Some applications of Fibonacci and Lucas numbers

Cristina FLAUT, Diana SAVIN and Gianina ZAHARIA

Abstract. In this paper, we provide new applications of Fibonacci and Lucas numbers. In some circumstances, we find algebraic structures on some sets defined with these numbers, we generalize Fibonacci and Lucas numbers by using an arbitrary binary relation over the real fields instead of addition of the real numbers and we give properties of the new obtained sequences. Moreover, by using some relations between Fibonacci and Lucas numbers, we provide a method to find new examples of split quaternion algebras and we give new properties of these elements.

Key Words: quaternion algebras; Fibonacci numbers; Lucas numbers.

2000 AMS Subject Classification: 11B39, 11R54, 17A35.

1. Introduction

There have been numerous papers devoted to the study of the properties and applications of Fibonacci and Lucas sequences. Due to this fact, to obtain new results in this direction is not always an easy problem. Our purpose in this chapter is to provide new applications of these sequences. Therefore, we studied if some algebraic structures can be defined by using Fibonacci and Lucas elements and we provided some new properties and relations of them.

Moreover, by taking into consideration some known relations between these numbers, we give a method to find new examples of quaternion split algebras. This method can be an easy alternative to using the properties of quadratic forms.

Let \((f_n)_{n \geq 0}\) be the Fibonacci sequence
\[
f_n = f_{n-1} + f_{n-2}, \quad n \geq 2, f_0 = 0; \quad f_1 = 1,
\]
and \((l_n)_{n \geq 0}\) be the Lucas sequence
\[
l_n = l_{n-1} + l_{n-2}, \quad n \geq 2, l_0 = 2; \quad l_1 = 1.
\]

Let \(n\) be an arbitrary positive integer and let \(p, q\) be two arbitrary integers. In the paper [Fl, Sa; 15], we introduced the sequence \((g_n)_{n \geq 1}\), where
\[
g_{n+1} = pf_n + ql_{n+1}, \quad n \geq 0, \tag{1.1}
\]
with \( g_0 = p + 2q, g_1 = q \). We remark that \( g_n = g_{n-1} + g_{n-2} \).

This sequence is called \textit{generalized Fibonacci-Lucas numbers}. To avoid confusions, from now on, we will use the notation \( g_n^p,q \) instead of \( g_n \).

Let \( \mathbb{H}(\alpha, \beta) \) be the generalized real quaternion algebra, i.e. the algebra of the elements of the form \( a = a_1 \cdot 1 + a_2 e_2 + a_3 e_3 + a_4 e_4 \), where \( a_i \in \mathbb{R}, i \in \{1, 2, 3, 4\} \), and the elements of the basis \( \{1, e_2, e_3, e_4\} \) satisfy the following rules, given in the below multiplication table:

\[
\begin{array}{c|cccc}
\cdot & 1 & e_1 & e_2 & e_3 \\
\hline
1 & 1 & e_1 & e_2 & e_3 \\
e_1 & e_1 & \alpha & e_3 \alpha e_2 \\
e_2 & e_2 & -e_3 & \beta & -\beta e_1 \\
e_3 & e_3 & -\alpha e_2 \beta e_1 & -\alpha \beta \\
\end{array}
\]

We denote by \( t(a) \) and \( n(a) \) the \textit{trace} and \textit{the norm} of a quaternion \( a \). The norm of a generalized quaternion has the following expression

\[ n(a) = a_1^2 - \alpha a_2^2 - \beta a_3^2 + \alpha \beta a_4^2. \]  (1.2.)

If, for \( x \in \mathbb{H}(\alpha, \beta) \), the relation \( n(x) = 0 \) implies \( x = 0 \), then the algebra \( \mathbb{H}(\alpha, \beta) \) is called a \textit{division} algebra, otherwise the quaternion algebra is called a \textit{split} algebra. For \( \alpha = \beta = -1 \), we obtain the real division algebra \( \mathbb{H} \).

\section*{2. Preliminaries}

First of all, we recall some elementary properties of the Fibonacci and Lucas numbers, properties which will be used in this chapter.

Let \( (f_n)_{n \geq 0} \) be the Fibonacci sequence and let \( (l_n)_{n \geq 0} \) be the Lucas sequence.

