#### Abstract

Let $H$ be the 16 -dimensional nontrivial (namely, noncommutative and noncocommutative) semisimple Hopf algebra $H_{b: 1}$ appeared in Kashina's work [28]. We obtain all simple Yetter-Drinfeld modules over $H$ and then determine all finite-dimensional Nichols algebras satisfying $\mathcal{B}(V) \cong \bigotimes_{i \in I} \mathcal{B}\left(V_{i}\right)$, where $V=\bigoplus_{i \in I} V_{i}$, each $V_{i}$ is a simple object in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$. Finally, we describe all liftings of those $\mathcal{B}(V)$ over $H$.

## 1 Introduction

Let $\mathbb{k}$ be an algebraically closed field of characteristic zero. In 1975, Kaplansky [27] posed ten conjectures including the number of iso-classes of finite-dimensional Hopf algebras over $\mathbb{k}$. Until now, although there are many classification results, there are no standard methods, except that in 1998, Andruskiewitsch and Schneider [10] put forward the lifting method which later on plays a very important role in the classification of finite-dimensional (co-)pointed Hopf algebras.

Actually, the lifting method works well for those classes of finite-dimensional Hopf algebras with Radford biproduct structure or their deformations by certain Hopf 2-cocycles. Let $A$ be a Hopf algebra. If the coradical $A_{0}$ is a subalgebra, then the coradical filtration $\left\{A_{n}\right\}_{n \geq 0}$ is a Hopf algebra filtration, and the associated graded coalgebra $\operatorname{gr} A=\bigoplus_{n \geq 0} A_{n} / A_{n-1}$ is

[^0]also a Hopf algebra, where $A_{-1}=0$. Let $\pi: g r A \rightarrow A_{0}$ be the homogeneous projection. By a theorem of Radford [31], there exists a unique connected graded braided Hopf algebra $R=\bigoplus_{n \geq 0} R(n)$ in the monoidal category $A_{A_{0}}^{A_{0}} \mathcal{Y} \mathcal{D}$ such that $g r A \cong R \sharp A_{0}$. We call $R$ or $R(1)$ the diagram or infinitesimal braiding of $A$, respectively. Moreover, $R$ is strictly graded, that is, $R(0)=\mathbb{k}, R(1)=\mathcal{P}(R)$ (see Definition 1.13 [12]).

The lifting method has been applied to classify some finite-dimensional pointed Hopf algebras such as [3], [4], [5], [6], 9], [13], [17], [20], etc., and copointed Hopf algebras [14], [26], etc. Nevertheless, there are a few classification results on finite-dimensional Hopf algebras whose coradical is neither a group algebra nor the dual of a group algebra, for instance, [7], [16], [19], [24], [25], [33], [34], etc. In fact, Shi began a program in [33] to classify the objects of finite-dimensional growth from a given nontrivial semisimple Hopf algebra $A_{0}=H_{8}$ via some relevant Nichols algebras $\mathcal{B}(V)$ derived from its semisimple Yetter-Drinfeld modules $V \in{ }_{A_{0}}^{A_{0}} \mathcal{Y} \mathcal{D}$.

The classification of finite-dimensional Hopf algebras $A$ whose coradical $A_{0}$ is a (Hopf) subalgebra needs the following main steps:
(a) Determine those $V$ in ${ }_{A_{0}}^{A_{0}} \mathcal{Y} \mathcal{D}$ such that the Nichols algebra $\mathcal{B}(V)$ is finite-dimensional and present $\mathcal{B}(V)$ by generators and relations.
(b) If $R=\bigoplus_{n \geq 0} R(n)$ is a finite-dimensional Hopf algebra in ${ }_{A_{0}}^{A_{0}} \mathcal{Y} \mathcal{D}$ with $V=R(1)$, decide if $R \cong \mathcal{B}(V)$.
(c) Given $V$ as in (a), classify all $A$ such that $g r A \cong \mathcal{B}(V) \sharp A_{0}$. We call $A$ a lifting of $\mathcal{B}(V)$ over $A_{0}$.

In this paper, we fix a 16-dimensional non-trivial semisimple Hopf algebra $H=H_{b: 1}$, which appeared in [28], and study these questions. For the definition of Hopf algebra $H$, see Definition 3.1. We first determine the Drinfeld double $D:=D\left(H^{c o p}\right)$ of $H^{c o p}$ and describe the simple $D$-modules. In fact, we prove in Theorem 3.6 that there are 32 one-dimensional simple objects $\mathbb{k}_{\chi_{i, j, k, l}}$ with $0 \leq i, k, l<2,0 \leq j<4$, and 56 two-dimensional simple objects $V_{i, j, k, l, m, n}$ with $(i, j, k, l, m, n) \in \Omega, W_{i, j, k, l}$ with $(i, j, k, l) \in \Lambda^{1}, U_{i, j, k, l}$ with $(i, j, k, l) \in \Lambda^{2}$. Using the fact that the baided categories ${ }_{D} \mathcal{M}$ and ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$ are monoidally isomorphic (see [29]), we actually get the simple objects in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$. Furthermore, we get all the possible finitedimensional Nichols algebras of semisimple objects satisfying $\mathcal{B}(V) \cong \bigotimes_{i \in I} \mathcal{B}\left(V_{i}\right)$. Here is our first main result.

Theorem A Let $V=\bigoplus_{i \in I} V_{i}$, each $V_{i}$ be a simple object in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$. Then the Nichols algebra $\mathcal{B}(V)$ satisfying $\mathcal{B}(V) \cong \bigotimes_{i \in I} \mathcal{B}\left(V_{i}\right)$ is finite-dimensional if and only if $V$ is isomorphic to one of the following Yetter-Drinfeld modules
(1) $\Omega_{1}\left(n_{1}, n_{2}, n_{3}, n_{4}, n_{5}, n_{6}, n_{7}, n_{8}\right) \triangleq \bigoplus_{j=1}^{8} V_{j}$ with $\sum_{j=1}^{8} n_{j} \geq 1$.
(2) $\Omega_{2}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{3}^{\oplus n_{1}} \oplus V_{4}^{\oplus n_{2}} \oplus V_{7}^{\oplus n_{3}} \oplus V_{8}^{\oplus n_{4}} \oplus M_{1}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(3) $\Omega_{3}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{1}^{\oplus n_{1}} \oplus V_{2}^{\oplus n_{2}} \oplus V_{5}^{\oplus n_{3}} \oplus V_{6}^{\oplus n_{4}} \oplus M_{2}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(4) $\Omega_{4}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{1}^{\oplus n_{1}} \oplus V_{3}^{\oplus n_{2}} \oplus V_{5}^{\oplus n_{3}} \oplus V_{7}^{\oplus n_{4}} \oplus M_{3}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(5) $\Omega_{5}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{1}^{\oplus n_{1}} \oplus V_{4}^{\oplus n_{2}} \oplus V_{5}^{\oplus n_{3}} \oplus V_{8}^{\oplus n_{4}} \oplus M_{4}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(6) $\Omega_{6}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{2}^{\oplus n_{1}} \oplus V_{4}^{\oplus n_{2}} \oplus V_{6}^{\oplus n_{3}} \oplus V_{8}^{\oplus n_{4}} \oplus M_{5}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(7) $\Omega_{7}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{2}^{\oplus n_{1}} \oplus V_{3}^{\oplus n_{2}} \oplus V_{6}^{\oplus n_{3}} \oplus V_{7}^{\oplus n_{4}} \oplus M_{6}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(8) $\Omega_{8}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{1}^{\oplus n_{1}} \oplus V_{2}^{\oplus n_{2}} \oplus V_{5}^{\oplus n_{3}} \oplus V_{6}^{\oplus n_{4}} \oplus M_{7}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(9) $\Omega_{9}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{3}^{\oplus n_{1}} \oplus V_{4}^{\oplus n_{2}} \oplus V_{7}^{\oplus n_{3}} \oplus V_{8}^{\oplus n_{4}} \oplus M_{8}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(10) $\Omega_{10}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{2}^{\oplus n_{1}} \oplus V_{4}^{\oplus n_{2}} \oplus V_{6}^{\oplus n_{3}} \oplus V_{8}^{\oplus n_{4}} \oplus M_{9}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(11) $\Omega_{11}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{2}^{\oplus n_{1}} \oplus V_{3}^{\oplus n_{2}} \oplus V_{6}^{\oplus n_{3}} \oplus V_{7}^{\oplus n_{4}} \oplus M_{10}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(12) $\Omega_{12}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{1}^{\oplus n_{1}} \oplus V_{3}^{\oplus n_{2}} \oplus V_{5}^{\oplus n_{3}} \oplus V_{7}^{\oplus n_{4}} \oplus M_{11}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(13) $\Omega_{13}\left(n_{1}, n_{2}, n_{3}, n_{4}\right) \triangleq V_{1}^{\oplus n_{1}} \oplus V_{4}^{\oplus n_{2}} \oplus V_{5}^{\oplus n_{3}} \oplus V_{8}^{\oplus n_{4}} \oplus M_{12}$ with $\sum_{j=1}^{4} n_{j} \geq 0$.
(14) $\Omega_{14} \triangleq M_{1} \oplus M_{1}, \Omega_{15} \triangleq M_{1} \oplus M_{2}, \Omega_{16} \triangleq M_{1} \oplus M_{7}, \Omega_{17} \triangleq M_{3} \oplus M_{3}, \Omega_{18} \triangleq M_{3} \oplus M_{5}$, $\Omega_{19} \triangleq M_{3} \oplus M_{9}, \Omega_{20} \triangleq M_{4} \oplus M_{4}, \Omega_{21} \triangleq M_{4} \oplus M_{6}, \Omega_{22} \triangleq M_{7} \oplus M_{7}, \Omega_{23} \triangleq M_{7} \oplus M_{8}$, $\Omega_{24} \triangleq M_{13} \oplus M_{13}, \Omega_{25} \triangleq M_{13} \oplus M_{14}, \Omega_{26} \triangleq M_{15} \oplus M_{15}, \Omega_{27} \triangleq M_{15} \oplus M_{16}, \Omega_{28} \triangleq M_{17} \oplus M_{17}$, $\Omega_{29} \triangleq M_{17} \oplus M_{18}$.
(15) $\Omega_{30} \triangleq M_{2} \oplus M_{2}, \Omega_{31} \triangleq M_{2} \oplus M_{8}, \Omega_{32} \triangleq M_{4} \oplus M_{10}, \Omega_{33} \triangleq M_{5} \oplus M_{5}, \Omega_{34} \triangleq M_{5} \oplus M_{11}$, $\Omega_{35} \triangleq M_{6} \oplus M_{6}, \Omega_{36} \triangleq M_{6} \oplus M_{12}, \Omega_{37} \triangleq M_{8} \oplus M_{8}, \Omega_{38} \triangleq M_{9} \oplus M_{9}, \Omega_{39} \triangleq M_{9} \oplus M_{11}$, $\Omega_{40} \triangleq M_{10} \oplus M_{10}, \Omega_{41} \triangleq M_{10} \oplus M_{12}, \Omega_{42} \triangleq M_{11} \oplus M_{11}, \Omega_{43} \triangleq M_{12} \oplus M_{12}, \Omega_{44} \triangleq M_{14} \oplus M_{14}$, $\Omega_{45} \triangleq M_{16} \oplus M_{16}, \Omega_{46} \triangleq M_{18} \oplus M_{18}, \Omega_{47} \triangleq M_{19} \oplus M_{19}, \Omega_{48} \triangleq M_{19} \oplus M_{20}, \Omega_{49} \triangleq M_{20} \oplus M_{20}$.

Remark 1.1 We point out which of the Yetter-Drinfeld modules have principal realizations and which not, since the liftings are known when there exist principal realizations [1, Subsection 2.2]. Let $(h)$ and $\left(\delta_{h}\right)$ be dual bases of $H$ and $H^{*}$. Define

$$
\begin{aligned}
\chi:= & \delta_{1}+\delta_{x^{2}}+(-1)^{i}\left(\delta_{x}+\delta_{x^{3}}\right)+(-1)^{j}\left(\delta_{y}+\delta_{x^{2} y}\right)+(-1)^{i+j}\left(\delta_{x y}+\delta_{x^{3} y}\right) \\
& +(-1)^{k}\left(\delta_{t}+\delta_{x^{2} t}\right)+(-1)^{i+k}\left(\delta_{x t}+\delta_{x^{3} t}\right)+(-1)^{j+k}\left(\delta_{y t}+\delta_{x^{2} y t}\right) \\
& +(-1)^{i+j+k}\left(\delta_{x y t}+\delta_{x^{3} y t}\right) \in \operatorname{Alg}(H, \mathbb{k}),
\end{aligned}
$$

then $\left(x^{j} y^{l}, \chi\right)$ is a YD-pair [2] if and only if $\mathbb{k}_{x^{j} y^{l}}^{\chi}$ is a one-dimensional Yetter-Drinfeld module. So only $\Omega_{1}\left(n_{1}, . ., n_{8}\right)$ has a principal realization.

Based on the principle of the lifting method, we classify the finite-dimensional Hopf algebras over $H$ such that their infinitesimal braidings are those Yetter-Drinfeld modules listed in Theorem A. Here is the second main result.

Theorem B Let $A$ be a finite-dimensional Hopf algebra over $H$ such that its infinitesimal braiding is isomorphic to one of the Yetter-Drinfeld modules in Theorem $A$, then $A$ is isomorphic either to
(1) $\mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}\right)$, see Definition 6.4;
(2) $\mathfrak{U}_{2}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{2}\right)$, see Definition 6.7;
(3) $\mathfrak{U}_{4}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{4}\right)$, see Definition 6.11;
(4) $\mathfrak{U}_{5}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{5}\right)$, see Definition 6.12;
(5) $\mathfrak{U}_{8}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{8}\right)$, see Definition 6.9;
(6) $\mathfrak{U}_{14}\left(I_{14}\right)$, see Definition 6.14; $\mathfrak{U}_{15}(\lambda, \mu)$, see Definition 6.15;
$\mathfrak{U}_{16}(\lambda, \mu)$, see Definition 6.16; $\mathfrak{U}_{17}\left(I_{17}\right)$, see Definition 6.17;
$\mathfrak{U}_{18}\left(I_{18}\right)$, see Definition 6.18: $\mathfrak{U}_{19}(\lambda, \mu)$, see Definition 6.19;
$\mathfrak{U}_{20}\left(I_{20}\right)$, see Definition 6.21; $\mathfrak{U}_{21}(\lambda, \mu)$, see Definition 6.22;
$\mathfrak{U}_{22}\left(I_{22}\right)$, see Definition 6.23; $\mathfrak{U}_{23}\left(I_{23}\right)$, see Definition 6.24;
$\mathfrak{U}_{24}(\lambda)$, see Definition 6.26; $\mathfrak{U}_{26}\left(I_{26}\right)$, see Definition 6.27;
$\mathfrak{U}_{27}(\lambda, \mu)$, see Definition 6.28: $\mathfrak{U}_{28}\left(I_{28}\right)$, see Definition 6.31;
$\mathfrak{U}_{29}(\lambda, \mu)$, see Definition 6.32.
(7) $\mathcal{B}\left(\Omega_{25}\right) \sharp H$, see Proposition 6.30.

Except for the case (7), the remaining families of Hopf algebras contain non-trivial lifting relations.
Remark 1.2 Note that (1) $\operatorname{dim} \mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}\right)=2^{4+\sum_{i=1}^{8} n_{i}}$;
(2) For $k \in\{2,4,5,8\}, \operatorname{dim} \mathfrak{U}_{k}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{k}\right)=2^{6+\sum_{i=1}^{4} n_{i}}$;
(3) For $i \in\{14,17,18,20,22,23,26,28\}, \operatorname{dim} \mathfrak{U}_{i}\left(I_{i}\right)=256$;
(4) For $i \in\{15,16,19,21,27,29\}, \operatorname{dim} \mathfrak{U}_{i}(\lambda, \mu)=\operatorname{dim} \mathfrak{U}_{24}(\lambda)=256$.

The paper is organized as follows. In section 2, we recall some basics and notations of Yetter-Drinfeld modules, Nichols algebras, Radford biproduct and Drinfeld double. In section 3, we describe the structures of $H$ and present the Drinfeld double $D=D\left(H^{c o p}\right)$ by generators and relations. We also determine the simple $D$-modules. In section 4 , we describe the simple objects of ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$ by using the monoidal isomorphism of braided categories ${ }_{H}^{H} \mathcal{Y} \mathcal{D} \cong{ }_{D} \mathcal{M}$. In section 5 , we obtain all the possible finite-dimensional Nichols algebras of semisimple modules satisfying $\mathcal{B}(V) \cong \bigotimes_{i \in I} \mathcal{B}\left(V_{i}\right)$. In section 6 , based on the principle of the lifting method, we classify the finite-dimensional Hopf algebras over $H$ such that their infinitesimal braidings are those Yetter-Drinfeld modules listed in Theorem A. Then we get Theorem B.

## 2 Preliminaries

Conventions. Throughout the paper, the ground field $\mathbb{k}$ is an algebraically closed field of characteristic zero and we denote by $\xi$ a primitive 4 -th root of unity. For the references of Hopf algebra theory, one can consult [30], [29], 32], [35], etc.

If $H$ is a Hopf algebra over $\mathbb{k}$, then $\triangle, \varepsilon, S$ denote the comultiplication, the counit and the antipode, respectively. We use Sweedler's notation for the comultiplication and coaction, e.g., $\triangle(h)=h_{(1)} \otimes h_{(2)}$ for $h \in H$. We denote by $H^{o p}$ the Hopf algebra with the opposite
multiplication, by $H^{c o p}$ the Hopf algebra with the opposite comultiplication, and by $H^{b o p}$ the Hopf algebra $H^{o p}$ cop. Denote by $G(H)$ the set of group-like elements of $H$.

$$
\mathcal{P}_{g, h}(H)=\{x \in H \mid \triangle(x)=x \otimes g+h \otimes x\}, \quad \forall g, h \in G(H)
$$

In particular, the linear space $\mathcal{P}(H)=\mathcal{P}_{1,1}(H)$ is called the set of primitive elements.
If $V$ is a $\mathbb{k}$-vector space, $v \in V, f \in V^{*}$, we use either $f(v),\langle f, v\rangle$ or $\langle v, f\rangle$ to denote the evaluation. Given $n \geq 0$, we denote $\mathbb{Z}_{n}=\mathbb{Z} / n \mathbb{Z}$ and $\mathbb{I}_{0, n}=\{0,1, \cdots, n\}$. It is emphasized that the operations $i j$ and $i \pm j$ are considered modulo $n+1$ for $i, j \in \mathbb{I}_{0, n}$ when not specified.

### 2.1 Yetter-Drinfeld modules and Nichols algebras

Let $H$ be a Hopf algebra. A left Yetter-Drinfeld module $V$ over $H$ is a left $H$-module ( $V, \cdot$ ) and a left $H$-comodule $(V, \delta)$ with $\delta(v)=v_{(-1)} \otimes v_{(0)} \in H \otimes V$ for all $v \in V$, satisfying

$$
\delta(h \cdot v)=h_{(1)} v_{(-1)} S\left(h_{(3)}\right) \otimes h_{(2)} \cdot v_{(0)}, \quad \forall v \in V, h \in H .
$$

We denote by ${ }_{H}^{H} \mathcal{Y D}$ the category of finite-dimensional left Yetter-Drinfeld modules over $H$. It is a braided monoidal category: for $V, W \in{ }_{H}^{H} \mathcal{Y} \mathcal{D}$, the braiding $c_{V, W}: V \otimes W \rightarrow W \otimes V$ is given by

$$
\begin{equation*}
c_{V, W}(v \otimes w)=v_{(-1)} \cdot w \otimes v_{(0)}, \quad \forall v \in V, w \in W \tag{2.1}
\end{equation*}
$$

In particular, $\left(V, c_{V, V}\right)$ is a braided vector space, that is, $c:=c_{V, V}$ is a linear isomorphism satisfying the braid equation

$$
(c \otimes i d)(i d \otimes c)(c \otimes i d)=(i d \otimes c)(c \otimes i d)(i d \otimes c)
$$

Moreover, ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$ is rigid. Denote by $V^{*}$ the left dual defined by

$$
\langle h \cdot f, v\rangle=\langle f, S(h) v\rangle, \quad f_{(-1)}\left\langle f_{(0)}, v\right\rangle=S^{-1}\left(v_{(-1)}\right)\left\langle f, v_{(0)}\right\rangle .
$$

Definition 2.1 [12, Definition 2.1] Let $H$ be a Hopf algebra and $V$ a Yetter-Drinfeld module over $H$. A braided $\mathbb{N}$-graded Hopf algebra $R=\bigoplus_{n \geq 0} R(n)$ in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$ is called a Nichols algebra of $V$ if

$$
\mathbb{k} \simeq R(0), V \simeq R(1), R(1)=\mathcal{P}(R), R \text { is generated as an algebra by } R(1)
$$

For any $V \in{ }_{H}^{H} \mathcal{Y} \mathcal{D}$ there is a Nichols algebra $\mathcal{B}(V)$ associated to it. It is the quotient of the tensor algebra $T(V)$ by the largest homogeneous two-sided ideal $I$ satisfying:

- $I$ is generated by homogeneous elements of degree $\geq 2$.
- $\triangle(I) \subseteq I \otimes T(V)+T(V) \otimes I$, i.e., it is also a coideal.

In such case, $\mathcal{B}(V)=T(V) / I$. See [12, Section 2.1] for details.

Remark 2.2 As well known, the Nichols algebra as an algebra and a coalgebra is completely determined by the braided space. If $W \subseteq V$ is a subspace such that $c(W \otimes W) \subseteq W \otimes W$, then $\operatorname{dim} \mathcal{B}(V)=\infty$ if $\operatorname{dim} \mathcal{B}(W)=\infty$. In particular, if $V$ contains a non-zero element $v$ such that $c(v \otimes v)=v \otimes v$, then $\operatorname{dim} \mathcal{B}(V)=\infty$.

Lemma 2.3 [21, Theorem 2.2] Let $(V, c)$ be a braided vector space, $V=\bigoplus_{i=1}^{n} V_{i}$, such that each $\mathcal{B}\left(V_{i}\right)$ is finite-dimensional. Then $\operatorname{dim} \mathcal{B}(V) \geq \prod_{i=1}^{n} \operatorname{dim} \mathcal{B}\left(V_{i}\right)$. Furthermore, the equality holds if and only if $b_{i j}=b_{j i}^{-1}$ for all $i \neq j\left(b_{i j}=\left.c\right|_{V_{i} \otimes V_{j}}\right)$.

### 2.2 Bosonization and Hopf algebras with a projection

Let $R$ be a Hopf algebra in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$ and denote the coproduct by $\triangle_{R}(r)=r^{(1)} \otimes r^{(2)}$ for $r \in R$. We define the Radford biproduct or bosonization $R \sharp H$ as follows: as a vector space, $R \sharp H=R \otimes H$, and the multiplication and comultiplication are given by the smash product and smash-coproduct, respectively:

$$
(r \sharp g)(s \sharp h)=r\left(g_{(1)} \cdot s\right) \sharp g_{(2)} h, \quad \triangle(r \sharp g)=r^{(1)} \sharp\left(r^{(2)}\right)_{(-1)} g_{(1)} \otimes\left(r^{(2)}\right)_{(0)} \sharp g_{(2)} .
$$

Clearly, the map $\iota: H \rightarrow R \sharp H, h \mapsto 1 \sharp h, \forall h \in H$ is injective and the map

$$
\pi: R \sharp H \rightarrow H, r \sharp h \mapsto \varepsilon_{R}(r) h, \forall r \in R, h \in H
$$

is surjective such that $\pi \circ \iota=i d_{H}$. Moreover, it holds that

$$
R=(R \sharp H)^{c o H}=\{x \in R \sharp H \mid(i d \otimes \pi) \triangle(x)=x \otimes 1\} .
$$

Conversely, if $A$ is a Hopf algebra with bijective antipode and $\pi: A \rightarrow H$ is a Hopf algebra epimorphism admitting a Hopf algebra section $\iota: H \rightarrow A$ such that $\pi \circ \iota=i d_{H}$. Then $R=A^{c o \pi}$ is a braided Hopf algebra in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$ and $A \cong R \sharp H$ as Hopf algebras. See 31] and [32] for more details.

