Well-posedness in Gevrey function space for 3D Prandtl equations without Structural Assumption

Wei-Xi Li, Nader Masmoudi and Tong Yang

Abstract. We establish the well-posedness in Gevrey function space with optimal class of regularity 2 for the three dimensional Prandtl system without any structural assumption. The proof combines in a novel way a new cancellation in the system with some of the old ideas to overcome the difficulty of the loss of derivatives in the system. This shows that the three dimensional instabilities in the system leading to ill-posedness are not worse than the two dimensional ones.

1. Introduction and main results

As the foundational system of boundary layer theories, Prandtl equation was derived by Prandtl in 1904 from the incompressible Navier-Stokes equation with no-slip boundary condition for the description of the behavior of fluid motion near the boundary when viscosity vanishes. In fact, in this viscous to inviscid limit process, there exists a boundary layer where the majority of the drag experienced by the solid body can be modelled by a 'simplified' system derived from the incompressible Navier-Stokes equations for balancing the inertial and frictional forces. Outside this layer, the viscosity can be basically neglected as it has no significant effect on the fluid so that the fluid motion can be modelled by the Euler equation. Even though there are fruitful mathematical theories developed since the seminal works by Oleinik in 1960s, most of the well-posedness theories are limited to the two space dimensions under Oleinik’s monotonicity condition except the classical work by Sammartino-Caflisch in 1998 in the framework of analytic functions and some recent work in Gevrey function spaces.

Prandtl equation can be viewed as a typical example of partial differential equations with rich structure that includes mix-type and degeneracy in dissipation. Hence, it provides many challenging mathematical problems and many of them remained unsolved after more than one hundred years from its derivation.

This paper aims to establish the well-posedness theory for the three dimensional Prandtl equation in Gevrey spaces with the optimal class of regularity 2 that is implied by the instability results, cf. [24, 23]. Compared with the recent result in two space dimensions [9], our new approach is more direct and robust to take care of the loss of derivative in the two tangential directions. In particular it gives a simpler proof to the result in two dimensions [9]. Hence, this paper is a complete answer to the well-posedness theory without any structural assumption in the three dimensional setting and also shows the optimality of the ill-posedness theories.

Denote $\mathbb{R}_+^3 = \{(x, y, z) \in \mathbb{R}^3; \; z > 0\}$ and let $(u, v)$ be the tangential component and $w$ be the vertical component of the velocity field. Then the three dimensional Prandtl system

2010 Mathematics Subject Classification. 35Q30, 35Q31.

Key words and phrases. 3D Prandtl boundary layer, well-posedness theory, non-structural assumption, Gevrey class.
in $\mathbb{R}_+^3$ reads
\begin{align}
\begin{aligned}
&\begin{cases}
\left( \partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_x^2 \right) u + \partial_z p = 0, \\
\left( \partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_x^2 \right) v + \partial_y p = 0, \\
\partial_x u + \partial_y v + \partial_z w = 0, \\
u|_{z=0} = v|_{z=0} = w|_{z=0} = 0, \\
u|_{t=0} = u_0, \\
v|_{t=0} = v_0,
\end{cases}
\end{aligned}
\end{align}

where $(U(t, x, y), V(t, x, y))$ and $p(t, x, y)$ are the boundary traces of the tangential velocity field and pressure of the outer flow, satisfying
\begin{align}
\begin{aligned}
&\begin{cases}
\partial_t U + U\partial_x U + V\partial_y U + \partial_z p = 0, \\
\partial_t V + U\partial_x V + V\partial_y V + \partial_y p = 0.
\end{cases}
\end{aligned}
\end{align}

Here, $p, U, V$ are given functions determined by the Euler flow. Note that (1) is a degenerate parabolic system losing one order derivative in the tangential variable. We refer to [27, 29, 30] for the background and mathematical presentation of this fundamental system.

So far, the well-posedness theories for the Prandtl equation are basically limited to the two space dimensions except the works by Sammartino-Caffisch [31] in analytic function space and some recent works in Gevrey function space. In the two dimensional case, under Oleinik’s monotonicity condition, there are mainly two analytic techniques for the well-posedness theories, one referred to as coordinate transformations and the second one referred to as cancellations. Precisely, the Crocco transformation was used by Oleinik [29] for the unsteady layer to transfer the two dimensional Prandtl equation into a degenerate parabolic equation. The cancellations in the convection terms were observed in recent years by two research groups independently, [11, 28], to overcome the difficulty of the loss of derivatives in the system. However, these two powerful analytic techniques are limited to the two space dimension so far. For three dimensions, much less is known in the well-posedness theories in Sobolev spaces. Let us also mention the work [32] on the global existence of weak solutions under an additional favorable pressure condition.

In two space dimensions, without the monotonicity condition, boundary layer separation is well expected and there are a lot of studies of the instability phenomena. Here, we only mention the works [10] about the construction of blowup solutions (see also [15, 17]), [14] on the unstable Euler shear flow that yields instability of Prandtl equation, [16, 20, 12] about the instability around a shear flow with a non-degenerate critical point, [18] on the instability even for Rayleigh’s stable shear flow, [24] about three space dimensional perturbation of shear flow when the initial data satisfying $U(z) \neq kV(z)$ with a constant $k$. In fact, the instability result in [12] implies that the critical Gevrey index for well-posedness without structural condition is 2 and this is proved in two space dimensional [9]. The well-posedness theories in function spaces of smooth functions was proved in [31] with justification of the Prandtl ansatz when the data is analytic; and then it was studied in [15] for two space dimension with Gevrey index $= \frac{7}{4}$ that was improved in [22] to the Gevrey index in (1,2] with non-monotonic flow and then finalized in two space dimension without any structural condition in [9]. In three dimensional space, we also have some work recently without monotonicity assumption. In addition, recently, the separation singularity for stationary Prandtl system was studied in [8] that justifies the Goldstein singularity.

All these results are in fact related to the high Reynolds number limit for viscous fluid systems that is important in both mathematics and physics. Without boundary effect, the
mathematical theories are now satisfactory (see for instance [5, 26] and references therein). The case with boundary is more complicated and interesting. For this, Kato in 1984 gave a necessary and sufficient condition for weak convergence of viscous fluid to inviscid fluid in terms of the vanishing energy dissipation rate in the region near the boundary. Recently, there is a series of works [4, 3] on such limit with relation to the Onsager conjecture. As for Prandtl boundary layer, [25] gave a proof when the initial vorticity is supported away from the boundary for two dimensional flow that was generalized to three dimension in [11]; and recently, there are also some interesting works on the limit to steady flow in [21] over a moving plate and in [19] over a small distance, and [15] about the Sobolev stability of steady shear flow in two dimensional space. For the time dependent problem, the stability of Prandtl expansion in two space dimension in Gevrey function space was studied in [14].

Without loss of generality we will assume that $(U, V) \equiv 0$. Extending our result to the case of a general outer flow requires using some nontrivial weights similar to those in [9].

Then for the zero outer flow, the Prandtl system (1) can be written as

$$
\begin{align*}
(\partial_t + u \partial_x + v \partial_y + w \partial_z - \partial_z^2) u &= 0, \quad t > 0, \quad (x, y, z) \in \mathbb{R}^3_+,
(\partial_t + u \partial_x + v \partial_y + w \partial_z - \partial_z^2) v &= 0, \quad t > 0, \quad (x, y, z) \in \mathbb{R}^3_+,
(u, v)|_{z=0} &= (0, 0), \quad \lim_{z \to +\infty} (u, v) = (0, 0),
(u, v)|_{t=0} &= (u_0, v_0), \quad (x, y, z) \in \mathbb{R}^3_+,
\end{align*}
$$

with

$$
w(t, x, y, z) = -\int_0^z \partial_z u(t, x, y, \bar{z}) \ d\bar{z} - \int_0^z \partial_y v(t, x, y, \bar{z}) \ d\bar{z}.
$$

Before stating our main result concerning with the well-posedness of the Prandtl system (2), we first list some notations to be used frequently throughout the paper and then introduce the Gevrey function space.

**Notations.** Throughout the paper we will use without confusion $\| \cdot \|_{L^2}$ and $(\cdot, \cdot)_{L^2}$ to denote the norm and inner product of $L^2 = L^2(\mathbb{R}^3_+)$, and use the notations $\| \cdot \|_{L^2(\mathbb{R}^3_+, y)}$ and $(\cdot, \cdot)_{L^2(\mathbb{R}^3_+, y)}$ when the variables are specified. Similarly for $L^\infty$. Moreover we also use $L^\infty_{x,y}(L^2_z) = L^\infty(\mathbb{R}^2; L^2(\mathbb{R}^+_z))$ to stands for the classical Sobolev space, so does the Sobolev space $L^2_{x,y}(L^\infty_z)$. In the following discussion by $\partial^\alpha$ we always mean $\partial_x^{\alpha_1} \partial_y^{\alpha_2}$ with each multi-index $\alpha = (\alpha_1, \alpha_2) \in \mathbb{Z}^2_+$.

**Definition 1.1.** Let $\ell > 1/2$ be a given number. With each pair $(\rho, \sigma)$, $\rho > 0$ and $\sigma \geq 1$, a Banach space $X_{\rho, \sigma}$ consists of all smooth vector-valued functions $(u, v)$ such that the Gevrey norm $\| (u, v) \|_{\rho, \sigma} < +\infty$, where $\| \cdot \|_{\rho, \sigma}$ is defined below. Recalling $\partial^\alpha = \partial_x^{\alpha_1} \partial_y^{\alpha_2}$ we define

$$
\| (u, v) \|_{\rho, \sigma} = \sup_{0 \leq j \leq 6} \rho^{|\alpha|+j-7} \sup_{|\alpha|+j \geq 7} \left( \| \langle z \rangle^{\ell+j} \partial^\alpha \partial_x^j u \|_{L^2} + \| \langle z \rangle^{\ell+j} \partial^\alpha \partial_x^j v \|_{L^2} \right)
$$

$$
+ \sup_{0 \leq j \leq 5} \left( \| \langle z \rangle^{\ell+j} \partial^\alpha \partial_x^j u \|_{L^2} + \| \langle z \rangle^{\ell+j} \partial^\alpha \partial_x^j v \|_{L^2} \right),
$$

where and throughout the paper $\langle z \rangle = (1 + |z|^2)^{1/2}$. We call $\sigma$ the Gevrey index.

**Remark 1.2.** Note that $X_{\rho, \sigma}$ is a partial Gevrey function space. By partial Gevrey function space, we mean it consists functions that are of Gevrey class in tangential variables $x, y$ and lie in Sobolev space for normal variable $z$. 

\[WELL-POSEDNESS\ IN\ GEVREY\ FUNCTION\ SPACE\ FOR\ 3D\ PRANDTL\ EQUATIONS\ 3\]
We will look for the solutions to (2) in the Gevrey function space \(X_{\rho,\sigma}\). For this, the initial data \((u_0, v_0)\) satisfy the following compatibility conditions

\[
\begin{cases}
(\partial_t + \partial_x + \partial_y + \partial_z - \partial_x^2) \varphi = \xi, \\
(\partial_t + \partial_x + \partial_y + \partial_z - \partial_z^2) \psi = \eta,
\end{cases}
\]

where the source terms \(\xi, \eta\) can be written as the linear combinations of the following types

\[
\varphi, \psi, \sum_{|\beta|=1} \partial^\beta \varphi, \sum_{|\beta|=1} \partial^\beta \psi,
\]

with \(\partial^\beta = \partial_x^{\beta_1} \partial_y^{\beta_2}\). So we lose one order tangential derivatives in the source terms \(\xi, \eta\), and usually we can expect only the existence theory in analytic space for the system (4). However, if \(\xi\) and \(\eta\) satisfy additionally the evolution equations

\[
\begin{cases}
(\partial_t + \partial_x + \partial_y + \partial_z - \partial_x^2) \varphi = G, \\
(\partial_t + \partial_x + \partial_y + \partial_z - \partial_z^2) \psi = H,
\end{cases}
\]

with \(G, H\) being the linear combinations of the following types

\[
\xi, \eta, \varphi, \psi, \sum_{|\beta|=1} \partial^\beta \varphi, \sum_{|\beta|=1} \partial^\beta \psi.
\]

Then we may improve the existence theory in Gevrey space with index \(\leq 2\), using standard energy method. Precisely, we denote \(\vec{b} = (\varphi, \psi, \xi, \eta)\) and define \(|\cdot|_\rho\) for each \(\rho > 0\) by

\[
|\vec{b}|_\rho = \sup_{|\alpha| \geq 0} \rho^{|\alpha|} \left( \|\partial^\alpha \varphi\|_{L^2} + \|\partial^\alpha \psi\|_{L^2} \right) + \sup_{|\alpha| \geq 0} \rho^{|\alpha|+1} \left( \|\partial^\alpha \xi\|_{L^2} + \|\partial^\alpha \eta\|_{L^2} \right),
\]

where \(\partial^\alpha = \partial_x^{\alpha_1} \partial_y^{\alpha_2}\). Note in the above definition there is an additional factor \(|\alpha|\) before the norms \(\|\partial^\alpha \xi\|_{L^2}\) and \(\|\partial^\alpha \eta\|_{L^2}\), that means we lose only 1/2 rather than 1 order derivatives.
thanks to the evolution equation (5). Applying standard energy method to (1) and (2) we have, for any $|\alpha| \geq 1$ and any $0 < \rho < 1$,

$$\frac{\rho^{2|\alpha|}}{|\alpha|!} \int_0^t \left( \|\partial^\alpha \varphi(t)\|_{L^2}^2 + \|\partial^\alpha \psi(t)\|_{L^2}^2 \right) \leq 2 \frac{\rho^{2|\alpha|}}{|\alpha|!} \int_0^t \|\partial^\alpha \xi(s)\|_{L^2} \|\partial^\alpha \varphi(s)\|_{L^2} ds + 2 \frac{\rho^{2|\alpha|}}{|\alpha|!} \int_0^t \|\partial^\alpha \eta(s)\|_{L^2} \|\partial^\alpha \psi(s)\|_{L^2} ds$$

$$+ C |\alpha|^2 \frac{\rho^{2(|\alpha|+1)}}{|(\alpha| + 1)!} \int_0^t \sum_{|\beta| = 1} \left( \|\partial^{\alpha+\beta} \varphi(s)\|_{L^2} + \|\partial^{\alpha+\beta} \psi(s)\|_{L^2} \right) \|\partial^\alpha \xi(s)\|_{L^2} ds$$

$$+ C |\alpha|^2 \frac{\rho^{2(|\alpha|+1)}}{|(\alpha| + 1)!} \int_0^t \sum_{|\beta| = 1} \left( \|\partial^{\alpha+\beta} \varphi(s)\|_{L^2} + \|\partial^{\alpha+\beta} \psi(s)\|_{L^2} \right) \|\partial^\alpha \eta(s)\|_{L^2} ds$$

$$+ \text{l.o.t} + \text{initial data},$$

where here and below l.o.t refers to lower order terms that are easier to control and initial data refers to terms that are controlled by the initial data. From the definition of $|.|_r$ given in (3), it follows that

$$\forall \ r > 0, \forall \ j \geq 1, \ \|\partial^j \varphi\|_{L^2} \leq \frac{(j!)^2}{r^j} |\bar{b}|_r, \ \|\partial^j \xi\|_{L^2} \leq \frac{1}{j} \frac{[(j+1)!]^2}{r^{j+1}} |\bar{b}|_r.$$

