SOLVABILITY FOR NON-SMOOTH SCHRÖDINGER EQUATIONS WITH SINGULAR POTENTIALS AND SQUARE INTEGRABLE DATA

ANDREW J. MORRIS AND ANDREW J. TURNER

ABSTRACT. We develop a holomorphic functional calculus for first-order operators $DB$ to solve boundary value problems for Schrödinger equations $-\text{div} A \nabla u + aV u = 0$ in the upper half-space $\mathbb{R}^{n+1}_+$ when $n \geq 3$. This relies on quadratic estimates for $DB$, which are proved for coefficients $A, a, V$ that are independent of the transversal direction to the boundary, and comprised of a complex-elliptic pair $A, a$ that are bounded and measurable, and a singular potential $V$ in either $L^2(\mathbb{R}^n)$ or the reverse H"older class $B^{\frac{n}{2}}(\mathbb{R}^n)$. In the latter case, the square function bounds are also shown to be equivalent to non-tangential maximal function bounds. This allows us to prove that the Dirichlet regularity and Neumann boundary value problems with $L^2(\mathbb{R}^n)$-data are well-posed if and only if certain boundary trace operators defined by the functional calculus are isomorphisms. We prove this property when the principal coefficient matrix $A$ has either a Hermitian or block structure. More generally, the set of all complex-elliptic $A$ for which the boundary value problems are well-posed is shown to be open in $L^\infty$.

1. Introduction

We consider boundary value problems for Schrödinger equations

\begin{equation}
H_{A,a,V} u(t,x) := - \text{div}_{t,x} A(x) \nabla_{t,x} u(t,x) + a(x)V(x)u(t,x) = 0
\end{equation}

on the upper half-space \( \mathbb{R}^{n+1}_+ := \{(t,x) \in \mathbb{R} \times \mathbb{R}^n : t > 0\} \), for integers \( n \geq 3 \), where \( A \in L^\infty(\mathbb{R}^{n+1}; \mathcal{L}(\mathbb{C}^{1+n})) \) and \( a \in L^\infty(\mathbb{R}^{n+1}; \mathcal{L}(\mathbb{C})) \) are complex, \( t \)-independent, and elliptic, which we will define later.

In [29], Shen studied the equation \(- \Delta u + V u = 0\) above a Lipschitz curve with \( V \in B^\infty \). It was shown there exists a unique solution of the Neumann problem with \( L^p \) boundary data for \( p \in (1, 2] \). Later, in [33], Tao and Wang extended these results to include solving the Neumann problem where \( V \in B^0 \) and with \( L^p \) boundary data for \( p \in (1, 2] \) or in the Hardy space \( H^p \) for \( p \in (1 - \varepsilon, 1) \) where \( \varepsilon \in (0, \frac{1}{4}) \). Tao also proved, in [32], the corresponding Regularity problem for boundary data in a Hardy space adapted to the potential \( V \in B^n(\mathbb{R}^{n+1}) \). In [34], Yang proves that for a bounded Lipschitz domain and \( V \in B^n(\mathbb{R}^n) \), the Neumann and regularity problems are well-posed in \( L^p \), for \( p > 2 \), if the non-tangential maximal function of the gradient of solutions satisfies an \( L^p \to L^2 \) weak reverse Hölder estimate.

More recently, boundary value problems for equations of the form

\begin{equation}
- \text{div}(A \nabla u + b \cdot u) + c \cdot \nabla u + du
\end{equation}

have been studied. In [23], Kim and Sakellaris study Green’s functions for this equation when \( b, c, d \) are in certain Lebesgue spaces, without any smallness condition, but with additional conditions that \( d \geq \text{div} b \) or \( d \geq \text{div} c \). Here \( A \) is assumed to be real and uniformly elliptic. In [26], Sakellaris, considered boundary value problems for (1.2) on bounded domains with Dirichlet and regularity boundary data, and the additional condition that \( A \) is Hölder continuous. Sakellaris, then extended this to arbitrary domains in [27], where the estimates on the Green functions are in Lorentz spaces and are scale invariant. Also, in [25], Mouroglou proves well posedness for the Dirichlet problem in unbounded domains, with coefficients in a local Stummel–Kato class. He also constructs Green functions and proves scale invariance for them. In [16], Davey, Hill, and Mayboroda construct Green’s matrices for complex bounded coefficients under particular conditions on the solutions of (1.1). Exponential decay of the fundamental solution to \(- (\nabla - ia)^T A(\nabla - ia) u + V u = 0\) was proven by Mayboroda and Poggi in [24]. There is also forthcoming work by Bortz, García, Hofmann, Mayboroda and Poggi, which treats well-posedness of these equations when the coefficients have sufficiently small \( L^p \)-norm.

We develop methods used by Auscher, Axelsson, and McIntosh in [4] for boundary value problems of the equation

\begin{equation}
\text{div}_{t,x} A(x) \nabla_{t,x} u(t,x) = 0,
\end{equation}

and adapt these methods to include the \( 0^{th} \) order term \( aV \). These methods rely on the bounded holomorphic functional calculus, which we will define later, of the first-order operator \( DB \), where \( D \) is a self-adjoint, first-order differential operator and \( B \) is a bounded matrix valued multiplication operator, that is elliptic on \( \mathcal{R}(D) \). In the case of (1.3) this was proved by Axelsson, Keith, and McIntosh in [12], which expanded on methods developed for the solution of the Kato square root problem obtained by Auscher, Hofmann, Lacey, McIntosh, and Tchamitchian in [11]. The first-order approach developed in [4] and later in [2] shows an equivalence between the second-order elliptic equation with a first-order Cauchy–Riemann-type system

\begin{equation}
\partial_t F + DBF = 0.
\end{equation}

If \( DB \) were to be a sectorial operator, then it would generate an analytic semigroup which would solve (1.4). However, \( DB \) is in fact a bisectorial operator. In the case \( V \equiv 0 \), the boundedness of the holomorphic functional calculus of \( DB \) was proved in [12] and this was used to prove that \( DB \) is sectorial on a subspace of \( \mathcal{R}(D) \). Then, in [4], this was used along with analytic semigroup theory to give solutions to (1.4). The problem was then reduced to showing these solutions come from the correct spaces of boundary data, by constructing a mapping between
the initial value of (1.4) with the correct boundary data for (1.1) and showing that this mapping is invertible.

The first order method has already been adapted to the degenerate elliptic case by Auscher, Rosen, and Rule in [10] and the parabolic case by Auscher, Egert, and Nystrom in [6]. The first order method was also used to prove solvability for elliptic systems with block triangular coefficient matrices $A$ by Auscher, Mourougou, and McIntosh in [7].

To prove the functional calculus results we follow [12] and [3] by proving a quadratic estimate. To overcome the lack of coercivity ((H8) in [12]), we exploit the structure of the operator $DB$ using ideas introduced by Bailey in [15]. In [15], it is proved that the operator $-\text{div } A\nabla + V$ satisfies a Kato square root type estimate for a large class of potentials $V$ using the Axelsson-Keith-McIntosh framework of [12]. However, in [15], the bounded holomorphic functional calculus is proved for Dirac-type operators of the form $\Gamma + \Gamma^* B$ which does not directly imply the same results for operators of the form $DB$. Therefore, we adapt the methods for such operators and in doing so we restrict the class of potentials we are interested in, namely the reverse Hölder class, $B^\frac{3}{2}(\mathbb{R}^n)$ (defined in section 2.1) and $L^\frac{3}{2}(\mathbb{R}^n)$. To establish bounds on the holomorphic functional calculus for $DB$, we divide the dyadic decomposition into, ‘big’ and ‘small’ cubes, depending on a property of the potential $V$. We shall see that on ‘small’ cubes $DB$ behaves similarly to the case when $V \equiv 0$, whereas, on ‘big’ cubes $DB$ will be treated differently by using the Fefferman–Phong inequality from [5]. Once the boundedness of the holomorphic functional calculus has been established, we will be able to split $\mathbb{R}(D)$ into two Hardy projections. We are then able to prove that these projections correspond to the initial data of solutions to the first-order equation on the upper or lower half-space.

