilde{r}(Y))^{2 + \sigma}} dY \leq K(\sigma)d_n^{\lambda + \sigma - 2\varepsilon} \int_{\mathbb{R}^2} \frac{1}{(1 + \tilde{r}(Y))^{2 + \sigma}} dY
\]
\[
\leq \frac{K(\sigma)d_n^{\lambda + \sigma + (1 - \alpha)\varepsilon - 2\varepsilon}}{(1 + |x - d_n \sigma_1^d|)^{1 - \alpha}} = \frac{o_n(0)}{(1 + |x - d_n \sigma_1^d|)^{1 - \alpha}}
\]
taking \( \sigma > 0 \) small enough (since \( \lambda + (1 - \alpha)\varepsilon' - 2\varepsilon < 0 \)). We deduce that, for \( x \in B(d_n \sigma_1^d, d_n^d) \),
\[
|\partial_x \mathcal{Y}_2| = |K_j * f'| \leq \frac{o_n(0) + o_{R \to \infty}(1)}{(1 + |x - d_n \sigma_1^d|)^{1 - \alpha}}.
\]

With (4.17), we have shown that
\[
|\partial_x \mathcal{Y}_2| \leq \frac{o_n(0) + o_{R \to \infty}(1)}{(1 + |x - d_n \sigma_1^d|)^{1 - \alpha}}.
\]

Now, since \( |\mathcal{Y}_2| + |\nabla \mathcal{Y}_2| = o_{R \to \infty}(1) \) in \( B(d_n \sigma_1^d, 10) \), by integration from \( d_n \sigma_1^d \), we check that, since \( \alpha > 0 \),
\[
|\mathcal{Y}_2| \leq \frac{o_n(0) + o_{R \to \infty}(1)}{(1 + |x - d_n \sigma_1^d|)^{\alpha}}.
\]

Step 7.2. Elliptic estimate for \( \mathcal{Y}_1 \).

For \( \mathcal{Y}_1 \) we also use the function \( K_0 \) and we have
\[
\mathcal{Y}_1 = \frac{1}{2\pi} K_0 \left( \sqrt{2}|x| \right) * (-\Delta \mathcal{Y}_1 + 2\mathcal{Y}_1),
\]
therefore
\[
|\mathcal{Y}_1|(x) \leq \int_{B_{d_n}(x)} \frac{1}{2\pi} K_0 \left( \sqrt{2}|x - Y| \right) |(-\Delta \mathcal{Y}_1 + 2\mathcal{Y}_1)(Y)| dY
\]
\[
+ \int_{\mathbb{R} \setminus B_{d_n}(x)} \frac{1}{2\pi} K_0 \left( \sqrt{2}|x - Y| \right) |(-\Delta \mathcal{Y}_1 + 2\mathcal{Y}_1)(Y)| dY,
\]
where \( B_{d_n}(x) = B(x - d_n \sigma_1^d, d_n^d) \). The first term can be computed as in the proof of Lemma 2.13, and for the second term, in \( \mathbb{R} \setminus B_{d_n} \), we have
\[
K_0 \left( \sqrt{2}|x| \right) \leq Ke^{-d_n^{\alpha/4}} e^{-|x|^{1/2}}
\]
from Lemma 2.12, which, with (4.12) and (4.13), make the term integrable and a \( o_{d_n \to \infty}(e^{-d_n^{\alpha/4}}) \), which is enough to show that
\[
|\nabla \mathcal{Y}_1| + |\mathcal{Y}_1| \leq \frac{o_n(0) + o_{R \to \infty}(1)}{(1 + r_1)^{1 - \alpha}}.
\]

Step 8. Conclusion.

We conclude that there is a contradiction, as in the end of the proof of Proposition 2.16. This ends the proof of Proposition 4.5.

In the rest of this paper, we take \( \alpha, \varepsilon, \varepsilon', \lambda \) such that they satisfy the conditions of Proposition 4.5, and
\[
\lambda + (1 - \alpha)\varepsilon' > 1.
\]
4.4 Proof of $\int_{B(d\bar{c},d')} \Re(\bar{\partial}_d V \partial_{z_1} (TW_c(V))) |_{d=d_c} = \frac{-\pi}{d_c} + o_{d_c \to \infty} \left( \frac{1}{d_c^2} \right)$

From (2.2), the equation on $V$ is

$$TW_c(V) = E - ic\partial_{x_2} V = -2\nabla V_1 \nabla V_1 - (1 - |V_1|^2)(1 - |V_1|^2)V_1 V_1 - ic\partial_{x_2}(V_1 V_1).$$

We use Lemma 4.2 to compute

$$\partial_{z_1} V = \partial_{x_1} V_1 V_1 - \partial_{x_1} V_1 V_1 - (-\partial_{x_1} V_1 V_1 + \partial_{x_1} V_1 V_1) = 2\partial_{x_1} V_1 V_1.$$

Therefore

$$\partial_{z_1} TW_c(V) = -4\nabla V_1 \nabla x_1 V_1 + 2(1 - |V_1|^2)V_1 \partial_{x_1}((1 - |V_1|^2)V_1) - 2ic\partial_{x_2}(V_1 \partial_{x_1} V_1),$$

and then

$$\int_{B(d\bar{c},d')} \Re(\bar{\partial}_d V \partial_{z_1} (TW_c(V))) = -4\int_{B(d\bar{c},d')} \Re(\bar{\partial}_d V \nabla V_1 \nabla x_1 V_1) + 2\int_{B(d\bar{c},d')} \Re(\bar{\partial}_d V (1 - |V_1|^2)V_1 \partial_{x_1}((1 - |V_1|^2)V_1)) - 2\int_{B(d\bar{c},d')} \Re(\bar{\partial}_d V ic\partial_{x_2}(V_1 \partial_{x_1} V_1)).$$

We want to compute this quantity at $d = d_c$. We omit the subscript and use only $d$ in this proof. In fact, it works for any $d$ such that $\frac{1}{d^2} \leq c \leq \frac{1}{d'}$.

Step 1. Proof of $\int_{B(d\bar{c},d')} \Re(\bar{\partial}_d V (1 - |V_1|^2)V_1 \partial_{x_1}((1 - |V_1|^2)V_1)) = o_{d \to \infty} \left( \frac{1}{d^2} \right)$.

First remark that $\partial_{x_1}((1 - |V_1|^2)V_1) = O_{d \to \infty} \left( \frac{1}{d^2} \right)$ in $B(d\bar{c},d')$ by Lemma 4.4 and

$$(1 - |V_1|^2)V_1 \partial_{d\bar{c}} V = O_{d \to \infty} \left( \frac{1}{d^2} \right)$$

therefore

$$\int_{B(d\bar{c},d')} \Re(\bar{\partial}_d V (1 - |V_1|^2)V_1 \partial_{x_1}((1 - |V_1|^2)V_1)) = o_{d \to \infty} \left( \frac{1}{d^2} \right).$$

Step 2. Proof of $\int_{B(d\bar{c},d')} \Re(\bar{\partial}_d V ic\partial_{x_2}(V_1 \partial_{x_1} V_1)) = o_{d \to \infty} \left( \frac{1}{d^2} \right)$.