We use the above estimates to compute, for any $\tilde{\rho}$ with $0 < \rho < \tilde{\rho} \leq 1$,

$$\frac{\rho^{2|\alpha|}}{|\alpha|!} \int_0^t \|\partial^\alpha \xi(s)\|_{L^2} \|\partial^\alpha \varphi(s)\|_{L^2} ds \leq \frac{\rho^{2|\alpha|}}{|\alpha|!} \int_0^t \frac{1}{|\alpha|} \left( \frac{\rho^{2|\alpha|}}{|\alpha|!} \frac{|\alpha| + 1)}{\rho^{|\alpha|}} \right) \|\tilde{b}(s)\|_{\tilde{\rho}}^2 ds$$

$$\leq 4 \int_0^t \frac{|\alpha| \rho^{2|\alpha|}}{\rho^{2|\alpha|}} |\tilde{b}(s)|_{\tilde{\rho}}^2 ds \leq 4 \int_0^t \frac{|\alpha|}{\rho} \frac{\rho^{2|\alpha|}}{\rho^{2|\alpha|}} |\tilde{b}(s)|_{\rho}^2 ds \leq 4 \int_0^t \frac{|\tilde{b}(s)|_{\rho}^2 ds}{\rho - \rho},$$

the last inequality using the fact that for any integer $k \geq 1$ and for any pair $(\rho, \tilde{\rho})$ with $0 < \rho < \tilde{\rho} \leq 1$,

$$k \left( \frac{\rho}{\tilde{\rho}} \right)^k \leq k \left( \frac{\rho}{\tilde{\rho}} \right) \leq \frac{1}{\rho - \rho}.$$ (7)

Note that the first inequality in (7) is obvious since $\tilde{\rho} \leq 1$ and the second one follows from the fact that

$$1 - \frac{\rho}{\tilde{\rho}} = \sum_{j=0}^\infty \left( \frac{\rho}{\tilde{\rho}} \right)^j \geq k \left( \frac{\rho}{\tilde{\rho}} \right)^k.$$

Applying the similar argument as above gives also

$$|\alpha|^2 \frac{\rho^{2(|\alpha|+1)}}{|(\alpha| + 1)!} \int_0^t \sum_{|\beta| = 1} \left( \|\partial^{\alpha+\beta} \varphi(s)\|_{L^2} + \|\partial^{\alpha+\beta} \psi(s)\|_{L^2} \right) \|\partial^\alpha \xi(s)\|_{L^2} ds$$

$$\leq 2 \int_0^t |\alpha| \frac{\rho^{2(|\alpha|+1)}}{\rho^{2(|\alpha|+1)}} |\tilde{b}(s)|_{\rho}^2 ds \leq 2 \int_0^t \frac{|\tilde{b}(s)|_{\rho}^2 ds}{\rho - \rho}.$$

Similarly for the other terms involving the higher order derivatives. Then combining the above inequalities we conclude

$$|\tilde{b}(t)|_{\rho}^2 \leq C \int_0^t \frac{|\tilde{b}(s)|_{\rho}^2 ds}{\rho - \rho} + \text{terms related to the lower order derivatives and initial data.}$$
This estimate enables us to follow the argument for proving abstract Cauchy-Kowalewski theorem, seeing for instance [2] or [22] Section 8 and Section 6 below for the detailed discussion, to obtain the existence of solution to (4).

2.2. Auxiliary functions and statement of a priori estimate. Inspired by [9] let $U$ be a solution to the linear initial-boundary problem

$$
\begin{cases}
(\partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_z^2) \int_0^z U(t, x, y, z)dz = -\partial_x w(t, x, y, z), \\
U|_{t=0} = 0, \quad \partial_z U|_{z=0} = U|_{z\rightarrow +\infty} = 0.
\end{cases}
$$

(8)

The existence of $U$ just follows from the standard parabolic theory. In fact we first construct a solution $f$ to the following

$$
\begin{cases}
(\partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_z^2)f = -\partial_x w \\
f|_{t=0} = 0, \quad f|_{z=0} = \partial_z f|_{z\rightarrow +\infty} = 0,
\end{cases}
$$

(9)

and then define $U = \partial_z f$ which will solve (8). Similarly let $\tilde{U}$ solve

$$
\begin{cases}
(\partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_z^2) \int_0^z \tilde{U}(t, x, y, z)dz = -\partial_y w(t, x, y, z), \\
\tilde{U}|_{t=0} = 0, \quad \partial_z \tilde{U}|_{z=0} = \tilde{U}|_{z\rightarrow +\infty} = 0.
\end{cases}
$$

(10)

As to be seen later we need $\lambda, \delta$ and $\tilde{\lambda}, \tilde{\delta}$ that defined as follows

$$
\begin{cases}
\lambda = \partial_x u - (\partial_x u) \int_0^z Udz, \quad \tilde{\lambda} = \partial_y u - (\partial_z u) \int_0^z \tilde{U}dz, \\
\delta = \partial_x v - (\partial_z v) \int_0^z Udz, \quad \tilde{\delta} = \partial_y v - (\partial_z v) \int_0^z \tilde{U}dz,
\end{cases}
$$

(11)

to derive the estimate on $U$ and $\tilde{U}$.

Next we will explain the main difficulties and the new ideas introduced in this paper. We first estimate $u$ and $v$. Applying $\partial_x$ to the first equation in (2) yields

$$
(\partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_z^2) \partial_x u = -(\partial_x w)\partial_x u - (\partial_x u)\partial_x u - (\partial_x v)\partial_y u.
$$

(12)

Note we lose one order tangential derivatives in $\partial_x w$ which is the main difficulty for the existence theory of Prandtl equation. To overcome the loss of derivatives we introduce a new cancellation in the system. Multiplying the equation (8) by $\partial_z u$ and then subtracting the resulting equation by (12); this eliminates the term $(\partial_z w)\partial_x u$ that loses derivatives and yields

$$
(\partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_z^2) \left[ \partial_x u - (\partial_x u) \int_0^z Udz \right] = -(\partial_x u)\partial_x u - (\partial_x v)\partial_y u + \text{l.o.t.}
$$

(13)

As a result if we can control $(\partial_x u) \int_0^z Udz$ then the estimate on $\partial_x u$ will follow from (13), since therein we don’t lose the derivatives anymore. Note we can’t perform the energy estimate for $(\partial_x u) \int_0^z Udz$ from its equation (8) since we lose one order derivatives caused by the source term $\partial_x w$. Instead we will control $(\partial_x u) \int_0^z Udz$ in terms of $U$ which solves the
following equation, applying $\partial_2$ to \((8)\),
\[
\begin{aligned}
(\partial_t + u\partial_x + v\partial_y + w\partial_z - \partial^2_x)U &= \partial_2^2 u - \partial_x \left[ (\partial_x u) \int_0^\xi U \, dz \right] + \partial_x \partial_2 v - \partial_y \left[ (\partial_y v) \int_0^\xi U \, dz \right] + \text{l.o.t.,}
\end{aligned}
\]
recalling $\lambda$ and $\delta$ are given by \((11)\). In the above equation we lose again one order derivatives caused by $\partial_x \lambda$ and $\partial_y \delta$. However we have additionally an evolution equation \((13)\) for $\lambda$. Similarly for $\delta$. Then this situation is quite similar as in the case for the model equations \((4)-(5)\), and thus following the argument in the previous subsection for the toy model, we can deduce the estimate for $U$ and then for $(\partial_z u) \int_0^\xi U \, dz$, and finally for $\partial_x u$. Similarly for the estimate on $\partial_x v$.

Inspired by the above discussion and the treatment of the model system \((4)-(5)\), it is natural to define $|\cdot|_{\rho,\sigma}$ as below, just similar to the definition in \((6)\). We use the notation
\[
\tilde{a} = (u, v, U, \tilde{U}, \lambda, \lambda, \delta, \delta)
\]
Recall $U, \tilde{U}$ are given by \((8)\) and \((10)\), and $\lambda, \lambda, \delta, \delta$ are defined by \((11)\).

**Definition 2.1.** Let $\| (u, v) \|_{\rho, \sigma}$ be given in Definition \((11)\). With the notation $\tilde{a}$ above, we define $|\tilde{a}|_{\rho, \sigma}$ by setting
\[
|\tilde{a}|_{\rho, \sigma} = \| (u, v) \|_{\rho, \sigma} + \sup_{|\alpha| \geq 6} \frac{\rho^{|\alpha|-6}}{([|\alpha| - 6])!^2} \left( \| \partial^0 U \|_{L^2} + \| \partial^0 \tilde{U} \|_{L^2} \right) + \sup_{|\alpha| \leq 5} \left( \| \partial^\alpha U \|_{L^2} + \| \partial^\alpha \tilde{U} \|_{L^2} \right) + \sup_{|\alpha| \geq 6} \frac{\rho^{|\alpha|-6}}{([|\alpha| - 6])!^2} |\alpha| \left( \| \partial^0 \lambda \|_{L^2} + \| \partial^0 \delta \|_{L^2} + \| \partial^\alpha \lambda \|_{L^2} + \| \partial^\alpha \delta \|_{L^2} \right) + \sup_{|\alpha| \leq 5} |\alpha| \left( \| \partial^\alpha \lambda \|_{L^2} + \| \partial^\alpha \delta \|_{L^2} + \| \partial^\alpha \tilde{\lambda} \|_{L^2} + \| \partial^\alpha \tilde{\delta} \|_{L^2} \right).
\]
Note there is an additional factor $|\alpha|$ before the $L^2$-norms of $\partial^0 \lambda, \partial^\alpha \delta$ and $\partial^\alpha \tilde{\lambda}, \partial^\alpha \tilde{\delta}$.

**Remark 2.2.** The auxiliary functions $U, \lambda, \delta$ are introduced for treating the derivatives $\partial_x^m$ and meanwhile $\tilde{U}, \tilde{\lambda}, \tilde{\delta}$ are for $\partial_y^m$. Then the estimate for the general $\partial^\alpha = \partial_x^\alpha \partial_y^m$ will follow as well using the relationship
\[
\forall \alpha \in \mathbb{Z}_+^2, \forall \ F \in H^\infty, \quad \| \partial^\alpha F \|_{L^2} \leq \| \partial_x^{|\alpha|} F \|_{L^2} + \| \partial_y^{|\alpha|} F \|_{L^2}. \tag{14}
\]
In this paper we will focus on performing only the estimates for $\partial_x^m$, since the estimates for $\partial_y^m$ can be treated symmetrically in the same way.

Now we are ready to state the main a priori estimate. We will present in detail the proof of Theorem \((13)\) for $\sigma \in [3/2, 2]$. Note that the constraint $\sigma \geq 3/2$ is not essential and indeed it is just a technical assumption for clear presentation. We refer to \([23, \text{Section 8}]\) for the explanation how to modify the proof for the case when $1 < \sigma < 3/2$. We make the following low regularity assumption that will be checked in the last section of the paper:

**Assumption 2.3.** Let $X_{\rho, \sigma}$ be the Gevrey function space equipped with the norm $\| \cdot \|_{\rho, \sigma}$ given in Definition \((17)\). Suppose $(u, v) \in L^\infty ([0, T]; X_{\rho_0, \sigma})$ for some $0 < \rho_0 \leq 1$ and $\sigma \in [3/2, 2]$ is a solution to the Prandtl system \((2)\) with initial datum $(u_0, v_0) \in X_{2\rho_0, \sigma}$. Without loss of
generality we may assume $T \leq 1$. Moreover we suppose that there exists a constant $C_*$ such that
\[
\forall \ t \in [0, T], \quad \sup_{|a|+|j| \leq 10} \left( \| \langle z \rangle^{\ell+j} \partial^a \partial_t^j u(t) \|_{L^2} + \| \langle z \rangle^{\ell+j} \partial^a \partial_t^j v(t) \|_{L^2} \right) \leq C_* ,
\]
where the constant $C_* \geq 1$ depends only on $\| (u_0, v_0) \|_{2\rho_0, \sigma}$, the Sobolev embedding constants and the numbers $\rho_0, \sigma, \ell$ that are given in Definition 1.1.

**Theorem 2.4** (A priori estimate in Gevrey space). Under Assumption 2.3 above, we can find two constant $C_1, C_2 \geq 1$, such that the estimate
\[
|\tilde{a}(t)|^2_{\rho, \sigma} \leq C_1 \| (u_0, v_0) \|_{2\rho_0, \sigma}^2 + C_2 \left( \int_0^t (|\tilde{a}(s)|^2_{\rho, \sigma} + |\tilde{a}(s)|^4_{\rho, \sigma}) \, ds + \int_0^t \frac{|\tilde{a}(s)|^2_{\rho, \sigma}}{\rho - \tilde{\rho}} \, ds \right)
\]
holds for any pair $(\rho, \tilde{\rho})$ with $0 < \rho < \tilde{\rho} < \rho_0$ and any $t \in [0, T]$, where the constant $C_1$ can be computed explicitly and the constant $C_2$ depends only on the Sobolev embedding constants and the numbers $\rho_0, \sigma, \ell$ given in Definition 1.1. Both $C_1$ and $C_2$ are independent of the constant $C_*$ given in (15).

3. Estimate on $\partial^\rho U$ and $\partial^\rho \tilde{U}$

To prove the a priori estimate stated in Theorem 2.4, we will proceed through this section and Sections 4.5 to derive the upper bound for the terms involved in Definition 2.1 of $|\tilde{a}|_{\rho, \sigma}$. For the argument presented in Sections 3.5 we always suppose Assumption 2.3 is fulfilled by $(u, v) \in L^\infty ([0, T]; X_{\rho_0, \sigma})$.

To simplify the notation, we use from now on the two capital letters $C_1, C_2$ to denote some generic constant that may vary from line to line, both depending only on the Sobolev embedding constants and the numbers $\rho_0, \sigma, \ell$ given in Definition 1.1 but independent of the constant $C_*$ in (15) and the order of derivatives denoted by $m$.

In this part we will derive the upper bound for the terms involving $U$ and $\tilde{U}$ in Definition 2.1 of $|\tilde{a}|_{\rho, \sigma}$. Recall $U$ and $\tilde{U}$ solve respectively the equations (8) and (10).

**Proposition 3.1.** Under Assumption 2.3 we have, for any $t \in [0, T]$ and for any pair $(\rho, \tilde{\rho})$ with $0 < \rho < \tilde{\rho} < \rho_0 \leq 1$,
\[
\sup_{|\alpha| \leq 5} \frac{\rho^{2(|\alpha| - 6)} \| \partial^\rho \partial_t^a U(t) \|_{L^2}^2 + \| \partial^\rho \partial_t^a \tilde{U}(t) \|_{L^2}^2}{\rho^2}\left( \int_0^t (|\tilde{a}(s)|^2_{\rho, \sigma} + |\tilde{a}(s)|^4_{\rho, \sigma}) \, ds + \int_0^t \frac{|\tilde{a}(s)|^2_{\rho, \sigma}}{\rho - \tilde{\rho}} \, ds \right)
\]
\[
\leq CC_* \left( \int_0^t (|\tilde{a}(s)|^2_{\rho, \sigma} + |\tilde{a}(s)|^4_{\rho, \sigma}) \, ds + \int_0^t \frac{|\tilde{a}(s)|^2_{\rho, \sigma}}{\rho - \tilde{\rho}} \, ds \right),
\]
where $C_* \geq 1$ is the constant given in (15). Symmetrically, the same upper bound also holds with $U$ replaced by $\tilde{U}$.