### 2.3 The Drinfeld double

Let $H$ be a finite-dimensional Hopf algebra over $\mathbb{k}$. The Drinfeld double $D(H)=H^{* c o p} \otimes H$ is a Hopf algebra with the tensor product coalgebra structure and algebra structure defined by

$$
(p \otimes a)(q \otimes b)=p\left\langle q_{(3)}, a_{(1)}\right\rangle q_{(2)} \otimes a_{(2)}\left\langle q_{(1)}, S^{-1}\left(a_{(3)}\right)\right\rangle b, \quad \forall p, q \in H^{*}, a, b \in H
$$

Proposition 2.4 [30, Proposition 10.6.16] Let $H$ be a finite-dimensional Hopf algebra. Then the Yetter-Drinfeld category ${ }_{H}^{H} \mathcal{Y D}$ can be identified with the category ${ }_{D\left(H^{c o o p}\right)} \mathcal{M}$ of left modules over the Drinfeld double $D\left(H^{c o p}\right)$.

## 3 The Hopf algebra $H$ and its Drinfeld double

In this section, we will recall the structure of the 16-dimensional non-trivial semisimple Hopf algebra $H=H_{b: 1}$ in [28] and present the Drinfeld Double $D=D\left(H^{c o p}\right)$ by generators and relations. Then we will determine all simple left $D$-modules.

Definition 3.1 As an algebra $H$ is generated by $x, y$, $t$ satisfying the relations

$$
\begin{equation*}
x^{4}=1, \quad y^{2}=1, \quad t^{2}=1, \quad x y=y x, \quad t x=x^{-1} t, \quad t y=y t \tag{3.2}
\end{equation*}
$$

and its coalgebra is given by

$$
\begin{align*}
& \triangle(x)=x \otimes x, \quad \triangle(y)=y \otimes y, \quad \varepsilon(x)=\varepsilon(y)=1  \tag{3.3}\\
& \triangle(t)=\frac{1}{2}\left[(1+y) t \otimes t+(1-y) t \otimes x^{2} t\right], \quad \varepsilon(t)=1 \tag{3.4}
\end{align*}
$$

and its antipode is given by

$$
S(x)=x^{-1}, \quad S(y)=y, \quad S(t)=\frac{1}{2}\left[(1+y) t+(1-y) x^{2} t\right] .
$$

Remark 3.2 1. $G(H)=\langle x\rangle \times\langle y\rangle, \mathcal{P}_{1, g}(H)=\mathbb{k}\{1-g\}$ for $g \in G(H)$ and a linear basis of $H$ is given by $\left\{x^{i}, x^{i} y, x^{i} t, x^{i} y t, i \in \mathbb{I}_{0,3}\right\}$.
2. Denote by $\left\{\left(x^{i}\right)^{*},\left(x^{i} y\right)^{*},\left(x^{i} t\right)^{*},\left(x^{i} y t\right)^{*}, i \in \mathbb{I}_{0,3}\right\}$ the the dual basis of Hopf algebra $H^{*}$. Let

$$
\begin{array}{ll}
a=\left[\left(1-x+x^{2}-x^{3}\right)(1+y)(1+t)\right]^{*}, & b=\left[\left(1+x+x^{2}+x^{3}\right)(1-y)(1+t)\right]^{*}, \\
c=\left[\left(1+x+x^{2}+x^{3}\right)(1-y)(1-t)\right]^{*}, & d=\left[\left(1+\xi x-x^{2}-\xi x^{3}\right)(1+y)(1+t)\right]^{*} .
\end{array}
$$

Then using the multiplication table induced by the relations of $H$, it follows that

$$
\begin{aligned}
& a^{2}=b^{2}=c^{2}=1, \quad a b=b a, \quad a c=c a, \quad b c=c b, \\
& d^{2}=a, \quad d a=a d, \quad \Delta b=c d, \quad d c=b d, \\
& \triangle(a)=a \otimes a, \quad \triangle(b)=b \otimes b, \quad \triangle(c)=c \otimes c, \\
& \triangle(d)=\frac{1}{2}(d+b c d) \otimes d+\frac{1}{2}(d-b c d) \otimes a d .
\end{aligned}
$$

3. The automorphisms of $H$ are given in Table 1.

|  | $x$ | $y$ | $t$ |  | $x$ | $y$ | $t$ |  | $x$ | $y$ | $t$ |  | $x$ | $y$ | $t$ |

## Table 1. Automorphisms of $H$

Now we describe the Drinfeld Double $D\left(H^{c o p}\right)$ of $H^{c o p}$.
Proposition 3.3 $D:=D\left(H^{c o p}\right)$ as a coalgebra is isomorphic to tensor coalgebra $H^{* b o p} \otimes$ $H^{c o p}$, and as an algebra is generated by the elements $a, b, c, d, x, y, t$ such that $x, y, t$ satisfying the relations of $H^{c o p}, a, b, c, d$ satisfying the relations of $H^{* b o p}$ and

$$
\begin{array}{llll}
x a=a x, & x b=b x, & x c=c x, & x d=b c d x \\
y a=a y, & y b=b y, & y c=c y, & y d=d y \\
t a=a t, & t b=b x^{2} t, & t c=c x^{2} t, & t d=a d y t
\end{array}
$$

Proof. After a direct computation, we have that

$$
\begin{aligned}
\triangle_{H^{c o p}}^{2}(x)= & x \otimes x \otimes x, \quad \triangle_{H^{c o p}}^{2}(y)=y \otimes y \otimes y \\
\triangle_{H^{* b o p}}^{2}(a)= & a \otimes a \otimes a, \quad \triangle_{H^{* b o p}}^{2}(b)=b \otimes b \otimes b, \quad \triangle_{H^{* o o p}}^{2}(c)=c \otimes c \otimes c \\
\triangle_{H^{c o p}}^{2}(t)= & \frac{1}{4}\left[t \otimes(1+y) t \otimes(1+y) t+x^{2} t \otimes(1-y) t \otimes(1+y) t\right. \\
& \left.+x^{2} t \otimes x^{2}(1+y) t \otimes(1-y) t+t \otimes x^{2}(1-y) t \otimes(1-y) t\right] \\
\triangle_{H^{* b o p}}^{2}(d)= & \frac{1}{4}[d \otimes(d+b c d) \otimes(d+b c d)+a d \otimes(d-b c d) \otimes(d+b c d) \\
& +a d \otimes a(d+b c d) \otimes(d-b c d)+d \otimes a(d-b c d) \otimes(d-b c d)] .
\end{aligned}
$$

It follows that

$$
\begin{aligned}
x a= & \langle a, x\rangle a x\langle a, S(x)\rangle=a x, \quad y a=\langle a, y\rangle a y\langle a, S(y)\rangle=a y, \\
x b= & \langle b, x\rangle b x\langle b, S(x)\rangle=b x, \quad y b=\langle b, y\rangle b y\langle b, S(y)\rangle=b y, \\
x c= & \langle c, x\rangle c x\langle c, S(x)\rangle=c x, \quad y c=\langle c, y\rangle c y\langle c, S(y)\rangle=c y, \\
x d= & \frac{1}{4}[\langle d, x\rangle(d+b c d) x\langle d+b c d, S(x)\rangle+\langle a d, x\rangle(d-b c d) x\langle d+b c d, S(x)\rangle]=b c d x, \\
y d= & \frac{1}{4}[\langle d, y\rangle(d+b c d) y\langle d+b c d, S(y)\rangle+\langle a d, y\rangle(d-b c d) y\langle d+b c d, S(y)\rangle]=d y, \\
t a= & \frac{1}{4}\left[\langle a, t\rangle a(1+y) t\langle a, S(t+y t)\rangle+\left\langle a, x^{2} t\right\rangle a(1-y) t\langle a, S(t+y t)\rangle\right]=a t, \\
t b= & \frac{1}{4}\left[\left\langle b, x^{2} t\right\rangle b x^{2}(1+y) t\langle b, S(t-y t)\rangle+\langle b, t\rangle b x^{2}(1-y) t\langle b, S(t-y t)\rangle\right]=b x^{2} t, \\
t c= & \frac{1}{4}\left[\left\langle c, x^{2} t\right\rangle c x^{2}(1+y) t\langle c, S(t-y t)\rangle+\langle c, t\rangle c x^{2}(1-y) t\langle c, S(t-y t)\rangle\right]=c x^{2} t, \\
t d= & \frac{1}{16}[\langle a d, t\rangle a(d+b c d)(1+y) t\langle d-b c d, S(t+y t)\rangle \\
& +\left\langle a d, x^{2} t\right\rangle a(d+b c d)(1-y) t\langle d-b c d, S(t+y t)\rangle \\
& +\langle d, t\rangle a(d-b c d)(1+y) t\langle d-b c d, S(t+y t)\rangle
\end{aligned}
$$

$$
\left.+\left\langle d, x^{2} t\right\rangle a(d-b c d)(1-y) t\langle d-b c d, S(t+y t)\rangle\right]=a d y t
$$

This completes the proof.
We begin by describing the one-dimensional $D$-modules.
Lemma 3.4 There are 32 non-isomorphic one-dimensional simple modules $\mathbb{k}_{\chi_{i, j, k, l}}$ given by the characters $\chi_{i, j, k, l}, 0 \leq i, k, l<2,0 \leq j<4$, where

$$
\begin{array}{lll}
\chi_{i, j, k, l}(x)=(-1)^{i}, & \chi_{i, j, k, l}(y)=(-1)^{j}, & \chi_{i, j, k, l}(t)=(-1)^{k}, \\
\chi_{i, j, k, l}(a)=(-1)^{j}, & \chi_{i, j, k, l}(b)=(-1)^{l}, & \chi_{i, j, k, l}(c)=(-1)^{l},
\end{array} \quad \chi_{i, j, k, l}(d)=\xi^{j} .
$$

Moreover, any one-dimensional D-module is isomorphic to $\mathbb{k}_{\chi_{i, j, k, l}}$ for some $0 \leq i, k, l<$ $2,0 \leq j<4$.

Proof. Let $\lambda: D \rightarrow \mathbb{k}$ be a character and write

$$
\lambda(x)=\lambda_{1}, \quad \lambda(y)=\lambda_{2}, \quad \lambda(t)=\lambda_{3}, \quad \lambda(a)=\lambda_{4}, \quad \lambda(b)=\lambda_{5}, \quad \lambda(c)=\lambda_{6}, \quad \lambda(d)=\lambda_{7} .
$$

Since $x^{4}=1, y^{2}=t^{2}=a^{2}=b^{2}=c^{2}=1$, it follows that

$$
\lambda_{1}^{4}=1, \quad \lambda_{2}^{2}=\lambda_{3}^{2}=\lambda_{4}^{2}=\lambda_{5}^{2}=\lambda_{6}^{2}=1
$$

By $t x=x^{-1} t$, we have $\lambda_{1}=\lambda_{1}^{3}$, that is $\lambda_{1}^{2}=1$. As $d b=c d, d c=b d$, then $\lambda_{5}=\lambda_{6}$. Because $t d=a d y t$, it follows that $\lambda_{2} \lambda_{4}=1$, i.e., $\lambda_{2}=\lambda_{4}$. From $d^{2}=a$, we get $\lambda_{7}^{2}=\lambda_{4}$. Hence, $\lambda$ is completely determined by $\lambda(x), \lambda(y), \lambda(t), \lambda(b)$. Let

$$
\lambda(x)=(-1)^{i}, \quad \lambda(y)=(-1)^{j}, \quad \lambda(t)=(-1)^{k}, \quad \lambda(b)=(-1)^{l} .
$$

It is clear that these modules are pairwise non-isomorphic and any one-dimensional $D$-module is isomorphic to some $\mathbb{k}_{\chi_{i, j, k, l}}$, where $0 \leq i, k, l<2,0 \leq j<4$.

Next we describe the simple $D$-modules of dimension two. For convenience, let

$$
\begin{aligned}
& \Omega^{1}=\left\{(0, j, k, l, m, n) \mid j, k, l, m, n \in \mathbb{Z}_{2}, m+n=1\right\} \\
& \Omega^{2}=\left\{(i, j, 0, l, m, n) \mid i, j, l, m, n \in \mathbb{Z}_{2}, m+n=0, j+l=1\right\}, \quad \Omega=\Omega^{1} \cup \Omega^{2} \\
& \Lambda^{1}=\left\{(1, j, k, l) \mid k \in \mathbb{Z}_{4}, j, l \in \mathbb{Z}_{2}\right\}, \quad \Lambda^{2}=\left\{(1, j, k, l) \mid j \in \mathbb{Z}_{4}, k, l \in \mathbb{Z}_{2}\right\}
\end{aligned}
$$

Clearly, $|\Omega|=24,\left|\Lambda^{1}\right|=\left|\Lambda^{2}\right|=16$.
Lemma 3.5 For any 6-tuple $(i, j, k, l, m, n) \in \Omega$, there exists a simple left $D$-module $V_{i, j, k, l, m, n}$ of dimension 2 with the action on a fixed basis given by

$$
[x]=\left(\begin{array}{cc}
(-1)^{i} & 0 \\
0 & (-1)^{i+m+n}
\end{array}\right), \quad[y]=\left(\begin{array}{cc}
(-1)^{j} & 0 \\
0 & (-1)^{j}
\end{array}\right)
$$

$$
\begin{aligned}
& {[t]=\left(\begin{array}{cc}
(-1)^{k} & 0 \\
0 & (-1)^{j+l+k}
\end{array}\right), \quad[a]=\left(\begin{array}{cc}
(-1)^{l} & 0 \\
0 & (-1)^{l}
\end{array}\right),} \\
& {[b]=\left(\begin{array}{cc}
(-1)^{m} & 0 \\
0 & (-1)^{n}
\end{array}\right), \quad[c]=\left(\begin{array}{cc}
(-1)^{n} & 0 \\
0 & (-1)^{m}
\end{array}\right), \quad[d]=\left(\begin{array}{cc}
0 & 1 \\
(-1)^{l} & 0
\end{array}\right) .}
\end{aligned}
$$

For any 4-tuple $(i, j, k, l) \in \Lambda^{1}$, there exists a simple left $D$-module $W_{i, j, k, l}$ of dimension 2 with the action on a fixed basis given by

$$
\begin{aligned}
& {[x]=\left(\begin{array}{cc}
\xi & 0 \\
0 & \xi^{-1}
\end{array}\right), \quad[y]=\left(\begin{array}{cc}
(-1)^{j} & 0 \\
0 & (-1)^{j}
\end{array}\right), \quad[t]=\left(\begin{array}{ll}
0 & 1 \\
1 & 0
\end{array}\right),} \\
& {[a]=\left(\begin{array}{cc}
(-1)^{k} & 0 \\
0 & (-1)^{k}
\end{array}\right), \quad[b]=\left(\begin{array}{cc}
(-1)^{l} & 0 \\
0 & (-1)^{l+1}
\end{array}\right)} \\
& {[c]=\left(\begin{array}{cc}
(-1)^{l} & 0 \\
0 & (-1)^{l+1}
\end{array}\right), \quad[d]=\left(\begin{array}{cc}
\xi^{k} & 0 \\
0 & (-1)^{j+k} \xi^{k}
\end{array}\right)}
\end{aligned}
$$

For any 4-tuple $(i, j, k, l) \in \Lambda^{2}$, there exists a simple left $D$-module $U_{i, j, k, l}$ of dimension 2 with the action on a fixed basis given by

$$
\begin{aligned}
& {[x]=\left(\begin{array}{cc}
\xi & 0 \\
0 & \xi^{-1}
\end{array}\right), \quad[y]=\left(\begin{array}{cc}
(-1)^{j} & 0 \\
0 & (-1)^{j}
\end{array}\right), \quad[t]=\left(\begin{array}{ll}
0 & 1 \\
1 & 0
\end{array}\right),} \\
& {[a]=\left(\begin{array}{cc}
(-1)^{k} & 0 \\
0 & (-1)^{k}
\end{array}\right), \quad[b]=\left(\begin{array}{cc}
(-1)^{l} & 0 \\
0 & (-1)^{l+1}
\end{array}\right),} \\
& {[c]=\left(\begin{array}{cc}
(-1)^{l+1} & 0 \\
0 & (-1)^{l}
\end{array}\right), \quad[d]=\left(\begin{array}{cc}
0 & \xi^{j} \\
(-1)^{j+k} \xi^{j} & 0
\end{array}\right) .}
\end{aligned}
$$

Moreover, if $V$ is a simple $D$-module of dimension 2 , then $V$ is isomorphic to $V_{i, j, k, l, m, n}$ for some $(i, j, k, l, m, n) \in \Omega$ or $W_{i, j, k, l}$ for some $(i, j, k, l) \in \Lambda_{1}$ or $U_{i, j, k, l}$ for some $(i, j, k, l) \in \Lambda_{2}$ and $V_{i, j, k, l, m, n} \cong V_{p, q, r, \kappa, \mu, \nu}$ if and only if $(i, j, k, l, m, n)=(p, q, r, \kappa, \mu, \nu), W_{i, j, k, l} \cong W_{p, q, r, \kappa}$ if and only if $(i, j, k, l)=(p, q, r, \kappa), U_{i, j, k, l} \cong U_{p, q, r, \kappa}$ if and only if $(i, j, k, l)=(p, q, r, \kappa)$.

Proof. Since the elements $x, y, a, b, c$ commute each other and $x^{4}=1, y^{2}=a^{2}=b^{2}=$ $c^{2}=1$, the matrices defining $D$-action on $V$ can be of the form

$$
\begin{array}{lll}
{[x]=\left(\begin{array}{cc}
x_{1} & 0 \\
0 & x_{2}
\end{array}\right),} & {[y]=\left(\begin{array}{cc}
y_{1} & 0 \\
0 & y_{2}
\end{array}\right),} & {[t]=\left(\begin{array}{cc}
t_{1} & t_{2} \\
t_{3} & t_{4}
\end{array}\right),} \\
{[a]=\left(\begin{array}{cc}
a_{1} & 0 \\
0 & a_{2}
\end{array}\right),} & {[b]=\left(\begin{array}{cc}
b_{1} & 0 \\
0 & b_{2}
\end{array}\right),} & {[c]=\left(\begin{array}{cc}
c_{1} & 0 \\
0 & c_{2}
\end{array}\right), \quad[d]=\left(\begin{array}{ll}
d_{1} & d_{2} \\
d_{3} & d_{4}
\end{array}\right),}
\end{array}
$$

where $x_{1}^{4}=x_{2}^{4}=y_{1}^{2}=y_{2}^{2}=a_{1}^{2}=a_{2}^{2}=b_{1}^{2}=b_{2}^{2}=c_{1}^{2}=c_{2}^{2}=1$. Since $t y=y t, d y=y d$, it follows that

$$
t_{2}\left(y_{1}-y_{2}\right)=0, \quad t_{3}\left(y_{1}-y_{2}\right)=0, \quad d_{2}\left(y_{1}-y_{2}\right)=0, \quad d_{3}\left(y_{1}-y_{2}\right)=0
$$

If $y_{1} \neq y_{2}$, then $t_{2}=t_{3}=d_{2}=d_{3}=0$ and whence $V$ is not simple $D$-module, a contradiction. Thus we have $y_{1}=y_{2}$. Similarly, the relations $t a=a t$, $d a=a d$ give $a_{1}=a_{2}$.

Since $t^{2}=1, t x=x^{-1} t$, it follows that

$$
\begin{align*}
& t_{1}^{2}+t_{2} t_{3}=1, \quad t_{4}^{2}+t_{2} t_{3}=1, \quad t_{2}\left(t_{1}+t_{4}\right)=0, \quad t_{3}\left(t_{1}+t_{4}\right)=0  \tag{3.5}\\
& t_{1} x_{1}\left(1-x_{1}^{2}\right)=0, \quad t_{4} x_{2}\left(1-x_{2}^{2}\right)=0, \quad t_{2}\left(x_{2}-x_{1}^{3}\right)=0, \quad t_{3}\left(x_{1}-x_{2}^{3}\right)=0 \tag{3.6}
\end{align*}
$$

From the relations $t b=b x^{2} t, t c=c x^{2} t, t d=a d y t$, we have the relations

$$
\begin{array}{ll}
t_{1} b_{1}\left(1-x_{1}^{2}\right)=0, & t_{4} b_{2}\left(1-x_{2}^{2}\right)=0, \\
t_{1} c_{1}\left(1-x_{1}^{2}\right)=0, & t_{4}\left(b_{2}-b_{1} x_{1}^{2}\right)=0, \\
t_{3}\left(1-x_{2}^{2}\right)=0, & t_{2}\left(b_{2}-b_{2} c_{1} x_{1}^{2}\right)=0, \\
t_{1} d_{1}+t_{2} d_{3}=t_{1} y_{1}\left(y_{1}\left(t_{1} d_{1}+t_{2} d_{2} x_{2}^{2}\right)=0,\right. & t_{1} d_{2}+t_{2} d_{4}=a_{1} y_{1}\left(t_{2} d_{1}+t_{4} d_{2}\right),  \tag{3.10}\\
t_{3} d_{1}+t_{4} d_{3}=a_{1} y_{1}\left(t_{1} d_{3}+t_{3} d_{4}\right), & t_{3} d_{2}+t_{4} d_{4}=a_{1} y_{1}\left(t_{2} d_{3}+t_{4} d_{4}\right) .
\end{array}
$$

By the relations $d^{2}=a, d b=c d, d c=b d, x d=b c d x$, it follows that

$$
\begin{align*}
& d_{1}^{2}+d_{2} d_{3}=a_{1}, \quad d_{4}^{2}+d_{2} d_{3}=a_{1}, \quad d_{2}\left(d_{1}+d_{4}\right)=0, \quad d_{3}\left(d_{1}+d_{4}\right)=0  \tag{3.11}\\
& d_{1}\left(b_{1}-c_{1}\right)=0, \quad d_{2}\left(b_{2}-c_{1}\right)=0, \quad d_{3}\left(b_{1}-c_{2}\right)=0,  \tag{3.12}\\
& d_{4}\left(b_{2}-c_{2}\right)=0  \tag{3.13}\\
& d_{1}\left(b_{1}-c_{1}\right)=0, \quad d_{2}\left(c_{2}-b_{1}\right)=0, \quad d_{3}\left(c_{1}-b_{2}\right)=0, \quad d_{4}\left(b_{2}-c_{2}\right)=0  \tag{3.14}\\
& x_{1} d_{1}\left(1-b_{1} c_{1}\right)=0, \quad x_{2} d_{4}\left(1-b_{2} c_{2}\right)=0, d_{2}\left(x_{1}-b_{1} c_{1} x_{2}\right)=0, d_{3}\left(x_{2}-b_{2} c_{2} x_{1}\right)=0
\end{align*}
$$

If $x_{1}^{2}=1, x_{2}^{2} \neq 1$, then by (3.6) we have that $t_{4}=0$ and whence from (3.5) we get that $t_{2} t_{3}=1$. Thus by relation (3.6), it follows that $x_{2}=x_{1}$, contradiction. Similarly, the case $x_{1}^{2} \neq 1, x_{2}^{2}=1$ doesn't appear.

