MATCHING NUMBERS AND DIMENSION OF EDGE IDEALS

AYANA HIRANO AND KAZUNORI MATSUDA

ABSTRACT. Let $G$ be a finite simple graph on the vertex set $V(G) = \{x_1, \ldots, x_n\}$ and match($G$), min-match($G$) and ind-match($G$) the matching number, minimum matching number and induced matching number of $G$, respectively. Let $K[V(G)] = K[x_1, \ldots, x_n]$ denote the polynomial ring over a field $K$ and $I(G) \subset K[V(G)]$ the edge ideal of $G$. The relationship between these graph-theoretic invariants and ring-theoretic invariants of the quotient ring $K[V(G)]/I(G)$ has been studied. In the present paper, we study the relationship between match($G$), min-match($G$), ind-match($G$) and dim$K[V(G)]/I(G)$.

INTRODUCTION

Let $G = (V(G), E(G))$ be a finite simple graph (i.e. a finite graph with no loop and no multiple edge) on the vertex set $V(G) = \{x_1, \ldots, x_n\}$ with the edge set $E(G)$. A subset $M = \{e_1, \ldots, e_s\} \subset E(G)$ is said to be a matching of $G$ if, for all $e_i$ and $e_j$ with $i \neq j$ belonging to $M$, one has $e_i \cap e_j = \emptyset$. A matching $M$ of $G$ is maximal if $M \cup \{e\}$ cannot be a matching of $G$ for all $e \in E(G) \setminus M$. A matching $M = \{e_1, \ldots, e_s\} \subset E(G)$ is said to be an induced matching of $G$ if for all $e_i$ and $e_j$ with $i \neq j$ belonging to $M$, there is no edge $e \in E(G)$ with $e \cap e_i \neq \emptyset$ and $e \cap e_j \neq \emptyset$. The matching number match($G$), the minimum matching number min-match($G$) and the induced matching number ind-match($G$) of $G$ are defined as follows respectively:

$$\text{match}(G) = \max\{|M| : M \text{ is a matching of } G\};$$
$$\text{min-match}(G) = \min\{|M| : M \text{ is a maximal matching of } G\};$$
$$\text{ind-match}(G) = \max\{|M| : M \text{ is an induced matching of } G\}.$$

It is known that ind-match($G$) ≤ min-match($G$) ≤ match($G$) ≤ 2min-match($G$) holds for all finite simple graph $G$ ([4 Proposition 2.1]). It is also known that there exists a finite connected simple graph $G_{a,b,c}$ with ind-match($G_{a,b,c}$) = $a$, min-match($G_{a,b,c}$) = $b$ and match($G_{a,b,c}$) = $c$ for all positive integers $a, b, c$ satisfying $1 \leq a \leq b \leq c \leq 2b$ ([4, Theorem 2.3]). A classification of finite connected simple graphs $G$ with ind-match($G$) = min-match($G$) = match($G$) is given ([11 Theorem 1], [3 Remark 0.1]). Such graphs are studied in [3, 6, 11] from a viewpoint of commutative algebra. In addition, finite simple graphs $G$ with ind-match($G$) = min-match($G$) are also studied in [4].

Key words and phrases. edge ideal, induced matching number, minimum matching number, matching number, independent set.
Let $G = (V(G), E(G))$ be a finite simple graph on the vertex set $V(G) = \{x_1, \ldots, x_n\}$ with the edge set $E(G)$. Let $K[V(G)] = K[x_1, \ldots, x_n]$ be the polynomial ring in $n = |V(G)|$ variables over a field $K$ with each $\deg x_i = 1$. The *edge ideal* of $G$ is the ideal

$$I(G) = (x_ix_j : \{x_i, x_j\} \in E(G)) \subset K[V(G)].$$

Edge ideals of finite simple graphs have been studied by many researcher, see [2, 10, 14] and their references. Let $\reg(G) = \reg(K[V(G)]/I(G))$, $\deg h(G) = \deg h(K[V(G)]/I(G))$ and $\dim(G) = \dim K[V(G)]/I(G)$ denote the regularity, the degree of the $h$-polynomial (see [5, p.312]) and the dimension of the quotient ring $K[V(G)]/I(G)$, respectively. In general, $\deg h(G) \leq \dim(G)$ holds. Moreover, $\reg(G) = \deg h(G)$ holds if $K[V(G)]/I(G)$ is Cohen-Macaulay ([14 Corollary B.4.1]). It is known that there exists a finite connected simple graph $G_{r,s}$ with $\reg(G_{r,s}) = r$ and $\deg h(G_{r,s}) = s$ for all integers $r,s \geq 1$ ([7, Theorem 3.1]).

