Orthant-Strictly Monotonic Norms, Graded Sequences and Generalized Top-k and k-Support Norms for Sparse Optimization

Jean-Philippe Chancelier and Michel De Lara*

Abstract

The so-called $\ell_0$ pseudonorm on $\mathbb{R}^d$ counts the number of nonzero components of a vector. We say that a sequence of norms on $\mathbb{R}^d$ is strictly increasingly graded (with respect to the $\ell_0$ pseudonorm) if it is nondecreasing and that the sequence of norms of a vector $x$ becomes stationary exactly at the index $\ell_0(x)$. In the same way, we define strictly decreasingly graded sequences. Thus, a strictly graded sequence detects the number of nonzero components of a vector in $\mathbb{R}^d$ in such a way that the level sets of the $\ell_0$ pseudonorm can be expressed by means of the difference of two convex functions (norms). We also introduce sequences of generalized top-k and k-support norms, generated from any (source) norm on $\mathbb{R}^d$, and the class of orthant-strictly monotonic norms on $\mathbb{R}^d$. Then, we show how these three new notions prove especially relevant for the $\ell_0$ pseudonorm. Indeed, on the one hand, we show that an orthant-strictly monotonic source norm generates a sequence of generalized top-k norms which is strictly increasingly graded with respect to the $\ell_0$ pseudonorm. On the other hand, we show that a source norm, which is orthant-monotonic and which makes the normed space $\mathbb{R}^d$ strictly convex when equipped with it, generates a sequence of generalized k-support norms that is strictly decreasingly graded. Thus, we provide a systematic way to generate sequences of norms with which we can express the level sets of the $\ell_0$ pseudonorm by means of the difference of two norms.

Key words: $\ell_0$ pseudonorm, orthant-strictly monotonic norm, generalized top-k norm, generalized k-support norm, strictly graded sequence of norms.

AMS classification: 15A60, 46N10

1 Introduction

The counting function, also called cardinality function or $\ell_0$ pseudonorm, counts the number of nonzero components of a vector in $\mathbb{R}^d$. It is used in sparse optimization, either as criterion or in the constraints, to obtain solutions with few nonzero entries. The $\ell_0$ pseudonorm is nonconvex, but its level sets can be expressed by means of the difference between two convex functions, more precisely two norms, taken from the nondecreasing sequence of so-called top-$k$ norms (see [17] and references therein). In this paper, we generalize this kind of result to a large class of sequences of norms. But this is not our original motivation. Indeed, in the companion paper [7], we display exact variational formulations for the $\ell_0$ pseudonorm, suitable for exact sparse optimization. However, to obtain such variational formulations, our proofs in the other companion paper [6] rely on three (new) concepts related to norms.

In this paper, we introduce these three concepts and we show why they prove especially relevant for the $\ell_0$ pseudonorm. In Sect. 2, we introduce a new class of orthant-strictly monotonic norms on $\mathbb{R}^d$ (inspired from orthant-monotonic norms [8]), for which we provide different characterizations. With such a norm, when one component of a vector moves away from zero, the norm of the vector strictly grows. Thus, an orthant-strictly monotonic norm is sensitive to the support of a vector, like the $\ell_0$ pseudonorm. In Sect. 3, we define sequences of generalized top-$k$ and $k$-support norms, generated from a source norm. This extends already known concepts of top-$k$ and $k$-support norms [2, 13]. Finally, in Sect. 4 we introduce the notion of sequences of norms that are, increasingly or decreasingly, strictly or not, graded with respect to the $\ell_0$ pseudonorm. A graded sequence detects the number of nonzero components of a vector in $\mathbb{R}^d$ when the sequence becomes stationary. Then, we state and prove our main results. We show that an orthant-strictly monotonic source norm generates a sequence of generalized top-$k$ norms which is strictly increasingly graded with respect to the $\ell_0$ pseudonorm. We also show that a source norm, which is orthant-monotonic and which makes the normed space $\mathbb{R}^d$ strictly convex when equipped with it, generates a sequence of generalized $k$-support norms that is strictly decreasingly graded. In conclusion, we hint at possible applications in sparse optimization.

2 Orthant-strictly monotonic norms

In §2.1, we introduce basic notations regarding the $\ell_0$ pseudonorm. In §2.2, we recall well-known definitions of properties of certain norms — absolute, monotonic, orthant-monotonic. Then, in §2.3, we introduce a new property — orthant-strictly monotonic — and we provide characterizations, as well as properties, that will prove especially relevant for the $\ell_0$ pseudonorm.

We work on the Euclidian space $\mathbb{R}^d$ (with $d \in \mathbb{N}^*$), equipped with the scalar product $\langle \cdot, \cdot \rangle$ (but not necessarily with the Euclidian norm). Thus, all norms define the same (Borel) topology.
2.1 The $\ell_0$ pseudonorm and its level sets

For any vector $x \in \mathbb{R}^d$, we define its support by

$$\text{supp}(x) = \{ j \in \{1, \ldots, d\} \mid x_j \neq 0 \} \subset \{1, \ldots, d\}.$$  

(1)

The so-called $\ell_0$ pseudonorm is the function $\ell_0 : \mathbb{R}^d \to \{0, 1, \ldots, d\}$ defined, for any $x \in \mathbb{R}^d$, by

$$\ell_0(x) = |\text{supp}(x)| = \text{number of nonzero components of } x,$$

(2)

where $|K|$ denotes the cardinal of a subset $K \subset \{1, \ldots, d\}$. The $\ell_0$ pseudonorm shares three out of the four axioms of a norm: nonnegativity, positivity except for $x = 0$, subadditivity. The axiom of 1-homogeneity does not hold true; in contrast, the $\ell_0$ pseudonorm is 0-homogeneous:

$$\ell_0(\rho x) = \ell_0(x), \ \forall \rho \in \mathbb{R}\setminus\{0\}, \ \forall x \in \mathbb{R}^d.$$  

(3)

The $\ell_0$ pseudonorm is used in exact sparse optimization problems of the form $\inf_{\ell_0(x) \leq k} f(x)$. Thus, we introduce the level sets

$$\ell_0 \leq k = \{ x \in \mathbb{R}^d \mid \ell_0(x) \leq k \}, \ \forall k = 0, 1, \ldots, d.$$  

(4)

For any subset $K \subset \{1, \ldots, d\}$, we denote the subspace of $\mathbb{R}^d$ made of vectors whose components vanish outside of $K$ by

$$\mathcal{R}_K = \mathbb{R}^K \times \{0\}^{-K} = \{ x \in \mathbb{R}^d \mid x_j = 0, \ \forall j \notin K \} \subset \mathbb{R}^d,$$

(5)

where $\mathcal{R}_\emptyset = \{0\}$. We denote by $\pi_K : \mathbb{R}^d \to \mathcal{R}_K$ the orthogonal projection mapping and, for any vector $x \in \mathbb{R}^d$, by $x_K = \pi_K(x) \in \mathcal{R}_K$ the vector which coincides with $x$, except for the components outside of $K$ that are zero. It is easily seen that the orthogonal projection mapping $\pi_K$ is self-dual, giving

$$\langle x_K, y_K \rangle = \langle x_K, y \rangle = \langle \pi_K(x), y \rangle = \langle x, \pi_K(y) \rangle = \langle x, y_K \rangle, \ \forall x \in \mathbb{R}^d, \ \forall y \in \mathbb{R}^d.$$  

(6)

The level sets of the $\ell_0$ pseudonorm in (4) are easily related to the subspaces $\mathcal{R}_K$ of $\mathbb{R}^d$, as defined in (5), by

$$\ell_0 \leq k = \{ x \in \mathbb{R}^d \mid \ell_0(x) \leq k \} = \bigcup_{|K| \leq k} \mathcal{R}_K, \ \forall k = 0, 1, \ldots, d,$$

(7)

where the notation $\bigcup_{|K| \leq k}$ is a shorthand for $\bigcup_{K \subset \{1, \ldots, d\}, |K| \leq k}$.

\footnote{Here, following notation from Game Theory, we have denoted by $-K$ the complementary subset of $K$ in $\{1, \ldots, d\}$: $K \cup (-K) = \{1, \ldots, d\}$ and $K \cap (-K) = \emptyset$.}
2.2 Background on orthant-monotonic norms

We recall well-known definitions of properties of certain norms — absolute, monotonic, orthant-monotonic — before introducing in the next §2.3 the new notion of orthant-strictly monotonic norm.

For any norm \(\|\cdot\|\) on \(\mathbb{R}^d\), we denote the unit sphere and the unit ball of the norm \(\|\cdot\|\) by

\[
\mathbb{S} = \left\{ x \in \mathbb{R}^d \mid \|x\| = 1 \right\}, \quad \text{(8a)}
\]

\[
\mathbb{B} = \left\{ x \in \mathbb{R}^d \mid \|x\| \leq 1 \right\}. \quad \text{(8b)}
\]

Dual norms

We recall that the following expression

\[
\|y\|_* = \sup_{\|x\| \leq 1} \langle x, y \rangle, \quad \forall y \in \mathbb{R}^d
\]

defines a norm on \(\mathbb{R}^d\), called the dual norm \(\|\cdot\|_*\) [1, Definition 6.7]. As an example, we recall that the \(\ell_p\)-norms \(\|\cdot\|_p\) on the space \(\mathbb{R}^d\) are defined, for \(p \in [1, \infty]\), by

\[
\|x\|_p = \left( \sum_{i=1}^{d} |x_i|^p \right)^{\frac{1}{p}}
\]

for \(p \in [1, \infty]\) and by \(\|x\|_{\infty} = \sup_{i \in \{1, \ldots, d\}} |x_i|\). It is well-known that the dual norm of the norm \(\|\cdot\|_p\) is the \(\ell_q\)-norm \(\|\cdot\|_q\), where \(q\) is such that \(1/p + 1/q = 1\) (with the extreme cases \(q = \infty\) when \(p = 1\), and \(q = 1\) when \(p = \infty\)).

We denote the unit sphere and the unit ball of the dual norm \(\|\cdot\|_*\) by

\[
\mathbb{S}_* = \left\{ y \in \mathbb{R}^d \mid \|y\|_* = 1 \right\}, \quad \text{(10a)}
\]

\[
\mathbb{B}_* = \left\{ y \in \mathbb{R}^d \mid \|y\|_* \leq 1 \right\}. \quad \text{(10b)}
\]

We have

\[
\|\cdot\| = \sigma_{\mathbb{B}} = \sigma_{\mathbb{S}} \quad \text{and} \quad \|\cdot\|_* = \sigma_{\mathbb{B}} = \sigma_{\mathbb{S}}, \quad \text{(11a)}
\]

where \(\sigma_{\mathbb{S}}\) denotes the support function of the set \(S \subset \mathbb{R}^d\) (\(\sigma_{\mathbb{S}}(y) = \sup_{x \in S} \langle x, y \rangle\)), and where \(\mathbb{B}_*\), the unit ball of the dual norm, is the polar set \(\mathbb{B}^\circ\) of the unit ball \(\mathbb{B}\):

\[
\mathbb{B}_* = \mathbb{B}^\circ = \left\{ y \in \mathbb{R}^d \mid \langle x, y \rangle \leq 1, \ \forall x \in \mathbb{B} \right\}. \quad \text{(11b)}
\]

Since the set \(\mathbb{B}\) is closed, convex and contains 0, we have [1, Theorem 5.103]

\[
\mathbb{B}^{\circ\circ} = (\mathbb{B}^\circ)^\circ = \mathbb{B}, \quad \text{(11c)}
\]

hence the bidual norm \(\|\cdot\|_* = (\|\cdot\|_*)_\|\cdot\|\) is the original norm:

\[
\|\cdot\|_* = (\|\cdot\|_*)_\|\cdot\|. \quad \text{(11d)}
\]
\section*{\|\cdot\|\text{-}duality}

By construction of the dual norm in (9), we have the inequality
\[ \langle x, y \rangle \leq \|x\| \times \|y\|_*, \quad \forall (x, y) \in \mathbb{R}^d \times \mathbb{R}^d. \] (12a)

One says that \( y \in \mathbb{R}^d \) is \( \|\cdot\|\text{-}dual \) to \( x \in \mathbb{R}^d \), denoted by \( y \parallel_{\|\cdot\|} x \), if equality holds in Inequality (12a), that is,
\[ y \parallel_{\|\cdot\|} x \iff \langle x, y \rangle = \|x\| \times \|y\|_. \] (12b)

We illustrate the \( \|\cdot\|\text{-}duality \) in the case of the \( \ell_p \)-norms \( \| \cdot \|_p \), for \( p \in [1, \infty] \). The notation \( x \circ x' = (x_1 x'_1, \ldots, x_d x'_d) \) is for the Hadamard (entrywise) product, for any \( x, x' \) in \( \mathbb{R}^d \). For any \( x \in \mathbb{R}^d \), we denote by \( \text{sign}(x) \in \{-1, 0, 1\}^d \) the vector of \( \mathbb{R}^d \) with components \( \text{sign}(x_i) \in \{-1, 0, 1\} \) of the entries \( x_i \), for \( i = 1, \ldots, d \). Let \( x \in \mathbb{R}^d \setminus \{0\} \) be a given vector (the case \( x = 0 \) is trivial). We easily obtain that a vector \( y \) is
\begin{itemize}
  \item \( \ell_2 \)-dual to \( x \) iff there exists \( \lambda \in \mathbb{R}_+ \) such that \( y = \lambda x \);
  \item \( \ell_p \)-dual to \( x \) for \( p \in ]1, \infty[ \) iff there exists \( \lambda \in \mathbb{R}_+ \) such that \( y = \lambda \text{sign}(x) \circ (|x_i|^{p/q})_{i \in \{1, \ldots, d\}} \), where \( q \) is such that \( 1/p + 1/q = 1 \);
  \item \( \ell_1 \)-dual to \( x \) iff the vectors \( y \) and \( \|y\|_\infty \text{sign}(x) \) coincide on \( \text{supp}(x) \), the support of the vector \( x \) as defined in (11);
  \item \( \ell_\infty \)-dual to \( x \) iff \( y \in \mathcal{R}_K \), where \( K = \arg\max_{i \in \{1, \ldots, d\}} |x_i| \), and \( y \circ x \geq 0 \).
\end{itemize}

\section*{Restriction norms}

Orthant-monotonic norms, introduced below, have strong links with so-called restriction norms.

