CANONICAL CONNECTIONS AND ALGEBRAIC RICCI SOLITONS OF THREE-DIMENSIONAL LORENTZIAN LIE GROUPS

YONG WANG

Abstract. In this paper, we compute canonical connections and Kobayashi-Nomizu connections and their curvature on three-dimensional Lorentzian Lie groups with some product structure. We define algebraic Ricci solitons associated to canonical connections and Kobayashi-Nomizu connections. We classify algebraic Ricci solitons associated to canonical connections and Kobayashi-Nomizu connections on three-dimensional Lorentzian Lie groups with some product structure.

1. Introduction

The concept of the algebraic Ricci soliton was first introduced by Lauret in Riemannian case in [6]. In [6], Lauret studied the relation between solvsolitons and Ricci solitons on Riemannian manifolds. More precisely, he proved that any Riemannian solvsoliton metric is a Ricci soliton. The concept of the algebraic Ricci soliton was extended to the pseudo-Riemannian case in [7]. In [7], Batat and Onda studied algebraic Ricci solitons of three-dimensional Lorentzian Lie groups. They got a complete classification of algebraic Ricci solitons of three-dimensional Lorentzian Lie groups and they proved that, contrary to the Riemannian case, Lorentzian Ricci solitons needed not be algebraic Ricci solitons. In [8], Onda provided a study of algebraic Ricci solitons in the pseudo-Riemannian case and obtained a steady algebraic Ricci soliton and a shrinking algebraic Ricci soliton in the Lorentzian setting. In [9], Etayo and Santamaria studied some affine connections on manifolds with the product structure or the complex structure. In particular, the canonical connection and the Kobayashi-Nomizu connection for a product structure was studied. In this paper, we introduce a particular product structure on three-dimensional Lorentzian Lie groups and we compute canonical connections and Kobayashi-Nomizu connections and their curvature on three-dimensional Lorentzian Lie groups with this product structure. We define algebraic Ricci solitons associated to canonical connections and Kobayashi-Nomizu connections. We classify algebraic Ricci solitons associated to canonical connections and Kobayashi-Nomizu connections on three-dimensional Lorentzian Lie groups with this product structure.

In Section 2, We classify algebraic Ricci solitons associated to canonical connections and

2010 Mathematics Subject Classification: 53C40; 53C42.
Key words and phrases: Canonical connections; Kobayashi-Nomizu connections; algebraic Ricci solitons; three-dimensional Lorentzian Lie groups.
Kobayashi-Nomizu connections on three-dimensional unimodular Lorentzian Lie groups with the product structure. In Section 3, we classify algebraic Ricci solitons associated to canonical connections and Kobayashi-Nomizu connections on three-dimensional non-unimodular Lorentzian Lie groups with the product structure.

2. ALGEBRAIC RICCI SOLITONS ASSOCIATED TO CANONICAL CONNECTIONS AND KOBAYASHI-NOMIZU CONNECTIONS ON THREE-DIMENSIONAL UNIMODULAR LORENTZIAN LIE GROUPS

Three-dimensional Lorentzian Lie groups had been classified in \([2, 4]\) (see Theorem 2.1 and Theorem 2.2 in \([1]\)). Throughout this paper, we shall by \(\{G_i\}_{i=1,\ldots,7}\) denote the connected, simply connected three-dimensional Lie group equipped with a left-invariant Lorentzian metric \(g\) and having Lie algebra \(\{g_i\}_{i=1,\ldots,7}\). Let \(\nabla\) be the Levi-Civita connection of \(G_i\) and \(R\) its curvature tensor, taken with the convention

\[
R(X,Y)Z = \nabla_X \nabla_Y Z - \nabla_Y \nabla_X Z - \nabla_{[X,Y]} Z.
\]

The Ricci tensor of \((G_i, g)\) is defined by

\[
\rho(X,Y) = -g(R(X, e_1)Y, e_1) - g(R(X, e_2)Y, e_2) + g(R(X, e_3)Y, e_3),
\]

where \(\{e_1, e_2, e_3\}\) is a pseudo-orthonormal basis, with \(e_3\) timelike and the Ricci operator \(\text{Ric}\) is given by

\[
\rho(X,Y) = g(\text{Ric}(X), Y).
\]

We define a product structure \(J\) on \(G_i\) by

\[
J e_1 = e_1, \ J e_2 = e_2, \ J e_3 = -e_3,
\]

then \(J^2 = \text{id}\) and \(g(Je_j, Je_j) = g(e_j, e_j)\). By \([5]\), we define the canonical connection and the Kobayashi-Nomizu connection as follows:

\[
\nabla^0_X Y = \nabla_X Y - \frac{1}{2}((\nabla Y - \nabla J)JX - (\nabla Y - \nabla J)JX).
\]

We define

\[
\nabla^1_X Y = \nabla^0_X Y - \frac{1}{4}((\nabla Y - \nabla J)JX - (\nabla Y - \nabla J)JX).
\]

We define

\[
R^0(X,Y)Z = \nabla^0_X \nabla^0_Y Z - \nabla^0_Y \nabla^0_X Z - \nabla^0_{[X,Y]} Z,
\]

\[
R^1(X,Y)Z = \nabla^1_X \nabla^1_Y Z - \nabla^1_Y \nabla^1_X Z - \nabla^1_{[X,Y]} Z.
\]

The Ricci tensors of \((G_i, g)\) associated to the canonical connection and the Kobayashi-Nomizu connection are defined by

\[
\rho^0(X,Y) = -g(R^0(X, e_1)Y, e_1) - g(R^0(X, e_2)Y, e_2) + g(R^0(X, e_3)Y, e_3),
\]

\[
\rho^1(X,Y) = -g(R^1(X, e_1)Y, e_1) - g(R^1(X, e_2)Y, e_2) + g(R^1(X, e_3)Y, e_3).
\]
The Ricci operators $\text{Ric}^0$ and $\text{Ric}^1$ is given by
\begin{equation}
(2.11) \quad \rho^0(X, Y) = g(\text{Ric}^0(X), Y), \quad \rho^1(X, Y) = g(\text{Ric}^1(X), Y).
\end{equation}
Let
\begin{equation}
(2.12) \quad \tilde{\rho}^0(X, Y) = \frac{\rho^0(X, Y) + \rho^0(Y, X)}{2}, \quad \tilde{\rho}^1(X, Y) = \frac{\rho^1(X, Y) + \rho^1(Y, X)}{2},
\end{equation}
and
\begin{equation}
(2.13) \quad \tilde{\rho}^0(X, Y) = g(\tilde{\text{Ric}}^0(X), Y), \quad \tilde{\rho}^1(X, Y) = g(\tilde{\text{Ric}}^1(X), Y).
\end{equation}

**Definition 2.1.** $(G, g, J)$ is called the first (resp. second) kind algebraic Ricci soliton associated to the connection $\nabla^0$ if it satisfies
\begin{equation}
(2.14) \quad \text{Ric}^0 = c\text{Id} + D \quad \text{(resp. } \tilde{\text{Ric}}^0 = c\text{Id} + D),
\end{equation}
where $c$ is a real number, and $D$ is a derivation of $\mathfrak{g}$, that is
\begin{equation}
(2.15) \quad D[X, Y] = [DX, Y] + [X, DY] \quad \text{for } X, Y \in \mathfrak{g}.
\end{equation}
$(G, g, J)$ is called the first (resp. second) kind algebraic Ricci soliton associated to the connection $\nabla^1$ if it satisfies
\begin{equation}
(2.16) \quad \text{Ric}^1 = c\text{Id} + D \quad \text{(resp. } \tilde{\text{Ric}}^1 = c\text{Id} + D).
\end{equation}

### 2.1 Algebraic Ricci solitons of $G_1$

By (2.1) and Lemma 3.1 in $[\text{III}]$, we have for $G_1$, there exists a pseudo-orthonormal basis \{e_1, e_2, e_3\} with $e_3$ timelike such that the Lie algebra of $G_1$ satisfies
\begin{equation}
(2.17) \quad [e_1, e_2] = \alpha e_1 - \beta e_3, \quad [e_1, e_3] = -\alpha e_1 - \beta e_2, \quad [e_2, e_3] = \beta e_1 + \alpha e_2 + \alpha e_3, \quad \alpha \neq 0.
\end{equation}

**Lemma 2.2.** ([III], [III]) The Levi-Civita connection $\nabla$ of $G_1$ is given by
\begin{equation}
(2.18) \quad \nabla_{e_1}e_1 = -\alpha e_2 - \alpha e_3, \quad \nabla_{e_2}e_1 = \frac{\beta}{2} e_3, \quad \nabla_{e_3}e_1 = \frac{\beta}{2} e_2,
\end{equation}
\begin{equation}
\nabla_{e_1}e_2 = \alpha e_1 - \frac{\beta}{2} e_3, \quad \nabla_{e_2}e_2 = \alpha e_3, \quad \nabla_{e_3}e_2 = -\frac{\beta}{2} e_1 - \alpha e_3,
\end{equation}
\begin{equation}
\nabla_{e_1}e_3 = -\alpha e_1 - \frac{\beta}{2} e_2, \quad \nabla_{e_2}e_3 = \frac{\beta}{2} e_1 + \alpha e_2, \quad \nabla_{e_3}e_3 = -\alpha e_2.
\end{equation}

By (2.4) and (2.18), we have

**Lemma 2.3.** For $G_1$, the following equalities hold
\begin{equation}
(2.19) \quad \nabla_{e_1}(J)e_1 = -2\alpha e_3, \quad \nabla_{e_1}(J)e_2 = -\beta e_3, \quad \nabla_{e_1}(J)e_3 = 2\alpha e_1 + \beta e_2,
\end{equation}
\begin{equation}
\nabla_{e_2}(J)e_1 = \beta e_3, \quad \nabla_{e_2}(J)e_2 = 2\alpha e_3, \quad \nabla_{e_2}(J)e_3 = -\beta e_1 - 2\alpha e_2,
\end{equation}
\begin{equation}
\nabla_{e_3}(J)e_1 = 0, \quad \nabla_{e_3}(J)e_2 = -2\alpha e_3, \quad \nabla_{e_3}(J)e_3 = 2\alpha e_2.
By (2.4), (2.5), Lemma 2.2 and Lemma 2.3, we have

**Lemma 2.4.** The canonical connection $\nabla^0$ of $(G_1, J)$ is given by

\begin{equation}
\nabla^0_{e_1} e_1 = -\alpha e_2, \quad \nabla^0_{e_1} e_2 = \alpha e_1, \quad \nabla^0_{e_1} e_3 = 0,
\end{equation}

\begin{equation}
\nabla^0_{e_2} e_1 = 0, \quad \nabla^0_{e_2} e_2 = 0, \quad \nabla^0_{e_2} e_3 = 0,
\end{equation}

\begin{equation}
\nabla^0_{e_3} e_1 = \frac{\beta}{2} e_2, \quad \nabla^0_{e_3} e_2 = -\frac{\beta}{2} e_1, \quad \nabla^0_{e_3} e_3 = 0.
\end{equation}

By (2.7) and Lemma 2.4, we have

**Lemma 2.5.** The curvature $R^0$ of the canonical connection $\nabla^0$ of $(G_1, J)$ is given by

\begin{equation}
R^0(e_1, e_2)e_1 = (\alpha^2 + \frac{\beta^2}{2})e_2, \quad R^0(e_1, e_2)e_2 = -(\alpha^2 + \frac{\beta^2}{2})e_1, \quad R^0(e_1, e_2)e_3 = 0,
\end{equation}

\begin{equation}
R^0(e_1, e_3)e_1 = -\alpha^2 e_2, \quad R^0(e_1, e_3)e_2 = \alpha^2 e_1, \quad R^0(e_1, e_3)e_3 = 0,
\end{equation}

\begin{equation}
R^0(e_2, e_3)e_1 = \frac{\alpha \beta}{2} e_2, \quad R^0(e_2, e_3)e_2 = -\frac{\alpha \beta}{2} e_1, \quad R^0(e_2, e_3)e_3 = 0.
\end{equation}

