# New hierarchy of multiple soliton solutions of the (2+1)-dimensional Sawada-Kotera equation 

Ruoxia Yao ${ }^{1}$<br>School of Computer Science, Shaanxi Normal University, Xi’an, 710119, China<br>Yan $\mathrm{Li}^{2}$<br>School of Computer Science, Shaanxi Normal University, Xi’an, 710119, China<br>Senyue Lou ${ }^{3}$<br>School of Physical Science and Technology, Ningbo University, Ningbo, 315211, China

#### Abstract

A new transformation $u=4(\ln f)_{x}$ that can formulate a quintic linear equation and a pair of Hirota's bilinear equations for the ( $2+1$ )-dimensional Sawada-Kotera (2DSK) equation is reported firstly, which enables one to obtain a new hierarchy of multiple soliton solutions of the 2DSK equation. It tells a crucial fact that a nonlinear partial differential equation could possess two hierarchies of multiple soliton solutions and the 2DSK equation is the first and only one found in this paper. The quintic linear equation is solved by a pair of Hirota's bilinear equations, of which one is the $(2+1)$-dimensional bilinear SK equation obtained by $u=2(\ln f)_{x}$, and the other is the bilinear KdV equation. The (1+1)-dimensional SK equation does not possess this property. As another example, a (3+1)-dimensional nonlinear partial differential equation possessing a pair of Hirota's bilinear equations, however only bearing one hierarchy of multiple soliton solutions is studied.

Keywords: Multiple soliton solutions; Dependent variable transformation; Quintic linear equation; Hiorta's bilinear equation; $(2+1)$-dimensional Sawada-Kotera equation.

## 1. Introduction

Solitons of nonlinear partial differential equations play important roles in both fundamental theory and applications of nonlinear science. As shown in [1], the soliton and solitary wave solutions that reflect a common nonlinear phenomenon in nature provide physical information and more insights into the physical and mathematical aspects of the problem thus leading to further applications. In the last two decades, more and more researchers have taken their attentions to the study of solitary wave and soliton solutions of completely integrable nonlinear evolution

[^0]equations. Up to now, we know that an integrable nonlinear partial differential equation (PDE) usually possesses one hierarchy of multiple soliton solutions, however we find that the 2DSK equation possesses two hierarchies of multiple soliton solutions. This very special property is novel and first proposed in this paper.

The 2DSK equation

$$
\begin{equation*}
v_{t}+v_{5 x}+15 v_{x} v_{x x}+15 v v_{3 x}+45 v^{2} v_{x}+5 v_{x x y}+15 v v_{y}+15 v_{x} \int v_{y} \mathrm{~d} x-5 \int v_{y y} \mathrm{~d} x=0 \tag{1}
\end{equation*}
$$

where $v=v(x, y, t)$, was first proposed by Konopelchenko and Dubrovsky [2], and has been regarded as a $(2+1)$-dimensional integrable generalization of the ( $1+1$ )-dimensional Sawada-Kotera equation [3]. Now it is known also as a member of the so-called CKP hierarchy [4]. The 2DSK hierarchy with almost the same form and only having different coefficients of several terms of Eq. (11) are studied extensively, such that abundant results have been reported in the Refs. [5, 6, 4, 4, 7, 8, 9, 10, 11, 12] and therein. Recently, many new important types of solutions such as lump solutions, molecule soliton solutions and resonant soliton solutions are reported constantly in Refs. 13, 14, 15, 16, 17].

## 2. New transformation and a pair of Hirota's bilinear equations of the 2DSK equation

Eq. (1) reduces to

$$
\begin{equation*}
u_{x t}+u_{6 x}+5 u_{3 x y}-5 u_{y y}+15 u_{x x} u_{3 x}+15 u_{x} u_{4 x}+15 u_{x} u_{x y}+15 u_{x x} u_{y}+45 u_{x}^{2} u_{x x}=0, \tag{2}
\end{equation*}
$$