We first derive the evolution equation for $\partial^\rho U$. Applying $\partial_t$ to (8) yields
\[
(\partial_t + u \partial_x + v \partial_y + w \partial_z - \partial_x^2) U = \partial_x^2 u + \partial_y \partial_x v + (\partial_x u) \partial_x \int_0^z U d\tilde{z} - (\partial_x v) \partial_y \int_0^z U d\tilde{z} + (\partial_x u + \partial_y v) U,
\]
and thus, using the representation of $\lambda$ and $\delta$ given in (11),
\[
(\partial_t + u \partial_x + v \partial_y + w \partial_z - \partial_x^2) U = \partial_x \lambda + \partial_y \delta + (\partial_x \partial_u + \partial_y \partial_v) \int_0^z U d\tilde{z} + (\partial_x u + \partial_y v) U,
\]
Then, applying $\partial_x^m$ to the above equation we get

$$
(\partial_t + u \partial_x + v \partial_y + w \partial_z - \partial_z^2) \partial_x^m U = - \sum_{j=1}^m \binom{m}{j} \left[ (\partial_x^j u) \partial_x^{m-j+1} U + (\partial_x^j v) \partial_x^{m-j} \partial_y U + (\partial_x^j w) \partial_x^{m-j} \partial_z U \right] + \partial_x^m (\partial_x \lambda + \partial_y \delta) + \partial_x^m \left[ (\partial_x \partial_z u + \partial_y \partial_z v) \int_0^z U \partial \bar z + (\partial_x u + \partial_y v) \partial_z U \right].
$$

Taking the scalar product with $\partial_x^m U$ and observing $U|_{t=0} = \partial_z U|_{z=0} = 0$ gives

$$
\frac{1}{2} \|\partial_x^m U(t)\|_{L^2}^2 + \int_0^t \|\partial_x^m U(s)\|_{L^2}^2 ds
= \int_0^t \left( (\partial_x + u \partial_x + v \partial_y + w \partial_z - \partial_z^2) \partial_x^m U, \partial_x^m U \right)_{L^2} ds
= - \int_0^t \left( \sum_{j=1}^m \binom{m}{j} \left[ (\partial_x^j u) \partial_x^{m-j+1} U + (\partial_x^j v) \partial_x^{m-j} \partial_y U + (\partial_x^j w) \partial_x^{m-j} \partial_z U \right], \partial_x^m U \right)_{L^2} ds
+ \int_0^t \left( \partial_x^m (\partial_x \lambda + \partial_y \delta) + \partial_x^m \left[ (\partial_x \partial_z u + \partial_y \partial_z v) \int_0^z U \partial \bar z + (\partial_x u + \partial_y v) \partial_z U \right], \partial_x^m U \right)_{L^2} ds.
$$

(17)

Next we derive the upper bound for the terms on the right-hand side through the following three lemmas.

**Lemma 3.2.** Under the same assumptions as in Proposition 3.1 we have, for any $m \geq 6$, any $t \in [0,T]$ and for any pair $(\rho, \bar \rho)$ with $0 < \rho < \bar \rho < \rho_0 \leq 1$,

$$
\int_0^t \left( \partial_x^m (\partial_x \lambda + \partial_y \delta), \partial_x^m U \right)_{L^2} dt \leq C \frac{[(m-6)!]^2}{\rho^{m-6}} \int_0^t |\bar a(s)|_{\rho, \sigma}^2 ds.
$$

**Proof.** It follows from Definition 2.1 of $|\bar a|_{r, \sigma}$ that, for any $\alpha \in \mathbb{Z}^3_+^*$ and for any $r > 0$,

$$
|\alpha| \left( \|\partial^\alpha \lambda\|_{L^2} + \|\partial^\alpha \delta\|_{L^2} \right) \leq \begin{cases} 
\frac{[(\alpha)|-6)!]^\sigma}{\rho^{(\alpha)|-6|}} |\bar a|_{r, \sigma}, & \text{if } |\alpha| \geq 6, \\
|\bar a|_{r, \sigma}, & \text{if } |\alpha| \leq 5,
\end{cases}
$$

(18)

and that, observing $\ell > 1/2$,

$$
\| (z)^{-\ell - \frac{1}{2}} \int_0^z \partial^\alpha U \partial \bar z \|_{L^2} + \| (z)^{-\frac{1}{2}} \int_0^z \partial^\alpha U \partial \bar z \|_{L^2(\mathbb{L}^\infty)}
\leq C \|\partial^\alpha U\|_{L^2} \leq \begin{cases} 
C \frac{[(\alpha)|-6)!]^\sigma}{\rho^{(\alpha)|-6|}} |\bar a|_{r, \sigma}, & \text{if } |\alpha| \geq 6, \\
C |\bar a|_{r, \sigma}, & \text{if } |\alpha| \leq 5.
\end{cases}
$$

(19)

Using the above estimates we compute

$$
\int_0^t \left( \partial_x^m (\partial_x \lambda + \partial_y \delta), \partial_x^m U \right)_{L^2} dt \leq \int_0^t \frac{1}{m+1} \frac{[(m-5)!]^\sigma}{\rho^{m-5}} \frac{[(m-6)!]^\sigma}{\rho^{m-6}} |\bar a(s)|_{\rho, \sigma}^2 ds
\leq C \int_0^t \frac{m^{\sigma-1}}{\rho^{(\alpha)|-6|}} \frac{[(m-6)!]^\sigma}{\rho^{m-6}} |\bar a(s)|_{\rho, \sigma}^2 ds
\leq C \frac{[(m-6)!]^\sigma}{\rho^{2(m-6)}} \int_0^t |\bar a(s)|_{\rho, \sigma}^2 ds.
$$
the last inequality holding because $\sigma \leq 2$ and
\[
\frac{m}{\bar{\rho}} \frac{1}{\bar{\rho}^{2(m-6)}} = \frac{1}{\rho^{2(m-6)}} \frac{m \rho^{2(m-6)}}{\rho^{2(m-6)}} \leq C \frac{1}{\rho^{2(m-6)}} \rho^{m-6} \left( \frac{\rho}{\bar{\rho}} \right)^{m-6} \leq C \frac{1}{\rho^{2(m-6)}} \frac{1}{\bar{\rho} - \rho}
\]
due to (7). The proof of Lemma 3.2 is completed. \hfill \Box

**Lemma 3.3.** Under the same assumption as in Proposition 3.1, we have, for any $m \geq 6$, any $t \in [0, T]$ and for any pair $(\rho, \bar{\rho})$ with $0 < \rho < \bar{\rho} < \rho_0 \leq 1$,
\[
- \int_0^t \left( \sum_{j=1}^m \left( \frac{m}{j} \right) \left[ (\partial_x^{m-j+1} + \partial_x^{m-j}) U + (\partial_x^j v) \partial_x^{m-j-1} \partial_x U + (\partial_x^j w) \partial_x^{m-j} \partial_x U \right] \right) \rho^m \partial_x^m U \partial_x^m U \ dx \ ds 
\leq \frac{1}{2} \int_0^t \| \partial_x^m U \|_{L^2}^2 \ ds + C \frac{[m(m-6)]^{2\sigma}}{\rho^{2(m-6)}} \left( \int_0^t \left( |\bar{a}(s)|^{3+\sigma} + |\bar{a}(s)|^{4+\sigma} \right) \ ds + C_* \int_0^t \frac{|\bar{a}(s)|^2}{\bar{\rho} - \rho} \ ds \right),
\]
where $C_*$ is the constant in (15).

**Proof.** We treat the first term on the left side and write
\[
\sum_{j=1}^{[m/2]} \left( \frac{m}{j} \right) \| (\partial_x^j u) \partial_x^{m-j+1} U \|_{L^2} \leq \sum_{j=1}^{[m/2]} \left( \frac{m}{j} \right) \| \partial_x^j u \|_{L^\infty} \| \partial_x^{m-j+1} U \|_{L^2} + \sum_{j=m/2+1}^m \left( \frac{m}{j} \right) \| \partial_x^j u \|_{L^2} \| \partial_x^{m-j+1} U \|_{L^\infty} \| \partial_x^{m-j} U \|_{L^2}, \tag{20}
\]
where as standard, $[p]$ denotes the largest integer less than or equal to $p$. We need the following Sobolev embedding inequalities:
\[
\| F \|_{L^\infty(\mathbb{R}^2 \times y)} \leq \sqrt{2} \left( \| F \|_{L^1(\mathbb{R}^2 \times y)} + \| \partial_x F \|_{L^1(\mathbb{R}^2 \times y)} + \| \partial_y F \|_{L^1(\mathbb{R}^2 \times y)} + \| \partial_x \partial_y F \|_{L^1(\mathbb{R}^2 \times y)} \right), \tag{21}
\]
and moreover it follows that the definition of $|\bar{a}|_{r, \sigma}$ and Assumption 2.3 that, for any $\alpha \in \mathbb{Z}^2_+$, any $0 \leq j \leq 5$ and any $r > 0$,
\[
\| (z)^{\ell+j} \rho^\alpha \partial_z^j u \|_{L^2} + \| (z)^{\ell+j} \rho^\alpha \partial_z^j v \|_{L^2} \leq \begin{cases} 
[|\alpha| + j - 7]! \sigma \over r^{(|\alpha|+j-7)} |\bar{a}|_{r, \sigma}, & \text{if } |\alpha| + j \geq 7, \\
\min \left\{ |\bar{a}|_{r, \sigma}, C_* \right\}, & \text{if } |\alpha| + j \leq 6,
\end{cases} \tag{22}
\]
where $C_*$ is the constant given in (15). Consequently we use the above estimates and (19) to compute,
\[
\sum_{j=1}^{[m/2]} \left( \frac{m}{j} \right) \| \partial_x^j u \|_{L^\infty} \| \partial_x^{m-j+1} U \|_{L^2} \leq C \sum_{j=1}^{[m/2]} \frac{m!}{j!(m-j)!} \frac{[(j-4)!]^\sigma}{\rho^{j-4}} \frac{[(m-j-5)!]^\sigma}{\rho^{m-j-5}} |\bar{a}|_{\rho, \sigma}^2
\]
\[
+ C C_* \sum_{1 \leq j \leq 3} \frac{m!}{j!(m-j)!} \frac{[(m-j-5)!]^\sigma}{\bar{\rho}^{m-j-5}} |\bar{a}|_{\bar{\rho}, \sigma}. \tag{23}
\]
Direct verification shows
\[
\sum_{1 \leq j \leq 3} \frac{m!}{j!(m-j)!} \frac{[(m-j-5)]^\sigma}{\rho^{m-j-5}} |\tilde{a}|_{\tilde{\rho},\sigma} \leq C m\frac{[(m-6)]^\sigma}{\tilde{\rho}^{m-6}} |\tilde{a}|_{\tilde{\rho},\sigma},
\]
and meanwhile
\[
\sum_{j=4}^{[m/2]} \frac{m!}{j!(m-j)!} \frac{[(j-4)]^\sigma [(m-j-5)]^\sigma}{\rho^{m-j-5}} |\tilde{a}|_{\tilde{\rho},\sigma}^2 \\
\leq C |\tilde{a}|_{\tilde{\rho},\sigma}^2 \sum_{j=4}^{[m/2]} \frac{m![(j-4)]^\sigma [(m-j-5)]^\sigma}{j!(m-j)^5} \leq C |\tilde{a}|_{\tilde{\rho},\sigma}^2 \sum_{j=4}^{[m/2]} \frac{(m-6)!m^6}{j^4 m^5} [-(m-9)]^\sigma-1 \\
\leq C \frac{[(m-6)]^\sigma |\tilde{a}|_{\tilde{\rho},\sigma}^2}{\rho^{m-6} m^{5(\sigma-1)}} \sum_{j=4}^{[m/2]} \frac{1}{j^4} \leq C \frac{[(m-6)]^\sigma |\tilde{a}|_{\tilde{\rho},\sigma}^2}{\rho^{m-6}}.
\]
the last inequality using the fact that \( \sigma \in [3/2, 2] \). Combining the above inequalities with (23) gives
\[
\sum_{j=1}^{[m/2]} \binom{m}{j} \|\partial^j_x u\|_{L^\infty} \|\partial^m-x-j^+ U\|_{L^2} \leq C \frac{[(m-6)]^\sigma}{\rho^{m-6}} |\tilde{a}|_{\tilde{\rho},\sigma}^2 + C C_* \frac{[(m-6)]^\sigma}{\tilde{\rho}^{m-6}} |\tilde{a}|_{\tilde{\rho},\sigma}.
\]
Similarly
\[
\sum_{j=[m/2]+1}^{m} \binom{m}{j} \|\partial^j_x u\|_{L^\infty(L^\infty_x)} \|\partial^m-x-j^+ U\|_{L^\infty_x(L^2)} \\
\leq \sum_{j=[m/2]+1}^{m-3} \frac{m!}{j!(m-j)!} \frac{[(j-6)]^\sigma [(m-j-3)]^\sigma}{\rho^{m-j-3}} |\tilde{a}|_{\rho,\sigma}^2 + \sum_{j=m-2}^{m} \frac{m!}{j!(m-j)!} \frac{[(j-6)]^\sigma}{\rho^{j-6}} |\tilde{a}|_{\rho,\sigma}^2 \\
\leq C \frac{[(m-6)]^\sigma}{\rho^{m-6}} |\tilde{a}|_{\rho,\sigma}^2.
\]
Putting these inequalities into (20) we get
\[
\sum_{j=1}^{m} \binom{m}{j} \|\partial^j_x u\|_{L^\infty} \|\partial^m-x-j^+ U\|_{L^2} \leq C \frac{[(m-6)]^\sigma}{\rho^{m-6}} |\tilde{a}|_{\rho,\sigma}^2 + C C_* \frac{[(m-6)]^\sigma}{\tilde{\rho}^{m-6}} |\tilde{a}|_{\tilde{\rho},\sigma} \tag{24}
\]
The above estimate also holds with \((\partial^j_x u)\partial^m-x-j^+ U\) replaced by \((\partial^j_x v)\partial^m-x-j^+ \partial_y U\). This gives, using (19) and (7),
\[
-\int_0^t \left( \sum_{j=1}^{m} \binom{m}{j} \left[ (\partial^j_x u)\partial^m-x-j^+ U + (\partial^j_x v)\partial^m-x-j^+ \partial_y U \right], \partial^m_x U \right)_{L^2} ds \\
\leq C \frac{[(m-6)]^\sigma}{\rho^{2(m-6)}} \left( \int_0^t |\tilde{a}(s)|_{\rho,\sigma}^3 ds + C_* \int_0^t |\tilde{a}(s)|_{\rho,\sigma}^2 \rho ds \right).
\]
The assertion in Lemma 3.3 will follow if we have
\[- \int_0^t \left( \sum_{j=1}^m \binom{m}{j} (\partial_x^j w) \partial_x^{m-j} \partial_x U, \partial_x^m U \right)_{L^2} ds \leq \frac{1}{2} \int_0^t \| \partial_x \partial_x^m U \|_{L^2}^2 ds + \frac{C[(m-6)!]^{2\sigma}}{\rho^{2(m-6)}} \int_0^t \left( |\tilde{a}(s)|^3_{\rho,\sigma} + |\tilde{a}(s)|^4_{\rho,\sigma} \right) ds.\] (25)

It follows from integration by parts that
\[- \int_0^t \left( \sum_{j=1}^m \binom{m}{j} (\partial_x^j w) \partial_x^{m-j} \partial_x U, \partial_x^m U \right)_{L^2} ds \leq J_1 + J_2,\] (26)
with
\[J_1 = \int_0^t \sum_{j=1}^m \binom{m}{j} \| (\partial_x^j w) \partial_x^{m-j} U \|_{L^2} \| \partial_x \partial_x^m U \|_{L^2} ds\]
and
\[J_2 = \int_0^t \sum_{j=1}^m \binom{m}{j} \| (\partial_x^{j+1} u + \partial_x^j \partial_y v) \partial_x^{m-j} U \|_{L^2} \| \partial_x^m U \|_{L^2} ds.\]