Let \( \alpha = \frac{1 + \sqrt{5}}{2} \) and \( \beta = \frac{1 - \sqrt{5}}{2} \), be two real numbers.

The following formulae are well known:

\textit{Binet’s formula for Fibonacci sequence}

\[ f_n = \frac{\alpha^n - \beta^n}{\alpha - \beta} = \frac{\alpha^n - \beta^n}{\sqrt{5}}, \quad n \in \mathbb{N}. \]

\textit{Binet’s formula for Lucas sequence}

\[ l_n = \alpha^n + \beta^n, \quad n \in \mathbb{N}. \]
Proposition 2.1. ([Fib.]) Let \((f_n)_{n \geq 0}\) be the Fibonacci sequence and let \((l_n)_{n \geq 0}\) be the Lucas sequence. Therefore, the following properties hold:

i) \(5 \mid f_n\) if and only if \(5 \mid n\).

ii) \(f_{2n} = l_n \cdot f_n,\ n \in \mathbb{N}\).

iii) \(f_n^2 + f_{n+1}^2 = f_{2n+1},\ n \in \mathbb{N}\).

iv) \(f_n^2 - f_{n+1}f_{n-1} = (-1)^{n-1}, n \in \mathbb{N}\).

v) \(f_{-n} = (-1)^{n+1} f_n, n \in \mathbb{N}\).

vi) \(l_{-n} = (-1)^n l_n, n \in \mathbb{N}\).

vii) \(l_n^2 = 5f_n^2 + 4(-1)^n, n \in \mathbb{N}\).

viii) \(l_{2n} = l_n^2 + 2(-1)^{n+1}, n \in \mathbb{N}\).

ix) \(l_{2n}l_{2n+2} - 5f_{n+1}^2 = 1, n \in \mathbb{N}\).

x) \(f_{2n} + f_n^2 = 2f_n f_{n+1}, n \in \mathbb{N}\).

xi) \(f_{2n} - f_n^2 = 2f_n f_{n-1}, n \in \mathbb{N}\).

xii) \(l_n^2 - f_n^2 = 4f_{n-1}f_{n+1}, n \in \mathbb{N}\).

xiii) \(f_{2n} = f_{n+1}^2 - f_{n-1}^2, n \in \mathbb{N}\).
\[ l_{4n} = 5f_{2n}^2 + 2, \quad n \in \mathbb{N}. \]

\[ \square \]

**Proposition 2.2.** ([Gi, Sz; 06]). Let \( K \) be a field. Then, the quaternion algebra \( \mathbb{H}_K(a,b) \) is a split algebra if and only if the conic
\[ C(a,b) : ax^2 + by^2 = z^2 \]
has a rational point over \( K^* \), i.e. there are \( x_0, y_0, z_0 \in K^* \) such that \( ax_0^2 + by_0^2 = z_0^2 \). \[ \square \]

### 3. Main results

For the beginning, we want to find some properties of Fibonacci numbers \( f_{5n}, n \in \mathbb{N} \). We start with some examples.

**Example 3.1.** \( f_{10} = 55 = 11f_5 \), \( f_{15} = 610 = 11f_{10} + f_5 = 122f_5 \), \( f_{20} = 11f_{15} + f_{10} = 6765 = 1353f_5 \).

Using the computer algebra system Magma ([Mag.]), by using the function \( \text{Fibonacci}(n) \), we obtain another example.

We get \( f_{65} = 17167680177565 \), \( f_{35} = 9227465 \) and \( f_{65} \div f_{35} = 1860497 \), \( f_{65} \mod f_{35} = 9227460 \) and \( 9227460 \div f_5 = 1845492 \). Therefore, it results that
\[ f_{65} = 1860497f_{35} + 9227460 = 1860497f_{35} + 1845492f_5. \]

**Proposition 3.2.** The set
\[ A = \{ \alpha f_{5n} | n \in \mathbb{N}, \alpha \in \mathbb{Z} \} \]
is a commutative non-unitary ring, with addition and multiplication.

**Proof.** We remark that \( f_0 = 0 \in A \) is the identity element for addition on \( A \). It is clear that the addition on \( A \) is commutative.