Now we compute

$$ic\partial_{x_2}(V_1 \partial_{x_1} V_1) = ic\partial_{x_2}V_1 \partial_{x_1} V_1 + ic\partial_{x_1} V_1 V_1,$$

hence

$$\int_{B(d\bar{c},d')} \Re(\bar{\partial}_d V ic\partial_{x_2}(V_1 \partial_{x_1} V_1)) = -c \int_{B(d\bar{c},d')} \Re(\bar{\partial}_{x_1} V_1 \partial_{d\bar{c}} V_1 \partial_{x_1} V_1)$$

$$- c \int_{B(d\bar{c},d')} \Re(\bar{\partial}_{x_1} V_1 \partial_{d\bar{c}} V_1 \partial_{x_2} V_1 V_1)$$

$$+ c \int_{B(d\bar{c},d')} \Re(\bar{\partial}_{x_1} V_1 \partial_{d\bar{c}} V_1 \partial_{x_1} V_1)$$

$$+ c \int_{B(d\bar{c},d')} \Re(\bar{\partial}_{x_1} V_1 \partial_{d\bar{c}} V_1 \partial_{x_1} V_1 V_1).$$

Now, using Lemma 4.4, we estimate the first term of (4.19),

$$c \left| \int_{B(d\bar{c},d')} \Re(\bar{\partial}_{x_1} V_1 \partial_{d\bar{c}} V_1 \partial_{x_1} V_1 V_1) \right| \leq$$
Since $1 > \varepsilon' > 0$, we have

$$c \int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Re} \left( \overline{\partial_{x_1} V_1} i \partial_{x_2} V_1 \right) \leq C \int_{B(d\tilde{r}_1^{e},d')} \frac{1}{(1 + r_1^2)} \frac{1}{d^{3-\varepsilon}} \leq C \ln(d').$$

(4.20)

Using Lemma 4.4, for the second term of (4.19), we have

$$\left| c \int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Re} \left( \overline{\partial_{x_1} V_1 V_{-1}} i \partial_{x_2} V_1 \partial_{x_1} V_{-1} \right) \right| \leq \begin{align*}
&c \int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Im} \left( \partial_{x_1} V_1 V_{-1} \right) \mathfrak{Re} \left( \partial_{x_1} V_1 \right) \left| \mathfrak{Im} \left( \partial_{x_1} V_1 \right) \right| + c \int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Re} \left( \overline{\partial_{x_1} V_1} \right) \mathfrak{Im} \left( \partial_{x_1} V_1 \right) \mathfrak{Im} \left( \partial_{x_1} V_1 \right) \\
&\leq \int_{B(d\tilde{r}_1^{e},d')} \frac{K}{1 + r_1^2} \frac{1}{d^{3-2\varepsilon}} = o_{d \to \infty} \left( \frac{1}{d^2} \right).
\end{align*}$$

since $c \leq \frac{2}{7}$ and $\varepsilon' < 1$. For the third term of (4.19), we obtain similarly

$$\left| c \int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Re} \left( \overline{\partial_{x_1} V_{-1}} i \partial_{x_2} V_1 \partial_{x_1} V_{-1} \right) \right| \leq c \int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Im} \left( \partial_{x_1} V_1 \right) \mathfrak{Re} \left( \partial_{x_1} V_{-1} \partial_{x_1} V_{-1} \right) + c \int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Re} \left( \overline{\partial_{x_1} V_1} \right) \mathfrak{Im} \left( \partial_{x_1} V_{-1} \partial_{x_1} V_{-1} \right) \\
\leq \int_{B(d\tilde{r}_1^{e},d')} \frac{K}{1 + r_1^2} \frac{1}{d^{3-3\varepsilon}} = o_{d \to \infty} \left( \frac{1}{d^2} \right).$$

Finally, for the last term of (4.19),

$$\left| c \int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Re} \left( \overline{\partial_{x_1} V_{-1}} V_1 i \partial_{x_2} V_1 \partial_{x_1} V_{-1} \right) \right| \leq c \int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Im} \left( \partial_{x_1} V_{-1} \right) \mathfrak{Re} \left( \partial_{x_2} V_1 \partial_{x_1} V_{-1} \right) + c \int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Re} \left( \overline{\partial_{x_1} V_1} \right) \mathfrak{Im} \left( \partial_{x_1} V_{-1} \partial_{x_1} V_{-1} \right) \\
\leq \int_{B(d\tilde{r}_1^{e},d')} \frac{K}{1 + r_1^2} \frac{1}{d^{3-2\varepsilon}} = o_{d \to \infty} \left( \frac{1}{d^2} \right).$$

This conclude the proof of step 2.

Step 3. Proof of $\int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Re} (\overline{\partial_{d} V} (-4 \nabla V_1 \cdot \nabla \partial_{x_1} V_{-1})) = -\frac{\pi}{2\pi} + o_{d \to \infty} \left( \frac{1}{d^2} \right)$.

We have

$$-4 \nabla V_1 \cdot \nabla \partial_{x_1} V_{-1} = -4 \partial_{x_1} V_1 \partial_{x_1} x_{-1} - 4 \partial_{x_2} V_1 \partial_{x_2} x_{-1}.$$

Remark that using $|\partial_{d} V| \leq \frac{K}{1 + r_1^2}$ and Lemma 4.4 once again,

$$\int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Re} (\overline{\partial_{d} V} \partial_{x_1} V_1 \partial_{x_1} x_{-1}) \leq \int_{B(d\tilde{r}_1^{e},d')} \frac{K}{1 + r_1^2} \frac{1}{d^{3-\varepsilon}} = o_{d \to \infty} \left( \frac{1}{d^2} \right)$$

as for (4.20). Moreover,

$$-4 \int_{B(d\tilde{r}_1^{e},d')} \mathfrak{Re} (\overline{\partial_{d} V} \partial_{x_2} V_1 \partial_{x_2} x_{-1}) =$$

95
\[
4 \int_{B(d \xi, d')} \Re \left( \partial_{x_1} V_1 \partial_{x_2} V_3 \partial_{x_1 x_2} V_{-1} \right) - 4 \int_{\bar{B}(d \xi, d')} \Re \left( \partial_{x_1} V_{-1} \partial_{x_2} V_1 \partial_{x_1 x_2} V_{-1} \right). \tag{4.21}
\]

For the first integral in (4.21), we write
\[
4 \int_{B(d \xi, d')} \Re \left( \partial_{x_1} V_1 \partial_{x_2} V_3 \partial_{x_1 x_2} V_{-1} \right) =
\]
\[
4 \int_{B(d \xi, d')} \Re \left( \partial_{x_1} V_1 \partial_{x_2} V_3 \right) \Re \left( \partial_{x_1 x_2} V_{-1} \right) - 3 \Im \left( \partial_{x_1} V_1 \partial_{x_2} V_3 \right) \Im \left( \partial_{x_1 x_2} V_{-1} \right).
\]

For the first contribution, we have
\[
\left| \int_{B(d \xi, d')} \Re \left( \partial_{x_1} V_1 \partial_{x_2} V_3 \right) \Re \left( \partial_{x_1 x_2} V_{-1} \right) \right| \leq \int_{B(d \xi, d')} \frac{K}{(1 + r_1^2) d^{4-\varepsilon}} = o_{d \to \infty} \left( \frac{1}{d^2} \right)
\]
by the same computations as (4.20). For the second contribution, recall from Lemma 2.2 that
\[
\partial_{x_1} V_1 = \left( \cos(\theta_1) u + \frac{i}{r_1} \sin(\theta_1) \right) V_1 \quad \text{and} \quad \partial_{x_2} V_1 = \left( \sin(\theta_1) u + \frac{i}{r_1} \cos(\theta_1) \right) V_1,
\]
therefore
\[
\Im \left( \partial_{x_1} V_1 \partial_{x_2} V_3 \right) = \frac{u}{r_1} |V_1|^2,
\]
and then, by Lemma 4.4,
\[
-4 \int_{B(d \xi, d')} \Im \left( \partial_{x_1} V_1 \partial_{x_2} V_3 \right) \Im \left( \partial_{x_1 x_2} V_{-1} \right) = -4 \int_{B(d \xi, d')} \frac{u}{r_1} \frac{1}{4d^2} |V_1|^2 dr_1 = o_{d \to \infty} \left( \frac{1}{d^2} \right).
\]