If $x_{1}^{2} \neq 1, x_{2}^{2} \neq 1$, then by (3.6) we have that $t_{1}=t_{4}=0$ and whence by (3.5) we get $t_{2} t_{3}=1$. From the relations (3.6) - (3.10), it follows that

$$
x_{2}=x_{1}^{3}, \quad b_{2}=-b_{1}, \quad c_{2}=-c_{1}, \quad d_{4}=a_{1} y_{1} d_{1}, \quad t_{2} d_{3}=a_{1} y_{1} t_{3} d_{2}
$$

If $d_{2}=d_{3}=0$, then by relations (3.11) - (3.14), we get that

$$
d_{1}^{2}=a_{1}=d_{4}^{2}, \quad b_{1}=c_{1}, \quad b_{2}=c_{2}
$$

Whence the matrices defining the action on $V$ are of the form $W_{i, j, k, l}$, where $i \in\{1,3\}, 0 \leq$ $k<4,0 \leq j, l<2$. If $d_{1}=d_{4}=0$, then

$$
d_{2} d_{3}=a_{1}, \quad b_{2}=c_{1}, \quad b_{1}=c_{2}
$$

Whence the module is isomorphic to $U_{i, j, k, l}$, where $i \in\{1,3\}, 0 \leq j<4,0 \leq k, l<2$. If $d_{1} d_{4} \neq 0, d_{2} d_{3} \neq 0$, then $b_{1}=b_{2}$, a contradiction. Other conditions are contained in the above conditions. A direct computation shows that
when $j+k=0, W_{i, j, k, l} \cong W_{-i, j, k, l+1}, U_{i, j, k, l} \cong U_{-i, j, k, l+1} ;$
when $j+k=1, W_{i, j, k, l} \cong W_{-i, j, k+2, l+1}, U_{i, j, k, l} \cong U_{-i, j+2, k, l+1}$.
If $x_{1}^{2}=1, x_{2}^{2}=1$, suppose that $t_{1} t_{4} \neq 0, t_{2}=t_{3}=0$, then it is clear that $V$ is simple if and only if $d_{2} d_{3} \neq 0$, whence by (3.11) we have that $d_{1}+d_{4}=0$. By (3.5), (3.9), (3.10), (3.12), (3.14) we have that

$$
\begin{array}{lll}
t_{1}^{2}=t_{4}^{2}=1, & \left(1-a_{1} y_{1}\right) t_{1} d_{1}=0, & \left(1-a_{1} y_{1}\right) t_{4} d_{4}=0 \\
t_{4}=a_{1} y_{1} t_{1}, & b_{2}=c_{1}, \quad b_{1}=c_{2}, & x_{2}=b_{2} c_{2} x_{1}
\end{array}
$$

If $d_{1}=d_{4}=0$, then the matrices defining the action on $V$ are of the form $V_{i, j, k, l, m, n}$, where $i, j, k, l, m, n \in\{0,1\}$; If $d_{1} \neq 0, d_{4} \neq 0$, the module is not simple. Suppose that $t_{1}=t_{4}=0$, then by (3.5)-(3.14), we get that

$$
t_{2} t_{3}=1, \quad x_{1}=x_{2}, \quad b_{1}=b_{2}, \quad c_{1}=c_{2} \quad t_{2} d_{3}=a_{1} y_{1} t_{3} d_{2}, \quad d_{4}=a_{1} y_{1} d_{1}
$$

Whence the module is isomorphic to $V_{i, j, k, l, m, n}$. Similarly, for the case

$$
t_{1}+t_{4}=0, \quad t_{1} \neq 0, \quad t_{4} \neq 0, \quad t_{2} \neq 0, \quad t_{3} \neq 0
$$

the module is isomorphic to $V_{i, j, k, l, m, n}$. It is clear that $V_{i, j, k, l, m, n}$ is simple if and only if $m+n \neq 0$ or $j+l \neq 0$. A direct computation shows that
when $m+n=0, j+l=1, V_{i, j, k, l, m, n} \cong V_{i, j, k+1, l, n, m}$;
when $m+n=1, j+l=0, V_{i, j, k, l, m, n} \cong V_{-i, j, k, l, n, m}$;
when $m+n=1, j+l=1, V_{i, j, k, l, m, n} \cong V_{-i, j, k+1, l, n, m}$.
Obviously, $V_{i, j, k, l, m, n}$ with $(i, j, k, l, m, n) \in \Omega$ is not isomorphic to the above two modules and $W_{i, j, k, l} \not \neq U_{i^{\prime}, j^{\prime}, k^{\prime}, l^{\prime}}$ for $(i, j, k, l) \in \Lambda^{1}, \quad\left(i^{\prime}, j^{\prime}, k^{\prime}, l^{\prime}\right) \in \Lambda^{2}$.

We claim that $V_{i, j, k, l, m, n} \cong V_{i^{\prime}, j^{\prime}, k^{\prime}, l^{\prime}, m^{\prime}, n^{\prime}}$ if and only if $(i, j, k, l, m, n)=\left(i^{\prime}, j^{\prime}, k^{\prime}, l^{\prime}, m^{\prime}, n^{\prime}\right)$ in $\Omega$. Assume that $\Phi: V_{i, j, k, l, m, n} \rightarrow V_{i^{\prime}, j^{\prime}, k^{\prime}, l^{\prime}, m^{\prime}, n^{\prime}}$ is an isomorphism of $D$-modules. Denote by $[\Phi]=\left(p_{i, j}\right)_{i, j=1,2}$ the matrix of $\Phi$ with respect to the given basis. Since

$$
[y][\Phi]=[\Phi][y], \quad[a][\Phi]=[\Phi][a], \quad[d][\Phi]=[\Phi][d],
$$

we have that $j=j^{\prime}, l=l^{\prime}, p_{1}=p_{4}, p_{3}=(-1)^{l} p_{2}$. Since

$$
[x][\Phi]=[\Phi][x], \quad[t][\Phi]=[\Phi][t], \quad[b][\Phi]=[\Phi][b],
$$

we have that

$$
\begin{array}{ll}
{\left[(-1)^{i^{\prime}}-(-1)^{i}\right] p_{1}=0,} & {\left[(-1)^{i^{\prime}}-(-1)^{i+m+n}\right] p_{2}=0} \\
{\left[(-1)^{i^{\prime}+m^{\prime}+n^{\prime}}-(-1)^{i}\right] p_{2}=0,} & {\left[(-1)^{i^{\prime}+m^{\prime}+n^{\prime}}-(-1)^{i+m+n}\right] p_{1}=0} \\
{\left[(-1)^{k^{\prime}}-(-1)^{k}\right] p_{1}=0,} & {\left[(-1)^{k^{\prime}}-(-1)^{j+l+k}\right] p_{2}=0} \tag{3.17}
\end{array}
$$

$$
\begin{array}{ll}
{\left[(-1)^{m^{\prime}}-(-1)^{m}\right] p_{1}=0,} & {\left[(-1)^{m^{\prime}}-(-1)^{n}\right] p_{2}=0} \\
{\left[(-1)^{n^{\prime}}-(-1)^{m}\right] p_{2}=0,} & {\left[(-1)^{n^{\prime}}-(-1)^{n}\right] p_{1}=0} \tag{3.19}
\end{array}
$$

If $m+n=0$, then $k=k^{\prime}=0$ and by (3.15), (3.16) we have that $i=i^{\prime}, m^{\prime}+n^{\prime}=0$. Whence by (3.18), (3.19), it follows that $m^{\prime}=m, n^{\prime}=n$. If $m+n=1$, suppose $m^{\prime}+n^{\prime}=0$, then by (3.15), (3.16) we have that $i=-i$, contradiction. So $m^{\prime}+n^{\prime}=1$. Whence $i=i^{\prime}=0$, $p_{2}=0$. Then by (3.17)-(3.19), $k=k^{\prime}, m=m^{\prime}, n=n^{\prime}$. Thus the claim follows.

Similarly, we have that $W_{i, j, k, l} \cong W_{i^{\prime}, j^{\prime}, k^{\prime}, l^{\prime}}$ if and only if $(i, j, k, l)=\left(i^{\prime}, j^{\prime}, k^{\prime}, l^{\prime}\right)$ in $\Lambda^{1}$; $U_{i, j, k, l} \cong U_{i^{\prime}, j^{\prime}, k^{\prime}, l^{\prime}}$ if and only if $(i, j, k, l)=\left(i^{\prime}, j^{\prime}, k^{\prime}, l^{\prime}\right)$ in $\Lambda^{2}$.

Theorem 3.6 There are 88 simple left D-modules up to isomorphism, among which 32 onedimensional objects given by Lemma 3.4 and 56 two-dimensional objects given by Lemma 3.5.

Proof. Assume there is a simple module of dimension $d>2$ and let $n$ denote the number of simple $d$-dimensional modules pairwise non-isomorphic. By Lemmas 3.4 \& 3.5, we have

$$
32 \cdot 1^{2}+56 \cdot 2^{2}+n d^{2}=256+n d^{2} \leq \operatorname{dim}\left(D^{*}\right)_{0}=\operatorname{dim} D^{*}=256
$$

Then $n=0$.

## 4 The category ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$

In this section, by using the monoidal isomorphism ${ }_{H}^{H} \mathcal{Y} \mathcal{D} \cong{ }_{D} \mathcal{M}$, we will describe the simple objects in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$ and determine their braidings.

Proposition 4.1 Let $\mathbb{k}_{\chi_{i, j, k, l}}=\mathbb{k}\{v\}$ be a one-dimensional D-module with $i, k, l \in \mathbb{I}_{0,1}, j \in$ $\mathbb{I}_{0,3}$. Then $\mathbb{1}_{\chi_{i, j, k, l}} \in{ }_{H}^{H} \mathcal{Y} \mathcal{D}$ with its module and comodule structure given by

$$
x \cdot v=(-1)^{i} v, \quad y \cdot v=(-1)^{j} v, \quad t \cdot v=(-1)^{k} v, \quad \delta(v)=x^{j} y^{l} \otimes v
$$

Proof. The action is given by the restriction of the action given in Lemma 3.4. Since $\mathbb{k}_{\chi_{i, j, k, l}}$ is one-dimensional, we must have that $\delta(v)=h \otimes v$ with $h \in G(H)=\langle x\rangle \times\langle y\rangle$. As $f \cdot v=\langle f, h\rangle v$ for all $f \in H^{*}$, it follows that $\delta(v)=x^{j} y^{l} \otimes v$.

Proposition 4.2 The braiding of the one-dimensional Yetter-Drinfeld module $\mathbb{k}_{\chi_{i, j, k, l}}$ is $c(v \otimes v)=(-1)^{(i+l) j} v \otimes v$.

Proof. By formula (2.1) and Proposition 4.1, we have that

$$
c(v \otimes v)=x^{j} y^{l} \cdot v \otimes v=(-1)^{(i+l) j} v \otimes v
$$

This completes the proof.

Proposition 4.3 Let $V_{i, j, k, l, m, n}=\mathbb{k}\left\{v_{1}, v_{2}\right\}$ be a two-dimensional simple $D$-module with $(i, j, k, l, m, n) \in \Omega$, then $V_{i, j, k, l, m, n} \in{ }_{H}^{H} \mathcal{Y} \mathcal{D}$ with its action given by

$$
\begin{array}{lll}
x \cdot v_{1}=(-1)^{i} v_{1}, & y \cdot v_{1}=(-1)^{j} v_{1}, & t \cdot v_{1}=(-1)^{k} v_{1}, \\
x \cdot v_{2}=(-1)^{i+m+n} v_{2}, & y \cdot v_{2}=(-1)^{j} v_{2}, & t \cdot v_{2}=(-1)^{j+l+k} v_{2},
\end{array}
$$

and its coaction by

1. for $l=m=n=0$,

$$
\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) \otimes v_{1}+\frac{1}{2}\left(1-x^{2}\right) \otimes v_{2}, \quad \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) \otimes v_{2}+\frac{1}{2}\left(1-x^{2}\right) \otimes v_{1}
$$

2. for $l=0, m=n=1$,

$$
\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) y \otimes v_{1}+\frac{1}{2}\left(1-x^{2}\right) y \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) y \otimes v_{2}+\frac{1}{2}\left(1-x^{2}\right) y \otimes v_{1}
$$

3. for $l=m=0, n=1$,

$$
\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) t \otimes v_{1}+\frac{1}{2}\left(1-x^{2}\right) y t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) y t \otimes v_{2}+\frac{1}{2}\left(1-x^{2}\right) t \otimes v_{1}
$$

4. for $l=0, m=1, n=0$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) y t \otimes v_{1}+\frac{1}{2}\left(1-x^{2}\right) t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) t \otimes v_{2}+\frac{1}{2}\left(1-x^{2}\right) y t \otimes v_{1} ;$
5. for $l=1, m=n=0$,

$$
\delta\left(v_{1}\right)=\frac{1}{2} x\left(1+x^{2}\right) \otimes v_{1}+\frac{1}{2} \xi x\left(1-x^{2}\right) \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2} x\left(1+x^{2}\right) \otimes v_{2}-\frac{1}{2} \xi x\left(1-x^{2}\right) \otimes v_{1}
$$

6. for $l=m=n=1$,

$$
\delta\left(v_{1}\right)=\frac{1}{2} x y\left(1+x^{2}\right) \otimes v_{1}+\frac{1}{2} \xi x y\left(1-x^{2}\right) \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2} x y\left(1+x^{2}\right) \otimes v_{2}-\frac{1}{2} \xi x y\left(1-x^{2}\right) \otimes v_{1}
$$

7. for $l=1, m=0, n=1$,

$$
\delta\left(v_{1}\right)=\frac{1}{2} x t\left(1+x^{2}\right) \otimes v_{1}+\frac{1}{2} \xi x y t\left(1-x^{2}\right) \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2} x y t\left(1+x^{2}\right) \otimes v_{2}-\frac{1}{2} \xi x t\left(1-x^{2}\right) \otimes v_{1} ;
$$

8. for $l=m=1, n=0$,

$$
\delta\left(v_{1}\right)=\frac{1}{2} x y t\left(1+x^{2}\right) \otimes v_{1}+\frac{1}{2} \xi x t\left(1-x^{2}\right) \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2} x t\left(1+x^{2}\right) \otimes v_{2}-\frac{1}{2} \xi x y t\left(1-x^{2}\right) \otimes v_{1} .
$$

Proof. We just need to describe the coaction. Denote by $\left\{h_{i}\right\}_{1 \leq i \leq 16}$ and $\left\{h^{i}\right\}_{1 \leq i \leq 16}$ a basis of $H$ and its dual basis, respectively. Then the comodule structure is given by $\delta(v)=$ $\sum_{i=1}^{16} h_{i} \otimes h^{i} \cdot v$, it follows that

$$
\begin{aligned}
\delta\left(v_{1}\right)= & \sum_{i=0}^{1} \sum_{j=0}^{1} \sum_{k=0}^{1} \sum_{l=0}^{1}\left(a^{i} b^{j} c^{k} d^{l}\right)^{*} \otimes a^{i} b^{j} c^{k} d^{l} \cdot v_{1} \\
= & {\left[1^{*}+(-1)^{l} a^{*}+(-1)^{m} b^{*}+(-1)^{n} c^{*}+(-1)^{m+l}(a b)^{*}+(-1)^{l+n}(a c)^{*}+(-1)^{m+n}(b c)^{*}\right.} \\
& \left.+(-1)^{l+m+n}(a b c)^{*}\right] \otimes v_{1} \\
& +\left[(-1)^{l} d^{*}+(a d)^{*}+(-1)^{m+l}(b d)^{*}+(-1)^{n+l}(c d)^{*}+(-1)^{m}(a b d)^{*}+(-1)^{n}(a c d)^{*}\right. \\
& \left.+(-1)^{m+n+l}(b c d)^{*}+(-1)^{m+n}(a b c d)^{*}\right] \otimes v_{2}, \\
\delta\left(v_{2}\right)= & \sum_{i=0}^{1} \sum_{j=0}^{1} \sum_{k=0}^{1} \sum_{l=0}^{1}\left(a^{i} b^{j} c^{k} d^{l}\right)^{*} \otimes a^{i} b^{j} c^{k} d^{l} \cdot v_{2} \\
= & {\left[1^{*}+(-1)^{l} a^{*}+(-1)^{n} b^{*}+(-1)^{m} c^{*}+(-1)^{n+l}(a b)^{*}+(-1)^{l+m}(a c)^{*}+(-1)^{m+n}(b c)^{*}\right.} \\
& \left.+(-1)^{l+m+n}(a b c)^{*}\right] \otimes v_{2} \\
& +\left[d^{*}+(-1)^{l}(a d)^{*}+(-1)^{n}(b d)^{*}+(-1)^{m}(c d)^{*}+(-1)^{n+l}(a b d)^{*}+(-1)^{m+l}(a c d)^{*}\right.
\end{aligned}
$$

$$
\left.+(-1)^{m+n}(b c d)^{*}+(-1)^{m+n+l}(a b c d)^{*}\right] \otimes v_{1} .
$$

By discussing the possible situations, the claim follows.
Using the same method, we have the following propositions.
Proposition 4.4 Let $W_{i, j, k, l}=\mathbb{k}\left\{v_{1}, v_{2}\right\}$ be a two-dimensional simple $D$-module with $(i, j, k, l) \in$ $\Lambda^{1}$, then $W_{i, j, k, l} \in{ }_{H}^{H} \mathcal{Y} \mathcal{D}$ with its action given by

$$
\begin{array}{lll}
x \cdot v_{1}=\xi v_{1}, & y \cdot v_{1}=(-1)^{j} v_{1}, & t \cdot v_{1}=v_{2}, \\
x \cdot v_{2}=\xi^{-1} v_{2}, & y \cdot v_{2}=(-1)^{j} v_{2}, & t \cdot v_{2}=v_{1},
\end{array}
$$

and its coaction by $\delta\left(v_{1}\right)=x^{k} y^{l} \otimes v_{1}$,

1. $\operatorname{for}(k, j, l)=(0,0,0), \quad \delta\left(v_{2}\right)=y \otimes v_{2} ;(k, j, l)=(2,0,0), \quad \delta\left(v_{2}\right)=x^{2} y \otimes v_{2}$;
2. $\operatorname{for}(k, j, l)=(0,1,0), \quad \delta\left(v_{2}\right)=x^{2} y \otimes v_{2} ;(k, j, l)=(2,1,0), \quad \delta\left(v_{2}\right)=y \otimes v_{2}$;
3. for $(k, j, l)=(0,0,1), \quad \delta\left(v_{2}\right)=1 \otimes v_{2} ;(k, j, l)=(2,0,1), \quad \delta\left(v_{2}\right)=x^{2} \otimes v_{2}$;
4. for $(k, j, l)=(0,1,1), \quad \delta\left(v_{2}\right)=x^{2} \otimes v_{2} ;(k, j, l)=(2,1,1), \quad \delta\left(v_{2}\right)=1 \otimes v_{2}$;
5. for $(k, j, l)=(1,0,0), \quad \delta\left(v_{2}\right)=x^{3} y \otimes v_{2} ;(k, j, l)=(3,0,0), \quad \delta\left(v_{2}\right)=x y \otimes v_{2}$;
6. for $(k, j, l)=(1,1,0), \quad \delta\left(v_{2}\right)=x y \otimes v_{2} ;(k, j, l)=(3,1,0), \quad \delta\left(v_{2}\right)=x^{3} y \otimes v_{2}$;
7. for $(k, j, l)=(1,0,1), \quad \delta\left(v_{2}\right)=x^{3} \otimes v_{2} ;(k, j, l)=(3,0,1), \quad \delta\left(v_{2}\right)=x \otimes v_{2}$;
8. for $(k, j, l)=(1,1,1), \quad \delta\left(v_{2}\right)=x \otimes v_{2} ;(k, j, l)=(3,1,1), \quad \delta\left(v_{2}\right)=x^{3} \otimes v_{2}$.

Proposition 4.5 Let $U_{i, j, k, l}=\mathbb{k}\left\{v_{1}, v_{2}\right\}$ be a two-dimensional simple $D$-module with $(i, j, k, l) \in$ $\Lambda_{2}$, then $U_{i, j, k, l} \in{ }_{H}^{H} \mathcal{Y} \mathcal{D}$ with its action same as $W_{i, j, k, l}$ and its coaction by

1. for $(j, l, k)=(0,0,0)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) t \otimes v_{1}+\frac{1}{2}\left(1-x^{2}\right) y t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) y t \otimes v_{2}+\frac{1}{2}\left(1-x^{2}\right) t \otimes v_{1} ;$
for $(j, l, k)=(2,0,0)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) t \otimes v_{1}-\frac{1}{2}\left(1-x^{2}\right) y t \otimes v_{2}, \quad \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) y t \otimes v_{2}-\frac{1}{2}\left(1-x^{2}\right) t \otimes v_{1} ;$
2. for $(j, l, k)=(0,1,0)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) y t \otimes v_{1}+\frac{1}{2}\left(1-x^{2}\right) t \otimes v_{2}, \quad \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) t \otimes v_{2}+\frac{1}{2}\left(1-x^{2}\right) y t \otimes v_{1} ;$ for $(j, l, k)=(2,1,0)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) y t \otimes v_{1}-\frac{1}{2}\left(1-x^{2}\right) t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) t \otimes v_{2}-\frac{1}{2}\left(1-x^{2}\right) y t \otimes v_{1} ;$
3. for $(j, l, k)=(0,0,1)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) x t \otimes v_{1}+\frac{\xi}{2}\left(1-x^{2}\right) x y t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) x y t \otimes v_{2}-\frac{\xi}{2}\left(1-x^{2}\right) x t \otimes v_{1} ;$ for $(j, l, k)=(2,0,1)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) x t \otimes v_{1}-\frac{\xi}{2}\left(1-x^{2}\right) x y t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) x y t \otimes v_{2}+\frac{\xi}{2}\left(1-x^{2}\right) x t \otimes v_{1} ;$
4. for $(j, l, k)=(0,1,1)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) x y t \otimes v_{1}+\frac{\xi}{2}\left(1-x^{2}\right) x t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) x t \otimes v_{2}-\frac{\xi}{2}\left(1-x^{2}\right) x y t \otimes v_{1} ;$
for $(j, l, k)=(2,1,1)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) x y t \otimes v_{1}-\frac{\xi}{2}\left(1-x^{2}\right) x t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) x t \otimes v_{2}+\frac{\xi}{2}\left(1-x^{2}\right) x y t \otimes v_{1} ;$
5. for $(j, l, k)=(1,0,0)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) t \otimes v_{1}-\frac{\xi}{2}\left(1-x^{2}\right) y t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) y t \otimes v_{2}+\frac{\xi}{2}\left(1-x^{2}\right) t \otimes v_{1} ;$
for $(j, l, k)=(3,0,0)$,

$$
\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) t \otimes v_{1}+\frac{\xi}{2}\left(1-x^{2}\right) y t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) y t \otimes v_{2}-\frac{\xi}{2}\left(1-x^{2}\right) t \otimes v_{1}
$$

6. for $(j, l, k)=(1,1,0)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) y t \otimes v_{1}-\frac{\xi}{2}\left(1-x^{2}\right) t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) t \otimes v_{2}+\frac{\xi}{2}\left(1-x^{2}\right) y t \otimes v_{1} ;$ for $(j, l, k)=(3,1,0)$,

$$
\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) y t \otimes v_{1}+\frac{\xi}{2}\left(1-x^{2}\right) t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) t \otimes v_{2}-\frac{\xi}{2}\left(1-x^{2}\right) y t \otimes v_{1}
$$

7. for $(j, l, k)=(1,0,1)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) x t \otimes v_{1}+\frac{1}{2}\left(1-x^{2}\right) x y t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) x y t \otimes v_{2}+\frac{1}{2}\left(1-x^{2}\right) x t \otimes v_{1} ;$ for $(j, l, k)=(3,0,1)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) x t \otimes v_{1}-\frac{1}{2}\left(1-x^{2}\right) x y t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) x y t \otimes v_{2}-\frac{1}{2}\left(1-x^{2}\right) x t \otimes v_{1} ;$
8. for $(j, l, k)=(1,1,1)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) x y t \otimes v_{1}+\frac{1}{2}\left(1-x^{2}\right) x t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) x t \otimes v_{2}+\frac{1}{2}\left(1-x^{2}\right) x y t \otimes v_{1} ;$ for $(j, l, k)=(3,1,1)$,
$\delta\left(v_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) x y t \otimes v_{1}-\frac{1}{2}\left(1-x^{2}\right) x t \otimes v_{2}, \delta\left(v_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) x t \otimes v_{2}-\frac{1}{2}\left(1-x^{2}\right) x y t \otimes v_{1}$.

## 5 Nichols algebras in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$

Let $V=\bigoplus_{i \in I} V_{i}$, where $V_{i}$ is a simple object in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$. In this section we will try to determine all the finite-dimensional Nichols algebras satisfying $\mathcal{B}(V) \cong \bigotimes_{i \in I} \mathcal{B}\left(V_{i}\right)$. We begin by studying the Nichols algebras of simple Yetter-Drinfeld modules.