We consider the Fibonacci number \( f_{5n} \). If \( n \neq 0 \), there are two cases.

**Case 1.** If \( n \) is even, then \( n = 2k \), where \( k \in \mathbb{N} - \{0\} \). Applying Proposition 2.1 ii), we have that \( f_{5n} = f_{10k} = l_{5k}f_{5k} \). If we denote \( l_{5k} = a \in \mathbb{N} - \{0\} \), we obtain \( f_{5n} = f_{10k} = af_{5k} \) and, applying Proposition 2.1 i), we obtain \( f_{5k} = a'f_5 \), where \( a' \in \mathbb{N} - \{0\} \). It results,
\[ f_{5n} = f_{10k} = af_{5k} = aa'f_5, \quad \text{with} \ a, a' \in \mathbb{N} - \{0\}. \] (3.1)

**Case 2.** If \( n \) is odd, then \( n = 2k + 1 \), where \( k \in \mathbb{N} - \{0\} \). We have
\[ f_{5n} = f_{10k+5} = f_{10k+4} + f_{10k+3} = 2f_{10k+3} + f_{10k+2} = \]
\[ = 3f_{10k+2} + 2f_{10k+1} = 5f_{10k+1} + 3f_{10k} = f_{10k+1}f_5 + 3f_{10k}. \]

If we denote \( f_{10k+1} = a \in \mathbb{N} - \{0\} \), we obtain \( f_{5n} = af_5 + 3f_{10k} \). Applying Proposition 2.1 i), we get \( f_{10k} = bf_5 \), where \( b \in \mathbb{N} - \{0\} \). It results
\[ f_{5n} = f_{10k+5} = af_5 + 3f_{10k} = (a + 3b)f_5, \quad \text{with} \quad a, b \in \mathbb{N} - \{0\}. \quad (3.2) \]

From the relations (3.1) and (3.2), we have that \( \alpha f_{5n} - \beta f_{5m} = \gamma f_{5l} \), for each \( n, m \in \mathbb{N} \) and for each \( \alpha, \beta \in \mathbb{Z}, \gamma \in \mathbb{Z} \). Therefore \((A, +)\) is a subgroup of the group \((\mathbb{Z}, +)\).

Applying Proposition 2.1 i), we obtain that \( \alpha f_{5n} \beta f_{5m} = \delta f_{5r} \), for each \( n, m \in \mathbb{N} \) and for each \( \alpha, \beta, \gamma \in \mathbb{Z}, \delta \in \mathbb{Z} \). From here, it is clear that the multiplication on \( A \) is commutative.

Therefore \((A, +, \cdot)\) is a commutative non-unitary subring of the ring \((\mathbb{Z}, +, \cdot)\). □

Using the above proposition, we obtain the below results.

**Proposition 3.3.** We consider \((g_n^{p,q})_{n \geq 1}\) the generalized Fibonacci-Lucas numbers and the set
\[ M = \left\{ \sum_{i=1}^{n} g_{5n_i}^{p_i,5q_i}, |n_i \in \mathbb{N}, p_i, q_i \in \mathbb{Z} \right\} \cup \{0\}. \]

Then, the following relations are true:
i) \((M, +)\) is a subgroup of the group \((5\mathbb{Z}, +)\).
ii) \(M\) is a bilateral ideal of the ring \((\mathbb{Z}, +, \cdot)\).

**Proof.** Using Proposition 2.1 i), we have \( 5 \mid g_{5n}^{p,5q} \), for all \( n \in \mathbb{N} \) and \( p, q \in \mathbb{Z} \). Let \( n, m \in \mathbb{N} - \{0\} \) and \( p, q, p', q', \alpha, \beta, \gamma \in \mathbb{Z} \). We obtain that
\[ \alpha g_{5n}^{p,5q} + \beta g_{5m}^{p',5q'} = g_{5n}^{\alpha p,5q} + g_{5m}^{\alpha' p',5q'}. \]