We compute, using $|V_1|^2 = \rho_1^2$, $u = \frac{\rho_1'}{\rho_1}$ and Lemma 2.1,
\[
-4 \int_{B(d \xi, d')} \frac{u}{r_1} \frac{|V_1|^2}{4d^2} dr_1 = -\frac{2\pi}{d^2} \int_0^{d'} \rho_1'(r_1) \rho_1(r_1) dr_1 = \frac{-\pi}{d^2} \int_{\rho_1'0}^{2\rho_1'd'} = \frac{-\pi}{d^2} + o_{d \to \infty} \left( \frac{1}{d^2} \right).
\]

We obtain the estimate for the first integral in (4.21):
\[
4 \int_{B(d \xi, d')} \Re \left( \partial_{x_1} V_1 \partial_{x_2} V_3 \partial_{x_1 x_2} V_{-1} \right) = \frac{-\pi}{d^2} + o_{d \to \infty} \left( \frac{1}{d^2} \right).
\]

For the second integral in (4.21), we estimate
\[
\left| \int_{B(d \xi, d')} \Re \left( \partial_{x_1} V_{-1} \partial_{x_2} V_1 \partial_{x_1 x_2} V_{-1} \right) \right| \leq \int_{B(d \xi, d')} \frac{K}{(1 + r_1^2) d^{4-\varepsilon}} = o_{d \to \infty} \left( \frac{1}{d^2} \right).
\]

This ends the proof of this subsection.

4.5 Proof of $\partial_d \int_{B(d \xi, d')} \Re(\partial_d V \text{Tw}_\varepsilon(Q_{c,d})) |_{d=d_c} = \frac{-2\pi}{d_c^2} + o_{d_c \to \infty} \left( \frac{1}{d_c^2} \right)$

In order to prove the result of this subsection, by using (4.1) and the result of subsection 4.4 we just have to show that at $d = d_c$,
\[
\int_{B(d \xi, d')} \Re(\partial_d V L(\partial_{x_1} \Gamma_{c,d_c})) + \int_{B(d \xi, d')} \Re(\partial_d V (\partial_{x_1} L)(\Gamma_{c,d_c})) + \int_{B(d \xi, d')} \Re(\partial_d V \partial_{x_1} (\text{NL}_c(\Gamma_{c,d_c}))) = o_{d \to \infty} \left( \frac{1}{d_c^2} \right).
\]

Similarly to subsection 4.4, we omit the subscript on $d_c$ in the proof.
Step 1. Proof of $\int_{B(d\mathcal{C}_1, d^{1/4})} \Re(\overline{\partial_d V} L(\partial_2, \Gamma_{c,d})) = o_{d \to \infty} \left( \frac{1}{d^2} \right)$.

For this term, we want to do integration by parts and use that $L(\partial_d V)$ is very small, but since the integral is not on the whole space, there are the two boundary terms:

$$\left| \int_{B(d\mathcal{C}_1, d^{1/4})} \Re(\overline{\partial_d V} L(\partial_2, \Gamma_{c,d})) \right| \leq \left| \int_{B(d\mathcal{C}_1, d^{1/4})} \Re(L(\partial_d V)\overline{\partial_2 \Gamma_{c,d}}) \right| + \left| \int_{\partial B(d\mathcal{C}_1, d^{1/4})} \Re(\overline{\nabla \partial_d V} \overline{\partial_2 \Gamma_{c,d}}) \right|,$$

where $\partial B(d\mathcal{C}_1, d^{1/4})$ is the boundary of $B(d\mathcal{C}_1, d^{1/4})$. On $\partial B(d\mathcal{C}_1, d^{1/4})$, we have

$$\Gamma_{c,d} = V(e^{\Psi_{c,d}} - 1),$$

hence

$$\partial_2 \Gamma_{c,d} = 2V_1 \partial_2 z_1 V_{-1}(e^{\Psi_{c,d}} - 1) + V \partial_2 \Psi_{c,d} e^{\Psi_{c,d}}$$

and

$$\nabla \partial_2 \Gamma_{c,d} = 2V_1 \partial_2 z_1 V_{-1}(e^{\Psi_{c,d}} - 1) + 2V_1 \nabla \partial_2 z_1 V_{-1}(e^{\Psi_{c,d}} - 1) + 2V_1 \partial_2 z_1 V_{-1} \nabla \Psi_{c,d} e^{\Psi_{c,d}} + V \nabla \partial_2 \Psi_{c,d} e^{\Psi_{c,d}} + V \partial_2 \Psi_{c,d} \nabla \Psi_{c,d} e^{\Psi_{c,d}}.$$  

(4.23)

By Lemmas 2.2 and 4.4, Proposition 4.5 and (3.13), we infer on $\partial B(d\mathcal{C}_1, d^{1/4})$ that, for any $1 > \sigma > 0$,

$$|\partial_2 \Gamma_{c,d}| \leq K(\sigma) \left( \frac{K(\sigma)}{d^{1+\lambda+\alpha' \varepsilon'}} + \frac{K}{d^{1+\lambda-\alpha \varepsilon}} \right).$$  

(4.24)

Thus, still on $\partial B(d\mathcal{C}_1, d^{1/4})$, from Lemma 2.6 we compute

$$\left| \int_{\partial B(d\mathcal{C}_1, d^{1/4})} \Re(\overline{\nabla \partial_d V} \overline{\partial_2 \Gamma_{c,d}}) \right| = o_{d \to \infty} \left( \frac{1}{d^2} \right).$$

(4.23)

For (4.23), we estimate on $\partial B(d\mathcal{C}_1, d^{1/4})$, still using Lemmas 2.2 and 4.4, Proposition 4.5 and (3.13), for any $1 > \sigma > 0$,

$$|2V_1 \partial_2 z_1 V_{-1}(e^{\Psi_{c,d}} - 1) + 2V_1 \nabla \partial_2 z_1 V_{-1}(e^{\Psi_{c,d}} - 1) + 2V_1 \partial_2 z_1 V_{-1} \nabla \Psi_{c,d} e^{\Psi_{c,d}}| \leq \frac{K(\sigma)}{d^{3-\sigma}},$$

and

$$|\nabla \partial_2 \Psi_{c,d} e^{\Psi_{c,d}} + V \nabla \partial_2 \Psi_{c,d} e^{\Psi_{c,d}} + V \partial_2 \Psi_{c,d} \nabla \Psi_{c,d} e^{\Psi_{c,d}}| \leq \frac{K}{d^{1+\lambda-\alpha \varepsilon}} + \frac{K(\sigma)}{d^{1+\lambda+\alpha' \varepsilon'-\sigma}}.$$  

In particular, from (4.23), we can find $1 > \sigma > 0$ such that, on $\partial B(d\mathcal{C}_1, d^{1/4})$,

$$|\nabla \partial_2 \Gamma_{c,d}| = o_{d \to \infty} \left( \frac{1}{d^2} \right),$$

thus

$$\left| \int_{\partial B(d\mathcal{C}_1, d^{1/4})} \Re(\overline{\partial_d V} \nabla \partial_2 \Gamma_{c,d}) \right| = o_{d \to \infty} \left( \frac{1}{d^2} \right).$$  

From (2.34), we know that

$$|L(\partial_d V)| \leq \frac{K}{(1+\varepsilon^2)d}.$$
Moreover, by Proposition 4.5, we have $|\partial_z \Gamma_{c,d}| \leq \frac{K}{d^{1+1/8}}$ in $B(\delta \overline{\epsilon}^7, d'^{2})$, which is enough to show that

$$\int_{B(\delta \overline{\epsilon}^7, d')} \Re(L(\bar{d}_d V)\partial_z \Gamma_{c,d}) = o_{d \to \infty} \left( \frac{1}{d^2} \right).$$

Step 2. Proof of $\int_{B(\delta \overline{\epsilon}^7, d')} \Re(\overline{\partial_d V}(\partial_z L)(\Gamma_{c,d})) = o_{d \to \infty} \left( \frac{1}{d^2} \right)$.