Observe \( \| \partial_x^\alpha w \|_{L^2}^\infty \leq C(\| \langle z \rangle^\ell \partial_x \partial_x^\alpha u \|_{L^2} + \| \langle z \rangle^\ell \partial_y \partial_x^\alpha v \|_{L^2}) \) for \( \ell > 1/2 \), then it follows (22) that
\[\| \langle z \rangle^{-\ell} \partial_x^\alpha w \|_{L^2} + \| \partial_x^\alpha w \|_{L^2} \leq \left\{ \begin{array}{ll} C \left[ \frac{|\alpha| - 6)!}{\rho^{|\alpha|-6}} \right] |\tilde{a}|_{r,\sigma}, & \text{if } |\alpha| \geq 6, \\
C \min \left\{ |\tilde{a}|_{r,\sigma}, C_* \right\}, & \text{if } |\alpha| \leq 5. \end{array} \right.\] (27)

Then applying similar argument for proving (24), we have
\[\sum_{j=1}^m \binom{m}{j} \| (\partial_x^j w) \partial_x^{m-j} U \|_{L^2} + \sum_{j=1}^m \binom{m}{j} \| (\partial_x^{j+1} u + \partial_x^j \partial_y v) \partial_x^{m-j} U \|_{L^2} \leq C \left[ \frac{(m-6)!}{\rho^{m-6}} \right] |\tilde{a}|^2_{\rho,\sigma},\]
and thus, using the above inequality and (19),
\[J_1 + J_2 \leq \frac{1}{2} \int_0^t \| \partial_x \partial_x^m U \|_{L^2}^2 ds + C \left[ \frac{(m-6)!}{\rho^{m-6}} \right]^{2\sigma} \int_0^t \left( |\tilde{a}(s)|^3_{\rho,\sigma} + |\tilde{a}(s)|^4_{\rho,\sigma} \right) ds.\]

This with (26) yields (24). The proof of Lemma 3.3 is completed. \(\square\)

**Lemma 3.4.** Under the same assumption as in Proposition 3.1 we have, for any \( m \geq 6 \), any \( t \in [0, T] \) and for any pair \((\rho, \tilde{\rho})\) with \( 0 < \rho < \tilde{\rho} < \rho_0 \leq 1,\)
\[\int_0^t \left( \partial_x^m \left[ \left( \partial_x \partial_x u + \partial_y \partial_x v \right) \int_0^z U dz \right], \partial_x^m U \right)_{L^2} ds \leq \frac{1}{2} \int_0^t \| \partial_x \partial_x^m U \|_{L^2}^2 ds + C \left[ \frac{(m-6)!}{\rho^{m-6}} \right]^{2\sigma} \int_0^t \left( |\tilde{a}(s)|^3_{\rho,\sigma} + |\tilde{a}(s)|^4_{\rho,\sigma} \right) ds.\]

**Proof.** We only need to treat the first term on the left side and use Leibniz formula and integration by parts to write
\[\int_0^t \left( \partial_x^m \left[ \left( \partial_x \partial_x u \right) \int_0^z U dz \right], \partial_x^m U \right)_{L^2} ds = - \int_0^t \left( \partial_x^m \left[ \left( \partial_x u \right) \int_0^z U dz \right], \partial_x^2 \partial_x^m U \right)_{L^2} ds - \int_0^t \left( \partial_x^m \left[ \left( \partial_x u \right) U \right], \partial_x^m U \right)_{L^2} ds \leq I_1 + I_2,\]
with
\[
I_1 = \int_0^t \sum_{0 \leq j \leq [m/2]} \left( m \right) \left\{ \langle z \rangle^\ell \partial_x^j \partial_x u \|_{L^\infty_x(L^2_z)} \right\} \langle z \rangle^{-\ell} \int_0^z \partial_x^{m-j} U d\bar{z} \|_{L^2_x(L^\infty_z)} \| \partial_x^m U \|_{L^2} ds + \int_0^t \sum_{[m/2]+1 \leq j \leq m} \left( m \right) \left\{ \langle z \rangle^\ell \partial_x^j \partial_x u \|_{L^2} \right\} \langle z \rangle^{-\ell} \int_0^z \partial_x^{m-j} U d\bar{z} \|_{L^\infty} \| \partial_x^m U \|_{L^2} ds,
\]

\[
I_2 = \int_0^t \sum_{0 \leq j \leq [m/2]} \left( m \right) \left\{ \partial_x^j \partial_x u \|_{L^\infty_x(L^2_z)} \right\} \| \partial_x^{m-j} U \|_{L^2_x(L^\infty_z)} ds + \int_0^t \sum_{[m/2]+1 \leq j \leq m} \left( m \right) \left\{ \partial_x^j \partial_x u \|_{L^2} \right\} \| \partial_x^{m-j} U \|_{L^\infty_x(L^2_z)} ds.
\]

Now we follow the similar argument as in the proof of Lemma 3.3 using the estimates (19) and (22) as well as the Sobolev inequality (21), to compute

\[
\sum_{0 \leq j \leq [m/2]} \left( m \right) \| \langle z \rangle^\ell \partial_x^j \partial_x u \|_{L^\infty_x(L^2_z)} \langle z \rangle^{-\ell} \int_0^z \partial_x^{m-j} U d\bar{z} \|_{L^\infty_x(L^2_z)} \frac{m!}{j! (m-j)!} \frac{[(j-4)!]^\sigma}{\rho^{j-4}} |\bar{a}|_{\rho,\sigma} \times \frac{[(m-j-6)!]^\sigma}{\rho^{m-j-6}} |\bar{a}|_{\rho,\sigma}
\]

\[
+ \sum_{0 \leq j \leq 3} \frac{m!}{j! (m-j)!} |\bar{a}|_{\rho,\sigma} \times \frac{[(m-j-6)!]^\sigma}{\rho^{m-j-6}} |\bar{a}|_{\rho,\sigma}
\]

\[
\leq C \frac{(m-6)!}{\rho^{m-6}} \sum_{j=4}^{[m/2]} \frac{(m-6)![(j-4)!]^\sigma-1[(m-j-6)!]^\sigma-1}{j^4 (m-j)^6} + C \frac{(m-6)!}{\rho^{m-6}} |\bar{a}|_{\rho,\sigma}^2
\]

\[
\leq C \frac{(m-6)!}{\rho^{m-6}} |\bar{a}|_{\rho,\sigma}^2.
\]

Similarly,

\[
\sum_{[m/2]+1 \leq j \leq m} \left( m \right) \| \langle z \rangle^\ell \partial_x^j \partial_x u \|_{L^2} \langle z \rangle^{-\ell} \int_0^z \partial_x^{m-j} U d\bar{z} \|_{L^\infty} \leq C \frac{(m-6)!}{\rho^{m-6}} |\bar{a}|_{\rho,\sigma}^2.
\]

Thus

\[
I_1 \leq \frac{1}{8} \int_0^t \| \partial_x \partial_x^m U \|_{L^2}^2 ds + C \frac{(m-6)!}{\rho^{2(m-6)}} \int_0^t |\bar{a}(s)|_{\rho,\sigma}^4 ds.
\]

Observe \( \| \partial_x \partial_x^m U \|_{L^2_x(L^\infty_z)} \leq C \| \partial_x \partial_x^m U \|_{L^2} + C \| \partial_x^m \partial_x \partial_x^m U \|_{L^2} \). Then following the argument for treating \( I_1 \) we have also

\[
I_2 \leq \frac{1}{8} \int_0^t \| \partial_x \partial_x^m U \|_{L^2}^2 ds + C \frac{(m-6)!}{\rho^{2(m-6)}} \int_0^t \left( |\bar{a}(s)|^3_{\rho,\sigma} + |\bar{a}(s)|^4_{\rho,\sigma} \right) ds.
\]

Then

\[
\int_0^t \left( \partial_x^m \left[ (\partial_x \partial_x u) \int_0^z \partial_x \bar{U} d\bar{z} \right], \partial_x^m \bar{U} \right)_{L^2} ds \leq I_1 + I_2
\]

\[
\leq \frac{1}{4} \int_0^t \| \partial_x \partial_x^m U \|_{L^2}^2 ds + C \frac{(m-6)!}{\rho^{2(m-6)}} \int_0^t \left( |\bar{a}(s)|^3_{\rho,\sigma} + |\bar{a}(s)|^4_{\rho,\sigma} \right) ds.
\]
We need only to estimate the above estimate also holds with \( m \geq 6 \), for any \( t \in [0, T] \) and any pair \((\rho, \tilde{\rho})\) with \( 0 < \rho < \tilde{\rho} < \rho_0 \leq 1 \),

\[
\|\partial_x^m U(t)\|_{L^2}^2 \leq C \frac{[(m - 6)!]^2}{\rho^{2(m-6)}} \left( \int_0^t (|\tilde{a}(s)|^2 + |\tilde{a}(s)|^4) \, ds + \int_0^t \frac{|\tilde{a}(s)|^2}{\rho - \rho} \, ds \right).
\]

Similarly the above estimate also holds with \( \partial_y^m \) replaced by \( \partial_y^m \). Thus by (14) we have, any \( t \in [0, T] \) and for any pair \((\rho, \tilde{\rho})\) with \( 0 < \rho < \tilde{\rho} < \rho_0 \leq 1 \),

\[
\sup_{|\alpha| \geq 6} \frac{\rho^{2(|\alpha| - 6)}}{2!} \left( \int_0^t (|\tilde{a}(s)|^2 + |\tilde{a}(s)|^4) \, ds + \int_0^t \frac{|\tilde{a}(s)|^2}{\rho - \rho} \, ds \right)
\]

It can be checked straightforwardly that the same upper bound holds for \( \sup_{|\alpha| \leq 5} \|\partial^\alpha U(t)\|_{L^2} \). Then the desired estimate for \( \partial^\alpha U \) in Proposition 3.1 follows, and similarly for \( \partial^\alpha U \). The proof of Proposition 3.1 is thus completed.

4. Estimate on \( \| (u, v) \|_{\rho, \sigma} \)

The main estimate on \( \| (u, v) \|_{\rho, \sigma} \) can be stated as follows, recalling \( \| (u, v) \|_{\rho, \sigma} \) is given in Definition 1.1.

**Proposition 4.1.** Under Assumption 2.3 we have, for any \( t \in [0, T] \) and any pair \((\rho, \tilde{\rho})\) with \( 0 < \rho < \tilde{\rho} < \rho_0 \leq 1 \),

\[
\| (u(t), v(t)) \|_{\rho, \sigma}^2 \leq C_1 \| (u_0, v_0) \|_{2\rho_0, \sigma}^2 + CC_2 \left( \int_0^t (|\tilde{a}(s)|^2 + |\tilde{a}(s)|^4) \, ds + \int_0^t \frac{|\tilde{a}(s)|^2}{\rho - \rho} \, ds \right),
\]

where \( C_1 \) and \( C_2 \) are given in (15).

In view of Definition 1.1 of \( \| (u, v) \|_{\rho, \sigma} \), the above proposition will follow from the two lemmas as below.

**Lemma 4.2** (Estimate on the tangential derivatives). Under the same assumption as in Proposition 4.1 we have, recalling \( \partial^\alpha = \partial^\alpha_x \partial^\alpha_y \),

\[
\sup_{|\alpha| \geq 7} \frac{\rho^{2(|\alpha| - 7)}}{2!} \left( \| \partial^\alpha u(t) \|_{L^2}^2 + \| \partial^\alpha v(t) \|_{L^2}^2 \right) \leq C_1 \| (u_0, v_0) \|_{2\rho_0, \sigma}^2 + CC_2 \left( \int_0^t (|\tilde{a}(s)|^2 + |\tilde{a}(s)|^4) \, ds + \int_0^t \frac{|\tilde{a}(s)|^2}{\rho - \rho} \, ds \right).
\]

Similarly the upper bound still holds with \( \partial^\alpha u \) replaced by \( \partial^\alpha v \).

**Proof.** We need only to estimate \( u \) since \( v \) can be treated in the same way. Applying \( \partial_x^m \) to the first equation in (22) gives

\[
(\partial_t + u \partial_x + v \partial_y + w \partial_z - \partial_x^2) \partial_x^m u = -(\partial_x^m w) \partial_x u + F_m
\]

