#### Abstract

We determine the Lie point symmetries of a Gardner type system and establish its nonlinear self-adjointness. We then construct conservation laws via Ibragimov's Theorem.

# 2010 AMS Mathematics Classification numbers: <br> 76M60, 58J70, 70G65 

Keywords: Gardner type system, Lie point symmetries, nonlinear self-adjointness, conservation laws

## 1 Introduction

The well-known KdV , mKdV and Gardner equations [4, 13, 15], given respectively by

$$
u_{t}+a u u_{x}+c u_{x x x}=0, \quad u_{t}+b u^{2} u_{x}+c u_{x x x}=0
$$

and

$$
u_{t}+\left(a u+b u^{2}\right) u_{x}+c u_{x x x}=0
$$

are special cases of

$$
\begin{equation*}
u_{t}+\left(a u^{p}+b u^{2 p}\right) u_{x}+c u_{x x x}=0, \quad a, b, c \in \mathbb{R}, \quad p \in \mathbb{Z} \tag{1}
\end{equation*}
$$

a recurrent nonlinear evolution equation that, in the framework of hydrodynamics, models internal gravity waves in a density-stratified ocean [2]. Of great physical importance for also describing a variety of wave phenomena in plasma, solid state and quantum physics, its integrability has been investigated by several authors under different approaches. Explicit solutions (including solitons) and a detailed discussion of their properties (like stability) can be found in [6, 14, 22] and references therein.

The situations covered by the above equations tend to be idealized. This occurs, among some reasons, because such models are derived without considering the possible effects of one wave on another. However, since the pioneer works of Hirota and Satsuma [7, 18], where they present a system to study the interactions of two long waves with distinct dispersion relations, an increasing number of coupled KdV equations have been introduced in the literature with a substantially larger and more realistic range of applications. See for example [17, 20, 21]. In particular, starting from [1, 19]

$$
\left\{\begin{aligned}
u_{t}+a\left[\left(u^{2}+v^{2}\right) u\right]_{x}+u_{x x x} & =0 \\
v_{t}+a\left[\left(u^{2}+v^{2}\right) v\right]_{x}+v_{x x x} & =0
\end{aligned}\right.
$$

and

$$
\left\{\begin{array}{c}
u_{t}+\left(u^{p} v^{p+1}\right)_{x}+u_{x x x}=0 \\
v_{t}+\left(u^{p+1} v^{p}\right)_{x}+v_{x x x}=0
\end{array},\right.
$$

we propose in this paper the new class of system

$$
\left\{\begin{array}{c}
F_{1} \equiv u_{t}+a\left[\left(u^{p}+v^{p}\right) u\right]_{x}+b\left[(u v)^{p} v\right]_{x}+c u_{x x x}=0  \tag{2}\\
F_{2} \equiv v_{t}+a\left[\left(u^{p}+v^{p}\right) v\right]_{x}+b\left[(u v)^{p} u\right]_{x}+c v_{x x x}=0
\end{array},\right.
$$

a two-component generalization 1 of the equation (1), with the objective of determining the Lie point symmetries (Section 2). Established its nonlinear self-adjointness (Section 3), we then construct conservation laws via the recent Ibragimov's Theorem (Section 4), an extension of the celebrated Noether's Theorem to problems with no variational structure. The main references used are [3, [5, 8, ,9, 10, 11, 12, 16].

In what follows, we assume that $\{a c, b c\} \neq\{0\}$ and $p \geq 1$. All constants $c_{i}$ 's are arbitrary and all functions are smooth.

[^0]
## 2 Lie Point Symmetries Classification

To begin with, we denote

$$
f(u, v) \equiv a\left(u^{p}+v^{p}\right) u+b(u v)^{p} v, \quad g(u, v) \equiv a\left(u^{p}+v^{p}\right) v+b(u v)^{p} u .
$$