Recently, the relationship between graph-theoretic invariants $\match(G)$, $\ind-match(G)$, $\min-match(G)$ and ring-theoretic invariants of the quotient ring $K[V(G)]/I(G)$ has been studied. As previous results,

- [9, 13] $\ind-match(G) \leq \reg(G) \leq \min-match(G) \leq \match(G)$;
- [11] Theorem 11] there is no finite connected simple graph $G$ with $\ind-match(G) = 1$ and $\reg(G) = \min-match(G) = \match(G) = r$ for all $r \geq 3$;
- [5] Theorem 0.1] there exists a finite connected simple graph $G_{a,r,s}$ satisfying $\ind-match(G_{a,r,s}) = a$, $\reg(G_{a,r,s}) = r$ and $\deg h(G_{a,r,s}) = s$ for all integers $a, r, s$ with $1 \leq a \leq r$ and $s \geq 1$.

In the present paper, we study the relationship between $\match(G)$, $\min-match(G)$, $\ind-match(G)$ and $\dim K[V(G)]/I(G)$. We will prove that

**Theorem 0.1.** Let $a, b, c, d$ be positive integers. Then the following assertions are equivalent:

1. there exists a finite connected simple graph $G_{a,b,c,d}$ with $\ind-match(G_{a,b,c,d}) = a$, $\min-match(G_{a,b,c,d}) = b$, $\match(G_{a,b,c,d}) = c$ and $\dim(G_{a,b,c,d}) = d$;
2. $1 \leq a \leq b \leq c \leq 2b$ and $d \geq \max\{a, 2(c-b)\}$. 

**1. Preparation for Theorem 0.1**

In order to prove Theorem 0.1, we will prepare several lemmata in this section.

Let $G = (V(G), E(G))$ be a finite simple graph on the vertex set $V(G) = \{x_1, \ldots, x_n\}$ with the edge set $E(G)$. Given any subset $W \subset V(G)$, the *induced subgraph* of $G$ on $W$, denoted by $G_W$, is the graph on $V(G_W) = W$ with $E(G_W) = \{\{x_i, x_j\} : i, j \in W\}$. A subset $S \subset V(G)$ is an *independent set* of $G$ if $\{x_i, x_j\} \notin E(G)$ for all $x_i, x_j \in S$. Note that the empty set $\emptyset$ is an independent set of $G$. It is known that

**Lemma 1.1.** $\dim(G) = \max\{|S| : S \text{ is an independent set of } G\}$. 

Let us recall the definition of $S$-suspension (see [5, p.313]) of $G$. Let $S \subset V(G)$ be an independent set of $G$. Note that $0 \leq |S| \leq \dim(G)$ by Lemma [11]. The graph $G^S$ is defined by

- $V(G^S) = V(G) \cup \{x_{n+1}\}$, where $x_{n+1}$ is a new vertex.
- $E(G^S) = E(G) \cup \{\{x_i,x_{n+1}\} : x_i \not\in S\}$.

We call $G^S$ the $S$-suspension of $G$. Note that $G^S$ coincides with the suspension [8, p.141] of $G$ in usual sense. The following lemma mentions the induced matching number and the dimension of the $S$-suspension of a graph.

**Lemma 1.2** ([5 Lemma 1.5]). Let $G$ be a finite simple graph on the vertex set $V(G) = \{x_1, \ldots, x_n\}$ such that $G$ has no isolated vertices. Let $S \subset V(G)$ be an independent set of $G$. Then one has

1. \(\text{ind-match}(G^S) = \text{ind-match}(G)\).
2. \(\dim(G^S) = \begin{cases} \dim(G) & (0 \leq |S| \leq \dim(G) - 1), \\ \dim(G) + 1 & (|S| = \dim(G)). \end{cases}\)

**Remark 1.3.** In general, the $S$-suspension does not preserve the matching number and the minimum matching number. In fact, let $C_3$ be the 3-cycle on $V(C_3) = \{x_1,x_2,x_3\}$ with $E(C_3) = \{\{x_1,x_2\},\{x_2,x_3\},\{x_1,x_3\}\}$. Then $\text{match}(C_3) = \text{min-match}(C_3) = 1$ and $\text{match}(C_3^S) = \text{min-match}(C_3^S) = 2$.

Next, we give two lower bounds of $\dim(G)$.

**Lemma 1.4.** Let $G = (V(G), E(G))$ be a finite simple graph. Then

1. $\dim(G) \geq \text{ind-match}(G)$.
2. $\dim(G) \geq 2(\text{match}(G) - \text{min-match}(G))$.

**Proof.** (1) Assume $\text{ind-match}(G) = a$. Let $\{\{x_1,x_{a+1}\},\{x_2,x_{a+2}\},\ldots,\{x_a,x_{2a}\}\} \subset E(G)$ be an induced matching of $G$. Then $\{x_1,x_2,\ldots,x_a\} \subset V(G)$ is an independent set of $G$. Hence one has $\dim(G) \geq a$ from Lemma [11].