with

\[
F_m = - \sum_{j=1}^m \binom{m}{j} (\partial_x^j u) \partial_x^{m-j+1} u + (\partial_x^j v) \partial_x^{m-j} \partial_y u - \sum_{j=1}^{m-1} \binom{m}{j} (\partial_x^j w) \partial_x^{m-j} \partial_z u.
\]
On the other hand, applying \((\partial_z u)\partial_x^{m-1}\) to (3) we have
\[
\left( \partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_z^2 \right) (\partial_z u) \int_0^z \partial_x^{m-1} U dz = -(\partial_x^m w)\partial_z u + L_m
\] (29)
with
\[
L_m = -(\partial_z u) \sum_{j=1}^{m-1} \binom{m-1}{j} \left[ (\partial_x^j u) \int_0^z \partial_x^{m-j-1} U dz + (\partial_x^j v) \int_0^z \partial_x^{m-j} U dz + (\partial_x^j w)\partial_x^{m-1-j} U + \right.
\]
+ \left. \left[ (\partial_y v)\partial_z u - (\partial_y u)\partial_z v \right] \int_0^z \partial_x^{m-1} U dz - 2(\partial_z^2 u)\partial_x^{m-1} U, \right.
\]
where we have used the fact that, denoting by \([T_1, T_2] = T_1T_2 - T_2T_1\) the commutator of two operators \(T_1, T_2,\)
\[
[\partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_z^2, (\partial_z u)]
\]
= \((\partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_z^2)\partial_z u - 2(\partial_z^2 u)\partial_z u = (\partial_y v)\partial_z u - (\partial_y u)\partial_z v - 2(\partial_z^2 u)\partial_z u.
\]
Now we subtract the equation (29) by (28) to eliminate the higher order term \((\partial_x^m w)\partial_z u\)
and this gives the equation for
\[
\psi_m = \partial_x^m u - (\partial_z u) \int_0^z \partial_x^{m-1} U dz;
\] (30)
that is,
\[
(\partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_z^2) \psi_m = F_m - L_m,
\] (31)
and thus
\[
(\partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_z^2) \langle z \rangle^\ell \psi_m
\]
= \langle z \rangle^\ell F_m - \langle z \rangle^\ell L_m + w(\partial_z \langle z \rangle^\ell) \psi_m - (\partial_x^2 \langle z \rangle^\ell) \psi_m - 2(\partial_x \langle z \rangle^\ell)\partial_z \psi_m.
\]
Then we take the scalar product with \(\langle z \rangle^\ell \psi_m\) and observe \(\langle z \rangle^\ell \psi_m|_{z=0} = 0\), to obtain
\[
\frac{1}{2} \| \langle z \rangle^\ell \psi_m(t) \|^2_{L^2} - \frac{1}{2} \| \langle z \rangle^\ell \psi_m(0) \|^2_{L^2} + \int_0^t \| \partial_z \left[ \langle z \rangle^\ell \psi_m(s) \right] \|^2_{L^2} ds
\]
= \int_0^t \left( \langle z \rangle^\ell F_m, \langle z \rangle^\ell \psi_m \right)_{L^2} ds - \int_0^t \left( \langle z \rangle^\ell L_m, \langle z \rangle^\ell \psi_m \right)_{L^2} ds
\]
+ \int_0^t \left( w(\partial_z \langle z \rangle^\ell) \psi_m - (\partial_x^2 \langle z \rangle^\ell) \psi_m - 2(\partial_x \langle z \rangle^\ell)\partial_z \psi_m, \langle z \rangle^\ell \psi_m \right)_{L^2} ds.
\] (32)
Note for any \(0 < r \leq \rho_0\) we have, observing \(C_* \geq 1,\)
\[
\| \langle z \rangle^\ell \psi_m \|^2_{L^2} \leq \| \langle z \rangle^\ell \partial_x^m u \|^2_{L^2} + CC_*\| \partial_x^{m-1} U \|^2_{L^2} \leq CC_\sigma \frac{[m-7]!\|a\|_{r,\sigma}^{m-7}}{r^{m-7}} \tag{33}
\]
due to the definition of $\psi_m$ given by (30) as well as (22), (19) and (15). Then, in view of (27),
\[
\int_0^t \left( w(\partial_x (z) \ell)\psi_m - (\partial_x^2 (z) \ell)\psi_m - 2(\partial_x (z) \ell)\partial_x^2 \psi_m + \langle z \rangle^{\ell} \psi_m \right) \parallel_{L^2} ds \\
\leq CC_s \frac{[(m - 7)!]^{2\gamma}}{\rho^{2(\gamma - 1)}} \int_0^t |\bar{a}(s)|^{2\gamma}_{\rho,\sigma} ds. \quad (34)
\]
Note $F_m$ is given in (28), and we apply similar computation as in the proof of Lemma 3.3 using (22) instead of (19); this yields
\[
\int_0^t \left( \langle z \rangle^\ell F_m, \langle z \rangle^\ell \psi_m \right) \parallel_{L^2} ds \leq CC_s \frac{[(m - 7)!]^{2\gamma}}{\rho^{2(\gamma - 1)}} \left( \int_0^t |\bar{a}(s)|^{3\gamma}_{\rho,\sigma} ds + \int_0^t \frac{|\bar{a}(s)|^{2\gamma}_{\rho,\sigma}}{\bar{\rho} - \rho} ds \right). \quad (35)
\]
Recall $L_m$ is given in (29). Then
\[
\parallel \langle z \rangle^\ell L_m \parallel \leq \parallel \langle z \rangle^{\ell+1} \partial_x u \parallel_{L^\infty} \sum_{j=1}^{m-1} \left( \frac{m - 1}{j} \right) \parallel \langle z \rangle^{-1} (\partial_x^j U) \parallel_{L^2} \parallel \partial_x^{m-j} U d\bar{z} \parallel_{L^2} \\
+ \parallel \langle z \rangle^{\ell+1} \partial_x u \parallel_{L^\infty} \sum_{j=1}^{m-1} \left( \frac{m - 1}{j} \right) \parallel \langle z \rangle^{-1} (\partial_x^j v) \parallel_{L^2} \parallel \partial_x^{m-j} \partial_y U d\bar{z} \parallel_{L^2} \\
+ \parallel \langle z \rangle^{\ell+1} \partial_x u \parallel_{L^\infty} \sum_{j=1}^{m-1} \left( \frac{m - 1}{j} \right) \parallel \langle z \rangle^{-1} (\partial_x^j w) \parallel_{L^2} \parallel \partial_x^{m-j} U d\bar{z} \parallel_{L^2} \\
+ \parallel \langle z \rangle^{2\ell+1} \left[ (\partial_x v) \partial_x u - (\partial_y u) \partial_x v \right] \parallel_{L^\infty} \parallel \langle z \rangle^{-1} \partial_x U d\bar{z} \parallel_{L^2} \\
+ 2 \parallel \langle z \rangle^\ell \partial_x^2 u \parallel_{L^\infty} \parallel \partial_x^{m-1} U \parallel_{L^2}.
\]
Thus we apply again the argument for proving Lemma 3.3 to obtain, observing (15) and using (19), (22) and (27),
\[
\parallel \langle z \rangle^\ell L_m \parallel \leq C \frac{[(m - 7)!]^{\gamma}}{\rho^{2(m - 1)}} \left( |\bar{a}|^{2\gamma}_{\rho,\sigma} + |\bar{a}|^{3\gamma}_{\rho,\sigma} \right) + CC_s \frac{[(m - 7)!]^{\gamma}}{\rho^{2(m - 1)}} \left| \bar{a} \right|_{\rho,\sigma}^2,
\]
and thus, with (33) and (7),
\[
\int_0^t \left( \langle z \rangle^\ell L_m, \langle z \rangle^\ell \psi_m \right) \parallel_{L^2} ds \leq CC_s \frac{[(m - 7)!]^{2\gamma}}{\rho^{2(\gamma - 1)}} \left( \int_0^t \left( |\bar{a}|^{3\gamma}_{\rho,\sigma} + |\bar{a}|^{4\gamma}_{\rho,\sigma} \right) ds + \int_0^t \frac{|\bar{a}(s)|^{2\gamma}_{\rho,\sigma}}{\bar{\rho} - \rho} ds \right).
\]
Putting the above estimate and the estimates (34) and (35) into (32), yields
\[
\parallel \langle z \rangle^\ell \psi_m(t) \parallel_{L^2}^2 + \int_0^t \parallel \partial_x (\langle z \rangle^\ell \psi_m(s)) \parallel_{L^2}^2 dt \\
\leq \parallel \langle z \rangle^\ell \psi_m(0) \parallel_{L^2}^2 + CC_s \frac{[(m - 7)!]^{2\gamma}}{\rho^{2(\gamma - 1)}} \left( \int_0^t \left( |\bar{a}(s)|^{2\gamma}_{\rho,\sigma} + |\bar{a}(s)|^{4\gamma}_{\rho,\sigma} \right) ds + \int_0^t \frac{|\bar{a}(s)|^{2\gamma}_{\rho,\sigma}}{\bar{\rho} - \rho} ds \right).
\]
Moreover observe $\langle z \rangle^\ell \psi_m|_{t=0} = \langle z \rangle^\ell \partial_x u_0$ and thus
\[
\parallel \langle z \rangle^\ell \psi_m(0) \parallel_{L^2}^2 \leq \frac{[(m - 7)!]^{2\gamma}}{(2\rho_0)^{2(\gamma - 1)}} \| (u_0, v_0) \|^2_{2\rho_0,\sigma} \leq \frac{[(m - 7)!]^{2\gamma}}{\rho^{2(m - 1)}} \| (u_0, v_0) \|^2_{2\rho_0,\sigma}.
\]
Then we obtain
\[
\| \langle z \rangle^\ell \psi_m(t) \|^2_{L^2} + \int_0^t \| \partial_z (\langle z \rangle^\ell \psi_m(s)) \|^2_{L^2} dt \leq \frac{[(m - 7)!]^{2\sigma}}{\rho^{2(m-7)}} \| (u_0, v_0) \|^2_{2\rho,\sigma} \\
+ C \left[ \frac{[(m - 7)!]^{2\sigma}}{\rho^{2(m-7)}} \right] \left( \int_0^t \left( |\tilde{a}(s)|^2_{\rho,\sigma} + |\tilde{a}(s)|^4_{\rho,\sigma} \right) ds + \int_0^t \frac{|\tilde{a}(s)|^2_{\rho,\sigma}}{\rho - \rho} ds \right).
\] (36)
Consequently this inequality, along with the estimate
\[
\| \langle z \rangle^\ell \partial_x^m u \|^2_{L^2} \leq 2 \| \langle z \rangle^\ell \psi_m \|^2_{L^2} + 2 \| \langle z \rangle^\ell (\partial_z u) \| \int_0^z \partial_x^{m-1} U d\tilde{z} \|^2_{L^2}
\]
that are from the definition (30) of \( \psi_m \), and the fact that
\[
\| \langle z \rangle^\ell (\partial_z u(t)) \| \int_0^z \partial_x^{m-1} U d\tilde{z} \|^2_{L^2} \leq \| \langle z \rangle^{\ell + 1} \partial_x u(t) \|^2_{L^{\infty}(L^2)} \| \langle z \rangle^{-1} \int_0^z \partial_x^{m-1} U(t) d\tilde{z} \|^2_{L^2} \leq C \left[ \frac{[m - 7]!^{2\sigma}}{\rho^{2(m-7)}} \right] \left( \int_0^t \left( |\tilde{a}(s)|^2_{\rho,\sigma} + |\tilde{a}(s)|^4_{\rho,\sigma} \right) ds + \int_0^t \frac{|\tilde{a}(s)|^2_{\rho,\sigma}}{\rho - \rho} ds \right)
\]
due to (15) and Proposition 3.1 yields that for any \( m \geq 7 \) and any \( t \in [0, T] \),
\[
\| \langle z \rangle^\ell \partial_x^m u \|^2_{L^2} \leq 2 \frac{[m - 7]!^{2\sigma}}{\rho^{2(m-7)}} \| (u_0, v_0) \|^2_{2\rho,\sigma} \\
+ C \left[ \frac{[m - 7]!^{2\sigma}}{\rho^{2(m-7)}} \right] \left( \int_0^t \left( |\tilde{a}(s)|^2_{\rho,\sigma} + |\tilde{a}(s)|^4_{\rho,\sigma} \right) ds + \int_0^t \frac{|\tilde{a}(s)|^2_{\rho,\sigma}}{\rho - \rho} ds \right).
\]
We have proven the assertion for \( \partial^a = \partial_x^m \) with \( m \geq 7 \). By direct verification we can get the desired estimate for \( m \leq 6 \). Then we have obtained the estimate as desired for \( \partial^a = \partial_x^m \). Moreover the above estimates also hold with \( \partial_x^m \) replaced by \( \partial_y^m \), following the similar argument. Thus the desired estimate for general \( \partial^a u \) follows in view of (14). Similarly for \( \partial^a v \). The proof of Lemma 4.2 is completed. \( \square \)

**Lemma 4.3** (Estimate on the mixed derivatives). Under the same assumption as in Proposition 4.1 we have
\[
\sup_{1 \leq j \leq 5} \frac{\rho^{2(|\alpha| + j - 7)}}{[(|\alpha| + j - 7)!]^{2\sigma}} \| \langle z \rangle^{\ell + j} \partial_x^a \partial^j u(t) \|^2_{L^2} + \sup_{1 \leq j \leq 5} \| \langle z \rangle^{\ell + j} \partial_x^a \partial^j u(t) \|^2_{L^2} \\
\leq C_1 \| (u_0, v_0) \|^2_{2\rho,\sigma} + C \int_0^t \left( |\tilde{a}(s)|^2_{\rho,\sigma} + |\tilde{a}(s)|^4_{\rho,\sigma} \right) ds.
\]

Similarly for \( \partial^a v \).

**Proof.** The upper bound for \( \| \langle z \rangle^{\ell + j} \partial^a \partial^j u(t) \|_{L^2} \) with \( |\alpha| + j \leq 6 \) and \( 1 \leq j \leq 5 \) is straightforward. So we only need to consider the case of \( |\alpha| + j \geq 7 \) with \( 1 \leq j \leq 5 \). As before it suffices to estimate \( \langle z \rangle^{\ell + j} \partial_x^m \partial^j u \) since \( \langle z \rangle^{\ell + j} \partial_y^m \partial^j u \) can be treated in the same way.

We apply \( \langle z \rangle^{\ell + j} \partial^j_z \) to equation (28) to get
\[
(\partial_t + u\partial_x + v\partial_y + w\partial_z - \partial^2_z) \langle z \rangle^{\ell + j} \partial_x^m \partial^j w \\
= -\langle z \rangle^{\ell + j} \partial^j_z [\partial_x^m w] \partial_z u + \langle z \rangle^{\ell + j} \partial^j_z \tilde{F}_m + [u\partial_x + v\partial_y + w\partial_z - \partial^2_z, \langle z \rangle^{\ell + j} \partial^j_z] \partial_x^m u,
\]
where $F_m$ is defined in (28) and $[T_1, T_2] = T_1 T_2 - T_2 T_1$ stands for the commutator of two operators $T_1, T_2$. Thus,

\[
\frac{1}{2} \frac{d}{dt} \left\| \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right\|_{L^2}^2 + \left\| \partial_z \left( \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right) \right\|_{L^2}^2 + \int_{\mathbb{R}^2} \left( \partial^m \partial^j \right)(\partial^m \partial^j + 1) \left| z = 0 \right| dxdy \\
= \left( \left( \partial_t + u\partial_x + v\partial_y + w\partial_z - \partial_z^2 \right) \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right)_{L^2} \\
= \left[ \left( u\partial_x + v\partial_y + w\partial_z - \partial_z^2 \right) \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right]_{L^2} \\
+ \left[ u\partial_x + v\partial_y + w\partial_z - \partial_z^2, \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right]_{L^2} \\
\right)_{L^2},
\]

where we used the fact that

\[
\left( \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right) \partial_z \left( \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right) \bigg|_{z = 0} = \left( \partial^m \partial^j \right) \left( \partial^m \partial^j + 1 \right) \bigg|_{z = 0}.
\]

As for the terms on the right side of (37) we use the argument for proving Lemma 3.3 to get, recalling $F_m$ is given in (28),

\[
\left( \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right)_{L^2} \\
\leq \frac{1}{8} \left\| \partial_z \left( \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right) \right\|_{L^2}^2 + C \left\| \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right\|_{L^2}^2 \\
\leq \frac{1}{8} \left\| \partial_z \left( \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right) \right\|_{L^2}^2 + C \left( \frac{(m + j - 7)^{2\sigma}}{\rho^{2(m+j-7)}} \right) \left( |a|_{\rho, \sigma}^2 + |\tilde{a}|_{\rho, \sigma}^4 \right).
\]

Moreover, direct verification shows

\[
\left[ u\partial_x + v\partial_y + w\partial_z - \partial_z^2, \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right]_{L^2} \\
\leq \frac{1}{8} \left\| \partial_z \left( \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right) \right\|_{L^2}^2 + C \left( \frac{(m + j - 7)^{2\sigma}}{\rho^{2(m+j-7)}} \right) \left( |a|_{\rho, \sigma}^2 + |\tilde{a}|_{\rho, \sigma}^4 \right).
\]

By the two inequalities above we get the upper bound for the terms on the right side of (37), that is,

\[
\left( \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right)_{L^2} \\
+ \left\| \partial_z \left( \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right) \right\|_{L^2}^2 + C \left( \frac{(m + j - 7)^{2\sigma}}{\rho^{2(m+j-7)}} \right) \left( |a|_{\rho, \sigma}^2 + |\tilde{a}|_{\rho, \sigma}^4 \right).
\]

This with (37) yields

\[
\frac{1}{2} \frac{d}{dt} \left\| \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right\|_{L^2}^2 + \frac{3}{4} \left\| \partial_z \left( \left( \zeta \right)^{\ell+j} \partial^m \partial^j \right) \right\|_{L^2}^2 \\
\leq \left\| \int_{\mathbb{R}^2} \left( \partial^m \partial^j \right)(\partial^m \partial^j + 1) \left| z = 0 \right| dxdy \\
+ C \left( \frac{(m + j - 7)^{2\sigma}}{\rho^{2(m+j-7)}} \right) \left( |a|_{\rho, \sigma}^2 + |\tilde{a}|_{\rho, \sigma}^4 \right).
\]
Next we handle the first term on the right of (38). We claim the following estimate holds for \( j = 1, 2, 3, 5, \)

\[
\left| \int_{\mathbb{R}^2} (\partial^m_x \partial_z^j u)(\partial^m_x \partial_z^{j+1} u) \big|_{z=0} \, dx \, dy \right| \leq \frac{1}{4} \left\| \partial^m_x \partial_z^j u \right\|_{L^2_x}^2 + C \frac{[(m + j - 7)!!]^2}{\rho^{2(m+j-7)}} \left( |\vec{u}|^2_{\rho,\sigma} + |\vec{a}|^4_{\rho,\sigma} \right). \tag{39}
\]