Lemma 5.1 Let $(i, j, k, l) \in \mathbb{I}_{0,1} \times \mathbb{I}_{0,3} \times \mathbb{I}_{0,1} \times \mathbb{I}_{0,1}$. The Nichols algebras $\mathcal{B}\left(\mathbb{k}_{\chi_{i, j, k, l}}\right)$ associated to $\mathbb{k}_{\chi_{i, j, k, l}}=\mathbb{k} v$ are

$$
\mathcal{B}\left(\mathbb{k}_{\chi_{i, j, k, l}}\right)= \begin{cases}\mathbb{k}[v], & \text { if }(i+l) j=0,2, \\ \mathbb{k}[v] /\left(v^{2}\right)=\bigwedge \mathbb{k}_{\chi_{i, j, k, l}}, & \text { if }(i+l) j=1,3\end{cases}
$$

Proof. The claim follows by Proposition 4.2.
Remark 5.2 $\mathcal{B}\left(\mathbb{k}_{\chi_{i, j, k, l}}\right)$ is finite-dimensional if and only if $\mathbb{k}_{\chi_{i, j, k, l}}$ is isomorphic either to

$$
\begin{array}{llll}

V_{5}:=\mathbb{k}_{\chi_{1,3,0,0}}, & V_{6}:=\mathbb{k}_{\chi_{1,3,1,0}}, & V_{7}:=\mathbb{k}_{\chi 0,3,0,1}, & V_{8}:=\mathbb{k}_{\chi_{0,3,1,1}}
\end{array}
$$

For the convenience of our statements, we let

$$
\begin{array}{llll}
M_{1}=V_{0,1,0,0,1,1}, & M_{2}=V_{1,1,0,0,1,1,}, & M_{3}=V_{0,0,1,0,0,1}, & M_{4}=V_{0,1,1,0,0,1} \\
M_{5}=V_{0,0,1,0,1,0}, & M_{6}=V_{0,1,0,0,1,0}, & M_{7}=V_{1,0,0,1,0,0}, & M_{8}=V_{1,0,0,1,1,1} \\
M_{9}=V_{0,1,1,1,0,1}, & M_{10}=V_{0,0,1,1,0,1}, & M_{11}=V_{0,1,0,1,1,0}, & M_{12}=V_{0,0,1,1,1,0} \\
M_{13}=W_{1,1,0,1}, & M_{14}=W_{1,1,2,0}, & M_{15}=W_{1,0,2,0}, & M_{16}=W_{1,0,2,1} \\
M_{17}=U_{1,2,0,0}, & M_{18}=U_{1,2,0,1}, & M_{19}=U_{1,0,1,0}, & M_{20}=U_{1,0,1,1}
\end{array}
$$

Lemma 5.3 Let $V_{i, j, k, l, m, n} \in{ }_{H}^{H} \mathcal{Y} \mathcal{D}$ with $(i, j, k, l, m, n) \in \Omega$. Then
(1) $\operatorname{dim} \mathcal{B}\left(V_{i, j, k, l, m, n}\right)=\infty$, for $V_{i, j, k, l, m, n} \notin\left\{M_{1}, M_{2}, \ldots M_{12}\right\}$.
(2) $\forall V \in\left\{M_{1}, M_{2}, \ldots M_{12}\right\}, \operatorname{dim} \mathcal{B}(V)=4$ and relations of $\mathcal{B}\left(M_{4}\right), \mathcal{B}\left(M_{6}\right), \mathcal{B}\left(M_{9}\right)$, $\mathcal{B}\left(M_{11}\right)$ are given by $v_{1}^{2}=0, v_{2}^{2}=0, v_{1} v_{2}-v_{2} v_{1}=0$, others are given by $v_{1}^{2}=0, v_{2}^{2}=$ $0, v_{1} v_{2}+v_{2} v_{1}=0$.

Proof. If $V_{i, j, k, l, m, n} \notin\left\{M_{1}, M_{2}, \ldots M_{12}\right\}$, then the braiding has an eigenvector $v_{1} \otimes v_{1}$ of eigenvalue 1 , hence (1) follows by Remark 2.2. For (2), the braiding is of type $A_{1} \times A_{1}$, then we can get the relations of Nichols algebras.

Using the same method, we have the following Lemmas.
Lemma 5.4 Let $W_{i, j, k, l} \in{ }_{H}^{H} \mathcal{Y} \mathcal{D}$ with $(i, j, k, l) \in \Lambda^{1}$. Then
(1) $\operatorname{dim} \mathcal{B}\left(W_{i, j, k, l}\right)=\infty$, for $W_{i, j, k, l, m, n} \notin\left\{M_{13}, M_{14}, M_{15}, M_{16}\right\}$.
(2) $\forall V \in\left\{M_{13}, M_{14}, M_{15}, M_{16}\right\}, \operatorname{dim} \mathcal{B}(V)=4$ and the relations are given by $v_{1}^{2}=0, v_{2}^{2}=$ $0, v_{1} v_{2}+v_{2} v_{1}=0$.

Lemma 5.5 Let $U_{i, j, k, l} \in{ }_{H}^{H} \mathcal{Y} \mathcal{D}$ with $(i, j, k, l) \in \Lambda^{2}$. Then
(1) $\operatorname{dim} \mathcal{B}\left(U_{i, j, k, l}\right)=\infty$, for $U_{i, j, k, l} \notin\left\{M_{17}, M_{18}, M_{19}, M_{20}\right\}$.
(2) $\forall V \in\left\{M_{17}, M_{18}, M_{19}, M_{20}\right\}, \operatorname{dim} \mathcal{B}(V)=4$ and the relations of $\mathcal{B}\left(M_{17}\right), \mathcal{B}\left(M_{18}\right)$ are given by $v_{1} v_{2}=0, v_{2} v_{1}=0, v_{1}^{2}+v_{2}^{2}=0$, the relations of $\mathcal{B}\left(M_{19}\right), \mathcal{B}\left(M_{20}\right)$ are given by $v_{1} v_{2}=0, v_{2} v_{1}=0, v_{1}^{2}-v_{2}^{2}=0$.

Proof. (1) is similar to Proposition 5.3 (1).
(2) For $V \in\left\{M_{17}, M_{18}, M_{19}, M_{20}\right\}$, it belongs to the case $\mathfrak{R}_{1,4}$ in [8]. Then the assertion follows by [8, Proposition 3.15].

Proposition 5.6 (1) Let $V$, $W$ be simple objects in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$. Finite-dimensional $\mathcal{B}(V \oplus W) \cong$ $\mathcal{B}(V) \otimes \mathcal{B}(W)$ for the following cases
(a) $V, W \in\left\{V_{1}, V_{2}, \ldots V_{8}\right\}$;
(b) $V \in\left\{V_{3}, V_{4}, V_{7}, V_{8}\right\}, W \in\left\{M_{1}, M_{8}\right\}$;
(c) $V \in\left\{V_{1}, V_{2}, V_{5}, V_{6}\right\}, W \in\left\{M_{2}, M_{7}\right\}$;
(d) $V \in\left\{V_{1}, V_{3}, V_{5}, V_{7}\right\}, W \in\left\{M_{3}, M_{11}\right\}$;
(e) $V \in\left\{V_{1}, V_{4}, V_{5}, V_{8}\right\}, W \in\left\{M_{4}, M_{12}\right\}$;
(f) $V \in\left\{V_{2}, V_{4}, V_{6}, V_{8}\right\}, W \in\left\{M_{5}, M_{9}\right\}$;
(g) $V \in\left\{V_{2}, V_{3}, V_{6}, V_{7}\right\}, W \in\left\{M_{6}, M_{10}\right\}$;
(h) $V=M_{1}, W \in\left\{M_{2}, M_{7}\right\} ; V=M_{3}$ or $M_{11}, W \in\left\{M_{5}, M_{9}\right\}$;
(i) $V=M_{4}$ or $M_{12}, W \in\left\{M_{6}, M_{10}\right\}$;
(j) $(V, W) \in\left\{\left(M_{2}, M_{8}\right),\left(M_{7}, M_{8}\right),\left(M_{13}, M_{14}\right),\left(M_{15}, M_{16}\right),\left(M_{17}, M_{18}\right),\left(M_{19}, M_{20}\right)\right\}$;
(k) $V=W=M_{i}$ for $i \in \mathbb{I}_{1,20}$.
(2) For $W \in\left\{M_{13}, M_{14}, M_{15}, M_{16}\right\}, V \in\left\{V_{1}, \ldots, V_{8}\right\}, \operatorname{dim} \mathcal{B}(V \oplus W)=\infty$.
(3) For $W \in\left\{M_{17}, M_{18}, M_{19}, M_{20}\right\}, V \in\left\{V_{1}, \ldots, V_{8}\right\}, \operatorname{dim} \mathcal{B}(V \oplus W)=\infty$.

Proof. The part (1) is a direct result of Lemma 2.3,
(2) Let $M_{3}=\mathbb{k}\left\{v_{1}, v_{2}\right\}, \mathbb{k} p=\mathbb{k}_{\chi_{i, j, k, l}} \in\left\{V_{1}, \ldots, V_{8}\right\}$, then

$$
\begin{array}{ll}
c\left(p \otimes v_{1}\right)=(-1)^{l} \xi^{j} v_{1} \otimes p, & c\left(p \otimes v_{2}\right)=-(-1)^{l} \xi^{j} v_{2} \otimes p, \\
c\left(v_{1} \otimes p\right)=-p \otimes v_{1}, & c\left(v_{2} \otimes p\right)=p \otimes v_{2} .
\end{array}
$$

The generalized Dynkin diagram associated to the braiding is given by

$$
\begin{array}{cccc}
-1 & (-1)^{l+1} \xi^{j} & -1 & (-1)^{l+1} \xi^{j} \\
\stackrel{\circ}{\circ} & -1 \\
\stackrel{\circ}{v_{1}} & \stackrel{\sim}{0} & & v_{2}^{\circ}
\end{array}
$$

Then by [22] we know that the Nichols algebra $\mathcal{B}\left(\mathbb{k}_{\chi_{i, j, k, l}} \oplus M_{13}\right)$ is infinite-dimensional. The proofs for $M_{14}, M_{15}, M_{16}$ are completely analogous.
(3) Let $M_{17}=\mathbb{k}\left\{v_{1}, v_{2}\right\}, \mathbb{k} p=\mathbb{k}_{\chi_{i, j, k, l}} \in\left\{V_{1}, \ldots, V_{8}\right\}$, then

$$
\left(i d-c^{2}\right)\left(p \otimes v_{1}\right)=\left[1-(-1)^{k} \xi^{j}\right] p \otimes v_{1}, \quad\left(i d-c^{2}\right)\left(p \otimes v_{2}\right)=\left[1-(-1)^{k} \xi^{j}\right] p \otimes v_{2}
$$

Thus $a d\left(\mathbb{k}_{\chi_{i, j, k, l}}\right)\left(M_{17}\right)=\left(i d-c^{2}\right)\left(\mathbb{k}_{\chi_{i, j, k, l}} \otimes M_{17}\right) \cong \mathbb{k}_{\chi_{i, j, k, l}} \otimes M_{17}$. Let $u=p \otimes v_{1}, v=p \otimes v_{2}$, then

$$
\begin{aligned}
& x \cdot u=(-1)^{i} \xi u, \quad y \cdot u=-u, \quad t \cdot u=-(-1)^{k} v, \\
& x \cdot v=-(-1)^{i} \xi v, \quad y \cdot v=-v, \quad t \cdot v=-(-1)^{k} u, \\
& \delta(u)=\frac{1}{2} x^{j} y^{l}\left(1+x^{2}\right) t \otimes u-\frac{1}{2} x^{j} y^{l}\left(1-x^{2}\right) y t \otimes v, \\
& \delta(v)=\frac{1}{2} x^{j} y^{l}\left(1+x^{2}\right) y t \otimes v-\frac{1}{2} x^{j} y^{l}\left(1-x^{2}\right) t \otimes u .
\end{aligned}
$$

Whence by Lemma 5.5, we have that $\operatorname{dim} \mathcal{B}\left(a d\left(\mathbb{k}_{\chi_{i, j, k, l}}\right)\left(M_{17}\right)\right)=\infty$. As $\operatorname{ad}\left(\mathbb{k}_{\chi_{i, j, k, l}}\right)\left(M_{17}\right)$ is the Yetter-Drinfeld submodule of $\mathcal{B}\left(\mathbb{k}_{\chi_{i, j, k, l}} \oplus M_{17}\right)$ [23], then $\operatorname{dim} \mathcal{B}\left(\mathbb{k}_{\chi_{i, j, k, l}} \oplus M_{17}\right)=\infty$. The proofs for $M_{18}, M_{19}, M_{20}$ are completely analogous.
Proof of Theorem A. The claim follows by Remark 5.2, Lemmas 5.3, 5.4, 5.5 and Proposition 5.6.

## 6 Hopf algebras over $H$

In this section, based on the principle of the lifting method, we will determine finitedimensional Hopf algebras over $H$ such that their infinitesimal braidings are those YetterDrinfeld modules listed in Theorem A. We first show that the diagrams of these Hopf algebras are Nichols algebras.

Theorem 6.1 Let $A$ be a finite-dimensional Hopf algebra over $H$ such that its infinitesimal braiding is isomorphic to a Yetter-Drinfeld module $V$ in Theorem $A$. Then $\operatorname{gr}(A) \cong \mathcal{B}(V) \sharp H$.

Proof. Let $S$ be the graded dual of the diagram $R$ of $A$. By [12, Lemma 2.4], $S$ is generated by $W=S(1)$. Since $R(0)=\mathbb{k}, V:=R(1)=\mathcal{P}(R)$, there exists an epimorphism $S \rightarrow \mathcal{B}(W)$. We know that $R$ is a Nichols algebra if and only if $\mathcal{P}(S)=S(1)$, that is, $S$ is also a Nichols algebra. It is enough to show that the relations of $\mathcal{B}(W)$ also hold in $S$. If $V$ is a simple object in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$, then $W$ must be simple as an object in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$.

Assume $W=\Omega_{2}\left(n_{1}, n_{2}, n_{3}, n_{4}\right)$. Then $W$ is generated by

$$
p_{1}, \quad p_{2}, \quad\left\{C_{k}\right\}_{k=1,,, n_{1}}, \quad\left\{D_{\ell}\right\}_{\ell=1,,, n_{2}}, \quad\left\{G_{s}\right\}_{s=1, ., n_{3}}, \quad\left\{H_{r}\right\}_{r=1, . ., n_{4}}
$$

with $M_{1}=\mathbb{k}\left\{p_{1}, p_{2}\right\}, \mathbb{k}_{k} C_{k} \simeq V_{3}, \mathbb{k}_{k} D_{\ell} \simeq V_{4}, \mathbb{k}_{k} G_{s} \simeq V_{7}, \mathbb{k} H_{r} \simeq V_{8}$, and the defining ideal of the Nichols algebra $\mathfrak{B}(W)$ is generated by the elements

$$
\begin{aligned}
& p_{1}^{2}, \quad p_{2}^{2}, \quad p_{1} p_{2}+p_{2} p_{1}, \quad\left\{C_{k_{1}} C_{k_{2}}+C_{k_{2}} C_{k_{1}}\right\}_{1 \leq k_{1}, k_{2} \leq n_{1},}, \quad\left\{D_{\ell_{1}} D_{\ell_{2}}+D_{\ell_{2}} D_{\ell_{1}}\right\}_{1 \leq \ell_{1}, \ell_{2} \leq n_{2}}, \\
& \left\{G_{s_{1}} G_{s_{2}}+G_{s_{2}} G_{s_{1}}\right\}_{1 \leq s_{1}, s_{2} \leq n_{3},}, \quad\left\{H_{r_{1}} H_{r_{2}}+H_{r_{2}} H_{r_{1}}\right\}_{1 \leq r_{1}, r_{2} \leq n_{4}}, \quad C_{k} D_{\ell}+D_{\ell} C_{k}, \\
& C_{k} G_{s}+G_{s} C_{k}, \quad C_{k} H_{r}+H_{r} C_{k}, \quad D_{\ell} G_{s}+G_{s} D_{\ell}, \quad D_{\ell} H_{r}+H_{r} D_{\ell}, \quad G_{s} H_{r}+H_{r} G_{s}, \\
& p_{1} C_{k}+C_{k} p_{1}, \quad p_{2} C_{k}+C_{k} p_{2}, \quad p_{1} D_{\ell}+D_{\ell} p_{1}, \quad p_{2} D_{\ell}+D_{\ell} p_{2}, \quad p_{1} G_{s}+G_{s} p_{1}, \\
& p_{2} G_{s}+G_{s} p_{2}, \quad p_{1} H_{r}+H_{r} p_{1}, \\
& p_{2} H_{r}+H_{r} p_{2} .
\end{aligned}
$$

Since $S$ is finite-dimensional, it is enough to show that $c(r \otimes r)=r \otimes r$ for all generators given in above for the defining ideal. By [18, Theorem 6], all those generators are primitive elements. As $\delta\left(C_{k}\right)=x y \otimes C_{k}, \delta\left(D_{l}\right)=x y \otimes D_{l}$,

$$
\begin{aligned}
& \delta\left(p_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) y \otimes p_{1}+\frac{1}{2}\left(1-x^{2}\right) y \otimes p_{2} \\
& \delta\left(p_{2}\right)=\frac{1}{2}\left(1+x^{2}\right) y \otimes p_{2}+\frac{1}{2}\left(1-x^{2}\right) y \otimes p_{1}
\end{aligned}
$$

we have that

$$
\begin{aligned}
& \delta\left(p_{1}^{2}\right)=\frac{1}{2}\left(1+x^{2}\right) \otimes p_{1}^{2}+\frac{1}{2}\left(1-x^{2}\right) \otimes p_{2}^{2}, \\
& \delta\left(p_{2}^{2}\right)=\frac{1}{2}\left(1+x^{2}\right) \otimes p_{2}^{2}+\frac{1}{2}\left(1-x^{2}\right) \otimes p_{1}^{2}, \\
& \delta\left(C_{k} D_{l}+D_{l} C_{k}\right)=x^{2} \otimes\left(C_{k} D_{l}+D_{l} C_{k}\right) \\
& \delta\left(p_{1} p_{2}+p_{2} p_{1}\right)=\frac{1}{2}\left(1+x^{2}\right) \otimes\left(p_{1} p_{2}+p_{2} p_{1}\right)+\frac{1}{2}\left(1-x^{2}\right) \otimes\left(p_{1} p_{2}+p_{2} p_{1}\right), \\
& \delta\left(p_{1} C_{k}+C_{k} p_{1}\right)=\frac{1}{2} x\left(1+x^{2}\right) \otimes\left(p_{1} C_{k}+C_{k} p_{1}\right)+\frac{1}{2} x\left(1-x^{2}\right) \otimes\left(p_{2} C_{k}+C_{k} p_{2}\right) .
\end{aligned}
$$

Then by the definition of the braiding in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$, the claim follows. We leave the rest to the reader.

Lemma 6.2 [11, Lemma 6.1] Let $H$ be a Hopf algebra, $\psi: H \rightarrow H$ an automorphism of Hopf algebra, and $V, W$ Yetter-Drinfeld modules over $H$.
(1) Let $V^{\psi}$ be the same space as that of the underlying $V$ but with action and coaction

$$
h \cdot_{\psi} v=\psi(h) \cdot v, \quad \delta^{\psi}(v)=\left(\psi^{-1} \otimes i d\right) \delta(v), \quad h \in H, v \in V .
$$

Then $V^{\psi}$ is also a Yetter-Drinfeld module over $H$. If $T: V \rightarrow W$ is a morphism in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$, so is $T^{\psi}: V^{\psi} \rightarrow W^{\psi}$. Moreover, the braiding $c: V^{\psi} \otimes W^{\psi} \rightarrow W^{\psi} \otimes V^{\psi}$ coincides with the braiding $c: V \otimes W \rightarrow W \otimes V$.
(2) If $R$ is an algebra (resp., a coalgebra, a Hopf algebra) in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$, so is $R^{\psi}$, with the same structural maps.
(3) Let $R$ be a Hopf algebra in ${ }_{H}^{H} \mathcal{Y} \mathcal{D}$. Then the map $\varphi: R^{\psi} \sharp H \rightarrow R \sharp H$ given by $\varphi(r \sharp h)=$ $r \sharp \psi(h)$ is an isomorphism of Hopf algebras.

Corollary 6.3 (1) $V_{1}^{\tau_{17}} \simeq V_{3}, V_{2}^{\tau_{17}} \simeq V_{4}, V_{5}^{\tau_{17}} \simeq V_{7}, V_{6}^{\tau_{17}} \simeq V_{8}, M_{2}^{\tau_{17}} \simeq M_{1}, M_{7}^{\tau_{17}} \simeq M_{8}$.
(2) $V_{1}^{\tau_{5}} \simeq V_{2}, V_{3}^{\tau_{5}} \simeq V_{4}, V_{5}^{\tau_{5}} \simeq V_{6}, V_{7}^{\tau_{5}} \simeq V_{8}, M_{3}^{\tau_{5}} \simeq M_{5}, M_{11}^{\tau_{5}} \simeq M_{9}, M_{4}^{\tau_{5}} \simeq M_{6}$, $M_{12}^{\tau_{5}} \simeq M_{10}, M_{17}^{\tau_{5}} \simeq M_{18}, M_{13}^{\tau_{9}} \simeq M_{14}, M_{15}^{\tau_{9}} \simeq M_{16}$.
(3) $M_{3}^{\tau_{2}} \simeq M_{10}, M_{4}^{\tau_{2}} \simeq M_{9}, M_{5}^{\tau_{2}} \simeq M_{12}, M_{6}^{\tau_{2}} \simeq M_{11}, M_{17}^{\tau_{2}} \simeq M_{19}, M_{18}^{\tau_{2}} \simeq M_{20}, V_{1}^{\tau_{2}} \simeq V_{2}$, $V_{5}^{\tau_{2}} \simeq V_{6}, V_{i}^{\tau_{2}} \simeq V_{i}$ for $i \in\{3,4,7,8\}$.
(4) $\mathcal{B}\left(\Omega_{i}\left(n_{1}, n_{2}, n_{3}, n_{4}\right)\right) \sharp H \simeq \mathcal{B}\left(\Omega_{j}\left(n_{1}, n_{2}, n_{3}, n_{4}\right)\right) \sharp H$ for

$$
(i, j) \in\{(2,3),(4,6),(5,7),(8,9),(10,12),(11,13),(4,11),(5,10)\}
$$

(5) $\mathcal{B}\left(\Omega_{i}\right) \sharp H \simeq \mathcal{B}\left(\Omega_{j}\right) \sharp H$ for

$$
\begin{aligned}
(i, j) \in\{ & (14,30),(16,31),(19,32),(17,33),(19,34),(20,35),(32,36), \\
& (22,37),(20,38),(21,39),(17,40),(18,41),(38,42),(40,43), \\
& (24,44),(26,45),(28,46),(28,47),(29,48),(46,49)\} .
\end{aligned}
$$

Let $i, j, k, \ell, m, q, s, r \in \mathbb{N}^{*}$, denote

$$
\begin{aligned}
& \mathbb{k} A_{i} \simeq V_{1}, \quad \mathbb{k} B_{j} \simeq V_{2}, \quad \mathbb{k}_{k} \simeq V_{3}, \quad \mathbb{k} D_{\ell} \simeq V_{4}, \\
& \mathbb{k} E_{m} \simeq V_{5}, \quad \mathbb{k} F_{q} \simeq V_{6}, \quad \mathbb{k} G_{s} \simeq V_{7}, \quad \mathbb{k} H_{r} \simeq V_{8} .
\end{aligned}
$$