From here, we obtain conditions i) and ii). □

**Proposition 3.4.** With the above notations, the following statements are true:
1) The quaternion algebra \( \mathbb{H}_Q \left(f_{10n+5}, -1\right) \) is a split algebra over \( Q, n \in \mathbb{N} \).
2) The quaternion algebra \( \mathbb{H}_Q \left(\frac{1}{2n}, -\frac{1}{2}\right) \) is a split algebra over \( Q, n \in \mathbb{N} \).
3) The quaternion algebra \( \mathbb{H}_Q \left(f_{n+1}f_{n-1}, (-1)^{n-1}\right) \) is a split algebra over \( Q, n \in \mathbb{N} \).
4) The quaternion algebra \( \mathbb{H}_Q (5, (-1)^n) \) is a split algebra over \( Q, n \in \mathbb{N} \).
5) The quaternion algebra \( \mathbb{H}_Q (l_{2n}l_{2n+2}, -5) \) is a split algebra over \( Q, n \in \mathbb{N} \).
6) The quaternion algebra \( \mathbb{H}_Q (2f_nf_{n+1}, -2f_n) \) is a split algebra over \( Q, n \in \mathbb{N} \).
7) The quaternion algebra \( \mathbb{H}_Q (f_{2n}, -2f_nf_{n-1}) \) is a split algebra over \( Q, n \in \mathbb{N} \).
8) The quaternion algebras \( \mathbb{H}_Q \left(f_{n-1}f_{n+1}, f_n^2\right) \) and \( \mathbb{H}_Q \left(1, -f_{n-1}f_{n+1}\right) \) are split algebras over \( Q, n \in \mathbb{N} \).
9) The quaternion algebra \( \mathbb{H}_Q (f_{2n}, 1) \) is a split algebra over \( Q, n \in \mathbb{N} \).
Proof. 1) Applying Proposition 3.4 (i) from [Sa; 19], for \( n \rightarrow 5n + 2 \), we obtain that the quaternion algebra \( \mathbb{H}_Q (f_{10n+5}, -1) \) is a split algebra over \( \mathbb{Q} \), for all \( n \in \mathbb{N} \).

2) For this purpose, we use Proposition 2.2. Therefore, we study if the equation

\[
\frac{1}{5} l_{20n} \cdot x^2 - \frac{2}{5} \cdot y^2 = z^2
\]  

(3.3.)

has rational solutions. From Proposition 2.1 xiv), we have \( l_{20n} = 5f_{10n}^2 + 2 \), for all \( n \in \mathbb{N} \). It results \( \frac{1}{5} l_{20n} - \frac{2}{5} = f_{10n}^2 \), then \( (x_0, y_0, z_0) = (1, 1, f_{10n}) \in \mathbb{Q} \times \mathbb{Q} \times \mathbb{Q} \), is a rational solution of equation (3.3). We obtain that the quaternion algebra \( \mathbb{H}_Q \left( \frac{1}{5} l_{20n}, -\frac{2}{5} \right) \) is a split algebra over \( \mathbb{Q} \), for all \( n \in \mathbb{N} \).

3) Using the same idea, we study if the equation

\[
f_{n+1}f_{n-1}x^2 + (-1)^{n-1}y^2 = z^2
\]  

(3.4.)

has rational solutions. From Proposition 2.1 iv), it results that \( f_n^2 = f_{n+1}f_{n-1} + (-1)^{n-1} \), for all \( n \in \mathbb{N} \), therefore \( (1, 1, f_n) \) is a rational solution of equation (3.4). We obtain that the quaternion algebra \( \mathbb{H}_Q \left( f_{n+1}f_{n-1}, (-1)^{n-1} \right) \) is a split algebra over \( \mathbb{Q} \), for all \( n \in \mathbb{N} \).

4) From Proposition 2.1 vii), we have \( l_n^2 = 5f_n^2 + 4 (-1)^n \) and it results that the equation \( 5x^2 + (-1)^{n-1}y^2 = z^2 \) has \( (f_n, 2, l_n) \) as a rational solution. Therefore, the quaternion algebra \( \mathbb{H}_Q (5, (-1)^n) \) is a split algebra over \( \mathbb{Q} \), for all \( n \in \mathbb{N} \).