\textbf{Definition 1} For any norm \( \|\cdot\| \) on \( \mathbb{R}^d \) and any subset \( K \subset \{1, \ldots, d\} \), we define three norms on the subspace \( \mathcal{R}_K \) of \( \mathbb{R}^d \), as defined in (3), as follows.

\begin{itemize}
  \item The \( K \)-restriction norm \( \|\cdot\|_K \) is defined by
    \[ \|x\|_K = \|x\|, \quad \forall x \in \mathcal{R}_K. \] (13)
  \item The \((\ast, K)\)-norm \( \|\cdot\|_{\ast, K} \) is the norm \( (\|\cdot\|)_{K}^\ast \), given by the restriction to the subspace \( \mathcal{R}_K \) of the dual norm \( \|\cdot\|_\ast \) (first dual, then restriction),
  \item The \((K, \ast)\)-norm \( \|\cdot\|_{K, \ast} \) is the norm \( (\|\cdot\|_K)^\ast \), given by the dual norm (on the subspace \( \mathcal{R}_K \)) of the \( K \)-restriction norm \( \|\cdot\|_K \) to the subspace \( \mathcal{R}_K \) (first restriction, then dual).
\end{itemize}
Lemma 2 For any norm \( \| \cdot \| \) on \( \mathbb{R}^d \) and any subset \( K \subset \{1, \ldots, d\} \), we have

\[
\begin{align*}
\|y\|_{*,K} &= \sigma_{\pi_K(\mathbb{B})}(y) = \sigma_{\pi_K(\mathbb{S})}(y), \quad \forall y \in \mathcal{R}_K, \\
\|y\|_{K,*} &= \sigma_{\mathcal{R}_K \cap \mathbb{B}}(y) = \sigma_{\mathcal{R}_K \cap \mathbb{S}}(y), \quad \forall y \in \mathcal{R}_K,
\end{align*}
\]

and

\[
\|\cdot\|_{K,*} \leq \|\cdot\|_{*,K}.
\]

Proof.

• First, we prove (14a). For any \( y \in \mathcal{R}_K \), we have

\[
\begin{align*}
\|y\|_{*,K} &= \|y\|_*, \quad \text{(by using (13) with the dual norm \( \|\cdot\|_* \))} \\
&= \sigma_{\mathbb{B}}(y) \quad \text{(by (11a))} \\
&= \sup \{x, y\} \quad \text{(by definition of the support function \( \sigma_{\mathbb{B}} \))} \\
&= \sup \{x, \pi_K(y)\} \quad \text{(as \( y = \pi_K(y) \) because \( y \in \mathcal{R}_K \))} \\
&= \sup \{\pi_K(x), y\} \quad \text{(by the self-duality property (6) of the projection mapping \( \pi_K \))} \\
&= \sup \{x', y\} \quad \text{(by definition of the support function \( \sigma_{\pi_K(\mathbb{B})} \))} \\
&= \sigma_{\pi_K(\mathbb{B})}(y).
\end{align*}
\]

Thus, we have proved that \( \|y\|_{*,K} = \sigma_{\pi_K(\mathbb{B})}(y) \).

There remains to prove that \( \sigma_{\pi_K(\mathbb{B})}(y) = \sigma_{\pi_K(\mathbb{S})}(y) \). Now, as the unit ball \( \mathbb{B} \) is equal to the convex hull \( \text{co}(\mathbb{S}) \) of the unit sphere \( \mathbb{S} \), we easily get that \( \pi_K(\mathbb{B}) = \pi_K(\text{co}(\mathbb{S})) = \text{co}(\pi_K(\mathbb{S})) \). As \( \sigma_{\text{co}(\pi_K(\mathbb{S}))} = \sigma_{\pi_K(\mathbb{S})} \) [4, Prop. 7.13], we conclude that \( \|y\|_{*,K} = \sigma_{\pi_K(\mathbb{B})} = \sigma_{\text{co}(\pi_K(\mathbb{S}))} = \sigma_{\pi_K(\mathbb{S})} \) on \( \mathcal{R}_K \), that is, that (14a) holds true.

• Second, we prove (14b).

By (11a), we have the equality \( \|\cdot\|_{K,*} = \sigma_{\mathcal{R}_K \cap \mathbb{B}} \) on \( \mathcal{R}_K \), as \( \mathcal{R}_K \cap \mathbb{B} \) is easily seen to be the unit ball (in \( \mathcal{R}_K \)) of the restriction norm \( \|\cdot\|_K \) in (13). Therefore, we have proved that \( \|y\|_{K,*} = \sigma_{\mathcal{R}_K \cap \mathbb{B}}(y) \) for any \( y \in \mathcal{R}_K \).

Now, we prove that \( \sigma_{\mathcal{R}_K \cap \mathbb{B}}(y) = \sigma_{\mathcal{R}_K \cap \mathbb{S}}(y) \) for any \( y \in \mathcal{R}_K \). It is easy to check that the unit sphere (in \( \mathcal{R}_K \)) of the restriction norm \( \|\cdot\|_K \) in (13) is \( \mathcal{R}_K \cap \mathbb{S} \). Then, using the fact that the convex hull (be it in \( \mathcal{R}_K \) or in \( \mathbb{R}^d \)) of the unit sphere \( \mathcal{R}_K \cap \mathbb{S} \) is the unit ball \( \mathcal{R}_K \cap \mathbb{B} \), we have that \( \text{co}(\mathcal{R}_K \cap \mathbb{S}) = \mathcal{R}_K \cap \mathbb{B} \). As \( \sigma_{\text{co}(\mathcal{R}_K \cap \mathbb{S})} = \sigma_{\mathcal{R}_K \cap \mathbb{S}} \) [4, Prop. 7.13], we conclude that \( \|\cdot\|_{K,*} = \sigma_{\mathcal{R}_K \cap \mathbb{B}} = \sigma_{\text{co}(\mathcal{R}_K \cap \mathbb{S})} = \sigma_{\mathcal{R}_K \cap \mathbb{S}} \) on \( \mathcal{R}_K \), that is, that (14b) holds true.

• Third, we prove (14c) (for the sake of completeness, because it is a well-known result).

As \( \mathcal{R}_K \cap \mathbb{B} \subset \pi_K(\mathbb{B}) \), we deduce from (14a) and (14b) that \( \|\cdot\|_{K,*} \leq \|\cdot\|_{*,K} \), which is (14c).

This ends the proof. \( \square \)

It is proved ([8, Theorem 2.26], [10, Theorem 3.2] recalled in Proposition [6]) that norms for which the equality \( \|\cdot\|_{K,*} = \|\cdot\|_{*,K} \) holds for all subsets \( K \subset \{1, \ldots, d\} \), are the orthant-monotonic norms (see Definition [8] below).
Absolute, monotonic and orthant-monotonic norms

For any $x \in \mathbb{R}^d$, we denote by $|x|$ the vector of $\mathbb{R}^d$ with components $|x_i|$, $i = 1, \ldots, d$:

$$x = (x_1, \ldots, x_d) \Rightarrow |x| = (|x_1|, \ldots, |x_d|).$$

(15)

We recall well-known definitions.

**Definition 3** A norm $\|\cdot\|$ on the space $\mathbb{R}^d$ is called

- **absolute** \[3\] if $\|x\| = \|\|x||\|$, for all $x \in \mathbb{R}^d$,
- **monotonic** \[3\] if, for all $x, x' \in \mathbb{R}^d$, we have $|x| \leq |x'| \Rightarrow \|x\| \leq \|x'\|$, where $|x| \leq |x'|$ means $|x_i| \leq |x'_i|$ for all $i = 1, \ldots, d$,
- **orthant-monotonic** \[8\] if, for all $x, x' \in \mathbb{R}^d$, we have ($|x| \leq |x'|$ and $x \circ x' \geq 0 \Rightarrow \|x\| \leq \|x'\|$), where $x \circ x' = (x_1x'_1, \ldots, x_dx'_d)$ is the Hadamard (entrywise) product.

We will use the following, easy to prove, properties: any monotonic norm is orthant-monotonic; if a norm is orthant-monotonic, so are its restriction norms in Definition 1 (as norms on their respective subspaces). All the $\ell_p$-norms $\|\cdot\|_p$ on the space $\mathbb{R}^d$, for $p \in [1, \infty]$, are monotonic, hence orthant-monotonic. The definition of an orthant-monotonic seminorm is straightforward, and it is easily proven that the supremum of a family of orthant-monotonic seminorms is an orthant-monotonic seminorm.

Furthermore, it has long been established that the notions of absolute and monotonic norms coincide \[3, Theorem 2\], that the dual of an absolute norm is absolute \[3, Theorem 1\], that the dual of an orthant-monotonic norm is orthant-monotonic \[8, Theorem 2.23\].

Characterizations and properties of orthant-monotonic norms

We recall established characterizations of orthant-monotonic norms. Before starting, we recall two definitions.

**Definition 4** Let $U$ and $V$ be two subspaces of $\mathbb{R}^d$. Let $\|\cdot\|$ be a norm on $\mathbb{R}^d$.

- We say that the subspace $U$ is Birkhoff orthogonal \[5\] to the subspace $V$, denoted by $U \perp \|\cdot\| V$ if $\|u + v\| \geq \|u\|$, for any $u \in U$ and any $v \in V$, that is,

$$U \perp \|\cdot\| V \iff \|u + v\| \geq \|u\|, \ \forall u \in U, \ \forall v \in V.$$  

(16)

- We say that the subspace $U$ is strictly Birkhoff orthogonal \[16\] to the subspace $V$, denoted by $U \perp \|\cdot\| > V$ if $\|u + v\| > \|u\|$, for any $u \in U$ and any $v \in V \{0\}$, that is,

$$U \perp \|\cdot\| > V \iff \|u + v\| > \|u\|, \ \forall u \in U, \ \forall v \in V \{0\}.$$  

(17)

\[2\]It is proved in \[3, Lemma 2.12\] that a norm is orthant-monotonic if and only if it is monotonic in every orthant.
Now, we are ready to recall established characterizations of orthant-monotonic norms, and to add a new characterization, in the two following Propositions 5 and 6.

**Proposition 5** Let $\|\cdot\|$ be a norm on $\mathbb{R}^d$ and $K \subset \{1, \ldots, d\}$. The following assertions are equivalent.

1. $\|\cdot\|_{K,*} = \|\cdot\|_{*,K}$, where the $(\cdot,K)$-norm $\|\cdot\|_{\cdot,K}$ and the $(K,\cdot)$-norm $\|\cdot\|_{K,*}$ are introduced in Definition 1.
2. $R_K \perp \|\cdot\| R_{-K}$, where $R_K$ is defined in (5) and Birkhoff orthogonality $\perp \|\cdot\|$ in (16),
3. $R_K \perp \|\cdot\| R_{-K},$
4. For any vector $u \in R_K$, there exists a nonzero vector $v \in R_K$ which is $\|\cdot\|$-dual to $u$ as in (12b),
5. For any vector $v \in R_K$, there exists a nonzero vector $u \in R_K$ which is $\|\cdot\|_{\cdot,*}$-dual to $v$ as in (12b),
6. $\pi_K(\mathbb{B}) = R_K \cap \mathbb{B}$, where $\pi_K : \mathbb{R}^d \to R_K$ is the orthogonal projection mapping, and $\mathbb{B}$ is the unit ball of the norm $\|\cdot\|$ as in (8b).