Definition 6.4 For $n_{1}, n_{2}, . ., n_{8} \in \mathbb{N}^{*}$ with $\sum_{i=1}^{8} n_{i} \geq 1$ and

$$
\begin{aligned}
I_{1}= & \left\{\left(\alpha_{i_{1}, i_{2}}\right)_{n_{1} \times n_{1}},\left(\beta_{j_{1}, j_{2}}\right)_{n_{2} \times n_{2}},\left(\gamma_{k_{1}, k_{2}}\right)_{n_{3} \times n_{3}},\left(\eta_{\ell_{1}, \ell_{2}}\right)_{n_{4} \times n_{4}},\right. \\
& \left.\left(\zeta_{m_{1}, m_{2}}\right)_{n_{5} \times n_{5}},\left(\theta_{q_{1}, q_{2}}\right)_{n_{6} \times n_{6}},\left(\lambda_{s_{1}, s_{2}}\right)_{n_{7} \times n_{7}},\left(\mu_{r_{1}, r_{2}}\right)_{n_{8} \times n_{8}}\right\}
\end{aligned}
$$

with entries in $\mathfrak{k}$, let us denote by $\mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}\right)$ the algebra that is generated by $x, y, t$, $\left\{A_{i}\right\}_{i=1,,, n_{1}},\left\{B_{j}\right\}_{j=1, ., n_{2}},\left\{C_{k}\right\}_{k=1, . ., n_{3}},\left\{D_{\ell}\right\}_{\ell=1, . ., n_{4}},\left\{E_{m}\right\}_{m=1, . ., n_{5}},\left\{F_{q}\right\}_{q=1, . ., n_{6}},\left\{G_{s}\right\}_{s=1, . ., n_{7}}$, $\left\{H_{r}\right\}_{r=1, ., n_{8}}$ satisfying the relations (3.2), (3.3), (3.4) and
$x A_{i}=-A_{i} x, \quad y A_{i}=-A_{i} y, \quad t A_{i}=A_{i} x^{2} t$,

$$
\begin{align*}
& x B_{j}=-B_{j} x, \quad y B_{j}=-B_{j} y, \quad t B_{j}=-B_{j} x^{2} t,  \tag{6.21}\\
& x C_{k}=C_{k} x, \quad y C_{k}=-C_{k} y, \quad t C_{k}=C_{k} x^{2} t,  \tag{6.22}\\
& x D_{\ell}=D_{\ell} x, \quad y D_{\ell}=-D_{\ell} y, \quad t D_{\ell}=-D_{\ell} x^{2} t,  \tag{6.23}\\
& x E_{m}=-E_{m} x, \quad y E_{m}=-E_{m} y, \quad t E_{m}=E_{m} x^{2} t,  \tag{6.24}\\
& x F_{q}=-F_{q} x, \quad y F_{q}=-F_{q} y, \quad t F_{q}=-F_{q} x^{2} t,  \tag{6.25}\\
& x G_{s}=G_{s} x, \quad y G_{s}=-G_{s} y, \quad t G_{s}=G_{s} x^{2} t,  \tag{6.26}\\
& x H_{r}=H_{r} x, \quad y H_{r}=-H_{r} y, \quad t H_{r}=-H_{r} x^{2} t,  \tag{6.27}\\
& A_{i_{1}} A_{i_{2}}+A_{i_{2}} A_{i_{1}}=\alpha_{i_{1}, i_{2}}\left(1-x^{2}\right), \quad i_{1}, i_{2} \in\left\{1, \ldots, n_{1}\right\},  \tag{6.28}\\
& B_{j_{1}} B_{j_{2}}+B_{j_{2}} B_{j_{1}}=\beta_{j_{1}, j_{2}}\left(1-x^{2}\right), \quad j_{1}, j_{2} \in\left\{1, \ldots, n_{2}\right\},  \tag{6.29}\\
& C_{k_{1}} C_{k_{2}}+C_{k_{2}} C_{k_{1}}=\gamma_{k_{1}, k_{2}}\left(1-x^{2}\right), \quad k_{1}, k_{2} \in\left\{1, \ldots, n_{3}\right\},  \tag{6.30}\\
& D_{\ell_{1}} D_{\ell_{2}}+D_{\ell_{2}} D_{\ell_{1}}=\eta_{\ell_{1}, \ell_{2}}\left(1-x^{2}\right), \quad \ell_{1}, \ell_{2} \in\left\{1, \ldots, n_{4}\right\},  \tag{6.31}\\
& E_{m_{1}} E_{m_{2}}+E_{m_{2}} E_{m_{1}}=\zeta_{m_{1}, m_{2}}\left(1-x^{2}\right), \quad m_{1}, m_{2} \in\left\{1, \ldots, n_{5}\right\},  \tag{6.32}\\
& F_{q_{1}} F_{q_{2}}+F_{q_{2}} F_{q_{1}}=\theta_{q_{1}, q_{2}}\left(1-x^{2}\right), \quad q_{1}, q_{2} \in\left\{1, \ldots, n_{6}\right\},  \tag{6.33}\\

$$

It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{array}{ll}
\triangle\left(A_{i}\right)=A_{i} \otimes 1+x \otimes A_{i}, & \triangle\left(B_{j}\right)=B_{j} \otimes 1+x \otimes B_{j}, \\
\triangle\left(C_{k}\right)=C_{k} \otimes 1+x y \otimes C_{k}, & \triangle\left(D_{\ell}\right)=D_{\ell} \otimes 1+x y \otimes D_{\ell}, \\
\triangle\left(E_{m}\right)=E_{m} \otimes 1+x^{3} \otimes E_{m}, & \triangle\left(F_{q}\right)=F_{q} \otimes 1+x^{3} \otimes F_{q}, \\
\triangle\left(G_{s}\right)=G_{s} \otimes 1+x^{3} y \otimes G_{s}, & \triangle\left(H_{r}\right)=H_{r} \otimes 1+x^{3} y \otimes H_{r} .
\end{array}
$$

Remark 6.5 It is clear that $\mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; 0\right) \cong \mathcal{B}\left(\Omega_{1}\left(n_{1}, n_{2}, \ldots, n_{8}\right)\right) \sharp H$. Also note that $\mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}\right) \cong T\left(\Omega_{1}\left(n_{1}, n_{2}, \ldots, n_{8}\right)\right) / J\left(I_{1}\right)$, where $J\left(I_{1}\right)$ is a Hopf ideal generated by relations (6.28) - (6.35).

Now we determine the liftings and discuss the isomorphism classes of $\mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}\right)$.

Proposition 6.6 (1) Let $A$ be a finite-dimensional Hopf algebra over $H$ such that its infinitesimal braiding is $\Omega_{1}\left(n_{1}, n_{2}, \ldots, n_{8}\right)$, then $A \cong \mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}\right)$.
(2) $\mathfrak{U}_{1}\left(n_{1}, \ldots, n_{8} ; I_{1}\right) \cong \mathfrak{U}_{1}\left(n_{1}, \ldots, n_{8} ; I_{1}^{\prime}\right)$ if and only if there exist invertible matrices $\left(a_{i_{1}^{\prime} i_{1}}\right)_{n_{1} \times n_{1}},\left(a_{i_{2}^{\prime} i_{2}}\right)_{n_{1} \times n_{1}}, \quad\left(b_{j_{1}^{\prime} j_{1}}\right)_{n_{2} \times n_{2}}, \quad\left(b_{j_{2}^{\prime} j_{2}}^{\prime}\right)_{n_{2} \times n_{2}}, \quad\left(c_{k_{1}^{\prime} k_{1}}\right)_{n_{3} \times n_{3}},\left(c_{k_{2}^{\prime} k_{2}}\right)_{n_{3} \times n_{3}}, \quad\left(d_{\ell_{1}^{\prime} \ell_{1}}\right)_{n_{4} \times n_{4}}$, $\left(d_{\ell_{2}^{\prime} \ell_{2}}\right)_{n_{4} \times n_{4}},\left(e_{m_{1}^{\prime} m_{1}}\right)_{n_{5} \times n_{5}},\left(e_{m_{2}^{\prime} m_{2}}\right)_{n_{5} \times n_{5}},\left(f_{q_{1}^{\prime} q_{1}}\right)_{n_{6} \times n_{6}},\left(f_{q_{2}^{\prime} q_{2}}\right)_{n_{6} \times n_{6}},\left(g_{s_{1}^{\prime} s_{1}}\right)_{n_{7} \times n_{7}},\left(g_{s_{2}^{\prime} s_{2}}\right)_{n_{7} \times n_{7}}$, $\left(h_{r_{1}^{\prime} r_{1}}^{\prime}\right)_{n_{8} \times n_{8}},\left(h_{r_{2}^{\prime} r_{2}}\right)_{n_{8} \times n_{8}}$ such that

\end{array}
$$

or $n_{1}=n_{2}=n_{7}=n_{8}, n_{3}=n_{4}=n_{5}=n_{6}$ satisfying (6.62), (6.64) and (6.66).

Proof. (1) By Theorem 6.1, we have that $\operatorname{gr}(A) \cong \mathcal{B}\left(\Omega_{1}\left(n_{1}, n_{2}, \ldots, n_{8}\right)\right) \sharp H$. We can check the relations listed in Definition 6.4), except (6.28) - (6.42), hold in $A$ from the bosonization $\mathcal{B}\left(\Omega_{1}\left(n_{1}, n_{2}, \ldots, n_{8}\right)\right) \sharp H$. As $\triangle\left(A_{i}\right)=A_{i} \otimes 1+x \otimes A_{i}, \triangle\left(B_{j}\right)=B_{j} \otimes 1+x \otimes B_{j}$, a direct computation shows that

$$
\begin{aligned}
& \triangle\left(A_{i_{1}} A_{i_{2}}+A_{i_{2}} A_{i_{1}}\right)=\left(A_{i_{1}} A_{i_{2}}+A_{i_{2}} A_{i_{1}}\right) \otimes 1+x^{2} \otimes\left(A_{i_{1}} A_{i_{2}}+A_{i_{2}} A_{i_{1}}\right), \\
& \triangle\left(A_{i} B_{j}+B_{j} A_{i}\right)=\left(A_{i} B_{j}+B_{j} A_{i}\right) \otimes 1+x^{2} \otimes\left(A_{i} B_{j}+B_{j} A_{i}\right) .
\end{aligned}
$$

Then $A_{i_{1}} A_{i_{2}}+A_{i_{2}} A_{i_{1}}, A_{i} B_{j}+B_{j} A_{i} \in \mathcal{P}_{1, x^{2}}\left(\mathcal{B}\left(\Omega_{1}\left(n_{1}, n_{2}, \ldots, n_{8}\right)\right) \sharp H\right)=\mathcal{P}_{1, x^{2}}(H)=\mathbb{k}\left\{1-x^{2}\right\}$. Since $t\left(A_{i} B_{j}+B_{j} A_{i}\right)=-\left(A_{i} B_{j}+B_{j} A_{i}\right) t$, it follows that

$$
A_{i_{1}} A_{i_{2}}+A_{i_{2}} A_{i_{1}}=\alpha_{i_{1}, i_{2}}\left(1-x^{2}\right), \quad A_{i} B_{j}+B_{j} A_{i}=0
$$

for some $\alpha_{i_{1}, i_{2}} \in \mathbb{k}$. Similarly, the relations (6.29) - (6.42) hold in $A$. Then there is a surjective Hopf morphism from $\mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}\right)$ to $A$. We can observe that each element of $\mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}\right)$ can be expressed by a linear combination of

$$
\left\{A_{i}^{\alpha_{i}} B_{j}^{\beta_{j}} C_{k}^{\gamma_{k}} D_{\ell}^{\eta_{\ell}} E_{m}^{\zeta_{m}} F_{q}^{\theta_{q}} G_{s}^{\lambda_{s}} H_{r}^{\mu_{r}} x^{e} y^{f} t^{g} ; \alpha_{i}, \beta_{j}, \gamma_{k}, \eta_{\ell}, \zeta_{m}, \theta_{q}, \lambda_{s}, \mu_{r}, f, g \in \mathbb{I}_{0,1}, e \in \mathbb{I}_{0,3}\right\}
$$

In fact, according to the Diamond Lemma [15], the set is a basis of $\mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}\right)$. Then $\operatorname{dim} A=\operatorname{dim} \mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}\right)$ and whence $A \cong \mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}\right)$.
(2) Suppose that $\Phi: \mathfrak{U}_{1}\left(n_{1}, \ldots, n_{8} ; I_{1}\right) \rightarrow \mathfrak{U}_{1}\left(n_{1}, \ldots, n_{8} ; I_{1}^{\prime}\right)$ is an isomorphism of Hopf algebras, where

$$
\begin{aligned}
I_{1}^{\prime}=\{ & \left(\alpha_{i_{1}, i_{2}}^{\prime}\right)_{n_{1} \times n_{1}}, \\
& \left(\beta_{j_{1}, j_{2}}^{\prime}\right)_{n_{2} \times n_{2}},\left(\gamma_{k_{1}, k_{2}}^{\prime}\right)_{n_{3} \times n_{3}},\left(\eta_{\ell_{1}, \ell_{2}}^{\prime}\right)_{n_{4} \times n_{4}}, \\
& \left.\left.\left(\zeta_{2}\right)\right)_{n_{5} \times n_{5}},\left(\theta_{q_{1}, q_{2}}^{\prime}\right)_{n_{6} \times n_{6}},\left(\lambda_{s_{1}, s_{2}}^{\prime}\right)_{n_{7} \times n_{7}},\left(\mu_{r_{1}, r_{2}}^{\prime}\right)_{n_{8} \times n_{8}}\right\}
\end{aligned}
$$

and $\mathfrak{U}_{1}\left(n_{1}, n_{2}, \ldots, n_{8} ; I_{1}^{\prime}\right)$ is generated by $x, y, t, A_{i}^{\prime}, B_{j}^{\prime}, C_{k}^{\prime}, D_{\ell}^{\prime}, E_{m}^{\prime}, F_{q}^{\prime}, G_{s}^{\prime}, H_{r}^{\prime}$.
When $\left.\Phi\right|_{H}=\tau_{1}$ or $\tau_{3}$, then $\Phi\left(A_{i}\right)$ is $(1, x)$-skew primitive, so

$$
\Phi\left(A_{i}\right) \in \bigoplus_{i^{\prime}=1}^{n_{1}} \mathbb{k} A_{i^{\prime}}^{\prime} \bigoplus_{j^{\prime}=1}^{n_{2}} \mathbb{k} B_{j^{\prime}}^{\prime} \bigoplus \mathbb{k}(1-x)
$$

$t A_{i}=A_{i} x^{2} t, t B_{j^{\prime}}^{\prime}=-B_{j^{\prime}}^{\prime} x^{2} t$ imply that $\Phi\left(A_{i}\right)$ doesn't contain the term of $\bigoplus_{j^{\prime}=1}^{n_{2}} \mathbb{k} B_{j^{\prime}}^{\prime}$. $x A_{i}=-A_{i} x$ implies that $\Phi\left(A_{i}\right)$ doesn't contain the term of $1-x$. So there exists an invertible matrix $\left(a_{i^{\prime} i}\right)_{n_{1} \times n_{1}}$ such that $\Phi\left(A_{i}\right)=\sum_{i^{\prime}=1}^{n_{1}} a_{i^{\prime} i} A_{i^{\prime}}^{\prime}$. Similarly, $\Phi\left(B_{j}\right)=\sum_{j^{\prime}=1}^{n_{2}} b_{j^{\prime} j} B_{j^{\prime}}^{\prime}$,

$$
\begin{array}{ll}
\Phi\left(C_{k}\right)=\sum_{k^{\prime}=1}^{n_{3}} c_{k^{\prime} k} C_{k^{\prime}}^{\prime}, & \Phi\left(D_{\ell}\right)=\sum_{\ell^{\prime}=1}^{n_{4}} d_{\ell^{\prime} \ell} D_{\ell^{\prime}}^{\prime},
\end{array} \quad \Phi\left(E_{m}\right)=\sum_{m^{\prime}=1}^{n_{5}} e_{m^{\prime} m} E_{m^{\prime}}^{\prime}, ~=\sum_{q^{\prime}=1}^{n_{6}} f_{q^{\prime} q} F_{q^{\prime}}^{\prime}, \quad \Phi\left(G_{s}\right)=\sum_{s_{7}}^{n_{7}} g_{s^{\prime} s} G_{s^{\prime}}^{\prime}, \quad \Phi\left(H_{r}\right)=\sum_{r^{\prime}=1}^{n_{8}} h_{r^{\prime} r} H_{r^{\prime}}^{\prime} .
$$

In this case, $\Phi$ is an isomorphism of Hopf algebras if and only if the relations (6.43) - (6.46) hold. Similarly, $\Phi$ is an isomorphism of Hopf algebras if and only if
when $\left.\Phi\right|_{H}=\tau_{2}$ or $\tau_{4}$, the relations (6.44), (6.46), (6.47) hold;
when $\left.\Phi\right|_{H}=\tau_{5}$ or $\tau_{7}$, the relations (6.48), (6.47) hold;
when $\left.\Phi\right|_{H}=\tau_{6}$ or $\tau_{8}$, the relations (6.43), (6.45), (6.48) hold;
when $\left.\Phi\right|_{H}=\tau_{9}$ or $\tau_{11}$, the relations (6.49) - (6.52) hold;
when $\left.\Phi\right|_{H}=\tau_{10}$ or $\tau_{12}$, the relations (6.50), (6.52), (6.53) hold;
when $\left.\Phi\right|_{H}=\tau_{13}$ or $\tau_{15}$, the relations (6.53), (6.54) hold;
when $\left.\Phi\right|_{H}=\tau_{14}$ or $\tau_{16}$, the relations (6.49), (6.51), (6.54) hold;
when $\left.\Phi\right|_{H}=\tau_{17}$ or $\tau_{19}$, the relations (6.55) - (6.58) hold;
when $\left.\Phi\right|_{H}=\tau_{18}$ or $\tau_{20}$, the relations (6.55), (6.57), (6.59) hold;
when $\left.\Phi\right|_{H}=\tau_{21}$ or $\tau_{23}$, the relations (6.59), (6.60) hold;
when $\left.\Phi\right|_{H}=\tau_{22}$ or $\tau_{24}$, the relations (6.56), (6.58), (6.60) hold;
when $\left.\Phi\right|_{H}=\tau_{25}$ or $\tau_{27}$, the relations (6.61) - (6.64) hold;
when $\left.\Phi\right|_{H}=\tau_{26}$ or $\tau_{28}$, the relations (6.61), (6.63), (6.65) hold;
when $\left.\Phi\right|_{H}=\tau_{29}$ or $\tau_{31}$, the relations (6.65), (6.66) hold;
when $\left.\Phi\right|_{H}=\tau_{30}$ or $\tau_{32}$, the relations (6.62), (6.64), (6.66) hold.
Definition 6.7 For $n_{1}, n_{2}, n_{3} n_{4} \in \mathbb{N}^{*}$ with $\sum_{i=1}^{4} n_{i} \geq 0$ and

$$
I_{2}=\left\{\gamma_{k_{1}, k_{2}}, \eta_{\ell_{1}, \ell_{2}}, \lambda_{s_{1}, s_{2}}, \mu_{r_{1}, r_{2}}, \lambda_{k}, \zeta_{\ell}, \iota_{s}, \theta_{r}, \nu\right\}
$$

where $k, k_{1}, k_{2}=1, . ., n_{1}, \ell, \ell_{1}, \ell_{2}=1, . ., n_{2}, s, s_{1}, s_{2}=1, . ., n_{3}, r, r_{1}, r_{2}=1, . ., n_{4}$. Let us denote by $\mathfrak{U}_{2}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{2}\right)$ the algebra that is generated by $x, y, t, p_{1}, p_{2},\left\{C_{k}\right\}$, $\left\{D_{\ell}\right\},\left\{G_{s}\right\},\left\{H_{r}\right\}$ satisfying the relations (3.2) - (3.4), (6.22), (6.23), (6.26), (6.27), (6.30), (6.31), (6.34), (6.35) and

$$
\begin{aligned}
& x p_{1}=p_{1} x, x p_{2}=p_{2} x, y p_{1}=-p_{1} y, y p_{2}=-p_{2} y, t p_{1}=p_{1} x^{2} t, t p_{2}=-p_{2} x^{2} t, \\
& C_{k} D_{\ell}+D_{\ell} C_{k}=0, \quad C_{k} G_{s}+G_{s} C_{m}=0, \quad C_{k} H_{r}+H_{r} C_{k}=0 \\
& D_{\ell} G_{s}+G_{s} D_{\ell}=0, \quad D_{\ell} H_{r}+H_{r} D_{\ell}=0, \quad G_{s} H_{r}+H_{r} G_{s}=0
\end{aligned}
$$

$$
\begin{align*}
& p_{1}^{2}=\nu\left(1-x^{2}\right), \quad p_{2}^{2}=-\nu\left(1-x^{2}\right), \quad p_{1} p_{2}+p_{2} p_{1}=0,  \tag{6.67}\\
& p_{1} C_{k}+C_{k} p_{1}=\lambda_{k}\left(x+x^{3}-2\right), \quad p_{2} C_{k}+C_{k} p_{2}=\lambda_{k}\left(x-x^{3}\right),  \tag{6.68}\\
& p_{1} D_{\ell}+D_{\ell} p_{1}=\zeta_{\ell}\left(x-x^{3}\right), \quad p_{2} D_{\ell}+D_{\ell} p_{2}=\zeta_{\ell}\left(x+x^{3}-2\right),  \tag{6.69}\\
& p_{1} G_{s}+G_{s} p_{1}=\iota_{s}\left(x+x^{3}-2\right), \quad p_{2} G_{s}+G_{s} p_{2}=\iota_{s}\left(x^{3}-x\right),  \tag{6.70}\\
& p_{1} H_{r}+H_{r} p_{1}=\theta_{r}\left(x^{3}-x\right), \quad p_{2} H_{r}+H_{r} p_{2}=\theta_{r}\left(x+x^{3}-2\right) . \tag{6.71}
\end{align*}
$$

It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{aligned}
& \triangle\left(p_{1}\right)=p_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y \otimes p_{1}+\frac{1}{2}\left(1-x^{2}\right) y \otimes p_{2} \\
& \triangle\left(p_{2}\right)=p_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y \otimes p_{2}+\frac{1}{2}\left(1-x^{2}\right) y \otimes p_{1} \\
& \triangle\left(C_{k}\right)=C_{k} \otimes 1+x y \otimes C_{k}, \quad \triangle\left(D_{\ell}\right)=D_{\ell} \otimes 1+x y \otimes D_{\ell} \\

\end{equation*}
$$

(3) $\mathfrak{U}_{8}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{8}\right) \cong \mathfrak{U}_{8}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{8}^{\prime}\right)$ if and only if there exist nonzero parameter $z$ and invertible matrices $\left(a_{i_{1}^{\prime} i_{1}}\right)_{n_{1} \times n_{1}},\left(a_{i_{2}^{\prime} i_{2}}^{\prime}\right)_{n_{1} \times n_{1}},\left(b_{j_{1}^{\prime} j_{1}}\right)_{n_{2} \times n_{2}},\left(b_{j_{2}^{\prime} j_{2}}\right)_{n_{2} \times n_{2}},\left(e_{m_{1}^{\prime} m_{1}}\right)_{n_{3} \times n_{3}}$, $\left(e_{m_{2}^{\prime} m_{2}}\right)_{n_{3} \times n_{3}},\left(f_{q_{1}^{\prime} q_{1}}\right)_{n_{4} \times n_{4}},\left(f_{q_{2}^{\prime} q_{2}}\right)_{n_{4} \times n_{4}}$ satisfying $z^{2} v^{\prime}=v$, (6.43), (6.45) or $z^{2} v^{\prime}=-v$ or $n_{1}=n_{2}, n_{3}=n_{4}$ satisfying $z^{2} v^{\prime}=v$, (6.47) or $z^{2} v^{\prime}=-v$ or $n_{1}=n_{3}, n_{2}=n_{4}$ satisfying $z^{2} v^{\prime}=v$, (6.49), (6.51) or $z^{2} v^{\prime}=-v$ or $n_{1}=n_{4}, n_{2}=n_{3}$ satisfying $z^{2} v^{\prime}=v$, (6.53) or $z^{2} v^{\prime}=-v$.