5) We study if the equation

\[
l_{2n}l_{2n+2}x^2 - 5y^2 = z^2
\]  

(3.5.)

has rational solutions. From Proposition 2.1 ix), we have \( l_{2n}l_{2n+2} - 5f_{n+1}^2 = 1 \), \( n \in \mathbb{N} \), it results that the pair \( (1, f_{n+1}, 1) \) is a rational solution of the equation (3.5). Therefore, the quaternion algebra \( \mathbb{H}_Q (l_{2n}l_{2n+2}, -5) \) is a split algebra over \( \mathbb{Q} \), for all \( n \in \mathbb{N} \).

6) We study if the equation

\[
2f_nf_{n+1}x^2 - f_{2n}y^2 = z^2
\]  

(3.6.)

has rational solutions. From Proposition 2.1 x), we have that the pair \( (1, 1, f_n) \) is a rational solution of the equation (3.6). Therefore, the quaternion algebra \( \mathbb{H}_Q (2f_nf_{n+1}, -f_{2n}) \) is a split algebra over \( \mathbb{Q} \), for all \( n \in \mathbb{N} \).

7) From Proposition 2.1, xi), the equation

\[
f_{2n}x^2 - 2f_nf_{n-1}y^2 = z^2
\]  

(3.7.)

has the rational solution \( (1, 1, f_n) \), therefore the quaternion algebra \( \mathbb{H}_Q (f_{2n}, -2f_nf_{n-1}) \) is a split algebra over \( \mathbb{Q} \), for all \( n \in \mathbb{N} \).

8) From Proposition 2.1 xii), the equation

\[
f_{n-1}f_{n+1}x^2 + f_n^2y^2 = z^2
\]  

(3.8.)
has the rational solution \((2, 1, l_n)\), therefore the quaternion algebra \(\mathbb{H}_Q (f_{n-1} f_{n+1}, f_n^2)\) is a split algebra over \(Q\), for all \(n \in \mathbb{N}\).

In the same way, the equation

\[
x^2 - f_{n-1} f_{n+1} y^2 = z^2
\]

has the rational solution \((l_n, 2, f_n)\), therefore the quaternion algebra \(\mathbb{H}_Q (1, -f_{n-1} f_{n+1})\) is a split algebra over \(Q\), for all \(n \in \mathbb{N}\).

9) From Proposition 2.1 xiii), the equation

\[
f_{2n} x^2 + y^2 = f_{n+1}^2
\]

has the rational solution \((1, f_{n-1}, f_{n+1})\), therefore the quaternion algebra \(\mathbb{H}_Q (f_{2n}, 1)\) is a split algebra over \(Q\), for all \(n \in \mathbb{N}\). \(\square\)

Let \(\mathbb{H} (\alpha, \beta)\) be the generalized real quaternion algebra with the basis \(\{1, e_2, e_3, e_4\}\), \((f_n)_{n \geq 0}\) be the Fibonacci sequence and \((l_n)_{n \geq 0}\) be the Lucas sequence. We consider the quaternions

\[F_n = f_n + f_{n+1} e_2 + f_{n+3} e_3 + f_{n+4} e_4\]

and

\[L_n = l_n + l_{n+1} e_2 + l_{n+3} e_3 + l_{n+4} e_4,\]

called Fibonacci quaternion and, respectively, Lucas quaternion.

**Proposition 3.5.** With the above notations, in \(\mathbb{H} (\alpha, \beta)\), the following relations are true:

1) \(5 \mathbf{n} (F_n) = \mathbf{n} (L_n), n \in \mathbb{N}\).

2) \(5 (f_{2n+1} + f_{2n+5}) = l_{2n} + l_{2n+2} + l_{2n+4} + l_{2n+6}, n \in \mathbb{N}\).

3) \(\mathbf{n} (F_n + L_n) = \mathbf{n} (F_n) + \mathbf{n} (L_n) + 2 (f_{2n+7} - f_{2n+1}), n \in \mathbb{N}\).