Observe \( (\partial^2_z u, \partial^2_z v) |_{z=0} = (0, 0) \) which follows after taking trace for the equations in (2). Moreover applying \( \partial^2_z \) to the first equation in (2) gives

\[
\partial_t \partial_z^2 u + \partial_z^2 (u \partial_x u + v \partial_y u + w \partial_z u) - \partial_z^4 u = 0
\]

and thus,

\[
\partial_z^4 u |_{z=0} = \partial_z^2 (u \partial_x u + v \partial_y u + w \partial_z u) |_{z=0} = (\partial_z u) (\partial_z \partial_z u - \partial_y \partial_z v) |_{z=0} + 2(\partial_z v) \partial_y \partial_z u |_{z=0}. \tag{40}
\]

Moreover the above relationship, along with the equation

\[
\partial_t \partial_z^4 u + \partial_z^4 (u \partial_x u + v \partial_y u + w \partial_z u) - \partial_z^6 u = 0,
\]

yields

\[
\partial_z^6 u |_{z=0} = -(\partial_z^3 u) (\partial_z \partial_z u + \partial_y \partial_z v) |_{z=0} + 4(\partial_z u) \partial_z \partial_z^3 u |_{z=0} + 4(\partial_z v) \partial_y \partial_z^3 u |_{z=0}.
\]

Consequently we apply the similar computation as in the proof of Lemma 3.4 to get, using Sobolev inequality and the estimate (22),

\[
\left\| (\partial^m_x \partial_z^6 u |_{z=0}) \right\|_{L^2_{x,y}} \leq C \sum_{0 \leq j \leq 1} \left\| \partial^j_x \partial^m_x \left[ (\partial^3_z u) (\partial_z \partial_z u + \partial_y \partial_z v) \right] \right\|_{L^2_x} + \sum_{0 \leq j \leq 1} \left\| \partial^j_x \partial^m_x \left[ (\partial_z u) \partial_z \partial_z^3 u \right] \right\|_{L^2_x} + \sum_{0 \leq j \leq 1} \left\| \partial^j_x \partial^m_x \left[ (\partial_z v) \partial_y \partial_z^3 u \right] \right\|_{L^2_x}
\]

\[
\leq C \frac{[(m + 5 - 7)!!]^2}{\rho^{m+5-7}} |\vec{a}|^2_{\rho,\sigma},
\]

and similarly by (40),

\[
\left\| (\partial^m_x \partial_z^4 u |_{z=0}) \right\|_{L^2_{x,y}} \leq C \frac{[(m + 3 - 7)!!]^2}{\rho^{m+3-7}} |\vec{a}|^2_{\rho,\sigma}. \tag{41}
\]

Thus

\[
\left| \int_{\mathbb{R}^2} (\partial^m_x \partial_z^5 u)(\partial^m_x \partial_z^5 u) \big|_{z=0} \, dx \, dy \right| \leq \frac{1}{4} \left\| \partial^m_x \partial_z^5 u \right\|_{L^2_x}^2 + C \left\| \partial^m_x \partial_z^5 u \right\|_{L^2_x}^2 + C \left\| (\partial^m_x \partial_z^5 u |_{z=0}) \right\|_{L^2_{x,y}}^2
\]

\[
\leq \frac{1}{4} \left\| \partial^m_x \partial_z^5 u \right\|_{L^2_x}^2 + C \frac{[(m + 5 - 7)!!]^2}{\rho^{2(m+5-7)}} \left( |\vec{a}|^2_{\rho,\sigma} + |\vec{a}|^4_{\rho,\sigma} \right)
\]

and

\[
\left| \int_{\mathbb{R}^2} (\partial^m_x \partial_z^4 u)(\partial^m_x \partial_z^4 u) \big|_{z=0} \, dx \, dy \right| \leq \frac{1}{4} \left\| \partial^m_x \partial_z^4 u \right\|_{L^2_x}^2 + C \frac{[(m + 3 - 7)!!]^2}{\rho^{2(m+3-7)}} \left( |\vec{a}|^2_{\rho,\sigma} + |\vec{a}|^4_{\rho,\sigma} \right).
\]
This gives the validity of (39) for \( j = 3, 5 \). Note that (39) obviously holds for \( j = 1, 2 \) since \( \partial^2_{z} u |_{z = 0} = 0 \). Thus (39) is valid for \( j = 1, 2, 3, 5 \), and this with (38) yields

\[
\| \langle z \rangle^{\ell+j} \partial_{x}^{m} \partial_{z}^{4} u(t) \|_{L_{2}}^{2} + \int_{0}^{t} \| \partial_{z} (\langle z \rangle^{\ell+j} \partial_{x}^{m} \partial_{z}^{5} u(s)) \|_{L_{2}}^{2} ds \\
\leq \frac{[(m + j - 7)]^{2\sigma}}{\rho^{2(m+j-7)}} \| (u_{0}, v_{0}) \|_{2\rho, \sigma}^{2} + C \frac{[(m + j - 7)]^{2\sigma}}{\rho^{2(m+j-7)}} \int_{0}^{t} (|\tilde{a}(s)|_{\rho, \sigma}^{2} + |\tilde{a}(s)|_{\rho, \sigma}^{4}) ds
\]

for \( j = 1, 2, 3, 5 \).

It remains to prove the validity of (42) for the case of \( j = 4 \). By Sobolev inequality, we compute

\[
\left| \int_{\mathbb{R}^{2}} \left( \partial_{x}^{m} \partial_{z}^{4} u \right)\left( \partial_{x}^{m} \partial_{z}^{5} u \right) |_{z = 0} dxdy \right| \leq \frac{\rho^{2}}{m^{2\sigma}} \| \partial_{x}^{m} \partial_{z}^{5} u |_{z = 0} \|_{L_{2,x,y}}^{2} + \frac{m^{2\sigma}}{\rho^{2}} \| \partial_{x}^{m} \partial_{z}^{4} u |_{z = 0} \|_{L_{2,x,y}}^{2}
\leq C \frac{\rho^{2}}{m^{2\sigma}} \left( \| \partial_{x}^{m} \partial_{z}^{5} u \|_{L_{2}}^{2} + \| \partial_{x}^{m} \partial_{z}^{6} u \|_{L_{2}}^{2} \right) + C \frac{[(m + 4 - 7)]^{2\sigma}}{\rho^{2(m+4-7)}} |\tilde{a}|_{\rho, \sigma}^{4},
\]

the last inequality using (11). This, with (38) for \( j = 4 \), yields

\[
\| \langle z \rangle^{\ell+4} \partial_{x}^{m} \partial_{z}^{4} u(t) \|_{L_{2}}^{2} + \frac{3}{4} \int_{0}^{t} \| \partial_{z} (\langle z \rangle^{\ell+4} \partial_{x}^{m} \partial_{z}^{5} u(s)) \|_{L_{2}}^{2} dt \\
\leq \frac{[(m + 4 - 7)]^{2\sigma}}{\rho^{2(m+4-7)}} \| u_{0}, v_{0} \|_{2\rho, \sigma}^{2} + C \frac{\rho^{2}}{m^{2\sigma}} \int_{0}^{t} \left( \| \partial_{x}^{m} \partial_{z}^{5} u(s) \|_{L_{2}}^{2} + \| \partial_{x}^{m} \partial_{z}^{6} u(s) \|_{L_{2}}^{2} \right) ds
\]

Moreover we use (22) to get

\[
\frac{\rho^{2}}{m^{2\sigma}} \int_{0}^{t} \| \partial_{x}^{m} \partial_{z}^{5} u(s) \|_{L_{2}}^{2} ds \leq C \frac{[(m + 4 - 7)]^{2\sigma}}{\rho^{2(m+4-7)}} \int_{0}^{t} |\tilde{a}(s)|_{\rho, \sigma}^{2} ds,
\]

and meanwhile observe that we have proven (42) holds for \( j = 5 \) and this implies

\[
\frac{\rho^{2}}{m^{2\sigma}} \int_{0}^{t} \| \partial_{x}^{m} \partial_{z}^{6} u(s) \|_{L_{2}}^{2} ds \\
\leq 2 \frac{\rho^{2}}{m^{2\sigma}} \int_{0}^{t} \| \partial_{z} (\langle z \rangle^{\ell+5} \partial_{x}^{m} \partial_{z}^{5} u(s)) \|_{L_{2}}^{2} ds + C \frac{\rho^{2}}{m^{2\sigma}} \int_{0}^{t} \langle z \rangle^{\ell+5} \partial_{x}^{m} \partial_{z}^{5} u(s) \|_{L_{2}}^{2} ds
\]

\[
\leq 2 \frac{[(m + 4 - 7)]^{2\sigma}}{\rho^{2(m+4-7)}} \| (u_{0}, v_{0}) \|_{2\rho, \sigma}^{2} + C \frac{[(m + 4 - 7)]^{2\sigma}}{\rho^{2(m+4-7)}} \left( \int_{0}^{t} (|\tilde{a}(s)|_{\rho, \sigma}^{2} + |\tilde{a}(s)|_{\rho, \sigma}^{4}) ds \right).
\]

Combining the above inequalities we obtain the validity of (42) for \( j = 4 \). The proof of Lemma 13 is thus completed. \( \square \)

5. Estimate on \( \partial^{\alpha} \lambda, \partial^{\alpha} \delta \) and \( \partial^{\alpha} \tilde{\lambda}, \partial^{\alpha} \tilde{\delta} \)

Recall \( \lambda, \delta \) and \( \tilde{\lambda}, \tilde{\delta} \) are the functions given by (11), and this section is devoted to treating the terms involving these functions in the representation of \( |\tilde{a}|_{\rho, \sigma} \) (see Definition 2.4).
Proposition 5.1. Under Assumption $2.3$ we have, for any $t \in [0, T]$ and for any pair $(\rho, \bar{\rho})$ with $0 < \rho < \bar{\rho} < \rho_0 \leq 1$,

\[
\sup_{|\alpha| \geq 6} \frac{\rho^{2(|\alpha|-6)}}{(|\alpha|-6)!^{2|\sigma|}} \left( |\alpha|^2 \|\partial^\alpha \lambda(t)\|_{L^2}^2 + |\alpha|^2 \|\partial^\alpha \delta(t)\|_{L^2}^2 \right) + \sup_{|\alpha| \leq 5} \left( |\alpha|^2 \|\partial^\alpha \lambda(t)\|_{L^2}^2 + |\alpha|^2 \|\partial^\alpha \delta(t)\|_{L^2}^2 \right)
\]

\[
\leq C_1 \|\langle u_0, v_0 \rangle\|_{2\rho_0, \sigma}^2 + e^{CC_2} \left( \int_0^t \left( |\tilde{\alpha}(s)|_{\rho, \sigma}^2 + |\tilde{\alpha}(s)|_{\rho, \sigma}^4 \right) ds + \int_0^t \frac{|\tilde{\alpha}(s)|_{\rho, \sigma}^2}{\bar{\rho} - \rho} ds \right),
\]

where $C_* \geq 1$ is the constant given in [15]. Similarly the above estimate still holds with $\partial^\alpha \lambda$ and $\partial^\alpha \delta$ replaced respectively by $\partial^\alpha \tilde{\lambda}$ and $\partial^\alpha \tilde{\delta}$.

To prove the above proposition we first derive the equation solved by $\lambda$. Note that

\[
\lambda = \partial_x u - (\partial_x u) \int_0^z Ud\tilde{z} = \psi_1,
\]

with $\psi_1$ defined by (30). Then using (31) for $m = 1$ we obtain the equation for $\lambda$:

\[
(\partial_t + u \partial_x + v \partial_y + w \partial_z - \partial_z^2) \lambda = -(\partial_t u)\partial_x u - (\partial_x v)\partial_y u - (\partial_y v)\partial_z u + (\partial_t u)\partial_x u - (\partial_t v)\partial_x v - (\partial_t w)\partial_x w - (\partial_y v)\partial_z u + (\partial_y v)\partial_z u - (\partial_y w)\partial_z w - (\partial_x v)\partial_y v - (\partial_x w)\partial_y w - (\partial_y w)\partial_z w \int_0^z Ud\tilde{z} - 2(\partial_z^2 u)U.
\]

Now for any $m \geq 6$ we apply $\partial_x^m$ to the above equation; this gives

\[
(\partial_t + u \partial_x + v \partial_y + w \partial_z - \partial_z^2) \partial_x^m \lambda = -\sum_{j=1}^{m} \binom{m}{j} \left[ (\partial_x^j u)\partial_x^{m-j+1} \lambda + (\partial_x^j v)\partial_x^{m-j} \partial_y \lambda + (\partial_x^j w)\partial_x^{m-j} \partial_z \lambda \right]
\]

\[
- \partial_x^m \left[ (\partial_x u)\partial_x u + (\partial_x v)\partial_y u + (\partial_x w)\partial_x u + (\partial_x u)\partial_x u + (\partial_x v)\partial_y u + (\partial_x w)\partial_x u \right] \int_0^z Ud\tilde{z} - 2(\partial_z^2 u)U.
\]

Thus taking the scalar product with $m^2 \partial_x^m \lambda$ and observing $\lambda|_{t=0} = 0$ and $\lambda|_{t=0} = \partial_x u_0$ we have

\[
\frac{m^2}{2} \left( \|\partial_x^m \lambda(t)\|_{L^2}^2 - \|\partial_x^{m+1} u_0\|_{L^2}^2 \right) + m^2 \int_0^t \|\partial_x \partial_x^m \lambda(s)\|_{L^2}^2 ds
\]

\[
= m^2 \int_0^t \left( \|\partial_x + u \partial_x + v \partial_y + w \partial_z - \partial_z^2 \| \partial_x^m \lambda, \partial_x^m \lambda \|_{L^2}^2 ds = K_1 + K_2 + K_3,
\]

where

\[
K_1 = -m^2 \int_0^t \left( \sum_{j=1}^{m} \binom{m}{j} \left[ (\partial_x^j u)\partial_x^{m-j+1} \lambda + (\partial_x^j v)\partial_x^{m-j} \partial_y \lambda + (\partial_x^j w)\partial_x^{m-j} \partial_z \lambda \right] \right) \| \partial_x^m \lambda \|_{L^2}^2 ds,
\]

\[
K_2 = -m^2 \int_0^t \left( \partial_x^m \left[ (\partial_x u)\partial_x u + (\partial_x v)\partial_y u + (\partial_x w)\partial_x u \right] \| \partial_x^m \lambda \|_{L^2}^2 ds,
\]

\[
K_3 = m^2 \int_0^t \left( \| \partial_x^m (\partial_z^2 u)U, \partial_x^m \lambda \|_{L^2}^2 ds.
\]

To estimate the above $K_j$, $1 \leq j \leq 3$, we need the upper bounds of $\int_0^z Ud\tilde{z}$ and $U$ similar as that in [15], which is stated in the following
Lemma 5.2. Under the condition (15) we have, denoting $\partial^\beta = \partial_x^{\beta_1} \partial_y^{\beta_2}$ and recalling $T \leq 1,$
\[
\forall \ t \in [0, T], \sum_{|\beta| < 9} \left\| \langle z \rangle^{-\ell} \int_0^z \partial^\beta U(t) dz \right\|_{L^2} + \sum_{|\beta| + j \leq 8} \left\| \partial^\beta \partial_j^2 U(t) \right\|_{L^2} \leq e^{CC^2},
\]
and
\[
\forall \ t \in [0, T], \sum_{|\beta| + j \leq 8, 0 \leq j \leq 2} \left\| \partial^\beta \partial_j^2 \lambda \right\|_{L^2} \leq e^{CC^2},
\]
where $C_* \geq 1$ is the constant in (15), and $C$ is a constant depending only on the Sobolev embedding constants and the numbers $\rho_0, \sigma, \ell$ given in Definition 1.1.

