Subexponential densities of compound Poisson sums and the supremum of a random walk

Takaaki Shimura 1  Toshiro Watanabe 2

Abstract We characterize the subexponential densities on \((0, \infty)\) for compound Poisson distributions on \([0, \infty)\) with absolutely continuous Lévy measures. As a corollary, we show that the class of all subexponential probability density functions on \(\mathbb{R}^+\) is closed under generalized convolution roots of compound Poisson sums. Moreover, we give an application to the subexponential density on \((0, \infty)\) for the distribution of the supremum of a random walk.

Key words : subexponential density, local subexponentiality, compound Poisson distribution, random walk

Mathematics Subject Classification : 60E07, 60G50

1 Introduction and main results

In what follows, we denote by \(\mathbb{R}\) the real line and by \(\mathbb{R}^+\) the half line \([0, \infty)\). Denote by \(\mathbb{N}\) the totality of positive integers. The symbol \(\delta_a(dx)\) stands for the delta measure at \(a \in \mathbb{R}\). Let \(\eta\) and \(\rho\) be probability distributions on \(\mathbb{R}\). We denote by \(\eta \ast \rho\) the convolution of \(\eta\) and \(\rho\) and by \(\rho^n(dx) = \delta_0(dx)\). Let \(f(x)\) and \(g(x)\) be probability density functions on \(\mathbb{R}\). We denote by \(f \otimes g(x)\) the convolution of \(f(x)\) and \(g(x)\) and by \(f^\otimes_n(x)\) \(n\)-th convolution power of \(f(x)\) for \(n \in \mathbb{N}\). For positive functions \(f_1(x)\) and \(g_1(x)\) on \([a, \infty)\) for some \(a \in \mathbb{R}\), we define the relation \(f_1(x) \sim g_1(x)\) by \(\lim_{x \to \infty} f_1(x)/g_1(x) = 1\). We use the symbols \(\mathcal{L}\) and \(\mathcal{S}\) in the sense of long-tailed and subexponential, respectively.

Definition 1.1. (i) A nonnegative measurable function \(g(x)\) on \(\mathbb{R}\) belongs to the class \(\mathcal{L}\) if \(g(x + a) \sim g(x)\) for every \(a \in \mathbb{R}\).

(ii) A probability density function \(g(x)\) on \(\mathbb{R}\) belongs to the class \(\mathcal{L}_d\) if \(g(x) \in \mathcal{L}\).

(iii) A probability density function \(g(x)\) on \(\mathbb{R}\) belongs to the class \(\mathcal{S}_d\) if \(g(x) \in \mathcal{L}_d\) and \(g^\otimes_2(x) \sim 2g(x)\).

Definition 1.2. (i) Let \(\Delta := (0, c]\) with \(c > 0\). A distribution \(\rho\) on \(\mathbb{R}\) belongs to the class \(\mathcal{L}_\Delta\) if \(\rho((x, x + c]) \in \mathcal{L}\). A distribution \(\rho\) on \(\mathbb{R}\) belongs to the class \(\mathcal{L}_\Delta\) if \(\rho \in \mathcal{L}_\Delta\) for each \(\Delta := (0, c]\) with \(c > 0\).

(ii) Let \(\Delta := (0, c]\) with \(c > 0\). A distribution \(\rho\) on \(\mathbb{R}\) belongs to the class \(\mathcal{S}_\Delta\) if \(\rho \in \mathcal{L}_\Delta\) and \(\rho^\otimes_2((x, x + c]) \sim 2\rho((x, x + c])\). A distribution \(\rho\) on \(\mathbb{R}\) belongs to the class \(\mathcal{S}_\Delta\) if \(\rho \in \mathcal{S}_\Delta\) for each \(\Delta := (0, c]\) with \(c > 0\).

Functions in the class $L$ are called long-tailed functions. Probability density functions in the classes $L_d$ and $S_d$ are called long-tailed densities and subexponential densities, respectively. Density functions, which are not necessarily probability ones, are called subexponential if their normalized probability densities are subexponential. Note that if $f(x) \in L_d$, then $\lim_{x \to \infty} f(x) = 0$ and $\lim_{x \to \infty} e^{sx} f(x) = \infty$ for every $s > 0$. See Foss et al. (2013). Distributions in the classes $S_\Delta$ and $S_{loc}$ are called $\Delta$-subexponential and locally subexponential, respectively. The class $S_\Delta$ was introduced by Asmussen et al. (2003).

Let $\mu$ be a compound Poisson distribution on $\mathbb{R}_+$ with Lévy measure $\nu$. Denote by $\mu^\ast_t$ $t$-th convolution power of $\mu$ for $t > 0$. Compound Poisson distributions have many applications. Later, we give an application to the subexponential density on $(0, \infty)$ for the distribution $\pi$ of the supremum of a random walk. The compound Poisson distribution $\pi$ is important in classical ruin theory and queueing theory. It is obvious that a compound Poisson distribution $\mu$ on $\mathbb{R}_+$ is absolutely continuous on $(0, \infty)$ if and only if its Lévy measure $\nu$ is absolutely continuous. In the following theorem and the corollary, let $\mu$ be a compound Poisson distribution on $\mathbb{R}_+$ with absolutely continuous Lévy measure $\nu$. Let $\nu(dx) = \lambda \phi(x) dx$ on $\mathbb{R}_+$ with $\lambda := \nu((0, \infty)) \in (0, \infty)$ and define a probability density function of compound Poisson sums $p_t(x)$ on $\mathbb{R}_+$ for $t > 0$ as

$$p_t(x) := (e^{\lambda t} - 1)^{-1} \sum_{n=1}^{\infty} \frac{(\lambda t)^n}{n!} \phi^{\otimes n}(x)$$

and let $p(x) := p^1(x)$. Then, we have

$$\mu^\ast_t(dx) = e^{-\lambda t} \delta_0(dx) + (1 - e^{-\lambda t})p_t(x) dx.$$  

We are concerned with the asymptotic relation between the densities $p(x)$ and $\phi(x)$. Namely, we consider the following problem.