Proof. (1) We prove the claim only for $\Omega_{2}\left(n_{1}, n_{2}, n_{3}, n_{4}\right)$, since the proof for $\Omega_{8}\left(n_{1}, n_{2}, n_{3}, n_{4}\right)$ follows the same lines. By Theorem 6.1, we have that $\operatorname{gr}(A) \cong \mathcal{B}\left(\Omega_{2}\left(n_{1}, n_{2}, n_{3}, n_{4}\right)\right) \sharp H$. Let $M_{1}=\mathbb{k}_{k}\left\{p_{1}, p_{2}\right\}$. From Proposition 6.6 and a direct computation, we get that the relations except (6.67) - (6.71) hold in $A$. As

$$
\begin{aligned}
& \triangle\left(p_{1}\right)=p_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y \otimes p_{1}+\frac{1}{2}\left(1-x^{2}\right) y \otimes p_{2} \\
& \triangle\left(p_{2}\right)=p_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y \otimes p_{2}+\frac{1}{2}\left(1-x^{2}\right) y \otimes p_{1}
\end{aligned}
$$

it follows that

$$
\begin{aligned}
& \triangle\left(p_{1}^{2}+p_{2}^{2}\right)=\left(p_{1}^{2}+p_{2}^{2}\right) \otimes 1+1 \otimes\left(p_{1}^{2}+p_{2}^{2}\right) \\
& \triangle\left(p_{1}^{2}-p_{2}^{2}\right)=\left(p_{1}^{2}-p_{2}^{2}\right) \otimes 1+x^{2} \otimes\left(p_{1}^{2}-p_{2}^{2}\right) \\
& \triangle\left(p_{1} p_{2}+p_{2} p_{1}\right)=\left(p_{1} p_{2}+p_{2} p_{1}\right) \otimes 1+1 \otimes\left(p_{1} p_{2}+p_{2} p_{1}\right)
\end{aligned}
$$

So we have the relation (6.67) holds in $A$. Since $\triangle\left(C_{k}\right)=C_{k} \otimes 1+x y \otimes C_{k}$, we get that

$$
\begin{aligned}
\triangle\left(p_{1} C_{k}+C_{k} p_{1}\right)= & \left(p_{1} C_{k}+C_{k} p_{1}\right) \otimes 1+\frac{1}{2}\left(x+x^{3}\right) \otimes\left(p_{1} C_{k}+C_{k} p_{1}\right) \\
& +\frac{1}{2}\left(x-x^{3}\right) \otimes\left(p_{2} C_{k}+C_{k} p_{2}\right), \\
\triangle\left(p_{2} C_{k}+C_{k} p_{2}\right)= & \left(p_{2} C_{k}+C_{k} p_{2}\right) \otimes 1+\frac{1}{2}\left(x+x^{3}\right) \otimes\left(p_{2} C_{k}+C_{k} p_{2}\right) \\
& +\frac{1}{2}\left(x-x^{3}\right) \otimes\left(p_{1} C_{k}+C_{k} p_{1}\right) .
\end{aligned}
$$

Since

$$
t\left(p_{1} C_{k}+C_{k} p_{1}\right)=\left(p_{1} C_{k}+C_{k} p_{1}\right) t, \quad t\left(p_{2} C_{k}+C_{k} p_{2}\right)=-\left(p_{2} C_{k}+C_{k} p_{2}\right) t
$$

we have the relation (6.68) holds in $A$.
Similarly, the relations (6.69), (6.70), (6.71) hold in $A$. Then there is a surjective Hopf homomorphism from $\mathfrak{U}_{2}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{2}\right)$ to $A$. By the Diamond Lemma, we have that the linear basis of $\mathfrak{U}_{2}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{2}\right)$ is

$$
\left\{C_{k}^{\gamma_{k}} D_{\ell}^{\eta_{\ell}} G_{s}^{\lambda_{s}} H_{r}^{\mu_{r}} p_{1}^{i} p_{2}^{j} x^{e} y^{f} t^{g} ; \gamma_{k}, \eta_{\ell}, \lambda_{s}, \mu_{r}, i, j, f, g \in \mathbb{I}_{0,1}, e \in \mathbb{I}_{0,3}\right\}
$$

Then $\operatorname{dim} A=\operatorname{dim} \mathfrak{U}_{2}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{2}\right)$ and whence $A \cong \mathfrak{U}_{2}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{2}\right)$.
(2) Suppose that $\Phi: \mathfrak{U}_{2}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{2}\right) \rightarrow \mathfrak{U}_{2}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{2}^{\prime}\right)$ is an isomorphism of Hopf algebras. By Proposition 6.6, we know that $\left.\Phi\right|_{H} \in\left\{\tau_{1}, \cdots, \tau_{16}\right\}$. If $\left.\Phi\right|_{H} \in\left\{\tau_{1}, \tau_{2}, \tau_{3}, \tau_{4}\right\}$, then

$$
\begin{aligned}
& \Phi\left(p_{1}\right)=z p_{1}^{\prime}, \quad \Phi\left(p_{2}\right)=z p_{2}^{\prime}, \quad \Phi\left(C_{k}\right)=\sum_{k^{\prime}=1}^{n_{1}} c_{k^{\prime} k} C_{k^{\prime}}^{\prime}, \\
& \Phi\left(D_{\ell}\right)=\sum_{\ell^{\prime}=1}^{n_{2}} d_{\ell^{\prime} \ell} D_{\ell^{\prime}}^{\prime}, \quad \Phi\left(G_{s}\right)=\sum_{s^{\prime}=1}^{n_{3}} g_{s^{\prime} s}^{\prime} G_{s^{\prime}}^{\prime}, \quad \Phi\left(H_{r}\right)=\sum_{r^{\prime}=1}^{n_{4}} h_{r^{\prime} r} H_{r^{\prime}}^{\prime} .
\end{aligned}
$$

Whence the relations $z^{2} v^{\prime}=v$, (6.44), (6.46), (6.74) hold. Similarly, $\Phi$ is an isomorphism of Hopf algebras if and only if
when $\left.\Phi\right|_{H} \in\left\{\tau_{5}, \tau_{6}, \tau_{7}, \tau_{8}\right\}$, the relations $z^{2} v^{\prime}=-v$, (6.48), (6.75) hold;
when $\left.\Phi\right|_{H} \in\left\{\tau_{9}, \tau_{10}, \tau_{11}, \tau_{12}\right\}$, the relations $z^{2} v^{\prime}=v$, (6.50), (6.52), (6.76) hold;
when $\left.\Phi\right|_{H} \in\left\{\tau_{13}, \tau_{14}, \tau_{15}, \tau_{16}\right\}$, the relations $z^{2} v^{\prime}=-v$, (6.54), (6.77) hold.
The proof of (3) is completely analogous.
Definition 6.11 For $n_{1}, n_{2}, n_{3}, n_{4} \in \mathbb{N}^{*}$ with $\sum_{i=1}^{4} n_{i} \geq 0$ and a set

$$
I_{4}=\left\{\left(\alpha_{i_{1}, i_{2}}\right)_{n_{1} \times n_{1}},\left(\gamma_{k_{1}, k_{2}}\right)_{n_{2} \times n_{2}},\left(\zeta_{m_{1}, m_{2}}\right)_{n_{3} \times n_{3}},\left(\lambda_{s_{1}, s_{2}}\right)_{n_{4} \times n_{4}}, \nu\right\},
$$

we denote by $\mathfrak{U}_{4}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{4}\right)$ the algebra that is generated by $x, y, t, p_{1}, p_{2},\left\{A_{i}\right\}_{i=1, ., n_{1}}$, $\left\{C_{k}\right\}_{k=1, ., n_{2}},\left\{E_{m}\right\}_{m=1, ., n_{3}},\left\{G_{s}\right\}_{s=1, . ., n_{4}}$ satisfying the relations (3.2) - (3.4), (6.20), (6.22), (6.24) , (6.26) , (6.28), (6.30), (6.32), (6.34), (6.67) and

$$
\begin{align*}
& x p_{1}=p_{1} x, x p_{2}=-p_{2} x, y p_{1}=p_{1} y, y p_{2}=p_{2} y, t p_{1}=-p_{1} t, t p_{2}=-p_{2} t \\
& A_{i} C_{k}-C_{k} A_{i}=0, \quad A_{i} E_{m}+E_{m} A_{i}=0, \quad A_{i} G_{s}-G_{s} A_{i}=0 \\
& C_{k} E_{m}-E_{m} C_{m}=0, \quad C_{k} G_{s}+G_{s} C_{m}=0, \quad E_{m} G_{s}-G_{s} E_{m}=0 \\
& p_{1} A_{i}-A_{i} p_{1}=0, \quad p_{2} A_{i}+A_{i} p_{2}=0, \quad p_{1} C_{k}-C_{k} p_{1}=0, \quad p_{2} C_{k}+C_{k} p_{2}=0  \tag{6.78}\\
& p_{1} E_{m}-E_{m} p_{1}=0, \quad p_{2} E_{m}+E_{m} p_{2}=0, \quad p_{1} G_{s}-G_{s} p_{1}=0, \quad p_{2} G_{s}+G_{s} p_{2}=0 . \tag{6.79}
\end{align*}
$$

It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{aligned}
& \triangle\left(p_{1}\right)=p_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) t \otimes p_{1}+\frac{1}{2}\left(1-x^{2}\right) y t \otimes p_{2}, \\
& \triangle\left(p_{2}\right)=p_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y t \otimes p_{2}+\frac{1}{2}\left(1-x^{2}\right) t \otimes p_{1}, \\
& \triangle\left(A_{i}\right)=A_{i} \otimes 1+x \otimes A_{i}, \quad \triangle\left(C_{k}\right)=C_{k} \otimes 1+x y \otimes C_{k}, \\
& \triangle\left(E_{m}\right)=E_{m} \otimes 1+x^{3} \otimes E_{m}, \quad \triangle\left(G_{s}\right)=G_{s} \otimes 1+x^{3} y \otimes G_{s} .
\end{aligned}
$$

Definition 6.12 For $n_{1}, n_{2}, n_{3}, n_{4} \in \mathbb{N}^{*}$ with $\sum_{i=1}^{4} n_{i} \geq 0$ and a set

\end{aligned}
$$

Proposition 6.13 (1) Let $A$ be a finite-dimensional Hopf algebra with coradical $H$ such that its infinitesimal braiding is $\Omega_{i}\left(n_{1}, n_{2}, n_{3}, n_{4}\right)$ for $i \in\{4,5\}$, then $A \cong \mathfrak{U}_{i}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{i}\right)$.
(2) $\mathfrak{U}_{4}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{4}\right) \cong \mathfrak{U}_{4}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{4}^{\prime}\right)$ if and only if there exist nonzero parameter $z$ such that $z^{2} v^{\prime}=v$ and invertible matrices $\left(a_{i_{1}^{\prime} i_{1}}\right)_{n_{1} \times n_{1}},\left(a_{i_{2}^{\prime} i_{2}}\right)_{n_{1} \times n_{1}},\left(c_{k_{1}^{\prime} k_{1}}\right)_{n_{2} \times n_{2}}$, $\left(c_{k_{2}^{\prime} k_{2}}\right)_{n_{2} \times n_{2}},\left(e_{m_{1}^{\prime} m_{1}}\right)_{n_{3} \times n_{3}},\left(e_{m_{2}^{\prime} m_{2}}\right)_{n_{3} \times n_{3}},\left(g_{s_{1}^{\prime} s_{1}}\right)_{n_{4} \times n_{4}},\left(g_{s_{2}^{\prime} s_{2}}\right)_{n_{4} \times n_{4}}$ satisfying the first equations of (6.43) - (6.46) or $n_{1}=n_{3}, n_{2}=n_{4}$ satisfying the first equations of (6.49) - (6.52) or $n_{1}=n_{2}, n_{3}=n_{4}$ satisfying the first equations of (6.55) - (6.58) or $n_{1}=n_{4}, n_{2}=n_{3}$ satisfying the first equations of (6.61) - (6.64).
(3) $\mathfrak{U}_{5}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{5}\right) \cong \mathfrak{U}_{5}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{5}^{\prime}\right)$ if and only if there exist nonzero parameter $z$ and invertible matrices $\left(a_{i^{\prime} i}\right)_{n_{1} \times n_{1}},\left(a_{i_{1}^{\prime} i_{1}}^{\prime}\right)_{n_{1} \times n_{1}},\left(a_{i_{2}^{\prime} i_{2}}\right)_{n_{1} \times n_{1}},\left(d_{\ell^{\prime} \ell}\right)_{n_{2} \times n_{2}},\left(d_{\ell_{1}^{\prime} \ell_{1}}\right)_{n_{2} \times n_{2}}$, $\left(d_{\ell_{2}^{\prime} \ell_{2}}\right)_{n_{2} \times n_{2}},\left(e_{m^{\prime} m}\right)_{n_{3} \times n_{3}},\left(e_{m_{1}^{\prime} m_{1}}\right)_{n_{3} \times n_{3}},\left(e_{m_{2}^{\prime} m_{2}}\right)_{n_{3} \times n_{3}},\left(h_{r^{\prime} r}\right)_{n_{4} \times n_{4}},\left(h_{r_{1}^{\prime} r_{1}}\right)_{n_{4} \times n_{4}},\left(h_{r_{2}^{\prime} r_{2}}\right)_{n_{4} \times n_{4}}$ satisfying $z^{2} v^{\prime}=v$, the first equations of (6.43), (6.45), the second equations of (6.44), (6.46) and

Proof. (1) We prove the claim only for $\Omega_{4}\left(n_{1}, n_{2}, n_{3}, n_{4}\right)$, since the proof for $\Omega_{5}\left(n_{1}, n_{2}, n_{3}, n_{4}\right)$ follows the same lines. By Theorem 6.1, we have that $\operatorname{gr}(A) \cong \mathcal{B}\left(\Omega_{4}\left(n_{1}, n_{2}, n_{3}, n_{4}\right)\right) \sharp H$. Let $M_{3}=\mathbb{k}\left\{p_{1}, p_{2}\right\}$. Similar to Proposition 6.10, we only need to prove that the relations (6.78), (6.79) hold in $A$. Since $\triangle\left(A_{i}\right)=A_{i} \otimes 1+x \otimes A_{i}$, we have that

$$
\begin{aligned}
\triangle\left(p_{1} A_{i}-A_{i} p_{1}\right)= & \left(p_{1} A_{i}-A_{i} p_{1}\right) \otimes 1+\frac{1}{2}\left(x t+x^{3} t\right) \otimes\left(p_{1} A_{i}-A_{i} p_{1}\right) \\
& +\frac{1}{2}\left(x^{3} y t-x y t\right) \otimes\left(p_{2} A_{i}+A_{i} p_{2}\right) \\
\triangle\left(p_{2} A_{i}+A_{i} p_{2}\right)= & \left(p_{2} A_{i}+A_{i} p_{2}\right) \otimes 1+\frac{1}{2}\left(x y t+x^{3} y t\right) \otimes\left(p_{2} A_{i}+A_{i} p_{2}\right) \\
& +\frac{1}{2}\left(x^{3} t-x t\right) \otimes\left(p_{1} A_{i}-A_{i} p_{1}\right)
\end{aligned}
$$

If the relations $p_{1} A_{i}-A_{i} p_{1}=0$ admit non-trivial deformations, then $p_{1} A_{i}-A_{i} p_{1} \in A_{[1]}$ is a linear combination of

$$
\left\{x^{j} y^{l} t^{r}, A_{i} x^{j} y^{l} t^{r}, C_{k} x^{j} y^{l} t^{r}, E_{m} x^{j} y^{l} t^{r}, G_{s} x^{j} y^{l} t^{r}, p_{1} x^{j} y^{l} t^{r}, p_{2} x^{j} y^{l} t^{r}, j \in \mathbb{I}_{0,3}, l, r \in \mathbb{I}_{0,1}\right\} .
$$

Since

$$
y\left(p_{1} A_{i}-A_{i} p_{1}\right)=-\left(p_{1} A_{i}-A_{i} p_{1}\right) y, \quad t\left(p_{1} A_{i}-A_{i} p_{1}\right)=-\left(p_{1} A_{i}-A_{i} p_{1}\right) x^{2} t
$$

then $p_{1} A_{i}-A_{i} p_{1}=0$ hold in $A$. Whence by the above two equations we have that the relations $p_{2} A_{i}+A_{i} p_{2}=0$ hold in $A$.

Similarly, other relations hold in $A$. Then there is a surjective Hopf morphism from $\mathfrak{U}_{4}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{4}\right)$ to $A$. By the Diamond Lemma, the linear basis of $\mathfrak{U}_{4}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{4}\right)$ is $\left\{A_{i}^{\alpha_{i}} C_{k}^{\gamma_{k}} E_{m}^{\zeta_{m}} G_{s}^{\lambda_{s}} p_{1}^{j} p_{2}^{l} x^{e} y^{f} t^{g}\right\}$ for all parameters $\alpha_{i}, \gamma_{k}, \zeta_{m}, \lambda_{s}, j, l, f, g \in \mathbb{I}_{0,1}, e \in \mathbb{I}_{0,3}$. Then $\operatorname{dim} A=\operatorname{dim} \mathfrak{U}_{4}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{4}\right)$ and whence $A \cong \mathfrak{U}_{4}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{4}\right)$.
(2) Suppose that $\Phi: \mathfrak{U}_{4}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{4}\right) \rightarrow \mathfrak{U}_{4}\left(n_{1}, n_{2}, n_{3}, n_{4} ; I_{4}^{\prime}\right)$ is an isomorphism of Hopf algebras. Similar to the proof of Proposition 6.10, $\left.\Phi\right|_{H} \in\left\{\tau_{1}, \tau_{3}, \tau_{9}, \tau_{11}, \tau_{17}, \tau_{19}, \tau_{25}, \tau_{27}\right\}$. If $\left.\Phi\right|_{H}=\tau_{1}$, then

$$
\Phi\left(p_{1}\right)=z p_{1}^{\prime}, \quad \Phi\left(p_{2}\right)=z p_{2}^{\prime}, \quad \Phi\left(A_{i}\right)=\sum_{i^{\prime}=1}^{n_{1}} a_{i^{\prime} i} A_{i^{\prime}}^{\prime}
$$

$$
\Phi\left(C_{k}\right)=\sum_{k^{\prime}=1}^{n_{2}} c_{k^{\prime} k} C_{k^{\prime}}^{\prime}, \Phi\left(E_{m}\right)=\sum_{m^{\prime}=1}^{n_{3}} e_{m^{\prime} m} E_{m^{\prime}}^{\prime}, \Phi\left(G_{s}\right)=\sum_{s^{\prime}=1}^{n_{4}} g_{s^{\prime} s} G_{s^{\prime}}^{\prime}
$$

Whence the first equations of (6.43) - (6.46) hold. Similarly, $\Phi$ is an isomorphism of Hopf algebras if and only if
when $\left.\Phi\right|_{H}=\tau_{3}$, the first equations of (6.43) - (6.46) hold;
when $\left.\Phi\right|_{H} \in\left\{\tau_{9}, \tau_{11}\right\}$, the first equations of (6.49) - (6.52) hold;
when $\left.\Phi\right|_{H} \in\left\{\tau_{17}, \tau_{19}\right\}$, the first equations of (6.55) - (6.58) hold;
when $\left.\Phi\right|_{H} \in\left\{\tau_{25}, \tau_{27}\right\}$, the first equations of (6.61) - (6.64) hold.
The proof of (3) is completely analogous.
Definition 6.14 For a set of parameters $I_{14}=\{\lambda, \mu, \alpha\}$, denote by $\mathfrak{U}_{14}\left(I_{14}\right)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4) and

$$
\begin{align*}
& x p_{1}=p_{1} x, \quad y p_{1}=-p_{1} y, \quad t p_{1}=p_{1} x^{2} t, \quad x p_{2}=p_{2} x, \quad y p_{2}=-p_{2} y, \quad t p_{2}=-p_{2} x^{2} t  \tag{6.93}\\
& x q_{1}=q_{1} x, \quad y q_{1}=-q_{1} y, \quad t q_{1}=q_{1} x^{2} t, \quad x q_{2}=q_{2} x, \quad y q_{2}=-q_{2} y, \quad t q_{2}=-q_{2} x^{2} t  \tag{6.94}\\
& p_{1}^{2}=\lambda\left(1-x^{2}\right), \quad p_{2}^{2}=-\lambda\left(1-x^{2}\right), \quad p_{1} p_{2}+p_{2} p_{1}=0  \tag{6.95}\\
& q_{1}^{2}=\mu\left(1-x^{2}\right), \quad q_{2}^{2}=-\mu\left(1-x^{2}\right), \quad q_{1} q_{2}+q_{2} q_{1}=0  \tag{6.96}\\
& p_{1} q_{1}+q_{1} p_{1}=\alpha\left(1-x^{2}\right), \quad p_{2} q_{2}+q_{2} p_{2}=-\alpha\left(1-x^{2}\right), \quad p_{1} q_{2}+q_{2} p_{1}=p_{2} q_{1}+q_{1} p_{2}=0 . \tag{6.97}
\end{align*}
$$

It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{aligned}
& \triangle\left(p_{1}\right)=p_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y \otimes p_{1}+\frac{1}{2}\left(1-x^{2}\right) y \otimes p_{2}, \\
& \triangle\left(p_{2}\right)=p_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y \otimes p_{2}+\frac{1}{2}\left(1-x^{2}\right) y \otimes p_{1}, \\
& \triangle\left(q_{1}\right)=q_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y \otimes q_{1}+\frac{1}{2}\left(1-x^{2}\right) y \otimes q_{2}, \\
& \triangle\left(q_{2}\right)=q_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y \otimes q_{2}+\frac{1}{2}\left(1-x^{2}\right) y \otimes q_{1} .
\end{aligned}
$$

Definition 6.15 Denote by $\mathfrak{U}_{15}(\lambda, \mu)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4), (6.93), (6.95), (6.96) and
$x q_{1}=-q_{1} x, y q_{1}=-q_{1} y, t q_{1}=q_{1} x^{2} t, x q_{2}=-q_{2} x, y q_{2}=-q_{2} y, t q_{2}=-q_{2} x^{2} t$,
$p_{1} q_{1}+q_{1} p_{1}=0, \quad p_{2} q_{2}+q_{2} p_{2}=0, \quad p_{1} q_{2}+q_{2} p_{1}=0, \quad p_{2} q_{1}+q_{1} p_{2}=0$.
It is a Hopf algebra with the same coalgebra structure as $\mathfrak{U}_{14}\left(I_{14}\right)$.
Definition 6.16 Denote by $\mathfrak{U}_{16}(\lambda, \mu)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4), (6.93), (6.95), (6.96) and
$x q_{1}=-q_{1} x, \quad y q_{1}=q_{1} y, \quad t q_{1}=q_{1} t, \quad x q_{2}=-q_{2} x, \quad y q_{2}=q_{2} y, \quad t q_{2}=-q_{2} t$,
$p_{1} q_{1}-q_{1} p_{1}=0, \quad p_{2} q_{2}-q_{2} p_{2}=0, \quad p_{1} q_{2}-q_{2} p_{1}=0, \quad p_{2} q_{1}-q_{1} p_{2}=0$.
It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{aligned}
& \triangle\left(q_{1}\right)=q_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x \otimes q_{1}+\frac{1}{2}\left(1-x^{2}\right) x \otimes q_{2} \\
& \triangle\left(q_{2}\right)=q_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x \otimes q_{2}+\frac{1}{2}\left(1-x^{2}\right) x \otimes q_{1}
\end{aligned}
$$

Definition 6.17 For a set of parameters $I_{17}=\{\lambda, \mu, \alpha\}$, denote by $\mathfrak{U}_{17}\left(I_{17}\right)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4), (6.95) - (6.97) and

$$
\begin{align*}
& x p_{1}=p_{1} x, \quad y p_{1}=p_{1} y, \quad t p_{1}=-p_{1} t, \quad x p_{2}=-p_{2} x, \quad y p_{2}=p_{2} y, \quad t p_{2}=-p_{2} t,  \tag{6.102}\\
& x q_{1}=q_{1} x, \quad y q_{1}=q_{1} y, \quad t q_{1}=-q_{1} t, \quad x q_{2}=-q_{2} x, \quad y q_{2}=q_{2} y, \quad t q_{2}=-q_{2} t . \tag{6.103}
\end{align*}
$$

It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{aligned}
& \triangle\left(p_{1}\right)=p_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) t \otimes p_{1}+\frac{1}{2}\left(1-x^{2}\right) y t \otimes p_{2} \\
& \triangle\left(p_{2}\right)=p_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y t \otimes p_{2}+\frac{1}{2}\left(1-x^{2}\right) t \otimes p_{1} \\
& \triangle\left(q_{1}\right)=q_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) t \otimes q_{1}+\frac{1}{2}\left(1-x^{2}\right) y t \otimes q_{2} \\
& \triangle\left(q_{2}\right)=q_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y t \otimes q_{2}+\frac{1}{2}\left(1-x^{2}\right) t \otimes q_{1} .
\end{aligned}
$$

Definition 6.18 For a set of parameters $I_{18}=\{\lambda, \mu, \alpha\}$, denote by $\mathfrak{U}_{18}\left(I_{18}\right)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4), (6.95), (6.96), (6.102), (6.103) and
$p_{1} q_{1}+q_{1} p_{1}=\alpha\left(y+x^{2} y-2\right), \quad p_{2} q_{2}+q_{2} p_{2}=\alpha\left(y-x^{2} y\right)$,
$p_{1} q_{2}+q_{2} p_{1}=0, \quad p_{2} q_{1}+q_{1} p_{2}=0$.
It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{aligned}
& \triangle\left(q_{1}\right)=q_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y t \otimes q_{1}+\frac{1}{2}\left(1-x^{2}\right) t \otimes q_{2} \\
& \triangle\left(q_{2}\right)=q_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) t \otimes q_{2}+\frac{1}{2}\left(1-x^{2}\right) y t \otimes q_{1} .
\end{aligned}
$$