**Proof.** The equivalence between all statements but the last one can be found in [10, Proposition 2.4]. We prove that the first and last statements are equivalent.

Let $\|\cdot\|$ be a norm on $\mathbb{R}^d$ and $K \subset \{1, \ldots, d\}$ By (14), the equality $\|\cdot\|_{\cdot,K} = \|\cdot\|_{K,*}$ is equivalent to $\sigma_{\pi_K(\mathbb{B})} = \sigma_{R_K \cap \mathbb{B}}$, when this last equality is restricted to the subspace $R_K$. Now, on the one hand, the subset $\pi_K(\mathbb{B})$ of $R_K$ is convex and closed (in the subspace $R_K$) as the image of the convex and compact set $\mathbb{B}$ by the linear mapping $\pi_K$. On the other hand, the subset $R_K \cap \mathbb{B}$ of $R_K$ is convex and closed (in the subspace $R_K$). Therefore, $\|\cdot\|_{\cdot,K} = \|\cdot\|_{K,*}$ if and only if $\pi_K(\mathbb{B}) = R_K \cap \mathbb{B}$.

This ends the proof. \(\square\)

**Proposition 6** Let $\|\cdot\|$ be a norm on $\mathbb{R}^d$. The following assertions are equivalent.

1. The norm $\|\cdot\|$ is orthant-monotonic.
2. The norm $\|\cdot\|_{\cdot,*}$ is orthant-monotonic.
3. $\|\cdot\|_{K,*} = \|\cdot\|_{*,K}$, for all $K \subset \{1, \ldots, d\}$.
4. $R_K \perp \|\cdot\| R_{-K}$, for all $K \subset \{1, \ldots, d\}$.
5. $R_K \perp \|\cdot\| R_{-K}$, for all $K \subset \{1, \ldots, d\}$ with $|K| = d - 1$.
6. For any vector $u \in \mathbb{R}^d \setminus \{0\}$, there exists a vector $v \in \mathbb{R}^d \setminus \{0\}$ such that $\text{supp}(v) \subset \text{supp}(u)$, that $u \circ v \geq 0$, and that $v$ is $\|\cdot\|$-dual to $u$ as in (12b).
7. The norm $\|\cdot\|$ is increasing with the coordinate subspaces, in the sense that, for any $x \in \mathbb{R}^d$ and any $J \subset K \subset \{1, \ldots, d\}$, we have $\|x_J\| \leq \|x_K\|$.}

8
8. \( \pi_K(\mathbb{B}) = \mathcal{R}_K \cap \mathbb{B} \), for all \( K \subset \{1, \ldots, d\} \).

**Proof.** The equivalence between all statements but the two last ones can be found in [10, Proposition 2.4]. Item [7] is easily seen to be equivalent to Item [4]. By Proposition [5], the first and last statements are equivalent. \( \square \)

As an example, we illustrate Item [6] of Proposition [6] with the \( \ell_1 \) and \( \ell_\infty \) norms, that both are orthant-monotonic. For any vector \( u \in \mathbb{R}^d \),

- the vector \( v = \text{sign}(u) \) is such that \( \text{supp}(v) = \text{supp}(u) \), that \( u \odot v \geq 0 \), and is \( \| \cdot \|_1 \)-dual to the vector \( u \), as we have
  \[
  \langle u, v \rangle = \langle u, \text{sign}(u) \rangle = \langle |u|, I \rangle = \|u\|_1 = \|u\|_1 \|v\|_\infty ,
  \]
  where \( I \in \mathbb{R}^d \) is the vector whose components are all equal to one,

- the vector \( v = \text{sign}(u) \odot I_U \), where \( U = \arg\max_{i \in \{1, \ldots, d\}} |u_i| \), is such that \( \text{supp}(v) \subset \text{supp}(u) \), that \( u \odot v \geq 0 \), and is \( \| \cdot \|_\infty \)-dual to the vector \( u \), as we have
  \[
  \langle u, v \rangle = \langle u, \text{sign}(u) \odot I_U \rangle = \langle |u|, I_U \rangle = \|u\|_\infty \|I_U\|_1 = \|u\|_\infty \|v\|_1 .
  \]

### 2.3 Orthant-strictly monotonic norms

After these recalls, we introduce two new notions, that are the strict versions of monotonic and orthant-monotonic norms. Then, we will provide characterizations that will prove especially relevant for the \( \ell_0 \) pseudonorm.

**Definition 7** A norm \( \| \cdot \| \) on the space \( \mathbb{R}^d \) is called

- strictly monotonic if, for all \( x, x' \in \mathbb{R}^d \), we have \( |x| < |x'| \Rightarrow \|x\| < \|x'\| \), where \( |x| < |x'| \) means that \( |x_i| \leq |x'_i| \) for all \( i = 1, \ldots, d \), and that there exists \( j \in \{1, \ldots, d\} \) such that \( |x_j| < |x'_j| \),

- orthant-strictly monotonic if, for all \( x, x' \in \mathbb{R}^d \), we have \( |x| < |x'| \) and \( x \odot x' \geq 0 \Rightarrow \|x\| < \|x'\| \).

We will use the following, easy to prove, properties: any strictly monotonic norm is orthant-strictly monotonic; any orthant-strictly monotonic norm is orthant-monotonic.

All the \( \ell_p \)-norms \( \| \cdot \|_p \) on the space \( \mathbb{R}^d \), for \( p \in [1, \infty] \), are strictly monotonic, hence orthant-strictly monotonic. In contrast, the \( \ell_\infty \)-norm \( \| \cdot \|_\infty \) is not orthant-strictly monotonic.

To the difference with orthant-monotonicity, the notion of orthant-strictly monotonicity is not necessarily preserved when taking the dual norm: indeed, the \( \ell_1 \)-norm \( \| \cdot \|_1 \) is orthant-strictly monotonic, whereas its dual norm, the \( \ell_\infty \)-norm \( \| \cdot \|_\infty \) is orthant-monotonic, but not orthant-strictly monotonic.

Now, we provide characterizations of orthant-strictly monotonic norms.
Proposition 8 Let $\|\cdot\|$ be a norm on $\mathbb{R}^d$. The following assertions are equivalent.

1. The norm $\|\cdot\|$ is orthant-strictly monotonic.

2. The family $\{\mathcal{R}_K\}_{K \subset \{1, \ldots, d\}}$ of subspaces of $\mathbb{R}^d$ is strictly Birkhoff orthogonal, in the sense that $\mathcal{R}_K \perp_{\|\cdot\|} \mathcal{R}_{-K}$, for all $K \subset \{1, \ldots, d\}$, as in (17).

3. The norm $\|\cdot\|$ is strictly increasing with the coordinate subspaces, in the sense that, for any $x \in \mathbb{R}^d$ and any $J \subset K \subset \{1, \ldots, d\}$, we have $x_J \notin x_K \Rightarrow \|x_J\| < \|x_K\|$.

4. For any vector $u \in \mathbb{R}^d \setminus \{0\}$, there exists a vector $v \in \mathbb{R}^d \setminus \{0\}$ such that $\supp(v) = \supp(u)$, that $u \circ v \geq 0$, and that $v$ is $\|\cdot\|$-dual to $u$, that is, $\langle u, v \rangle = \|u\| \times \|v\|$.

Proof.

- We prove that Item 1 implies Item 2.

Let $K \subset \{1, \ldots, d\}$. Let $u \in \mathcal{R}_K$ and $v \in \mathcal{R}_{-K} \setminus \{0\}$, that is, $u = u_K$ and $v = v_{-K} \neq 0$. We want to show that $\|u + v\| > \|u\|$, by the definition (17) of strict Birkhoff orthogonality.

On the one hand, by definition (15) of the module of a vector, we easily see that $|x| = |x_K| + |x_{-K}|$, for any vector $x \in \mathbb{R}^d$. Thus, we have $\|u + v\| = |(u + v)_K| + |(u + v)_{-K}| = |u_K + v_K| + |u_{-K} + v_{-K}| = |u_K + 0| + |v_{-K}| = |u_K| + |v_{-K}| > |u_K| = |u|$ since $v_{-K} > 0$ as $v = v_{-K} \neq 0$, and since $u = u_K$. On the other hand, we easily get that $(u + v) \circ u = ((u + v)_K \circ u_K) + ((u + v)_{-K} \circ u_{-K}) = (u_K \circ u_K) + (v_{-K} \circ u_{-K}) = (u_K \circ u_K)$, because $u_{-K} = 0$. Therefore, we get that $(u + v) \circ u = (u_K \circ u_K) \geq 0$.

As the norm $\|\cdot\|$ is orthant-strictly monotonic, from $|u + v| > |u|$ and $(u + v) \circ u \geq 0$, we deduce that $\|u + v\| > \|u\|$ by Definition 7. Thus, (17) is satisfied, hence Item 2 holds true.

- We prove that Item 2 implies Item 3.

Let $x \in \mathbb{R}^d$ and $J \subset K \subset \{1, \ldots, d\}$ be and such that $x_J \neq x_K$. We will show that $\|x_J\| < \|x_K\|$.

As $J \subset K \subset \{1, \ldots, d\}$ and $x_J \neq x_K$, there exists $w \in \mathcal{R}_{-J}$, $w \neq 0$, such that $x_K = x_J + w$. Now, as the family $\{\mathcal{R}_K\}_{K \subset \{1, \ldots, d\}}$ is strictly Birkhoff orthogonal by assumption (Item 2), we have $\mathcal{R}_J \perp_{\|\cdot\|} \mathcal{R}_{-J}$. As a consequence, we obtain that $\|x_K\| = \|x_J + w\| > \|x_J\|$.

- We prove that Item 3 implies Item 4.

Let $u \in \mathbb{R}^d \setminus \{0\}$ be given and let us put $K = \supp(u) \neq \emptyset$. As the norm $\|\cdot\|$ is orthant-strictly monotonic, it is orthant-monotonic; hence, by Item 6 in Proposition 4, there exists a vector $v \in \mathbb{R}^d \setminus \{0\}$ such that $\supp(v) \subset \supp(u)$, that $u \circ v \geq 0$ and that $v$ is $\|\cdot\|$-dual to $u$, as in (12b), that is, $\langle u, v \rangle = \|u\| \times \|v\|$. Thus $J = \supp(v) \subset K = \supp(u)$. We will now show that $J \subset K$ is impossible, hence that $J = K$, thus proving that Item 4 holds true with the above vector $v$.

Writing that $\langle u, v \rangle = \|u\| \times \|v\|$ (using that $u = u_K$ and $v = v_K = v_J$), we obtain $\|u\| \times \|v\| = \langle u, v \rangle = \langle u_K, v \rangle = \langle u_K, v_K \rangle = \langle u_K, v_J \rangle = \langle u_J, v \rangle = \langle u_J, v \rangle$. As a consequence, $\{u_K, u_J\} \subset \arg\max_{\|x\| \leq \|u\|} \langle x, v \rangle$, by definition (9) of $\|\cdot\|$-dual, because $\|u\| = \|u_K\| \geq \|u_J\|$, by Item 7 in Proposition 6 since $J \subset K$ and the norm $\|\cdot\|$ is orthant-monotonic. But any solution in $\arg\max_{\|x\| \leq \|u\|} \langle x, v \rangle$ belongs to the frontier of the ball of radius $\|u\|$, hence has exactly norm $\|u\|$. Thus, we deduce that $\|u\| = \|u_K\| = \|u_J\|$. If we had $J = \supp(v) \subset K = \supp(u)$, we would

---

3By $J \subset K$, we mean that $J \subset K$ and $J \neq K$. 

10
have $u_j \neq u_K$, hence $\|u_K\| > \|u_j\|$ by Item 3; this would be in contradiction with $\|u_K\| = \|u_j\|$.

Therefore, $J = \text{supp}(v) = K = \text{supp}(u)$.

- We prove that Item 4 implies Item 1

    Let $x, x'$ in $\mathbb{R}^d$ be such that $|x| < |x'|$ and $x \circ x' \geq 0$. We are going to prove that $\|x\| < \|x'\|$.