Proof. This just follows from direct computation. Precisely we use standard energy method for the equation (9) solved by $f = \int_0^z U dz,$ applying $\langle z \rangle^{-\ell} \partial^\beta = \langle z \rangle^{-\ell} \partial_x^{\beta_1} \partial_y^{\beta_2}, |\beta| \leq 9,$ to the equation (9) and then taking the scalar product with $\langle z \rangle^{-\ell} \partial^\beta f$; this with Sobolev inequality (21) and the condition (15) gives
\[
\frac{1}{2} \frac{d}{dt} \sum_{|\beta| \leq 9} \left\| \langle z \rangle^{-\ell} \partial^\beta f \right\|_{L^2}^2 + \sum_{|\beta| \leq 9} \left\| \partial_z \left( \langle z \rangle^{-\ell} \partial^\beta f \right) \right\|_{L^2}^2 \leq CC_* \sum_{|\beta| \leq 9} \left\| \langle z \rangle^{-\ell} \partial^\beta f \right\|_{L^2}^2,
\]
where $C_* \geq 1$ is just the constant given in (15). Moreover we apply again the energy method for the equation (16) solved by $U,$ to obtain
\[
\frac{1}{2} \frac{d}{dt} \sum_{0 \leq j \leq 2} \left\| \partial^\beta \partial_j^2 U \right\|_{L^2}^2 + \sum_{0 \leq j \leq 2} \left\| \partial_z \partial^\beta \partial_j^2 U \right\|_{L^2}^2 \leq CC_* \sum_{0 \leq j \leq 2} \left\| \partial^\beta \partial_j^2 U \right\|_{L^2}^2 + CC_* \sum_{0 \leq j \leq 2} \left\| \langle z \rangle^{-\ell} \partial^\beta f \right\|_{L^2}^2.
\]
As a result using Gronwall inequality we obtain the first estimate as desired in Lemma 5.2 which with the representation of $\lambda$ given in (11) as well as (15), yields the second one. The proof of Lemma 5.2 is completed.

Now we continue the proof of Proposition 5.1. Recall $K_1$ is given in (43). By the second estimate in Lemma 5.2 we can apply similar argument for proving Lemma 5.3 to compute, using (18) here instead of (19) and observing there is a fact $m$ before $\|\partial_x^m \lambda\|_{L^2}$ in (18),
\[
K_1 \leq \frac{m^2}{4} \int_0^t \left\| \partial_z \partial_x^m \lambda(s) \right\|_{L^2}^2 ds + C \frac{[(m - 6)!]^{2\sigma}}{\rho^{2(m-6)}} \left( \int_0^t \left( |\tilde{a}(s)|_{\rho, \sigma}^3 + |\tilde{a}(s)|_{\rho, \sigma}^4 \right) ds + e^{CC^2} \int_0^t \frac{|\tilde{a}(s)|_{\rho, \sigma}^2}{\rho - \rho} ds \right) \tag{44}
\]
and
\[
K_2 \leq C \frac{[(m - 6)!]^{2\sigma}}{\rho^{2(m-6)}} \left( \int_0^t \left| \tilde{a}(s) \right|_{\rho, \sigma}^3 ds + e^{CC^2} \int_0^t \frac{|\tilde{a}(s)|_{\rho, \sigma}^2}{\rho - \rho} ds \right) \tag{45}
\]
It remains to treat $K_3$ given in (13). We write

$$K_3 = K_{3,1} + K_{3,2} + K_{3,3},$$

with

$$K_{3,1} = 2m^2 \int_0^t \left( \sum_{j=0}^{\lfloor m/2 \rfloor} \binom{m}{j} \left( \partial_x^j \partial_\tau^2 u \right) \partial_x^{m-j} U, \partial_x^m \lambda \right) \, ds,$$

$$K_{3,2} = 2m^2 \int_0^t \left( \sum_{j=\lfloor m/2 \rfloor + 1}^{m-5} \binom{m}{j} \left( \partial_x^j \partial_\tau^2 u \right) \partial_x^{m-j} U, \partial_x^m \lambda \right) \, ds,$$

$$K_{3,3} = 2m^2 \int_0^t \left( \sum_{j=m-4}^{m} \binom{m}{j} \left( \partial_x^j \partial_\tau^2 u \right) \partial_x^{m-j} U, \partial_x^m \lambda \right) \, ds.$$

The rest part is devoted to estimating the above terms $K_{3,1}, K_{3,2}$ and $K_{3,3}$. Using (22), (19) and (18) as well as (15) and recalling $\sigma \geq 3/2$ we follow the similar computation as in the proof of Lemma 3.3 to obtain

$$K_{3,1} \leq 2m^2 \left[ \sum_{0 \leq j \leq 1} \binom{m}{j} \int_0^t \| (\partial_x^j \partial_\tau^2 u) \|_{L^\infty} \| \partial_x^{m-j} U \|_{L^2} \| \partial_x^m \lambda \|_{L^2} \, ds \right]$$

$$\leq C C_\sigma \left[ \frac{(m-6)!}{\rho^{2(m-6)}} \right]^{2\sigma} \int_0^t |\tilde{a}(s)|^3 \rho ds \leq C \frac{(m-6)!}{\rho^{2(m-6)}} \int_0^t |\tilde{a}(s)|^3 \rho ds,$$

and

$$K_{3,2} \leq 2m^2 \sum_{j=\lfloor m/2 \rfloor + 1}^{m-5} \binom{m}{j} \int_0^t \| (\partial_x^j \partial_\tau^2 u) \|_{L^2} \| \partial_x^{m-j} U \|_{L^2} \| \partial_x^m \lambda \|_{L^2} \, ds$$

$$\leq C \int_0^t \left[ \frac{(m-6)!}{\rho^{2(m-6)}} \right] |\tilde{a}(s)|^3 \rho \left( m \| \partial_x^m \lambda \|_{L^2} + m \| \partial_x \partial_x^m \lambda \|_{L^2} \right) ds$$

$$\leq \frac{m^2}{8} \int_0^t \| \partial_x \partial_x^m \lambda(s) \|_{L^2}^2 ds + C \left[ \frac{(m-6)!}{\rho^{2(m-6)}} \right] \int_0^t \left( |\tilde{a}(s)|^3 \rho + |\tilde{a}(s)|^4 \right) ds.$$

Finally, integration by parts gives

$$K_{3,3} = -2m^2 \int_0^t \left( \sum_{j=m-4}^{m} \binom{m}{j} \left( \partial_x^j \partial_\tau^2 u \right) \partial_x^{m-j} U, \partial_x \partial_x^m \lambda \right) \, ds$$

$$-2m^2 \int_0^t \left( \sum_{j=m-4}^{m} \binom{m}{j} \left( \partial_x^j \partial_\tau^2 u \right) \partial_x \partial_x^{m-j} U, \partial_x^m \lambda \right) \, ds$$

$$\leq \frac{m^2}{8} \int_0^t \| \partial_x \partial_x^m \lambda(s) \|_{L^2}^2 dt + C \int_0^t \left[ m \sum_{j=m-4}^{m} \binom{m}{j} \| (\partial_x^j \partial_\tau^2 u) \partial_x^{m-j} U \|_{L^2}^2 \right] ds$$

$$+ 2m^2 \sum_{j=m-4}^{m} \binom{m}{j} \int_0^t \| \partial_x^j \partial_\tau^2 u \|_{L^2} \| \partial_x \partial_x^{m-j} U \|_{L^\infty} \| \partial_x^m \lambda \|_{L^2} \, ds.$$
As for the last term on the right side, we use \(18\), \(22\) and the first assertion in Lemma 5.2 to compute
\[
2m^2 \sum_{j=m-4}^{m} \left( \frac{m}{j} \right) \int_{0}^{t} \| \partial_x^j \partial_x u \|_{L^2} \| \partial_x \partial_x^{m-j} U \|_{L^\infty} \| \partial_x^m \lambda \|_{L^2} ds \leq C \frac{m}{(m-6)!}!^{2\sigma} \frac{(m-6)!}{\rho^{2(m-6)}} \int_{0}^{t} \frac{\| \bar{a}(s) \|_{\rho, \sigma}^2}{\rho - \rho} ds.
\]
Meanwhile we claim
\[
\int_{0}^{t} \left[ \sum_{j=m-4}^{m} \left( \frac{m}{j} \right) \left( \partial_x^m \lambda(s) \right) \right] ds \leq C \frac{m}{(m-6)!}!^{2\sigma} \frac{(m-6)!}{\rho^{2(m-6)}} \int_{0}^{t} \left( |\bar{a}(s)|_{\rho, \sigma}^2 + |\bar{a}(s)|_{\rho, \sigma}^4 \right) ds + \int_{0}^{t} \frac{|\bar{a}(s)|_{\rho, \sigma}^2}{\rho - \rho} ds.
\]
The proof of (46) is postponed to the end of this section. Thus we combine the above three inequalities to get
\[
K_{3,3} \leq \frac{m^2}{8} \int_{0}^{t} \| \partial_x \partial_x^m \lambda \|_{L^2}^2 ds + C \frac{m}{(m-6)!}!^{2\sigma} \frac{(m-6)!}{\rho^{2(m-6)}} \int_{0}^{t} \left( |\bar{a}(s)|_{\rho, \sigma}^2 + |\bar{a}(s)|_{\rho, \sigma}^4 \right) ds + \int_{0}^{t} \frac{|\bar{a}(s)|_{\rho, \sigma}^2}{\rho - \rho} ds,
\]
which with upper bounds of \(K_{3,1}\) and \(K_{3,2}\) yields
\[
K_3 \leq \frac{m^2}{4} \int_{0}^{t} \| \partial_x \partial_x^m \lambda \|_{L^2}^2 ds + C \frac{m}{(m-6)!}!^{2\sigma} \frac{(m-6)!}{\rho^{2(m-6)}} \int_{0}^{t} \left( |\bar{a}(s)|_{\rho, \sigma}^2 + |\bar{a}(s)|_{\rho, \sigma}^4 \right) ds + \int_{0}^{t} \frac{|\bar{a}(s)|_{\rho, \sigma}^2}{\rho - \rho} ds.
\]
Now we put the above estimate and the estimates (14)-(15) on \(K_1, K_2\) into (13) to obtain
\[
m^2 \| \partial_x^m \lambda(t) \|_{L^2}^2 + m^2 \int_{0}^{t} \| \partial_x \partial_x^m \lambda(s) \|_{L^2}^2 ds \leq \frac{m^2}{2} \| \partial_x^{m+1} u_0 \|_{L^2}^2 + C \frac{m}{(m-6)!}!^{2\sigma} \frac{(m-6)!}{\rho^{2(m-6)}} \int_{0}^{t} \left( |\bar{a}(s)|_{\rho, \sigma}^2 + |\bar{a}(s)|_{\rho, \sigma}^4 \right) ds + \int_{0}^{t} \frac{|\bar{a}(s)|_{\rho, \sigma}^2}{\rho - \rho} ds,
\]
which with the fact that
\[
m^2 \| \partial_x^{m+1} u_0 \|_{L^2}^2 \leq m^2 \frac{(m-6)!}{(2\rho_0)^{2(m-6)}} \| (u_0, v_0) \|_{2\rho_0, \sigma}^2 \leq 4^6 \frac{(m-6)!}{\rho^{2(m-6)}} \| (u_0, v_0) \|_{2\rho_0, \sigma}^2
\]
due to the fact \(\rho < \rho_0\), gives the desired upper bound for \(\partial_x^m \lambda\) with \(m \geq 6\). And the estimate for \(m \leq 5\) is straightforward. The above estimate still holds with \(\partial_x^m \lambda\) replaced by \(\partial_y^m \lambda\), which can be treated in the same way. Thus in view of (14) the desired estimate on \(\partial_x^m \lambda\) follows. We can apply the similar argument to get the upper bounds of \(\partial^\alpha \delta, \partial^\alpha \lambda\) and \(\partial^\alpha \delta\). Thus the proof of Proposition 5.3 will be completed if the assertion (46) holds.

**Proof of the assertion (46).** We write
\[
\int_{0}^{t} \left[ \sum_{j=m-4}^{m} \left( \frac{m}{j} \right) \left( \partial_x^j \partial_x u \right) \right] ds \leq Cm^2 \int_{0}^{t} \| U \partial_x^m u \|_{L^2}^2 ds + Cm^4 \int_{0}^{t} \| (\partial_x^m u) \partial_x^{m-1} \partial_x u \|_{L^2}^2 ds + C \sum_{j=m-4}^{m-6} m^{2(m-j+1)} \int_{0}^{t} \| \partial_x^j \partial_x u \|_{L^2}^2 \| \partial_x^{m-j} U \|_{L^\infty}^2 ds.
\]
As for the last term on the right side, we use the first inequality in Lemma and the fact that $\sigma \geq 3/2$ to compute directly \[5.2\]

\[
\sum_{j=m-4}^{m-2} m^{2(m-j+1)} \int_0^t \left\| \partial_x^j \partial_z u \right\|_{L^2}^2 \left\| \partial_x^{m-j} U \right\|_{L^\infty}^2 ds
\leq e^{CC^2} m^6 m^{-4\sigma} \frac{(m - 6)!}{\rho^{2(m-6)}} \int_0^t |\bar{a}(s)|^2 ds \leq e^{CC^2} \frac{(m - 6)!}{\rho^{2(m-6)}} \int_0^t |\bar{a}(s)|^2 ds.
\]

Thus the desired (46) will follow if we can show that

\[
\int_0^t \left\| \partial_z \partial_x^m u \right\|_{L^2}^2 ds \leq e^{CC^2} \frac{(m - 7)!}{\rho^{2(m-7)}} \left( \int_0^t (|\bar{a}(s)|^2 + |\bar{a}(s)|^4) ds + \int_0^t |\bar{a}(s)|^2 ds \right) \quad (47)
\]

and

\[
\int_0^t \left\| (\partial_z U) \partial_x^{m-1} u \right\|_{L^2}^2 ds
\leq e^{CC^2} \frac{(m - 8)!}{\rho^{2(m-8)}} \left( \int_0^t (|\bar{a}(s)|^2 + |\bar{a}(s)|^4) ds + \int_0^t |\bar{a}(s)|^2 ds \right). \quad (48)
\]

The argument is quite similar as that for proving Lemma 4.2. In fact, recalling $\psi_m$ is defined in (30) and multiplying both side of (31) by $U$ instead of $\langle z \rangle^\ell$ therein, we obtain

\[
(\partial_t + u \partial_x + v \partial_y + w \partial_z - \partial_x^2) U \psi_m = U (F_m - L_m) - 2(\partial_z U) \partial_z \psi_m
\]

\[
+ \left[ \partial_x^2 u + \partial_y \partial_x - (\partial_2 u) \partial_z \right] \int_0^z Ud\bar{z} - (\partial_z v) \partial_y \int_0^z Ud\bar{z} + (\partial_z u + \partial_y v) U \right] \psi_m,
\]

where we used the equation (10). In view of the first assertion in Lemma 5.2 we repeat the argument for proving (30) with slight modification to conclude, observing $U \psi_m |_{t=0} = 0$,

\[
\left\| U(t) \psi_m(t) \right\|_{L^2}^2 + \int_0^t \left\| \partial_z \left[ U(s) \psi_m(s) \right] \right\|_{L^2}^2 ds
\leq e^{CC^2} \frac{(m - 7)!}{\rho^{2(m-7)}} \left( \int_0^t (|\bar{a}(s)|^2 + |\bar{a}(s)|^4) ds + \int_0^t |\bar{a}(s)|^2 ds \right).
\]