**Problem 1** Are the following assertions equivalent?

(a) $p(x) \in S_d$.
(b) $\phi(x) \in S_d$.
(c) $\phi(x) \in L_d$ and $(1 - e^{-\lambda})p(x) \sim \lambda \phi(x)$.
(d) $\phi(x) \in L_d$ and there is $C \in (0, \infty)$ such that $p(x) \sim C \phi(x)$.

We say that the class $S_d$ of probability density functions on $\mathbb{R}_+$ is closed under generalized convolution roots of compound Poisson sums if assertion (a) implies (b). We answer Problem 1 under the assumption that $\int_0^\infty (\phi(x))^2 dx < \infty$.

**Theorem 1.1.** Let assertions (a)-(d) be the same as those in Problem 1. Then, we have the following.

(i) Assertion (a) implies (b).
(ii) Assertions (c) and (d) are equivalent and (c) implies (a).
(iii) Assume that $\int_0^\infty (\phi(x))^2 dx < \infty$. Then, (b) implies (c). Thus, under the assumption that $\int_0^\infty (\phi(x))^2 dx < \infty$, all assertions (a)-(d) are equivalent.
Remark 1.1. In the theorem above, without the assumption that \( \int_{0}^{\infty} (\phi(x))^2 dx < \infty \), assertion (b) does not necessarily imply (c). See Remark 2.1 (b) below.

Klüppelberg (1989) also obtained in her Corollary 3.3 a result analogous to Theorem 1.1 under the assumptions that \( \phi(x) \in \mathcal{L}_d \) and that \( \phi(x) \) is bounded on \( \mathbb{R}_+ \). We do not need the assumption that \( \phi(x) \in \mathcal{L}_d \) for the proof of (i) of Theorem 1.1. Thus, the class \( \mathcal{S}_d \) of probability density functions on \( \mathbb{R}_+ \) is closed under generalized convolution roots of compound Poisson sums. As an example, every compound Poisson distribution on \( \mathbb{R}_+ \) has a square integrable regularly varying density on \((0, \infty)\) if and only if so does \( \nu \).

We can characterize the precise asymptotic behavior of the distributions of compound Poisson processes with absolutely continuous Lévy measures as follows.

**Corollary 1.1.** Assume that \( \int_{0}^{\infty} (\phi(x))^2 dx < \infty \). Then, we have the following.

(i) If \( p'(x) \in \mathcal{S}_d \) for some \( t > 0 \), then \( p'(x) \in \mathcal{S}_d \) for all \( t > 0 \) and
\[
(1 - e^{-\lambda t})p'(x) \sim t(1 - e^{-\lambda})p(x).
\]

(ii) If \( p(x) \in \mathcal{L}_d \) and, for some \( t \in (0, 1) \cup (1, \infty) \), there is \( C(t) \in (0, \infty) \) such that
\[
(1 - e^{-\lambda t})p'(x) \sim C(t)(1 - e^{-\lambda})p(x),
\]
then \( C(t) = t \) and \( p(x) \in \mathcal{S}_d \).

The organization of this paper is as follows. In Sect. 2, we explain basic results on the classes \( \mathcal{S}_d \) and \( \mathcal{S}_{loc} \) as preliminaries. In Sect. 3, we prove Theorem 1.1 together with its corollary. In Sect. 4, we give an application of Theorem 1.1 to the supremum of a random walk.

## 2 Preliminaries

In this section, we give several fundamental results on the classes \( \mathcal{S}_d \) and \( \mathcal{S}_{loc} \).

**Lemma 2.1.** Let \( f(x) \) and \( g(x) \) be probability density functions on \( \mathbb{R} \).

(i) If \( f(x), g(x) \in \mathcal{L}_d \), then \( f \otimes g(x) \in \mathcal{L}_d \).

(ii) Let \( f(x) \in \mathcal{L}_d \) and define a distribution \( \rho \) on \( \mathbb{R} \) by
\[
\rho(dx) := c_0 \delta_0(dx) + (1 - c_0)f(x)dx
\]
with \( c_0 \in [0, 1] \). Then, \( \rho \in \mathcal{S}_{loc} \) if and only if \( f(x) \in \mathcal{S}_d \).

Proof. Assertion (i) is due to Theorem 4.3 of Foss et al. (2013). Next, we prove assertion (ii). Assume that \( f(x) \in \mathcal{L}_d \). Then, by (i), \( f^{\otimes \infty}(x) \in \mathcal{L}_d \) and hence \( f(x + u) \sim f(x) \) and \( f^{\otimes \infty}(x + u) \sim f^{\otimes \infty}(x) \) uniformly in \( u \in [0, c] \) with \( c > 0 \). Thus, we have, for \( x > 0 \),
\[
\rho^{\otimes \infty}((x, x + c])
\]
\[
= 2c_0(1 - c_0) \int_{0}^{c} f(x + u)du + (1 - c_0)^2 \int_{0}^{c} f^{\otimes \infty}(x + u)du
\]
\[
\sim 2c_0(1 - c_0)cf(x) + (1 - c_0)^2 cf^{\otimes \infty}(x).
\]
Hence, we see that \( \rho \in \mathcal{S}_{loc} \) if and only if \( f^{\otimes \infty}(x) \sim 2f(x) \), namely, \( f(x) \in \mathcal{S}_d \). \(\square\)
Lemma 2.2. Let $f(x)$ and $g(x)$ be probability density functions on $\mathbb{R}_+$. 

(i) If $f(x) \in \mathcal{S}_d$ and $g(x) \sim cf(x)$ with $c \in (0, \infty)$, then $g(x) \in \mathcal{S}_d$.