(2) Assume $\text{min-match}(G) = b$ and $\text{match}(G) = c$. Then we have $|V(G)| \geq 2c$. Let $\{\{x_1,x_{b+1}\},\{x_2,x_{b+2}\},\ldots,\{x_b,x_{2b}\}\} \subset E(G)$ be a minimum matching of $G$ and put $W = \{x_1,x_2,\ldots,x_{2b}\}$. Then the induced subgraph $G_{V(G)\backslash W}$ has no edge by definition of minimum matching. Hence $V(G_{V(G)\backslash W})$ is an independent set of $G$. Since $|V(G)| \geq 2c$ and $|W| = 2b$, it follows that $|V(G_{V(G)\backslash W})| \geq 2(c - b)$. Therefore $\dim(G) \geq 2(c - b)$. \[\square\]

Let $s \geq 1$ be an integer. Let $G^\text{star}(x_v)\_s$ be the graph on $V(G^\text{star}(x_v)\_s) = \{x_1,\ldots,x_s,x_v\}$ with $E(G^\text{star}(x_v)\_s) = \{\{x_i,x_j\} : 1 \leq i \leq s\}$; see [6 Figure 2]. We call $G^\text{star}(x_v)$ the *star graph*. The star graph is the complete bipartite graph $K_{1,s}$. The *complete graph* $K_n$ is the graph on the vertex set $V(K_n) = \{x_1,\ldots,x_n\}$ with its edge set $E(K_n) = \{\{x_i,x_j\} : 1 \leq i < j \leq n\}$. Lemma [11] says that $\dim(G) = 1$ if and only if $G = K_n$. The following lemma mentions invariants of star graphs and complete graphs.
Lemma 1.5. Let \( s \geq 1 \) be an integer.

1. Let \( G_{s}^{\text{star}(x_{v})} \) be the star graph which appears as above. Then \( \text{ind-match}(G_{s}^{\text{star}(x_{v})}) = \min\text{-match}(G_{s}^{\text{star}(x_{v})}) = \text{match}(G_{s}^{\text{star}(x_{v})}) = 1 \) and \( \text{dim}(G_{s}^{\text{star}(x_{v})}) = s \).
2. Let \( K_{2s} \) be the complete graph on \( 2s \) vertices. Then \( \text{ind-match}(K_{2s}) = \text{dim}(K_{2s}) = 1 \) and \( \text{min-match}(K_{2s}) = \text{match}(K_{2s}) = s \).

Lemma 1.6. Let \( G \) be a finite simple graph on the vertex set \( V(G) \) and \( W \subset V(G) \) a subset. Then one has

1. \( \text{match}(G_{W}) \leq \text{match}(G) \).
2. \( \text{min-match}(G_{W}) \leq \text{min-match}(G) \).
3. \( \text{ind-match}(G_{W}) \leq \text{ind-match}(G) \).

Lemma 1.7. Let \( G = (V(G), E(G)) \) be a finite simple graph.

1. Assume that there exist two edges \( \{x_{i}, x_{j}\}, \{x_{i}, x_{k}\} \in E(G) \) such that \( \deg(x_{j}) = \deg(x_{k}) = 1 \). Then
   (a) \( \text{match}(G) = \text{match}(G_{V(G) \setminus \{x_{k}\}}) \).
   (b) \( \text{min-match}(G) = \text{min-match}(G_{V(G) \setminus \{x_{k}\}}) \).
   (c) \( \text{ind-match}(G) = \text{ind-match}(G_{V(G) \setminus \{x_{k}\}}) \).
2. \( \text{match}(G) \leq \left\lfloor \frac{|V(G)|}{2} \right\rfloor \).

Lemma 1.8. Let \( G \) be a finite disconnected simple graph and \( G_{1}, \ldots, G_{\ell} \) the connected components of \( G \). Then we have

1. \( \text{match}(G) = \sum_{i=1}^{\ell} \text{match}(G_{i}) \).
2. \( \text{min-match}(G) = \sum_{i=1}^{\ell} \text{min-match}(G_{i}) \).
3. \( \text{ind-match}(G) = \sum_{i=1}^{\ell} \text{ind-match}(G_{i}) \).
4. \( \text{dim}(G) = \sum_{i=1}^{\ell} \text{dim}(G_{i}) \).

2. PROOF OF THEOREM 0.1

In this section, we give a proof of Theorem 0.1.

Proof. (Proof of Theorem 0.1)

1. \( \Rightarrow \) (2): It follows from \[ [4, \text{Proposition 2.1}] \] and Lemma 1.4.