after introducing a potential variable transformation $v=u_{x}, u=u(x, y, t)$, and $u_{x t}=\frac{\partial^{2}}{\partial x \partial t} u(x, y, t)$. Eq. (2) is the two (space)-dimensional extension of the famous KP equation first reported by Kadomtsev and Petviashvili [18]. In this paper, we mainly consider the reduced Eq. (2). The 2DSK equation usually can be written in Hirota's bilinear form by expressing solutions in terms of a $\tau$-function. If $u=2(\ln \tau)_{x}$ then $\tau(x, y, t)$ satisfies the Hirota's bilinear equation

$$
\begin{equation*}
\left(D_{x}^{6}+D_{x} D_{t}-5 D_{x}^{3} D_{y}+5 D_{y}^{2}\right) \tau \cdot \tau=0, \tag{3}
\end{equation*}
$$

where the Hirota's $D$-operator is defined in Ref. 19]. In the following, we will show that we obtain different bilinear expressions of Eq. (2).

In Refs. [20, 21, 22, 23], Hietarinta provided a complete classification for KdV-type, mKdVtype, sine-Gordon-type and complex bilinear equations passing Hirota's three-soliton condition. In Ref. [24], Cheng studied some decompositions including ( $1+1$ )-dimensional KdV +5 th-order KdV and Ito+KdV equations. The results presented in this paper have not yet been reported therein or elsewhere.

Starting with a dependent variable transformation

$$
\begin{equation*}
u=p(\ln f)_{x} \tag{4}
\end{equation*}
$$

where $f=f(x, y, t)$ and combining with the assumption

$$
\begin{equation*}
f \equiv f_{1}=1+\exp \left(\xi_{1}\right), \quad \xi_{1}=k_{1} x+l_{1} y+w_{1} t \tag{5}
\end{equation*}
$$

instead of using the Hirota's bilinear method, we get (see Ref. [25] for more details)

$$
\begin{align*}
& p=2, w_{1}=-\left(k_{1}^{6}+5 k_{1}^{3} l_{1}-5 l_{1}^{2}\right) / k_{1}  \tag{6}\\
& p=4, l_{1}=-k_{1}^{3}, w_{1}=9 k_{1}^{5} \tag{7}
\end{align*}
$$

and then a quintic linear equation for Eq. (21) later corresponding to (7). The advantage is that the direct method could avoid seeking for bilinear form at the beginning of constructing multiple soliton solutions. We prove that even a nonlinear PDE does not possess the so-called Hirota's bilinear form apparently [26, 27, 19], maybe we could obtain a new hierarchy of related soliton solutions.

In this paper, we adopt the determined dependent variable transformation

$$
\begin{equation*}
u=4(\ln f)_{x} \tag{8}
\end{equation*}
$$

instead of $u=2(\ln f)_{x}$ to find soliton solutions first of Eq. (22), and then use $v \rightarrow u_{x}$, namely, $v=4(\ln f)_{x x}$ to obtain the multiple soliton solutions of Eq. (1). Substituting Eq. (8) into Eq. (2) yields the following quintic linear equation

$$
\begin{align*}
P \equiv & f^{4}\left(f_{7 x}+5 f_{4 x y}+f_{2 x t}-5 f_{x 2 y}\right)+f^{3}\left(25 f_{4 x} f_{3 x}+39 f_{5 x} f_{2 x}-5 f_{4 x} f_{y}-f_{2 x} f_{t}-7 f_{6 x} f x\right. \\
& \left.-20 f_{3 x y} f_{x}+40 f_{3 x} f_{x y}+5 f_{x} f_{2 y}+30 f_{2 x} f_{2 x y}+10 f_{x y} f_{y}-2 f_{x t} f_{x}\right) \\
& +2 f^{2}\left(-10 f_{3 x} f_{x} f_{y}+f_{x}^{2} f_{t}-50 f_{3 x}^{2} f_{x}-135 f_{4 x} f_{x} f_{2 x}-9 f_{5 x} f_{x}^{2}-90 f_{2 x} f_{x} f_{x y}+75 f_{3 x} f_{2 x}^{2}\right. \\
& \left.-5 f_{x} f_{y}^{2}-15 f_{2 x}^{2} f_{y}\right)+2 f\left(90 f_{2 x} f_{x}^{2} f_{y}+270 f_{3 x} f_{x}^{2} f_{2 x}+60 f_{x}^{3} f_{x y}-225 f_{2 x}^{3} f_{x}+105 f_{4 x} f_{x}^{3}\right) \\
& -40\left(12 f_{3 x} f_{x}^{4}+9 f_{2 x}^{2} f_{x}^{3}-3 f_{x}^{4} f_{y}\right)=0 \tag{9}
\end{align*}
$$

Therefor, if $f=f(x, y, t)$ solves Eq. (9), $u=4(\ln f)_{x}$ solves Eq. (2), and $v$ obtained by computing once derivative of the obtained solution $u$ with respect to $x$ solves Eq. (11).