For $F \in L^2_{\text{loc}}(\mathbb{R}_+^{n+1})$ and $x \in \mathbb{R}^n$, we define the non-tangential maximal operator as

$$(\tilde{N}_s F)(x) := \sup_{t > 0} \left( \int_{W(t,x)} |F(s,y)|^2 \, dy \, ds \right)^\frac{1}{2},$$

where $W(t,x) := [t, 2t] \times Q(t,x)$ and is the Whitney box of scale $t > 0$, centred at $x \in \mathbb{R}^n$ where $Q(t,x)$ is the cube of side-length $l(Q(t,x)) = t$, centred at $x$. Also for $F \in L^2_{\text{loc}}(\mathbb{R}_+^{n+1})$ and $f \in L^2_{\text{loc}}(\mathbb{R}^n)$, we say that $F$ converges to $f$ pointwise on Whitney averages if

$$\lim_{t \to 0} \int_{W(t,x)} |F(s,y) - f(x)|^2 \, dy \, dt = 0, \quad \text{for almost all } x \in \mathbb{R}^n.$$ 

We introduce the adapted gradients

$$\nabla_{\mu} f := \left[ \begin{array}{c} \nabla f \\ |V|^2 f \end{array} \right]$$

We also define an adapted Sobolev space, $\mathcal{V}^{1,2}(\Omega)$, adapted to the potential $V$. We have that $\mathcal{V}^{1,2}_{\text{loc}}(\Omega)$ is the version defined locally and $\dot{\mathcal{V}}^{1,2}(\Omega)$ is the homogeneous version. We give a detailed description of these in Section 2.1.

**Definition 1.1.** We shall write that $u$ is a weak solution of $-\text{div } A\nabla u + Vu = 0$ in $\Omega$, or simply that $H_{A,0,V} u = 0$ in $\Omega$, if $u \in \mathcal{V}^{1,2}_{\text{loc}}(\Omega)$ and

$$\int_{\Omega} A\nabla u \cdot \nabla v + aVu \varphi = 0,$$

for all $v \in C^\infty_c(\Omega)$.

We will impose one of the following conditions on $u$ on the boundary of $\partial \mathbb{R}_+^{n+1}$ (which we identify naturally with $\mathbb{R}^{n}$): Neumann, or Dirichlet Regularity,

$$(\mathcal{N}_{L^2})^d_{L^2} \begin{cases} -\text{div } A\nabla u + aVu = 0 \text{ in } \mathbb{R}^{n+1}_+; \\
\tilde{N}_s(\nabla_{\mu} u) \in L^2(\mathbb{R}^n), \\
\lim_{t \to 0} \partial_{\nu_{A}} u(t,\cdot) = \varphi, \varphi \in L^2(\mathbb{R}^n) \end{cases}$$

$$(\mathcal{R}_{L^2})^d \begin{cases} -\text{div } A\nabla u + aVu(t,x) = 0 \text{ in } \mathbb{R}^{n+1}_+; \\
\tilde{N}_s(\nabla_{\mu} u) \in L^2(\mathbb{R}^n), \\
\lim_{t \to 0} \nabla_{\mu} u(t,\cdot) = \nabla_{\mu} \varphi, \varphi \in \dot{\mathcal{V}}^{1,2}(\mathbb{R}^n) \end{cases}$$
where the limits are taken to be in $L^2$ and pointwise on Whitney averages. We say $(\mathcal{N})^A_{L^2}$ and $(\mathcal{R})^A_{L^2}$ are well-posed if, for each boundary data, there exists a unique $u$ satisfying the above boundary value problems. We also define the sets $WP(\mathcal{N})$ and $WP(\mathcal{R})$ to be the set of all $\mathcal{A}$ such that $(\mathcal{N})^A_{L^2}$ and $(\mathcal{R})^A_{L^2}$ are well-posed respectively.

**Theorem 1.2.** Let $V \in B^\infty_+(\mathbb{R}^n)$ and let $\mathcal{A} \in L^\infty(\mathbb{R}^{n+1}_+; \mathcal{L}(\mathbb{C}^{n+2}))$ be elliptic. Then the following are true:

1. The boundary value problems $(\mathcal{R})^A_{L^2}$ and $(\mathcal{N})^A_{L^2}$ are well-posed if $\mathcal{A}$ is self-adjoint or block-type;
2. The sets $WP(\mathcal{R})$ and $WP(\mathcal{N})$ are open;
3. If $\mathcal{A} \in WP(\mathcal{R})$, then for each $\varphi \in \dot{V}^{1,2}(\mathbb{R}^n)$ we have the estimates
   \[
   \int_0^\infty \|t\partial_t(\nabla_\mu u)\|^2_t dt \lesssim \|\tilde{N}_s(\nabla_\mu u)\|_2 \lesssim \|\nabla_\mu \varphi\|_2^2
   \]
   where $u$ is the solution for the initial data $\varphi \in \dot{V}^{1,2}(\mathbb{R}^n)$;
4. If $\mathcal{A} \in WP(\mathcal{N})$, then for each $\varphi \in L^2(\mathbb{R}^n)$ we have the estimates
   \[
   \int_0^\infty \|t\partial_t \nabla_\mu u_t\|^2_t dt \lesssim \|\tilde{N}_s(\nabla_\mu u)\|_2 \lesssim \|\varphi\|_2^2,
   \]
   where $u$ is the solution for the initial data $\varphi \in L^2(\mathbb{R}^n)$.

We prove the non-tangential maximal function estimates in Theorem 1.2 on the adapted gradient, $\nabla_\mu$, because this allows us to prove the following Fatou-type result as well. Our estimate is in fact a stronger statement as it requires non-tangential control of $|V|^{1/2}u$ as well as $\nabla_{t,x}u$. Thus we recover the more classical non-tangential estimate as a corollary.

**Theorem 1.3.** Let $V \in B^\infty_+(\mathbb{R}^n)$ and let $\mathcal{A} \in L^\infty(\mathbb{R}^{n+1}_+; \mathcal{L}(\mathbb{C}^{n+2}))$ be elliptic. Let $u \in \mathcal{V}^{1,2}(\mathbb{R}^{n+1})$ be such that $H_{\mathcal{A},a,V} u = 0$ with $\tilde{N}_s(\nabla_\mu u) \in L^2(\mathbb{R}^n)$. Then we have that:

1. There exists $\varphi \in L^2(\mathbb{R}^n)$ such that $\lim_{t \to 0} \partial_\varphi u(\cdot, t) = \varphi$ in $L^2$ and pointwise on Whitney averages;
2. There exists $\varphi \in \dot{V}^{1,2}(\mathbb{R}^n)$ such that $\lim_{t \to 0} \nabla_\mu u(t, \cdot) = \nabla_\mu \varphi$ in $L^2$ and pointwise on Whitney averages.

For $a, b \in \mathbb{R}$ we write $a \lesssim b$ if there exists $c > 0$ such that $a \leq cb$, and $a \equiv b$ if $a \lesssim b$ and $b \lesssim a$. We also use $\langle \cdot, \cdot \rangle$ to denote the $L^2$ inner product. We also denote the positive real line as $\mathbb{R}_+ := (0, \infty)$ and the negative real line as $\mathbb{R}_- := (-\infty, 0)$.

**Acknowledgements.** We would like to sincerely thank Julian Bailey and Pierre Portal for sharing preliminary versions of their recent work with us, which in particular, allowed us to remove an unnatural Riesz transform assumption in the proof of the main quadratic estimate. We are also deeply grateful to Moritz Egert for generously sharing his expertise and advice concerning the first-order functional calculus approach to boundary value problems. We would also like to thank Pascal Auscher, Simon Bortz, Steve Hofmann, Alessio Martini, Andreas Rosén and Adam Sikora for helpful discussions and insights that have contributed significantly to this paper. The second named author was also supported by a PhD scholarship from the EPSRC in the UK.

## 2. Preliminaries

### 2.1. Sobolev Spaces adapted to Singular Potentials.

Throughout this section, suppose that $d > 2$ is an integer and that $\Omega$ is an open subset of $\mathbb{R}^d$. The potential $V : \mathbb{R}^d \to \mathbb{C}$ always denotes a locally integrable function. In most results, it will be either complex-valued in $L^p(\mathbb{R}^d) := L^p(\mathbb{R}^d; \mathbb{C})$ for some $p \in (1, \infty)$, or nonnegative-valued in the reverse Hölder class $B^q(\mathbb{R}^d) := B^q(\mathbb{R}^d; [0, \infty))$ for some $q \in (1, \infty)$, so that either

\[
\|V\|_p := \left(\int_{\mathbb{R}^d} |V|^p \right)^{1/p} < \infty \quad \text{or} \quad [V]^q := \sup_{Q \subset \mathbb{R}^d} \frac{\langle V \rangle_Q}{|Q|}^{1/q} < \infty,
\]
where the supremum is taken over all (open $d$-dimensional) cubes $Q$ in $\mathbb{R}^d$, with side-length denoted by $l(Q)$, Lebesgue measure denoted by $|Q|$, and $\int_Q f := |Q|^{-1} \int_Q f$ for all $f \in L^1_{\text{loc}}(\mathbb{R}^d)$.

