mongkhon@kku.ac.th

Abstract

The \(q\)-integer is the polynomial \([n]_q = 1 + q + q^2 + \cdots + q^{n-1}\). For every sequences of polynomials \(S = \{s_m(q)\}_{m=1}^{\infty}, T = \{t_m(q)\}_{m=1}^{\infty}, U = \{u_m(q)\}_{m=1}^{\infty}\) and \(V = \{v_m(q)\}_{m=1}^{\infty}\), define an addition rule for three \(q\)-integers by

\[\oplus S, T, U, V([m]_q, [n]_q, [k]_q) = s_m(q)[m]_q + t_m(q)[n]_q + u_m(q)[k]_q + v_m(q)[n]_q[k]_q.\]

This is called the first kind of quadratic addition rule for three \(q\)-integers, if

\[\oplus S, T, U, V([m]_q, [n]_q, [k]_q) = [m + n + k]_q\]

for all positive integers \(m, n, k\).

In this paper the first kind of quadratic addition rules for three \(q\)-integers are determined when \(s_m(q) \equiv 1\). Moreover, the solution of the functional equation for a sequence of polynomials \(\{f_n(q)\}_{n=1}^{\infty}\) given by

\[f_{m+n+k}(q) = f_m(q) + q^n f_n(q) + q^m f_k(q) + q^{m+n} f_{k-1}(q)f_{n-1}(q),\]

for all positive integers \(m, n, k\), are computed.

Mathematics Subject Classification: 30B12, 81R50, 11B13
Keywords: linear addition rule, quantum addition rule, \(q\)-polynomial, \(q\)-series

1 Introduction

For every positive integer \(n\), the \(q\)-integer \([n]_q\) is the polynomial

\([n]_q = 1 + q + q^2 + \cdots + q^{n-1}\)

and define \([0]_q = 0\). These polynomials appear in many contexts such as in quantum calculus Kac and Cheung (2001), and quantum groups Kassel (2012).

From the fact that \([m + n]_q = [m]_q + q^n [n]_q\) for all positive integers \(m\) and \(n\), Nathanson (2007) defined the linear addition rule for \(q\)-integers by

\([m]_q \oplus \ell [n]_q = [m]_q + q^m [n]_q\)

for all positive integers \(m\) and \(n\). Associated to the linear addition rule for \(q\)-integers, the functional equation for a sequence of polynomials \(\{f_n(q)\}_{n=1}^{\infty}\), given by

\[f_{m+n}(q) = f_m(q) + q^m f_n(q),\]

were also studied. The solution of this equation are defined by \(f_n(q) = [n]_q f_1(q)\).
From two observations that \( m + n_q = [m]_q + [n]_q + (q - 1) [m]_q [n]_q \) and that \([m + n]_q = [m]_q + [n]_q + (q - 1) [m]_q [n]_q \) for all positive integers \( m \) and \( n \), Kontorovich and Nathanson (2006) defined two non-linear addition rules for \( q \)-integers, respectively, by
\[
[m]_q +_1 [n]_q = [m]_q + [n]_q + (q - 1) [m]_q [n]_q ,
\]
\[
[m]_q +_2 [n]_q = q^n [m]_q + q^m [n]_q + (1 - q) [m]_q [n]_q ,
\]
for all positive integers \( m \) and \( n \). These give the corresponding two functional equations on a sequence of polynomials \( \{f_n(q)\}_{n=1}^{\infty} \), given by
\[
f_{m+n}(q) = f_m(q) + f_n(q) + (q - 1) f_m(q) f_n(q) ,
\]
\[
f_{m+n}(q) = q^n f_m(q) + q^m f_n(q) + (1 - q) f_m(q) f_n(q) ,
\]
whose solutions are defined, respectively, by
\[
f_n(q) = \frac{1 - \{1 + (q - 1)f_1(q)\}^n}{1 - q} ,
\]
\[
f_n(q) = \frac{\{q + (1 - q)f_1(q)\}^n - q^n}{1 - q} .
\]

Moreover, Nathanson (2003) defined the multiplication rule for \( q \)-integers and considered the associated polynomial functional equation. Many articles contained solutions of the multiplicative functional equations, for examples Nguyen (2013, 2012, 2010a,b); Nathanson (2004).