By (2.9), (2.11) and Lemma 2.5, we get

\begin{equation}
\text{Ric}^0 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\left(\alpha^2 + \frac{\beta^2}{2}\right) & 0 & 0 \\ 0 & -\left(\alpha^2 + \frac{\beta^2}{2}\right) & 0 \\ \frac{\alpha \beta}{2} & \frac{\alpha \beta}{2} & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\end{equation}

If $(G_1, g, J)$ is the first kind algebraic Ricci soliton associated to the connection $\nabla^0$, then $\text{Ric}^0 = c\text{Id} + D$, so

\begin{equation}
\begin{cases}
De_1 = -(\alpha^2 + \frac{\beta^2}{2} + c)e_1, \\
De_2 = -(\alpha^2 + \frac{\beta^2}{2} + c)e_2, \\
De_3 = \frac{\alpha \beta}{2} e_1 + \alpha^2 e_2 - ce_3.
\end{cases}
\end{equation}

By (2.15) and (2.23), we get $\alpha^2 + c = 0, \beta = 0$. Then

**Theorem 2.6.** $(G_1, g, J)$ is the first kind algebraic Ricci soliton associated to the connection $\nabla^0$ if and only if $\alpha^2 + c = 0, \beta = 0, \alpha \neq 0$. In particular,

\begin{equation}
\text{Ric}^0 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\alpha^2 & 0 & 0 \\ 0 & -\alpha^2 & 0 \\ 0 & \alpha^2 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}, \quad D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & \alpha^2 & \alpha^2 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\end{equation}
By (2.12), (2.13) and (2.22), we have

\[ \tilde{\text{Ric}}^0 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\left(\alpha^2 + \frac{\beta^2}{2}\right) & 0 & -\frac{\alpha \beta}{2} \\ 0 & -\left(\alpha^2 + \frac{\beta^2}{2}\right) & -\frac{\alpha^2}{2} \\ \frac{\alpha \beta}{4} & \frac{\alpha^2}{2} & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}. \]  

If \((G_1, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^0\), then \(\tilde{\text{Ric}}^0 = c\text{Id} + D\), so

\[ \begin{align*}
D e_1 &= -(\alpha^2 + \frac{\beta^2}{2} + c)e_1 - \frac{\alpha \beta}{2} e_3, \\
D e_2 &= -(\alpha^2 + \frac{\beta^2}{2} + c)e_2 - \frac{\alpha^2}{2} e_3, \\
D e_3 &= \frac{\alpha \beta}{4} e_1 + \frac{\alpha^2}{2} e_2 - c e_3.
\end{align*} \]

By (2.15) and (2.26), we get \(\frac{\alpha^2}{2} + c = 0, \beta = 0\). Then

**Theorem 2.7.** \((G_1, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^0\) if and only if \(\frac{\alpha^2}{2} + c = 0, \beta = 0, \alpha \neq 0\). In particular,

\[ \tilde{\text{Ric}}^0 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\alpha^2 & 0 & 0 \\ 0 & -\alpha^2 & -\frac{\alpha^2}{2} \\ 0 & \frac{\alpha^2}{2} & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}, \quad D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\frac{\alpha^2}{2} & 0 & 0 \\ 0 & -\frac{\alpha^2}{2} & -\frac{\alpha^2}{2} \\ 0 & \frac{\alpha^2}{2} & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}. \]

By (2.6), Lemma 2.3 and Lemma 2.4, we have

**Lemma 2.8.** The Kobayashi-Nomizu connection \(\nabla^1\) of \((G_1, J)\) is given by

\[ \nabla^1_{e_1} e_1 = -\alpha e_2, \quad \nabla^1_{e_1} e_2 = \alpha e_1, \quad \nabla^1_{e_1} e_3 = 0, \]

\[ \nabla^1_{e_2} e_1 = 0, \quad \nabla^1_{e_2} e_2 = 0, \quad \nabla^1_{e_2} e_3 = \alpha e_3, \]

\[ \nabla^1_{e_3} e_1 = \alpha e_1 + \beta e_2, \quad \nabla^1_{e_3} e_2 = -\alpha e_2 - \beta e_1, \quad \nabla^1_{e_3} e_3 = 0. \]

By (2.8) and Lemma 2.8, we have

**Lemma 2.9.** The curvature \(R^1\) of the Kobayashi-Nomizu connection \(\nabla^1\) of \((G_1, J)\) is given by

\[ R^1(e_1, e_2) e_1 = \alpha \beta e_1 + (\alpha^2 + \beta^2)e_2, \quad R^1(e_1, e_2) e_2 = -(\alpha^2 + \beta^2)e_1 - \alpha \beta e_2, \quad R^1(e_1, e_2) e_3 = 0, \]

\[ R^1(e_1, e_3) e_1 = -3\alpha^2 e_2, \quad R^1(e_1, e_3) e_2 = -\alpha^2 e_1, \quad R^1(e_1, e_3) e_3 = \alpha \beta e_3, \]

\[ R^1(e_2, e_3) e_1 = -\alpha^2 e_1, \quad R^1(e_2, e_3) e_2 = \alpha^2 e_2, \quad R^1(e_2, e_3) e_3 = -\alpha^2 e_3. \]
By (2.10), (2.11) and Lemma 2.9, we get

\[
\text{Ric}^1 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\alpha^2 & 0 & \alpha \beta \\ 0 & -\alpha^2 & 0 \\ \alpha \beta & 0 & -\alpha^2 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]  

(2.30)

If \((G_1, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^1\), then \(\text{Ric}^1 = c\text{Id} + D\), so

\[
\begin{align*}
D_{e_1} &= -(\alpha^2 + \beta^2 + c)e_1 + \alpha \beta e_2 + \alpha \beta e_3, \\
D_{e_2} &= \alpha \beta e_1 - (\alpha^2 + \beta^2 + c)e_2 - \alpha^2 e_3, \\
D_{e_3} &= -\alpha \beta e_3.
\end{align*}
\]

(2.31)

By (2.15) and (2.31), we get \(\beta = 0, c = 0\). Then

**Theorem 2.10.** \((G_1, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^1\) if and only if \(\beta = 0, c = 0, \alpha \neq 0\). In particular,

\[
\text{Ric}^1 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\alpha^2 & 0 & 0 \\ 0 & -\alpha^2 & 0 \\ 0 & 0 & -\alpha^2 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}, \\
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\alpha^2 & 0 & 0 \\ 0 & -\alpha^2 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

(2.32)

By (2.12), (2.13) and (2.30), we have

\[
\widetilde{\text{Ric}}^1 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\alpha^2 & \alpha \beta & \frac{\alpha \beta \alpha}{2} \\ \alpha \beta & -\alpha^2 & \frac{\alpha^2}{2} \\ \frac{\alpha \beta \alpha}{2} & \frac{\alpha^2}{2} & -\alpha^2 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

(2.33)

If \((G_1, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^1\), then \(\widetilde{\text{Ric}}^1 = c\text{Id} + D\), so

\[
\begin{align*}
D_{e_1} &= -(\alpha^2 + \beta^2 + c)e_1 + \alpha \beta e_2 + \frac{\alpha^2}{2} e_3, \\
D_{e_2} &= \alpha \beta e_1 - (\alpha^2 + \beta^2 + c)e_2 - \frac{\alpha^2}{2} e_3, \\
D_{e_3} &= -\frac{\alpha^2}{2} e_1 + \frac{\alpha^2}{2} e_2 - \alpha \beta e_3.
\end{align*}
\]

(2.34)

By (2.15) and (2.34), we get \(\alpha^2 + c = 0, \beta = 0\). Then

**Theorem 2.11.** \((G_1, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^1\) if and only if \(\alpha^2 + c = 0, \beta = 0, \alpha \neq 0\). In particular,

\[
\widetilde{\text{Ric}}^1 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\alpha^2 & 0 & 0 \\ 0 & -\alpha^2 & -\frac{\alpha^2}{2} \\ \frac{\alpha^2}{2} & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}, \\
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\alpha^2 & 0 & 0 \\ 0 & -\alpha^2 & -\frac{\alpha^2}{2} \\ \frac{\alpha^2}{2} & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

(2.35)
2.2 Algebraic Ricci solitons of $G_2$

By (2.2) and Lemma 3.5 in [1], we have for $G_2$, there exists a pseudo-orthonormal basis $\{e_1, e_2, e_3\}$ with $e_3$ timelike such that the Lie algebra of $G_2$ satisfies

\begin{equation}
[e_1, e_2] = \gamma e_2 - \beta e_3, \quad [e_1, e_3] = -\beta e_2 - \gamma e_3, \quad [e_2, e_3] = \alpha e_1, \quad \gamma \neq 0.
\end{equation}

Lemma 2.12. ([3],[1]) The Levi-Civita connection $\nabla$ of $G_2$ is given by

\begin{equation}
\nabla_{e_1} e_1 = 0, \quad \nabla_{e_2} e_1 = -\gamma e_2 + \frac{\alpha}{2} e_3, \quad \nabla_{e_3} e_1 = \frac{\alpha}{2} e_2 + \gamma e_3,
\end{equation}

\begin{equation}
\nabla_{e_1} e_2 = (\frac{\alpha}{2} - \beta) e_3, \quad \nabla_{e_2} e_2 = \gamma e_1, \quad \nabla_{e_3} e_2 = -\frac{\alpha}{2} e_1,
\end{equation}

\begin{equation}
\nabla_{e_1} e_3 = (\frac{\alpha}{2} - \beta) e_2, \quad \nabla_{e_2} e_3 = \frac{\alpha}{2} e_1, \quad \nabla_{e_3} e_3 = \gamma e_1.
\end{equation}

By (2.4) and (2.37), we have

Lemma 2.13. For $G_2$, the following equalities hold

\begin{equation}
\nabla_{e_1} (J)e_1 = 0, \quad \nabla_{e_1} (J)e_2 = (\alpha - 2\beta) e_3, \quad \nabla_{e_1} (J)e_3 = -(\alpha - 2\beta) e_2,
\end{equation}

\begin{equation}
\nabla_{e_2} (J)e_1 = \alpha e_3, \quad \nabla_{e_2} (J)e_2 = 0, \quad \nabla_{e_2} (J)e_3 = -\alpha e_1,
\end{equation}

\begin{equation}
\nabla_{e_3} (J)e_1 = 2\gamma e_3, \quad \nabla_{e_3} (J)e_2 = 0, \quad \nabla_{e_3} (J)e_3 = -2\gamma e_1.
\end{equation}

By (2.4),(2.5), Lemma 2.12 and Lemma 2.13, we have

Lemma 2.14. The canonical connection $\nabla^0$ of $(G_2, J)$ is given by

\begin{equation}
\nabla^0_{e_1} e_1 = 0, \quad \nabla^0_{e_1} e_2 = 0, \quad \nabla^0_{e_1} e_3 = 0,
\end{equation}

\begin{equation}
\nabla^0_{e_2} e_1 = -\gamma e_2, \quad \nabla^0_{e_2} e_2 = \gamma e_1, \quad \nabla^0_{e_2} e_3 = 0,
\end{equation}

\begin{equation}
\nabla^0_{e_3} e_1 = \frac{\alpha}{2} e_2, \quad \nabla^0_{e_3} e_2 = -\frac{\alpha}{2} e_1, \quad \nabla^0_{e_3} e_3 = 0.
\end{equation}