Definition 6.19 Denote by $\mathfrak{U}_{19}(\lambda, \mu)$ the algebra that is generated by $x, y, t$, $p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4), (6.95), (6.102) and
$x q_{1}=q_{1} x, y q_{1}=-q_{1} y, t q_{1}=-q_{1} x^{2} t, x q_{2}=-q_{2} x, y q_{2}=-q_{2} y, t q_{2}=-q_{2} x^{2} t$,
$q_{1}^{2}=\mu\left(1-x^{2}\right), \quad q_{2}^{2}=-\mu\left(1-x^{2}\right), \quad q_{1} q_{2}-q_{2} q_{1}=0$,
$p_{1} q_{1}+q_{1} p_{1}=0, \quad p_{2} q_{2}-q_{2} p_{2}=0, \quad p_{1} q_{2}+q_{2} p_{1}=0, \quad p_{2} q_{1}-q_{1} p_{2}=0$.
It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{aligned}
& \triangle\left(q_{1}\right)=q_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x t \otimes q_{1}+\frac{1}{2}\left(1-x^{2}\right) x y t \otimes q_{2} \\
& \triangle\left(q_{2}\right)=q_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x y t \otimes q_{2}+\frac{1}{2}\left(1-x^{2}\right) x t \otimes q_{1} .
\end{aligned}
$$

Proposition 6.20 (1) Suppose $A$ is a finite-dimensional Hopf algebra with coradical $H$ such that its infinitesimal braiding is isomorphic to $\Omega_{i}$ for $i \in\{14,15,16,17,18,19\}$, then $A \cong$ $\mathfrak{U}_{14}\left(I_{14}\right)$ or $\mathfrak{U}_{15}(\lambda, \mu)$ or $\mathfrak{U}_{16}(\lambda, \mu)$ or $\mathfrak{U}_{17}\left(I_{17}\right), \mathfrak{U}_{18}\left(I_{18}\right), \mathfrak{U}_{19}(\lambda, \mu)$.
(2) $\mathfrak{U}_{17}\left(I_{17}\right) \cong \mathfrak{U}_{17}\left(I_{17}^{\prime}\right)$ if and only if there exist nonzero parameters $a_{1}, a_{2}, b_{1}, b_{2}$ satisfying (6.109) $\cdot \mathfrak{U}_{14}\left(I_{14}\right) \cong \mathfrak{U}_{14}\left(I_{14}^{\prime}\right)$ if and only if there exist nonzero parameters $a_{1}, a_{2}, b_{1}, b_{2}$ such that

$$
\begin{align*}
& a_{1}^{2} \lambda^{\prime}+a_{1} a_{2} \alpha^{\prime}+a_{2}^{2} \mu^{\prime}=\lambda, \quad b_{1}^{2} \lambda^{\prime}+b_{1} b_{2} \alpha^{\prime}+b_{2}^{2} \mu^{\prime}=\mu,  \tag{6.109}\\
& 2 a_{1} b_{1} \lambda^{\prime}+2 a_{2} b_{2} \mu^{\prime}+\left(a_{1} b_{2}+a_{2} b_{1}\right) \alpha^{\prime}=\alpha,
\end{align*}
$$

or satisfying

$$
\begin{align*}
& a_{1}^{2} \lambda^{\prime}+a_{1} a_{2} \alpha^{\prime}+a_{2}^{2} \mu^{\prime}=-\lambda, \quad b_{1}^{2} \lambda^{\prime}+b_{1} b_{2} \alpha^{\prime}+b_{2}^{2} \mu^{\prime}=-\mu,  \tag{6.110}\\
& 2 a_{1} b_{1} \lambda^{\prime}+2 a_{2} b_{2} \mu^{\prime}+\left(a_{1} b_{2}+a_{2} b_{1}\right) \alpha^{\prime}=-\alpha .
\end{align*}
$$

(3) $\mathfrak{U}_{18}\left(I_{18}\right) \cong \mathfrak{U}_{18}\left(I_{18}^{\prime}\right)$ if and only if there exist nonzero parameters $a_{1}$, $a_{2}$ such that

$$
\begin{array}{ll}
a_{1}^{2} \lambda^{\prime}=\lambda, & a_{2}^{2} \mu^{\prime}=\mu, \\
a_{1} a_{2} \alpha^{\prime}=\alpha,  \tag{6.112}\\
a_{1}^{2} \mu^{\prime}=\lambda, & a_{2}^{2} \lambda^{\prime}=\mu,
\end{array} a_{1} a_{2} \alpha^{\prime}=\alpha . ~ \$
$$

(4) Let $i \in\{15,16,19\} . \mathfrak{U}_{i}(\lambda, \mu) \cong \mathfrak{U}_{i}(1,1)$ for $\lambda, \mu \neq 0$, and $\mathfrak{U}_{i}(1,1) \not \equiv \mathfrak{U}_{i}(0,0)$.

Proof. (1) We prove the claim for $\Omega_{14}$. The proofs for others follow the same lines. By Theorem [6.1, we have that $\operatorname{gr}(A) \cong \mathcal{B}\left(\Omega_{14}\right) \sharp H$. Let $M_{1}=\mathbb{k}\left\{p_{1}, p_{2}\right\}=\mathbb{k}\left\{q_{1}, q_{2}\right\}$. By Proposition 6.10, we only need to prove that (6.97) holds in $A$. After a direct computation, we have that

$$
\begin{aligned}
\triangle\left(p_{1} q_{1}+q_{1} p_{1}\right)= & \left(p_{1} q_{1}+q_{1} p_{1}\right) \otimes 1+\frac{1}{2}\left(1+x^{2}\right) \otimes\left(p_{1} q_{1}+q_{1} p_{1}\right) \\
& +\frac{1}{2}\left(1-x^{2}\right) \otimes\left(p_{2} q_{2}+q_{2} p_{2}\right) \\
\triangle\left(p_{2} q_{2}+q_{2} p_{2}\right)= & \left(p_{2} q_{2}+q_{2} p_{2}\right) \otimes 1+\frac{1}{2}\left(1+x^{2}\right) \otimes\left(p_{2} q_{2}+q_{2} p_{2}\right) \\
& +\frac{1}{2}\left(1-x^{2}\right) \otimes\left(p_{1} q_{1}+q_{1} p_{1}\right) .
\end{aligned}
$$

So $p_{1} q_{1}+q_{1} p_{1}=\alpha\left(1-x^{2}\right), p_{2} q_{2}+q_{2} p_{2}=-\alpha\left(1-x^{2}\right)$ for some $\alpha \in \mathbb{k}$. Similarly, other relations hold in $A$. Then there is a surjective Hopf homomorphism from $\mathfrak{U}_{14}\left(I_{14}\right)$ to $A$. We can observe that all elements of $\mathfrak{U}_{14}\left(I_{14}\right)$ can be expressed by linear combinations of

$$
\left\{p_{1}^{i} p_{2}^{j} q_{1}^{k} q_{2}^{l} x^{e} y^{f} t^{g} ; i, j, k, l, f, g \in \mathbb{I}_{0,1}, e \in \mathbb{I}_{0,3}\right\}
$$

In fact, according to the Diamond Lemma, the set is a basis of $\mathfrak{U}_{14}\left(I_{14}\right)$. Then $\operatorname{dim} A=$ $\operatorname{dim} \mathfrak{U}_{14}\left(I_{14}\right)$, whence $A \cong \mathfrak{U}_{14}\left(I_{14}\right)$.
(2) Suppose $\Phi: \mathfrak{U}_{14}\left(I_{14}\right) \rightarrow \mathfrak{U}_{14}\left(I_{14}^{\prime}\right)$ is an isomorphism of Hopf algebras. Similar to the proof of Proposition 6.10, $\left.\Phi\right|_{H} \in\left\{\tau_{1}-\tau_{16}\right\}$ : when $\left.\Phi\right|_{H} \in\left\{\tau_{1}-\tau_{4}, \tau_{9}-\tau_{12}\right\}$,

$$
\Phi\left(p_{1}\right)=a_{1} p_{1}^{\prime}+a_{2} q_{1}^{\prime}, \Phi\left(p_{2}\right)=a_{1} p_{2}^{\prime}+a_{2} q_{2}^{\prime}, \Phi\left(q_{1}\right)=b_{1} p_{1}^{\prime}+b_{2} q_{1}^{\prime}, \Phi\left(q_{2}\right)=b_{1} p_{2}^{\prime}+b_{2} q_{2}^{\prime},
$$

then the relation (6.109) holds; when $\left.\Phi\right|_{H} \in\left\{\tau_{5}-\tau_{8}, \tau_{13}-\tau_{16}\right\}$,

$$
\Phi\left(p_{1}\right)=a_{1} p_{2}^{\prime}+a_{2} q_{2}^{\prime}, \Phi\left(p_{2}\right)=a_{1} p_{1}^{\prime}+a_{2} q_{1}^{\prime}, \Phi\left(q_{1}\right)=b_{1} p_{2}^{\prime}+b_{2} q_{2}^{\prime}, \Phi\left(q_{2}\right)=b_{1} p_{1}^{\prime}+b_{2} q_{1}^{\prime}
$$

the relation (6.110) holds.

For $\mathfrak{U}_{17}\left(I_{17}\right)$, the proof is completely analogous.
(3) Suppose $\Phi: \mathfrak{U}_{18}\left(I_{18}\right) \rightarrow \mathfrak{U}_{18}\left(I_{18}^{\prime}\right)$ is an isomorphism of Hopf algebras.

When $\left.\Phi\right|_{H} \in\left\{\tau_{1}, \tau_{9}, \tau_{17}, \tau_{25}\right\}$,

$$
\Phi\left(p_{1}\right)=a_{1} p_{1}^{\prime}, \quad \Phi\left(p_{2}\right)=a_{1} p_{2}^{\prime}, \quad \Phi\left(q_{1}\right)=a_{2} q_{1}^{\prime}, \quad \Phi\left(q_{2}\right)=a_{2} q_{2}^{\prime} ;
$$

when $\left.\Phi\right|_{H} \in\left\{\tau_{3}, \tau_{11}, \tau_{19}, \tau_{27},\right\}$,

$$
\Phi\left(p_{1}\right)=a_{1} p_{1}^{\prime}, \quad \Phi\left(p_{2}\right)=-a_{1} p_{2}^{\prime}, \quad \Phi\left(q_{1}\right)=a_{2} q_{1}^{\prime}, \quad \Phi\left(q_{2}\right)=-a_{2} q_{2}^{\prime},
$$

then the relation (6.111) holds. When $\left.\Phi\right|_{H} \in\left\{\tau_{5}, \tau_{13}, \tau_{21}, \tau_{29}\right\}$,

$$
\Phi\left(p_{1}\right)=a_{1} q_{1}^{\prime}, \quad \Phi\left(p_{2}\right)=a_{1} q_{2}^{\prime}, \quad \Phi\left(q_{1}\right)=a_{2} p_{1}^{\prime}, \quad \Phi\left(q_{2}\right)=a_{2} p_{2}^{\prime}
$$

when $\left.\Phi\right|_{H} \in\left\{\tau_{7}, \tau_{15}, \tau_{23}, \tau_{31},\right\}$,

$$
\Phi\left(p_{1}\right)=a_{1} q_{1}^{\prime}, \quad \Phi\left(p_{2}\right)=-a_{1} q_{2}^{\prime}, \quad \Phi\left(q_{1}\right)=a_{2} p_{1}^{\prime}, \quad \Phi\left(q_{2}\right)=-a_{2} p_{2}^{\prime},
$$

then the relation (6.112) holds.
(4) When $\lambda, \mu \neq 0, \Phi: \mathfrak{U}_{15}(1,1) \rightarrow \mathfrak{U}_{15}(\lambda, \mu)$ by $\left.\Phi\right|_{H}=i d, p_{i} \mapsto \sqrt{\lambda} p_{i}, q_{i} \mapsto \sqrt{\mu} q_{i}$ for $i=1,2$. For $\mathfrak{U}_{16}(\lambda, \mu), \mathfrak{U}_{19}(\lambda, \mu)$, the proofs are completely analogous.

Definition 6.21 For a set of parameters $I_{20}=\{\lambda, \mu, \alpha\}$, denote by $\mathfrak{U}_{20}\left(I_{20}\right)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4) and
$x p_{1}=p_{1} x, y p_{1}=-p_{1} y, t p_{1}=-p_{1} x^{2} t, x p_{2}=-p_{2} x, y p_{2}=-p_{2} y, t p_{2}=p_{2} x^{2} t$,
$x q_{1}=q_{1} x, y q_{1}=-q_{1} y, t q_{1}=-q_{1} x^{2} t, x q_{2}=-q_{2} x, y q_{2}=-q_{2} y, t q_{2}=q_{2} x^{2} t$,
$p_{1}^{2}=\lambda\left(1-x^{2}\right), \quad p_{2}^{2}=-\lambda\left(1-x^{2}\right), \quad p_{1} p_{2}-p_{2} p_{1}=0$,
$q_{1}^{2}=\mu\left(1-x^{2}\right), \quad q_{2}^{2}=-\mu\left(1-x^{2}\right), \quad q_{1} q_{2}-q_{2} q_{1}=0$,
$p_{1} q_{1}+q_{1} p_{1}=\alpha\left(1-x^{2}\right), \quad p_{2} q_{2}+q_{2} p_{2}=-\alpha\left(1-x^{2}\right)$,
$p_{1} q_{2}-q_{2} p_{1}=0, \quad p_{2} q_{1}-q_{1} p_{2}=0$.
It is a Hopf algebra with the same coalgebra structure as $\mathfrak{U}_{17}\left(I_{17}\right)$.
Definition 6.22 Denote by $\mathfrak{U}_{21}(\lambda, \mu)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4), (6.113), (6.115), (6.116) and
$x q_{1}=q_{1} x, y q_{1}=-q_{1} y, t q_{1}=q_{1} x^{2} t, x q_{2}=-q_{2} x, y q_{2}=-q_{2} y, t q_{2}=-q_{2} x^{2} t$,
$p_{1} q_{1}-q_{1} p_{1}=0, \quad p_{2} q_{2}-q_{2} p_{2}=0, \quad p_{1} q_{2}+q_{2} p_{1}=0, \quad p_{2} q_{1}+q_{1} p_{2}=0$.
It is a Hopf algebra with the same coalgebra structure as $\mathfrak{U}_{18}\left(I_{18}\right)$.

Definition 6.23 For a set of parameters $I_{22}=\{\lambda, \mu, \alpha\}$, denote by $\mathfrak{U}_{22}\left(I_{22}\right)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4), (6.95), (6.96), (6.100) and

$$
\begin{align*}
& x p_{1}=-p_{1} x, \quad y p_{1}=p_{1} y, \quad t p_{1}=p_{1} t, \quad x p_{2}=-p_{2} x, \quad y p_{2}=p_{2} y, \quad t p_{2}=-p_{2} t,  \tag{6.121}\\
& p_{1} q_{1}+q_{1} p_{1}=p_{2} q_{2}+q_{2} p_{2}=\alpha\left(1-x^{2}\right), \quad p_{1} q_{2}+q_{2} p_{1}=0, \quad p_{2} q_{1}+q_{1} p_{2}=0 . \tag{6.122}
\end{align*}
$$

It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{aligned}
& \triangle\left(p_{1}\right)=p_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x \otimes p_{1}+\frac{1}{2}\left(1-x^{2}\right) x \otimes p_{2}, \\
& \triangle\left(p_{2}\right)=p_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x \otimes p_{2}+\frac{1}{2}\left(1-x^{2}\right) x \otimes p_{1}, \\
& \triangle\left(q_{1}\right)=q_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x \otimes q_{1}+\frac{1}{2}\left(1-x^{2}\right) x \otimes q_{2}, \\
& \triangle\left(q_{2}\right)=q_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x \otimes q_{2}+\frac{1}{2}\left(1-x^{2}\right) x \otimes q_{1} .
\end{aligned}
$$

Definition 6.24 For a set of parameters $I_{23}=\{\lambda, \mu, \alpha\}$, denote by $\mathfrak{U}_{23}\left(I_{23}\right)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4), (6.95), (6.96), (6.100), (6.121) and
$p_{1} q_{1}+q_{1} p_{1}=\alpha\left(y+x^{2} y-2\right), \quad p_{2} q_{2}+q_{2} p_{2}=\alpha\left(x^{2} y-y\right)$,
$p_{1} q_{2}+q_{2} p_{1}=0, \quad p_{2} q_{1}+q_{1} p_{2}=0$.
It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{aligned}
& \triangle\left(p_{1}\right)=p_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x \otimes p_{1}+\frac{1}{2}\left(1-x^{2}\right) x \otimes p_{2}, \\
& \triangle\left(p_{2}\right)=p_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x \otimes p_{2}+\frac{1}{2}\left(1-x^{2}\right) x \otimes p_{1}, \\
& \triangle\left(q_{1}\right)=q_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x y \otimes q_{1}+\frac{1}{2}\left(1-x^{2}\right) x y \otimes q_{2}, \\
& \triangle\left(q_{2}\right)=q_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) x y \otimes q_{2}+\frac{1}{2}\left(1-x^{2}\right) x y \otimes q_{1} .
\end{aligned}
$$

Similar to Proposition 6.20, we have the following
Proposition 6.25 (1) Suppose $A$ is a finite-dimensional Hopf algebra with coradical $H$ such that its infinitesimal braiding is isomorphic to $\Omega_{i}$ for $i \in\{20,21,22,23\}$, then $A \cong \mathfrak{U}_{i}\left(I_{i}\right)$.
(2) $\mathfrak{U}_{20}\left(I_{20}\right) \cong \mathfrak{U}_{20}\left(I_{20}^{\prime}\right), \mathfrak{U}_{22}\left(I_{22}\right) \cong \mathfrak{U}_{22}\left(I_{22}^{\prime}\right)$ if and only if there exist nonzero parameters $a_{1}, a_{2}, b_{1}, b_{2}$ satisfying (6.109) or (6.110).
(3) $\mathfrak{U}_{23}\left(I_{23}\right) \cong \mathfrak{U}_{23}\left(I_{23}^{\prime}\right)$ if and only if there exist nonzero parameters $a_{1}$, a $a_{2}$ satisfying (6.111) or (6.112) or satisfying

$$
\begin{equation*}
a_{1}^{2} \lambda^{\prime}=-\lambda, \quad a_{2}^{2} \mu^{\prime}=-\mu, \quad \alpha=0 \tag{6.125}
\end{equation*}
$$

or satisfying

$$
\begin{equation*}
a_{1}^{2} \mu^{\prime}=-\lambda, \quad a_{2}^{2} \lambda^{\prime}=-\mu, \quad \alpha=0 . \tag{6.126}
\end{equation*}
$$

(4) $\mathfrak{U}_{21}(\lambda, \mu) \cong \mathfrak{U}_{21}(1,1)$ for $\lambda, \mu \neq 0$, and $\mathfrak{U}_{21}(1,1) \not \not \mathfrak{U}_{21}(0,0)$.

Definition 6.26 Denote by $\mathfrak{U}_{24}(\lambda)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4) and

$$
\begin{align*}
& x p_{1}=\xi p_{1} x, y p_{1}=-p_{1} y, t p_{1}=p_{2} x^{2} t, x p_{2}=-\xi p_{2} x, y p_{2}=-p_{2} y, t p_{2}=p_{1} x^{2} t,  \tag{6.127}\\
& x q_{1}=\xi q_{1} x, y q_{1}=-q_{1} y, t q_{1}=q_{2} x^{2} t, \quad x q_{2}=-\xi q_{2} x, y q_{2}=-q_{2} y, t q_{2}=q_{1} x^{2} t,  \tag{6.128}\\
& p_{1}^{2}=0, \quad p_{2}^{2}=0, \quad p_{1} p_{2}+p_{2} p_{1}=0, \quad q_{1}^{2}=0, \quad q_{2}^{2}=0, \quad q_{1} q_{2}+q_{2} q_{1}=0,  \tag{6.129}\\
& p_{1} q_{1}+q_{1} p_{1}=0, \quad p_{2} q_{2}+q_{2} p_{2}=0,  \tag{6.130}\\
& p_{1} q_{2}+q_{2} p_{1}=\lambda\left(1-x^{2} y\right), \quad p_{2} q_{1}+q_{1} p_{2}=-\lambda\left(1-x^{2} y\right) . \tag{6.131}
\end{align*}
$$

It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{array}{ll}
\triangle\left(p_{1}\right)=p_{1} \otimes 1+y \otimes p_{1}, & \triangle\left(p_{2}\right)=p_{2} \otimes 1+x^{2} \otimes p_{2} \\
\triangle\left(q_{1}\right)=q_{1} \otimes 1+y \otimes q_{1}, & \triangle\left(q_{2}\right)=q_{2} \otimes 1+x^{2} \otimes q_{2}
\end{array}
$$

Definition 6.27 For a set of parameters $I_{26}=\{\lambda, \mu, \alpha\}$, denote by $\mathfrak{U}_{26}\left(I_{26}\right)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4) and

$$
\begin{align*}
& x p_{1}=\xi p_{1} x, y p_{1}=p_{1} y, t p_{1}=p_{2} t, x p_{2}=-\xi p_{2} x, y p_{2}=p_{2} y, t p_{2}=p_{1} t  \tag{6.132}\\
& x q_{1}=\xi q_{1} x, y q_{1}=q_{1} y, t q_{1}=q_{2} t, x q_{2}=-\xi q_{2} x, y q_{2}=q_{2} y, t q_{2}=q_{1} t  \tag{6.133}\\
& p_{1}^{2}=0, \quad p_{2}^{2}=0, \quad p_{1} p_{2}+p_{2} p_{1}=\lambda(1-y)  \tag{6.134}\\
& q_{1}^{2}=0, \quad q_{2}^{2}=0, \quad q_{1} q_{2}+q_{2} q_{1}=\mu(1-y)  \tag{6.135}\\
& p_{1} q_{1}+q_{1} p_{1}=0, \quad p_{2} q_{2}+q_{2} p_{2}=0, \quad p_{1} q_{2}+q_{2} p_{1}=p_{2} q_{1}+q_{1} p_{2}=\alpha(1-y) . \tag{6.136}
\end{align*}
$$

It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{array}{ll}
\triangle\left(p_{1}\right)=p_{1} \otimes 1+x^{2} \otimes p_{1}, & \triangle\left(p_{2}\right)=p_{2} \otimes 1+x^{2} y \otimes p_{2}, \\
\triangle\left(q_{1}\right)=q_{1} \otimes 1+x^{2} \otimes q_{1}, & \triangle\left(q_{2}\right)=q_{2} \otimes 1+x^{2} y \otimes q_{2} .
\end{array}
$$

Definition 6.28 Denote by $\mathfrak{U}_{27}(\lambda, \mu)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4), (6.132), (6.134), (6.135) and

$$
\begin{align*}
& x q_{1}=-\xi q_{1} x, y q_{1}=q_{1} y, t q_{1}=q_{2} t, \quad x q_{2}=\xi q_{2} x, y q_{2}=q_{2} y, t q_{2}=q_{1} t  \tag{6.137}\\
& p_{1} q_{1}+q_{1} p_{1}=0, \quad p_{2} q_{2}+q_{2} p_{2}=0, \quad p_{1} q_{2}+q_{2} p_{1}=0, \quad p_{2} q_{1}+q_{1} p_{2}=0 \tag{6.138}
\end{align*}
$$