**Proof.** 1) From Proposition 2.1 vii), we have

\[\mathbf{n} (L_n) = l_n^2 + l_{n+1}^2 + l_{n+3}^2 + l_{n+4}^2 =\]

\[= 5 f_n^2 + 4 (-1)^n + 5 f_{n+1}^2 + 4 (-1)^{n+1} +\]

\[+ 5 f_{n+2}^2 + 4 (-1)^{n+2} + 5 f_{n+3}^2 + 4 (-1)^{n+3} = 5 \mathbf{n} (F_n).\]

2) From Proposition 2.1 viii), we have

\[\mathbf{n} (L_n) = l_n^2 + l_{n+1}^2 + l_{n+3}^2 + l_{n+4}^2 =\]

\[= l_{2n} - 2 (-1)^{n+1} + l_{2n+2} - 2 (-1)^{n+2} +\]

\[+ l_{2n+4} - 2 (-1)^{n+3} + l_{2n+6} - 2 (-1)^{n+4} =\]

\[= l_{2n} + l_{2n+2} + l_{2n+4} + l_{2n+6}.\]

From Proposition 2.1 iii), we have

\[\mathbf{n} (F_n) = f_n^2 + f_{n+1}^2 + f_{n+2}^2 + f_{n+3}^2 = f_{2n+1} + f_{2n+5} \text{ and we apply the relation 1)}.\]

3) We have \(\mathbf{n} (F_n + L_n) =\)

\[= (f_n + l_n)^2 + (f_{n+1} + l_{n+1})^2 + (f_{n+2} + l_{n+2})^2 + (f_{n+3} + l_{n+3})^2 =\]

\[= f_n^2 + f_{n+1}^2 + f_{n+2}^2 + f_{n+3}^2 + l_n^2 + l_{n+1}^2 + l_{n+2}^2 + l_{n+3}^2 +\]

\[+ 2 f_n l_n + 2 f_{n+1} l_{n+1} + 2 f_{n+2} l_{n+2} + 2 f_{n+3} l_{n+3} =\]

7
\[
\begin{align*}
&= n(F_n) + n(L_n) + 2(f_{2n} + f_{2n+2} + f_{2n+4} + f_{2n+6}) = \\
&= n(F_n) + n(L_n) + 2(f_{n+1}^2 - f_{n-1}^2 + f_{n+2}^2 - f_n^2 + f_{n+3} - f_{n+1}^2 + f_{n+4} - f_{n+2}^2) = \\
&= n(F_n) + n(L_n) + 2(-f_{2n-1} + f_{2n+7}). \quad \square
\end{align*}
\]

Fibonacci numbers are defined by using the addition operation over the real field. It will be interesting to search what happens when, instead of addition, we use an arbitrary binary relation over \(\mathbb{R}\). Therefore, we will consider "\(*\)" a binary relation over \(\mathbb{R}\) and \(a, b \in \mathbb{R}\). We define the following sequence
\[
\varphi_n = \varphi_{n-1} * \varphi_{n-2}, \varphi_0 = a, \varphi_1 = b.
\]
We call this sequence the left Fibonacci type sequence attached to the binary relation "\(*\)", generated by \(a\) and \(b\).

The following sequence
\[
\varphi_n = \varphi_{n-2} * \varphi_{n-1}, \varphi_0 = a, \varphi_1 = b
\]
is called the right Fibonacci type sequence attached to the binary relation "\(*\)", generated by \(a\) and \(b\).

**Proposition 3.6.** Let \(A, B \in \mathbb{R}\) such that \(\Delta = A^2 + 4B > 0\). We define on \(\mathbb{R}\) the following binary relation \(x \ast y = Ax + By, x, y \in \mathbb{R}\).

We consider \((\varphi_n)_{n \in \mathbb{N}}\) the left Fibonacci type sequence attached to the binary relation "\(*\)". Therefore, we have
\[
\varphi_{n+1} = \frac{1}{\beta - \alpha} \left[(-b + a\beta) \alpha^{n+1} + (b - a\alpha) \beta^{n+1}\right],
\]
where \(\alpha = \frac{A + \sqrt{\Delta}}{2}, \beta = \frac{A - \sqrt{\Delta}}{2}\) and
\[
\mathcal{L} = \lim_{n \to \infty} \frac{\varphi_{n+1}}{\varphi_n} = \max\{\alpha, \beta\}. \quad (3.12.)
\]