2. \( \Rightarrow \) (1): Let \( a, b, c, d \) be positive integers satisfying \( 1 \leq a \leq b \leq c \leq 2b \) and \( d \geq \max\{a, 2(c - b)\} \). Put \( V_{2b} = \{v_{1}, v_{2}, \ldots, v_{2b}\} \).
   - **Case 1:** \( a = 1, 1 \leq b = c \) and \( d \geq 1 \).

Let \( G_{1, b, b, d}^{(1)} \) be the graph such that

\[
\begin{align*}
V(G_{1, b, b, d}^{(1)}) &= V_{2b} \cup \{x_{1}, x_{2}, \ldots, x_{d-1}\} \\
E(G_{1, b, b, d}^{(1)}) &= \{\{v_{i}, v_{j}\} : 1 \leq i < j \leq 2b\} \cup \{\{v_{1}, x_{k}\} : 1 \leq k \leq d - 1\};
\end{align*}
\]

see Figure I.
Then ind-match($G_{1,b,b,d}^{(1)}$) = 1 since each edge of $G_{1,b,b,d}^{(1)}$ contains a vertex belonging to $V_{2b}$. We prove min-match($G_{1,b,b,d}^{(1)}$) = match($G_{1,b,b,d}^{(1)}$) = $b$. If $d = 1$, then $G_{1,b,b,1}^{(1)} = K_{2b}$. Hence min-match($G_{1,b,b,1}^{(1)}$) = match($G_{1,b,b,1}^{(1)}$) = $b$ by Lemma [1.5]. Assume $d > 1$. Since $K_{2b}$ is an induced subgraph of $(G_{1,b,b,d}^{(1)})$, by using Lemma [1.5][1.6] and [1.7] we have $b = \text{min-match}(K_{2b}) \leq \text{min-match}(G_{1,b,b,d}^{(1)}) \leq \text{match}(G_{1,b,b,d}^{(1)}) = \text{match}(G_{1,b,b,2}^{(1)}) \leq b$. Thus we have min-match($G_{1,b,b,d}^{(1)}$) = match($G_{1,b,b,d}^{(1)}$) = $b$. A subset \( \{x_1, \ldots, x_{d-1}, v_{2b}\} \subset V(G_{1,b,b,d}^{(1)}) \) is an independent set of $G_{1,b,b,d}^{(1)}$. Hence dim($G_{1,b,b,d}^{(1)}$) ≥ $d$ by Lemma [1.7]. Let $W \subset V(G_{1,b,b,d}^{(1)})$ with $|W| \geq d + 1$. Then $|W \cap V_{2b}| \geq 2$. Thus $W$ is not an independent set. Therefore one has dim($G_{1,b,b,d}^{(1)}$) = $d$.

- **Case 2:** $a = 1$, $1 \leq b < c \leq 2b$ and $d = 2(c - b)$.

Let $G_{1,b,c,2(c-b)}^{(2)}$ be the graph such that

\[
V(G_{1,b,c,2(c-b)}^{(2)}) = V_{2b} \cup \{x_1, x_2, \ldots, x_{2(c-b)}\},
\]

\[
E(G_{1,b,c,2(c-b)}^{(2)}) = \{\{v_i, v_j\} : 1 \leq i < j \leq 2b\} \cup \bigcup_{k=1}^{b} \bigcup_{\ell=1}^{c-b} \{\{v_k, x_\ell\}, \{v_{b+k}, x_{c-b+\ell}\}\};
\]

see Figure 2.

**Figure 1.** The graph $G_{1,b,b,d}^{(1)}$

**Figure 2.** The graph $G_{1,b,c,2(c-b)}^{(2)}$
Then $\text{ind-match}(G_{1,b,c,2(c-b)}^{(2)}) = 1$ since each edge of $G_{1,b,c,2(c-b)}^{(2)}$ contains a vertex belonging to $V_{2b}$. Since $\bigcup_{i=1}^{b} \{v_i, v_{b+i}\} \subseteq E(G_{1,b,c,2(c-b)}^{(2)})$ is a maximal matching, one has $\min\text{-match}(G_{1,b,c,2(c-b)}^{(2)}) \leq b$. Moreover, by virtue of Lemma 1.5 and 1.6 it follows that $b = \min\text{-match}(K_{2b}) \leq \min\text{-match}(G_{1,b,c,2(c-b)}^{(2)})$. Therefore $\min\text{-match}(G_{1,b,c,2(c-b)}^{(2)}) = b$. Let $E^{(2)} = \bigcup_{i=1}^{b-1} \{v_i, x_j\} \cup \bigcup_{j=1}^{2b-c} \{v_{c-b+j}, v_{c+j}\}$. Then $E^{(2)}$ is a perfect matching of $G_{1,b,c,2(c-b)}^{(2)}$ (i.e. a matching in which every vertex of $G_{1,b,c,2(c-b)}^{(2)}$ is contained in some edge belonging to $E^{(2)}$). Hence $\text{match}(G_{1,b,c,2(c-b)}^{(2)}) = c$. A subset $\{x_1, x_2, \ldots, x_{2(c-b)}\} \subseteq V(G_{1,b,c,2(c-b)}^{(2)})$ is an independent set of $G_{1,b,c,2(c-b)}^{(2)}$. Hence we have $\text{dim}(G_{1,b,c,2(c-b)}^{(2)}) \geq 2(c-b)$ by Lemma 1.1. Let $W \subseteq V(G_{1,b,c,2(c-b)}^{(2)})$ with $|W| \geq 2(c-b) + 1$. Then $|W \cap V_{2b}| \geq 1$. We may assume $v_1 \in W$. Assume that $W$ is an independent set. Since $\deg(v_1) = b + c - 1$ and $b < c$, we have $|W| \leq |V(G_{1,b,c,2(c-b)}^{(2)})| - \deg(v_1) = c - b + 1 < 2(c-b) + 1$, but this is a contradiction. Thus $W$ is not an independent set. Therefore one has $\text{dim}(G_{1,b,c,2(c-b)}^{(2)}) = 2(c-b)$.