(ii) Assume that $f(x) \in \mathcal{S}_d$ and $\int_0^\infty (f(x))^2dx < \infty$. Then, for any $\epsilon > 0$, there are $x_0(\epsilon) > 0$ and $C(\epsilon) > 0$ such that, for all $x > x_0(\epsilon)$ and all $n \in \mathbb{N}$,

$$f^n(\epsilon)(x) \leq C(\epsilon)(1 + \epsilon)^n f(x).$$

(iii) If $f(x) \in \mathcal{S}_d$, then, for all $n \in \mathbb{N}$,

$$f^n(\epsilon)(x) \sim nf(x).$$

Proof. Assertions (i) and (iii) are due to Theorem 4.8 and Corollary 4.10 of Foss et al. (2013), respectively. Assertion (ii) is a modification of Theorem 4.11 of Foss et al. (2013).

Remark 2.1. (a) Watanabe and Yamamuro (2017) showed in Theorem 1.2 that assertion (i) is not necessarily true for probability density functions $f(x)$ and $g(x)$ on $\mathbb{R}$. Assertion (ii) is called Kesten’s bound. In Theorem 4.11 of Foss et al. (2013), boundedness of $f(x)$ on $\mathbb{R}_+$ is assumed in place of square integrability of $f(x)$ on $\mathbb{R}_+$. If $C := \int_0^\infty (f(x))^2dx < \infty$, then $f^n(\epsilon)(x) \leq C$ for all $x > 0$ and all integers $n \geq 2$. Thus, without any change, the proof of Theorem 4.11 of Foss et al. (2013) leads to assertion (ii). See Finkelshtein and Tkachov (2018) for Kesten’s bound for a probability density function $f(x)$ on $\mathbb{R}$. It needs some additional conditions for $f(x)$ on $\mathbb{R}$. Assertion (iii) goes back to Chover et al. (1973).

(b) We show that there exists a subexponential probability density function $\phi(x)$ on $\mathbb{R}_+$ which does not satisfy Kesten’s bound. Let

$$h(x) := 1_{(-e^{-1}, e^{-1})}(x)|x|^{-1}|\log |x||^{-2}$$

and let $g(x) := 2^{-1}h(x - 1)$. Then $g(x)$ is a probability density function on $\mathbb{R}_+$. We have easily, for all $n \in \mathbb{N}$,

$$\lim_{x \to \infty} g^n(x) = \infty.$$ 

Let $f(x) \in \mathcal{S}_d$ be bounded on $\mathbb{R}_+$ and let $\phi(x) := 2^{-1}f(x) + 2^{-1}g(x)$. Then we have $\phi(x) \in \mathcal{S}_d$ but Kesten’s bound does not hold for $\phi(x)$. Moreover, we see that, for all $n \in \mathbb{N}$,

$$\lim_{x \to \infty} p(x) = \lim_{x \to \infty} (e - 1)^{-1}\sum_{k=1}^{\infty} \frac{\phi^k(x)}{k!} = \infty.$$ 

Thus, assertion (b) does not necessarily imply (c) in Problem 1 without the assumption that $\int_0^\infty (\phi(x))^2dx < \infty$.

Watanabe and Yamamuro (2010) used the principal results of Watanabe (2008) on the convolution equivalence of infinitely divisible distributions on $\mathbb{R}$ to prove the following lemmas. Our main results essentially depend on those two results.

Lemma 2.3. (Theorem 1.1 of Watanabe and Yamamuro (2010)) Let $\mu$ be an infinitely divisible distribution on $\mathbb{R}_+$ with Lévy measure $\nu$. Then, the following are equivalent:

4
Lemma 3.1. We begin with a key lemma for the proof of Theorem 1.1.

(1) \( \mu \in S_{loc} \).

(2) \( \nu(1) \in S_{loc} \).

(3) \( \nu(1) \in L_{loc} \) and \( \mu((x,x+c]) \sim \nu((x,x+c]) \) for all \( c > 0 \).

(4) \( \nu(1) \in L_{loc} \) and there is \( C \in (0,\infty) \) such that \( \mu((x,x+c]) \sim C\nu((x,x+c]) \) for all \( c > 0 \).

Lemma 2.4. (Theorem 1.2 of Watanabe and Yamamuro (2010)) Let \( \mu \) be an infinitely divisible distribution on \( \mathbb{R}_+ \) with Lévy measure \( \nu \). Then, we have the following.

(i) If \( \mu^t \in S_{loc} \) for some \( t > 0 \), then \( \mu^t \in S_{loc} \) for all \( t > 0 \) and

\[
\mu^t((x,x+c]) \sim t\mu((x,x+c])
\]

for all \( t > 0 \) and for all \( c > 0 \).

(ii) If \( \mu \in S_{loc} \) and, for some \( t \in (0,1) \cup (1,\infty) \), there is \( C(t) \in (0,\infty) \) such that

\[
\mu^t((x,x+c]) \sim C(t)\mu((x,x+c])
\]  

(2.1)

for all \( c > 0 \), then \( C(t) = t \) and \( \mu \in S_{loc} \).

3 Proofs of Theorem 1.1 and its corollary

For an integrable function \( h(x) \) on \( \mathbb{R}_+ \), denote by \( L_h(t) \) the Laplace transform of \( h(x) \), namely, for \( t \in \mathbb{R}_+ \),

\[
L_h(t) := \int_0^\infty e^{-tx}h(x)dx.
\]

We begin with a key lemma for the proof of Theorem 1.1.