In this paper, we consider an addition rule for three \( q \)-integers which is a mixed type of linear addition rule and the first kind of quadratic addition rule, given by
\[
\oplus \left( [m]_q , [n]_q , [k]_q \right) = [m]_q \oplus t \left( [n]_q \oplus_1 [k]_q \right)
\]
for all positive integers \( m, n, k \), or equivalently,
\[
\oplus \left( [m]_q , [n]_q , [k]_q \right) = [m]_q + q^m [n]_q + q^m [k]_q + q^m (q - 1) [n]_q [k]_q .
\]

Furthermore, we shall compute the solution of the functional equation
\[
f_{m+n+k}(q) = f_m(q) + q^n f_n(q) + q^m f_k(q) + q^m (q - 1) f_n(q) f_k(q)
\]
on a sequence of polynomials \( \{f_n(q)\}_{n=1}^{\infty} \).

2 Quadratic addition rules

For every sequences of polynomials \( S = \{s_m(q)\}_{m=1}^{\infty} , \ T = \{t_m(q)\}_{m=1}^{\infty} , \ U = \{u_m(q)\}_{m=1}^{\infty} \) and \( V = \{v_m(q)\}_{m=1}^{\infty} \), define an addition rule for three \( q \)-integers by
\[
\oplus_{S,T,U,V} \left( [m]_q , [n]_q , [k]_q \right) = s_m(q) [m]_q + t_m(q) [n]_q + u_m(q) [k]_q + v_m(q) [n]_q [k]_q .
\]
This is called the first kind of quadratic addition rule for three \( q \)-integers, if
\[
\oplus_{S,T,U,V} \left( [m]_q , [n]_q , [k]_q \right) = [m + n + k]_q
\]
for all positive integers \( m, n \) and \( k \).
Theorem 1. For every sequence of constants $A = \{a_m\}_{m=1}^{\infty}$, and three sequences of polynomials $T = \{t_m(q)\}_{m=1}^{\infty}$, $U = \{u_m(q)\}_{m=1}^{\infty}$, $V = \{v_m(q)\}_{m=1}^{\infty}$, the $\oplus_{A,T,U,V}$ is the first kind of quadratic addition rule for three $q$-integers if and only if $a_m = 1$, $t_m(q) = u_m(q) = q^m$, and $v_m(q) = q^m(q-1)$ for all positive integers $m$.

Proof. Let $\oplus_{A,T,U,V}$ be the first kind of quadratic addition rule for three $q$-integers. Thus

\[
[m + n + k]_q = a_m [m]_q + t_m(q) [n]_q + u_m(q) [k]_q + v_m(q) [n]_q [k]_q
\]

for all positive integers $m, n, k$. For all positive integers $m$ and $n$, we have

\[
[m + n + 1]_q = a_m [m]_q + t_m(q) [n]_q + u_m(q) [1]_q + v_m(q) [n]_q [1]_q
\]

and

\[
[m + 1 + n]_q = a_m [m]_q + t_m(q) [1]_q + u_m(q) [n]_q + v_m(q) [1]_q [n]_q
\]

Subtracting, we obtain

\[
0 = t_m(q) \left( [n]_q - [1]_q \right) - u_m(q) \left( [n]_q - [1]_q \right),
\]

which implies that $t_m(q) = u_m(q)$ for all $m \geq 1$. For all positive integers $m$, we have

\[
[m + 1 + 1]_q = a_m [m]_q + t_m(q) [1]_q + u_m(q) [1]_q + v_m(q) [1]_q [1]_q
\]

and

\[
[m + 1 + 2]_q = a_m [m]_q + t_m(q) [1]_q + u_m(q) [2]_q + v_m(q) [1]_q [2]_q
\]

Subtracting, we obtain

\[
q^{m+2} = qu_m(q) + qv_m(q),
\]

it follows that $v_m(q) = q^{m+1} - u_m(q)$ for all $m$. Now, the equation (1) can be expanded to

\[
[m + n + k]_q = a_m [m]_q + u_m(q) [n]_q + u_m(q) [k]_q + (q^{m+1} - u_m(q)) [n]_q [k]_q
\]

for all positive integers $m, n, k$. For all positive integers $m$, we obtain

\[
[m + 1 + 1]_q = a_m [m]_q + u_m(q) [1]_q + u_m(q) [1]_q + (q^{m+1} - u_m(q)) [1]_q [1]_q.
\]