We will need to adapt the usual Sobolev spaces to account for the potential $V$ in our analysis. The following notation will be convenient for this purpose. If $f \in L^2_{\text{loc}}(\Omega)$, then $\nabla f \in \mathcal{D}'(\Omega)$ denotes the distribution

$$\nabla f := \left(\begin{array}{c} \nabla f \\ |V|^{1/2} f \end{array}\right),$$

where $\nabla f = (\partial_1 f, \ldots, \partial_d f)^T$ is the standard distributional gradient of $f$, whilst the product $\langle |V|^{1/2} f(x) \rangle = |V(x)|^{1/2} f(x)$ is defined pointwise almost everywhere on $\Omega$ and belongs to $L^1_{\text{loc}}(\Omega)$ (and thus can be interpreted as a distribution) because $f \in L^2_{\text{loc}}(\Omega)$ and $V \in L^1_{\text{loc}}(\mathbb{R}^d)$.

Our starting point is a minor variant of the standard Sobolev inequality (see, for instance, Section 2 in Chapter V of [31]): If $f \in L^p(\mathbb{R}^d)$ for some $p \in [1, \infty)$ and $\nabla f \in L^2(\mathbb{R}^d)$, then

$$\|f\|_{2^*} \lesssim_d \|\nabla f\|_2,$$

where $2^* := 2d/(d-2)$ is the Sobolev exponent for $\mathbb{R}^d$. We will consider potentials that can be controlled by this inequality as follows: If $V \in L^{d/2}(\mathbb{R}^d)$, then Hölder’s inequality implies that

$$\|V^{1/2} f\|_{L^2} \leq \|V\|_{L^{d/2}} \|f\|_{L^{2^*}}.$$

If $V \in B^{d/2}(\mathbb{R}^d)$, then Hölder’s inequality implies the local variant

$$\|V^{1/2} f\|_{L^2(Q)} \leq \|V\|_{L^{d/2}(Q)} \|f\|_{L^{2^*}(Q)} \leq \|V\|_{d/2} \left\langle l(Q)^2 \int_Q |V| \right\rangle \|f\|_{2^*},$$

for all cubes $Q \subset \mathbb{R}^d$. The following technical lemma provides the basis for the definition and analysis of our adapted Sobolev spaces.

**Lemma 2.1.** Let $p \in [1, \infty]$ and suppose that either $V \in L^{d/2}(\mathbb{R}^d)$ or $V \in B^{d/2}(\mathbb{R}^d)$. If $\{f_m\}$ is a sequence in $L^p(\Omega)$ that converges to some $f$ in $L^p(\Omega)$, and $\{\nabla f_m\}$ is a Cauchy sequence in $L^2(\Omega, \mathcal{C}^{d+1})$, then $\{\nabla f_m\}$ converges to $\nabla f$ in $L^2(\Omega, \mathcal{C}^{d+1})$.

**Proof.** Suppose that $\{f_m\}$ and $f$ satisfy the hypotheses of the lemma, in which case $\{\nabla f_m\}$ converges to some $(F_1, \ldots, F_d)$ in $L^2(\Omega, \mathcal{C}^{d+1})$ and $\{V^{1/2} f_m\}$ converges to some $F_d+1$ in $L^2(\Omega)$. It suffices to prove that $F_j = \partial_j f$ when $j \in \{1, \ldots, d\}$ whilst $F_{d+1} = |V|^{1/2} f$. If $j \in \{1, \ldots, d\}$ and $\phi \in \mathcal{C}^\infty_c(\Omega)$, then the definition of the distributional derivative and Hölder’s inequality imply the simple estimate

$$\left| \left(\int F_j \phi \right) - \left(\int f \partial_j \phi \right) \right| \leq \|F_j - \partial_j f_m\|_2 \|\phi\|_2 + \|f_m - f\|_p \|\partial_j \phi\|_{p'},$$

hence $\int F_j \phi = - \int f \partial_j \phi$ and thus $F_j = \partial_j f$. In particular, this shows that $\nabla f_m$ converges to $\nabla f$ in $L^2(\Omega, \mathcal{C}^d)$, which we shall now rely on to complete the proof. Suppose that $Q$ is a cube contained in $\Omega$. If $j = d+1$ and $\phi \in \mathcal{C}^\infty_c(\Omega)$ is supported in $Q$, then by (2.2) combined with either (2.3) or (2.4), we obtain

$$\left| \left(\int (F_{d+1} - |V|^{1/2} f) \phi \right) \right| \leq \|F_{d+1} - |V|^{1/2} f_m\|_2 \|\phi\|_2 + \|V^{1/2} (f_m - f)\|_{L^2(Q)} \|\phi\|_2 \lesssim_{d,V,Q} \|F_{d+1} - |V|^{1/2} f_m\|_2 \|\phi\|_2 + \|\nabla f_m - \nabla f\|_2 \|\phi\|_2,$n

hence $F_{d+1} = |V|^{1/2} f_m$ almost everywhere on $Q$, and thus also almost everywhere on $\Omega$. \qed

We now define the adapted Sobolev space $\mathcal{V}^{1,2}(\Omega)$ to be the inner-product space consisting of the set

$$\mathcal{V}^{1,2}(\Omega) := \{f \in L^2(\Omega) : \nabla f \in L^2(\Omega, \mathcal{C}^{d+1})\}$$

with the (complex) inner-product $\langle f, g \rangle_{\mathcal{V}^{1,2}(\Omega)} := \int_\Omega f \overline{g} + \int_\Omega \nabla f \cdot \nabla \overline{g}$ and the associated norm

$$\|f\|_{\mathcal{V}^{1,2}(\Omega)} := \left(\|f\|_{L^2}^2 + \|\nabla f\|_{L^2(\Omega, \mathcal{C}^{d+1})}^2\right)^{1/2}.$$
If either $V \in L^{d/2}(\mathbb{R}^d)$ or $V \in B^{d/2}(\mathbb{R}^d)$, then Lemma 2.1 shows that $\mathcal{V}^{1,2}(\Omega)$ is a Hilbert space. We then define $\mathcal{V}^{1,2}_0(\Omega)$ to be the closure of $C_c^\infty(\Omega)$ in $\mathcal{V}^{1,2}(\Omega)$. In the case $\Omega = \mathbb{R}^d$, it holds that $\mathcal{V}^{1,2}_0(\mathbb{R}^d) = \mathcal{V}^{1,2}(\mathbb{R}^d)$, since $C_c^\infty(\mathbb{R}^d)$ is a dense subspace of $\mathcal{V}^{1,2}(\mathbb{R}^d)$. The density of $C_c^\infty(\mathbb{R}^d)$ in the case $V \in B^{d/2}(\mathbb{R}^d)$ is proved in Theorem 1.8.1 of [17], which only requires that $V$ is nonnegative and locally integrable. In the case $V \in L^{d/2}(\mathbb{R}^d)$, the Sobolev inequality in (2.3) implies that $\|f\|_{\mathcal{V}^{1,2}}^2 \cong \|f\|_2^2 + \|\nabla f\|_2^2 =: \|f\|_{\mathcal{V}^{1,2}}^2$, so in fact $\mathcal{V}^{1,2}(\mathbb{R}^d)$ is just an equivalent normed space to the usual Sobolev space $W^{1,2}(\mathbb{R}^d)$, for which density of $C_c^\infty(\mathbb{R}^d)$ is well-known.

We also define $\mathcal{V}^{1,2}_{\text{loc}}(\Omega)$ to be the set of all $f \in L^2_{\text{loc}}(\Omega)$ such that $f \in \mathcal{V}^{1,2}(\Omega')$ for all open sets $\Omega'$ with compact closure $\overline{\Omega'} \subseteq \Omega$ (henceforth denoted $\Omega' \subset \Omega$).