Theorem 1 If $f=f(x, y, t)$ solves a couple of bilinear form equations

$$
\begin{array}{r}
\left(D_{x}^{6}+D_{x} D_{t}+5 D_{x}^{3} D_{y}-5 D_{y}^{2}\right) f \cdot f=0 \\
\left(D_{x}^{4}+D_{x} D_{y}\right) f \cdot f=0 \tag{11}
\end{array}
$$

where Eq. (10) is of the standard Hirota's bilinear 2DSK equation, and Eq. (11) is of the standard Hirota's bilinear KdV equation, then $u=4(\ln f)_{x}$ solves $E q$. (2) with $f$ also solved by the quintic linear equation (9).

Proof From the definition of the Hirota's bilinear derivative, the quintic linear equation (9) can be written as the following form

$$
\begin{align*}
P \equiv & 2\left(\Delta_{\mathrm{sk}}\right)_{x} / f^{2}-4\left[\Delta_{\mathrm{sk}} f_{x}-15 \Delta_{\mathrm{kdv}}\left(f_{x x}+f_{3 x}\right)\right] / f^{3} \\
& -60 \Delta_{\mathrm{kdv}}\left[\left(f_{x}^{2}+5 f_{x x} f_{x}\right) / f^{4}-4 f_{x}^{3} / f^{5}\right] \tag{12}
\end{align*}
$$

where $\Delta_{\mathrm{kdv}} \equiv\left(D_{x}^{4}+D_{x} D_{y}\right) f \cdot f, \quad \Delta_{\text {sk }} \equiv\left(D_{x}^{6}+D_{x} D_{t}+5 D_{x}^{3} D_{y}-5 D_{y}^{2}\right) f \cdot f$. It shows that if $\Delta_{\mathrm{sk}}=0$ and $\Delta_{\mathrm{kdv}}=0$, then $P=0$. Obviously, Eq. (10), namely $\Delta_{\mathrm{sk}}$, is the standard Hirota's bilinear 2DSK equation, and Eq. (11), $\Delta_{\mathrm{kdv}}$, is the Hirota's bilinear KdV equation.

To show that $f=f(x, y, t)$ solving Eqs. (10) and (11) is a solution of Eq. (9), one should prove the consistency of Eqs. (10) and (11), say, of which the solution set is not empty. For simplicity and without loss of generality, setting $f=\exp (\tilde{v}), \tilde{v}=\tilde{v}(x, y, t)$ in Eqs. (10), (11) and solving $\tilde{v}_{x t}, \tilde{v}_{y x}$ respectively yields

$$
\begin{equation*}
\tilde{v}_{x t}=120 \tilde{v}_{2 x}^{3}-5 \tilde{v}_{3 x y}+5 \tilde{v}_{2 y}-\tilde{v}_{6 x}, \quad \tilde{v}_{x y}=-\tilde{v}_{4 x}-6 \tilde{v}_{2 x}^{2} . \tag{13}
\end{equation*}
$$

Next, one should prove $\tilde{v}_{x t, x y}=\tilde{v}_{x y, x t}$. Easily, we get

$$
\begin{align*}
& \tilde{v}_{x y, x t}=-\tilde{v}_{5 x t}-12 \tilde{v}_{3 x} \tilde{v}_{2 x t}-12 \tilde{v}_{2 x} \tilde{v}_{3 x t},  \tag{14}\\
& \tilde{v}_{x t, x y}=720 \tilde{v}_{2 x} \tilde{v}_{2 x y} \tilde{v}_{3 x}+360 \tilde{v}_{2 x} \tilde{v}_{3 x y}-5 \tilde{v}_{4 x 2 y}+5 v_{x 3 y}-\tilde{v}_{7 x y} .
\end{align*}
$$

Computing $\tilde{v}_{x y, x t}-\tilde{v}_{x t, x y}$ and substituting $\tilde{v}_{x t}$ and $\tilde{v}_{x y}$ with the forms (13) into the obtained expression, one can obtain $\tilde{v}_{x y, x t}-\tilde{v}_{x t, x y} \equiv 0$.