By (2.7) and Lemma 2.14, we have

Lemma 2.15. The curvature $R^0$ of the canonical connection $\nabla^0$ of $(G_2, J)$ is given by

\begin{equation}
R^0(e_1, e_2)e_1 = (\gamma^2 + \frac{\alpha\beta}{2}) e_2, \quad R^0(e_1, e_2)e_2 = -(\gamma^2 + \frac{\alpha\beta}{2}) e_1, \quad R^0(e_1, e_2)e_3 = 0,
\end{equation}

\begin{equation}
R^0(e_1, e_3)e_1 = \frac{(\alpha\gamma - \beta\gamma)}{2} e_2, \quad R^0(e_1, e_3)e_2 = -(\frac{(\alpha\gamma - \beta\gamma)}{2}) e_1, \quad R^0(e_1, e_3)e_3 = 0,
\end{equation}

\begin{equation}
R^0(e_2, e_3)e_1 = 0, \quad R^0(e_2, e_3)e_2 = 0, \quad R^0(e_2, e_3)e_3 = 0.
\end{equation}
By (2.9), (2.11) and Lemma 2.15, we get for \((G_2, \nabla^0)\)
\[
\text{Ric}^0 \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \\ \end{array} \right) = \left( \begin{array}{ccc} - (\gamma^2 + \frac{\alpha \beta}{2}) & 0 & 0 \\ 0 & - (\gamma^2 + \frac{\alpha \beta}{2}) & 0 \\ 0 & 0 & \beta \gamma - \frac{\alpha \gamma}{2} \end{array} \right) \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \\ \end{array} \right).
\]

If \((G_2, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^0\), then \(\text{Ric}^0 = c \text{Id} + D\), so
\[
\begin{align*}
De_1 &= -(\gamma^2 + \frac{\alpha \beta}{2} + c)e_1, \\
De_2 &= -(\gamma^2 + \frac{\alpha \beta}{2} + c)e_2, \\
De_3 &= (\beta \gamma - \frac{\alpha \gamma}{2})e_2 - ce_3.
\end{align*}
\]

By (2.15) and (2.42), we get \(\alpha = \beta = 0\). \(\gamma^2 + c = 0\). Then

\textbf{Theorem 2.16.} \((G_2, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^0\) if and only if \(\alpha = \beta = 0\), \(\gamma^2 + c = 0\), \(\gamma \neq 0\). In particular,
\[
\text{Ric}^0 \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \\ \end{array} \right) = \left( \begin{array}{ccc} -\gamma^2 & 0 & 0 \\ 0 & -\gamma^2 & 0 \\ 0 & 0 & 0 \end{array} \right) \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \\ \end{array} \right), D \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \\ \end{array} \right) = \left( \begin{array}{ccc} 0 & 0 & 0 \\ 0 & 0 & \gamma^2 \\ 0 & 0 & 0 \end{array} \right) \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \\ \end{array} \right).
\]

By (2.12), (2.13) and (2.41), we have for \((G_2, \nabla^0)\)
\[
\tilde{\text{Ric}}^0 \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \\ \end{array} \right) = \left( \begin{array}{ccc} -(\gamma^2 + \frac{\alpha \beta}{2}) & 0 & 0 \\ 0 & -(\gamma^2 + \frac{\alpha \beta}{2}) & \frac{\alpha \gamma}{2} - \frac{\beta \gamma}{2} \\ 0 & \frac{\beta \gamma}{2} - \frac{\alpha \gamma}{2} & 0 \end{array} \right) \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \\ \end{array} \right).
\]

If \((G_2, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^0\), then \(\tilde{\text{Ric}}^0 = c \text{Id} + D\), so
\[
\begin{align*}
De_1 &= -(\gamma^2 + \frac{\alpha \beta}{2} + c)e_1, \\
De_2 &= -(\gamma^2 + \frac{\alpha \beta}{2} + c)e_2 + (\frac{\alpha \gamma}{4} - \frac{\beta \gamma}{2})e_3, \\
De_3 &= (\frac{\beta \gamma}{2} - \frac{\alpha \gamma}{4})e_2 - ce_3.
\end{align*}
\]

By (2.15) and (2.45), we get
\[
\begin{align*}
\gamma^2 + \alpha \beta - \beta^2 + c &= 0, \\
\beta (2 \gamma^2 + \alpha \beta + c) + \gamma (\beta \gamma - \frac{\alpha \gamma}{2}) &= 0, \\
\beta c + \gamma (\beta \gamma - \frac{\alpha \gamma}{2}) &= 0, \\
\alpha c &= 0.
\end{align*}
\]

Solving (2.46), we get \(\alpha = \beta = 0\), \(\gamma^2 + c = 0\). Then
Theorem 2.17. \((G_2, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^0\) if and only if \(\alpha = \beta = 0, \gamma^2 + c = 0, \gamma \neq 0\). In particular,
\[
(2.47) \quad \tilde{\text{Ric}}^0 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\gamma^2 & 0 & 0 \\ 0 & -\gamma^2 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}, \quad D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & \gamma^2 \\ 0 & \gamma^2 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

By (2.6), Lemma 2.13 and Lemma 2.14, we have

Lemma 2.18. The Kobayashi-Nomizu connection \(\nabla^1\) of \((G_2, J)\) is given by
\[
(2.48) \quad \nabla^1_{e_1}e_1 = 0, \quad \nabla^1_{e_1}e_2 = 0, \quad \nabla^1_{e_1}e_3 = -\gamma e_3,
\]
\[
\nabla^1_{e_2}e_1 = -\gamma e_2, \quad \nabla^1_{e_2}e_2 = \gamma e_1, \quad \nabla^1_{e_2}e_3 = 0,
\]
\[
\nabla^1_{e_3}e_1 = \beta e_2, \quad \nabla^1_{e_3}e_2 = -\alpha e_1, \quad \nabla^1_{e_3}e_3 = 0.
\]

By (2.8) and Lemma 2.18, we have

Lemma 2.19. The curvature \(R^1\) of the Kobayashi-Nomizu connection \(\nabla^1\) of \((G_2, J)\) is given by
\[
(2.49) \quad R^1(e_1, e_2)e_1 = (\beta + \gamma^2)e_2, \quad R^1(e_1, e_2)e_2 = -(\gamma^2 + \alpha \beta) e_1, \quad R^1(e_1, e_2)e_3 = 0,
\]
\[
R^1(e_1, e_3)e_1 = 0, \quad R^1(e_1, e_3)e_2 = (\beta \gamma - \alpha \gamma) e_1, \quad R^1(e_1, e_3)e_3 = 0,
\]
\[
R^1(e_2, e_3)e_1 = (\beta \gamma - \alpha \gamma) e_1, \quad R^1(e_2, e_3)e_2 = (\alpha \gamma - \beta \gamma) e_2, \quad R^1(e_2, e_3)e_3 = \alpha \gamma e_3.
\]

By (2.10),(2.11) and Lemma 2.19, we get for \((G_2, \nabla^1)\)
\[
(2.50) \quad \text{Ric}^1 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} - (\beta^2 + \gamma^2) & 0 & 0 \\ 0 & -(\gamma^2 + \alpha \beta) & \alpha \gamma \\ 0 & \alpha \gamma & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

If \((G_2, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^1\), then \(\text{Ric}^1 = c \text{Id} + D\), so
\[
(2.51) \quad \begin{cases} 
De_1 = -(\beta^2 + \gamma^2 + c) e_1, \\
De_2 = -(\gamma^2 + \alpha \beta + c) e_2 + \alpha \gamma e_3, \\
De_3 = -\gamma e_3.
\end{cases}
\]

By (2.15) and (2.51), we get
\[
(2.52) \quad \begin{cases} 
\beta^2 + \gamma^2 + c + \alpha \beta = 0, \\
\beta (\beta^2 + 2 \gamma^2 + c + \alpha \beta) - 2 \alpha \gamma^2 = 0, \\
\beta (\beta^2 - \alpha \beta + c) = 0, \\
\alpha (\beta^2 - \alpha \beta - c) = 0.
\end{cases}
\]

Solving (2.52), we get \(\alpha = \beta = 0, \gamma^2 + c = 0\). Then
Theorem 2.20. \((G_2, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^1\) if and only if \(\alpha = \beta = 0, \gamma^2 + c = 0, \gamma \neq 0\). In particular,

\[
(2.53) \quad \text{Ric}^1 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\gamma^2 & 0 & 0 \\ 0 & -\gamma^2 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}, \quad D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & \gamma^2 \\ 0 & \gamma & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

By (2.12), (2.13) and (2.50), we have for \((G_2, \nabla^1)\)

\[
(2.54) \quad \text{Ric}^1 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} - (\beta^2 + \gamma^2) & 0 & 0 \\ 0 & - (\gamma^2 + \alpha \beta) & \frac{\alpha \gamma}{2} \\ 0 & \frac{-\alpha \gamma}{2} & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

If \((G_2, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^1\), then \(\text{Ric}^1 = c\text{Id} + D\), so

\[
(2.55) \quad \begin{cases} 
  De_1 = -(\beta^2 + \gamma^2 + c)e_1, \\
  De_2 = -(\gamma^2 + \alpha \beta + c)e_2 + \frac{\alpha \gamma}{2}e_3, \\
  De_3 = -\frac{\alpha \gamma}{2}e_2 - ce_3.
\end{cases}
\]

By (2.15) and (2.55), we get

\[
(2.56) \quad \begin{cases} 
  \beta^2 + \gamma^2 + c + \alpha \beta = 0, \\
  \beta(\beta^2 + 2\gamma^2 + c + \alpha \beta) - \alpha \gamma^2 = 0, \\
  \beta(\beta^2 - \alpha \beta + c) - \alpha \gamma^2 = 0, \\
  \alpha(\beta^2 - \alpha \beta - c) = 0.
\end{cases}
\]

Solving (2.56), we get \(\alpha = \beta = 0, \gamma^2 + c = 0\). Then

Theorem 2.21. \((G_2, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^1\) if and only if \(\alpha = \beta = 0, \gamma^2 + c = 0, \gamma \neq 0\). In particular,

\[
(2.57) \quad \text{Ric}^1 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\gamma^2 & 0 & 0 \\ 0 & -\gamma^2 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}, \quad D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & \gamma^2 \\ 0 & \gamma & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

2.3 Algebraic Ricci solitons of \(G_3\)

By (2.3) and Lemma 3.8 in [1], we have for \(G_3\), there exists a pseudo-orthonormal basis \(\{e_1, e_2, e_3\}\) with \(e_3\) timelike such that the Lie algebra of \(G_3\) satisfies

\[
(2.58) \quad [e_1, e_2] = -\gamma e_3, \quad [e_1, e_3] = -\beta e_2, \quad [e_2, e_3] = \alpha e_1.
\]
Lemma 2.22. ([3], [1]) The Levi-Civita connection $\nabla$ of $G_3$ is given by
\begin{align}
\nabla_{e_1}e_1 &= 0, \quad \nabla_{e_2}e_1 = a_2e_3, \quad \nabla_{e_3}e_1 = a_3e_2, \\
\nabla_{e_1}e_2 &= a_1e_3, \quad \nabla_{e_2}e_2 = 0, \quad \nabla_{e_3}e_2 = -a_3e_1, \\
\nabla_{e_1}e_3 &= a_1e_2, \quad \nabla_{e_2}e_3 = a_2e_1, \quad \nabla_{e_3}e_3 = 0,
\end{align}
where
\begin{align}
a_1 &= \frac{1}{2}(\alpha - \beta - \gamma), \quad a_2 = \frac{1}{2}(\alpha - \beta + \gamma), \quad a_3 = \frac{1}{2}(\alpha + \beta - \gamma).
\end{align}
By (2.4) and (2.59), we have