- **Case 3:** $a = 1, 1 \leq b < c \leq 2b$ and $d > 2(c-b)$.

Let $G_{1,b,c,d}^{(3)}$ be the graph such that

\[
V(G_{1,b,c,d}^{(3)}) = V_{2b} \cup \{x_1, x_2, \ldots, x_{2(c-b)}\} \cup \{y_1, y_2, \ldots, y_{d-2(c-b)}\},
\]

\[
E(G_{1,b,c,d}^{(3)}) = \{\{v_i, v_j\} : 1 \leq i < j \leq 2b\} \cup \bigcup_{k=1}^{b} \bigcup_{\ell=1}^{c-b} \{v_{b+k}, x_{c-b+\ell}\}
\]

\[
\cup \{\{v_1, y_k\} : 1 \leq k \leq d - 2(c-b)\};
\]

see Figure 3.

![Figure 3](image)

**Figure 3.** The graph $G_{1,b,c,d}^{(3)}$

Then $\text{ind-match}(G_{1,b,c,d}^{(3)}) = 1$ since each edge of $G_{1,b,c,d}^{(3)}$ contains a vertex belonging to $V_{2b}$. By the same argument in the Case 2, we can see that $\min\text{-match}(G_{1,b,c,d}^{(3)}) = b$. 
Since \( G^{(2)}_{1,b,c,2(c-b)} \) which appears in Case 2 is an induced subgraph of \( G^{(3)}_{1,b,c,d} \), hence \( \text{match}(G^{(3)}_{1,b,c,d}) \geq c \) from Lemma 1.6. Moreover, \( G^{(3)}_{1,b,c,2(c-b)+1} \) is also an induced subgraph of \( G^{(3)}_{1,b,c,d} \) with \( |V(G^{(3)}_{1,b,c,2(c-b)+1})| = 2c+1 \). Thus, by virtue of Lemma 1.6 and 1.7, we have \( \text{match}(G^{(3)}_{1,b,c,d}) = \text{match}(G^{(3)}_{1,b,c,2(c-b)+1}) \leq c \). Therefore \( \text{match}(G^{(3)}_{1,b,c,d}) = c \). A subset \( \{x_1, x_2, \ldots, x_{2(c-b)}\} \cup \{y_1, y_2, \ldots, y_{d-2(c-b)}\} \subset V(G^{(3)}_{1,b,c,d}) \) is an independent set of \( G^{(3)}_{1,b,c,d} \). Hence \( \text{dim}(G^{(3)}_{1,b,c,d}) \geq 2(c-b) + d - 2(c-b) = d \) by Lemma 1.1. Let \( W \subset V(G^{(3)}_{1,b,c,d}) \) with \( |W| \geq d+1 \). Then there exists a vertex \( v \in V_{2b} \). Assume that \( W \) is an independent set. Since \( \text{deg}(v) \geq b + c - 1 \) and \( b < c \), we have \( |W| \leq |V(G^{(3)}_{1,b,c,d})| - \text{deg}(v) \leq d + b - c + 1 < d + 1 \), but this is a contradiction. Thus \( W \) is not an independent set. Therefore \( \text{dim}(G^{(3)}_{1,b,c,d}) = d \).

- **Case 4**: \( 1 < a \leq b = c \) and \( d = a \).

Let \( G^{(4)}_{a,b,b,a} \) be the graph such that

\[
V(G^{(4)}_{a,b,b,a}) = V_{2b} \cup \{x\},
\]
\[
E(G^{(4)}_{a,b,b,a}) = \bigcup_{i=1}^{a-1} \{v_{2i-1}, v_{2i}\} \cup \{v_j, v_k : 2a - 1 \leq j < k \leq 2b\} \cup \{v_\ell, x : 1 \leq \ell \leq 2b\};
\]

see Figure 4.