From this fact, we can show that

\[
[m + 1 + 1]_q = a_m [m]_q + u_m(q) + q^{m+1}
\]

and so that

\[
[m + 1]_q = a_m [m]_q + u_m(q).\]
Then, \( u_m(q) = q^m + (1 - a_m) [m]_q \) and \( v_m(q) = q^m(q - 1) + (a_m - 1) [m]_q \). By replacing \( u_m(q) \) and \( v_m(q) \) in (1),

\[
[m + n + k]_q = a_m [m]_q + q^m [n]_q + (1 - a_m) [m]_q [n]_q + q^m [k]_q + (1 - a_m) [m]_q [k]_q + q^m(q - 1) [n]_q[k]_q + (a_m - 1) [m]_q [n]_q[k]_q
\]

\[
= [m]_q + q^m [n]_q + q^m [k]_q + q^m(q - 1) [n]_q[k]_q + (a_m - 1) [m]_q \left( 1 - [n]_q - [k]_q + [n]_q[k]_q \right)
\]

\[
= [m + n + k]_q + (a_m - 1) [m]_q \left( 1 - [n]_q - [k]_q + [n]_q[k]_q \right),
\]

we can see that \( 0 = (a_m - 1) [m]_q \left( 1 - [n]_q - [k]_q + [n]_q[k]_q \right) \) for all \( m, n, k \geq 1 \). Therefore \( a_m = 1 \), and hence \( t_m(q) = u_m(q) = q^m \), \( v_m(q) = q^m(q-1) \) for all positive integers \( m \).

\[\square\]

**Theorem 2.** For every sequences of polynomials \( S = \{s_m\}_{m=1}^{\infty} \), \( T = \{t_m(q)\}_{m=1}^{\infty} \), \( U = \{u_m(q)\}_{m=1}^{\infty} \), \( V = \{v_m(q)\}_{m=1}^{\infty} \), if there exists a positive integer \( m \) such that the degree of a polynomial \( s_m(q) \) is greater than 2, then \( \oplus_{S,T,U,V} \) is not the first kind of quadratic addition rule for three \( q \)-integers.

**Proof.** Suppose that \( \deg s_m(q) > 2 \) for some positive integer \( m \geq 1 \), and that \( \oplus_{S,T,U,V} \) is the first kind of quadratic addition rule for three \( q \)-integers. Then

\[
[m + n + k]_q = s_m(q) [m]_q + t_m(q) [n]_q + u_m(q) [k]_q + v_m(q) [n]_q[k]_q
\]

for all positive integers \( m, n, k \). In the proof of Theorem 1, it is easy to see that \( t_m(q) = u_m(q), v_m(q) = q^{m+1} - u_m(q), \) and \( u_m(q) = [m+1]_q - s_m(q) [m]_q \) for all \( m \geq 1 \). So, we get

\[
\deg u_m(q) = \deg s_m(q) [m]_q > m + 1,
\]

\[
\deg u_m(q) > \deg s_m(q),
\]

\[
\deg v_m(q) = \deg u_m(q) > m + 1,
\]

which implies that

\[
\deg s_m(q) [m]_q = \deg s_m(q) + (m-1) < \deg u_m(q) + (m-1),
\]

\[
\deg t_m(q) [n]_q = \deg u_m(q) + (n-1),
\]

\[
\deg u_m(q) [k]_q = \deg u_m(q) + (k-1),
\]

\[
\deg v_m(q) [n]_q[k]_q = \deg u_m(q) + (n-1) + (k-1).
\]

In the case of \( m < n + k - 1 \), we have

\[
\deg [m + n + k]_q = m + n + k - 1
\]

\[
< \deg u_m(q) + (n-1) + (k-1) = \deg v_m(q) [n]_q[k]_q
\]

\[
= \deg \left( s_m(q) [m]_q + t_m(q) [n]_q + u_m(q) [k]_q + v_m(q) [n]_q[k]_q \right),
\]

a contradiction. \[\square\]
3 Zero identity

For every double sequence of polynomial $\mathcal{R} = \{r'_{m,n}(q)\}_{m,n=1}^\infty$, and sequences of polynomials $\mathcal{S} = \{s'_m(q)\}_{m=1}^\infty$, $\mathcal{T} = \{t'_m(q)\}_{m=1}^\infty$, $\mathcal{U} = \{u'_m(q)\}_{m=1}^\infty$, $\mathcal{V} = \{v'_m(q)\}_{m=1}^\infty$, $\mathcal{W} = \{w'_m(q)\}_{m=1}^\infty$, define an addition rule for three $q$-integers by

$$\oplus_{\mathcal{R},\mathcal{US},\mathcal{VT},\mathcal{W}} r'_{n,k}(q) [m]_q + u'_m(q)s'_k(q) [n]_q + v'_m(q)t'_n(q) [k]_q + w'_m(q) [n]_q [k]_q.$$

This is called the first kind of quadratic zero identity for three $q$-integers, if

$$\oplus_{\mathcal{R},\mathcal{US},\mathcal{VT},\mathcal{W}} ([m]_q, [n]_q, [k]_q) = 0$$

for all positive integers $m$, $n$ and $k$.