Lemma 2.23. For $G_3$, the following equalities hold
\begin{align}
\nabla_{e_1}(J)e_1 &= 0, \quad \nabla_{e_1}(J)e_2 = 2a_1e_3, \quad \nabla_{e_1}(J)e_3 = -2a_1e_2, \\
\nabla_{e_2}(J)e_1 &= 2a_2e_3, \quad \nabla_{e_2}(J)e_2 = 0, \quad \nabla_{e_2}(J)e_3 = -2a_2e_1, \\
\nabla_{e_3}(J)e_1 &= 0, \quad \nabla_{e_3}(J)e_2 = 0, \quad \nabla_{e_3}(J)e_3 = 0.
\end{align}
By (2.4), (2.5), Lemma 2.22 and Lemma 2.23, we have

Lemma 2.24. The canonical connection $\nabla^0$ of $(G_3, J)$ is given by
\begin{align}
\nabla^0_{e_1}e_1 &= 0, \quad \nabla^0_{e_1}e_2 = 0, \quad \nabla^0_{e_1}e_3 = 0, \\
\nabla^0_{e_2}e_1 &= 0, \quad \nabla^0_{e_2}e_2 = 0, \quad \nabla^0_{e_2}e_3 = 0, \\
\nabla^0_{e_3}e_1 &= a_3e_2, \quad \nabla^0_{e_3}e_2 = -a_3e_1, \quad \nabla^0_{e_3}e_3 = 0.
\end{align}
By (2.7) and Lemma 2.24, we have

Lemma 2.25. The curvature $R^0$ of the canonical connection $\nabla^0$ of $(G_3, J)$ is given by
\begin{align}
R^0(e_1, e_2)e_1 &= \gamma a_3e_2, \quad R^0(e_1, e_2)e_2 = -\gamma a_3e_1, \quad R^0(e_1, e_2)e_3 = 0, \\
R^0(e_1, e_3)e_1 &= 0, \quad R^0(e_1, e_3)e_2 = 0, \quad R^0(e_1, e_3)e_3 = 0, \\
R^0(e_2, e_3)e_1 &= 0, \quad R^0(e_2, e_3)e_2 = 0, \quad R^0(e_2, e_3)e_3 = 0.
\end{align}
By (2.9), (2.11) and Lemma 2.25, we get for $(G_3, \nabla^0)$
\begin{align}
\text{Ric}^0 \left( \begin{array}{c}
    e_1 \\
    e_2 \\
    e_3
\end{array} \right) &= \left( \begin{array}{ccc}
    -\gamma a_3 & 0 & 0 \\
    0 & -\gamma a_3 & 0 \\
    0 & 0 & 0
\end{array} \right) \left( \begin{array}{c}
    e_1 \\
    e_2 \\
    e_3
\end{array} \right).
\end{align}
If \((G_3, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^0\), then \(\text{Ric}^0 = c\text{Id} + D\), so

\[
\begin{align*}
\text{De}_1 &= - (\gamma a_3 + c) e_1, \\
\text{De}_2 &= - (\gamma a_3 + c) e_2, \\
\text{De}_3 &= - c e_3.
\end{align*}
\]

By (2.15) and (2.65), we get

\[
\begin{align*}
\gamma (2\gamma a_3 + c) &= 0, \\
\beta c &= 0, \\
\alpha c &= 0.
\end{align*}
\]

Solving (2.66), then we have

**Theorem 2.26.** \((G_3, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^0\) if and only if

(i) \(\alpha = \beta = \gamma = 0\), in particular

\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -c & 0 & 0 \\ 0 & -c & 0 \\ 0 & 0 & -c \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

(ii) \(\alpha = \beta = 0, \gamma^2 = c\), in particular

\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\frac{\gamma^2}{2} & 0 & 0 \\ 0 & -\frac{\gamma^2}{2} & 0 \\ 0 & 0 & -\gamma^2 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

(iii) \(\alpha \neq 0 \text{ or } \beta \neq 0, \gamma = 0, c = 0\), in particular

\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

(iv) \(\alpha \neq 0 \text{ or } \beta \neq 0, \gamma = \alpha + \beta, c = 0\), in particular

\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

Since \(\rho^0(e_i, e_j) = \rho^0(e_j, e_i)\), then \(\tilde{\rho}^0(e_i, e_j) = \rho^0(e_i, e_j)\). Then \((G_3, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^0\) if and only if \((G_3, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^0\). By (2.4), (2.6), Lemma 2.23 and Lemma 2.24, we have
Lemma 2.27. The Kobayashi-Nomizu connection $\nabla^1$ of $(G_3, J)$ is given by

\begin{align}
\nabla^1_{e_1} e_1 &= 0, \ 
abla^1_{e_1} e_2 = 0, \ 
abla^1_{e_1} e_3 = 0, \\
\nabla^1_{e_2} e_1 &= 0, \ 
abla^1_{e_2} e_2 = 0, \ 
abla^1_{e_2} e_3 = 0, \\
\nabla^1_{e_3} e_1 &= (a_3 - a_1) e_2, \ 
\nabla^1_{e_3} e_2 = -(a_2 + a_3) e_1, \ 
\nabla^1_{e_3} e_3 &= 0.
\end{align}

By (2.8) and Lemma 2.27, we have

Lemma 2.28. The curvature $R^1$ of the Kobayashi-Nomizu connection $\nabla^1$ of $(G_3, J)$ is given by

\begin{align}
R^1(e_1, e_2) e_1 &= \gamma(a_3 - a_1) e_2, \ 
R^1(e_1, e_2) e_2 = -\gamma(a_2 + a_3) e_1, \ 
R^1(e_1, e_2) e_3 = 0, \\
R^1(e_1, e_3) e_1 &= 0, \ 
R^1(e_1, e_3) e_2 = 0, \ 
R^1(e_1, e_3) e_3 = 0, \\
R^1(e_2, e_3) e_1 &= 0, \ 
R^1(e_2, e_3) e_2 = 0, \ 
R^1(e_2, e_3) e_3 = 0.
\end{align}

By (2.10), (2.11) and Lemma 2.28, we get for $(G_3, \nabla^1)$

\begin{align}
\Ric^1 \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \end{array} \right) &= \left( \begin{array}{ccc} \gamma(a_1 - a_3) & 0 & 0 \\ 0 & -\gamma(a_2 + a_3) & 0 \\ 0 & 0 & 0 \end{array} \right) \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \end{array} \right).
\end{align}

If $(G_3, g, J)$ is the first kind algebraic Ricci soliton associated to the connection $\nabla^1$, then $\Ric^1 = c \Id + D$, so

\begin{align}
\begin{cases}
De_1 = \gamma(a_1 - a_3) e_1 - c e_1, \\
De_2 = -\gamma(a_2 + a_3) e_2 - c e_2, \\
De_3 = -c e_3.
\end{cases}
\end{align}

By (2.15) and (2.70), we get

\begin{align}
\begin{cases}
\gamma[\gamma(\alpha + \beta) + c] = 0, \\
\beta[\gamma(\alpha - \beta) - c] = 0, \\
\alpha[\gamma(\alpha - \beta) + c] = 0,
\end{cases}
\end{align}

Solving (2.71), we get

Theorem 2.29. $(G_3, g, J)$ is the first kind algebraic Ricci soliton associated to the connection $\nabla^1$ if and only if

(i) $\alpha \beta \neq 0$, $\gamma = 0$, $c = 0$, in particular,

\begin{align}
D \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \end{array} \right) &= \left( \begin{array}{ccc} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{array} \right) \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \end{array} \right).
\end{align}
(ii) $\alpha = \beta = \gamma = 0$, $c \neq 0$, in particular,
\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -c & 0 & 0 \\ 0 & -c & 0 \\ 0 & 0 & -c \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

(iii) $\alpha = 0$, $\gamma \beta + c = 0$, in particular,
\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & -c & 0 \\ 0 & 0 & -c \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

(iv) $\beta = 0$, $\gamma \alpha + c = 0$, in particular,
\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -c & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & -c \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

Since $\rho^1(e_i, e_j) = \rho^1(e_j, e_i)$, then $\tilde{\rho}^1(e_i, e_j) = \rho^1(e_i, e_j)$. Then $(G_3, g, J)$ is the second kind algebraic Ricci soliton associated to the connection $\nabla^1$ if and only if $(G_3, g, J)$ is the first kind algebraic Ricci soliton associated to the connection $\nabla^1$.

### 2.4 Algebraic Ricci solitons of $G_4$

By (2.4) and Lemma 3.11 in [1], we have for $G_4$, there exists a pseudo-orthonormal basis $\{e_1, e_2, e_3\}$ with $e_3$ timelike such that the Lie algebra of $G_4$ satisfies
\[
[e_1, e_2] = -e_2 + (2\eta - \beta)e_3, \quad \eta = 1 \text{ or } -1, \quad [e_1, e_3] = -\beta e_2 + e_3, \quad [e_2, e_3] = \alpha e_1.
\]

**Lemma 2.30.** ([3], [1]) The Levi-Civita connection $\nabla$ of $G_4$ is given by
\[
\nabla e_1 = 0, \quad \nabla e_2 = e_2 + b_2 e_3, \quad \nabla e_3 = b_3 e_2 - e_3,
\]
\[
\nabla e_1 e_2 = b_1 e_3, \quad \nabla e_2 e_2 = -e_1, \quad \nabla e_3 e_2 = -b_3 e_1,
\]
\[
\nabla e_1 e_3 = b_1 e_2, \quad \nabla e_2 e_3 = b_2 e_1, \quad \nabla e_3 e_3 = -e_1,
\]
where
\[
b_1 = \frac{\alpha}{2} + \eta - \beta, \quad b_2 = \frac{\alpha}{2} - \eta, \quad b_3 = \frac{\alpha}{2} + \eta.
\]

By (2.4) and Lemma 2.30, we have

**Lemma 2.31.** For $G_4$, the following equalities hold
\[
\nabla e_1(J) e_1 = 0, \quad \nabla e_1(J) e_2 = 2b_1 e_3, \quad \nabla e_1(J) e_3 = -2b_1 e_2,
\]
\[
\nabla e_2(J) e_1 = 2b_2 e_3, \quad \nabla e_2(J) e_2 = 0, \quad \nabla e_2(J) e_3 = -2b_2 e_1,
\]
\[
\nabla e_3(J) e_1 = -2e_3, \quad \nabla e_3(J) e_2 = 0, \quad \nabla e_3(J) e_3 = 2e_1.
\]
By (2.4), (2.5), Lemma 2.30 and Lemma 2.31, we have

Lemma 2.32. The canonical connection $\nabla^0$ of $(G_4, J)$ is given by

\[(2.76) \begin{align*}
\nabla^0_{e_1} e_1 &= 0, \quad \nabla^0_{e_1} e_2 = 0, \quad \nabla^0_{e_1} e_3 = 0, \\
\nabla^0_{e_2} e_1 &= e_2, \quad \nabla^0_{e_2} e_2 = -e_1, \quad \nabla^0_{e_2} e_3 = 0, \\
\nabla^0_{e_3} e_1 &= b_3 e_2, \quad \nabla^0_{e_3} e_2 = -b_3 e_1, \quad \nabla^0_{e_3} e_3 = 0.
\end{align*}\]