We also define the homogeneous space $\mathcal{V}^{1,2}(\mathbb{R}^d)$ to be the completion of the normed space consisting of the set $C_c^\infty(\mathbb{R}^d)$ with the norm

$$\|f\|_{\mathcal{V}^{1,2}(\mathbb{R}^d)} := \|\nabla f\|_{L^2(\mathbb{R}^d,\mathbb{C}^d)}.$$ 

The precomplented space is a genuine normed space, since if $f \in \mathcal{D}^c(\mathbb{R}^d)$ and $\|\nabla f\|_{L^2(\mathbb{R}^d)} = 0$, then $f$ is a constant function, so when $f$ is also in $C_c^\infty(\mathbb{R}^d)$, it must hold that $f = 0$. Moreover, the Sobolev inequality (2.2), and Lemma 2.1 in the case $p = 2^*$, show that there is an injective embedding from the completion into $L^2(\mathbb{R}^d)$, allowing us to henceforth identify it as the set

$$\mathcal{V}^{1,2}(\mathbb{R}^d) = \{ f \in L^2(\mathbb{R}^d) : \nabla f \in L^2(\mathbb{R}^d) \},$$

with the norm equivalence

$$\|f\|_{\mathcal{V}^{1,2}(\mathbb{R}^d)} = \|\nabla f\|_{L^2(\mathbb{R}^d,\mathbb{C}^d)} \cong \left( \|f\|_{L^2(\mathbb{R}^d)}^2 + \|\nabla f\|_{L^2(\mathbb{R}^d,\mathbb{C}^d)}^2 \right)^{1/2}.$$ 

In particular, the set inclusion $\mathcal{V}^{1,2}(\mathbb{R}^d) \supseteq \{ f \in L^2(\mathbb{R}^d) : \nabla f \in L^2(\mathbb{R}^d) \}$ requires the density of $C_c^\infty(\mathbb{R}^d)$, with respect to the norm $\|\nabla f\|_{L^2(\mathbb{R}^d,\mathbb{C}^d)}$, in the latter set. This density can be proved using the arguments in Theorem 1.8.1 of [17], as discussed above for the space $\mathcal{V}^{1,2}(\mathbb{R}^d)$. In the case $V \in L^{d/2}(\mathbb{R}^d)$, we also have the equivalence $\|f\|_{\mathcal{V}^{1,2}}^2 \cong \|f\|_2^2 + \|\nabla f\|_2^2 \cong \|\nabla f\|_2^2$, so $\mathcal{V}^{1,2}(\mathbb{R}^d)$ is then just the realisation of the usual homogeneous Sobolev space $W^{1,2}(\mathbb{R}^d)$ in which each equivalent class of locally integrable functions modulo constant functions $[f] \in L^1_{\text{loc}}(\mathbb{R}^d)/\mathbb{C}$ is identified with a unique function $g \in L^2(\mathbb{R}^d)$ such that $g \in [f]$.

2.2. The Coefficients. We define the following two matrices $A \in L^\infty(\mathbb{R}^{1+n};\mathcal{L}(\mathbb{C}))$ and $A \in L^\infty(\mathbb{R}^{1+n};\mathcal{L}(\mathbb{C}^{1+n}))$ as $t$-independent $1 \times 1$ and $(n+1) \times (n+1)$-dimensional matrices respectively, with complex components. We split the coefficients of $A$ to obtain the following

$$A^V = \begin{bmatrix} A_{\perp \perp} & A_{\perp ||} & 0 \\ A_{|| \perp} & A_{|| ||} & 0 \\ 0 & 0 & \kappa \arg \nu \end{bmatrix}. $$

where $A_{\perp \perp}(x) \in \mathcal{L}(\mathbb{C})$, $A_{\perp ||}(x) \in \mathcal{L}(\mathbb{C}^n;\mathbb{C})$, $A_{|| \perp}(x) \in \mathcal{L}(\mathbb{C};\mathbb{C}^n)$, and $A_{|| ||}(x) \in \mathcal{L}(\mathbb{C}^n)$. In the case when $V(x) \geq 0$ for all $x \in \mathbb{R}^n$ we let $A := A^V$ to simplify notation. We also will represent vectors $v \in \mathbb{C}^{n+2}$ as the following

$$v = \begin{bmatrix} v_{\perp} \\ v_{||} \end{bmatrix},$$

where $v_{\perp} \in \mathbb{C}$ represents the normal part, $v_{||} \in \mathbb{C}^n$ represents the tangential part, and $v_{||} \in \mathbb{C}$ represents the potential adapted part. We assume that $A^V$ satisfies the following ellipticity condition: there exists $\kappa > 0$ such that

$$\sum_{l=0}^n \sum_{k=0}^n \Re \int_{\mathbb{R}^n} A^V_{l,k}(x) f_l(x) f_k(x) \, dx \geq \kappa \sum_{k=0}^n \int_{\mathbb{R}^n} |f(x)|^2 \, dx,$$
for all $f \in \{g \in L^2(\mathbb{R}^n, \mathbb{C}^{n+2}) : g_\perp \in L^2(\mathbb{R}^n)$ and $(g_\perp, g_\mu)^T = \nabla_\mu h$ for some $h \in \mathcal{V}^{1,2}(\mathbb{R}^n)\}$. We note that this is similar to the ellipticity condition in [4] adapted to the potential $V$. This is equivalent to the following

$$\begin{cases}
\text{Re}(A_{\perp \perp}(x)\xi) \cdot \overline{\xi} \geq \kappa |\xi|^2, \\
\text{Re} \int_{\mathbb{R}^n} [A_{\parallel} \parallel(x)\nabla f(x) \cdot \nabla f(x) + a(x)V(x)f(x)] \, dx \geq \kappa \int_{\mathbb{R}^n} |\nabla_\mu f(x)|^2 \, dx \quad \forall f \in \mathcal{V}^{1,2}(\mathbb{R}^n).
\end{cases}$$

To see the second inequality above set $f_{\perp} = 0$ in (2.5). For the first inequality set $f = (u,0,0)^T$ in (2.5) to get that

$$\text{Re} \int_{\mathbb{R}^n} A_{\perp \perp}(x)u(x) \overline{u(x)} \, dx \geq \kappa \int_{\mathbb{R}^n} |u(x)|^2 \, dx, \quad \forall u \in L^2(\mathbb{R}^n).$$

Now let $\varphi$ be a positive mollifier and then for $\xi \in \mathbb{C}$ and $y \in \mathbb{R}^n$ choose $u(x) = \xi \varphi_\varepsilon(y-x)$. Therefore we have that

$$\text{Re} \int_{\mathbb{R}^n} A_{\perp \perp}(x)\xi \varphi_\varepsilon(y-x) \xi \varphi_\varepsilon(y-x) \, dx \geq \kappa \int_{\mathbb{R}^n} |\xi \varphi_\varepsilon(y-x)|^2 \, dx \geq \kappa |\xi|^2 \left| \left\langle \phi(x) \, dx \right\rangle \right| = \kappa |\xi|^2.$$  

Also,

$$\text{Re} \int_{\mathbb{R}^n} A_{\perp \perp}(x)\xi \varphi_\varepsilon(y-x) \xi \varphi_\varepsilon(y-x) \, dx = \text{Re}((A_{\perp \perp} \ast \varphi_\varepsilon)(y)\xi \cdot \overline{\xi}).$$

Thus, taking limits as $\varepsilon \to 0$ we obtain

$$\text{Re}(A_{\perp}(y)\xi) \cdot \overline{\xi} \geq \kappa |\xi|^2, \quad \forall \xi \in \mathbb{C}, \quad a.e. \ y \in \mathbb{R}^n.$$

We note that the ellipticity condition (2.5) is between the pointwise ellipticity condition

$$\text{Re}(A^V(x)\xi) \cdot \overline{\xi} \geq \kappa |\xi|^2, \quad \forall \xi \in \mathbb{C}^{n+1}, \quad a.e. \ x \in \mathbb{R}^n,$$

and the following Gårding-type inequality adapted to the potential $V$

$$\text{Re} \int_{\mathbb{R}^n_{+1}} (A^V(x)\nabla f(t,x)) \cdot \nabla f(t,x) \, dt \, dx \geq \kappa \int_{\mathbb{R}^n_{+1}} \nabla_\mu f(t,x) \, dt \, dx \quad \forall f \in \mathcal{V}^{1,2}(\mathbb{R}^n_{+1})$$