**Theorem 3.** For every double sequence of polynomial $\mathcal{R} = \{r'_{m,n}(q)\}_{m,n=1}^\infty$, three sequences of polynomials $\mathcal{S} = \{s'_m(q)\}_{m=1}^\infty$, $\mathcal{T} = \{t'_m(q)\}_{m=1}^\infty$, $\mathcal{W} = \{w'_m(q)\}_{m=1}^\infty$, and two sequences of polynomials $\mathcal{U} = \{u'_m(q)\}_{m=1}^\infty$ and $\mathcal{V} = \{v'_m(q)\}_{m=1}^\infty$ with the initial constants $u'_1(q) \equiv u$ and $v'_1(q) \equiv v$, respectively, the $\oplus_{\mathcal{R},\mathcal{US},\mathcal{VT},\mathcal{W}}$ is the first kind of quadratic zero identity for three $q$-integers if and only if

$$r'_{n,k}(q) = r_{1,k}(q) [n]_q + r_{n,1}(q) [k]_q - r(q) [n]_q [k]_q,$$

$$s'_k(q) = -\frac{1}{u} \left\{ r_{1,k}(q) - r(q) [k]_q - us(q) [k]_q \right\},$$

$$t'_n(q) = -\frac{1}{v} \left\{ r_{n,1}(q) - r(q) [n]_q - vt(q) [n]_q \right\},$$

$$u'_m(q) = u [m]_q,$$

$$v'_m(q) = v [m]_q,$$

$$w'_m(q) = -\{r(q) + us(q) + vt(q)\} [m]_q,$$

for some initial polynomials $s(q)$, $t(q)$, and two sequences of polynomials $\{r_{1,k}(q)\}_{k=1}^\infty$, $\{r_{n,1}(q)\}_{n=1}^\infty$ with a common initial polynomial $r(q) = r_{1,1}(q)$.

**Proof.** Let $\oplus_{\mathcal{R},\mathcal{US},\mathcal{VT},\mathcal{W}}$ be the first kind of quadratic zero identity for three $q$-integers. Thus

$$r'_{n,k}(q) [m]_q + u'_m(q)s'_k(q) [n]_q + v'_m(q)t'_n(q) [k]_q + w'_m(q) [n]_q [k]_q = 0$$

for all positive integers $m, n, k$. Choose $r(q) = r'_{1,1}(q)$, $s(q) = s'_1(q)$ and $t(q) = t'_1(q)$ from the initial polynomials of the sequences $\mathcal{R}$, $\mathcal{S}$, $\mathcal{T}$, respectively. For $m = 1$, set $w(q) = w'_1(q)$, we have that for all positive integers $n$ and $k$,

$$r'_{n,k}(q) [1]_q + u_1s'_k(q) [n]_q + v_1t'_n(q) [k]_q + w(q) [n]_q [k]_q = 0.$$

For $m = 1$ and $n = 1$, choose $r_{1,k}(q) = r'_{1,k}(q)$, we obtain

$$r_{1,k}(q) [1]_q + u_1s'_k(q) [1]_q + v_1t(q) [k]_q + w(q) [1]_q [k]_q = 0,$$
so that for all \( k \geq 1 \),
\[
s'_k(q) = -\frac{1}{u} \left\{ r_{1,k}(q) + vt(q) [k]_q + w(q) [k]_q \right\}.
\] (4)

For \( m = 1 \) and \( k = 1 \), choose \( r_{n,1}(q) = r'_{n,1}(q) \), we also obtain
\[
r_{n,1}(q) [1]_q + us(q) [n]_q + vt_{n}(q) [1]_q + w(q) [n]_q [1]_q = 0,
\]
and so that for all \( n \geq 1 \),
\[
t'_n(q) = -\frac{1}{v} \left\{ r_{n,1}(q) + us(q) [n]_q + w(q) [n]_q \right\}. \tag{5}
\]

Replacing (4) and (5) in (3), we can see that for all positive integers \( n \) and \( k \),
\[
r'_{n,k}(q) = r_{1,k}(q) [n]_q + r_{n,1}(q) [k]_q - r(q) [n]_q [k]_q.
\] (6)

For \( m = 1, n = 1 \) and \( k = 1 \), the quadratic zero identity (2) can be reduced to
\[
r(q) [1]_q + us(q) [1]_q + vt(q) [1]_q + w(q) [1]_q [1]_q = 0,
\]
this implies that
\[
w(q) = - \{ r(q) + us(q) + vt(q) \}. \tag{7}
\]