We have

$$(\partial_z L)(\Gamma_{c,d}) = 4 \Re(\overline{\partial_{x_1} V_{-1, V_1}} \Gamma_{c,d}) V + 4 \Re(\overline{\partial_{x_1} V_{-1}} \Gamma_{c,d}) V + 4 \Re(\overline{\partial_z V_{-1}} \Gamma_{c,d}) V + 4 \Re(\overline{\partial_z V_1} \partial_{x_1} V_{-1}) \Re(\overline{\partial_d V} V),$$

thus

$$\int_{B(\delta \overline{\epsilon}^7, d')} \Re(\overline{\partial_d V}(\partial_z L)(\Gamma_{c,d})) = 4 \int_{B(\delta \overline{\epsilon}^7, d')} \Re(\overline{\partial_d V} \Gamma_{c,d}) \Re(\overline{\partial_{x_1} V_{-1}}) V + 4 \int_{B(\delta \overline{\epsilon}^7, d')} \Re(\overline{\partial_{x_1} V_{-1}} \Gamma_{c,d}) \Re(\overline{\partial_{x_1} V} V) + 4 \int_{B(\delta \overline{\epsilon}^7, d')} \Re(\overline{\partial_{x_1} V_1} \partial_{x_1} V_{-1}) \Re(\overline{\partial_d V} V).$$

Using $|\partial_d V| \leq \frac{K}{1 + r_1}$,

$$\Re(\overline{\partial_{x_1} V_{-1}} V_{-1}) = O_{d \to \infty} \left( \frac{1}{d^3} \right)$$

and $|\Gamma_{c,d}| \leq \frac{K}{(1 + r_1)^{1/2} d^{1/2}}$ from Lemma 2.6, Lemma 2.2 and (3.9) respectively, we may bound

$$\left| \int_{B(\delta \overline{\epsilon}^7, d')} \Re(\overline{\partial_d V} \Gamma_{c,d}) \Re(\overline{\partial_{x_1} V_{-1}} V_{-1}) \right| \leq \int_{B(\delta \overline{\epsilon}^7, d')} \frac{K}{(1 + r_1)^{1/2} d^{1/2} + 1/2} = o_{d \to \infty} \left( \frac{1}{d^2} \right).$$

The second term of (4.25) is

$$4 \int_{B(\delta \overline{\epsilon}^7, d')} \Re(\overline{\partial_{x_1} V_{-1}} \Gamma_{c,d}) \Re(\overline{\partial_{x_1} V} V).$$

We compute that

$$|\Re(\overline{\partial_{x_1} V_{-1}} \Gamma_{c,d})| \leq \frac{K}{(1 + r_1)^{1/8} d^{17/8}}$$

and $|\Re(\overline{\partial_{x_1} V} V)| \leq \frac{K}{(1 + r_1)^{3/2}}$ in $B(\delta \overline{\epsilon}^7, d'^{2})$ using

$$|\Gamma_{c,d}| \leq \frac{K}{(1 + r_1)^{1/8} d^{17/8}}$$

since $\left\| \frac{\Gamma_{c,d}}{d^{17/8}} \right\|_{L_{\infty}^1} \leq K \epsilon^{7/8}$. Therefore, since $17/8 > 2$,

$$\int_{B(\delta \overline{\epsilon}^7, d')} 4 \Re(\overline{\partial_{x_1} V_{-1}} \Gamma_{c,d}) \Re(\overline{\partial_{x_1} V} V) = o_{d \to \infty} \left( \frac{1}{d^2} \right).$$

The last term of (4.25) is

$$\int_{B(\delta \overline{\epsilon}^7, d')} 4 \Re(\overline{\partial_{x_1} V} \Gamma_{c,d}) \Re(V_1 \partial_{x_1} V_{-1} \overline{\partial_d V}).$$

Recalling that

$$|\Re(\overline{\partial_{x_1} V} \Gamma_{c,d})| \leq K |\Re(\Psi)| \leq \frac{K}{(1 + r_1)^{1/8} d^{17/8}}$$

and

$$|\Re(V_1 \partial_{x_1} V_{-1} \overline{\partial_d V})| \leq \frac{K}{d^{5/4}(1 + r_1)},$$

98
we deduce
\[ \int_{B(d\Gamma_{c,d}')} 4\Re(V \Gamma_{c,d}) \Re(V_1 \partial_{z_1} V_{-1} \partial_d V) = o_{d \to \infty} \left( \frac{1}{d^2} \right). \]

Step 3. Proof of \( \int_{B(d\Gamma_{c,d}')} 4\Re(V \partial_{z_1} \partial_{z_2} (\text{NL}_V (\Gamma_{c,d}))) = o_{d \to \infty} \left( \frac{1}{d^2} \right). \)

Recall that
\[ \partial_{z_1} \text{NL}_V (\Gamma_{c,d}) = 4\Re(V_{-1} \Gamma_{c,d} \Gamma_{c,d} + 2\Re(V \Gamma_{c,d} \partial_{z_1} \Gamma_{c,d} + 2\Re(V \Gamma_{c,d} \partial_{z_1} \Gamma_{c,d} + 2\Re((\Gamma_{c,d} \partial_{z_1} \Gamma_{c,d} + V \Gamma_{c,d} + |\Gamma_{c,d}|^2(2\partial_{z_1} V_{-1} V_1 + \partial_{z_1} \Gamma_{c,d}). \]

We write
\[ \int_{B(d\Gamma_{c,d}')} 4\Re(V \partial_{z_1} \partial_{z_2} (\text{NL}_V (\Gamma_{c,d}))) = I_1 + I_2 + I_3 + I_4 + I_5, \]

with
\[ I_1 = \int_{B(d\Gamma_{c,d}')} 4\Re(V \partial_{z_1} V \Gamma_{c,d}) \Re(V_{-1} \Gamma_{c,d}), \]
\[ I_2 = \int_{B(d\Gamma_{c,d}')} 2\Re(V \partial_{z_1} \Gamma_{c,d}) \Re(V \partial_{z_1} \Gamma_{c,d}), \]
\[ I_3 = \int_{B(d\Gamma_{c,d}')} 2\Re(V \partial_{z_1} \Gamma_{c,d}) \Re(V \partial_{z_1} \Gamma_{c,d}), \]
\[ I_4 = \int_{B(d\Gamma_{c,d}')} 2\Re(V \partial_{z_1} \partial_{z_1} \Gamma_{c,d}) \Re(V \partial_{z_1} \Gamma_{c,d} + 2\Re((\Gamma_{c,d} \partial_{z_1} \Gamma_{c,d} \Re(V \partial_{z_1} \Gamma_{c,d})), \]
\[ I_5 = \int_{B(d\Gamma_{c,d}')} \Gamma_{c,d} \Re(V \partial_{z_1} (2\partial_{z_1} V_{-1} V_1 + \partial_{z_1} \Gamma_{c,d})). \]