By (2.7) and Lemma 2.32, we have

Lemma 2.33. The curvature $R^0$ of the canonical connection $\nabla^0$ of $(G_4, J)$ is given by

\[(2.77) \begin{align*}
R^0(e_1, e_2)e_1 &= [(\beta - 2\eta)b_3 + 1]e_2, \quad R^0(e_1, e_2)e_2 = [b_3(2\eta - \beta) - 1]e_1, \quad R^0(e_1, e_2)e_3 = 0, \\
R^0(e_1, e_3)e_1 &= (\beta - b_3)e_2, \quad R^0(e_1, e_3)e_2 = (b_3 - \beta)e_1, \quad R^0(e_1, e_3)e_3 = 0, \\
R^0(e_2, e_3)e_1 &= 0, \quad R^0(e_2, e_3)e_2 = 0, \quad R^0(e_2, e_3)e_3 = 0.
\end{align*}\]

By (2.9), (2.11) and Lemma 2.33, we get for $(G_4, \nabla^0)$

\[(2.78) \text{Ric}^0 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} b_3(2\eta - \beta) - 1 \\ 0 \\ 0 \end{pmatrix} \begin{pmatrix} 0 \\ b_3(2\eta - \beta) - 1 \\ b_3 - \beta \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.\]

If $(G_4, g, J)$ is the first kind algebraic Ricci soliton associated to the connection $\nabla^0$, then $\text{Ric}^0 = c\text{Id} + D$, so

\[(2.79) \begin{align*}
D e_1 &= [b_3(2\eta - \beta) - 1 - c]e_1, \\
D e_2 &= [b_3(2\eta - \beta) - 1 - c]e_2, \\
D e_3 &= (b_3 - \beta)e_2 - ce_3.
\end{align*}\]

By (2.9) and (2.79), we get

\[(2.80) \begin{align*}
(2\eta - \beta)(2b_3 - \beta) - c - 1 &= 0, \\
(2b_3(2\eta - \beta) - 2 - c)(2\eta - \beta) &= 0, \\
2(b_3 - \beta) - c\beta &= 0, \\
c\alpha &= 0.
\end{align*}\]

Solving (2.80), we get

Theorem 2.34. $(G_4, g, J)$ is the first kind algebraic Ricci soliton associated to the connection $\nabla^0$ if and only if
(i) $\alpha = 0$, $\beta = 1$, $c = 0$, $\eta = 1$, in particular,
\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

(ii) $\alpha = 0$, $c = -1$, $\beta = 2\eta$,
\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & -\eta & 1 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

By (2.12), (2.13) and (2.78), we have for $(G_4, \nabla^0)$
\[
(2.81) \quad \tilde{\text{Ric}}^0 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} [(2\eta - \beta)b_3 - 1] & 0 & 0 \\ 0 & [(2\eta - \beta)b_3 - 1] & \frac{\beta - b_3}{2} \\ 0 & \frac{\beta - b_3}{2} & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

If $(G_4, g, J)$ is the second kind algebraic Ricci soliton associated to the connection $\nabla^0$, then $\tilde{\text{Ric}}^0 = c\text{Id} + D$, so
\[
(2.82) \quad \begin{cases} 
De_1 = [(2\eta - \beta)b_3 - 1 - c]e_1, \\
De_2 = [(2\eta - \beta)b_3 - 1 - c]e_2 + \frac{\beta - b_3}{2} e_3, \\
De_3 = \frac{b_3 - \beta}{2} e_2 - ce_3.
\end{cases}
\]

By (2.15) and (2.82), we get
\[
(2.83) \quad \begin{cases} 
(2\eta - \beta)b_3 - 1 - c + (\eta - \beta)(b_3 - \beta) = 0, \\
\beta - b_3 + [2(2\eta - \beta)b_3 - 2 - c](2\eta - \beta) = 0, \\
b_3 - \beta = c\beta, \\
\alpha c = 0.
\end{cases}
\]

Solving (2.83), we get

**Theorem 2.35.** $(G_4, g, J)$ is the second kind algebraic Ricci soliton associated to the connection $\nabla^0$ if and only if $\alpha = 0$, $\beta = \eta$, $c = 0$. In particular,
\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

By (2.4), (2.6), Lemma 2.31 and Lemma 2.32, we have
Lemma 2.36. The Kobayashi-Nomizu connection $\nabla^1$ of $(G_4, J)$ is given by

\begin{equation}
\nabla_{e_1}^1 e_1 = 0, \quad \nabla_{e_1}^1 e_2 = 0, \quad \nabla_{e_1}^1 e_3 = e_3,
\end{equation}

\begin{equation}
\nabla_{e_2}^1 e_1 = e_2, \quad \nabla_{e_2}^1 e_2 = -e_1, \quad \nabla_{e_2}^1 e_3 = 0,
\end{equation}

\begin{equation}
\nabla_{e_3}^0 e_1 = (b_3 - b_1)e_2, \quad \nabla_{e_3}^1 e_2 = -(b_2 + b_3)e_1, \quad \nabla_{e_3}^1 e_3 = 0.
\end{equation}

By (2.8) and Lemma 2.36, we have

Lemma 2.37. The curvature $R^1$ of the Kobayashi-Nomizu connection $\nabla^1$ of $(G_4, J)$ is given by

\begin{equation}
R^1(e_1, e_2)e_1 = [1 + (\beta - 2\eta)(b_3 - b_1)]e_2, \quad R^1(e_1, e_2)e_2 = -[1 + (\beta - 2\eta)(b_2 + b_3)]e_1,
\end{equation}

\begin{equation}
R^1(e_1, e_3)e_1 = (\beta - b_3 + b_1)e_2, \quad R^1(e_1, e_3)e_2 = (b_2 + b_3 - \beta)e_1,
\end{equation}

\begin{equation}
R^1(e_1, e_3)e_3 = 0, \quad e_1 \quad 2, \quad \nabla_{e_2}^1 e_3 = 0.
\end{equation}

By (2.10), (2.11) and Lemma 2.37, we get for $(G_4, \nabla^1)$

\begin{equation}
\text{Ric}^1 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -[1 + (\beta - 2\eta)(b_3 - b_1)] & 0 & 0 \\ 0 & -[1 + (\beta - 2\eta)(b_2 + b_3)] & -\alpha \\ 0 & (b_3 - b_1 - \beta) & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\end{equation}

If $(G_4, g, J)$ is the first kind algebraic Ricci soliton associated to the connection $\nabla^1$, then $\text{Ric}^1 = c\text{Id} + D$, so

\begin{equation}
\begin{cases}
De_1 = -[1 + (\beta - 2\eta)(b_3 - b_1) + c]e_1, \\
De_2 = -[1 + (\beta - 2\eta)(b_2 + b_3) + c]e_2 - \alpha e_3, \\
De_3 = (b_3 - b_1 - \beta)e_2 - ce_3.
\end{cases}
\end{equation}

By (2.15) and (2.87), we get

\begin{equation}
\begin{cases}
(2\eta - \beta)(2b_3 - 2b_1 - \beta) - c - 1 - \alpha\beta = 0, \\
(\beta - 2\eta)[2 + (\beta - 2\eta)(b_2 + 2b_3 - b_1)] + c - 2\alpha = 0, \\
\beta(\beta - 2\eta)(b_1 + b_2) - c\beta = 0, \\
\alpha(\beta - 2\eta)(b_1 + b_2) + c = 0.
\end{cases}
\end{equation}

Solving (2.88), (2.88) has no solutions. Then

Theorem 2.38. $(G_4, g, J)$ is not the first kind algebraic Ricci soliton associated to the connection $\nabla^1$. 

By (2.12), (2.13) and (2.86), we have for \((G_4, \nabla^1)\)

\[
\widetilde{\text{Ric}} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -[1 + (\beta - 2\eta)(b_3 - b_1)] & 0 & 0 \\ 0 & -[1 + (\beta - 2\eta)(b_2 + b_3)] & \frac{b_3 - \beta - \alpha}{2} \\ 0 & \frac{b_3 - \beta - \alpha}{2} & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

If \((G_4, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^1\), then \(\widetilde{\text{Ric}} = c\text{Id} + D\), so

\[
\begin{align*}
De_1 &= -[1 + (\beta - 2\eta)(b_3 - b_1)] + ce_1, \\
De_2 &= -[1 + (\beta - 2\eta)(b_2 + b_3)] + \frac{b_3 - \beta - \alpha}{2} e_3, \\
De_3 &= \frac{b_3 - \beta - \alpha}{2} e_2 - ce_3.
\end{align*}
\]

By (2.15) and (2.90), we get

\[
\begin{align*}
(2\eta - \beta)[\frac{\alpha - \beta}{2} + \frac{1}{2}(b_3 - b_1)] - 1 - c - \frac{\alpha \beta}{2} &= 0, \\
(\beta - 2\eta)[2 + (\beta - 2\eta)(b_2 + 2b_3 - b_1) + c] - \alpha &= 0, \\
\beta(\beta - 2\eta)(b_1 + b_2) + \alpha - c\beta &= 0, \\
\alpha(\beta - 2\eta)(b_1 + b_2) + c &= 0.
\end{align*}
\]

Solving (2.91), (2.91) has no solutions. Then

**Theorem 2.39.** \((G_4, g, J)\) is not the second kind algebraic Ricci soliton associated to the connection \(\nabla^1\).

3. **Algebraic Ricci solitons associated to canonical connections and Kobayashi-Nomizu connections on three-dimensional non-unimodular Lorentzian Lie groups**

3.1 **Algebraic Ricci solitons of \(G_5\)**

By (2.5) and Lemma 4.1 in [1], we have for \(G_5\), there exists a pseudo-orthonormal basis \(\{e_1, e_2, e_3\}\) with \(e_3\) timelike such that the Lie algebra of \(G_5\) satisfies

\[
\begin{align*}
[e_1, e_2] &= 0, \\
[e_1, e_3] &= \alpha e_1 + \beta e_2, \\
[e_2, e_3] &= \gamma e_1 + \delta e_2, \\
\alpha + \delta &\neq 0, \\
\alpha \gamma + \beta \delta &= 0.
\end{align*}
\]
Lemma 3.1. ([3],[1]) The Levi-Civita connection $\nabla$ of $G_5$ is given by
\begin{align*}
\nabla e_1 e_1 &= \alpha e_3, \\
\nabla e_2 e_1 &= \frac{\beta + \gamma}{2} e_3, \\
\nabla e_3 e_1 &= -\frac{\beta - \gamma}{2} e_2, \\
\nabla e_1 e_2 &= \alpha e_1 + \frac{\beta + \gamma}{2} e_2, \\
\nabla e_2 e_2 &= \delta e_3, \\
\nabla e_3 e_2 &= \frac{\beta + \gamma}{2} e_1 + \delta e_2, \\
\nabla e_1 e_3 &= -\frac{\beta - \gamma}{2} e_2, \\
\nabla e_2 e_3 &= -\frac{\beta - \gamma}{2} e_1.
\end{align*}
(3.2)

By (2.4) and (3.2), we have

Lemma 3.2. For $G_5$, the following equalities hold
\begin{align*}
\nabla e_1 (J)e_1 &= 2\alpha e_3, \\
\nabla e_1 (J)e_2 &= (\beta + \gamma)e_3, \\
\nabla e_1 (J)e_3 &= -2\alpha e_1 - (\beta + \gamma)e_2, \\
\nabla e_2 (J)e_1 &= (\beta + \gamma)e_3, \\
\nabla e_2 (J)e_2 &= 2\delta e_3, \\
\nabla e_2 (J)e_3 &= -(\beta + \gamma)e_1 - 2\delta e_2, \\
\nabla e_3 (J)e_1 &= 0, \\
\nabla e_3 (J)e_2 &= 0, \\
\nabla e_3 (J)e_3 &= 0.
\end{align*}
(3.3)

By (2.4),(2.5), Lemma 3.1 and Lemma 3.2, we have

Lemma 3.3. The canonical connection $\nabla^0$ of $(G_5, J)$ is given by
\begin{align*}
\nabla^0 e_1 e_1 &= 0, \\
\nabla^0 e_2 e_2 &= 0, \\
\nabla^0 e_3 e_3 &= 0, \\
\nabla^0 e_1 &= 0, \\
\nabla^0 e_2 &= 0, \\
\nabla^0 e_3 &= 0, \\
\nabla^0 e_1 e_2 &= -\frac{\beta - \gamma}{2} e_2, \\
\nabla^0 e_2 e_3 &= \frac{\beta - \gamma}{2} e_1, \\
\nabla^0 e_3 &= 0.
\end{align*}
(3.4)

By (2.7) and Lemma 3.3, we have

Lemma 3.4. The curvature $R^0$ of the canonical connection $\nabla^0$ of $(G_5, J)$ is flat, that is $R^0(e_i, e_j)e_k = 0$.