Suppose that $A^V$ is as above. We now define the following sesquilinear form

$$J_{A,a,V}(u,v) := \int_{\mathbb{R}^n_{+1}} A \nabla u \cdot \nabla v + \int_{\mathbb{R}^n_{+1}} a V u \overline{v} = \int_{\mathbb{R}^n_{+1}} A^V \nabla_\mu u \cdot \nabla_\mu v,$$

for all $u, v \in \mathcal{V}^{1,2}(\mathbb{R}^n_{+1})$. If $J_{A,a,V}(u,u) \geq \|u\|_{1,2}^2$ for all $u \in \mathcal{Y}_{0}^{1,2}(\mathbb{R}^n_{+1})$, then $J_{A,a,V}$ is an accretive sesquilinear form, and we define $H_{A,a,V}$ to be the associated maximal accretive operator whereby $J_{A,a,V}(u,v) = (H_{A,a,V} u, v)$ for all $u$ in a dense domain $\text{D}(H_{A,a,V})$ in $L^2$ (see, for instance, Chapter 6 in [22]). We are now able to define the square root operator, $\sqrt{H_{A,a,V}}$, of $H_{A,a,V}$ as the unique maximal accretive operator such that $\sqrt{H_{A,a,V}} \sqrt{H_{A,a,V}} = H_{A,a,V}$, see [22, Theorem V.3.35] for more detail. Now the form satisfies

$$|J_{A,a,V}(u,v)| \leq \|A\|_{\infty} \int_{\mathbb{R}^n_{+1}} |\nabla_\mu u| |\nabla_\mu v| \leq \max\{\|A\|_{\infty}, \|a\|_{\infty}\} \|\nabla_\mu u\|_2 \|\nabla_\mu v\|_2.$$

Also, by (2.5) we have

$$|J_{A,a,V}(u,u)| \geq \text{Re}(A \nabla u, \nabla u) + (a V^{1/2} u, V^{1/2} u) \geq \kappa \|\nabla_\mu u\|_2^2.$$  

2.3. Functional Calculus of Bisectorial Operators. This section gives the definitions and some important results regarding the functional calculus of bisectorial operators and the relationship between functional calculus and quadratic estimates. For the proofs and more detail see [1] or [20]. We start by defining the closed and open sectors as

$$S_{\omega^\perp} = \{z \in \mathbb{C} : |\text{arg}(z)| \leq \omega\} \cup \{0\},$$

$$S_{\mu^\perp} = \{z \in \mathbb{C} : z \neq 0, |\text{arg}(z)| < \mu\},$$

where $0 \leq \omega < \mu < \pi$. Then we define the open bisector $S_{\mu}^o = S_{\mu^\perp} \cup (-S_{\mu^\perp})$ and closed bisector $S_{\mu} = S_{\mu^\perp} \cup (-S_{\mu^\perp})$ for $0 \leq \mu < \frac{\pi}{2}$. For a closed operator $T$ we denote $\sigma(T)$ as the spectrum of $T$.  

\textit{Note:} The symbol $\mathcal{V}^{1,2}$ is used to denote the Sobolev space of order 2. The notation $\mathcal{D}(\cdot)$ indicates the domain of an operator. The symbol $\text{Re}$ denotes the real part of a complex number. The symbol $\langle \cdot, \cdot \rangle$ denotes the inner product. The symbol $\nabla$ denotes the gradient operator. The symbol $\|\cdot\|_{\infty}$ denotes the supremum norm. The symbol $\|\cdot\|_2$ denotes the 2-norm. The symbol $\text{arg}$ denotes the argument of a complex number.
Definition 2.2. Let $\mathcal{X}$ be a Banach space. Let $0 \leq \omega < \pi$. Then a closed operator $T$ on $\mathcal{X}$ is sectorial of type $S_{\omega}$ if $\sigma(T) \subseteq S_{\omega}$ and, for each $\mu > \omega$, there exists $C_\mu > 0$ such that

$$
\|(T - zI)^{-1}\| \leq C_\mu |z|^{-1}, \quad \forall z \in \mathbb{C} \setminus S_{\mu}.
$$

We have a similar definition for bisectorial.

Definition 2.3. Let $\mathcal{X}$ be a Banach space. Let $0 \leq \omega < \frac{\pi}{2}$. Then a closed operator $T$ on $\mathcal{X}$ is bisectorial of type $S_{\omega}$ if $\sigma(T) \subseteq S_{\omega}$ and, for each $\mu > \omega$, there exists $C_\mu > 0$ such that

$$
\|(T - zI)^{-1}\| \leq C_\mu |z|^{-1}, \quad \forall z \in \mathbb{C} \setminus S_{\mu}.
$$

Let $H(S_{\mu}^0)$ be the set of all holomorphic functions on $S_{\mu}^0$. We define the following

$$
H^\infty(S_{\mu}^0) = \{ f \in H(S_{\mu}^0) : \|f\|_{\infty} < \infty \},
$$

$$
\Psi(S_{\mu}^0) = \{ \psi \in H^\infty(S_{\mu}^0) : \exists s, C > 0, |\psi(z)| \leq C|z|^s(1 + |z|^{2s})^{-1} \},
$$

$$
\mathcal{F}(S_{\mu}^0) = \{ f \in H(S_{\mu}^0) : \exists s, C > 0, |f(z)| \leq C(|z|^s + |z|^{-s}) \}.
$$

Note that $\Psi(S_{\mu}^0) \subseteq H^\infty(S_{\mu}^0) \subseteq \mathcal{F}(S_{\mu}^0) \subseteq H(S_{\mu}^0)$. Now for $\psi \in \Psi(S_{\mu}^0)$ and $\gamma$, the unbounded contour $\gamma = \{ z = re^{i\theta} : r \geq 0 \}$ parametrised clockwise around $S_{\omega}$ such that $0 \leq \omega < \theta < \mu < \pi$. Then for an injective, type $S_{\omega}$ operator $T$ we define $\psi(T)$ as

$$
\psi(T) = \frac{1}{2\pi i} \int_\gamma \psi(z)(T - zI)^{-1}dz.
$$

Note that as the integral converges and the resolvent operators are bounded we have $\psi(T) \in \mathcal{L}(\mathcal{X})$. Then we define the $\mathcal{F}$-functional calculus for $f \in \mathcal{F}(S_{\mu}^0)$ in the following way: let $\psi \in \Psi(S_{\mu}^0)$ be defined as

$$
\psi(z) = \left(\frac{z}{1 + z^2}\right)^{k+1},
$$

so $\psi f \in \Psi(S_{\mu}^0)$. Then for an injective, type $S_{\omega}$ operator $T$ we define $f(T)$ as

$$(2.6) \quad f(T) = (\psi(T))^{-1}(\psi f)(T).$$

Definition 2.4. Let $T$ be an injective operator of type $S_{\omega}$ in $\mathcal{H}$, and $0 \leq \omega < \mu < \pi$, then we say that $T$ has bounded $H^\infty$ functional calculus if, for all $f \in H^\infty((S_{\mu}^0))$, $f(T) \in \mathcal{L}(\mathcal{X})$ and there exists $c_\mu > 0$ such that

$$
\|f(T)u\| \leq c_\mu \|f\|_{\infty}\|u\|, \quad \forall u \in \mathcal{H}.
$$

The following theorem gives an equivalent condition to proving that an operator has a bounded holomorphic functional calculus.