Applying the standard algorithm presented in [3] and [16], a differential operator

$$
X=\mathcal{T}(t, x, u, v) \frac{\partial}{\partial t}+\mathcal{X}(t, x, u, v) \frac{\partial}{\partial x}+\mathcal{U}(t, x, u, v) \frac{\partial}{\partial u}+\mathcal{V}(t, x, u, v) \frac{\partial}{\partial v}
$$

generates the Lie point symmetries of the system (2) if the conditions of invariance

$$
\begin{align*}
& \left(D_{t} W^{u}+\mathcal{T} u_{t t}+\mathcal{X} u_{t x}\right)+f_{u}\left(D_{x} W^{u}+\mathcal{T} u_{t x}+\mathcal{X} u_{x x}\right)+f_{v}\left(D_{x} W^{v}+\mathcal{T} v_{t x}+\mathcal{X} v_{x x}\right)+ \\
& \quad+f_{u u} \mathcal{U} u_{x}+f_{u v}\left(\mathcal{V} u_{x}+\mathcal{U} v_{x}\right)+f_{v v} \mathcal{V} v_{x}+c\left(D_{x}^{3} W^{u}+\mathcal{T} u_{t x x x}+\mathcal{X} u_{x x x x}\right)=M F_{1}+N F_{2} \tag{3}
\end{align*}
$$

and

$$
\begin{align*}
& \left(D_{t} W^{v}+\mathcal{T} v_{t t}+\mathcal{X} v_{t x}\right)+g_{u}\left(D_{x} W^{u}+\mathcal{T} u_{t x}+\mathcal{X} u_{x x}\right)+g_{v}\left(D_{x} W^{v}+\mathcal{T} v_{t x}+\mathcal{X} v_{x x}\right)+ \\
& \quad+g_{u u} \mathcal{U} u_{x}+g_{u v}\left(\mathcal{V} u_{x}+\mathcal{U} v_{x}\right)+g_{v v} \mathcal{V} v_{x}+c\left(D_{x}^{3} W^{v}+\mathcal{T} v_{t x x x}+\mathcal{X} v_{x x x x}\right)=P F_{1}+Q F_{2} \tag{4}
\end{align*}
$$

where

$$
W^{u}=\mathcal{U}-\mathcal{T} u_{t}-\mathcal{X} u_{x}, \quad W^{v}=\mathcal{V}-\mathcal{T} v_{t}-\mathcal{X} v_{x}
$$

are satisfied for some set of coefficients $M, N, P$ and $Q$ to be determined. From (3) and (4), the determining equations can be written as

$$
\begin{gathered}
M=\mathcal{U}_{u}-\mathcal{T}_{t}, N=\mathcal{U}_{v}, P=\mathcal{V}_{u}, Q=\mathcal{V}_{v}-\mathcal{T}_{t} \\
\mathcal{T}_{x}=\mathcal{T}_{u}=\mathcal{T}_{v}=\mathcal{T}_{t}-3 \mathcal{X}_{x}=0 \\
\mathcal{X}_{t}=\mathcal{X}_{u}=\mathcal{X}_{v}=0 \\
\mathcal{U}_{t}=\mathcal{U}_{x}=\mathcal{U}_{u v}=\mathcal{U}-\left(\mathcal{U}_{u} u+\mathcal{U}_{v} v\right)=0 \\
\mathcal{V}_{t}=\mathcal{V}_{x}=\mathcal{V}_{u v}=\mathcal{V}-\left(\mathcal{V}_{u} u+\mathcal{V}_{v} v\right)=0 \\
a\left[2 \mathcal{X}_{x}+p \mathcal{U}_{u}+(2-p) \mathcal{V}_{u}\right]=0 \\
b\left(\mathcal{X}_{x}+p \mathcal{U}_{u}\right)=b \mathcal{U}_{v}=b \mathcal{V}_{u}=0 \\
(1-p)\left(\mathcal{U}_{v}+\mathcal{V}_{u}\right)=(1-p)(2-p) \mathcal{U}_{v}=0 \\
\mathcal{U}_{u}-\mathcal{V}_{v}=(2-p)\left(\mathcal{U}_{v}-\mathcal{V}_{u}\right)
\end{gathered}
$$

It's easy to see therefore that

$$
\begin{aligned}
& \mathcal{T}=3 c_{1} t+c_{2}, \quad \mathcal{X}=c_{1} x+c_{3}, \\
& \mathcal{U}=c_{4} v+\left[c_{6}+(2-p) c_{4}\right] u, \mathcal{V}=\left[c_{6}+(2-p) c_{5}\right] v+c_{5} u
\end{aligned}
$$

with

$$
\begin{gathered}
a\left(2 c_{1}+c_{4}+c_{5}+p c_{6}\right)=0 \\
b c_{4}=b c_{5}=b\left(c_{1}+p c_{6}\right)=0 \\
(1-p)(2-p) c_{4}=(1-p)\left(c_{4}+c_{5}\right)=0
\end{gathered}
$$