**Proof.** Taking \(\varphi_0 = a, \varphi_1 = b\), we get
\[
\varphi_2 = \varphi_1 \ast \varphi_0 = Ab + Ba,
\varphi_3 = \varphi_2 \ast \varphi_1 = A(\varphi_1 \ast \varphi_0) + Bb =
= (A^2 + B)b + ABa, \text{ etc. From here, } \varphi_n \text{ can be write under the form}
\]
\[
\varphi_n = \varphi_{n-1} \ast \varphi_{n-2} = x_n b + y_n a.
\]
We have
\[
\varphi_{n+1} = x_{n+1} b + y_{n+1} a
\]
and
\[
\varphi_{n+1} = A\varphi_n + B\varphi_{n-1} = A(x_n b + y_n a) + B(x_{n-1} b + y_{n-1} a) =
= (Ax_n + Bx_{n-1}) b + (Ay_n + By_{n-1}) a. \text{ It results,}
\]
\[
x_{n+1} = Ax_n + Bx_{n-1}
\]
and
\[ y_{n+1} = Ay_n + By_{n-1}. \]

We consider the roots of the equation
\[ x^2 - Ax - B = 0, \]
\[ \alpha = \frac{A + \sqrt{\Delta}}{2}, \beta = \frac{A - \sqrt{\Delta}}{2}, \Delta = A^2 + 4B. \]

Therefore,
\[ x_{n+1} = X_1\alpha^{n+1} + X_2\beta^{n+1}, \]
\[ y_{n+1} = Y_1\alpha^{n+1} + Y_2\beta^{n+1}, \]
with \( X_1 + X_2 = 0, X_1\alpha + X_2\beta = 1 \) and \( Y_1 + Y_2 = 1, Y_1\alpha + Y_2\beta = 0. \) We obtain
\[ X_1 = \frac{1}{\beta - a}, X_2 = \frac{1}{\beta - a}, Y_1 = \frac{\beta}{\beta - a}, Y_2 = -\frac{a}{\beta - a}. \] It results,
\[ x_{n+1} = \frac{1}{\beta - a}(\alpha^{n+1} + \beta^{n+1}) \]
and
\[ y_{n+1} = \frac{1}{\beta - a}(\beta\alpha^{n+1} + \alpha\beta^{n+1}). \]

Therefore, by straightforward calculations, we get
\[ \varphi_{n+1} = \frac{1}{\beta - \alpha} \left[ (-b + a\beta)\alpha^{n+1} + (b - a\alpha)\beta^{n+1} \right]. \]

This formula is a Binet-type formula.

Now, for the limit \( \mathcal{L} \), we obtain
\[ \mathcal{L} = \lim_{n \to \infty} \frac{\varphi_{n+1}}{\varphi_n} = \lim_{n \to \infty} \frac{1}{\beta - \alpha} \left[ (-b + a\beta)\alpha^n + (b - a\alpha)\beta^n \right] = \max\{\alpha, \beta\}. \]

\[ \square \]

**Remark 3.7.**
1) Similar results can be obtained for the right Fibonacci type sequences.
2) The above formula (3.11) is a Binet’s-type formula. Indeed, for \( A = B = 1, a = 0, b = 1 \), we obtain the Binet’s formula for Fibonacci sequence.
3) The limit \( \mathcal{L} \), from relation (3.12) is a Golden-ratio type number. Indeed, for \( A = B = 1, a = 0, b = 1 \), we obtain the Golden-ratio.

We consider now the following difference equation of degree two
\[ d_n = ad_{n-1} + bd_{n-2}, d_0 = \alpha, d_1 = \beta, \quad (3.13.) \]
with \( a, b, \alpha, \beta \) arbitrary integers, \( n \in \mathbb{N} \). It is clear that \( d_2 = a\beta + b\alpha, d_3 = a^2\beta + +aba + b\beta, \) etc.
Let \((G, \ast)\) be an arbitrary group and \(g_0, g_1 \in G\). We define the following sequence

\[
\varphi_n = \varphi_{n-1}^a \ast \varphi_{n-2}^b, \varphi_0 = g_0^d \ast g_0^{d-1}, \varphi_1 = g_1^d \ast g_0^d,
\]  
(3.14.)

where \(d_{-1}\) is defined depending on the sequence \((d_n)_{n \in \mathbb{N}}\) and \(g^a = g \ast g \ast \ldots \ast g, a\)-time, \(g \in G\). This sequence is called the left \(d\)-type sequence attached to the binary relation \(\ast\), generated by \(g_0\) and \(g_1\).