Lemma 3.1. Let \( \mu \) be a compound Poisson distribution with absolutely continuous Lévy measure \( \nu \). Let \( \nu(dx) = \lambda \phi(x)dx \) on \( \mathbb{R}_+ \) with \( \lambda := \nu((0,\infty)) \in (0,\infty) \) and let \( \lambda_1 \phi_1(x) := \lambda_{1(c_1,\infty)}(x)\phi(x) \) with \( c_1 > 0 \) and \( \lambda_1 := \lambda \int_{c_1}^{\infty} \phi(x)dx \). Define probability density functions \( p(x) \) and \( p_1(x) \) on \( \mathbb{R}_+ \) as

\[
p(x) := (e^\lambda - 1)^{-1} \sum_{n=1}^\infty \frac{\lambda^n}{n!} \phi^n(x)
\]

and

\[
p_1(x) := (e^{\lambda_1} - 1)^{-1} \sum_{n=1}^\infty \frac{\lambda_{1(c_1,\infty)}^n}{n!} \phi_1^n(x).
\]

Then, \( p(x) \in S_d \) implies that \( p_1(x) \in S_d \) for every \( c_1 > 0 \).

Proof. Suppose that \( p(x) \in S_d \). If \( \nu((0,c_1]) = 0 \), then \( p_1(x) = p(x) \in S_d \).

Hence, we can assume that \( \nu((0,c_1]) > 0 \). We define a strictly increasing finite sequence \( \{a_n\}_{n=0}^N \) with \( N \in \mathbb{N} \) such that \( a_0 = 0 \) and \( a_N = c_1 \). Let

\[
a_n := \exp(-\nu((a_n,\infty))) \in (0,1)
\]
for $0 \leq n \leq N$ and let
\[ \beta_n := \exp(-\nu((a_{n-1}, a_n])) \]
for $1 \leq n \leq N$. Then, we have $\alpha_n \beta_n = \alpha_{n-1}$ for $1 \leq n \leq N$. We can choose $\beta_n$ such that, for $1 \leq n \leq N$,
\[ 2^{-1} < \beta_n < 1. \tag{3.1} \]
Define probability density functions $\varphi_n(x)$ and $f_n(x)$ on $\mathbb{R}_+$ as, for $0 \leq n \leq N$,
\[ (-\log \alpha_n)\varphi_n(x) := \lambda_{1(a_n, \infty)}(x)\phi(x), \]
and
\[ (1 - \alpha_n)f_n(x) := \alpha_n \sum_{k=1}^{\infty} \frac{(-\log \alpha_n)^k}{k!} \varphi_n^k(x). \]
Moreover, define probability density functions $\psi_n(x)$ and $g_n(x)$ on $\mathbb{R}_+$ as, for $1 \leq n \leq N$,
\[ (-\log \beta_n)\psi_n(x) := \lambda_{1(a_{n-1}, a_n)}(x)\phi(x), \]
and
\[ (1 - \beta_n)g_n(x) := \beta_n \sum_{k=1}^{\infty} \frac{(-\log \beta_n)^k}{k!} \psi_n^k(x). \tag{3.2} \]
Since, for $1 \leq n \leq N$,
\[ (-\log \alpha_{n-1})\varphi_{n-1}(x) = (-\log \beta_n)\psi_n(x) + (-\log \alpha_n)\varphi_n(x), \]
we have, for $x \in \mathbb{R}_+$,
\[ (1 - \alpha_{n-1})f_{n-1}(x) = \alpha_n(1 - \beta_n)g_n(x) + \beta_n(1 - \alpha_n)f_n(x) + (1 - \alpha_n)(1 - \beta_n)f_n \otimes g_n(x). \tag{3.3} \]
We shall prove that if $f_{n-1}(x) \in S_d$ for some $1 \leq n \leq N$, then $f_n(x) \in S_d$. Suppose that $f_{n-1}(x) \in S_d$ for some $1 \leq n \leq N$. Define constants $C^*$ and $C_*$ as
\[ C^* := \limsup_{x \to \infty} \frac{f_n(x)}{f_{n-1}(x)}, \quad C_* := \liminf_{x \to \infty} \frac{f_n(x)}{f_{n-1}(x)}. \]
We find from (3.3) that
\[ 0 \leq C_* \leq C^* < \infty. \]
By virtue of Fatou’s lemma, we have
\[ \liminf_{x \to \infty} \frac{f_n \otimes g_n(x)}{f_{n-1}(x)} \geq \lim_{M \to \infty} \int_0^M \liminf_{x \to \infty} \frac{f_n(x-u)}{f_{n-1}(x-u)} \frac{f_{n-1}(x) g_n(u) du}{f_{n-1}(x)} \geq C_* \int_0^\infty g_n(u) du = C_. \]
Thus, we obtain from (3.3) that
\[ 1 - \alpha_{n-1} \geq \beta_n(1 - \alpha_n)C^* + (1 - \alpha_n)(1 - \beta_n)C_* \tag{3.4} \]
Define a probability density function $h_n(x)$ on $\mathbb{R}_+$ for $0 \leq n \leq N$ as

$$(1 - \alpha_n^2)h_n(x) := \alpha_n^2 \sum_{k=1}^{\infty} \frac{(-2 \log \alpha_n)^k}{k!} \psi_k^{\otimes n}(x).$$

Then, we have for $1 \leq n \leq N$

$$(1 - \alpha_n^2)h_n(x) \geq \alpha_n^2 \sum_{k=1}^{\infty} \frac{(-2 \log \beta_n)^k}{k!} \psi_k^{\otimes n}(x). \quad (3.5)$$

Let $M > 0$ and $K(M) := \left\lfloor \frac{M}{a_n} \right\rfloor$. Here, the symbol $[x]$ stands for the largest integer not exceeding $x \in \mathbb{R}$. Since $\psi_k^{\otimes n}(x) = 0$ for $1 \leq k \leq K(M)$ and $x > M$, we see from (3.2) and (3.5) that, for $x > M$,

$$g_n(x) \leq \frac{(1 - \alpha_{n-1}^2)\beta_n}{\alpha_{n-1}^2(1 - \beta_n)2^K(M)} h_{n-1}(x). \quad (3.6)$$