    We suppose that $x \neq 0$ (otherwise the proof is trivial). By Item 4 there exists a vector $w \in \mathbb{R}^d$ such that $\text{supp}(w) = \text{supp}(x)$, $x \circ w \geq 0$ and that $\langle x, w \rangle = \|x\| \times \|w\|_\ast$. As $\text{supp}(w) = \text{supp}(x)$ with $x \neq 0$, we have $w \neq 0$, so that we can always suppose that $\|w\|_\ast = 1$ (after renormalization), giving $\|x\| = \langle x, w \rangle$.

    First, we are going to establish that $i \in \text{supp}(x) \Rightarrow x_i'w_i \geq x_iw_i$. From $|x'| > |x|$, we deduce that $|x'|^2 \geq |x| \circ |x|$, and, as $x' \circ x \geq 0$, we obtain that $|x'|^2 \geq x' \circ x = |x'| \circ |x| \geq 0$. Hence, we deduce

    $$(x' \circ x) \circ (x' \circ w) = |x'|^2 \circ (x \circ w) \geq (x' \circ x) \circ (x \circ w),$$

    as $x \circ w \geq 0$. Moving to components, we get that, for all $i = 1, \ldots, d$, $x_i'w_i x_i'w_i \geq x_i'x_iw_i$, so that, on the one hand

    $$x_i'x_i > 0 \Rightarrow x_i'w_i \geq x_iw_i.$$ 

    On the other hand, as $|x'| > |x|$ and $x \circ x' \geq 0$, we easily get that $x'_ix_i > 0 \iff i \in \text{supp}(x)$. Therefore, we deduce that $i \in \text{supp}(x) \Rightarrow x'_ix_i > 0 \Rightarrow x'_iw_i \geq x_iw_i$.

    Second, we show that $\|x\| \leq \|x'\|$. Indeed, we have:

    $$\|x'\| = \sup_{\|w\|_\ast \leq 1} \langle x', w' \rangle \quad \text{(by 3 as } \|\cdot\| = (\|\cdot\|_\ast)_\ast)$$

    $$\geq \langle x', w \rangle \quad \text{(as } \|w\|_\ast = 1)$$

    $$= \sum_{i \in \text{supp}(w)} x_i'w_i \quad \text{(as } \text{supp}(w) = \text{supp}(x))$$

    $$\geq \sum_{i \in \text{supp}(x)} x_iw_i \quad \text{(as } i \in \text{supp}(x) \Rightarrow x'_iw_i \geq x_iw_i)$$

    $$= \langle x, w \rangle \quad \text{(by the property } \|x\| = \langle x, w \rangle \text{ of the vector } w.)$$

    Third, we will show that $\|x\| < \|x'\|$. There are two cases.

    In the first case, there exists $j \in \text{supp}(x)$ such that $0 < |x_j| < |x'_j|$. As a consequence, on the one hand, $0 < |w_j| |x_j| < |w_j| |x'_j|$, since $w_j \neq 0$ because $j \in \text{supp}(x) = \text{supp}(w)$. On the other hand, $x'_jx_j > 0$ implies $x'_jw_j \geq x_jw_j$, as seen above, and $x_jw_j \geq 0$ because $x \circ w \geq 0$. Thus, we get that $x'_jw_j \geq x_jw_j \geq 0$. As $0 < |x_j| < |x'_j|$, we deduce that $x'_jw_j > x_jw_j$. Returning to the last inequality in the sequence of equalities and inequalities above, we observe that it is now strict, and we conclude that $\|x'\| > \|x\|$.

    In the second case, $i \in \text{supp}(x) \Rightarrow 0 < |x_i| = |x'_i|$. As $|x| < |x'|$, we deduce that there exists $j \in \text{supp}(x') \setminus \text{supp}(x)$ such that $0 = |x_j| < |x'_j|$. We define a new vector $\tilde{x}$ by $\tilde{x}_j = 1/2x'_j \neq 0$ and $\tilde{x}_i = x_i$ for $i \neq j$. Putting $I = \text{supp}(x)$, we have $\tilde{x} = x_I + 1/2x'_j e_j = \tilde{x}_I + \tilde{x}_j$, where $e_j$ denotes the $j$-canonical vector of $\mathbb{R}^d$. On the one hand, from the first case we obtain that $\|\tilde{x}\| < \|x'\|$. On the other hand, we have $\|x\| \leq \|\tilde{x}\|$; indeed, by Proposition 6 Item 4 implies that the norm
is orthant-monotonic, hence that $\|\bar{x}\| = \|\bar{x}_I + \bar{x}_{\{j\}}\| \geq \|\bar{x}_I\| = \|x\|$. We conclude that $\|x\| \leq \|\bar{x}\| < \|x^*\|$.

This ends the proof. □

As an example, we illustrate Item 4 of Proposition 8 with the $\ell_1$ (orthant-strictly monotonic) and $\ell_\infty$ (not orthant-strictly monotonic) norms.

• For any vector $u \in \mathbb{R}^d$, we have seen that the vector $v = \text{sign}(u)$ is such that supp$(v) = \text{supp}(u)$, that $u \circ v \geq 0$, and is $\| \cdot \|_1$-dual to the vector $u$. This is another proof that the norm $\ell_1$ is orthant-strictly monotonic.

• In contrast, if the vector $v$ is $\| \cdot \|_\infty$-dual to the vector $u = (1, 1/2, 0, \ldots, 0)$, then an easy computation shows that, necessarily, $v = (v_1, 0, 0, \ldots, 0)$ with $v_1 \geq 0$. As a consequence, this gives $\{1\} = \text{supp}(v) \subset \text{supp}(u) = \{1, 2\}$. This suffices to prove that the norm $\ell_\infty$ is not orthant-strictly monotonic.

We end this §2.3 with additional properties related to exposed and extreme points of the unit ball $B$ of an orthant-strictly monotonic norm $\| \cdot \|$.

We recall that an element $x$ of a convex set $C$ is called an exposed point of $C$ if there exists a support hyperplane $H$ to the convex set $C$ at $x$ such that $H \cap C = \{x\}$. We show in the next proposition that orthant-strictly monotonicity implies that the intersection of the unit sphere $S$ with the subspaces $R_{\{i\}}$ in (5), for $i \in \{1, \ldots, d\}$, is made of exposed points of the unit ball $B$.

**Proposition 9** If the norm $\| \cdot \|$ is orthant-strictly monotonic, then the elements of the renormalized canonical basis of $\mathbb{R}^d$, that is the $e_i/\|e_i\|$ for $i \in \{1, \ldots, d\}$, are exposed points of the unit ball $B$.

**Proof.** Assume that the norm $\| \cdot \|$ is orthant-strictly monotonic and fix $i \in \{1, \ldots, d\}$. Then, using item 2 of Proposition 8, we have that $\|\bar{\tau}_i + \sum_{j \in \{1, \ldots, d\} \setminus \{i\}} \lambda_j \bar{\tau}_j\| > \|\bar{\tau}_i\|$, for all $\{\lambda_j\}_{j \in \{1, \ldots, d\} \setminus \{i\}}$ where not all $\lambda_j$’s are 0 and where $\bar{\tau}_j = e_j/\|e_j\|$ for all $j \in \{1, \ldots, d\}$. This means that the renormalized canonical basis is strongly orthonormal relative to $\bar{\tau}_i$ in the sense of Birkhoff. Using [14, Theorem 2.6], we obtain that $\bar{\tau}_i$ is an exposed point of the unit ball $B$. This ends the proof. □

We recall that the normed space $(\mathbb{R}^d, \| \cdot \|)$ is said to be strictly convex if the unit ball $B$ (of the norm $\| \cdot \|$) is rotund, that is, if all points of the unit sphere $S$ are extreme points of the unit ball $B$. The normed space $(\mathbb{R}^d, \| \cdot \|_p)$, equipped with the $\ell_p$-norm $\| \cdot \|_p$ (for $p \in [1, \infty]$), is strictly convex if and only if $p \in ]1, \infty[$.

**Proposition 10** If the norm $\| \cdot \|$ is orthant-monotonic and if the normed space $(\mathbb{R}^d, \| \cdot \|)$ is strictly convex, then the norm $\| \cdot \|$ is orthant-strictly monotonic.

12
Proof. In \cite[Theorem 2.2]{16}, we find the following result: if the family $\{R_K\}_{K \subset \{1,\ldots,d\}}$ of subspaces of $\mathbb{R}^d$ is Birkhoff orthogonal for a norm $\| \cdot \|$, and if the unit ball for that norm is rotund, then the family $\{R_K\}_{K \subset \{1,\ldots,d\}}$ is strictly Birkhoff orthogonal.

Now for the proof. If the norm $\| \cdot \|$ is orthant-monotonic, then the family $\{R_K\}_{K \subset \{1,\ldots,d\}}$ of subspaces of $\mathbb{R}^d$ is Birkhoff orthogonal by Item 4 in Proposition 6. As the unit ball for that norm is rotund, we deduce that the family $\{R_K\}_{K \subset \{1,\ldots,d\}}$ is strictly Birkhoff orthogonal. As Item 2 implies Item 4 in Proposition 8, we conclude that the norm $\| \cdot \|$ is orthant-strictly monotonic. \hfill \Box

3 Generalized top-\(k\) and \(k\)-support norms

In \S 3.1, we introduce \textit{generalized top-\(k\) and \(k\)-support norms} that are constructed from a source norm, and we provide various examples. In \S 3.2, we establish properties valid for any source norm, whereas, in \S 3.3 we establish properties valid when the source norm is orthant-monotonic, making thus the connection with the previous Sect. 2.

Source norm. Let $\| \cdot \|$ be a norm on $\mathbb{R}^d$, that we will call the \textit{source norm}.

3.1 Definition and examples

We introduce \textit{generalized top-\(k\) and \(k\)-support norms} that are constructed from the source norm $\| \cdot \|$.

\textbf{Definition 11} For $k \in \{1,\ldots,d\}$, we call \textit{generalized top-\(k\) norm} (associated with the source norm $\| \cdot \|$) the norm defined by

$$
\|x\|_{(k)}^{tn} = \sup_{|K| \leq k} \|x_K\|, \quad \forall x \in \mathbb{R}^d,
$$

where we recall that $x_K$ is the vector which coincides with $x$, except for the components outside of $K$ that are zero.

We call \textit{generalized \(k\)-support norm} the dual norm of the generalized top-\(k\) norm, denoted by $\| \cdot \|_{(k)}^{\text{sn}}$:

$$
\| \cdot \|_{(k)}^{\text{sn}} = (\| \cdot \|_{(k)}^{tn})^*.
$$

The notation $\sup_{|K| \leq k}$ is a shorthand for $\sup_{K \subset \{1,\ldots,d\}, |K| \leq k}$. It is easily verified that $\| \cdot \|_{(k)}^{tn}$ indeed is a norm, for all $k \in \{1,\ldots,d\}$.

We provide examples of generalized top-\(k\) and \(k\)-support norms in the case of permutation invariant monotonic source norms and of $\ell_p$ source norms.

\footnote{We use the symbol $\ast$ in the superscript to indicate that the generalized \(k\)-support norm $\| \cdot \|_{(k)}^{\text{sn}}$ is a dual norm.}
The case of permutation invariant monotonic source norms. Letting $x \in \mathbb{R}^d$ and $\nu$ be a permutation of $\{1, \ldots, d\}$ such that $|x_{\nu(1)}| \geq |x_{\nu(2)}| \geq \cdots \geq |x_{\nu(d)}|$, we note $x^\dagger = ([x_{\nu(1)}], [x_{\nu(2)}], \ldots, [x_{\nu(d)}])$.

The proof of the following Lemma is easy.

**Lemma 12** Let $\|\cdot\|$ be a norm on $\mathbb{R}^d$. Then, if the norm $\|\cdot\|$ is permutation invariant and monotonic, we have that $\|x\|_{(k)}^{tn} = \|x^\dagger\|_\mathbb{R}^k$, where $x^\dagger \in \mathbb{R}^k$ is given by $(x^\dagger)_{\{1, \ldots, k\}}$, for all $x \in \mathbb{R}^d$.

The case of $\ell_p$ source norms. When the norm $\|\cdot\|$ is the Euclidian norm $\|\cdot\| = \|\cdot\|_2$ of $\mathbb{R}^d$, the generalized top-$k$ norm in (18) is known under different names: the top-$(k,2)$ norm in [17], or the $2$-$k$-symmetric gauge norm [12] or the Ky Fan vector norm [13]. Indeed, in all these cases, the norm of a vector $x$ is obtained with a subvector of size $k$ having the $k$ largest components in module, because the assumptions of Lemma 12 are satisfied.