**Figure 4.** The graph \( G^{(4)}_{a,b,b,a} \)

Let \( H^{(4)} = (G^{(4)}_{a,b,b,a})_{V_{2b}} \) be the induced subgraph of \( G^{(4)}_{a,b,b,a} \) on \( V_{2b} \). Then we can regard that \( G^{(4)}_{a,b,b,a} \) is the 0-suspension of \( H^{(4)} \) and \( H^{(4)} \) is the disjoint union of \( a-1 \) \( K_2 \) and \( K_{2(b-a+1)} \). By virtue of Lemma 1.5 and 1.8 it follows that \( \text{ind-match}(G^{(4)}_{a,b,b,a}) = \text{dim}(G^{(4)}_{a,b,b,a}) = a \). Moreover, it is easy to see that \( \text{min-match}(G^{(4)}_{a,b,b,a}) = \text{match}(G^{(4)}_{a,b,b,a}) = a - 1 + b - a + 1 = b \).
**Case 5:** $1 < a \leq b = c$ and $d > a$.

Let $G_{a,b,b,d}$ be the graph such that

$$V(G_{a,b,b,d}^{(5)}) = V_{2b} \cup \{x\} \cup \{y_1, y_2, \ldots, y_{d-a-1}\},$$

$$E(G_{a,b,b,d}^{(5)}) = \bigcup_{i=1}^{a-1} \{v_{2i-1}, v_{2i}\} \cup \{v_j, v_k : 2a - 1 \leq j < k \leq 2b\}$$

$$\cup \{\{v_{2\ell-1}, x\} : 1 \leq \ell \leq a\} \cup \{\{v_1, y_m\} : 1 \leq m \leq d - a - 1\};$$

see Figure 5.

![Figure 5](image)

**Figure 5.** The graph $G_{a,b,b,d}^{(5)}$

Let $H^{(5)} = (G_{a,b,b,d}^{(5)})_{V_{2b} \cup \{x\}}$ be the induced subgraph of $G_{a,b,b,d}^{(5)}$ on $V_{2b} \cup \{x\}$. It is easy to see that \(\text{ind-match}(H^{(5)}) = a\) and \(\text{min-match}(H^{(5)}) = \text{match}(H^{(5)}) = a - 1 + b - a + 1 = b\). Hence we have \(\text{ind-match}(G_{a,b,b,d}^{(5)}) = a\) and \(\text{min-match}(G_{a,b,b,d}^{(5)}) = \text{match}(G_{a,b,b,d}^{(5)}) = b\) by virtue of Lemma \[7\]. A subset \(\{v_2, v_4, \ldots, v_{2a-2}, v_{2b}\} \cup \{x\} \cup \{y_1, y_2, \ldots, y_{d-a-1}\} \subset V(G_{a,b,b,d}^{(5)})\) is an independent set of \(G_{a,b,b,d}^{(5)}\). Hence \(\dim(G_{a,b,b,d}^{(5)}) \geq a + 1 + d - a - 1 = d\) by Lemma \[11\]. Let \(W \subset V(G_{a,b,b,d}^{(5)})\) with \(|W| \geq d + 1\). Then \(|W \cap V_{2b}| \geq a + 1\). Thus \(W\) is not an independent set. Therefore \(\dim(G_{a,b,b,d}^{(5)}) = d\).

**Case 6:** $1 < a \leq b < c \leq 2b$ and $d \geq 2(c-b) \geq a$.

Let $Y_{d-2(c-b)} = \{y_1, y_2, \ldots, y_{d-2(c-b)}\}$. Let $G_{a,b,c,d}^{(6)}$ be the graph such that

$$V(G_{a,b,c,d}^{(6)}) = V_{2b} \cup \{x_1, x_2, \ldots, x_{2(c-b)}\} \cup Y_{d-2(c-b)};$$

$$E(G_{a,b,c,d}^{(6)}) = \bigcup_{i=1}^{a-1} \{v_{2i-1}, v_{2i}\} \cup \{v_j, v_k : 2a - 1 \leq j < k \leq 2b\}$$