Since we assume that $f_n(x) \in S_d$, note that

$$(1 - \alpha_{n-1}^2)h_{n-1}(x) = 2\alpha_{n-1}(1 - \alpha_{n-1})f_{n-1}(x) + (1 - \alpha_{n-1})^2f_{n-1}^{2\otimes}(x)
\sim 2(1 - \alpha_{n-1})f_{n-1}(x).$$

Since $\lim_{M \to \infty} K(M) = \infty$, we obtain from (3.6) that

$$\lim_{x \to \infty} \frac{g_n(x)}{f_{n-1}(x)} = 0. \quad (3.7)$$

Let

$$f_n \otimes g_n(x) = I_1(x) + I_2(x),$$

where

$$I_1(x) := \int_0^M f_n(x - u)g_n(u)du$$

and

$$I_2(x) := \int_M^x f_n(x - u)g_n(u)du.$$

Then, we have by Fatou’s lemma

$$\limsup_{x \to \infty} \frac{I_1(x)}{f_{n-1}(x)} \leq \int_0^M \limsup_{x \to \infty} \frac{f_n(x - u)}{f_{n-1}(x - u)} \frac{f_{n-1}(x - u)}{f_{n-1}(x)} g_n(u)du \quad \quad (3.8)$$
$$\quad \quad = C^* \int_0^M g_n(u)du.$$

We find from (3.3) that, for $x > 0$,

$$f_n(x) \leq \frac{1 - \alpha_{n-1}}{\beta_n(1 - \alpha_n)} f_{n-1}(x).$$
Note from (3.7) that there is $c(M) > 0$ such that $\lim_{M \to \infty} c(M) = 0$ and $g_n(x) \leq c(M)f_{n-1}(x)$ for $x > M$. Thus, we have

$$\limsup_{x \to \infty} \frac{f_2(x)}{f_{n-1}(x)} \leq \limsup_{x \to \infty} \frac{1}{f_{n-1}(x)} \int_M^x \beta_n(1-\alpha_n) f_{n-1}(x-u) \epsilon(M)f_{n-1}(u) du$$

$$\leq \frac{\epsilon(M)(1-\alpha_{n-1})}{\beta_n(1-\alpha_n)} \lim_{x \to \infty} f_{n-1}^x \beta_n(1-\alpha_n) f_{n-1}(x)$$

$$= \frac{2\epsilon(M)(1-\alpha_{n-1})}{\beta_n(1-\alpha_n)}.$$ 

Hence, we see from (3.8) that

$$\limsup_{x \to \infty} \frac{f_n \otimes g_n(x)}{f_{n-1}(x)} \leq \lim_{M \to \infty} \left( C^* \int_0^M g_n(u) du + \frac{2\epsilon(M)(1-\alpha_{n-1})}{\beta_n(1-\alpha_n)} \right) = C^*.$$  

(3.9)

Thus, we obtain from (3.7) and (3.9) that

$$1 - \alpha_{n-1} \leq \beta_n(1-\alpha_n) C^* + (1-\alpha_n)(1-\beta_n)C^*.$$  

(3.10)

Hence, $C^* > 0$ and by (3.1), (3.4), and (3.10) we have

$$0 \geq (C^* - C_*)(1-\alpha_n)(2\beta_n - 1) \geq 0.$$ 

Thus, we have $C^* = C_* \in (0, \infty)$ and $f_n(x) \sim C^* f_{n-1}(x)$. By (i) of Lemma 2.2, we have proved that $f_n(x) \in S_d$. Since $f_0(x) = p(x) \in S_d$, we conclude that $f_N(x) = p_1(x) \in S_d$ by induction. \hfill \Box

Proof of Theorem 1.1. First, we prove assertion (i). Suppose that (a) holds. Since $\lim_{x \to \infty} p(x) = 0$, we have $\lim_{x \to \infty} \phi(x) = 0$. Choose sufficiently large $c_1 > 0$ such that $e^{\lambda_1} < 2$ with $\lambda_1 := \nu((c_1, \infty))$ and $\sup_{x > c_1} \phi(x) < \infty$. Then, we see from Lemma 3.1 that $p_1(x) \in S_d$ and $p_1(x)$ is bounded on $\mathbb{R}_+$. Noting that $0 < e^{\lambda_1} - 1 < 1$, define a function $\phi_0(x)$ on $\mathbb{R}_+$ as

$$\lambda_1 \phi_0(x) := -\sum_{n=1}^{\infty} \frac{(1 - e^{\lambda_1})^n}{n} p_1^n \phi(x).$$

Since $p_1(x) \in S_d$ and $p_1(x)$ is bounded on $\mathbb{R}_+$, we obtain from (ii) and (iii) of Lemma 2.2 that

$$\lambda_1 \phi_0(x) \sim -\sum_{n=1}^{\infty} (1 - e^{\lambda_1})^n p_1(x) = (1 - e^{-\lambda_1}) p_1(x).$$

(3.11)

Let $\tilde{\phi}_0(x) := \phi_0(x) \lor 0$. By using Remark 21.6 of Sato (2013), we have, for
\[ t \in \mathbb{R}^+, \]

\[
\lambda_1 L_{\phi_0}(t) = -\sum_{n=1}^{\infty} \frac{(1 - e^{\lambda_1})^n}{n} (L_{p_1}(t))^n
\]

\[
= \log(1 - (1 - e^{\lambda_1}) L_{p_1}(t))
\]

\[
= \log(\lim_{t \to \infty} (e^{-t x} - 1) \phi_1(x) dx)
\]

\[
= \lambda_1 L_{\phi_1}(t).
\]

Thereby, we see that \( \tilde{\phi}_0(x) := \phi_1(x) \) for a.e. \( x \in \mathbb{R}^+ \). Thus, we obtain from (3.11) and (i) of Lemma 2.2 that \( \phi_0(x) \in \mathcal{S}_d \) and \( \phi_0(x) \) is bounded on \( \mathbb{R}^+ \). Hence, by (ii) and (iii) of Lemma 2.2 and (3.11), we have

\[
\lambda_1 \phi_1(x) = (e^{\lambda_1} - 1)p_1(x) - \sum_{n=2}^{\infty} \frac{\lambda_n}{n!} \phi_0^n(x)
\]

\[
\sim (1 - e^{-\lambda_1})p_1(x).
\]