Theorem 2.5. Let $T$ be an injective operator of type $S_{\omega}$ in $\mathcal{H}$. Then the following are equivalent:

1. The operator $T$ has a bounded $S_{\mu}^0$ holomorphic functional calculus for all $\mu > \omega$;
2. For each $\mu > \omega$, there exists $c_\mu > 0$ such that $\|\psi(T)u\| \leq c_\mu \|\psi\|_{\infty}\|u\|$ for all $u \in \mathcal{H}$ and for all $\psi \in \Psi(S_{\mu}^0)$;
3. The following quadratic estimate holds

$$
\int_0^\infty \|tT(I + t^2T^2)^{-1}u\|^2 \frac{dt}{t} \approx \|u\|^2_2 \text{ for all } u \in \mathcal{H};
$$

4. If $\mu > \omega$ and $\psi \in \Psi(S_{\mu}^0)$, then the following quadratic estimate holds

$$
\int_0^\infty \|\psi(tT)u\|^2 \frac{dt}{t} \approx \|u\|^2_2 \text{ for all } u \in \mathcal{H}.
$$

We note that in the definition of bounded holomorphic functional calculus we present the operator $T$ as being injective. In general we will not be dealing with injective operators, however, we will later restrict our operators to a subspace where injectivity holds, and so these result will be applicable after such a restriction.
3. Quadratic Estimates for First-Order Systems with Singular Potentials

The focus of this section is to prove quadratic estimates for first-order systems of the $DB$-type introduced in [8], and first developed in [3], which we adapt to incorporate singular potentials. We use the framework from Section 2.1 with $d = n > 2$ and $\Omega = \mathbb{R}^n$, since ultimately we will solve boundary value problems in the upper half-space $\mathbb{R}^{n+1}_+$ by applying the quadratic estimates obtained here on the domain boundary $\partial \mathbb{R}^{n+1}_+$. Moreover, it will be sufficient for our purposes to suppose throughout this section that either $V \in C^\infty(\mathbb{R}^n)$ or $V \in B^\infty_\alpha(\mathbb{R}^n)$. The operator $D: D(D) \subset L^2(\mathbb{R}^n, C^{n+2}) \to L^2(\mathbb{R}^n, C^{n+2})$ is then defined by the first-order system

$$Df := \begin{bmatrix} 0 & \text{div} & -|V|^\frac{1}{2} \\ -\nabla & 0 & 0 \\ -|V|^\frac{1}{2} & 0 & 0 \end{bmatrix} \begin{bmatrix} f_\parallel \\ f_\perp \\ f_\mu \end{bmatrix},$$

with its maximal domain in $L^2(\mathbb{R}^n, C^{n+2})$ being given by

$$D(D) := \{ f \in L^2(\mathbb{R}^n, C^{n+2}) : f_\perp \in V^{1,2}(\mathbb{R}^n) \text{ and } \text{div} f_\parallel - |V|^{1/2} f_\mu \in L^2(\mathbb{R}^n) \}.$$ 

This domain is maximal since $Df$ is well-defined as a distribution for all $f \in L^2(\mathbb{R}^n, C^{n+2})$. Indeed, recalling (2.1) and the surrounding discussion, the requirement that $f_\perp \in V^{1,2}(\mathbb{R}^n)$ is just that $\nabla_\mu f_\perp \in L^2(\mathbb{R}^n)$, whilst $\text{div} f_\parallel$ denotes the distributional divergence of $f_\parallel$, and $|V|^{1/2} f_\mu \in L^2_{\text{loc}}(\mathbb{R}^n)$ when $f_\mu \in L^2(\mathbb{R}^n)$ because $V \in L^2_{\text{loc}}(\mathbb{R}^n)$.

The operator $D$ is also self-adjoint, hence closed, since in fact

$$D = \begin{bmatrix} 0 & -\nabla_\mu \\ -\nabla_\mu & 0 \end{bmatrix},$$

where here $\nabla_\mu$ is interpreted as the *unbounded operator* from $L^2(\mathbb{R}^n)$ into $L^2(\mathbb{R}^n, C^{n+1})$ defined by (2.1) on the domain $D(\nabla_\mu) := V^{1,2}(\mathbb{R}^n)$. In particular, the operator $\nabla_\mu$ is closed by Lemma 2.1, and since $C^\infty(\mathbb{R}^n)$ is dense in $V^{1,2}(\mathbb{R}^n)$, its adjoint satisfies $(\nabla_\mu)^* = (-\text{div}, |V|^{1/2})$ on its domain

(3.1) \quad $D((\nabla_\mu)^*) = \{ (f_\parallel, f_\mu) \in L^2(\mathbb{R}^n, C^{n+1}) : (-\text{div} f_\parallel + |V|^{1/2} f_\mu) \in L^2(\mathbb{R}^n) \}$,

where $(-\text{div} f_\parallel + |V|^{1/2} f_\mu) \in L^2(\mathbb{R}^n)$ means there exists $F \in L^2(\mathbb{R}^n)$, and $(\nabla_\mu)^*((f_\parallel, f_\mu)) := F$, such that $\int (f_\parallel : \nabla \phi + f_\mu |V|^{1/2} \phi) = \int F \phi$ for all $\phi \in C^\infty(\mathbb{R}^n)$.

The self-adjointness of $D$ provides the orthogonal Hodge decomposition

(3.2) \quad $L^2(\mathbb{R}^n, C^{n+2}) = \mathcal{N}(D) \oplus \overline{\mathcal{R}(D)}$.

Moreover, the null space of $D$ is the set

$$\mathcal{N}(D) = \{ f \in L^2(\mathbb{R}^n, C^{n+2}) : f_\perp = 0 \text{ and } \text{div} f_\parallel = |V|^{1/2} f_\mu \},$$

whilst the closure of the range of $D$ is characterised in the following lemma.

**Lemma 3.1.** The closure of the range of $D$ in $L^2(\mathbb{R}^n, C^{n+2})$ is the set

$$\overline{\mathcal{R}(D)} = \{ f \in L^2(\mathbb{R}^n, C^{n+2}) : f_\perp \in L^2(\mathbb{R}^n) \text{ and } (f_\parallel, f_\mu)^T = \nabla_\mu g \text{ for some } g \in V^{1,2}(\mathbb{R}^n) \}.$$

**Proof.** First, suppose that $f \in \overline{\mathcal{R}(D)}$, so then $f_\perp \in L^2(\mathbb{R}^n)$ and there exists a sequence $\{g_m\}$ in $V^{1,2}(\mathbb{R}^n)$ such that $\nabla_\mu g_m$ converges to $(f_\parallel, f_\mu)^T$ in $L^2(\mathbb{R}^n, C^{n+1})$. The Sobolev inequality (2.2) then implies that $\{g_m\}$ is Cauchy and hence convergent to some function $g$ in $L^2(\mathbb{R}^n)$. Therefore, by Lemma 2.1 in the case $p = 2^*$, the sequence $\{\nabla_\mu g_m\}$ must converge to $\nabla_\mu g$ in $L^2(\mathbb{R}^n, C^{n+1})$, hence $(f_\parallel, f_\mu)^T = \nabla_\mu g$ and $g \in V^{1,2}(\mathbb{R}^n)$, as required.

For the converse, suppose that $f_\perp \in L^2(\mathbb{R}^n)$ and that $(f_\parallel, f_\mu)^T = \nabla_\mu g$ for some $g \in V^{1,2}(\mathbb{R}^n)$. If $h \in \mathcal{N}(D)$, then $h_\perp = 0$ and $\text{div} h_\parallel = |V|^{1/2} h_\mu$, hence

$$\langle f, h \rangle_{L^2(\mathbb{R}^n, C^{n+2})} = \langle \nabla g, h_\parallel \rangle_{L^2(\mathbb{R}^n, C^n)} + \langle |V|^{1/2} g, h_\mu \rangle_{L^2(\mathbb{R}^n)} = 0,$$
where the last equality, which is immediate when \( g \in C_c^\infty(\mathbb{R}^n) \), relies on the density of \( C_c^\infty(\mathbb{R}^n) \) in \( \mathcal{V}^{1,2}(\mathbb{R}^n) \). The orthogonal Hodge decomposition in (3.2) then allows us to conclude that \( f \in [N(D)]^\perp = R(D) \).

We define the bounded operator \( B : L^2(\mathbb{R}^n; \mathbb{C}^{n+2}) \to L^2(\mathbb{R}^n; \mathbb{C}^{n+2}) \) to be multiplication by a matrix valued function \( B \in L^\infty(\mathbb{R}^n; L(\mathbb{C}^{n+2})) \) where \( B \) has the following structure

\[
B := \begin{bmatrix}
B_{\perp} \perp & B_{\parallel} \parallel 0 \\
0 & 0 & b
\end{bmatrix}.
\]

We assume that \( B \) is elliptic on \( \overline{R(D)} \), in the sense that there exists \( \kappa > 0 \) such that

\[
(3.3) \quad \text{Re}\langle Bu, u \rangle \geq \kappa \|u\|_2^2, \quad \text{for all } u \in \overline{R(D)}.
\]

We now turn our attention to the first-order operator \( DB \). From [4, Proposition 3.3] we have the following proposition about the behaviour of \( DB \).