It is a Hopf algebra with the same coalgebra structure as $\mathfrak{U}_{26}\left(I_{26}\right)$.
Proposition 6.29 (1) Suppose $A$ is a finite-dimensional Hopf algebra with coradical $H$ such that its infinitesimal braiding is isomorphic to $\Omega_{i}$ for $i \in\{24,26,27\}$, then $A \cong \mathfrak{U}_{24}(\lambda)$ or $\mathfrak{U}_{26}\left(I_{26}\right)$ or $\mathfrak{U}_{27}(\lambda, \mu)$.
(2) $\mathfrak{U}_{24}(\lambda) \cong \mathfrak{U}_{24}(1), \mathfrak{U}_{27}(\lambda, \mu) \cong \mathfrak{U}_{27}(1,1)$ for $\lambda, \mu \neq 0, \mathfrak{U}_{24}(1) \not \equiv \mathfrak{U}_{24}(0)$ and $\mathfrak{U}_{27}(1,1) \nsubseteq$ $\mathfrak{U}_{27}(0,0)$.
(3) $\mathfrak{U}_{26}\left(I_{26}\right) \cong \mathfrak{U}_{26}\left(I_{26}^{\prime}\right)$ if and only if there exist nonzero parameters $a_{1}, a_{2}, b_{1}, b_{2}$ such that

$$
\begin{align*}
& a_{1}^{2} \lambda^{\prime}+2 a_{1} a_{2} \alpha^{\prime}+a_{2}^{2} \mu^{\prime}=\lambda, \quad b_{1}^{2} \lambda^{\prime}+2 b_{1} b_{2} \alpha^{\prime}+b_{2}^{2} \mu^{\prime}=\mu,  \tag{6.139}\\
& a_{1} b_{1} \lambda^{\prime}+\left(a_{1} b_{2}+a_{2} b_{1}\right) \alpha^{\prime}+a_{2} b_{2} \mu^{\prime}=\alpha,
\end{align*}
$$

or satisfying

$$
\begin{align*}
& a_{1}^{2} \lambda^{\prime}+2 a_{1} a_{2} \alpha^{\prime}+a_{2}^{2} \mu^{\prime}=-\xi \lambda, \quad b_{1}^{2} \lambda^{\prime}+2 b_{1} b_{2} \alpha^{\prime}+b_{2}^{2} \mu^{\prime}=-\xi \mu, \\
& a_{1} b_{1} \lambda^{\prime}+\left(a_{1} b_{2}+a_{2} b_{1}\right) \alpha^{\prime}+a_{2} b_{2} \mu^{\prime}=-\xi \alpha, \tag{6.140}
\end{align*}
$$

or satisfying

$$
\begin{align*}
& a_{1}^{2} \lambda^{\prime}+2 a_{1} a_{2} \alpha^{\prime}+a_{2}^{2} \mu^{\prime}=-\lambda, \quad b_{1}^{2} \lambda^{\prime}+2 b_{1} b_{2} \alpha^{\prime}+b_{2}^{2} \mu^{\prime}=-\mu, \\
& a_{1} b_{1} \lambda^{\prime}+\left(a_{1} b_{2}+a_{2} b_{1}\right) \alpha^{\prime}+a_{2} b_{2} \mu^{\prime}=-\alpha, \tag{6.141}
\end{align*}
$$

or satisfying

$$
\begin{align*}
& a_{1}^{2} \lambda^{\prime}+2 a_{1} a_{2} \alpha^{\prime}+a_{2}^{2} \mu^{\prime}=\xi \lambda, \quad b_{1}^{2} \lambda^{\prime}+2 b_{1} b_{2} \alpha^{\prime}+b_{2}^{2} \mu^{\prime}=\xi \mu, \\
& a_{1} b_{1} \lambda^{\prime}+\left(a_{1} b_{2}+a_{2} b_{1}\right) \alpha^{\prime}+a_{2} b_{2} \mu^{\prime}=\xi \alpha . \tag{6.142}
\end{align*}
$$

Proof. (1) We prove the claim for $\Omega_{24}$. The proofs for $\Omega_{26}, \Omega_{27}$ follow the same lines. By Theorem 6.1, we have that $\operatorname{gr}(A) \cong \mathcal{B}\left(\Omega_{24}\right) \sharp H$. Let $M_{13}=\mathbb{k}\left\{p_{1}, p_{2}\right\}=\mathbb{k}\left\{q_{1}, q_{2}\right\}$. Similar to Proposition 6.20, we only need to prove that (6.129) - (6.131) in Definition 6.26 hold in $A$. Since

$$
\begin{array}{ll}
\triangle\left(p_{1}\right)=p_{1} \otimes 1+y \otimes p_{1}, & \triangle\left(p_{2}\right)=p_{2} \otimes 1+x^{2} \otimes p_{2} \\
\triangle\left(q_{1}\right)=q_{1} \otimes 1+y \otimes q_{1}, & \triangle\left(q_{2}\right)=q_{2} \otimes 1+x^{2} \otimes q_{2}
\end{array}
$$

then $p_{1}^{2}, p_{2}^{2}, p_{1} q_{1}+q_{1} p_{1}, p_{2} q_{2}+q_{2} p_{2}$ are primitive elements and

$$
\begin{aligned}
& \triangle\left(p_{1} p_{2}+p_{2} p_{1}\right)=\left(p_{1} p_{2}+p_{2} p_{1}\right) \otimes 1+x^{2} y \otimes\left(p_{1} p_{2}+p_{2} p_{1}\right) \\
& \triangle\left(p_{1} q_{2}+q_{2} p_{1}\right)=\left(p_{1} q_{2}+q_{2} p_{1}\right) \otimes 1+x^{2} y \otimes\left(p_{1} q_{2}+q_{2} p_{1}\right) \\
& \triangle\left(p_{2} q_{1}+q_{1} p_{2}\right)=\left(p_{2} q_{1}+q_{1} p_{2}\right) \otimes 1+x^{2} y \otimes\left(p_{2} q_{1}+q_{1} p_{2}\right)
\end{aligned}
$$

As

$$
t\left(p_{1} p_{2}+p_{2} p_{1}\right)=-\left(p_{1} p_{2}+p_{2} p_{1}\right) t, \quad t\left(p_{1} q_{2}+q_{2} p_{1}\right)=-\left(p_{2} q_{1}+q_{1} p_{2}\right) t
$$

the relations (6.129) - (6.131) hold in $A$. Then there is a surjective Hopf morphism from $\mathfrak{U}_{24}\left(I_{24}\right)$ to $A$. We can observe that each element of $\mathfrak{U}_{24}\left(I_{24}\right)$ can be expressed by a linear combination of $\left\{p_{1}^{i} p_{2}^{j} q_{1}^{k} q_{2}^{l} x^{e} y^{f} t^{g}\right\}$ for all parameters $i, j, k, l, f, g \in \mathbb{I}_{0,1}, e \in \mathbb{I}_{0,3}$. In fact, according to the Diamond Lemma, the set is a basis of $\mathfrak{U}_{24}\left(I_{24}\right)$. Then $\operatorname{dim} A=\operatorname{dim} \mathfrak{U}_{24}\left(I_{24}\right)$, whence $A \cong \mathfrak{U}_{24}\left(I_{24}\right)$.
(2) The proof is the same as that of Proposition 6.20 (4).
(3) Suppose $\Phi: \mathfrak{U}_{26}\left(I_{26}\right) \rightarrow \mathfrak{U}_{26}\left(I_{26}^{\prime}\right)$ is an isomorphism of Hopf algebras. Similar to Proposition 6.20, $\left.\Phi\right|_{H} \in\left\{\tau_{1}-\tau_{8}, \tau_{17}-\tau_{24}\right\}$. When $\left.\Phi\right|_{H} \in\left\{\tau_{1}, \tau_{5}, \tau_{17}, \tau_{21}\right\}$,

$$
\Phi\left(p_{1}\right)=a_{1} p_{1}^{\prime}+a_{2} q_{1}^{\prime}, \quad \Phi\left(p_{2}\right)=a_{1} p_{2}^{\prime}+a_{2} q_{2}^{\prime}, \quad \Phi\left(q_{1}\right)=b_{1} p_{1}^{\prime}+b_{2} q_{1}^{\prime}, \quad \Phi\left(q_{2}\right)=b_{1} p_{2}^{\prime}+b_{2} q_{2}^{\prime},
$$

then the relation (6.139) holds. When $\left.\Phi\right|_{H} \in\left\{\tau_{2}, \tau_{6}, \tau_{18}, \tau_{22}\right\}$,

$$
\Phi\left(p_{1}\right)=a_{1} p_{1}^{\prime}+a_{2} q_{1}^{\prime}, \Phi\left(p_{2}\right)=\xi\left(a_{1} p_{2}^{\prime}+a_{2} q_{2}^{\prime}\right), \Phi\left(q_{1}\right)=b_{1} p_{1}^{\prime}+b_{2} q_{1}^{\prime}, \Phi\left(q_{2}\right)=\xi\left(b_{1} p_{2}^{\prime}+b_{2} q_{2}^{\prime}\right)
$$

then the relation (6.140) holds. When $\left.\Phi\right|_{H} \in\left\{\tau_{3}, \tau_{7}, \tau_{19}, \tau_{23}\right\}$,

$$
\Phi\left(p_{1}\right)=a_{1} p_{1}^{\prime}+a_{2} q_{1}^{\prime}, \Phi\left(p_{2}\right)=-\left(a_{1} p_{2}^{\prime}+a_{2} q_{2}^{\prime}\right), \Phi\left(q_{1}\right)=b_{1} p_{1}^{\prime}+b_{2} q_{1}^{\prime}, \Phi\left(q_{2}\right)=-\left(b_{1} p_{2}^{\prime}+b_{2} q_{2}^{\prime}\right),
$$

then the relation (6.141) holds. When $\left.\Phi\right|_{H} \in\left\{\tau_{4}, \tau_{8}, \tau_{20}, \tau_{24}\right\}$,
$\Phi\left(p_{1}\right)=a_{1} p_{1}^{\prime}+a_{2} q_{1}^{\prime}, \Phi\left(p_{2}\right)=-\xi\left(a_{1} p_{2}^{\prime}+a_{2} q_{2}^{\prime}\right), \Phi\left(q_{1}\right)=b_{1} p_{1}^{\prime}+b_{2} q_{1}^{\prime}, \Phi\left(q_{2}\right)=-\xi\left(b_{1} p_{2}^{\prime}+b_{2} q_{2}^{\prime}\right)$,
then the relation (6.142) holds.

Proposition 6.30 Suppose $A$ is a finite-dimensional Hopf algebra with coradical $H$ such that its infinitesimal braiding is $\Omega_{25}$, then $A \cong \mathcal{B}\left(\Omega_{25}\right) \sharp H$.

Proof. Let $M_{13}=\mathbb{k}\left\{p_{1}, p_{2}\right\}, M_{14}=\mathbb{k}\left\{q_{1}, q_{2}\right\}$. By Theorem 6.1, we have that $\operatorname{gr}(A) \cong$ $\mathcal{B}\left(\Omega_{25}\right) \sharp H$. Recall that $\mathcal{B}\left(\Omega_{25}\right) \sharp H$ is the algebra generated by $p_{1}, p_{2}, q_{1}, q_{2}, x, y, t$ with $p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relation of $\mathcal{B}\left(\Omega_{25}\right), x, y, t$ satisfying the relations of $H$, and all together satisfying the cross relations:

$$
\begin{aligned}
& x p_{1}=\xi p_{1} x, \quad y p_{1}=-p_{1} y, \quad t p_{1}=p_{2} x^{2} t \quad x p_{2}=-\xi p_{2} x, \quad y p_{2}=-p_{2} y, \quad t p_{2}=p_{1} x^{2} t, \\
& x q_{1}=-\xi q_{1} x, \quad y q_{1}=-q_{1} y, \quad t q_{1}=q_{2} x^{2} t \quad x q_{2}=\xi q_{2} x, \quad y q_{2}=-q_{2} y, \quad t q_{2}=q_{1} x^{2} t
\end{aligned}
$$

By Proposition 6.29 (1), we know that the relations $p_{1}^{2}=0, p_{2}^{2}=0, p_{1} p_{2}+p_{2} p_{1}=0$ hold in $A$. Similarly, the relations $q_{1}^{2}=0, q_{2}^{2}=0, q_{1} q_{2}+q_{2} q_{1}=0$ hold in $A$. After a direct computation, $p_{1} q_{1}+q_{1} p_{1}, p_{2} q_{2}+q_{2} p_{2}$ are primitive elements and $p_{1} q_{2}+q_{2} p_{1}, p_{2} q_{1}+q_{1} p_{2}$ are ( $1, x^{2} y$ )-skew primitive. As

$$
x\left(p_{1} q_{2}+q_{2} p_{1}\right)=-\left(p_{1} q_{2}+q_{2} p_{1}\right) x, \quad x\left(p_{2} q_{1}+q_{1} p_{2}\right)=-\left(p_{2} q_{1}+q_{1} p_{2}\right) x
$$

then the relations

$$
p_{1} q_{1}+q_{1} p_{1}=0, \quad p_{2} q_{2}+q_{2} p_{2}=0, \quad p_{1} q_{2}+q_{2} p_{1}=0, \quad p_{2} q_{1}+q_{1} p_{2}=0
$$

hold in $A$. Therefore, $A \cong \operatorname{gr}(A)$.

Definition 6.31 For a set of parameters $I_{28}=\{\lambda, \mu, \alpha\}$, denote by $\mathfrak{U}_{28}\left(I_{28}\right)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4), (6.132), (6.133) and
$p_{1}^{2}+p_{2}^{2}=0, \quad p_{1} p_{2}=p_{2} p_{1}=\lambda(1-y), \quad q_{1}^{2}+q_{2}^{2}=0, \quad q_{1} q_{2}=q_{2} q_{1}=\mu(1-y)$,
$p_{1} q_{1}+q_{1} p_{1}+p_{2} q_{2}+q_{2} p_{2}=0, \quad p_{1} q_{2}+q_{2} p_{1}+p_{2} q_{1}+q_{1} p_{2}=\alpha(1-y)$,
$p_{1} q_{1}-q_{1} p_{1}-p_{2} q_{2}+q_{2} p_{2}=0, \quad p_{1} q_{2}-q_{2} p_{1}-p_{2} q_{1}+q_{1} p_{2}=0$.
It is a Hopf algebra with its coalgebra structure determined by

$$
\begin{aligned}
& \triangle\left(p_{1}\right)=p_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) t \otimes p_{1}-\frac{1}{2}\left(1-x^{2}\right) y t \otimes p_{2} \\
& \triangle\left(p_{2}\right)=p_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y t \otimes p_{2}-\frac{1}{2}\left(1-x^{2}\right) t \otimes p_{1} \\
& \triangle\left(q_{1}\right)=q_{1} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) t \otimes q_{1}-\frac{1}{2}\left(1-x^{2}\right) y t \otimes q_{2} \\
& \triangle\left(q_{2}\right)=q_{2} \otimes 1+\frac{1}{2}\left(1+x^{2}\right) y t \otimes q_{2}-\frac{1}{2}\left(1-x^{2}\right) t \otimes q_{1}
\end{aligned}
$$

Definition 6.32 Denote by $\mathfrak{U}_{29}(\lambda, \mu)$ the algebra that is generated by $x, y, t, p_{1}, p_{2}, q_{1}, q_{2}$ satisfying the relations (3.2) - (3.4), (6.132), (6.137), (6.143), (6.145) and
$p_{1} q_{1}+q_{1} p_{1}+p_{2} q_{2}+q_{2} p_{2}=0, \quad p_{1} q_{2}+q_{2} p_{1}+p_{2} q_{1}+q_{1} p_{2}=0$.
It is a Hopf algebra with the same coalgebra structure as $\mathfrak{U}_{28}\left(I_{28}\right)$.
Proposition 6.33 (1) Suppose $A$ is a finite-dimensional Hopf algebra with coradical $H$ such that its infinitesimal braiding is isomorphic to $\Omega_{28}$ or $\Omega_{29}$, then $A \cong \mathfrak{U}_{28}\left(I_{28}\right)$ or $\mathfrak{U}_{29}(\lambda, \mu)$.
(2) $\mathfrak{U}_{28}\left(I_{28}\right) \cong \mathfrak{U}_{28}\left(I_{28}^{\prime}\right)$ if and only if there exist nonzero parameters $a_{1}, a_{2}, b_{1}, b_{2}$ such that

$$
\begin{align*}
& a_{1}^{2} \lambda^{\prime}+\frac{1}{2} a_{1} a_{2} \alpha^{\prime}+a_{2}^{2} \mu^{\prime}=\lambda, \quad b_{1}^{2} \lambda^{\prime}+\frac{1}{2} b_{1} b_{2} \alpha^{\prime}+b_{2}^{2} \mu^{\prime}=\mu,  \tag{6.147}\\
& 4 a_{1} b_{1} \lambda^{\prime}+\left(a_{1} b_{2}+a_{2} b_{1}\right) \alpha^{\prime}+4 a_{2} b_{2} \mu^{\prime}=\alpha,
\end{align*}
$$

or satisfying

$$
\begin{align*}
& a_{1}^{2} \lambda^{\prime}+\frac{1}{2} a_{1} a_{2} \alpha^{\prime}+a_{2}^{2} \mu^{\prime}=-\lambda, \quad b_{1}^{2} \lambda^{\prime}+\frac{1}{2} b_{1} b_{2} \alpha^{\prime}+b_{2}^{2} \mu^{\prime}=-\mu,  \tag{6.148}\\
& 4 a_{1} b_{1} \lambda^{\prime}+\left(a_{1} b_{2}+a_{2} b_{1}\right) \alpha^{\prime}+4 a_{2} b_{2} \mu^{\prime}=-\alpha .
\end{align*}
$$

(3) $\mathfrak{U}_{29}(\lambda, \mu) \cong \mathfrak{U}_{29}(1,1)$ for $\lambda, \mu \neq 0$, and $\mathfrak{U}_{29}(1,1) \not \nexists \mathfrak{U}_{29}(0,0)$.

Proof. (1) We prove the claim for $\Omega_{28}$. The proof for $\Omega_{29}$ follows the same lines. By Theorem 6.1, we have that $\operatorname{gr}(A) \cong \mathcal{B}\left(\Omega_{28}\right) \sharp H$. Let $M_{17}=\mathbb{k}\left\{p_{1}, p_{2}\right\}=\mathbb{k}\left\{q_{1}, q_{2}\right\}$. Similar to Proposition 6.20, we only need to prove that (6.143) - (6.145) in Definition 6.31 hold in $A$. Let $u=p_{1} q_{1}-q_{1} p_{1}-p_{2} q_{2}+q_{2} p_{2}, v=p_{1} q_{2}+q_{2} p_{1}+p_{2} q_{1}+q_{1} p_{2}, w=p_{1} q_{2}-q_{2} p_{1}-p_{2} q_{1}+q_{1} p_{2}$.

After a direct computation we have that $p_{1}^{2}+p_{2}^{2}, q_{1}^{2}+q_{2}^{2}, p_{1} q_{1}+q_{1} p_{1}+p_{2} q_{2}+q_{2} p_{2}$ are primitive elements and

$$
\begin{aligned}
& \triangle\left(p_{1} p_{2}+p_{2} p_{1}\right)=\left(p_{1} p_{2}+p_{2} p_{1}\right) \otimes 1+y \otimes\left(p_{1} p_{2}+p_{2} p_{1}\right), \\
& \triangle\left(p_{1} p_{2}-p_{2} p_{1}\right)=\left(p_{1} p_{2}-p_{2} p_{1}\right) \otimes 1+x^{2} y \otimes\left(p_{1} p_{2}-p_{2} p_{1}\right), \\
& \triangle(u)=u \otimes 1+x^{2} \otimes u, \triangle(v)=v \otimes 1+y \otimes v, \triangle(w)=w \otimes 1+x^{2} y \otimes w .
\end{aligned}
$$

As

$$
t\left(p_{1} p_{2}-p_{2} p_{1}\right)=-\left(p_{1} p_{2}-p_{2} p_{1}\right) t, \quad t u=-u t, \quad t w=-w t
$$

the relations (6.143) - (6.145) hold in $A$. Then there is a surjective Hopf homomorphism from $\mathfrak{U}_{28}\left(I_{28}\right)$ to $A$. We can observe that all elements of $\mathfrak{U}_{28}\left(I_{28}\right)$ can be expressed by linear combinations of

$$
\left\{\left(p_{1}+p_{2}\right)^{i}\left(p_{1}-p_{2}\right)^{j}\left(q_{1}+q_{2}\right)^{k}\left(q_{1}-q_{2}\right)^{l} x^{e} y^{f} t^{g} ; i, j, k, l, f, g \in \mathbb{I}_{0,1}, e \in \mathbb{I}_{0,3}\right\} .
$$

In fact, according to the Diamond Lemma, the set is a basis of $\mathfrak{U}_{28}\left(I_{28}\right)$. Then $\operatorname{dim} A=$ $\operatorname{dim} \mathfrak{U}_{28}\left(I_{28}\right)$, whence $A \cong \mathfrak{U}_{28}\left(I_{28}\right)$.
(2) Suppose $\Phi: \mathfrak{U}_{28}\left(I_{28}\right) \rightarrow \mathfrak{U}_{28}\left(I_{28}^{\prime}\right)$ is an isomorphism of Hopf algebras. Similar to Proposition 6.20, $\left.\Phi\right|_{H} \in\left\{\tau_{1}, \tau_{3}, \tau_{13}, \tau_{15}, \tau_{17}, \tau_{19}, \tau_{29}, \tau_{31}\right\}$. When $\left.\Phi\right|_{H} \in\left\{\tau_{1}, \tau_{17}\right\}$, then

$$
\Phi\left(p_{1}\right)=a_{1} p_{1}^{\prime}+a_{2} q_{1}^{\prime}, \quad \Phi\left(p_{2}\right)=a_{1} p_{2}^{\prime}+a_{2} q_{2}^{\prime}, \quad \Phi\left(q_{1}\right)=b_{1} p_{1}^{\prime}+b_{2} q_{1}^{\prime}, \quad \Phi\left(q_{2}\right)=b_{1} p_{2}^{\prime}+b_{2} q_{2}^{\prime} ;
$$

when $\left.\Phi\right|_{H} \in\left\{\tau_{13}, \tau_{29}\right\}$, then

$$
\Phi\left(p_{1}\right)=a_{1} p_{2}^{\prime}+a_{2} q_{2}^{\prime}, \Phi\left(p_{2}\right)=a_{1} p_{1}^{\prime}+a_{2} q_{1}^{\prime}, \Phi\left(q_{1}\right)=b_{1} p_{2}^{\prime}+b_{2} q_{2}^{\prime}, \Phi\left(q_{2}\right)=b_{1} p_{1}^{\prime}+b_{2} q_{1}^{\prime},
$$

thus the relation (6.147) holds. When $\left.\Phi\right|_{H} \in\left\{\tau_{3}, \tau_{19}\right\}$, then

$$
\Phi\left(p_{1}\right)=a_{1} p_{1}^{\prime}+a_{2} q_{1}^{\prime}, \Phi\left(p_{2}\right)=-a_{1} p_{2}^{\prime}-a_{2} q_{2}^{\prime}, \Phi\left(q_{1}\right)=b_{1} p_{1}^{\prime}+b_{2} q_{1}^{\prime}, \Phi\left(q_{2}\right)=-b_{1} p_{2}^{\prime}-b_{2} q_{2}^{\prime} ;
$$

when $\left.\Phi\right|_{H} \in\left\{\tau_{15}, \tau_{31}\right\}$, then

$$
\Phi\left(p_{1}\right)=a_{1} p_{2}^{\prime}+a_{2} q_{2}^{\prime}, \Phi\left(p_{2}\right)=-a_{1} p_{1}^{\prime}-a_{2} q_{1}^{\prime}, \Phi\left(q_{1}\right)=b_{1} p_{2}^{\prime}+b_{2} q_{2}^{\prime}, \Phi\left(q_{2}\right)=-b_{1} p_{1}^{\prime}-b_{2} q_{1}^{\prime},
$$

thus the relation (6.148) holds.
(3) The proof is the same as that of Proposition 6.20 (4).

Proof of Theorem B. Let $M$ be one of the Yetter-Drinfeld modules listed in Theorem A. Let $A$ be a finite-dimensional Hopf algebra over $H$ such that its infinitesimal braiding is isomorphic to $M$. By Theorem 6.1, $\operatorname{gr} A \cong \mathcal{B}(M) \sharp H$. Propositions 6.6, 6.10, 6.13, 6.20, 6.25, 6.29, 6.30, 6.33 finish the proof.

## ACKNOWLEDGMENT

The authors would like to thank Dr. Yuxing Shi and Dr. Rongchuan Xiong for their helpful discussions. The first author is indebted to Dr. Jiao Zhang for her seminar. The second author is supported by NSERC of Canada. The third author is supported by the NSFC (Grant No. 11771142) and in part by the Science and Technology Commission of Shanghai Municipality (No. 18dz2271000).