Theorem 1 shows that the obtained quintic linear equation is solved by the couple of Hirota's bilinear equations which usually serves as a role to construct the new hierarchy of soliton solutions. It is well known that Eq. (10) ensures the $N$-soliton solutions of the 2DSK equation starting from $u=2(\ln f)_{x}$, and Eq. (11) ensures the $N$-soliton solutions of the KdV equation. Therefore, an explicit connection between the KdV equation and the 2DSK equation is established.

## 3. Two hierarchies of multiple solition solutions of the 2DSK equation

To construct multiple soliton solutions of the 2DSK Eq. (2), usually one can start from Eq. (8) with 19]

$$
\begin{align*}
f_{1}= & 1+\exp \left(\xi_{1}\right)  \tag{15}\\
f_{2}= & 1+\exp \left(\xi_{1}\right)+\exp \left(\xi_{2}\right)+h_{1,2} \exp \left(\xi_{1}+\xi_{2}\right)  \tag{16}\\
f_{3}= & 1+\exp \left(\xi_{1}\right)+\exp \left(\xi_{2}\right)+\exp \left(\xi_{3}\right) \\
& +h_{1,2} \exp \left(\xi_{1}+\xi_{2}\right)+h_{1,3} \exp \left(\xi_{1}+\xi_{3}\right)+h_{2,3} \exp \left(\xi_{2}+\xi_{3}\right) \\
& +h_{1,2} h_{1,3} h_{2,3} \exp \left(\xi_{1}+\xi_{2}+\xi_{3}\right)  \tag{17}\\
& \cdots \cdots,  \tag{18}\\
f_{n}= & \sum_{\mu \in 0,1} \exp \left(\sum_{i=1}^{n} \mu_{i} \xi_{i}+\sum \mu_{i} \mu_{j} H_{i j}\right)
\end{align*}
$$

where $\xi_{i}=\xi_{i}(x, y, t)=k_{i} x+l_{i} y+w_{i} t,(i=1, \ldots, n)$, and $k_{i}, l_{i}, w_{i}$ are arbitrary constants for all $i$. It is actually a simplified direct Hirota method.

Usually, researchers proceed with the studies such as constructing multiple soliton solutions by taking $p=2$ in Eq. (4). The transformation $u=2(\ln f)_{x}$ enables one to obtain a Hirota's
bilinear form, and then soliton solutions. It is deemed that one could not obtain high-order multiple soliton solutions if $u=4(\ln f)_{x}$ does not make the 2DSK to transform into a Hirota's bilinear form directly. It is crucial that we do obtain a new hierarchy of multiple soliton solutions of the 2DSK equation, which have not been given in previous references. The 2DSK equation (2) is the first and only one that bearing two hierarchies of multiple soliton solutions.

For completeness, two one-soliton solutions of Eq. (2) are listed bellow

$$
\begin{align*}
& u_{1}=4\left(\ln f_{1}\right)_{x} \text { with } f_{1}=1+\exp \left(k_{1} x-k_{1}^{3} y+9 k_{1}^{5} t\right) \\
& \tilde{u}_{1}=2\left(\ln \tilde{f}_{1}\right)_{x} \text { with } \tilde{f}_{1}=1+\exp \left(k_{1} x+l_{1} y+\frac{5 l_{1}^{2}-k_{1}^{6}+5 k_{1}^{3} l_{1}}{k_{1}} t\right) \tag{19}
\end{align*}
$$

where $k_{1} \neq 0, l_{1} \neq 0$ are free parameters. They can be written as the following forms $\lfloor 28]$.

$$
\begin{align*}
& u_{1}=4 \ln \left(\cosh \left(\frac{k_{1}}{2} x-\frac{k_{1}^{3}}{2} y+\frac{9 k_{1}^{5}}{2} t\right)\right)_{x}  \tag{20}\\
& \tilde{u}_{1}=2 \ln \left(\cosh \left(\frac{p_{1}+q_{1}}{2} x-\frac{p_{1}^{3}+q_{1}^{3}}{2} y+\frac{9\left(p_{1}^{5}+q_{1}^{5}\right)}{2} t\right)\right)_{x}
\end{align*}
$$

where $p_{1}, q_{1}$ are arbitrary constants.