**Proposition 3.2.** Let \( D \) be a self-adjoint operator and let \( B \) be a bounded operator in \( L^2(\mathbb{R}^n; \mathbb{C}^{n+1}) \) satisfying (3.3). Then the operator \( DB \) is a closed, densely defined \( \omega \)--sectorial operator with resolvent bounds \( \| (\lambda I - DB)^{-1} u \|_2 \lesssim \frac{\|u\|_2}{\text{dist}(\lambda, S_\omega)} \) when \( \lambda \notin S_\omega \). Also

1. The operator \( DB \) has range \( R(DB) = R(D) \) and null space \( N(DB) = B^{-1}N(D) \) with \( L^2(\mathbb{R}^n; \mathbb{C}^{2+n}) = R(DB) \oplus N(DB) \).
2. The restriction of \( DB \) to \( R(DB) \) is a closed and injective operator with dense range in \( R(D) \) with spectrum and resolvent bounds as above.

And for \( BD \) we have a similar result in [3, Proposition 3.1].

**Proposition 3.3.** Let \( D \) be a self-adjoint operator and let \( B \) be a bounded operator in \( L^2(\mathbb{R}^n; \mathbb{C}^{n+1}) \) satisfying (3.3). Then the operator \( BD \) is a closed, densely defined \( \omega \)--sectorial operator with resolvent bounds \( \| (\lambda I - BD)^{-1} u \|_2 \lesssim \frac{\|u\|_2}{\text{dist}(\lambda, S_\omega)} \) when \( \lambda \notin S_\omega \). Also

1. The operator \( BD \) has range \( R(BD) = BR(D) \) and null space \( N(BD) = N(D) \) with \( L^2(\mathbb{R}^n; \mathbb{C}^{2+n}) = R(BD) \oplus N(BD) \).
2. The restriction of \( BD \) to \( R(BD) \) is a closed and injective operator with dense range in \( R(BD) \) with spectrum and resolvent bounds as above.

The main theorem of this section is the following quadratic estimate. First define \( P^B_t := (I + t^2(DB)^2)^{-1} \) and \( Q^B_t := tDB(I + t^2(DB)^2)^{-1} = tDBP^B_t \). We let \( P_t := P^B_t \) and \( Q_t := Q^B_t \).

**Theorem 3.4.** If \( V \in B^{\frac{n}{2}}(\mathbb{R}^n) \) or \( V \in L^{\frac{n}{2}}(\mathbb{R}^n) \) with sufficiently small norm, then we have the quadratic estimate

\[
\int_0^\infty \| tDB(I + t^2DBDB)^{-1} u \|_2^2 \, \frac{dt}{t} \approx \|u\|_2^2, \quad \forall u \in \overline{R(D)},
\]

where the implicit constant depends only on \( V, n, \kappa, \) and \( \|B\|_\infty \).

We do this by proving the upper estimate in Theorem 3.4 for all \( u \in L^2(\mathbb{R}^n; \mathbb{C}^{n+2}) \) and then use the properties of \( B \) on \( \overline{R(D)} \) to proof an analogous estimate for \( BD \) and use duality to prove the lower estimate. We specialise to the case when \( V \in B^{\frac{n}{2}}(\mathbb{R}^n) \), as this is in fact more difficult. However, we will summarise the differences between the case when \( V \in L^{\frac{n}{2}}(\mathbb{R}^n) \) with sufficiently small norm as we move forward.

**Proposition 3.5.** If \( V \in B^{\frac{n}{2}}(\mathbb{R}^n) \), then we have the estimate

\[
(3.4) \quad \int_0^\infty \| tDB(I + t^2DBDB)^{-1} u \|_2^2 \, \frac{dt}{t} \lesssim \|u\|_2^2, \quad \forall u \in L^2(\mathbb{R}^n; \mathbb{C}^{n+2}),
\]

where the implicit constant depends only on \( V, n, \kappa, \) and \( \|B\|_\infty \).
To see that it suffices to prove Proposition 3.5 we present the duality argument first. As $tDBP^B_t = P^B_t tDB$, so if $u \in \mathbb{N}(DB)$, then we have $Q^B_t u = 0$. Therefore, we only need to prove the quadratic estimate on $R(D)$. Now, assume $DB$ satisfies the Quadratic Estimate (3.4). Then using the fact

$$(I + t^2 DBBD)^{-1}u = B(I + t^2 DBBD)^{-1}B^{-1}u,$$

for all $u \in R(DB)$, then (3.4), and the boundedness of $B$ and (3.3), we have

$$(3.5) \quad \int_0^\infty \|tBD(I + t^2 DBBD)^{-1}u\|_2^2 \frac{dt}{t} \lesssim \|u\|_2^2 \quad \forall u \in L^2(\mathbb{R}^n; \mathbb{C}^{n+2}).$$

Note that we have $\text{Re}(B^*v, v) \geq \kappa\|v\|$ for all $v \in \overline{R(D)}$. Therefore, by (3.5), where $B$ is replaced by $B^*$, we have the estimate of the dual

$$(\int_0^\infty \|(Q^B_t)^*v\|_2^2 \frac{dt}{t})^{\frac{1}{2}} = \left(\int_0^\infty \|B^*D(I + t^2 B^*DBD)^{-1}v\|_2^2 \frac{dt}{t}\right)^{\frac{1}{2}} \lesssim \|v\|_2$$

for all $v \in L^2(\mathbb{R}^N; \mathbb{C}^{n+2})$. To prove Theorem 3.4 it suffices to prove the lower estimate for all $u \in \overline{R(D)}$. We refer the reader to [12, Proposition 4.8 (iii)] for the proof of the lower estimate. Therefore, to prove Theorem 3.4 it suffices to prove Proposition 3.5.

3.1. Initial Estimates. We start by giving some estimates which are key for proving the quadratic estimate. First note that we can decompose $L^2(\mathbb{R}^n; \mathbb{C}^{n+2})$ as follows $L^2(\mathbb{R}^n; \mathbb{C}^{n+2}) = L^2(\mathbb{R}^n) \oplus L^2(\mathbb{R}^n; \mathbb{C}) \oplus L^2(\mathbb{R}^n)$. Now define the projections on $L^2(\mathbb{R}^n; \mathbb{C}^{n+2})$ onto each of these spaces as

$$\mathbb{P}_\perp f := \begin{bmatrix} f_\perp \\ 0 \\ 0 \end{bmatrix}, \quad \mathbb{P}_\parallel f := \begin{bmatrix} 0 \\ f_\parallel \\ 0 \end{bmatrix}, \text{ and } \mathbb{P}_\mu f := \begin{bmatrix} 0 \\ 0 \\ f_\mu \end{bmatrix}.$$  

Moreover, define $\tilde{\mathbb{P}} := (\mathbb{P}_\perp + \mathbb{P}_\parallel)$. We give the following Riesz transform type bounds which will be important to replacing the coercivity in [12] which our operators do not have.

**Lemma 3.6.** If $V \in B^2(\mathbb{R}^n)$, then we have the following estimates

$$\|DB\mathbb{P}_\mu u\|_2 \lesssim \|Du\|_2, \quad \|\nabla \tilde{\mathbb{P}} f_\perp\|_2 \lesssim \|Du\|_2, \quad \|V\tilde{\mathbb{P}}\mathbb{P}_\mu u\|_2 \lesssim \|Du\|_2,$$

for all $u \in R(D)$, where the constants depend only on $V$, $n$, and $\|B\|_\infty$.