So we get for $(G_5, \nabla^0)$
\begin{align*}
\text{Ric}^0 \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \end{array} \right) &= \left( \begin{array}{ccc} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{array} \right) \left( \begin{array}{c} e_1 \\ e_2 \\ e_3 \end{array} \right).
\end{align*}
(3.5)

If $(G_5, g, J)$ is the first kind algebraic Ricci soliton associated to the connection $\nabla^0$, then $\text{Ric}^0 = c\text{Id} + D$, so
\begin{align*}
\begin{cases}
De_1 &= -ce_1, \\
De_2 &= -ce_2, \\
De_3 &= -ce_3.
\end{cases}
\end{align*}
(3.6)

By (2.15) and (3.6), we get
**Theorem 3.5.** \((G_5, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^0\) if and only if \(c = 0\). In particular,

\[
D \begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix}
= \begin{pmatrix}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{pmatrix}
\begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix}.
\]

By (2.6), Lemma 3.2 and Lemma 3.3, we have

**Lemma 3.6.** The Kobayashi-Nomizu connection \(\nabla^1\) of \((G_5, J)\) is given by

\[
\nabla^1_{e_1} e_1 = 0, \quad \nabla^1_{e_2} e_2 = 0, \quad \nabla^1_{e_3} e_3 = 0,
\]

\[
\nabla^1_{e_2} e_1 = 0, \quad \nabla^1_{e_2} e_2 = 0, \quad \nabla^1_{e_3} e_3 = 0,
\]

\[
\nabla^0_{e_3} e_1 = -\alpha e_1 - \beta e_2, \quad \nabla^1_{e_3} e_2 = -\gamma e_1 - \delta e_2, \quad \nabla^1_{e_3} e_3 = 0.
\]

**Lemma 3.7.** The curvature \(R^1\) of the Kobayashi-Nomizu connection \(\nabla^1\) of \((G_5, J)\) is flat, that is \(R^1(e_i, e_j) e_k = 0\).

So similar to Theorem 3.5, we have

**Theorem 3.8.** \((G_5, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^1\) if and only if \(c = 0\). In particular,

\[
D \begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix}
= \begin{pmatrix}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{pmatrix}
\begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix}.
\]

**3.2 Algebraic Ricci solitons of** \(G_6\)

By (2.6) and Lemma 4.3 in [1], we have for \(G_6\), there exists a pseudo-orthonormal basis \(\{e_1, e_2, e_3\}\) with \(e_3\) timelike such that the Lie algebra of \(G_6\) satisfies

\[
[e_1, e_2] = \alpha e_2 + \beta e_3, \quad [e_1, e_3] = \gamma e_2 + \delta e_3, \quad [e_2, e_3] = 0, \quad \alpha + \delta \neq 0, \quad \alpha \gamma - \beta \delta = 0.
\]

**Lemma 3.9.** \((G_6, [3, 1])\) The Levi-Civita connection \(\nabla\) of \(G_6\) is given by

\[
\nabla_{e_1} e_1 = 0, \quad \nabla_{e_2} e_1 = -\alpha e_2 - \frac{\beta - \gamma}{2} e_3, \quad \nabla_{e_3} e_1 = \frac{\beta - \gamma}{2} e_2 - \delta e_3,
\]

\[
\nabla_{e_1} e_2 = \frac{\beta + \gamma}{2} e_3, \quad \nabla_{e_2} e_2 = \alpha e_1, \quad \nabla_{e_3} e_2 = -\frac{\beta - \gamma}{2} e_1,
\]

\[
\nabla_{e_1} e_3 = \frac{\beta + \gamma}{2} e_2, \quad \nabla_{e_2} e_3 = -\frac{\beta - \gamma}{2} e_1, \quad \nabla_{e_3} e_3 = -\delta e_1.
\]
By (2.4) and (3.11), we have

**Lemma 3.10.** For $G_6$, the following equalities hold

(3.12) \[ \nabla_{e_1}(J)e_1 = 0, \quad \nabla_{e_1}(J)e_2 = (\beta + \gamma)e_3, \quad \nabla_{e_1}(J)e_3 = -(\beta + \gamma)e_2, \]
\[ \nabla_{e_2}(J)e_1 = -(\beta - \gamma)e_3, \quad \nabla_{e_2}(J)e_2 = 0, \quad \nabla_{e_2}(J)e_3 = (\beta - \gamma)e_1, \]
\[ \nabla_{e_3}(J)e_1 = -2\delta e_3, \quad \nabla_{e_3}(J)e_2 = 0, \quad \nabla_{e_3}(J)e_3 = 2\delta e_1. \]

By (2.4),(2.5), Lemma 3.9 and Lemma 3.10, we have

**Lemma 3.11.** The canonical connection $\nabla^0$ of $(G_6, J)$ is given by

(3.13) \[ \nabla^0_{e_1}e_1 = 0, \quad \nabla^0_{e_1}e_2 = 0, \quad \nabla^0_{e_1}e_3 = 0, \]
\[ \nabla^0_{e_2}e_1 = -\alpha e_2, \quad \nabla^0_{e_2}e_2 = \alpha e_1, \quad \nabla^0_{e_2}e_3 = 0, \]
\[ \nabla^0_{e_3}e_1 = \frac{\beta - \gamma}{2} e_2, \quad \nabla^0_{e_3}e_2 = -\frac{\beta - \gamma}{2} e_1, \quad \nabla^0_{e_3}e_3 = 0. \]

By (2.7) and Lemma 3.11, we have

**Lemma 3.12.** The curvature $R^0$ of the canonical connection $\nabla^0$ of $(G_6, J)$ is given by

(3.14) \[ R^0(e_1, e_2)e_1 = [\alpha^2 - \frac{1}{2}\beta(\beta - \gamma)]e_2, \quad R^0(e_1, e_2)e_2 = [-\alpha^2 + \frac{1}{2}\beta(\beta - \gamma)]e_1, \quad R^0(e_1, e_2)e_3 = 0, \]
\[ R^0(e_1, e_3)e_1 = [\gamma \alpha - \frac{1}{2}\delta(\beta - \gamma)]e_2, \quad R^0(e_1, e_3)e_2 = [-\gamma \alpha + \frac{1}{2}\delta(\beta - \gamma)]e_1, \quad R^0(e_1, e_3)e_3 = 0, \]
\[ R^0(e_2, e_3)e_1 = 0, \quad R^0(e_2, e_3)e_2 = 0, \quad R^0(e_2, e_3)e_3 = 0. \]

By (2.9),(2.11) and Lemma 3.12, we get for $(G_6, \nabla^0)$

(3.15) \[ \text{Ric}^0 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} \frac{1}{2}\beta(\beta - \gamma) - \alpha^2 & 0 & 0 \\ 0 & \frac{1}{2}\beta(\beta - \gamma) - \alpha^2 & 0 \\ 0 & 0 & -\gamma \alpha + \frac{1}{2}\delta(\beta - \gamma) \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}. \]

If $(G_6, g, J)$ is the first kind algebraic Ricci soliton associated to the connection $\nabla^0$, then $\text{Ric}^0 = c\text{Id} + D$, so

(3.16) \[ \begin{cases} De_1 = \left[\frac{1}{2}\beta(\beta - \gamma) - \alpha^2 - c\right]e_1, \\ De_2 = \left[\frac{1}{2}\beta(\beta - \gamma) - \alpha^2 - c\right]e_2, \\ De_3 = \left[-\gamma \alpha + \frac{1}{2}\delta(\beta - \gamma)\right]e_2 - ce_3. \end{cases} \]
By (2.15) and (3.16), we get
\begin{equation}
\begin{aligned}
\alpha&\left[\frac{1}{2}\beta(\beta - \gamma) - \alpha^2 - c\right] - \beta[\gamma\alpha + \frac{1}{2}\delta(\beta - \gamma)] = 0, \\
\beta[\beta(\beta - \gamma) - 2\alpha^2 - c] = 0, \\
-c\gamma + [-\gamma\alpha + \frac{1}{2}\delta(\beta - \gamma)](\alpha - \delta) = 0, \\
\delta[\frac{1}{2}\beta(\beta - \gamma) - \alpha^2 - c] + \beta[-\gamma\alpha + \frac{1}{2}\delta(\beta - \gamma)] = 0.
\end{aligned}
\end{equation}
Solving (3.17), then

**Theorem 3.13.** \((G_6, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^0\) if and only if

(i) \(\alpha = \beta = \gamma = c = 0, \delta \neq 0\), in particular,

\[
D \begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix} = \begin{pmatrix}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{pmatrix} \begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix}.
\]

(ii) \(\alpha \neq 0, \beta = \gamma = 0, \alpha^2 + c = 0, \alpha + \delta \neq 0\), in particular,

\[
D \begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix} = \begin{pmatrix}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & \alpha^2
\end{pmatrix} \begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix}.
\]

(iii) \(\alpha \neq 0, \beta \neq 0, \gamma = \delta = 0, \beta^2 = 2\alpha^2, c = 0\), in particular,

\[
D \begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix} = \begin{pmatrix}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{pmatrix} \begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix}.
\]

By (2.12),(2.13) and (3.15), we have for \((G_6, \nabla^0)\)

\begin{equation}
\begin{aligned}
\widetilde{\text{Ric}}^0 \begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix} &= \begin{pmatrix}
\frac{1}{2}\beta(\beta - \gamma) - \alpha^2 & 0 & 0 \\
0 & \frac{1}{2}\beta(\beta - \gamma) - \alpha^2 & \frac{1}{2}[\gamma\alpha - \frac{1}{2}\delta(\beta - \gamma)] \\
0 & \frac{1}{2}[-\gamma\alpha + \frac{1}{2}\delta(\beta - \gamma)] & 0
\end{pmatrix} \begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix}.
\end{aligned}
\end{equation}

If \((G_6, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^0\), then \(\text{Ric}^0 = c\text{Id} + D\), so

\begin{equation}
\begin{aligned}
De_1 &= \frac{1}{2}\beta(\beta - \gamma) - \alpha^2 - c]e_1, \\
De_2 &= \frac{1}{2}\beta(\beta - \gamma) - \alpha^2 - c]e_2 + \frac{1}{2}[\gamma\alpha - \frac{1}{2}\delta(\beta - \gamma)]e_3, \\
De_3 &= \frac{1}{2}[-\gamma\alpha + \frac{1}{2}\delta(\beta - \gamma)]e_2 - ce_3.
\end{aligned}
\end{equation}