Proposition 1. The Lie point symmetries of the system (2) are summarized in Table 1, where

$$
\begin{gathered}
X_{1}=3 t \frac{\partial}{\partial t}+x \frac{\partial}{\partial x}-\frac{1}{p}\left(u \frac{\partial}{\partial u}+v \frac{\partial}{\partial v}\right) \\
Y_{1}=3 t \frac{\partial}{\partial t}+x \frac{\partial}{\partial x}-\frac{2}{p}\left(u \frac{\partial}{\partial u}+v \frac{\partial}{\partial v}\right), X_{2}=\frac{\partial}{\partial t}, X_{3}=\frac{\partial}{\partial x} \\
X_{4}=v\left(\frac{\partial}{\partial u}-\frac{\partial}{\partial v}\right), Y_{4}=v \frac{\partial}{\partial u}-u \frac{\partial}{\partial v}, X_{5}=u\left(\frac{\partial}{\partial u}-\frac{\partial}{\partial v}\right) . \\
\begin{array}{|c|c|c|}
\hline a=0 & b=0 & a b \neq 0 \\
\hline X_{1}, X_{2} & Y_{1}, X_{2}, X_{3}, X_{4}(p=1) & X_{2}, X_{3} \\
X_{3} & Y_{4}(p=2), X_{5}(p=1) & \\
\hline
\end{array}
\end{gathered}
$$

Table 1.

## 3 Self-Adjointness Classification

For the system (2), the formal Lagrangian is

$$
\mathcal{L}=\bar{u} F_{1}+\bar{v} F_{2} .
$$

Here $\bar{u}$ and $\bar{v}$ are the new dependent variables (so-called nonlocal variables). Calculated the adjoint equations

$$
F_{1}^{*} \equiv-\frac{\delta \mathcal{L}}{\delta u}=\bar{u}_{t}+f_{u} \bar{u}_{x}+g_{u} \bar{v}_{x}+c \bar{u}_{x x x}=0
$$

and

$$
F_{2}^{*} \equiv-\frac{\delta \mathcal{L}}{\delta v}=\bar{v}_{t}+f_{v} \bar{u}_{x}+g_{v} \bar{v}_{x}+c \bar{v}_{x x x}=0
$$

where $\delta / \delta u$ and $\delta / \delta v$ are Euler-Lagrange operators, we impose that

$$
\begin{equation*}
\left.F_{1}^{*}\right|_{(\bar{u}, \bar{v})=(\varphi, \psi)}=M F_{1}+N F_{2},\left.\quad F_{2}^{*}\right|_{(\bar{u}, \bar{v})=(\varphi, \psi)}=P F_{1}+Q F_{2} . \tag{5}
\end{equation*}
$$

Again $M, N, P$ and $Q$ is a set of coefficients to be determined and

$$
\begin{equation*}
\varphi=\varphi(t, x, u, v), \quad \psi=\psi(t, x, u, v) \tag{6}
\end{equation*}
$$

two functions that not vanish simultaneously.
As

$$
\left.F_{1}^{*}\right|_{(\bar{u}, \bar{v})=(\varphi, \psi)}=D_{t} \varphi+f_{u} D_{x} \varphi+g_{u} D_{x} \psi+c D_{x}^{3} \varphi
$$

and

$$
\left.F_{2}^{*}\right|_{(\bar{u}, \bar{v})=(\varphi, \psi)}=D_{t} \psi+f_{v} D_{x} \varphi+g_{v} D_{x} \psi+c D_{x}^{3} \psi,
$$

from (5) it's possible to conclude that $M=\varphi_{u}, N=\varphi_{v}, P=\psi_{u}, Q=\psi_{v}$ and

$$
\begin{gathered}
\varphi_{t}-\psi_{t}=\varphi_{x}-\psi_{x}=\varphi_{u}-\psi_{v}=\varphi_{v}-\psi_{u}=0 \\
\varphi_{t}+2 a(u+v) \varphi_{x}=b \varphi_{x}=(p-1) \varphi_{x}=0 \\
a(p-2)\left(\varphi_{u}-\varphi_{v}\right)=b \varphi_{v}=(p-1) \varphi_{v}=0 \\
\varphi_{x x}=\varphi_{x u}=\varphi_{x v}=\varphi_{u u}=\varphi_{u v}=\varphi_{v v}=0
\end{gathered}
$$