Since

\[
\phi(x) \sim \frac{\lambda_1}{\lambda} \phi_1(x) \sim \frac{1 - e^{-\lambda_1}}{\lambda} p_1(x),
\]

we find from (i) of Lemma 2.2 that \( \phi(x) \in \mathcal{S}_d \). Next, we see from Lemma 2.3 and (ii) of Lemma 2.1 that assertion (ii) is valid and from (ii) and (iii) of Lemma 2.2 that assertion (iii) is also valid.

\[ \square \]

Proof of Corollary 1.1. Assume that \( \int_{0}^{\infty} (\phi(x))^2 dx < \infty \). First, we prove assertion (i). Let \( \nu(dx) = \lambda \phi(x) dx \) with \( \lambda := \nu((0, \infty)) \in (0, \infty) \). Suppose that \( p'(x) \in \mathcal{S}_d \) for some \( t > 0 \). Then, we obtain from Theorem 1.1 that \( \phi(x) \in \mathcal{S}_d \) and hence \( p'(x) \in \mathcal{S}_d \) for all \( t > 0 \). Moreover, we find again from Theorem 1.1 that, for all \( t > 0 \),

\[
(1 - e^{-\lambda_1})p'(x) \sim t \lambda \phi(x) \sim t (1 - e^{-\lambda})p(x).
\]

Next, we prove assertion (ii). Suppose that \( p(x) \in \mathcal{S}_d \) and, for some \( t \in (0, 1) \cup (1, \infty) \), there is \( C(t) \in (0, \infty) \) such that (1.1) holds. Then, we have \( \mu \in \mathcal{L}_{loc} \) and (2.1) holds. Thus, we obtain from Lemma 2.4 that \( C(t) = t \) and \( \mu \in \mathcal{S}_{loc} \) and hence, by \( p(x) \in \mathcal{S}_d \) and (ii) of Lemma 2.1, \( p(x) \in \mathcal{S}_d \).

\[ \square \]

4 Application to the supremum of a random walk

In this section, we characterize the subexponentiality of the density on \( (0, \infty) \) for the distribution of the supremum of a random walk. For a distribution \( \rho \) on \( \mathbb{R} \), denote the tail of \( \rho \) by \( \bar{\rho}(x) := \rho((x, \infty)) \) for \( x \in \mathbb{R} \).

Definition 4.1. (i) A distribution \( \rho \) on \( \mathbb{R} \) belongs to the class \( \mathcal{L} \) if \( \bar{\rho}(x) \in \mathcal{L} \). A probability distribution \( \rho \) on \( \mathbb{R} \) is called subexponential if \( \rho \in \mathcal{L} \) and

\[
\bar{\rho}^{\alpha}(x) \sim 2 \bar{\rho}(x).
\]
The class of all subexponential distributions on $\mathbb{R}$ is denoted by $S$.

(ii) A distribution $\rho$ on $\mathbb{R}$ belongs to the class $S^*$ if $\bar{\rho}(x) > 0$ for all $x \in \mathbb{R}$, $\int_0^\infty x\rho(dx) < \infty$ and if

$$
\int_0^x \bar{\rho}(x-y)\rho(y)dy \sim 2 \int_0^\infty u\rho(du)\bar{\rho}(x).
$$

Refer to Klüppelberg (1988) for the class $S^*$. Note that the class $S^*$ is included in the class $S$. We define a function $\varphi_{\alpha,\lambda}(s)$ on $(-1/\lambda, 1/\lambda)$ for $0 < \lambda < 1$ and $\alpha > 0$ by

$$
\varphi_{\alpha,\lambda}(s) := \left(\frac{1-\lambda}{1-\lambda s}\right)^\alpha = \sum_{n=0}^\infty \frac{(\alpha + n - 1)}{\alpha - 1} \lambda^n s^n.
$$

Define by $\varphi'_{\alpha,\lambda}(s)$ the derivative of $\varphi_{\alpha,\lambda}(s)$. Let $c_0 := (1-\lambda)^\alpha$ and $\delta := -\log(1-\lambda)$.

**Lemma 4.1.** Let $0 < \lambda < 1$ and $\alpha > 0$ and let $f(x)$ be a probability density function on $\mathbb{R}_+$. Define probability density functions $p(x)$ and $\phi(x)$ on $\mathbb{R}_+$ as

$$
p(x) := \frac{c_0}{1 - c_0} \sum_{n=1}^\infty \frac{(\alpha + n - 1)}{\alpha - 1} \lambda^n f^n\otimes(x)
$$

and

$$
\phi(x) := \delta^{-1} \sum_{n=1}^\infty \frac{\lambda^n}{n} f^n\otimes(x).
$$

Then, we see, for all $x \in \mathbb{R}_+$,

$$
p(x) = (e^{\alpha\delta} - 1)^{-1} \sum_{n=1}^\infty \frac{(\alpha\delta)^n}{n!} \phi^n\otimes(x).
$$

**Proof.** Let

$$
\bar{\rho}(x) := (e^{\alpha\delta} - 1)^{-1} \sum_{n=1}^\infty \frac{(\alpha\delta)^n}{n!} \phi^n\otimes(x).
$$

Substituting (4.2) in the above equation, we have

$$
\bar{\rho}(x) = \sum_{n=1}^\infty p_n f^n\otimes(x),
$$

for some nonnegative sequence $\{p_n\}_{n=1}^\infty$ with $\sum_{n=1}^\infty p_n = 1$. Denote by $H(z)$, for $|z| \leq 1$, be the probability generating function of $\{p_n\}_{n=1}^\infty$. Then, we have

$$
H(z) = (e^{\alpha\delta} - 1)^{-1} (\exp(-\alpha \log(1-\lambda z)) - 1) = \frac{c_0}{1 - c_0} \sum_{n=1}^\infty \frac{(\alpha + n - 1)}{\alpha - 1} \lambda^n z^n.
$$