Estimate for \( I_1. \)

We estimate, by using \( |\Gamma_{c,d}| \leq \frac{K}{(1+r_1)^{r/2}} \) (from \( \|V_{-1}\|_{9/16} \leq K e^{7/16} \)) that
\[ |\Re(V \partial_{z_1} V \Gamma_{c,d}) \Re(V_{-1} \Gamma_{c,d})| \leq |\Gamma_{c,d}|^2 \frac{K}{(1+r_1)d^{1/4}} \leq \frac{K}{(1+r_1)^{2+1/8} d^{7/8}}. \]

Then, since \( 17/8 > 2, \)
\[ \int_{B(d\Gamma_{c,d}')} 4\Re(V \partial_{z_1} V \Gamma_{c,d}) \Re(V_{-1} \Gamma_{c,d}) = o_{d \to \infty} \left( \frac{1}{d^2} \right). \]

Estimate for \( I_2. \)

From (4.22), we have
\[ \partial_{z_1} \Gamma_{c,d} = 2V_1 \partial_{z_1} V_{-1} (e^{\Psi_{c,d}} - 1) + V \partial_{z_1} \Psi_{c,d} e^{\Psi_{c,d}}, \]
therefore, on \( B(d\Gamma_{c,d}'), \) by Lemma 4.4, Proposition 4.5 and (3.13), for any \( 1 > \sigma > 0, \)
\[ |\Re(V \partial_{z_1} \Gamma_{c,d})| \leq \frac{K(\sigma)}{d^{3-\sigma}} + \frac{K}{(1+r_1)^{1-\sigma} d^{1-\sigma}} + \frac{K(\sigma)}{d^{2+\lambda-\sigma}(1+r_1)^{-\sigma}}. \]

Combining this with
\[ |\Re(V \partial_{z_1} \Gamma_{c,d})| \leq \frac{K(\sigma)}{(1+r_1)d^{1-\sigma}} \]

99
since $|\Gamma_{c,d}| \leq \frac{K}{d^\alpha}$, we infer
\[
\left| \int_{B(d\overline{e}^1,d^2')} 2\Re(\overline{\partial_d} V \Gamma_{c,d}) \Re(\overline{V} \partial_{z_1} \Gamma_{c,d}) \right| \leq \left| \int_{B(d\overline{e}^1,d^2')} \frac{K(\sigma)}{(1 + r_1)d^{4-\varepsilon'-2\varepsilon}} \right|
+ \left| \int_{B(d\overline{e}^1,d^2')} \frac{K(\sigma)}{(1 + r_1)^{2-\alpha}d^{2+\lambda-\sigma}} \right|
+ \left| \int_{B(d\overline{e}^1,d^2')} \frac{K(\sigma)}{(1 + r_1)^{1-\alpha}d^{2+\lambda-2\sigma}} \right|
\]
and since $\lambda + (1 - \alpha)\varepsilon' > 1$, we conclude, taking $\sigma > 0$ small enough,
\[
\int_{B(d\overline{e}^1,d^2')} 2\Re(\overline{\partial_d} V \Gamma_{c,d}) \Re(\overline{V} \partial_{z_1} \Gamma_{c,d}) = o_{d \to \infty} \left( \frac{1}{d^2} \right).
\]

Estimate for $I_3$.

We have from (4.22) that
\[
\partial_{z_1} \Gamma_{c,d} = 2V_1 \partial_{x_1} V \varepsilon_{c,d}^0 - 1 + \partial_{z_1} \Psi_{c,d} e^{\Psi_{c,d}},
\]
therefore
\[
\left| \Re(\overline{\partial_d} V \partial_{z_1} \Gamma_{c,d}) \right| \leq K \left( \frac{1}{(1 + r_1)d^{3-2\varepsilon}} + \frac{1}{(1 + r_1)^{1-\alpha}d^{1+\lambda}} \right)
\]
and $|\Re(\overline{V} \Gamma_{c,d})| \leq K|\Re(\Psi_{c,d})|$, hence
\[
|\Re(\overline{V} \Gamma_{c,d})| \leq \frac{K(\sigma)}{(1 + r_1)^{1+\sigma}d^{1-\sigma}},
\]
then
\[
\left| \int_{B(d\overline{e}^1,d^2')} 2\Re(\overline{\partial_d} V \partial_{z_1} \Gamma_{c,d}) \Re(\overline{V} \Gamma_{c,d}) \right| \leq \int_{B(d\overline{e}^1,d^2')} \frac{K(\sigma)}{(1 + r_1)^{2+\sigma}d^{4-2\varepsilon'-\sigma}}
+ \int_{B(d\overline{e}^1,d^2')} \frac{K(\sigma)}{(1 + r_1)^{2+\sigma-\alpha}d^{2+\lambda-\sigma}}
= o_{d \to \infty} \left( \frac{1}{d^2} \right)
\]
by taking $\sigma > 0$ small enough and using $\lambda + (1 - \alpha)\varepsilon' > 1$.

Estimate for $I_4$.

Recall that
\[
|\Re(\overline{\partial_d} V V)| \leq \frac{K}{(1 + r_1)^3},
\]
and we have
\[
|\Re(\overline{\partial_d} V \Gamma_{c,d})| \leq \frac{K}{(1 + r_1)^{1+6/8d^{2/8}}}
\]
since $|\Gamma_{c,d}| \leq \frac{K}{(1 + r_1)^{1+6/8d^{2/8}}}$. Therefore, with $\frac{1}{d} \leq \frac{K}{(1 + r_1)^2}$,
\[
|\Re(\overline{\partial_d} V V) + \Re(\overline{\partial_d} V \Gamma_{c,d})| \leq \frac{K}{(1 + r_1)^2}
\]
100
Now, we use $|\Gamma_{c,d}| \leq \frac{K(\sigma)}{(1+r_1)^{\sigma-d}}$ and Proposition 4.5 to get

$$|\Re(\overline{\partial_{c,d'}} \Gamma_{c,d})| \leq \frac{K}{(1+r_1)^{\sigma-d2+\lambda-\sigma}}.$$

We conclude that, taking $1 > \sigma > 0$ and as for the previous estimates,

$$\int_{B(d\overline{\Gamma}_{c,d})} 2(\Re(\overline{\partial_{c,d'}} V) + \Re(\overline{\partial_{c,d}} V)) \Re(\overline{\partial_{c,d'}} \Gamma_{c,d}) \Re(\overline{\partial_{c,d'}} \Gamma_{c,d}) = o_{d \to \infty} \left( \frac{1}{d^2} \right).$$

**Estimate for $I_5$.**

We have, by Proposition 4.5,

$$|\Re(\overline{\partial_{c,d'}} (\partial_{x_1} V - \partial_{z_1} \Gamma_{c,d}))| \leq \frac{K}{(1+r_1)} \left( \frac{1}{d^{2-\varepsilon'}} + \frac{1}{(1+r_1)^{1-\alpha d^2+\lambda-\sigma}} \right)$$

and using $|\Gamma_{c,d}| \leq \frac{K(\sigma)}{d^{2-2\sigma}}$, we have

$$|\Gamma_{c,d}|^2 \leq \frac{K(\sigma)}{d^{2-2\sigma}}.$$

Therefore, for $\sigma > 0$ small enough, since $\lambda + (1-\alpha)\varepsilon' > 1$,

$$\int_{B(d\overline{\Gamma}_{c,d})} |\Gamma_{c,d}|^2 \Re(\overline{\partial_{c,d'}} (2\partial_{x_1} V - \partial_{z_1} \Gamma_{c,d})) = o_{d \to \infty} \left( \frac{1}{d^2} \right)$$

which concludes the estimates.