Hence

$$
\left\{\begin{array}{l}
\varphi=\left(2 a c_{1} t+c_{2}\right) v+\left(2 a c_{1} t+c_{3}\right) u-c_{1} x+c_{4} \\
\psi=\left(2 a c_{1} t+c_{3}\right) v+\left(2 a c_{1} t+c_{2}\right) u-c_{1} x+c_{5}
\end{array}\right.
$$

with

$$
\begin{gathered}
(p-1) c_{1}=b c_{1}=(p-1) c_{2}=b c_{2}=0 \\
a(p-2)\left(c_{2}-c_{3}\right)=0
\end{gathered}
$$

Proposition 2. The system (2) is nonlinearly self-adjoint. The substitutions (6) are as follows.
i) If $a=0$ or $p=2$,

$$
\varphi=c_{3} u+c_{4}, \quad \psi=c_{3} v+c_{5}
$$

ii) if $b=0$ and $p=1$,

$$
\varphi=\left(2 a c_{1} t+c_{2}\right)(v+u)-c_{1} x+c_{4}, \quad \psi=\left(2 a c_{1} t+c_{2}\right)(v+u)-c_{1} x+c_{5}
$$

iii) in all other cases,

$$
\varphi=c_{4}, \quad \psi=c_{5} .
$$

Remark 1. Actually, the system (2) is quasi self-adjoint. In particular, it's strictly self-adjoint iff $a=0$ or $p=2$.

Remark 2. Indeed, any system of the form

$$
\left\{\begin{aligned}
u_{t}+r_{x}(u, v)+c u_{x x x} & =0 \\
v_{t}+s_{x}(u, v)+c v_{x x x} & =0
\end{aligned}\right.
$$

is strictly self-adjoint whenever $r_{v}=s_{u}$.

## 4 Conservation Laws

According to the theorem demonstrated by Ibragimov [9], the components of the conserved vector $C=\left(C^{t}, C^{x}\right)$ associated to $X$, a Lie point symmetry admitted by the system (2), are given by

$$
\begin{equation*}
C^{t}=\varphi W^{u}+\psi W^{v} \tag{7}
\end{equation*}
$$

and

$$
\begin{align*}
C^{x}=\varphi & \left(f_{u} W^{u}+f_{v} W^{v}\right)+c\left(\varphi D_{x}^{2}-D_{x} \varphi D_{x}+D_{x}^{2} \varphi\right) W^{u}+  \tag{8}\\
& +\psi\left(g_{u} W^{u}+g_{v} W^{v}\right)+c\left(\psi D_{x}^{2}-D_{x} \psi D_{x}+D_{x}^{2} \psi\right) W^{v}
\end{align*}
$$

In view of Proposition 2, the next result takes into account all the generators of Table 1. In most cases, however, the expressions (7) and (8) lead us to trivial conservation laws or to the vectors

$$
C^{t}=u, \quad C^{x}=f(u, v)+c u_{x x}
$$

and

$$
C^{t}=v, \quad C^{x}=g(u, v)+c v_{x x}
$$

that can be readily obtained from the system (2) by direct integration. Below we only bring the unobvious cases.

Proposition 3. i) Let $a=0$. For

$$
\varphi=u, \quad \psi=v
$$

$X_{1}$ provides

$$
\begin{gathered}
C^{t}=(p+1)\left(u^{2}+v^{2}\right) \\
C^{x}=2 b(2 p+1)(u v)^{p+1}+c(p+1)\left[\left(u^{2}+v^{2}\right)_{x x}-3\left(u_{x}^{2}+v_{x}^{2}\right)\right]
\end{gathered}
$$

ii) Let $b=0$.
ii.a) Taking

$$
\varphi=\psi=u+v
$$

for $Y_{1}$ and

$$
\varphi=\psi=2 a t(u+v)-x
$$

for $X_{2}$, we obtain

$$
\begin{gathered}
C^{t}=3(u+v)^{2} \\
C^{x}=4 a(u+v)^{3}+3 c\left\{\left[(u+v)^{2}\right]_{x x}-3\left(u_{x}+v_{x}\right)^{2}\right\}
\end{gathered}
$$

when $p=1$.
ii.b) Furthermore, for

$$
\varphi=u, \quad \psi=v
$$

$Y_{1}$ also provides

$$
\begin{gathered}
C^{t}=2\left(u^{2}+v^{2}\right), \\
C^{x}=3 a\left(u^{2}+v^{2}\right)^{2}+2 c\left[\left(u^{2}+v^{2}\right)_{x x}-3\left(u_{x}^{2}+v_{x}^{2}\right)\right]
\end{gathered}
$$

when $p=2$.