$$\cup \{\{v_\ell, x_m\} : 1 \leq \ell \leq 2b, 1 \leq m \leq 2(c-b)\}$$

$$\cup \{\{v_1, y_p\} : 1 \leq p \leq d - 2(c-b)\};$$

see Figure 6.
Let $S_0 = Y_{d-2(c-b)}$. For $1 \leq i \leq 2(c-b)-1$, we define $S_i = Y_{d-2(c-b)} \cup \{x_1, \ldots, x_i\}$. Then $S_i$ is independent sets and $|S_i| = d - 2(c-b) + i$ for $i = 0, 1, \ldots, 2(c-b)-1$. Let $H^{(6)}_0 = (G^{(6)}_{a,b,c,d})_{V_{2b} \cup Y_{d-2(c-b)}}$ be the induced subgraph on $V_{2b}$. We can regard that $H^{(6)}_0$ is the disjoint union of the star graph $G^{\text{star}(v_1)}_{d-2(c-b)+1}$, $(a-2)K_2$ and $K_{2(b-a+1)}$. Hence we have ind-match($H^{(6)}_0$) = $a$ and dim($H^{(6)}_0$) = $d - 2(c-b) + 1 + a - 2 + 1 = d - 2(c-b) + a$ by Lemma 1.5.

For $1 \leq j \leq 2(c-b)$, we define $H^{(6)}_j = (H^{(6)}_{j-1})^{S_j-1}$ inductively. Then, Lemma 1.2 says that ind-match($H^{(6)}_j$) = $a$ for all $j = 0, 1, \ldots, 2(c-b)$ and

$$\text{dim}(H^{(6)}_j) = \begin{cases} d - 2(c-b) + a & (0 \leq j \leq a), \\ d - 2(c-b) + j & (a + 1 \leq j \leq 2(c-b)). \end{cases}$$

Since $G^{(6)}_{a,b,c,d} = H^{(6)}_{2(c-b)}$, one has ind-match($G^{(6)}_{a,b,c,d}$) = $a$ and dim($G^{(6)}_{a,b,c,d}$) = $d$ from Lemma 1.2.

Note that $\bigcup_{i=1}^{b} \{v_{2i-1}, v_{2i}\} \subset E(G^{(6)}_{a,b,c,d})$ is a maximal matching of $G^{(6)}_{a,b,c,d}$. Hence one has min-match($G^{(6)}_{a,b,c,d}$) $\leq b$. Moreover, by virtue of Lemma 1.5 and 1.6 it follows that $b = \text{min-match}(G^{(6)}_{a,b,c,d}) = \text{min-match}(G^{(6)}_{a,b,c,d})$. Therefore min-match($G^{(6)}_{a,b,c,d}$) = $b$. Since $\bigcup_{i=1}^{2(c-b)} \{v_i, x_i\} \cup \bigcup_{j=1}^{2b-c} \{v_{2(c-b)+2j-1}, v_{2(c-b)+2j}\}$ is a matching, hence we have match($G^{(6)}_{a,b,c,d}$) $\geq 2(c-b) + 2b = c$. In addition, since $|V(G^{(6)}_{a,b,c,2(c-b)+1})| = 2c + 1$, we also have match($G^{(6)}_{a,b,c,d}$) = match($G^{(6)}_{a,b,c,2(c-b)+1}$) $\leq c$ by Lemma 1.7. Thus one has match($G^{(6)}_{a,b,c,d}$) = $c$.

**Figure 6.** The graph $G^{(6)}_{a,b,c,d}$
- **Case 7**: $1 < a \leq b < c \leq 2b$ and $d \geq a > 2(c-b)$.

Let $Y_{d-a} = \{y_1, y_2, \ldots, y_{d-a}\}$. Let $G_{a,b,c,d}^{(7)}$ be the graph such that

\[
V(G_{a,b,c,d}^{(7)}) = V_{2b} \cup \{x_1, x_2, \ldots, x_{2(c-b)}\} \cup Y_{d-a},
\]

\[
E(G_{a,b,c,d}^{(7)}) = \bigcup_{i=1}^{a-1} \{v_{2i-1}, v_{2i}\} \cup \left\{ \{v_j, v_k\} : 2a - 1 \leq j < k \leq 2b \right\}
\]

\[
\cup \left\{ \{v_\ell, x_m\} : 1 \leq \ell \leq 2b, 1 \leq m \leq 2(c-b) \right\}
\]

\[
\cup \left\{ \{v_1, y_p\} : 1 \leq p \leq d-a \right\};
\]

see Figure [7].

![Figure 7](image)

**Figure 7.** The graph $G_{a,b,c,d}^{(7)}$

Applying the same argument as in the Case 6, we have that $\text{min-match}(G_{a,b,c,d}^{(7)}) = b$ and $\text{match}(G_{a,b,c,d}^{(7)}) = c$.

Let $S_0 = Y_{d-a}$. For $1 \leq i \leq 2(c-b) - 1$, we define $S_i = Y_{d-a} \cup \{x_1, \ldots, x_i\}$. Then $S_i$ are independent sets and $|S_i| = d - a + i$ for $i = 0, 1, \ldots, 2(c-b) - 1$. In particular, $|S_i| < d$ since $a > 2(c-b)$. Let $H_0^{(7)} = (G_{a,b,c,d}^{(7)})_{V_{2b} \cup Y_{d-a}}$ be the induced subgraph on $V_{2b} \cup Y_{d-a}$.