### 4.6 Proof of $\partial_c d_c = -\frac{1}{\varepsilon'} + o_{c \to 0} \left( \frac{1}{\varepsilon'} \right)$

Recall that $d_c$ is defined by the implicit equation

$$\int_{B(d\overline{\Gamma}_{c,d}) \cup B(-d\overline{\Gamma}_{c,d})} \Re(\overline{\partial_{c,d'}} TW_c(Q_{c,d})) = 0.$$

We showed in subsection 4.5 that

$$\partial_{c} \int_{B(d\overline{\Gamma}_{c,d}) \cup B(-d\overline{\Gamma}_{c,d})} \Re(\overline{\partial_{c,d'}} TW_c(Q_{c,d}))|_{d=d_c} = \frac{-2\pi}{d_c^2} + o_{d_c \to \infty} \left( \frac{1}{d_c^2} \right).$$

Therefore, by the implicit function theorem,

$$\partial_c d_c = \frac{\partial_{c} \int_{B(d\overline{\Gamma}_{c,d}) \cup B(-d\overline{\Gamma}_{c,d})} \Re(\overline{\partial_{c,d'}} TW_c(Q_{c,d}))|_{d=d_c}}{-\frac{2\pi}{d_c^2} + o_{d_c \to \infty} \left( \frac{1}{d_c^2} \right)}.$$

We compute for

$$TW_c(Q_{c,d}) = -i \partial_{x_2} Q_{c,d} - \Delta Q_{c,d} - (1 - |Q_{c,d}|^2)Q_{c,d}$$

that, with $\partial_c Q_{c,d} = \partial_c (V + \Gamma_{c,d}) = \partial_c \Gamma_{c,d}$ at fixed $d$, we have (still at fixed $d$)

$$\partial_c (TW_c(Q_{c,d})) = -i \partial_{x_2} Q_{c,d} - L_{Q_{c,d}}(\partial_c \Gamma_{c,d}),$$

where

$$L_{Q_{c,d}}(h) := -\Delta h - i \partial_{x_2} h - (1 - |Q_{c,d}|^2)h + 2 \Re(\overline{Q_{c,d}} h)Q_{c,d}.$$

We are left with the computation of

$$\partial_c \int_{B(d\overline{\Gamma}_{c,d}) \cup B(-d\overline{\Gamma}_{c,d})} \Re(\overline{\partial_{c,d'}} TW_c(Q_{c,d}))|_{d=d_c} =$$
We have, by definition, hence
\[
\int_{B(d, t')} |\partial_d V| d = d_c.
\]
As above, we omit the subscript in \(d_c\) for the computations.

Step 1. Proof of \(\int_{B(d, t')} |\partial_d V| d = d_c = 2\pi + o_{c \to 0}(1)\).

We have \(\partial_{x_2} Q_c = \partial_{x_2} V + \partial_{x_2} \Gamma_{c,d}\), hence
\[
- \int_{B(d, t')} \Re(\partial_d V(i\partial_{x_2} Q_c)) = \int_{B(d, t')} \Re(i\partial_d V \partial_{x_2} V) - \int_{B(d, t')} \Re(i\partial_d V \partial_{x_2} \Gamma_{c,d}).
\]
Since
\[
|\partial_d V| \leq \frac{K}{(1 + r_1)}
\]
and
\[
|\partial_{x_2} \Gamma_{c,d}| \leq \frac{K}{(1 + r_1)^{1/2}}
\]
(by \(\| \Gamma_{c,d} \|_{L^1} \leq \frac{K}{d^{1/2}}\)), we have
\[
\int_{B(d, t')} \Re(i\partial_d V \partial_{x_2} \Gamma_{c,d}) = o_{c \to 0}(1).
\]
Furthermore,
\[
- \int_{B(d, t')} \Re(i\partial_d V \partial_{x_2} V) = \int_{B(d, t')} \Re(i\partial_{x_1} V_1 \partial_{x_2} V_1) + o_{c \to 0}(1),
\]
and we already computed in (2.32) that
\[
\int_{\mathbb{R}^2} \Re(i\partial_{x_2} V_1 \partial_{x_1} V_1) = -\pi + o_{c \to 0}(c^{1/4})
\]
hence
\[
\int_{B(d, t')} \Re(i\partial_d V (-i\partial_{x_2} Q_c)) |d = d_c = 2\pi + o_{c \to 0}(1).
\]

Step 2. Proof of \(\int_{B(d, t')} \Re(\partial_d V L_{Q_c}(\partial_c \Gamma_{c,d})) |d = d_c = o_{c \to 0}(1)\).

From the definition of \(\Gamma_{c,d}\), at fixed \(d\), we have
\[
\partial_c \Gamma_{c,d} = \eta V \partial_x \Psi_{c,d} + (1 - \eta) V \partial_x \Psi_{c,d} e^{\Psi_{c,d}}.
\]
We have, by definition,
\[
L_{Q_c}(\partial_c \Gamma_{c,d}) = -i c \partial_{x_2} \partial_c \Gamma_{c,d} - \Delta \partial_c \Gamma_{c,d} - (1 - |Q_c|^2) \partial_c \Gamma_{c,d} + 2 \Re(Q_c \partial_c \Gamma_{c,d}) Q_c,
\]
and using \(|\partial_d V| \leq \frac{K}{(1 + r_1)}\) with \(|\partial_{x_2} \partial_c \Gamma_{c,d}| \leq \frac{K c^{-1/2}}{(1 + r_1)^{1/2}}\) since \(\| \partial_c \Gamma_{c,d} \|_{L^1} \leq K c^{-1/2}\) from Lemma 3.2 and (4.26), we have
\[
\int_{B(d, t')} \Re(\partial_d V (-i \partial_{x_2} \partial_c \Gamma_{c,d})) \leq K \int_{B(d, t')} \frac{c^{1/2}}{(1 + r_1)^{2 + 1/2}} = o_{c \to 0}(1).
\]
The estimate on $B(-d\overline{e}_1^1, d')$ is similar.