By replacing (7) in (6), (4) and (5), respectively, we obtain
\[
r'_{n,k}(q) = r_{1,k}(q) [n]_q + r_{n,1}(q) [k]_q - r(q) [n]_q [k]_q,
\]
\[
s'_k(q) = -\frac{1}{u} \left\{ r_{1,k}(q) - r(q) [k]_q - us(q) [k]_q \right\},
\]
\[
t'_n(q) = -\frac{1}{v} \left\{ r_{n,1}(q) - r(q) [n]_q - vt(q) [n]_q \right\}.
\]

From these relations, the quadratic zero identity (2) can be expanded to
\[
0 = r_{1,k}(q) [n]_q [m]_q + r_{n,1}(q) [k]_q [m]_q - r(q) [n]_q [k]_q [m]_q
\]
\[
- \frac{u'm(q)}{u} r_{1,k}(q) [n]_q + \frac{u'm(q)}{u} r(q) [k]_q [n]_q + u'm(q) s(q) [k]_q [n]_q
\]
\[
- \frac{v'm(q)}{v} r_{n,1}(q) [k]_q + \frac{v'm(q)}{v} r(q) [n]_q [k]_q + v'm(q) t(q) [n]_q [k]_q
\]
Since \( r_{1,k}(q) \) and \( r_{n,1}(q) \) are arbitrary polynomials, we can conclude that
\[
0 = r_{1,k}(q) [n]_q [m]_q - \frac{u'm(q)}{u} r_{1,k}(q) [n]_q,
\]
\[
0 = r_{n,1}(q) [k]_q [m]_q - \frac{v'm(q)}{v} r_{n,1}(q) [k]_q,
\]
which implies that \( u'm(q) = u [m]_q \) and \( v'm(q) = v [m]_q \) for all positive integers \( m \).

Finally, for \( n = 1 \) and \( k = 1 \), the quadratic zero identity (2) can be reduced to
\[
r(q) [m]_q + u'm(q) s(q) [1]_q + v'm(q) t(q) [1]_q + w'm(q) [1]_q [1]_q = 0,
\]
and hence
\[
w'm(q) = - \{ r(q) + us(q) + vt(q) \} [m]_q.
\]
4 Polynomial functional equations

In this section, we shall compute the solution of functional equations for a sequence of polynomials \( \{f_n(q)\}_{n=1}^{\infty} \) associated to the first kind of quadratic addition rules:

\[
f_{m+n+k} = f_m(q) + q^m f_n(q) + q^n f_k(q) + q^{m+n}(q-1)f_n(q)f_k(q)
\]

for all positive integers \( m, n \) and \( k \). This functional equation always has the trivial solutions \( f_n(q) = [n]_q \) for all \( n \geq 1 \), and \( f_n(q) \equiv 0 \) for all positive integers \( n \).

**Theorem 4.** The polynomial functional equation (8) has only trivial solutions.

**Proof.** Suppose that the solution of (8) are given by \( f_n(q) = h(q)[n]_q \) for some polynomial \( h(q) \). Then

\[
f_{n+2}(q) = f_{n+1+1}(q) = f_n(q) + q^n f_1(q) + q^n f_1(q) + q^n(q-1) f_1(q) f_1(q)
\]

\[
= h(q)[n]_q + q^n h(q) [1]_q + q^n h(q) [1]_q + q^n(q-1) h(q) [1]_q h(q) [1]_q
\]

\[
= h(q) \left\{ [n]_q + q^n [1]_q + q^n [1]_q + q^n(q-1) [1]_q [1]_q \right\}
\]

\[
+ q^n(q-1) \left( h^2(q) - h(q) \right) [1]_q [1]_q
\]

\[
= f_{n+2}(q) + q^n(q-1) \left( h^2(q) - h(q) \right) [1]_q [1]_q
\]

So, that \( 0 = q^n(q-1) \left( h^2(q) - h(q) \right) [1]_q [1]_q \), and that \( 0 = h^2(q) - h(q) \). Hence, either \( h(q) \equiv 0 \) or \( h(q) \equiv 1 \). This completes the proof.

5 The second kind of quadratic addition rules

The functional equation for a sequence of polynomials \( \{f_n(q)\}_{n=1}^{\infty} \) is given by

\[
f_{m+n}(q) = f_m(q) + q^m f_n(q)
\] (linear functional eq.)

\[
f_{m+n}(q) = f_m(q) + f_n(q) + (q-1) f_m(q) f_n(q)
\] (quadratic functional eq. I)

\[
f_{m+n}(q) = q^n f_m(q) + q^m f_n(q) + (1-q) f_m(q) f_n(q)
\] (quadratic functional eq. II)