More generally, when the norm $\|\cdot\|$ is the $\ell_p$-norm $\|\cdot\|_p$, for $p \in [1, \infty]$, the assumptions of Lemma 12 are also satisfied, as $\ell_p$-norms are permutation invariant and monotonic. Therefore, we obtain that the corresponding generalized top-$k$ norm $(\|\cdot\|_p)_{(k)}^{tn}$ has the expression $(\|\cdot\|_p)_{(k)}^{tn}(x) = \sup_{|K| \leq k} \|x_K\|_p = \|x^\dagger_{\{1, \ldots, k\}}\|_p$, for all $x \in \mathbb{R}^d$. Thus, we have obtained that the generalized top-$k$ norm associated with the $\ell_p$-norm is the norm $(\cdot)_{\{1, \ldots, k\}}^\dagger_p$: we call it top-$(k,p)$ norm — to follow the naming convention of [17] where top-$(k,1)$ and top-$(k,2)$ were used — and we denote it by $\|\cdot\|_{k,p}^{tn}$. Notice that $(\|\cdot\|_\infty)_{(k)}^{tn} = \|\cdot\|_\infty$ for all $k$.

Now, we turn to generalized $k$-support norm as in (19). When the norm $\|\cdot\|$ is the Euclidian norm $\|\cdot\| = \|\cdot\|_2$ of $\mathbb{R}^d$, the generalized $k$-support norm is the so-called $k$-support norm [2]. In [11] Definition 21], the authors define the $k$-support $p$-norm or $(p,k)$-support norm for $p \in [1, \infty]$. They show, in [11] Corollary 22], that the dual norm $\left((\|\cdot\|_p)_{(k)}^{tn}\right)^*$ of the above top-$(k,p)$ norm is the $(q,k)$-support norm, where $1/p + 1/q = 1$. Thus, what we call the generalized $k$-support norm $(\|\cdot\|_p)_{(k)}^{sn} = \left((\|\cdot\|_p)_{(k)}^{tn}\right)^*$, associated with the $\ell_p$-norm is the $(q,k)$-support norm, that we denote $\|\cdot\|_{q,k}^{sn}$. Table II provides a summary.

### 3.2 General properties

We establish properties of generalized top-$k$ and $k$-support norms, valid for any source norm, that will be useful to prove our main results in Sect. 4.

**Properties of generalized top-$k$ norms**

We denote the unit ball of the generalized top-$k$ norm $\|\cdot\|_{(k)}^{tn}$ in Definition 11 by

$$\mathbb{B}_{(k)}^{tn} = \{x \in \mathbb{R}^d \mid \|x\|_{(k)}^{tn} \leq 1\} , \; k = 1, \ldots, d .$$

(20)

**Proposition 13**

- For $k \in \{1, \ldots, d\}$, the generalized top-$k$ norm $\|\cdot\|_{tn(k)}$ (in Definition 17) has unit ball
  \[
  B_{tn(k)} = \overline{co}\left( \bigcup_{|K| \leq k} \pi_K(S_{\nu}) \right),
  \]
  where $\overline{co}(S)$ denotes the closed convex hull of a subset $S \subset \mathbb{R}^d$.
- We have the inequality, for all $x \in \mathbb{R}^d$:
  \[
  \|x\| \leq \|x\|_{tn(d)}.
  \]
- The sequence \(\{\|\cdot\|_{tn(j)}\}_{j=1,\ldots,d}\) of generalized top-$k$ norms in (18) is nondecreasing, in the sense that the following inequalities hold true, for all $x \in \mathbb{R}^d$:
  \[
  \|x\|_{tn(1)} \leq \cdots \leq \|x\|_{tn(j)} \leq \|x\|_{tn(j+1)} \leq \cdots \leq \|x\|_{tn(d)}.
  \]
- The sequence \(\{B_{tn(j)}\}_{j=1,\ldots,d}\) of units balls of the generalized top-$k$ norms in (20) is nonincreasing, in the sense that the following inclusions hold true:
  \[
  B_{tn(d)} \subset \cdots \subset B_{tn(j+1)} \subset B_{tn(j)} \subset \cdots \subset B_{tn(1)}.
  \]

Proof.
• For any $x \in \mathbb{R}^d$, we have

\[ \|x\|_{tn}^{(k)} = \sup_{|K| \leq k} \|x_K\| \]  

(by definition (18) of the generalized top-$k$ norm $\|\cdot\|_{tn}^{(k)})$

\[ = \sup_{|K| \leq k} \sigma_{S_*}(x_K) \]  

(by (11a))

\[ = \sup_{|K| \leq k} \sup_{y \in S_*} \langle x_K, y \rangle \]  

(by definition of the support function $\sigma_{S_*}$)

\[ = \sup_{|K| \leq k} \sup_{y \in S_*} \langle x, \pi_K(y) \rangle \]  

(by the self-duality property (6) of the projection mapping $\pi_K$)

\[ = \sup_{|K| \leq k} \sup_{y' \in \pi_K(S_*)} \langle x, y' \rangle \]  

(by definition of the support function $\sigma_{\pi_K(S_*)}$)

\[ = \sigma_{\pi_K(S_*)}(x) \]  

(as the support function turns a union of sets into a supremum)

\[ = \sigma_{\bigcup_{|K| \leq k} \pi_K(S_*)}(x) \]  

(by [4, Prop. 7.13])

and we conclude that $\mathbb{B}^{tn}_{(k)} = \sigma_{\bigcup_{|K| \leq k} \pi_K(S_*)}$ by (11a). Thus, we have proved (21).

• From the very definition (18) of the generalized top-$d$ norm $\|\cdot\|_{tn}^{(d)}$, we get (22). Indeed, for all $x \in \mathbb{R}^d$, we have:

\[ \|x\|_{tn}^{(d)} = \sup_{|K| \leq d} \|x_K\| \geq \|x_{\{1, \ldots, d\}}\| = \|x\| . \]

• The inequalities (23) between norms easily derive from the very definition (18) of the generalized top-$k$ norms $\|\cdot\|_{tn}^{(k)}$.

• The inclusions (24) between unit balls directly follow from the inequalities (23) between norms.

This ends the proof. □

Properties of generalized $k$-support norms

We denote the unit ball of the generalized $k$-support norm $\|\cdot\|_{sn*}^{(k)}$ in Definition 11 by

\[ \mathbb{B}^{sn*}_{(k)} = \left\{ y \in \mathbb{R}^d \mid \|y\|_{sn*}^{(k)} \leq 1 \right\} , \ k = 1, \ldots, d . \]  

(25)

Proposition 14

• We have the inequality, for all $y \in \mathbb{R}^d$:

\[ \|y\|_{sn*}^{(k)} \leq \|y\|_* . \]  

(26)
The sequence \( \{ \| \cdot \|_{(j)}^{\text{sn}} \} \) of generalized \( k \)-support norms in (19) is nonincreasing, in the sense that the following inequalities hold true, for all \( y \in \mathbb{R}^d \):

\[
\| y \|_{(d)}^{\text{sn}} \leq \cdots \leq \| y \|_{(j+1)}^{\text{sn}} \leq \| y \|_{(j)}^{\text{sn}} \leq \cdots \leq \| y \|_{(1)}^{\text{sn}}. 
\] (27)

The sequence \( \{ \mathbb{B}_{(j)}^{\text{sn}} \} \) of units balls of the generalized \( k \)-support norms in (25) is nondecreasing, in the sense that the following inclusions hold true:

\[
\mathbb{B}_{(1)}^{\text{sn}} \subset \cdots \subset \mathbb{B}_{(j)}^{\text{sn}} \subset \mathbb{B}_{(j+1)}^{\text{sn}} \subset \cdots \subset \mathbb{B}_{(d)}^{\text{sn}}. 
\] (28)

**Proof.**

- From the inequality (22) between norms, we deduce the inequality (26) between dual norms, by the definition (9) of a dual norm.
- The inequalities in (27) easily derive from the inclusions (28).
- The inclusions (28) directly follow from the inclusions (24) and from (11b) as \( \mathbb{B}_{(k)}^{\text{sn}} = (\mathbb{B}_{(k)}^{tn})^\circ \), the polar set of \( \mathbb{B}_{(k)}^{tn} \).
  
  This ends the proof. \( \square \)

### 3.3 Properties under orthant-monotonicity

We establish properties of generalized top-\( k \) and \( k \)-support norms, valid when the source norm is orthant-monotonic, which will be useful to prove our main results in Sect. 4.

**Proposition 15**

1. Let \( k \in \{0, 1, \ldots, d\} \). If the source norm \( \| \cdot \| \) is orthant-monotonic, then
   - the generalized top-\( k \) norm has the expression
     \[
     \| x \|_{(k)}^{tn} = \sup_{|K| \leq k} \sigma_{\mathbb{R}_K \cap S_*} (x), \quad \forall x \in \mathbb{R}^d, 
     \] (29)
     where \( S_* \) is the unit sphere of the dual norm \( \| \cdot \|_* \) as in (10a),
   - the unit ball of the \( k \)-support norm is given by
     \[
     \mathbb{B}_{(k)}^{\text{sn}} = \overline{\mathbb{C} \left( \bigcup_{|K| \leq k} (\mathbb{R}_K \cap S_*) \right)}. 
     \] (30)

2. The source norm \( \| \cdot \| \) is orthant-monotonic if and only if \( \| \cdot \| = \| \cdot \|_{(d)}^{tn} \) if and only if \( \| \cdot \|_* = \| \cdot \|_{(d)}^{\text{sn}} \).

3. If the source norm \( \| \cdot \| \) is orthant-monotonic, then the generalized top-\( k \) norms and the generalized \( k \)-support norms are orthant-monotonic.
Proof.

1. We suppose that the source norm $\|\cdot\|$ is orthant-monotonic. Let $k \in \{1, \ldots, d\}$.
   - We prove (29). For any $x \in \mathbb{R}^d$, we have
     \[
     \|x\|_{tn}^{(k)} = \sup_{|K| \leq k} \|x_K\| \quad \text{(by definition (18) of the generalized top-k norm)}
     \]
     \[
     = \sup_{|K| \leq k} \|x_K\|_* \quad \text{(as any norm is equal to its bidual norm by (11d))}
     \]
     \[
     = \sup_{|K| \leq k} (\|\cdot\|_*)_{\cdot,K}(x_K) \quad \text{(by Definition 1 of the the (\cdot,K)-norm)}
     \]
     \[
     = \sup_{|K| \leq k} (\|\cdot\|_*)_{\cdot,K}(x_K)
     \]
     by Item 3 in Proposition 6 because, as the norm $\|\cdot\|$ is orthant-monotonic, so is also the dual norm $\|\cdot\|_*$ (equivalence between Item 1 and Item 2 in Proposition 6)
     \[
     = \sup_{|K| \leq k} \sigma_{\mathcal{R}_K \cap \mathcal{S}_*}(x_K) \quad \text{(by (11b) applied to $\|\cdot\|_*$ with $x_K \in \mathcal{R}_K$)}
     \]
     \[
     = \sup_{|K| \leq k} \sigma_{\mathcal{R}_K \cap \mathcal{S}_*}(x) \quad \text{by the self-duality property (6) of the projection mapping $\pi_K$, and by definition (5) of the subspace $\mathcal{R}_K$.}
     \]
   - We prove (30). Indeed, by (29), we have that $\|\cdot\|_{tn}^{(k)} = \sup_{|K| \leq k} \sigma_{\mathcal{R}_K \cap \mathcal{S}_*}$. As $\sup_{|K| \leq k} \sigma_{\mathcal{R}_K \cap \mathcal{S}_*} = \sigma_{\bigcup_{|K| \leq k} (\mathcal{R}_K \cap \mathcal{S}_*)}$, we have just established that $\|\cdot\|_{tn}^{(k)} = \sigma_{\bigcup_{|K| \leq k} (\mathcal{R}_K \cap \mathcal{S}_*)}$. On the other hand, by (11a) we have that $\|\cdot\|_{tk}^{(k)} = \sigma_{\mathcal{B}_{tn}^*(\mathcal{K})}$ since, by Definition 11, the $k$-support norm is the dual norm of the top-k norm. Then, by [1 Prop. 7.13], we deduce that $\sigma_{\mathcal{B}_{tn}^*(\mathcal{K})} = \sigma_{\mathcal{B}_{tn}^*(\mathcal{K} \cap \mathcal{S}_*)}$. As the unit ball $\mathcal{B}_{tn}^*(\mathcal{K})$ in (25) is closed and convex, we immediately obtain (30).