### 3.1. Two-soliton solutions of the 2DSK equation

As for two-soliton solutions, starting from $u=4\left(\ln f_{2 \text { new }}\right)_{x}$ of Eq. (2) we obtain a new twosoliton solution with $f_{2 \text { new }}$ having the form

$$
\begin{equation*}
f_{2 \text { new }}=a_{1,2} \cosh \left(\frac{\xi_{1}}{2}+\frac{\xi_{2}}{2}\right)+b_{1,2} \cosh \left(\frac{\xi_{1}}{2}-\frac{\xi_{2}}{2}\right), \quad \xi_{i}=k_{i} x+l_{i} y+w_{i} t \tag{21}
\end{equation*}
$$

and $l_{i}=-k_{i}^{3}, w_{i}=9 k_{i}^{5},(i=1,2), a_{1,2}=k_{1}-k_{2}, b_{1,2}=k_{1}+k_{2}, k_{1} \neq \pm k_{2}$.
As a comparison, we give the two-soliton solution in terms of cosh function obtained by $u=2\left(\ln f_{2 \text { old }}\right)_{x}$ with $f_{2 \text { old }}$ having the same form with that of Eq. (21), whereas

$$
\begin{align*}
& k_{i}=p_{i}+q_{i}, \quad l_{i}=-\left(p_{i}^{3}+q_{i}^{3}\right), \quad w_{i}=9\left(p_{i}^{5}+q_{i}^{5}\right), \quad(i=1,2) \\
& a_{1,2}=\sqrt{\left(q_{1}-q_{2}\right)\left(q_{1}-p_{2}\right)\left(p_{1}-q_{2}\right)\left(p_{1}-p_{2}\right)}  \tag{22}\\
& b_{1,2}=\sqrt{\left(q_{1}+q_{2}\right)\left(q_{1}+p_{2}\right)\left(p_{1}+q_{2}\right)\left(p_{1}+p_{2}\right)}
\end{align*}
$$

where, and from now on, $p_{i}, q_{i},\left(p_{i} \neq \pm p_{j}, q_{i} \neq \pm q_{j}, p_{i} \neq \pm q_{j}\right)$ are constants for all $i$.

### 3.2. Three-soliton solutions of the 2DSK equation

Starting from $u=4(\ln f)_{x}$ we obtain a new three-soliton solution with

$$
\begin{align*}
f_{3 \text { new }}= & K_{0} \cosh \left(\frac{\xi_{1}}{2}+\frac{\xi_{2}}{2}+\frac{\xi_{3}}{2}\right)+K_{1} \cosh \left(\frac{\xi_{1}}{2}-\frac{\xi_{2}}{2}-\frac{\xi_{3}}{2}\right)+ \\
& K_{2} \cosh \left(\frac{\xi_{1}}{2}-\frac{\xi_{2}}{2}+\frac{\xi_{3}}{2}\right)+K_{3} \cosh \left(\frac{\xi_{1}}{2}+\frac{\xi_{2}}{2}-\frac{\xi_{3}}{2}\right) \tag{23}
\end{align*}
$$

where $\xi_{i}=k_{i} x-k_{i}^{3} y+9 k_{i}^{5} t,(i=1, \ldots, 3)$, and

$$
\begin{align*}
& K_{0}=a_{1,2} a_{1,3} a_{2,3}, \quad K_{1}=b_{1,2} b_{1,3} a_{2,3}, \quad K_{2}=b_{1,2} a_{1,3} b_{2,3}, \quad K_{3}=a_{1,2} b_{1,3} b_{2,3}  \tag{24}\\
& a_{i, j}=k_{i}-k_{j}, \quad b_{i, j}=k_{i}+k_{j}, \quad k_{i} \neq \pm k_{j}, \quad(1 \leq i<j \leq 3)
\end{align*}
$$