By (2.15) and (3.19), we get

\begin{equation}
\begin{aligned}
\alpha&\left[\frac{1}{2}\beta(\beta - \gamma) - \alpha^2 - c\right] + \frac{1}{2}(\beta + \gamma)[\gamma\alpha - \frac{1}{2}\delta(\beta - \gamma)] = 0, \\
\beta[\beta(\beta - \gamma) - 2\alpha^2 - c] + \frac{1}{2}(\delta - \alpha)[\gamma\alpha - \frac{1}{2}\delta(\beta - \gamma)] = 0, \\
-c\gamma + \frac{1}{2}(\alpha - \delta)[-\gamma\alpha + \frac{1}{2}\delta(\beta - \gamma)] = 0, \\
\delta[\frac{1}{2}\beta(\beta - \gamma) - \alpha^2 - c] + \frac{1}{2}(\beta + \gamma)[-\gamma\alpha + \frac{1}{2}\delta(\beta - \gamma)] = 0.
\end{aligned}
\end{equation}
Solving (3.20), we get

**Theorem 3.14.** $(G_6, g, J)$ is the second kind algebraic Ricci soliton associated to the connection $\nabla^0$ if and only if

(i) $\beta = \gamma = 0$, $\alpha^2 + c = 0$, $\alpha + \delta \neq 0$, in particular,

$$D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & -c \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.$$

(ii) $\gamma = \delta = c = 0$, $\alpha \neq 0$, $\beta \neq 0$, $\beta^2 = 2\alpha^2$, in particular,

$$D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.$$

By (2.6), Lemma 3.10 and Lemma 3.11, we have

**Lemma 3.15.** The Kobayashi-Nomizu connection $\nabla^1$ of $(G_6, J)$ is given by

\begin{align*}
\nabla^1_{e_1} e_1 &= 0, \quad \nabla^1_{e_1} e_2 = 0, \quad \nabla^1_{e_1} e_3 = \delta e_3, \\
\nabla^1_{e_2} e_1 &= -\alpha e_2, \quad \nabla^1_{e_2} e_2 = \alpha e_1, \quad \nabla^1_{e_2} e_3 = 0, \\
\nabla^1_{e_3} e_1 &= -\gamma e_2, \quad \nabla^1_{e_3} e_2 = 0, \quad \nabla^1_{e_3} e_3 = 0.
\end{align*}

By (2.8) and Lemma 3.15, we have

**Lemma 3.16.** The curvature $R^1$ of the Kobayashi-Nomizu connection $\nabla^1$ of $(G_6, J)$ is given by

\begin{align*}
R^1(e_1, e_2) e_1 &= (\alpha^2 + \beta \gamma) e_2, \quad R^1(e_1, e_2) e_2 = -\alpha^2 e_1, \quad R^1(e_1, e_2) e_3 = 0, \\
R^1(e_1, e_3) e_1 &= \gamma (\alpha + \delta) e_2, \quad R^1(e_1, e_3) e_2 = -\alpha \gamma e_1, \quad R^1(e_1, e_3) e_3 = 0, \\
R^1(e_2, e_3) e_1 &= -\alpha \gamma e_1, \quad R^1(e_2, e_3) e_2 = \alpha \gamma e_2, \quad R^1(e_2, e_3) e_3 = 0.
\end{align*}

By (2.10),(2.11) and Lemma 3.16, we get for $(G_6, \nabla^1)$

\begin{align*}
Ric^1 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -(\alpha^2 + \beta \gamma) & 0 & 0 \\ 0 & -\alpha^2 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\end{align*}
If \((G_6, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^1\), then \(\text{Ric}^1 = c\text{Id} + D\), so

\[
\begin{align*}
D e_1 &= -(\alpha^2 + \beta\gamma + c)e_1, \\
D e_2 &= -(\alpha^2 + c)e_2, \\
D e_3 &= -ce_3.
\end{align*}
\]

(3.24)

By (2.15) and (3.24), we get

\[
\begin{align*}
\alpha(\alpha^2 + \beta\gamma + c) &= 0, \\
\beta(2\alpha^2 + \beta\gamma + c) &= 0, \\
(\beta\gamma + c)\gamma &= 0, \\
(\alpha^2 + \beta\gamma + c)\delta &= 0.
\end{align*}
\]

(3.25)

Solving (3.25), we get

**Theorem 3.17.** \((G_6, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^1\) if and only if

(i) \(\alpha = \beta = c = 0, \delta \neq 0\), in particular,

\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

(ii) \(\alpha \neq 0, \beta = \gamma = 0, \alpha^2 + c = 0, \alpha + \delta \neq 0\), in particular,

\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & \alpha^2 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

3.3 Algebraic Ricci solitons of \(G_7\)

By (2.7) and Lemma 4.5 in [1], we have for \(G_7\), there exists a pseudo-orthonormal basis \(\{e_1, e_2, e_3\}\) with \(e_3\) timelike such that the Lie algebra of \(G_7\) satisfies

\[
[e_1, e_2] = -\alpha e_1 - \beta e_2 - \beta e_3, \ [e_1, e_3] = \alpha e_1 + \beta e_2 + \beta e_3, \ [e_2, e_3] = \gamma e_1 + \delta e_2 + \delta e_3, \alpha + \delta \neq 0, \alpha \gamma = 0.
\]

(3.26)

**Lemma 3.18.** \([3, \text{II}]\) The Levi-Civita connection \(\nabla\) of \(G_7\) is given by

\[
\begin{align*}
\nabla_{e_1} e_1 &= \alpha e_2 + \alpha e_3, \ \nabla_{e_2} e_1 = \beta e_2 + (\beta + \frac{\gamma}{2})e_3, \ \nabla_{e_3} e_1 = -(\beta - \frac{\gamma}{2})e_2 - \beta e_3, \\
\nabla_{e_1} e_2 &= -\alpha e_1 + \frac{\gamma}{2} e_3, \ \nabla_{e_2} e_2 = -\beta e_1 + \delta e_3, \ \nabla_{e_3} e_2 = (\beta - \frac{\gamma}{2})e_1 - \delta e_3, \\
\nabla_{e_1} e_3 &= \alpha e_1 + \frac{\gamma}{2} e_2, \ \nabla_{e_2} e_3 = (\beta + \frac{\gamma}{2})e_1 + \delta e_2, \ \nabla_{e_3} e_3 = -\beta e_1 - \delta e_2.
\end{align*}
\]

(3.27)
By (2.4) and (3.27), we have

**Lemma 3.19.** For $G_7$, the following equalities hold

\[(3.28) \quad \nabla_{e_1}(J)e_1 = 2\alpha e_3, \ \nabla_{e_1}(J)e_2 = \gamma e_3, \ \nabla_{e_1}(J)e_3 = -2\alpha e_1 - \gamma e_2, \]
\[\nabla_{e_2}(J)e_1 = 2(\beta + \frac{\gamma}{2})e_3, \ \nabla_{e_2}(J)e_2 = 2\delta e_3, \ \nabla_{e_2}(J)e_3 = -2(\beta + \frac{\gamma}{2})e_1 - 2\delta e_2, \]
\[\nabla_{e_3}(J)e_1 = -2\beta e_3, \ \nabla_{e_3}(J)e_2 = -2\delta e_3, \ \nabla_{e_3}(J)e_3 = 2\beta e_1 + 2\delta e_2. \]

By (2.4),(2.5), Lemma 3.18 and Lemma 3.19, we have

**Lemma 3.20.** The canonical connection $\nabla^0$ of $(G_7, J)$ is given by

\[(3.29) \quad \nabla^0_{e_1}e_1 = \alpha e_2, \ \nabla^0_{e_1}e_2 = -\alpha e_1, \ \nabla^0_{e_1}e_3 = 0, \]
\[\nabla^0_{e_2}e_1 = \beta e_2, \ \nabla^0_{e_2}e_2 = -\beta e_1, \ \nabla^0_{e_2}e_3 = 0, \]
\[\nabla^0_{e_3}e_1 = -(\beta - \frac{\gamma}{2})e_2, \ \nabla^0_{e_3}e_2 = (\beta - \frac{\gamma}{2})e_1, \ \nabla^0_{e_3}e_3 = 0. \]

By (2.7) and Lemma 3.20, we have

**Lemma 3.21.** The curvature $R^0$ of the canonical connection $\nabla^0$ of $(G_7, J)$ is given by

\[(3.30) \quad R^0(e_1, e_2)e_1 = (\alpha^2 + \frac{\beta\gamma}{2})e_2, \quad R^0(e_1, e_2)e_2 = -(\alpha^2 + \frac{\beta\gamma}{2})e_1, \quad R^0(e_1, e_2)e_3 = 0, \]
\[R^0(e_1, e_3)e_1 = -(\alpha^2 + \frac{\beta\gamma}{2})e_2, \quad R^0(e_1, e_3)e_2 = (\alpha^2 + \frac{\beta\gamma}{2})e_1, \quad R^0(e_1, e_3)e_3 = 0, \]
\[R^0(e_2, e_3)e_1 = -(\gamma\alpha + \frac{\beta\gamma}{2})e_2, \quad R^0(e_2, e_3)e_2 = (\gamma\alpha + \frac{\beta\gamma}{2})e_1, \quad R^0(e_2, e_3)e_3 = 0. \]

By (2.9),(2.11) and Lemma 3.21, we get for $(G_7, \nabla^0)$

\[(3.31) \quad \text{Ric}^0 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -(\alpha^2 + \frac{\beta\gamma}{2}) & 0 & 0 \\ 0 & -\alpha^2 + \frac{\beta\gamma}{2} & 0 \\ -(\gamma\alpha + \frac{\beta\gamma}{2}) & 0 & (\alpha^2 + \frac{\beta\gamma}{2}) \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}. \]

If $(G_7, g, J)$ is the first kind algebraic Ricci soliton associated to the connection $\nabla^0$, then \text{Ric}^0 = c\text{Id} + D$, so

\[(3.32) \quad \begin{cases} 
De_1 = -(\alpha^2 + \frac{\beta\gamma}{2} + c)e_1, \\
De_2 = -(\alpha^2 + \frac{\beta\gamma}{2} + c)e_2, \\
De_3 = -(\gamma\alpha + \frac{\beta\gamma}{2})e_1 + (\alpha^2 + \frac{\beta\gamma}{2})e_2 - ce_3.
\end{cases} \]
By (2.15) and (3.32), we get

\[
\begin{align*}
\begin{bmatrix}
\alpha (\alpha^2 + \frac{\beta \gamma}{2} + c) - \beta (\gamma \alpha + \frac{\delta \gamma}{2}) = 0, \\
\beta (2\alpha^2 + \beta \gamma + c) = 0, \\
c \gamma + (\alpha - \delta)(\gamma \alpha + \frac{\delta \gamma}{2}) = 0, \\
(\alpha^2 + \frac{\beta \gamma}{2} + c) \delta + \beta (\gamma \alpha + \frac{\delta \gamma}{2}) = 0
\end{bmatrix}
\end{align*}
\]  

(3.33)

Solving (3.33), we get

**Theorem 3.22.** \((G_7, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^0\) if and only if

(i) \(\alpha = \gamma = c = 0, \beta \neq 0, \delta \neq 0\), in particular,

\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}
\]

(ii) \(\beta = \gamma = 0, \alpha^2 + c = 0, \alpha + \delta \neq 0\), in particular,

\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & \alpha^2 & \alpha^2 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}
\]