We define
\[ \tilde{L}_{Q_c}(h) := -\Delta h - (1 - |Q_c|^2)h + 2\Re(\overline{Q}_c h)Q_c \]
and we are then left with the computation of
\[ \int_{B(d\overline{e}_1^1, d')} \Re(\overline{\partial}_d V \tilde{L}_{Q_c}(\partial_c \Gamma_{c,d})), \]
the part on $B(-d\overline{e}_1^1, d')$ being symmetrical. We want to put the linear operator onto $\partial_d V$ since $\tilde{L}_{Q_c}(\partial_d V)$ is close to $L_V(\partial_d V)$ which is itself small. We then integrate by parts:
\[ \left| \int_{B(d\overline{e}_1^1, d')} \Re(\overline{\partial}_d V \tilde{L}_{Q_c}(\partial_c \Gamma_{c,d})) \right| \leq \int_{B(d\overline{e}_1^1, d')} \Re(\tilde{L}_{Q_c}(\partial_d V)\overline{\partial}_c \Gamma_{c,d}) \]
\[ + \int_{\partial B(d\overline{e}_1^1, d')} \Re(\overline{\partial}_d V \tilde{L}_{Q_c}(\partial_c \Gamma_{c,d})) \]
We have on $\partial B(d\overline{e}_1^1, d')$, that $|\partial_d V| \leq \frac{K}{d^{1/4}}$, $|\nabla \partial_d V| \leq \frac{K}{d^{1/8}}$ from Lemma 2.6. Moreover, by $\left| \frac{\partial_c \Gamma_{c,d}}{r^{1/2}} \right| \leq Kc^{-1/2}$ from Lemma 3.2 and (4.26), we deduce $|\nabla \partial_c \Gamma_{c,d}| \leq \frac{Kd^{1/2}}{d^{1/4}d^{1/8}} \leq \frac{K}{d^{1/4}}$ and $|\partial_c \Gamma_{c,d}| \leq \frac{Kd^{1/2}}{d^{1/4}d^{1/8}} \leq Kd^{1/8}$. We then obtain
\[ \left| \int_{\partial B(d\overline{e}_1^1, d')} \Re(\overline{\partial}_d V \nabla \partial_c \Gamma_{c,d}) \right| \leq \int_{\partial B(d\overline{e}_1^1, d')} |\partial_d V||\nabla \partial_c \Gamma_{c,d}| \leq d^{3/4} \frac{K}{d^{3/4}d^{1/8}} = o_{c \to 0}(1), \]
\[ \left| \int_{\partial B(d\overline{e}_1^1, d')} \Re(\nabla \partial_d V \partial_c \Gamma_{c,d}) \right| \leq \int_{\partial B(d\overline{e}_1^1, d')} |\nabla \partial_d V||\partial_c \Gamma_{c,d}| \leq d^{3/4} \frac{Kd^{1/8}}{d^{3/2}} = o_{c \to 0}(1). \]
Therefore,
\[ \int_{B(d\overline{e}_1^1, d')} \Re(\overline{\partial}_d V \tilde{L}_{Q_c}(\partial_c \Gamma_{c,d})) = \int_{B(d\overline{e}_1^1, d')} \Re(\tilde{L}_{Q_c}(\partial_d V)\overline{\partial}_c \Gamma_{c,d}) + o_{c \to 0}(1). \]
Now, from (2.34), we have that that
\[ |L_V(\partial_d V)| \leq \frac{K}{(1 + r^2)d} \]
and by Lemma 3.2 and (4.26), we have $|\partial_c \Gamma_{c,d}| \leq \frac{Kd^{1/2}}{(1 + r^2)^{1/2}}$, hence
\[ \left| \int_{B(d\overline{e}_1^1, d')} \Re(L_V(\partial_d V)\overline{\partial}_c \Gamma_{c,d}) \right| \leq K \int_{B(d\overline{e}_1^1, d')} \frac{1}{(1 + r^2)^{2+1/2}d^{1/2}d^{1/2}} = o_{c \to 0}(1). \]
We deduce from this that
\[ \int_{B(d\overline{e}_1^1, d')} \Re(\overline{\partial}_d V \tilde{L}_{Q_c}(\partial_c \Gamma_{c,d})) = \int_{B(d\overline{e}_1^1, d')} \Re((\tilde{L}_{Q_c} - L_V)(\partial_d V)\overline{\partial}_c \Gamma_{c,d}) + o_{c \to 0}(1). \]
We have $\tilde{L}_{Q_c}(h) = -\Delta h - (1 - |Q_c|^2)h + 2\Re(\overline{Q}_c h)Q_c$ and $L_V(h) = -\Delta h - (1 - |V|^2)h + 2\Re(\overline{V} h)V$, therefore
\[ (\tilde{L}_{Q_c} - L_V)(\partial_d V) = (|Q_c|^2 - |V|^2)\partial_d V + 2\Re(\overline{V} \partial_d V)(Q_c - V) + 2\Re(\overline{Q}_c - V \partial_d V)Q_c. \]
We have by (3.16) that $||Q_c|^2 - |V|^2| \leq \frac{Kd^{3/4}}{(1 + r^2)^{1/4}}$, hence
\[ \left| \int_{B(d\overline{e}_1^1, d')} \Re((|Q_c|^2 - |V|^2)\partial_d V\overline{\partial}_c \Gamma_{c,d}) \right| \leq K \int_{B(d\overline{e}_1^1, d')} \frac{c^{1/4}}{(1 + r^2)^{2+3/4}} = o_{c \to 0}(1). \]
We have from (3.15) that $|Q_c - V| \leq \frac{e^{3/4}}{(1 + r_1)^{3/2}}$, and, in $B(d\bar{e}_1', d')$, we have (by Lemmas 2.1 and 2.2) that $|\Re(\tilde{V}\partial_d V)| \leq \frac{K}{(1 + r_1)^{3/2}}$, therefore

$$\left| \int_{B(d\bar{e}_1', d')} \Re(2\Re(\tilde{V}\partial_d V)(Q_c - V)\partial_d \Gamma_{c,d}) \right| \leq K \int_{B(d\bar{e}_1', d')} \frac{e^{1/4}}{(1 + r_1)^{3/2}} = o_{c \rightarrow 0}(1).$$

Finally, by using the same estimates, we have

$$\left| \int_{B(d\bar{e}_1', d')} \Re(2\Re(Q_c - V)\partial_d V)Q_c \partial_d \Gamma_{c,d} \right| \leq K \int_{B(d\bar{e}_1', d')} \frac{e^{3/4}}{(1 + r_1)^{1 + 1/4}} |\Re(Q_c\partial_c \Gamma_{c,d})|.$$  

We compute

$$\Re(Q_c \partial_c \Gamma_{c,d}) = \Re(\tilde{V}\partial_d \Gamma_{c,d}) + \Re(\Gamma_{c,d} \partial_c \Gamma_{c,d}).$$

By using $\left\| \frac{\partial \Gamma_{c,d}}{V} \right\|_{*,1/2,d} \leq K^{-1/2} e^{-3/2}$ from Lemma 3.2 and (4.26), we have $\left| \Re(\tilde{V}\partial_d \Gamma_{c,d}) \right| \leq K^{-1/2} e^{-3/2}$. Furthermore, with $|\Gamma_{c,d}| \leq \frac{K e^{-1/2}}{(1 + r_1)^{3/2}}$ (by $\left\| \Gamma_{c,d}/V \right\|_{*,1/2,d} \leq e^{1/2}$), we have $\left| \Re(\Gamma_{c,d} \partial_c \Gamma_{c,d}) \right| \leq K$. With these estimates, we infer

$$\left| \int_{B(d\bar{e}_1', d')} \Re(2\Re(Q_c - V)\partial_d V)Q_c \partial_d \Gamma_{c,d} \right| = o_{c \rightarrow 0}(1)$$

which ends the proof of

$$\int_{B(d\bar{e}_1', d')} \Re((\tilde{L}Q_c - L_V)(\partial_d V)\partial_d \Gamma_{c,d}) = o_{c \rightarrow 0}(1).$$

Step 3. Conclusion.