For the known three-soliton solution in terms of cosh function, $f_{3 \text { old }}$ has the same form with that of Eq. (23), where

$$
\xi_{i}=k_{i} x+l_{i} y+w_{i} t, \quad k_{i}=p_{i}+q_{i}, \quad l_{i}=-\left(p_{i}^{3}+q_{i}^{3}\right), \quad w_{i}=9\left(p_{i}^{5}+q_{i}^{5}\right), \quad(i=1, \ldots, 3)
$$

and $K_{i}(i=0, \ldots, 3)$ is the same with (24), however $a_{i, j}, b_{i, j}$ have the following different forms

$$
\begin{array}{ll}
a_{1,2}=\sqrt{\left(q_{1}-q_{2}\right)\left(q_{1}-p_{2}\right)\left(p_{1}-q_{2}\right)\left(p_{1}-p_{2}\right)}, & b_{1,2}=\sqrt{\left(q_{1}+q_{2}\right)\left(q_{1}+p_{2}\right)\left(p_{1}+q_{2}\right)\left(p_{1}+p_{2}\right)}, \\
a_{1,3}=\sqrt{\left(q_{1}-q_{3}\right)\left(q_{1}-p_{3}\right)\left(p_{1}-q_{3}\right)\left(p_{1}-p_{3}\right)}, & b_{1,3}=\sqrt{\left(q_{1}+q_{3}\right)\left(q_{1}+p_{3}\right)\left(p_{1}+q_{3}\right)\left(p_{1}+p_{3}\right)}, \\
a_{2,3}=\sqrt{\left(q_{3}-q_{2}\right)\left(q_{3}-p_{2}\right)\left(p_{3}-q_{2}\right)\left(p_{3}-p_{2}\right)}, & b_{2,3}=\sqrt{\left(q_{2}+q_{3}\right)\left(p_{2}+q_{3}\right)\left(q_{2}+p_{3}\right)\left(p_{2}+p_{3}\right)} .
\end{array}
$$

## 3.3. $N$-soliton solutions of the 2DSK equation

Starting from $u=4\left(\ln f_{N \text { new }}\right)_{x}$ we obtain an $N$-soliton solution with

$$
\begin{equation*}
f_{\text {Nnew }}=\sum_{\nu} K_{\nu} \cosh \left(\sum_{i=1}^{N} \frac{\nu_{i} \xi_{i}}{2}\right), \quad K_{\nu}=\prod_{i<j} a_{i, j} \tag{25}
\end{equation*}
$$

where $\xi_{i}=k_{i} x-k_{i}^{3} y+9 k_{i}^{5} t,(i=1, \ldots, N), a_{i, j}=k_{i}-\nu_{i} \nu_{j} k_{j},(1 \leq i<j \leq N)$, and the summation of $\nu=\left\{\nu_{1}, \nu_{2}, \ldots, \nu_{N}\right\}$ are did for all non-dual permutations of $\nu_{i}=1,-1,(i=1, \ldots, N),\left(\nu \nu^{\prime}\right.$ are dual if $\nu=-\nu^{\prime}$ ).

The already existing $N$-soliton solution that we can write it in terms of $\cosh$ function, $f_{\text {Nold }}$ is the same with that of (25), and $\xi_{i}=k_{i} x+l_{i} y+w_{i} t,(i=1, \ldots, N), k_{i}=p_{i}+q_{i}, l_{i}=$ $-\left(p_{i}^{3}+q_{i}^{3}\right), w_{i}=9\left(p_{i}^{5}+q_{i}^{5}\right)$ with

$$
a_{i, j}^{2}=\left(q_{i}-\nu_{i} \nu_{j} q_{j}\right)\left(q_{i}-\nu_{i} \nu_{j} p_{j}\right)\left(p_{i}-\nu_{i} \nu_{j} q_{j}\right)\left(p_{i}-\nu_{i} \nu_{j} p_{j}\right)
$$

and the summation of $\nu=\left\{\nu_{1}, \nu_{2}, \ldots, \nu_{N}\right\}$ same as before.