By (2.12),(2.13) and (3.31), we have for \((G_7, \nabla^0)\)

\[
\tilde{\text{Ric}}^0 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -(\alpha^2 + \frac{\beta \gamma}{2}) & 0 & \frac{1}{2}(\gamma \alpha + \frac{\delta \gamma}{2}) \\ 0 & -(\alpha^2 + \frac{\beta \gamma}{2}) & \frac{1}{2}(\alpha^2 + \frac{\beta \gamma}{2}) \\ -\frac{1}{2}(\gamma \alpha + \frac{\delta \gamma}{2}) & \frac{1}{2}(\alpha^2 + \frac{\beta \gamma}{2}) & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}
\]

If \((G_7, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^0\), then \(\text{Ric}^0 = c \text{Id} + D\), so

\[
\begin{align*}
D e_1 &= -(\alpha^2 + \frac{\beta \gamma}{2} + c)e_1 + \frac{1}{2}(\gamma \alpha + \frac{\delta \gamma}{2})e_3, \\
D e_2 &= -(\alpha^2 + \frac{\beta \gamma}{2} + c)e_2 - \frac{1}{2}(\alpha^2 + \frac{\beta \gamma}{2})e_3, \\
D e_3 &= -\frac{1}{2}(\gamma \alpha + \frac{\delta \gamma}{2})e_1 + \frac{1}{2}(\alpha^2 + \frac{\beta \gamma}{2})e_2 - ce_3.
\end{align*}
\]

(3.35)

By (2.15) and (3.35), we get

\[
\begin{align*}
\alpha (\frac{\alpha^2}{2} + \frac{\beta \gamma}{2} + c) - \frac{1}{2}(\beta + \gamma)(\gamma \alpha + \frac{\delta \gamma}{2}) &= 0, \\
\beta (\frac{\alpha^2}{2} + \frac{\beta \gamma}{2} + c) - \frac{1}{2}\delta(\gamma \alpha + \frac{\delta \gamma}{2}) &= 0, \\
\alpha (\frac{\alpha^2}{2} + \frac{\beta \gamma}{2} + c) - \frac{1}{2}\beta(\gamma \alpha + \frac{\delta \gamma}{2}) &= 0, \\
\gamma \alpha - \frac{1}{4}\gamma \delta^2 &= 0, \\
\delta (\frac{\alpha^2}{2} + \frac{\beta \gamma}{2} + c) + \frac{1}{2}\beta(\gamma \alpha + \frac{\delta \gamma}{2}) &= 0, \\
\delta (\frac{\alpha^2}{2} + \frac{\beta \gamma}{2} + c) + \frac{1}{2}(\beta + \gamma)(\gamma \alpha + \frac{\delta \gamma}{2}) &= 0.
\end{align*}
\]

(3.36)

Solving (3.36), we get
**Theorem 3.23.** \((G_7, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^0\) if and only if 

(i) \(\alpha = \gamma = c = 0, \beta \neq 0\), in particular,

\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

(ii) \(\alpha \neq 0, \beta = \gamma = 0, \frac{\alpha^2}{2} + c = 0, \alpha + \delta \neq 0\), in particular,

\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\frac{\alpha^2}{2} & 0 & 0 \\ 0 & -\frac{\alpha^2}{2} & -\frac{\alpha^2}{2} \\ 0 & 0 & -\frac{\alpha^2}{2} \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

By (2.6), Lemma 3.19 and Lemma 3.20, we have

**Lemma 3.24.** The Kobayashi-Nomizu connection \(\nabla^1\) of \((G_7, J)\) is given by

\[
(3.37) \quad \nabla^1_{e_1} e_1 = \alpha e_2, \quad \nabla^1_{e_1} e_2 = -\alpha e_1, \quad \nabla^1_{e_1} e_3 = \beta e_3,
\]

\[
\nabla^1_{e_2} e_1 = \beta e_2, \quad \nabla^1_{e_2} e_2 = -\beta e_1, \quad \nabla^1_{e_2} e_3 = \delta e_3,
\]

\[
\nabla^1_{e_3} e_1 = -\alpha e_1 - \beta e_2, \quad \nabla^1_{e_3} e_2 = -\gamma e_1 - \delta e_2, \quad \nabla^1_{e_3} e_3 = 0.
\]

By (2.8) and Lemma 3.24, we have

**Lemma 3.25.** The curvature \(R^1\) of the Kobayashi-Nomizu connection \(\nabla^1\) of \((G_7, J)\) is given by

\[
R^1(e_1, e_2)e_1 = -\alpha \beta e_1 + \alpha^2 e_2, \quad R^1(e_1, e_2)e_2 = -(\alpha^2 + \beta^2 + \beta \gamma) e_1 - \beta \delta e_2,
\]

\[
R^1(e_1, e_2)e_3 = \beta (\alpha + \delta) e_3, \quad R^1(e_1, e_3)e_1 = (2 \alpha \beta + \alpha \gamma) e_1 + (-2 \alpha^2 + \alpha \delta) e_2,
\]

\[
R^1(e_1, e_3)e_2 = (\alpha \delta + \beta^2 + \beta \gamma) e_1 - (\gamma \alpha + \alpha \beta - \beta \delta) e_2, \quad R^1(e_1, e_3)e_3 = -\beta (\alpha + \delta) e_3,
\]

\[
R^1(e_2, e_3)e_1 = (\beta^2 + \beta \gamma + \alpha \delta) e_1 - (\alpha \beta - \beta \delta + \alpha \gamma) e_2,
\]

\[
R^1(e_2, e_3)e_2 = (2 \beta \delta - \alpha \beta + \alpha \gamma + \delta \gamma) e_1 - (\beta \gamma + \beta^2 - \delta^2) e_2,
\]

\[
R^1(e_2, e_3)e_3 = -(\beta \gamma + \delta^2) e_3.
\]

By (2.10), (2.11) and Lemma 3.25, we get for \((G_7, \nabla^1)\)

\[
(3.39) \quad \text{Ric}^1 \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\alpha^2 & \beta \delta & -\beta (\alpha + \delta) \\ -\alpha \beta & -\alpha^2 + \beta^2 + \beta \gamma & -\beta (\alpha + \delta) \\ \beta (\alpha + \delta) & -\alpha \beta & \delta (\alpha + \delta) \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]
If \((G_7, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^1\), then 
\[ \text{Ric}^1 = c \text{Id} + D, \]
so
\[\begin{align*}
D e_1 &= -(\alpha^2 + c) e_1 + \beta \delta e_2 - \beta (\alpha + \delta) e_3, \\
D e_2 &= -\alpha \beta e_1 - (\alpha^2 + \beta^2 + \beta \gamma + c) e_2 - (\beta \gamma + \delta^2) e_3, \\
D e_3 &= \beta (\alpha + \delta) e_1 + \delta (\alpha + \delta) e_2 - c e_3.
\end{align*}\] (3.40)

By (2.15) and (3.40), we get
\[\begin{align*}
\alpha (\alpha^2 + \beta^2 + c) + \beta^2 \delta + \beta \gamma \delta - \alpha \delta^2 &= 0, \\
\beta \alpha^2 + \beta c + 3 \alpha \beta \delta + \beta^2 \gamma - \beta^2 \gamma &= 0, \\
\beta (\alpha^2 + \beta^2 + c - \delta^2 - \beta \gamma) &= 0, \\
\alpha c + \beta^2 \delta - \beta \gamma \delta + \alpha^2 \delta + \alpha \delta^2 &= 0, \\
\beta (\beta^2 + \beta \gamma - 3 \alpha \delta - c - \delta^2) &= 0, \\
\beta (\beta \gamma + \delta^2 - c) &= 0, \\
\gamma (\alpha^2 + \beta^2 + \beta \gamma + c) + \beta \delta^2 - \alpha \beta \delta &= 0, \\
\delta (\beta \gamma + c + \delta \alpha + \delta^2 - \beta^2) &= 0, \\
\delta (\alpha^2 + \beta^2 - \delta^2 + c) - (\alpha + \delta)(\beta \gamma + \beta^2) + \alpha \beta^2 &= 0.
\end{align*}\] (3.41)

Solving (3.41), we get

**Theorem 3.26.** \((G_7, g, J)\) is the first kind algebraic Ricci soliton associated to the connection \(\nabla^1\) if and only if \(\alpha \neq 0, \beta = \gamma = 0, \alpha = 2 \delta, c = -3 \delta^2\), in particular

\[
D \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} = \begin{pmatrix} -\delta^2 & 0 & 0 \\ 0 & -\delta^2 & -\delta^2 \\ 0 & 3 \delta^2 & 3 \delta^2 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\]

By (2.12),(2.13) and (3.39), we have for \((G_7, \nabla^1)\)
\[\begin{align*}
\widetilde{\text{Ric}}^{-1} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix} &= \begin{pmatrix} -\alpha^2 & \frac{1}{2} (\beta \delta - \alpha \beta) & -\beta (\alpha + \delta) \\ \frac{1}{2} (\beta \delta - \alpha \beta) & -\alpha^2 + \beta^2 + \beta \gamma & -\frac{1}{2} (\beta \gamma + \alpha \delta + 2 \delta^2) \\ \beta (\alpha + \delta) & \frac{1}{2} (\beta \gamma + \alpha \delta + 2 \delta^2) & 0 \end{pmatrix} \begin{pmatrix} e_1 \\ e_2 \\ e_3 \end{pmatrix}.
\end{align*}\] (3.42)

If \((G_7, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^1\), then \(\widetilde{\text{Ric}}^1 = c \text{Id} + D\), so
\[\begin{align*}
D e_1 &= -(\alpha^2 + c) e_1 + \frac{1}{2} (\beta \delta - \alpha \beta) e_2 - \beta (\alpha + \delta) e_3, \\
D e_2 &= \frac{1}{2} (\beta \delta - \alpha \beta) e_1 - (\alpha^2 + \beta^2 + \beta \gamma + c) e_2 - \frac{1}{2} (\beta \gamma + \alpha \delta + 2 \delta^2) e_3, \\
D e_3 &= \beta (\alpha + \delta) e_1 + \frac{1}{2} (\beta \gamma + \alpha \delta + 2 \delta^2) e_2 - c e_3.
\end{align*}\] (3.43)
By (2.15) and (3.43), we get

\[
\begin{align*}
\alpha(\alpha^2 + \beta^2 + \beta \gamma + c) + (\beta^2 + \beta \gamma)(\alpha + \delta) + \beta(\beta \delta - \alpha \beta) - \alpha c &= 0, \\
\beta(2\alpha^2 + \beta^2 + \beta \gamma + c) + \beta(\alpha + \delta)(\delta - \alpha) - \beta(\beta \gamma + \alpha \delta + 2\delta^2) &= 0, \\
\alpha c + \frac{1}{2}(\beta - \gamma)(\beta \delta - \alpha \beta) + \alpha \delta c &= 0, \\
\frac{1}{2}(\beta \delta - \alpha \beta) + \beta(\beta^2 + \beta \gamma - c) + \beta(\beta \gamma + \alpha \delta + 2\delta^2) &= 0, \\
\beta(\alpha - \delta) &= 0.
\end{align*}
\]

Solving (3.44), we get

**Theorem 3.27.** \((G, g, J)\) is the second kind algebraic Ricci soliton associated to the connection \(\nabla^1\) if and only if \(\alpha \neq 0\), \(\beta = \gamma = 0\), \(\alpha = 2\delta\), \(\alpha^2 + 2c = 0\), in particular

\[
D\begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix} = \begin{pmatrix}
-\frac{\alpha^2}{2} & 0 & 0 \\
0 & -\frac{\alpha^2}{2} & -\frac{\alpha^2}{2} \\
0 & \frac{\alpha^2}{2} & \frac{\alpha^2}{2}
\end{pmatrix}\begin{pmatrix}
e_1 \\
e_2 \\
e_3
\end{pmatrix}.
\]