Thus, we obtain (4.3) for all $x \in \mathbb{R}_+$. \qed
Theorem 4.1. Let $0 < \lambda < 1$ and $\alpha > 0$ and let $f(x)$ be a probability density function on $\mathbb{R}_+$. Define a probability density function $p(x)$ by (4.1). Assume that $\int_0^\infty (f(x))^2dx < \infty$. Then, the following are equivalent:

(a) $p(x) \in \mathcal{S}_d$.
(b) $f(x) \in \mathcal{S}_d$.
(c) $f(x) \in \mathcal{L}_d$ and

$$(1 - c_0)p(x) \sim \varphi'_{\alpha,\lambda}(1)f(x).$$

Proof. Assume that $\int_0^\infty (f(x))^2dx < \infty$. Then, by (ii) and (iii) of Lemma 2.2, (b) implies (c). By Theorem 4.30 of Foss et al. (2013), (c) implies (b) and, by (i) of Lemma 2.2, (b) implies (a). Finally, we prove that (a) implies (b). Define a probability density functions $\phi(x)$ on $\mathbb{R}_+$ by (4.2). We find from Theorem 1.2 and Lemma 4.1 that $\phi(x) \in \mathcal{S}_d$ and from (4.2) that $\int_0^\infty (\phi(x))^2dx < \infty$. We obtain from (ii) and (iii) of Lemma 2.2 that

$$(1 - e^{-\alpha \delta})p(x) \sim \alpha \delta \phi(x). \quad (4.4)$$

Define a function $f_0(x)$ on $\mathbb{R}_+$ as

$$f_0(x) := -\lambda^{-1} \sum_{n=1}^\infty \frac{(-\delta)^n}{n!} \phi^n \otimes (x).$$

Then, we have, for $t \in \mathbb{R}_+$,

$$L_{f_0}(t) = -\lambda^{-1} \sum_{n=1}^\infty \frac{(-\delta)^n}{n!} (L_\phi(t))^n$$

$$= -\lambda^{-1} \exp(-\delta L_\phi(t)) - 1$$

$$= -\lambda^{-1} \exp(\log(1 - \lambda L_f(t))) - 1$$

$$= L_f(t).$$

Thus, we have $f_0(x) = f(x)$ for a.e. $x \in \mathbb{R}_+$. Since $\int_0^\infty (\phi(x))^2dx < \infty$, we obtain from (ii) and (iii) of Lemma 2.2 that

$$f_0(x) \sim \lambda^{-1} \delta e^{-\delta} \phi(x). \quad (4.5)$$

Hence, by (i) of Lemma 2.2, we get

$$\tilde{f}_0(x) := f_0(x) \vee 0 \in \mathcal{S}_d.$$ 

Thus, we have by (4.4) and (4.5)

$$c_0 \alpha \lambda f(x) = (1 - c_0)p(x) - c_0 \sum_{n=2}^\infty \binom{\alpha + n - 1}{\alpha - 1} \lambda^n f_0^n \otimes (x)$$

$$\sim \alpha \delta \phi(x) - (\varphi'_{\alpha,\lambda}(1) - c_0 \alpha \lambda) \delta \lambda^{-1} (1 - \lambda) \phi(x)$$

$$= c_0 \alpha \delta (1 - \lambda) \phi(x).$$

Hence, we see that

$$f(x) \sim \lambda^{-1} \delta (1 - \lambda) \phi(x),$$
and from (i) of Lemma 2.2 that \( f(x) \in \mathcal{S}_d. \) □

Next, we define the distribution \( \pi \) of the supremum of a random walk. Let \( \{X_n\}_{n=1}^\infty \) be IID random variables with common distribution \( \rho \) on \( \mathbb{R} \). Let \( \{S_n\}_{n=0}^\infty \) be a random walk on \( \mathbb{R} \) defined by \( S_0 := 0 \) and \( S_n := \sum_{k=1}^n X_k \) for \( n \geq 1 \). Let \( \pi \) be the distribution of the supremum \( M \) of \( \{S_n\} \), that is, \( M := \sup_{n \geq 0} S_n \). Define the measure \( \nu \) on \((0, \infty)\) and a quantity \( B \) as

\[
\nu(dx) := 1_{(0,\infty)}(x) \sum_{n=1}^\infty n^{-1} \rho^{n*}(dx) \tag{4.6}
\]

and

\[
B := \sum_{n=1}^\infty n^{-1} P(S_n > 0) = \nu((0,\infty)).
\]

It is well known that \( M < \infty \) a.s. if and only if \( B < \infty \) and that if \( B < \infty \), then \( \pi \) is a compound Poisson distribution on \( \mathbb{R}_+ \) with Lévy measure \( \nu \). A sufficient condition for \( M < \infty \) a.s. is that \( -\infty < E(X_1) < 0 \). Define \( \lambda \) as \( \lambda := 1 - e^{-B} \) when \( B < \infty \). Let \( Z^+ \) be the first ascending ladder height in the random walk \( \{S_n\} \) and denote the defective distribution on \( \mathbb{R}_+ \) by \( \lambda \rho^+ \). Then, \( \rho^+ \) is a distribution on \( \mathbb{R}_+ \) with \( \rho^+([0]) = 0 \). It is also well known that

\[
\pi = \sum_{n=0}^\infty (1 - \lambda) \lambda^n (\rho^+)^{n*}. \tag{4.7}
\]

The distribution \( \pi \) is important in classical ruin theory and queueing theory. See Asmussen and Albrecher (2010). Let \( Z^- \) be the first descending ladder height in the random walk \( \{S_n\} \) under the assumption that \( -\infty < E(X_1) < 0 \). We say that \( \rho \) is non-lattice if the support of \( \rho \) is not on any lattice. The following remark and the lemma are known up to now on the local subexponentiality of the distribution \( \pi \).