## 4. Concluding remarks

In short, this paper is devoted to exploring new auxiliary transformation to derive a quintic linear equations that can be solved by a pair of Hirota's bilinear forms used for constructing new hierarchy of multiple soliton solutions of the 2DSK equation. Also, an explicit connection between the KdV and the 2DSK equations is established. Up to now, the 2DSK is the only nonlinear PDE reported in this paper that possesses two hierarchies of multiple soliton solutions. The new transformation has not been given more attention or has been missed by researchers before maybe because it can not provide Hirota's bilinear form directly by using the classical Hirota's bilinear method. We implement this newly found simple but novel transformation to find new hierarchy of multiple soliton solutions of the 2DSK equation. The famous 2DSK equation is investigated successfully, and for further we hope to obtain a category of nonlinear PDEs that also possess multiple soliton solutions obtained by two or three Hirota's bilinear equations. Actually, there
indeed exists such nonlinear partial differential equation. As an example, we consider a (3+1)dimensional nonlinear PDE with the form

$$
\begin{align*}
& v_{2 x} v_{y z}+2 v_{2 x} v_{3 x z}+12 v_{x x}^{2} v_{x z}+v_{x y} v_{x t}-120 v_{x y} v_{4 x} v_{2 x}-4 v_{x y} v_{6 x}-240 v_{x y} v_{2 x}^{3}  \tag{26}\\
& -10 v_{x y} v_{3 x y}-60 v_{x y} v_{2 x}+5 v_{x y} v_{2 y}=0
\end{align*}
$$

Likewise, substituting $v=\ln (f), f=f(x, y, z, t)$ into the Eq. (17), we obtain the following couple of bilinear equations

$$
\begin{equation*}
\left(D_{y} D_{z}+2 D_{x}^{3} D_{z}\right) f \cdot f=0, \quad\left(D_{x} D_{t}-4 D_{x}^{6}-10 D_{x}^{3} D_{y}+5 D_{y}^{2}\right) f \cdot f=0 \tag{27}
\end{equation*}
$$

The consistency of them is discussed bellow. From the bilinear equations in (27), we get

$$
\begin{align*}
& -8 f_{6 x} f+48 f_{5 x} f_{x}-120 f_{4 x} f_{2 x}+80 f_{3 x}-20 f_{3 x y} f+60 f_{2 x y} f_{x}-60 f_{x y} f_{2 x} \\
& +20 f_{y} f_{3 x}+2 f_{x t} f-2 f_{x} f_{t}-2 f_{x} f_{t}-10 f_{2 y} f+10 f_{y}^{2}=0  \tag{28}\\
& 4 f_{3 x z} f-12 f_{2 x z} f_{x}+12 f_{x z} f_{2 x}-4 f_{3 x} f_{z}+2 f_{y z} f-2 f_{y} f_{z}=0
\end{align*}
$$

Same as Theorem 1, we can get

$$
\begin{equation*}
\tilde{v}_{x t}=240 \tilde{v}_{2 x}^{3}+10 \tilde{v}_{3 x y}+120 \tilde{v}_{4 x} \tilde{v}_{2 x}-5 \tilde{v}_{2 y}+4 \tilde{v}_{6 x}, \quad \tilde{v}_{y z}=-2 \tilde{v}_{3 x z}-12 \tilde{v}_{2 x} \tilde{v}_{x z} . \tag{29}
\end{equation*}
$$

It is easy to prove that $\left(\tilde{v}_{x t}\right)_{y z}-\left(\tilde{v}_{y z}\right)_{x t}=0$ after simple computations, which completes the proof of the consistency. Thus, three-soliton solution of Eq. (26) by $v=\ln (f)$ with $f$ being the same form given in Eq. (17) is obtained, whereas,

$$
\begin{aligned}
& \xi_{i}=k_{i} x+p_{i} y+q_{i} z+w_{i} t, \quad p_{i}=-2 k_{i}^{3}, \quad w_{i}=-36 k_{i}^{5}, \quad(i=1, \ldots, 3) \\
& h_{i, j}=\frac{\left(q_{i}-q_{j}\right)\left(k_{i}-k_{j}\right)}{\left(q_{i}+q_{j}\right)\left(k_{i}+k_{j}\right)}, \quad q_{i} \neq \pm q_{j}, \quad k_{i} \neq \pm k_{j}, \quad(1 \leq i<j \leq 3) .
\end{aligned}
$$