2. First, let us observe that, from the very definition (18) of the generalized top-d norm $\|\cdot\|_{tn}^{(d)}$, and by (22), we have, for all $x \in \mathbb{R}^d$:
   \[
   \|x\|_{tn}^{(d)} = \|x\| \iff \sup_{|K| \leq d} \|x_K\| = \|x\| \iff \|x_K\| \leq \|x\|, \forall K \subset \{1, \ldots, d\}. \quad (31)
   \]
   Now, we turn to prove Item 2 as two reverse implications.
   - Suppose that the source norm $\|\cdot\|$ is orthant-monotonic, and let us prove that $\|x\|_{tn}^{(d)} = \|x\|$. By Item 7 in Proposition 6, we get that $\|x_K\| \leq \|x\|$, for all $K \subset \{1, \ldots, d\}$, hence $\|x\|_{tn}^{(d)} = \|x\|$, for all $x \in \mathbb{R}^d$ by (31).
   - Suppose that $\|x\|_{tn}^{(d)} = \|x\|$ and let us prove that the source norm $\|\cdot\|$ is orthant-monotonic. By (31), we have that $\|x_J\| \leq \|x\|$, for all $x \in \mathbb{R}^d$ and all $J \subset \{1, \ldots, d\}$. This gives, in particular, $\|x_{K \cap J}\| = \|x_K\| \leq \|x_K\|$; if $J \subset K$, we deduce that $\|x_J\| \leq \|x_K\|$. Thus, Item 7 in Proposition 6 holds true, and we obtain that the source norm $\|\cdot\|$ is orthant-monotonic.
We end the proof by taking the dual norms of both sides of the equality \( \| \cdot \| = \| \cdot \|^{\text{tn}}_{(d)} \), yielding \( \| \cdot \|_* = \| \cdot \|^{\text{sn}}_{(d)} \) by (19).

3. The generalized top-\( k \)-norm in (18) is the supremum of the subfamily, when \(|K| \leq k\), of the seminorms \( \| \pi_K(\cdot) \|_K \). As already mentioned, the definition of orthant-monotonic norms can be extended to seminorms. With this extension, it is easily seen that the seminorms \( \| \pi_K(\cdot) \|_K \) are orthant-monotonic as soon as the source norm \( \| \cdot \| \) is orthant-monotonic. Therefore, if the source norm \( \| \cdot \| \) is orthant-monotonic, so is the supremum in (18), thanks to the property claimed right after the Definition 3: the supremum of a family of orthant-monotonic seminorms is an orthant-monotonic seminorm. Thus, we have established that the generalized top-\( k \)-norm in (18) is orthant-monotonic. We deduce that its dual norm, the generalized \( k \)-support norm \( \| \cdot \|^{\text{sn}}_{(k)} \) in (19), is orthant-monotonic. Indeed, the dual norm of an orthant-monotonic norm \( \| \cdot \| \) is orthant-monotonic, as proved in [8, Theorem 2.23] (equivalence between Item 1 and Item 2 in Proposition 6).

This ends the proof. \( \square \)

The proof of the following Proposition 16 relies on Lemma 17 and its Corollary 18.

**Proposition 16** If the source norm \( \| \cdot \| \) is orthant-monotonic and if the normed space \( (\mathbb{R}^d, \| \cdot \|) \) is strictly convex — that is, the unit ball \( \mathbb{B}_* \) of the dual norm \( \| \cdot \|_* \) is rotund — then we have

\[
\ell_0^{\leq k} \cap \mathbb{S}_* = \mathbb{B}^{\text{sn}}_{(k)} \cap \mathbb{S}_*, \quad \forall k \in \{0, 1, \ldots, d\},
\]

where \( \ell_0^{\leq k} \) is the level set in (4) of the \( \ell_0 \) pseudonorm in (2), where \( \mathbb{S}_* \) in (10a) is the unit sphere of the dual norm \( \| \cdot \|_* \), and where \( \mathbb{B}^{\text{sn}}_{(k)} \) in (25) is the unit ball of the generalized \( k \)-support norm \( \| \cdot \|^{\text{sn}}_{(k)} \).

**Proof.** First, let us observe that the level set \( \ell_0^{\leq k} \) in (4) is closed because the pseudonorm \( \ell_0 \) is lower semi continuous. Then, we get

\[
\ell_0^{\leq k} \cap \mathbb{S}_* = \overline{\text{co}}(\ell_0^{\leq k} \cap \mathbb{S}_*) \cap \mathbb{S}_*,
\]

(by Corollary 18 because \( \ell_0^{\leq k} \cap \mathbb{S}_* \subset \mathbb{S}_* \) and is closed, and because the unit ball \( \mathbb{B}_* \) is rotund)

\[
= \overline{\text{co}}\left( \bigcup_{|K| \leq k} (\mathcal{R}_K \cap \mathbb{S}_*) \right) \cap \mathbb{S}_* \quad \text{(as } \ell_0^{\leq k} = \bigcup_{|K| \leq k} \mathcal{R}_K \text{ by (7))}
\]

\[
= \mathbb{B}^{\text{sn}}_{(k)} \cap \mathbb{S}_*,
\]

as \( \overline{\text{co}}\left( \bigcup_{|K| \leq k} (\mathcal{R}_K \cap \mathbb{S}_*) \right) = \mathbb{B}^{\text{sn}}_{(k)} \) by (30) because the source norm \( \| \cdot \| \) is orthant-monotonic.

This ends the proof. \( \square \)

**Lemma 17** Let \( \| \cdot \| \) be a norm on \( \mathbb{R}^d \). Let \( \tilde{\mathbb{S}} \) be a subset of \( \text{extr}(\mathbb{B}) \subset \mathbb{S} \), the set of extreme points of \( \mathbb{B} \). If \( A \) is a subset of \( \tilde{\mathbb{S}} \), then \( A = \text{co}(A) \cap \tilde{\mathbb{S}} \). If \( A \) is a closed subset of \( \tilde{\mathbb{S}} \), then \( A = \overline{\text{co}}(A) \cap \tilde{\mathbb{S}} \).

19
Proof. We first prove that $A = \text{co}(A) \cap \tilde{S}$ when $A \subset \tilde{S}$. Since $A \subset \text{co}(A)$ and $A \subset \tilde{S}$, we immediately get that $A \subset \text{co}(A) \cap \tilde{S}$. To prove the reverse inclusion, we first start by proving that $\text{co}(A) \cap \tilde{S} \subset \text{extr}(\text{co}(A))$, the set of extreme points of $\text{co}(A)$.

The proof is by contradiction. Suppose indeed that there exists $x \in \text{co}(A) \cap \tilde{S}$ and $x \notin \text{extr}(\text{co}(A))$. Then, by definition of an extreme point, we could find $y \in \text{co}(A)$ and $z \in \text{co}(A)$, distinct from $x$, and such that $x = \lambda y + (1 - \lambda)z$ for some $\lambda \in ]0, 1[$. Notice that necessarily $y \neq z$ (because, else, we would have $x = y = z$ which would contradict $y \neq x$ and $z \neq x$). By assumption $A \subset \tilde{S}$, we deduce that $\text{co}(A) \subset \text{co}(\tilde{S}) \subset \text{co}(S) = \mathbb{B} = \{x \in \mathbb{R}^d \mid \|x\| \leq 1\}$, the unit ball, and therefore that $\|y\| \leq 1$ and $\|z\| \leq 1$. If $y$ or $z$ were not in $\tilde{S}$ — that is, if either $\|y\| < 1$ or $\|z\| < 1$ — then we would obtain that $\|x\| \leq \lambda \|y\| + (1 - \lambda)\|z\| < 1$ since $\lambda \in ]0, 1[$; we would thus arrive at a contradiction since $x$ could not be in the sphere $S$ and thus not in $\tilde{S}$. Thus, both $y$ and $z$ must be in $\mathbb{S}$, and we have a contradiction. Indeed, by assumption that $\tilde{S}$ is a subset of $\text{extr}(S)$, no $x \in \tilde{S}$ can be obtained as a convex combination of $y \in S\setminus\{x\}$ and $z \in S\setminus\{x\}$, with $y \neq z$.

Hence, we have proved by contradiction that $\text{co}(A) \cap \tilde{S} \subset \text{extr}(\text{co}(A))$. We can conclude using the fact that $\text{extr}(\text{co}(A)) \subset A$, because the convex closure operation cannot generate new extreme points, as proved in [9, Exercice 6.4].

Now, we consider the case where the subset $A$ of $\tilde{S}$ is closed. Using the first part of the proof we have that $A = \text{co}(A) \cap \tilde{S}$. Now, $A$ is closed by assumption and bounded since $A \subset \tilde{S} \subset S$. Thus, $A$ is a compact subset of $\mathbb{R}^d$ and, in a finite dimensional space, we get that $\text{co}(A)$ is compact [15, Theorem 17.2], thus closed. We conclude that $A = \text{co}(A) \cap \tilde{S} = \text{co}(A) \cap \tilde{S} = \text{co}(A) \cap \mathbb{S}$, where the last equality comes from [4, Prop. 3.46].

This ends the proof. \(\square\)

If the unit ball $\mathbb{B}$ is rotund, we then have that $S = \text{extr}(\mathbb{B})$, and we can apply Lemma [17] with $\tilde{S} = S$ to obtain the following corollary.

Corollary 18 Let $\|\cdot\|$ be a norm on $\mathbb{R}^d$. Suppose that the unit ball of the norm $\|\cdot\|$ is rotund. If $A$ is a subset of the unit sphere $S$, then $A = \text{co}(A) \cap S$. If $A$ is a closed subset of $S$, then $A = \text{co}(A) \cap S$.

4 Graded sequences of norms

Finally, we introduce the notion of sequences of norms that are, increasingly or decreasingly, strictly or not, graded with respect to the $\ell_0$ pseudonorm: in a sense, the monotone sequence detects the number of nonzero components of a vector in $\mathbb{R}^d$ when it becomes stationary. Then, we prove that, when the source norm is orthant-strictly monotonic, the sequence of induced generalized top-$k$ norms is strictly increasingly graded. We also show that, when the source norm is orthant-monotonic and the normed space $\mathbb{R}^d$ is strictly convex when equipped with the dual norm, the sequence of induced generalized $k$-support norms is strictly decreasingly graded.

Definitions of graded sequences of norms.
Definition 19 We say that a sequence \( \{\|\cdot\|_k\}_{k=1}^d \) of norms on \( \mathbb{R}^d \) is increasingly graded with respect to the \( \ell_0 \) pseudonorm if, for any \( x \in \mathbb{R}^d \), one of the three following equivalent statements holds true.

1. We have the implication, for any \( l = 1, \ldots, d \),
\[
\ell_0(x) = l \Rightarrow \|x\|_1 \leq \cdots \leq \|x\|_{l-1} \leq \|x\|_l = \cdots = \|x\|_d.
\]
(33a)

2. The sequence \( k \in \{1, \ldots, d\} \mapsto \|x\|_k \) is nondecreasing and we have the implication, for any \( l = 1, \ldots, d \),
\[
\ell_0(x) \leq l \Rightarrow \|x\|_l = \|x\|_d.
\]
(33b)

3. The sequence \( k \in \{1, \ldots, d\} \mapsto \|x\|_k \) is nondecreasing and we have the inequality
\[
\ell_0(x) \geq \min \left\{ k \in \{1, \ldots, d\} \mid \|x\|_k = \|x\|_d \right\}.
\]
(33c)

We say that a sequence \( \{\|\cdot\|_k\}_{k=1}^d \) of norms on \( \mathbb{R}^d \) is strictly increasingly graded with respect to the \( \ell_0 \) pseudonorm if, for any \( x \in \mathbb{R}^d \), one of the three following equivalent statements holds true.

1. We have the equivalence, for any \( l = 1, \ldots, d \),
\[
\ell_0(x) = l \iff \|x\|_1 \leq \cdots \leq \|x\|_{l-1} < \|x\|_l = \cdots = \|x\|_d.
\]
(34a)

2. The sequence \( k \in \{1, \ldots, d\} \mapsto \|x\|_k \) is nondecreasing and we have the equivalence, for any \( l = 1, \ldots, d \),
\[
\ell_0(x) \leq l \iff \|x\|_l = \|x\|_d \left( \iff \|x\|_l \geq \|x\|_d \right).
\]
(34b)

3. The sequence \( k \in \{1, \ldots, d\} \mapsto \|x\|_k \) is nondecreasing and we have the equality
\[
\ell_0(x) = \min \left\{ k \in \{1, \ldots, d\} \mid \|x\|_k = \|x\|_d \right\}.
\]
(34c)

Definition 20 We say that a sequence \( \{\|\cdot\|_k\}_{k=1}^d \) of norms on \( \mathbb{R}^d \) is decreasingly graded with respect to the \( \ell_0 \) pseudonorm if, for any \( y \in \mathbb{R}^d \), one of the three following equivalent statements holds true.