In a similar way, we define the right \(d\)-type sequence attached to the binary relation \(\ast\), generated by \(g_0\) and \(g_1\), namely

\[
\varphi_n = \varphi_{n-2}^a \ast \varphi_{n-1}^b, \varphi_0 = g_0^{d-1} \ast g_1^a, \varphi_1 = g_0^d \ast g_1^b,
\]  
(3.15.)

where \(d_{-1}\) is defined depending on the sequence \((d_n)_{n \in \mathbb{N}}\) and \(g^a = g \ast g \ast \ldots \ast g, a\)-time, \(g \in G\).

**Proposition 3.8.** With the above notations, if \(g_1 \ast g_0 = g_0 \ast g_1\), the following relation holds:

\[
\varphi_n = g_1^{d_n} \ast g_0^{d_{n-1}}.
\]  
(3.16.)

**Proof.** By straightforward calculations, it results

\[
\varphi_2 = \varphi_1^a \ast \varphi_0^b = \left(g_1^a \ast g_0^b \right)^a \ast \left(g_1^a \ast g_0^{d-1} \right)^b = \\
g_1^{a^2} \ast g_0^{d^2} = g_1^{a^2} \ast g_0^{d^2},
\]

\[
\varphi_3 = \varphi_2^a \ast \varphi_1^b = \left(g_1^{a^2} \ast g_0^{d^2} \right)^a \ast \left(g_1^d \ast g_0^d \right)^b = \\
g_1^{d^3} \ast g_0^{d^3},
\]

\[
\varphi_{n+1} = \varphi_n^a \ast \varphi_{n-1}^b = \left(g_1^{d_n} \ast g_0^{d_{n-1}} \right)^a \ast \left(g_1^{d_n} \ast g_0^{d_{n-2}} \right)^b = \\
g_1^{d_{n+1}} \ast g_0^{d_n}.
\]  
\[\square\]

**Remark 3.9.**

1) For \(a = b = 1, \alpha = 0, \beta = 1\), we get the Fibonacci sequence and relation (3.14) becomes

\[
\varphi_n = \varphi_{n-2} \ast \varphi_{n-1}, \varphi_0 = g_0^{-1}, \varphi_1 = g_1,
\]

since \(f_{-1} = 1\). In this case, relation (3.16) has the following form

\[
\varphi_n = g_1^{f_n} \ast g_0^{f_{n-1}}.
\]  
(3.17.)

Relation (3.17) was independently found in [HKN; 12], Proposition 5.2 and it is a particular case of relation (3.16).

2) For \(a = b = 1, \alpha = 2, \beta = 1\), we get the Lucas sequence and relation (3.14) becomes

\[
\varphi_n = \varphi_{n-2} \ast \varphi_{n-1}, \varphi_0 = g_1^2 \ast g_0^{-1}, \varphi_1 = g_1 \ast g_0^2.
\]

In this case, relation (3.16) has the following form

\[
\varphi_n = g_1^{l_n} \ast g_0^{l_{n-1}}.
\]
Conclusions. In this paper, we provided new applications of Fibonacci and Lucas sequences. In Proposition 3.2 and in Proposition 3.3, we obtained some algebraic structures defined by using Fibonacci and Lucas elements. In Proposition 3.5, we provided some new properties and relations of these sequences.

In Proposition 3.6 and in Proposition 3.8, we also generalized Fibonacci and Lucas numbers by using an arbitrary binary relation over the real fields instead of addition of the real numbers and we give properties of the new obtained sequences.

Moreover, taking into consideration some known relations between these numbers, in Proposition 3.4, we give a method to find new examples of quaternion split algebras. This method can be an easy alternative for using the properties of quadratic forms.

As a further research, we intend to continue the study of such sequences, especially in their connections with quaternion algebras, expecting to obtain new and interesting results.