We showed that

$$\partial_c d_c = -\frac{\partial L_{c_e}}{c^2} + \frac{2\pi + o_{c \rightarrow 0}(1)}{c} \left( \frac{1}{d^2} + o_{c \rightarrow 0}(1) \right),$$

therefore, with $d_c = \frac{1 + o_{c \rightarrow 0}(1)}{c}$ from Proposition 2.25 we have

$$\partial_c d_c = -\frac{1 + o_{c \rightarrow 0}(1)}{c^2}.$$

As a result of subsection 4.5, at fixed $c$,

$$\partial_d \int_{B(d\bar{e}_1', d')} \Re(\tilde{V} \partial_d V) TW_c(Q_{c,d}))|_{d=\bar{d}_c} \neq 0$$

for $c$ small enough. By the implicit function theorem, taking some $0 < c_* < c_0(\sigma)$, we can construct a $C^1$ branch $c \mapsto d_c$ in a vicinity of $c_*$. We define $C$ as the set of $c_* > c_0 \geq 0$ such that there exists a $C^1$ branch $c \mapsto d_c$ on $[c_0, c_*]$. We have just shown that $C$ is not empty. Let us suppose that $c_0 := \inf C \neq 0$. Then, $c \mapsto d_c$ is uniformly bounded on $[c_0, c_*]$ in $C^1$ by subsection 4.6, and can therefore be extended by continuity to $c_0$, and we denote $d_{c_0}$ its value there. We can construct the perturbation $\Phi_{c_0,d_{c_0}}$ by continuity since $c,d \mapsto \Phi_{c,d}$ are $C^1$ functions in the Banach space $\Phi \in C^1(\mathbb{R}^2, \mathbb{C})$, $\|\Phi\|_{*,\sigma,d} < +\infty$ for its canonical norm (which is equivalent to $\|\cdot\|_{*,\sigma,d}$). By passing to the limit, we have $\|\Phi_{c_0,d_{c_0}}\|_{*,\sigma,d} \leq K_0(\sigma)c_0^{1-\sigma}$ for $K_0(\sigma)$ defined in Proposition 2.20. By continuity of $\lambda$, we check that we have $\lambda(c_0, d_{c_0}) = 0$ for the perturbation $\Phi_{c_0,d_{c_0}}$. Therefore, by the implicit function theorem, there exists a unique branch $c \mapsto d_c$ in a vicinity of $(c_0, d_{c_0})$ such that $\lambda(c, d_c) = 0$. This branch, by uniqueness, corresponds to the branch we had on $[c_0, c_*]$; and is also $C^1$ by the implicit function theorem. Therefore $\inf C < c_0$, which is in contradiction with $c_0 = \inf C$, and thus $\inf C = 0$.

In particular, the travelling wave $Q_c$ on this branch is uniquely defined by this construction and is a $C^1$ function of $c$. Indeed, we shall now show that there is only one choice of $d_c$ such that $\lambda(c, d_c) = 0$ in $\frac{1}{12} \leq \frac{2}{c} \leq \frac{1}{2}$. If there exist $d_1 \neq d_2$ in $\frac{1}{12} \leq \frac{2}{c} \leq \frac{1}{2}$ such that $\lambda(c, d_1) = \lambda(c, d_2) = 0$, by Subsection 4.5, we have

$$\partial_d(\lambda(c, d))|_{d=d_1} < 0 \quad \text{and} \quad \partial_d(\lambda(c, d))|_{d=d_2} < 0,$$
therefore, there exists $d'$ such that $\lambda(c, d') = 0$ and $\partial_d(\lambda(c, d'))|_{d=d'} \geq 0$, but then, since $\lambda(c, d') = 0$, we have $\partial_d(\lambda(c, d'))|_{d=d'} < 0$, which is in contradiction with $\partial_d(\lambda(c, d'))|_{d=d'} \geq 0$. Now that we have uniqueness in the choice of $d_c$ (in $[\frac{1}{2e^c}, \frac{2}{e^c}]$), we have uniqueness of $\Phi_{c,d}$ in the set 

$$\{ \Phi \in C^1(\mathbb{R}^2, \mathbb{C}), \| \Phi \|_{s, \sigma, d_c} \leq K_0(\sigma)c^{1-\sigma} \}$$

for $K_0(\sigma) > 0$ defined in Proposition 2.20.

### 4.7 Proof of the estimate on $\partial_c Q_c$

We conclude the proof of Theorem 1.1 with the following lemma.

**Lemma 4.6** For any $0 < \sigma < 1$, there exist $c_0(\sigma) > 0$ such that for any $c < c_0(\sigma)$,

$$\left\| \frac{\partial_c Q_c}{V} + \left(1 + \frac{0c \rightarrow 0(1)}{c^2}\right) \frac{\partial_d V|_{d=d_c}}{V} \right\|_{s, \sigma, d_c} = o_{c \rightarrow 0} \left(\frac{1}{c^2}\right).$$

With this estimate and by using the same computations as in the proof of Lemma 3.6, we show that

$$\left\| \partial_c Q_c + \left(1 + \frac{0c \rightarrow 0(1)}{c^2}\right) \partial_d(V_1(., -d\tilde{c})V\tau(., +d\tilde{c}))|_{d=d_c} \right\|_p = o_{c \rightarrow 0} \left(\frac{1}{c^2}\right).$$

for all $+\infty > p > 2$ if $c$ is small enough, which ends the proof of Theorem 1.1.

**Proof** From subsection 4.5, we know that $Q_c$ is a $C^1$ function of $c$. We have $Q_c = V + \Gamma_{c,d_c}$, hence

$$\partial_c Q_c = \partial_c V + \partial_c(\Gamma_{c,d_c}) = \frac{-1 + 0c \rightarrow 0(1)}{c^2} \partial_d V + \partial_c(\Gamma_{c,d_c}),$$

where we used $\partial_c V = (\frac{-1}{c} + 0c \rightarrow 0(\frac{1}{c^2})) \partial_d V$ thanks to subsection 4.6. $\Gamma_{c,d_c}$ depends on $c$ directly and through $d_c$. We will write $\partial_c \Gamma_{c,d_c}$ for the derivatives with respect to $c$ but at a fixed $d_c$, and $\partial_d \Gamma_{c,d_c}$ for the derivative with respect to $d_c$ but at fixed $\sigma$.

In particular,

$$\partial_c \Gamma_{c,d_c} = \partial_c \Gamma_{c,d_c} + \partial_c d_c \partial_d \Gamma_{c,d_c}.$$ 

From Lemma 3.2 and (4.26), we showed that

$$\left\| \frac{\partial_c \Gamma_{c,d_c}}{V} \right\|_{s, \sigma, d_c} \leq K(\sigma)c^{-\sigma},$$

and from Lemma 3.3 with the definition of $\Gamma_{c,d}$, we show easily that

$$\left\| \frac{\partial_d \Gamma_{c,d}}{V} \right\|_{s, \sigma, d_c} \leq K(\sigma)c^{1-\sigma}.$$ 

Finally, from subsection 4.6, we have $\partial_c d_c = \frac{1 + 0c \rightarrow 0(1)}{c^2}$, therefore

$$\left\| \frac{\partial_c (\Gamma_{c,d_c})}{V} \right\|_{s, \sigma, d_c} \leq K(\sigma)(c^{-\sigma} + c^{-2}(1 + 0c \rightarrow 0(1))c^{1-\sigma}) = o_{c \rightarrow 0} \left(\frac{1}{c^2}\right)$$

since $0 < \sigma < 1$.

This concludes the proof of Lemma 4.6, which itself concludes the proof of Theorem 1.1.