On the other hand,

\[
\int_0^t \left\| \partial_z \partial_x^m u \right\|_{L^2}^2 ds \leq 2 \int_0^t \left\| \partial_z \left[ \partial_x^m u \right] \right\|_{L^2}^2 ds + C \int_0^t \left\| (\partial_z U) \partial_x^m u \right\|_{L^2}^2 ds
\]

\[
\leq 4 \int_0^t \left( \left\| \partial_z \left[ U \psi_m \right] \right\|_{L^2}^2 + \left\| \partial_z \left[ U(\partial_z u) \int_0^z \partial_x^{m-1} Ud\bar{z} \right] \right\|_{L^2}^2 \right) ds + C \int_0^t \left\| (\partial_z U) \partial_x^m u \right\|_{L^2}^2 ds
\]

\[
\leq 4 \int_0^t \left\| \partial_z \left[ U \psi_m \right] \right\|_{L^2}^2 ds + e^{CC^2} \int_0^t \left\| \partial_x^{m-1} Ud\bar{z} \right\|_{L^2}^2 ds + e^{CC^2} \int_0^t \left\| \partial_x^m u \right\|_{L^2}^2 ds,
\]

the second inequality following from (30) and the last inequality using Lemma 5.2 and the assumption (12). Combining the above inequalities we conclude for any $m \geq 7$, using again (19) and (22),

\[
\int_0^t \left\| U(s) \partial_x^m u(s) \right\|_{L^2}^2 ds \leq e^{CC^2} \frac{(m - 7)!}{\rho^{2(m-7)}} \left( \int_0^t (|\bar{a}(s)|^2 + |\bar{a}(s)|^4) ds + \int_0^t |\bar{a}(s)|^2 ds \right).
\]

We have proven (17). Similarly for (18). Thus the proof of (16) is completed. \qed
6. Proof of the main result

We will prove in this section the main result on the existence and uniqueness for Prandtl system \([2]\). Since the proof is similar as in 2D case once we have the a priori estimate, we will only give a sketch, and refer to \([22],\) Section 7 and Section 8 \([22]\) for the detailed discussion.

**Proof of Theorem 1.3.** The proof relies on the a priori estimates given in Theorems 2.4. In order to obtain the existence of solutions to the Prandtl equations \([2]\), there are two main ingredients, and one is to investigate the existence of approximate solutions to the regularized Prandtl system

\[
\begin{align*}
\partial_t u_\varepsilon + (u_\varepsilon \partial_x + v_\varepsilon \partial_y + w_\varepsilon \partial_z) u_\varepsilon - \varepsilon \partial_x^2 u_\varepsilon - \varepsilon \partial_y^2 u_\varepsilon = 0, \\
\partial_t v_\varepsilon + (u_\varepsilon \partial_x + v_\varepsilon \partial_y + w_\varepsilon \partial_z) v_\varepsilon - \varepsilon \partial_x^2 v_\varepsilon - \varepsilon \partial_y^2 v_\varepsilon = 0, \\
(u_\varepsilon, v_\varepsilon)|_{z=0} = (0, 0), \quad \lim_{z \to +\infty} (u_\varepsilon, v_\varepsilon) = (0, 0), \\
(u_\varepsilon, v_\varepsilon)|_{t=0} = (u_0, v_0),
\end{align*}
\]

with \(w_\varepsilon = -\int_0^z (\partial_x u_\varepsilon + \partial_y v_\varepsilon) d\tilde{z}\). We remark that the regularized equations above share the same compatibility condition \([3]\) as the original system \([2]\). Another ingredient is to derive a uniform estimate with respect to \(\varepsilon\) for the approximate solutions \((u_\varepsilon, v_\varepsilon)\).

The existence for the parabolic system \([19]\) is standard. Indeed, suppose that \((u_0, v_0) \in X_{2\rho_0, \sigma}\). Then we can construct, following the similar scheme as that in \([22],\) Section 7, a solution \((u_\varepsilon, v_\varepsilon) \in L^\infty([0, \tilde{T}_\varepsilon]; X_{3\rho_0/2, \sigma})\) to \([19]\) for some \(\tilde{T}_\varepsilon > 0\) that may depend on \(\varepsilon\).

It remains to derive a uniform estimate for the approximate solutions \((u_\varepsilon, v_\varepsilon)\), so that we can remove the \(\varepsilon\)-dependence of the lifespan \(\tilde{T}_\varepsilon\). To do so we define as in Subsection 2.2 the auxiliary functions \(\mathcal{U}_\varepsilon, \lambda_\varepsilon, \delta_\varepsilon\) in the similar way as that for \(\mathcal{U}, \lambda, \delta\) given in Subsection 2.2 with \((u, v, w)\) and the Prandtl operator therein replaced respectively by \((u_\varepsilon, v_\varepsilon, w_\varepsilon)\) and the regularized Prandtl operator given above. Similarly for \(\mathcal{U}_\varepsilon, \lambda_\varepsilon, \delta_\varepsilon\). Accordingly denote

\[
\bar{a}_\varepsilon = (u_\varepsilon, v_\varepsilon, \mathcal{U}_\varepsilon, \lambda_\varepsilon, \delta_\varepsilon)
\]

and define \(|\bar{a}_\varepsilon|\) similarly as that of \(|\bar{a}|\) (see Definition 2.1). Note that

\[
|\bar{a}_\varepsilon|_{t=0} = (u_0, v_0, 0, 0, \partial_x u_0, \partial_y u_0, \partial_x v_0, \partial_y v_0).
\]

Then we can verify directly that

\[
\forall \rho \leq \rho_0, \quad |\bar{a}_\varepsilon(0)|_{\rho, \sigma} \leq C_{\rho_0, \sigma} \|(u_0, v_0)\|_{2\rho_0, \sigma},
\]

with \(C_{\rho_0, \sigma}\) a constant depending only on \(\rho_0\) and \(\sigma\).

Let \(\tau > 1\) be a fixed number to be determined later. We define

\[
\|\bar{a}_\varepsilon\|_{(\tau)} \overset{def}{=} \sup_{\rho, t} \left(\frac{\rho - \rho - \tau t}{\rho_0 - \rho}\right)^{1/2} |\bar{a}_\varepsilon(t)|_{\rho, \sigma},
\]

where the supremum is taken over all pairs \((\rho, t)\) such that \(\rho > 0, 0 \leq t \leq \rho_0/(4\tau)\) and \(\rho + \tau t < \rho_0\). Let \(C_{\rho_0, \sigma}\) be the constant given in \((50)\) and letting \(C_1 \geq 1\) be the constant given in Theorem 2.4 which depends only on \(\rho_0, \sigma\) and the Sobolev embedding constants, we denote

\[
C_0 = 2(C_{\rho, \sigma} + C_1) \|(u_0, v_0)\|_{2\rho_0, \sigma} + 1.
\]

In the following discussion, we will use the bootstrap argument to prove the assertion that

\[
\|\bar{a}_\varepsilon\|_{(\tau)} \leq C_0/2.
\]
for some $\tau$ large enough, if the condition
\[ \| \bar{a}_\varepsilon \|_{(\tau)} \leq C_0 \] (54)
is fulfilled.

**Step 1.** Observe, for any $t \in [0, \rho_0/(4\tau)]$,
\[ \frac{\sqrt{2}}{2} \| (u_\varepsilon(t), v_\varepsilon(t)) \|_{\rho_0, \sigma} \leq \frac{\sqrt{2}}{2} |\bar{a}_\varepsilon(t)|_{\rho_0, \sigma} \leq \left( \frac{\rho_0 - \rho}{\rho_0 - \frac{\rho_0}{2}} - \frac{\rho_0}{2} \right)^{1/2} \] (55)

Thus under the condition (54), we have $\| (u_\varepsilon(t), v_\varepsilon(t)) \|_{\rho_0/2, \sigma} \leq \sqrt{2} C_0$ for any $t \in [0, \rho_0/(4\tau)]$ and thus it follows from the definition of $\| (u_\varepsilon(t), v_\varepsilon(t)) \|_{\rho_0/2, \sigma}$ that
\[ \forall t \in [0, \rho_0/(4\tau)], \sup_{\| \alpha \|_2 \leq 10} \left( \| \langle z \rangle^{t+i} \partial^\alpha \partial^i u_\varepsilon(t) \|_{L^2} + \| \langle z \rangle^{t+i} \partial^\alpha \partial^i v_\varepsilon(t) \|_{L^2} \right) \leq \tilde{C}_{\rho_0, \sigma} C_0 \]

with $\tilde{C}_{\rho_0, \sigma} \geq 1$ a constant depending only on $\rho_0$ and $\sigma$. Then Assumption 2.3 is fulfilled with $(u, v)$ therein replaced by $(u_\varepsilon, v_\varepsilon)$ and thus similar to Theorem 2.4 we can repeat the argument in Sections 3.4 with minor modification to obtain the following assertion: for any $t \in [0, \rho_0/(4\tau)]$ and any pair $(\rho, \tilde{\rho})$ with $0 < \rho < \tilde{\rho} < \rho_0 \leq 1$,
\[ |\bar{a}_\varepsilon(t)|_{\rho, \sigma}^2 \leq C_1 \| (u_0, v_0) \|_{2\rho_0, \sigma}^2 + C_2 C_0 \left( \int_0^t |\bar{a}_\varepsilon(s)|_{\rho, \sigma}^2 \, ds + \int_0^t \| \bar{a}_\varepsilon(s) \|_{\tilde{\rho}, \sigma}^2 \, ds \right) \] (56)

where $C_2 > 0$ is a constant depending only on the numbers $\rho_0, \sigma$ and the Sobolev embedding constants but independent of $\varepsilon$, and the constant $C_1 \geq 1$ is just the one given in Theorem 2.4.

**Step 2.** We let $(\rho, t)$ be an arbitrary pair which is fixed at moment and satisfies that $0 < \rho, t \in [0, \rho_0/(4\tau)]$ and $\rho + \tau t < \rho_0$. Then it follows from the definition (51) of $\| \bar{a}_\varepsilon \|_{(\tau)}$ that
\[ \forall 0 \leq s \leq t, \quad |\bar{a}_\varepsilon(s)|_{\rho, \sigma} \leq \| \bar{a}_\varepsilon \|_{(\tau)} \left( \frac{\rho_0 - \rho}{\rho_0 - \rho - \tau s} \right)^{1/2}. \] (57)

Furthermore, we take in particular such a $\tilde{\rho}(s)$ that
\[ \tilde{\rho}(s) = \frac{\rho_0 + \rho - \tau s}{2}. \]

Then direct calculation shows that
\[ \forall 0 \leq s \leq t, \quad \rho < \tilde{\rho}(s) \quad \text{and} \quad \tilde{\rho}(s) + \tau s < \rho_0, \] (58)

and
\[ \forall 0 \leq s \leq t, \quad \tilde{\rho}(s) - \rho = \frac{\rho_0 - \rho - \tau s}{2} = \rho_0 - \tilde{\rho}(s) - \tau s. \] (59)

By the inequalities in (58) and the second equality in (59) it follows that, for any $0 \leq s \leq t$,
\[ |\bar{a}_\varepsilon(s)|_{\tilde{\rho}(s), \sigma} \leq \| \bar{a}_\varepsilon \|_{(\tau)} \left( \frac{\rho_0 - \tilde{\rho}(s)}{\rho_0 - \rho - \tau s} \right)^{1/2} \leq \| \bar{a}_\varepsilon \|_{(\tau)} \left( \frac{2 (\rho_0 - \rho)}{\rho_0 - \rho - \tau s} \right)^{1/2}. \] (60)
Putting (57) and (60) into the estimate (56) and using the first equality in (59), we have
\[
|\tilde{a}_\varepsilon(t)|^2_{\rho,\sigma} \leq C_1 \|(u_0, v_0)\|_{2\rho_0,\sigma}^2 + e^{C_2C_0^2} \|\tilde{a}_\varepsilon\|_{(\tau)}^2 \int_0^t \frac{\rho_0 - \rho}{\rho_0 - \rho - ts} ds \\
+ e^{C_2C_0^2} \|\tilde{a}_\varepsilon\|_{(\tau)}^2 \left( \int_0^t \frac{(\rho_0 - \rho)^2}{(\rho_0 - \rho - ts)^2} ds + \int_0^t \frac{2^2(\rho_0 - \rho)}{(\rho_0 - \rho - ts)^2} ds \right) \\
\leq C_1 \|(u_0, v_0)\|_{2\rho_0,\sigma}^2 + \frac{e^{C_2C_0^2}(5 + C_0^2)}{\tau} \|\tilde{a}_\varepsilon\|_{(\tau)} \frac{\rho_0 - \rho}{\rho_0 - \rho - \tau t},
\]
where in the last inequality we have used the condition (54) and the fact that
\[
\frac{\rho_0 - \rho}{\rho_0 - \rho - ts} \leq \frac{(\rho_0 - \rho)^2}{(\rho_0 - \rho - ts)^2} \leq \frac{\rho_0 - \rho}{(\rho_0 - \rho - ts)^2}.
\]
Thus we multiply both sides by the fact \((\rho_0 - \rho - \tau t) / (\rho_0 - \rho)\) and observe \((\rho, t)\) is an arbitrary pair with \(\rho > 0, t \in [0, \rho_0/(4\tau)]\) and \(\rho + \tau t < \rho_0\); this with \(C_1 \geq 1\) gives
\[
\|\tilde{a}_\varepsilon\|_{(\tau)} \leq C_1 \|(u_0, v_0)\|_{2\rho_0,\sigma} + \frac{\sqrt{e^{C_2C_0^2}(5 + C_0^2)}}{\sqrt{\tau}} \|\tilde{a}_\varepsilon\|_{(\tau)}. \tag{61}
\]
Now we choose such a \(\tau\) that
\[
1 - \frac{\sqrt{e^{C_2C_0^2}(5 + C_0^2)}}{\sqrt{\tau}} = \frac{C_1}{C_1 + C_{\rho,\sigma}}. \tag{62}
\]
Then it follows from (61) that
\[
\|\tilde{a}_\varepsilon\|_{(\tau)} \leq (C_1 + C_{\rho,\sigma}) \|(u_0, v_0)\|_{2\rho_0,\sigma} \leq C_0/2,
\]
recalling \(C_0\) is given by (52). This gives the desired assertion (53) provided (54) holds. Thus by the bootstrap argument we conclude, with \(\tau\) defined by (62),
\[
\|\tilde{a}_\varepsilon\|_{(\tau)} \leq (C_1 + C_{\rho,\sigma}) \|(u_0, v_0)\|_{2\rho_0,\sigma} + 1/2,
\]
which with (55) yields
\[
\forall t \in [0, \rho_0/(4\tau)], \quad \|(u_\varepsilon(t), v_\varepsilon(t))\|_{\rho_0/2,\sigma} \leq \sqrt{2} (C_1 + C_{\rho,\sigma}) \|(u_0, v_0)\|_{2\rho_0,\sigma} + \sqrt{2}/2.
\]
Now letting \(\varepsilon \to 0\) we have, by compactness arguments, the limit \(u\) of \(u_\varepsilon\) solves the equation (2). We complete the existence part of Theorem 1.3. The uniqueness will follow from a similar argument as in [22, Subsection 8.2] so we omit it here for brevity. Thus the proof of Theorem 1.3 is completed. \(\square\)