We can regard that $H_0^{(7)}$ is the disjoint union of the star graph $G_{d-a+1}^{\text{star}(v_1)}$, $(a - 2)K_2$ and $K_{2(b-a+1)}$. Hence $\text{ind-match}(H_0^{(7)}) = a$ and $\text{dim}(H_0^{(7)}) = d - a + 1 + a - 2 + 1 = d$ by Lemma [1,5].

For $1 \leq j \leq 2(c-b)$, we define $H_j^{(7)} = (H_{j-1}^{(7)})_{S_j-1}$ inductively. Then, Lemma [1,2] says that $\text{ind-match}(H_j^{(7)}) = a$ and $\text{dim}(H_j^{(7)}) = d$ for all $j = 0, 1, \ldots, 2(c-b)$. Since $G_{a,b,c,d}^{(7)} = H_2^{(7)(c-b)}$, it follows that $\text{ind-match}(G_{a,b,c,d}^{(7)}) = a$ and $\text{dim}(G_{a,b,c,d}^{(7)}) = d$. \( \square \)

**Remark 2.1.** Let $a, b, m, n$ be non-negative integers with $m \leq n$ and $1 \leq n$. Let $G_{a,b,m,n}$ be the graph which appears in [4, p. 176]. [4, Theorem 2.3] says that $\text{ind-match}(G_{a,b,m,n}) = a + b + 1$, $\text{min-match}(G_{a,b,m,n}) = a + b + n$ and $\text{match}(G_{a,b,m,n}) = 2a + b + n + m$. Note that
\[
\dim(G_{a,b,m,n}) = \begin{cases} 
3a + 2b + 2m & (m = n), \\
3a + 2b + 2m + 1 & (m < n). 
\end{cases}
\]

In particular, we have

- Suppose that \(\text{ind-match}(G_{a,b,m,n}) = 1\). Then \(a = b = 0\). Hence

\[
\dim(G_{a,b,m,n}) = \begin{cases} 
2\{\text{match}(G_{a,b,m,n}) - \text{min-match}(G_{a,b,m,n})\} & (m = n), \\
2\{\text{match}(G_{a,b,m,n}) - \text{min-match}(G_{a,b,m,n})\} + 1 & (m < n). 
\end{cases}
\]

- Suppose that \(\text{min-match}(G_{a,b,m,n}) = \text{match}(G_{a,b,m,n})\). Then \(a = m = 0\). Hence \(\dim(G_{a,b,m,n}) = 2\text{ind-match}(G_{a,b,m,n}) - 1\).

- Suppose that \(\text{match}(G_{a,b,m,n}) = 2\text{min-match}(G_{a,b,m,n})\). Then \(b = 0\) and \(m = n\). Hence \(\dim(G_{a,b,m,n}) = 2\text{min-match}(G_{a,b,m,n}) + \text{ind-match}(G_{a,b,m,n}) - 1\).

- Suppose that \(\text{min-match}(G_{a,b,m,n}) < \text{match}(G_{a,b,m,n}) < 2\text{min-match}(G_{a,b,m,n})\). Then \(0 < a + m\) and \(m < b + n\). Hence \(\dim(G_{a,b,m,n}) \geq 2\text{ind-match}(G_{a,b,m,n})\).

**Example 2.2.**

1. Let \(a = 1, b = c = 2\) and \(d = 3\). Then

\[
G_{1,2,2,3}^{(1)} = \quad \text{Diagram}
\]

2. Let \(a = 1, b = 2, c = 3\) and \(d = 2\). Then

\[
G_{1,2,3,2}^{(2)} = \quad \text{Diagram}
\]

3. Let \(a = 1, b = 3, c = 4\) and \(d = 5\). Then

\[
G_{1,3,4,5}^{(3)} = \quad \text{Diagram}
\]
(4) Let \( a = 2, b = c = 3 \) and \( d = 2 \). Then

\[
G_{2,3,3,2}^{(4)} = \begin{array}{c}
\end{array}
\]

(5) Let \( a = 2, b = c = 3 \) and \( d = 4 \). Then

\[
G_{2,3,3,4}^{(5)} = \begin{array}{c}
\end{array}
\]

(6) Let \( a = 3, b = 4, c = 6 \) and \( d = 5 \). Then

\[
G_{3,4,6,5}^{(6)} = \begin{array}{c}
\end{array}
\]

(7) Let \( a = 3, b = 4, c = 5 \) and \( d = 4 \). Then

\[
G_{3,4,5,4}^{(7)} = \begin{array}{c}
\end{array}
\]