**Remark 4.1.** Suppose that \( -\infty < E(X_1) < 0 \) and that \( \rho \) is non-lattice.

(i) (Theorem 1 of Asmussen et al. (2002)) If \( \rho \in \mathcal{S}^* \), then we have

\[
\pi((x,x+c]) \sim \frac{c}{|E(X_1)|} \bar{\rho}(x) \tag{4.8}
\]

for all \( c > 0 \).

(ii) (Theorem 2 (b) of Foss and Zachary (2003)) If \( \rho \in \mathcal{L} \) and (4.8) holds for all \( c > 0 \), then \( \rho \in \mathcal{S}^* \).

(iii) (Lemma 3 of Asmussen et al. (2002)) If \( \rho \in \mathcal{L} \), then

\[
\rho^+((x,x+c]) \sim \frac{c}{\lambda|E(Z^-)|} \bar{\rho}(x)
\]

for all \( c > 0 \). Note that, throughout in Asmussen et al. (2002), \( \rho \in \mathcal{S}^* \) is assumed but to prove Lemma 3 they did not use \( \rho \in \mathcal{S}^* \).

**Lemma 4.2.** (Theorem 6.2 of Watanabe and Yamamuro (2010)) Suppose that \( -\infty < E(X_1) < 0 \) and that \( \rho \) is non-lattice. Then, the following are equivalent:

(1) \( \pi \in \mathcal{S}_{loc} \).
(2) $\nu(1) \in S_{\text{loc}}$.
(3) $\rho^+ \in S_{\text{loc}}$.
(4) $\rho \in S^\ast$.
(5) $\rho \in L$ and (4.8) holds.
(6) $\rho \in L$ and there is $C \in (0, \infty)$ such that $\pi((x, x + c]) \sim Cc\bar{\rho}(x)$ for all $c > 0$.

We find from (4.6) and (4.7) that $\rho$ is absolutely continuous on $(0, \infty)$ if and only if so is $\rho^+$ on $\mathbb{R}_+$. Let $\rho^+(dx) := f(x)dx$ and $\lambda := 1 - e^{-B} \in (0, 1)$. Define $p(x)$ and $\phi(x)$ on $\mathbb{R}_+$ as

$$p(x) := (1 - \lambda) \sum_{n=1}^{\infty} \lambda^{n-1} f^n(x)$$

and

$$\phi(x) := B^{-1} \sum_{n=1}^{\infty} \frac{\lambda^n}{n} f^n(x).$$

Then, we have by Lemma 4.1 with $\alpha = 1$ and $\delta = B$

$$p(x) = (e^B - 1)^{-1} \sum_{n=1}^{\infty} \frac{B^n}{n!} \phi^n(x)$$

for $x \in \mathbb{R}_+$. Moreover, $\pi$ and $\nu(0)$ are represented on $\mathbb{R}_+$ as

$$\pi(dx) = e^{-B} \delta_0(dx) + (1 - e^{-B}) p(x) dx$$

and $\nu(0)(dx) = \phi(x)dx$.

**Theorem 4.2.** Suppose that $-\infty < E(X_1) < 0$. Assume that $\rho$ is absolutely continuous on $(0, \infty)$. Let $p(x)$ and $\phi(x)$ be given by (4.9) and (4.10), respectively. Further, assume that $\int_0^\infty (p(x))^2 dx < \infty$. Then, the following are equivalent:

1. $p(x) \in S_d$.
2. $\phi(x) \in S_d$.
3. $f(x) \in S_d$.
4. $p \in S^\ast$ and $\phi(x) \in L_d$.
5. $p \in L$ and

$$(1 - e^{-B}) p(x) \sim \frac{\bar{\rho}(x)}{|E(X_1)|}.$$ 

6. $\rho \in L$ and there is $C \in (0, \infty)$ such that $(1 - e^{-B}) p(x) \sim C \bar{\rho}(x)$.

Proof. Note from (4.9) and (4.10) that the three conditions $\int_0^\infty (p(x))^2 dx < \infty$, $\int_0^\infty (\phi(x))^2 dx < \infty$, and $\int_0^\infty (f(x))^2 dx < \infty$ are equivalent. Equivalence of (1) and (2) is due to Theorem 1.1 and that of (1) and (3) is due to Theorem 4.1. Suppose that (4) holds. Then, we find from Lemma 4.2 that $\phi(x)dx \in S_{\text{loc}}$ and hence, by $\phi(x) \in L_d$ and (ii) of Lemma 2.1, (2) holds. Conversely, by Lemma 4.2, (2) implies (4). Suppose that (1) holds. Then, we obtain from Lemma 4.2 that $\rho \in L$ and

$$(1 - e^{-B}) p(x) \sim \pi((x, x + 1]) \sim \frac{\bar{\rho}(x)}{|E(X_1)|}.$$
Thus, (5) and (6) hold. Conversely, suppose that (6) holds. Then, we have $p(x) \in \mathcal{L}_d$. We see from Lemma 4.2 that $C = 1/[E(X_1)]$ and (5) holds and $\pi \in S_{loc}$. Thus, by (ii) of Lemma 2.1, $p(x) \in S_d$. Therefore, all assertions (1)-(6) are equivalent. □

Remark 4.2. Our result characterizes the absolutely continuous case. On the other hand, Korshunov (2006) discussed the non-absolutely continuous case and showed in his Theorem 4 that if $\rho \in S^*$ and the absolutely continuous part of $\rho$ is in $\mathcal{L}_d$, then assertion (5) of the above theorem holds for the absolutely continuous part of the distribution $\pi$ under an additional assumption for the singular part of $\rho$. However, he did not obtain the converse direction.