1. We have the implication, for any \( l = 1, \ldots, d \),
\[
\ell_0(y) = l \Rightarrow \|y\|_1 \geq \cdots \geq \|y\|_{l-1} \geq \|y\|_l = \cdots = \|y\|_d.
\]
(35a)
2. The sequence \( k \in \{1, \ldots, d\} \mapsto \|y\|_k \) is nonincreasing and we have the implication, for any \( l = 1, \ldots, d \),
\[
\ell_0(y) \leq l \Rightarrow \|y\|_l = \|y\|_d .
\] (35b)

3. The sequence \( k \in \{1, \ldots, d\} \mapsto \|x\|_k \) is nonincreasing and we have the inequality
\[
\ell_0(x) \geq \min \left\{ k \in \{1, \ldots, d\} \mid \|y\|_k = \|y\|_d \right\}.
\] (35c)

We say that a sequence \( \{\|\cdot\|_k\}_{k=1,\ldots,d} \) of norms on \( \mathbb{R}^d \) is strictly decreasingly graded with respect to the \( \ell_0 \) pseudonorm if, for any \( y \in \mathbb{R}^d \) and \( l = 1, \ldots, d \), one of the three following equivalent statements holds true.

1. We have the equivalence
\[
\ell_0(y) = l \iff \|y\|_1 \geq \cdots \geq \|y\|_{l-1} > \|y\|_l = \cdots = \|y\|_d .
\] (36a)

2. The sequence \( k \in \{1, \ldots, d\} \mapsto \|y\|_k \) is nonincreasing and we have the equivalence
\[
\ell_0(y) \leq l \iff \|y\|_l = \|y\|_d \quad (\iff \|y\|_l \leq \|y\|_d) .
\] (36b)

3. The sequence \( k \in \{1, \ldots, d\} \mapsto \|x\|_k \) is nonincreasing and we have the equality
\[
\ell_0(x) = \min \left\{ k \in \{1, \ldots, d\} \mid \|y\|_k = \|y\|_d \right\}.
\] (36c)

The property of orthant-strict monotonicity for norms, as introduced in Definition 7, proves especially relevant for the \( \ell_0 \) pseudonorm, as the following Propositions 21 and 23 show.

### Sufficient conditions for increasingly graded sequence of generalized top-\( k \) norms.

**Proposition 21**

- If the norm \( \|\cdot\| \) is orthant-monotonic, then the nondecreasing sequence \( \{\|\cdot\|_{(l)}^{tn}\}_{j=1,\ldots,d} \) of generalized top-\( k \) norms in (18) is increasingly graded with respect to the \( \ell_0 \) pseudonorm, that is,
\[
\ell_0(x) \leq l \Rightarrow \|x\|_{(l)}^{tn} = \|x\|_{(d)}^{tn} , \quad \forall x \in \mathbb{R}^d , \quad \forall l = 0, 1, \ldots, d .
\]

- If the norm \( \|\cdot\| \) is orthant-strictly monotonic, then the nondecreasing sequence \( \{\|\cdot\|_{(l)}^{tn}\}_{j=1,\ldots,d} \) of generalized top-\( k \) norms in (18) is strictly increasingly graded with respect to the \( \ell_0 \) pseudonorm, that is,
\[
\ell_0(x) \leq l \iff \|x\|_{(l)}^{tn} = \|x\|_{(d)}^{tn} , \quad \forall x \in \mathbb{R}^d , \quad \forall l = 0, 1, \ldots, d .
\]
Proof.

- We suppose that the norm \( \| \cdot \| \) is orthant-monotonic. As the sequence \( \{ \| \cdot \|^{tn}_{(j)} \}_{j=1, \ldots, d} \) of generalized top-k norms in (13) is nondecreasing by the inequalities (23), it suffices to show (33b) — that is, \( \ell_0(x) \leq l \Rightarrow \|x\|^{tn}_{(d)} = \|x\|^{tn}_{(l)} \) — to prove that the sequence is increasingly graded with respect to the \( \ell_0 \) pseudonorm.

For this purpose, we consider \( x \in \mathbb{R}^d \), we put \( L = \text{supp}(x) \) and we suppose that \( \ell_0(x) = |L| \leq l \).

We will show that \( \|x\|^{tn}_{(d)} = \|x\|^{tn}_{(l)} \). Since \( x = x_L \), we have \( \|x\| = \|x_L\| = \|x_L\|_L \leq \|x\|^{tn}_{(l)} \), by the very definition (18) of the generalized top-l norm \( \| \cdot \|^{tn}_{(l)} \).

We suppose that the norm \( \| \cdot \|_{\ell} \) stationary for \( k \) by definition (18) of the generalized top-\( k \) pseudonorm. We will show that \( \|x\|^{tn}_{(k)} \) holds true for the sequence \( \{ \| \cdot \|^{tn}_{(j)} \}_{j=1, \ldots, d} \), it is easily seen that it suffices to show that

\[
\ell_0(x) = l \Rightarrow \|x\|^{tn}_{(1)} < \cdots < \|x\|^{tn}_{(l-1)} < \|x\|^{tn}_{(l)} = \|x\|^{tn}_{(l+1)} = \cdots = \|x\|^{tn}_{(d)}, \quad \forall x \in \mathbb{R}^d.
\]

We consider \( x \in \mathbb{R}^d \). We put \( L = \text{supp}(x) \) and we suppose that \( \ell_0(x) = |L| = l \). As the norm \( \| \cdot \| \) is orthant-strictly monotonic, it is orthant-monotonic, so that the equalities \( \|x\|^{tn}_{(1)} = \|x\|^{tn}_{(l+1)} = \cdots = \|x\|^{tn}_{(d)} \) above hold true (as just established in the first part of the proof). Therefore, there only remains to prove that \( \|x\|^{tn}_{(1)} < \cdots < \|x\|^{tn}_{(l-1)} < \|x\|^{tn}_{(l)} \). Now, for any \( k \in \{1, \ldots, l-1\} \), we have

\[
\|x\|^{tn}_{(k)} = \sup_{|K| \leq k} \|x_K\| = \sup_{|K| \leq k} \|x_{K \cap L}\| = \sup_{|K| \leq k, K \subseteq L} \|x_K\| = \sup_{|K| \leq k, K \subseteq L} \|x_K\| < \sup_{|K| \leq k, K \subseteq L} \|x_K'\| = \sup_{|J| \leq k+1, J \subseteq L} \|x_J\| \leq \|x\|^{tn}_{(k+1)}
\]

where, with any subset \( K \subseteq L \) of indices with \( |K| \leq k \), we associate a subset \( K' \subseteq L \) with \( |K'| = k+1 \) by adding to \( K \) a number \( k+1 - |K| \geq 1 \) of indices in the nonempty set \( L \setminus K \), whose cardinal is \( |L| - |K| = l - |K| \geq k+1 - |K| \); now, since the norm \( \| \cdot \| \) is orthant-strictly monotonic, using Item 3 in Proposition 8, we obtain that \( \|x_K\| > \|x_K'\| \) because, by construction, \( K \subseteq K' \) and \( x_K \neq x_{K'} \)

\[
\leq \sup_{|J| \leq k+1, J \subseteq L} \|x_J\| \quad \text{(as all the subsets} K' \text{ are such that} K' \subseteq L \text{ and} |K'| = k+1) \leq \|x\|^{tn}_{(k+1)}
\]

by definition (18) of the generalized top-\( k+1 \) norm (in fact the last inequality is easily shown to be an equality as \( x_L = x \)). Thus, for any \( k \in \{1, \ldots, l-1\} \), we have established that \( \|x\|^{tn}_{(k)} < \|x\|^{tn}_{(k+1)} \).

23
Proposition 22  The following statements are equivalent.

1. The dual norm $\|\cdot\|_*$ is orthant-strictly monotonic and the sequence $\left\{\|\cdot\|_{\ell_0}^{\text{tn}}(j)\right\}_{j=1,\ldots,d}$ of generalized top-$k$ norms in (18) is strictly increasingly graded with respect to the $\ell_0$ pseudonorm.

2. Both the norm $\|\cdot\|$ and the dual norm $\|\cdot\|_*$ are orthant-strictly monotonic.

Proof.

• Suppose that Item [1] is satisfied and let us show that Item [2] holds true. For this, it suffices to prove that the norm $\|\cdot\|$ is orthant-strictly monotonic.

To prove that the norm $\|\cdot\|$ is orthant-strictly monotonic, we will show that Item 3 in Proposition 8 holds true for $\|\cdot\|_{\ell_0}^{\text{tn}}$. For this purpose, we consider $x \in \mathbb{R}^d$ and $J \subseteq K \subset \{1,\ldots,d\}$ such that $x_J \neq x_K$. By definition of the $\ell_0$ pseudonorm in (2), we have $j = \ell_0(x_J) < k = \ell_0(x_K)$.

On the one hand, as the dual norm $\|\cdot\|_*$ is orthant-strictly monotonic, it is orthant-monotonic, so that the norm $\|\cdot\|$ is also orthant-monotonic, as proved in [8, Theorem 2.23] (equivalence between Item 1 and Item 2 in Proposition 6). As a consequence, so are the norms in the sequence $\left\{\|\cdot\|_{\ell_0}^{\text{tn}}(j)\right\}_{j=1,\ldots,d}$ by Item 3 in Proposition 15, and we get that $\|x_J\|_{\ell_0}^{\text{tn}}(k-1) \leq \|x_K\|_{\ell_0}^{\text{tn}}(k-1)$, in particular, by the equivalence between Item 1 and Item 7 in Proposition 6.

On the other hand, since, by assumption, the sequence $\left\{\|\cdot\|_{\ell_0}^{\text{tn}}(j)\right\}_{j=1,\ldots,d}$ of dual coordinate-$k$ norms is strictly increasingly graded with respect to the $\ell_0$ pseudonorm, we have by (34a) that, on the one hand, $\|x_J\|_{\ell_0}^{\text{tn}}(1) \leq \cdots \leq \|x_J\|_{\ell_0}^{\text{tn}}(j-1) < \|x_J\|_{\ell_0}^{\text{tn}}(j) = \cdots = \|x_J\|_{\ell_0}^{\text{tn}}(d) = \|x_J\|$, because $j = \ell_0(x_J)$, and, on the other hand, $\|x_J\|_{\ell_0}^{\text{tn}}(1) \leq \cdots \leq \|x_K\|_{\ell_0}^{\text{tn}}(k-1) < \|x_K\|_{\ell_0}^{\text{tn}}(k) = \cdots = \|x_K\|_{\ell_0}^{\text{tn}}(d) = \|x_K\|$, because $k = \ell_0(x_K)$. Since $j < k$, we deduce that $\|x_J\| = \|x_J\|_{\ell_0}^{\text{tn}}(j) = \|x_J\|_{\ell_0}^{\text{tn}}(k-1) \leq \|x_K\|_{\ell_0}^{\text{tn}}(k-1) < \|x_K\|_{\ell_0}^{\text{tn}}(k) = \|x_K\|$, and therefore that $\|x_J\| < \|x_K\|$. Thus, Item 3 in Proposition 8 holds true for $\|\cdot\|_{\ell_0}^{\text{tn}}$, so that the dual norm $\|\cdot\|$ is orthant-strictly monotonic. Hence, we have shown that Item [2] is satisfied.

• Suppose that Item [2] is satisfied and let us show that Item [1] holds true.

Since the norm $\|\cdot\|$ is orthant-strictly monotonic, it has been proved in Proposition 21 that the sequence $\left\{\|\cdot\|_{\ell_0}^{\text{tn}}(j)\right\}_{j=1,\ldots,d}$ is strictly increasingly graded with respect to the $\ell_0$ pseudonorm. Hence, Item [1] holds true.

This ends the proof.

Sufficient conditions for decreasingly graded sequence of generalized $k$-support norms.

Proposition 23
• If the source norm \( \| \cdot \| \) is orthant-monotonic, then the nonincreasing sequence \( \{ \| \cdot \|^{|s\mathbf{n}|}(j) \} \) of generalized \( k \)-support norms in (19) is decreasingly graded with respect to the \( \ell_0 \) pseudonorm, that is,
\[
\ell_0(y) \leq l \Rightarrow \|y\|^{|s\mathbf{n}|}(l) = \|y\|^{|s\mathbf{n}|}(d), \quad \forall y \in \mathbb{R}^d, \quad \forall l = 0, 1, \ldots, d.
\]

• If the source norm \( \| \cdot \| \) is orthant-monotonic, and if the normed space \( (\mathbb{R}^d, \| \cdot \|_*) \) is strictly convex, then the nonincreasing sequence \( \{ \| \cdot \|^{|s\mathbf{n}|}(j) \} \) of generalized \( k \)-support norms in (19) is strictly decreasingly graded with respect to the \( \ell_0 \) pseudonorm, that is,
\[
\ell_0(y) \leq l \iff \|y\|^{|s\mathbf{n}|}(l) = \|y\|^{|s\mathbf{n}|}(d), \quad \forall y \in \mathbb{R}^d, \quad \forall l = 0, 1, \ldots, d.
\]

**Proof.**

• We suppose that the source norm \( \| \cdot \| \) is orthant-monotonic.

For any \( y \in \mathbb{R}^d \) and for any \( k \in \{1, \ldots, d\} \), we have\(^5\)
\[
y \in \ell_0^{\leq k} \Leftrightarrow y = 0 \text{ or } \frac{y}{\|y\|_*} \in \ell_0^{\leq k}.
\]
(by 0-homogeneity (3) of the \( \ell_0 \) pseudonorm, and by definition (14) of \( \ell_0^{\leq k} \))
\[
\Leftrightarrow y = 0 \text{ or } \frac{y}{\|y\|_*} \in \ell_0^{\leq k} \cap \mathbb{S}_*
\]
(as \( y/\|y\|_* \in \mathbb{S}_* \))
\[
\Leftrightarrow y = 0 \text{ or } \frac{y}{\|y\|_*} \in \bigcup_{|K| \leq k} (\mathcal{R}_K \cap \mathbb{S}_*)
\]
(as \( \ell_0^{\leq k} = \bigcup_{|K| \leq k} \mathcal{R}_K \) by (7))
\[
\Rightarrow y = 0 \text{ or } \frac{y}{\|y\|_*} \in \overline{\mathcal{S}} \left( \bigcup_{|K| \leq k} (\mathcal{R}_K \cap \mathbb{S}_*) \right)
\]
(as \( S \subset \overline{\mathcal{S}}(S) \) for any subset \( S \) of \( \mathbb{R}^d \))
\[
\Rightarrow y = 0 \text{ or } \frac{y}{\|y\|_*} \in \mathbb{B}_{\mathbf{s}\mathbf{n}}^{(k)}
\]
(by definition (25) of the unit ball \( \mathbb{B}_{\mathbf{s}\mathbf{n}}^{(k)} \))
\[
\Rightarrow \|y\|^{|s\mathbf{n}|}(k) \leq \|y\|_* = \|y\|^{|s\mathbf{n}|}(d)
\]
(where the last equality comes from Item 2 in Proposition 15 since the norm \( \| \cdot \| \) is orthant-monotonic)
\[
\Rightarrow \|y\|^{|s\mathbf{n}|}(k) = \|y\|^{|s\mathbf{n}|}(d).
\]
(as \( \|y\|^{|s\mathbf{n}|}(k) \geq \|y\|^{|s\mathbf{n}|}(d) \) by (27))

Therefore, we have obtained (35b). As the sequence \( \{ \| \cdot \|^{|s\mathbf{n}|}(j) \} \) of generalized \( k \)-support norms is nonincreasing by (27), we conclude that it is decreasingly graded with respect to the \( \ell_0 \) pseudonorm (see Definition 20).

• We suppose that the source norm \( \| \cdot \| \) is orthant-monotonic and that the normed space \( (\mathbb{R}^d, \| \cdot \|_*) \) is strictly convex.

\(^5\)In what follows, by “or”, we mean the so-called exclusive or (exclusive disjunction). Thus, every “or” should be understood as “or \( y \neq 0 \) and”.

25
For any $y \in \mathbb{R}^d$ and for any $k \in \{1, \ldots, d\}$, we have\footnote{See Footnote 3}
\[ y \in \ell_0^k \iff y = 0 \text{ or } \frac{y}{\|y\|} \in \ell_0^k \]
(by 0-homogeneity \footnote{See Footnote 3} of the $\ell_0$ pseudonorm, and by definition \footnote{See Footnote 3} of $\ell_0^k$)
\[ \iff y = 0 \text{ or } \frac{y}{\|y\|} \in \ell_0^k \cap S_* \]
(as $\frac{y}{\|y\|} \in S_*$)
\[ \iff y = 0 \text{ or } \frac{y}{\|y\|} \in B_{sn}^{\infty} \cap S_* \]
by \footnote{See Footnote 3} since the assumptions of Proposition \footnote{See Footnote 3} — namely, the source norm $\|\cdot\|$ is orthant-monotonic and the normed space $(\mathbb{R}^d, \|\cdot\|_*)$ is strictly convex — are satisfied
\[ \iff y = 0 \text{ or } \frac{y}{\|y\|} \|_{\|\cdot\|_*}^{sn} \leq 1 \]
(by definition \footnote{See Footnote 3} of the unit ball $B_{sn}^k$)
\[ \iff \|y\|_{\|\cdot\|_*}^{sn} = \|y\|_{\|\cdot\|_*}^{sn}(d) \]
(\footnote{See Footnote 3} where the last equality comes from Item \footnote{See Footnote 3}
in Proposition \footnote{See Footnote 3} since the norm $\|\cdot\|$ is orthant-monotonic)
\[ \iff \|y\|_{\|\cdot\|_*}^{sn} = \|y\|_{\|\cdot\|_*}^{sn}(d) \]
(\footnote{See Footnote 3} as $\|y\|_{\|\cdot\|_*}^{sn}(d) \geq \|y\|_{\|\cdot\|_*}^{sn}(d)$ by \footnote{See Footnote 3})

Therefore, we have obtained \footnote{See Footnote 3}. As the sequence $\{\|\cdot\|_{\|\cdot\|_*}^{sn}(j)\}_{j=1, \ldots, d}$ of generalized $k$-support norms is nonincreasing by \footnote{See Footnote 3}, we conclude that it is strictly decreasingly graded with respect to the $\ell_0$ pseudonorm (see Definition \footnote{See Footnote 3}).

This ends the proof. \hfill \square

Expressing the $\ell_0$ pseudonorm by means of the difference between two norms.
Propositions \footnote{See Footnote 3} and \footnote{See Footnote 3} open the way for so-called “difference of convex” (DC) optimization methods \footnote{See Footnote 3} to achieve sparsity. Indeed, if the source norm $\|\cdot\|$ is orthant-strictly monotonic, the level sets of the $\ell_0$ pseudonorm in \footnote{See Footnote 3} can be expressed by means of the difference between two norms (one being a generalized top-$k$ norm), as follows,
\[ \ell_0^k = \{ x \in \mathbb{R}^d \mid \|x\| = \|x\|_{\|\cdot\|_*}^{tn}(k) \} = \{ x \in \mathbb{R}^d \mid \|x\| \leq \|x\|_{\|\cdot\|_*}^{tn}(k) \} \], \forall k = 0, 1, \ldots, d \]
\footnote{See Footnote 3}(38a)
and the $\ell_0$ pseudonorm has the expression (see \footnote{See Footnote 3})
\[ \ell_0(x) = \min \left\{ k \in \{1, \ldots, d\} \mid \|x\|_{\|\cdot\|_*}^{tn}(k) = \|x\| \right\} \], \forall x \in \mathbb{R}^d \]
\footnote{See Footnote 3}(38b)
As the $\ell_p$-norm $\|\cdot\|_p$ and its dual norm are orthant-strictly monotonic for $p \in ]1, \infty[$, the formulas above hold true with the top-$(k, p)$ norms $\|\cdot\|_{\|\cdot\|_*}^{tn}(k) = \|\cdot\|_{\|\cdot\|_*}^{tn}(k, p)$ (see Table \footnote{See Footnote 3}).

If the source norm $\|\cdot\|$ is orthant-monotonic and the normed space $(\mathbb{R}^d, \|\cdot\|_*)$ is strictly convex, the level sets of the $\ell_0$ pseudonorm in \footnote{See Footnote 3} can be expressed by means of the difference between two norms (one being a generalized $k$-support norm), as follows,
\[ \ell_0^k = \{ y \in \mathbb{R}^d \mid \|y\|_{\|\cdot\|_*}^{sn} = \|y\|_* \} = \{ y \in \mathbb{R}^d \mid \|y\|_{\|\cdot\|_*}^{sn} \leq \|y\|_* \} \], \forall k = 0, 1, \ldots, d \]
\footnote{See Footnote 3}(39a)
and the $\ell_0$ pseudonorm has the expression (see (36c))

$$\ell_0(y) = \min\left\{ k \in \{1, \ldots, d\} \mid \|y\|^{*\text{sn}}_k = \|y\|_*, \forall y \in \mathbb{R}^d \right\}. \quad (39b)$$

As the $\ell_p$-norm $\|\cdot\|_p$ is orthant-monotonic and the normed space $(\mathbb{R}^d, \|\cdot\|_q)$ is strictly convex, when $p \in [1, \infty]$ and $1/p + 1/q = 1$, the formulas above hold true with the $(q, k)$-support norms $\|\cdot\|_{q,k}^{*\text{sn}} = \|\cdot\|_{q,k}^{*\text{sn}}$ for $q \in [1, \infty]$ (see Table 1).

5 Conclusion

In sparse optimization problems, one looks for solution that have few nonzero components, that is, sparsity is exactly measured by the $\ell_0$ pseudonorm. However, the mathematical expression of the $\ell_0$ pseudonorm, taking integer values, makes it difficult to handle it in optimization problems on $\mathbb{R}^d$. To overcome this difficulty, one can try to replace the embarrassing $\ell_0$ pseudonorm by nicer terms, like norms. In this paper, we contribute to this program by bringing up three new concepts for norms, and show how they prove especially relevant for the $\ell_0$ pseudonorm.

First, we have introduced a new class of ortahn-strictly monotonic norms on $\mathbb{R}^d$, inspired from orthant-monotonic norms. With such a norm, when one component of a vector moves away from zero, the norm of the vector strictly grows. Thus, an orthant-strictly monotonic norm is sensitive to the support of a vector, like the $\ell_0$ pseudonorm. Second, we have extended already known concepts of top-$k$ and $k$-support norms to sequences of generalized top-$k$ and $k$-support norms, generated from any source norm (and not only the Euclidian norm or the $\ell_p$ norms). Third, we have introduced the notion of sequences of norms that are, increasingly or decreasingly, strictly or not, graded with respect to the $\ell_0$ pseudonorm. A graded sequence detects the number of nonzero components of a vector in $\mathbb{R}^d$ when the sequence becomes stationary.

With these three notions, we have proved that, when the source norm is orthant-strictly monotonic, the sequence of induced generalized top-$k$ norms is strictly increasingly graded. We have also shown that, when the source norm is orthant-monotonic and that the normed space $\mathbb{R}^d$ is strictly convex when equipped with the dual norm, the sequence of induced generalized $k$-support norms is strictly decreasingly graded.

These results — summarized in Table 2 — open the way for so-called “difference of convex” (DC) optimization methods to achieve sparsity. Indeed, the level sets of the $\ell_0$ pseudonorm can be expressed by means of the difference between norms, taken from an increasingly or decreasingly graded sequence of norms. And we provide a way to generate such sequences from any source norm that has properties related to orthant-strict monotonicity, going beyond the Euclidian source norm case and, more generally, beyond the $\ell_p$ norms case.

Table 2: Table of results. It reads by columns as follows: to obtain that \( \{ \|\cdot\|_{\text{tn}} \} \) \( j = 1, \ldots, d \) is increasingly strictly graded (column 4), it suffices that \( \|\cdot\| \) be orthant-strictly monotonic (the only checkmark ✓ in column 4); to obtain that \( \{ \|\cdot\|_{\text{tn}} \} \) \( j = 1, \ldots, d \) is increasingly graded (columns 2 and 3), it suffices that either \( \|\cdot\| \) be orthant-monotonic (the only checkmark ✓ in column 2) or \( \|\cdot\| \) be orthant-monotonic (the only checkmark ✓ in column 3); to obtain that \( \{ \|\cdot\|_{\text{sn}} \} \) \( j = 1, \ldots, d \) is decreasingly strictly graded (columns 7 and 8), it suffices either that \( \|\cdot\| \) be orthant-monotonic and that \( (\mathbb{R}^d, \|\cdot\|_*) \) be strictly convex (two checkmarks ✓ in column 7) or that \( \|\cdot\| \) be orthant-monotonic and that \( (\mathbb{R}^d, \|\cdot\|_*) \) be strictly convex (two checkmarks ✓ in column 8).