**Proof.** Let $u = Df$ for $f \in D(D)$. First we calculate

$$D^2 f = \begin{bmatrix} -\text{div} \nabla f_\perp + Vf_\perp \\ \nabla (|V|^{\frac{1}{2}} f_\parallel - \text{div} f_\parallel) \\ |V|^{\frac{1}{2}} (|V|^{\frac{1}{2}} f_\mu - \text{div} f_\mu) \end{bmatrix},$$

Then by direct computations we have that

$$DB\mathbb{P}_\mu Df = \begin{bmatrix} aVf_\perp \\ 0 \\ 0 \end{bmatrix},$$

and

$$\nabla \tilde{\mathbb{P}} Dv = \begin{bmatrix} \nabla (\text{div} f_\parallel - |V|^{\frac{1}{2}} f_\mu) \\ -\nabla^2 f_\perp \\ 0 \end{bmatrix}, \quad |V|^{\frac{1}{2}} \tilde{\mathbb{P}} Dv = \begin{bmatrix} |V|^{\frac{1}{2}} (\text{div} f_\parallel - |V|^{\frac{1}{2}} f_\mu) \\ -|V|^{\frac{1}{2}} \nabla f_\perp \\ 0 \end{bmatrix}.$$  

Now by the boundedness of $a$ and Riesz transform bounds, from [28] and [5], we have that

$$\|aVf_\perp\|_2 \lesssim \|B\|_\infty \|Vf_\perp\|_2 \lesssim \|(-\text{div} \nabla + V)f_\perp\|_2.$$  

Thus $\|DB\mathbb{P}_\mu Df\|_2 \lesssim \|D^2 f\|_2$. For the second two inequalities we use $\|\nabla^2 f_\perp\|_2 \lesssim \|(-\text{div} \nabla + V)f_\perp\|_2$ and $\|Vf_\perp\|_2 \lesssim \|(-\text{div} \nabla + V)f_\perp\|_2$, to obtain $\|\nabla \tilde{\mathbb{P}} Df\|_2 \lesssim \|D^2 f\|_2$ and $\||V|^{\frac{1}{2}} \tilde{\mathbb{P}} Df\|_2 \lesssim \|D^2 f\|_2$. This completes the proof.  

$\square$
We have a similar result for $V \in L^{\frac{2}{1}}(\mathbb{R}^n)$ with small norm. We note that the smallness of $V$ is needed when using the Riesz transform estimates.

**Lemma 3.7.** If $V \in L^{\frac{2}{1}}(\mathbb{R}^n)$ with small norm, then

$$\|DBP_{\mu}u\|_2 \lesssim \|Du\|_2, \quad \|\nabla P u\|_2 \lesssim \|Du\|_2$$

for all $u \in \mathcal{R}(D)$, where the constants depend only on $V$, $n$ and $\|B\|_\infty$.

**Proof.** The proof is similar to the above. \(\square\)

We define the standard dyadic decomposition of $\mathbb{R}^n$ as $\Delta := \bigcup_{k=-\infty}^{\infty} \Delta_{2^k}$, where $\Delta_t := \{2^k(m + (0,1)) : m \in \mathbb{Z}^n\}$ if $2^{k-1} < t \leq 2^k$. Now we introduce the following collection of dyadic cubes depending on the potential $V$.

**Definition 3.8.** Let $V \in B^{\frac{2}{1}}(\mathbb{R}^n)$. Then define $\Delta^V_t$ to be all the dyadic cubes, $Q \in \Delta_t$, with

$$l(Q)^2 \int_Q V \leq 1.$$ And define $\Delta^V := \bigcup_{t > 0} \Delta^V_t$.

We refer to cubes in $\Delta^V$ as ‘small’ as for almost all $x \in \mathbb{R}^n$ then there exists $\varepsilon > 0$ such that for all $t < \varepsilon$ then the unique dyadic cubes containing $x$ of scale $t$ will be in $\Delta^V_t$. We introduce the idea of the ‘small’ cube so that in the following Lemma we obtain a homogeneous estimate so long as we are on small cubes by using (2.4). We also note that if $V \in L^{\frac{2}{1}}(\mathbb{R}^n)$ then we will consider all cubes to be ‘small’. We also define the dyadic averaging operator $A_t : L^2(\mathbb{R}^n; \mathbb{C}^{n+2}) \to L^2(\mathbb{R}^n; \mathbb{C}^{n+2})$ given by

$$A_t u(x) := av_Q u := \int_Q u(y) \, dy,$$

for every $x \in \mathbb{R}^n$ and $t > 0$, where $Q \in \Delta_t$ is the unique dyadic cube such that $x \in Q$.

Denote $\langle x \rangle := 1 + |x|$ and $\text{dist}(E, F) := \inf\{|x - y| : x \in E, y \in F\}$ for every $E, F \subseteq \mathbb{R}^n$. We will now recall the following off-diagonal estimates. These estimates are important for later sections as they relate how the operators $P_t^B$ and $Q_t^B$ are locally bounded on cubes.

**Proposition 3.9.** (Off-Diagonal Estimates). Let $U_t$ be given by either $R_t^B$ for every nonzero $t \in \mathbb{R}^n$, or $P_t^B$ or $Q_t^B$ for ever $t > 0$. Then for any $M \in \mathbb{N}$ there exists $C_M > 0$, which depends only on $V$, $n$, $\kappa$, and $\|B\|_\infty$, such that

$$\|U_t u\|_{L^2(E)} \leq C_M \left( \frac{\text{dist}(E, F)}{t} \right)^{-M} \|u\|_{L^2(F)},$$

for every $E, F \subseteq \mathbb{R}^n$ Borel sets, and $u \in L^2(\mathbb{R}^n; \mathbb{C}^{n+2})$ with supp $u \subset F$.

**Proof.** This comes after noticing that the commutator identity

$$[\eta I, D] u = \eta D u - D(\eta u) = \eta D_1 u - D_1(\eta u) = [\eta I, D_1] u.$$ Thus we have the commutator bounds $\|\eta I, D] u \| \lesssim \|\nabla \eta\||u||$. The proof then follows in the same manner as in [12, Proposition 5.2]. \(\square\)

We decompose $D$ into its homogeneous and inhomogeneous parts. Namely,

$$D_1 := \begin{bmatrix} 0 & \text{div} & 0 \\ -\nabla & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}, \quad \text{and} \quad D_0 := \begin{bmatrix} 0 & 0 & -|V|\frac{1}{2} \\ 0 & 0 & 0 \\ -|V|\frac{1}{2} & 0 & 0 \end{bmatrix}.$$ Then we have that $D = D_1 + D_0$. We exploit $D_1$ being a first-order homogeneous differential operator and so satisfies

$$\int D_1 \varphi = 0,$$
for any $\varphi \in C_0^\infty(\mathbb{R}^n; C^{n+2})$. The next lemma is adapted from the proofs of [12, Lemma 5.6] and [11, Lemma 5.15] to incorporate the inhomogeneity of the operator $D$. To do this we use the fact that the Sobolev exponent $2^* = 2 \left( \frac{d}{d+2} \right)$, the Hölder conjugate of the regularity of $V$.

**Lemma 3.10.** We have the estimate

$$\left| \int_Q Du \right|^2 \lesssim \frac{1}{l(Q)} \left( 1 + \left( \int_Q |V|^\frac{2}{d} \right)^{\frac{d}{2}} \right) \left( \int_Q |u|^2 \right)^\frac{1}{2} \left( \int_Q |Du|^2 \right)^{\frac{1}{2}},$$

for all $Q \in \Delta$ and $u \in D(D)$. Moreover, if $V \in B_1^\infty(\mathbb{R}^n)$ and $Q \in \Delta V$ or $V \in L_1^\infty(\mathbb{R}^n)$, then we have

$$\int_Q Du \lesssim \frac{1}{l(Q)} \left( \int_Q |u|^2 \right)^{\frac{1}{2}} \left( \int_Q |Du|^2 \right)^{\frac{1}{2}},$$

for all $u \in D(D)$.

**Proof.** Let

$$t = \left( \int_Q |u|^2 \right)^{\frac{1}{2}} \left( \int_Q |Du|^2 \right)^{-\frac{1}{2}}.$$

If $t \geq \frac{1}{l(Q)}$ then proceed as in [12, Lemma 5.6]. Now suppose $t \leq \frac{1}{l(Q)}$. Let $\eta \in C_0^\infty$ such that $\eta(x) = 1$ when $\text{dist}(x, \mathbb{R}^n \setminus Q) > t$ and $\|\nabla \eta\|_\infty \lesssim \frac{1}{t}$. Now, we have

$$\left| \int_Q Du \right| \lesssim \|\nabla \eta\|_\infty \|\nabla \eta\|_\infty \left( \int_Q |u|^2 \right)^{\frac{1}{2}} + |\nabla \eta|\left( \int_Q |Du|^2 \right)^{\frac{1}{2}} + \left( \int_Q |V|^\frac{2}{d} \right)^{\frac{1}{2}} \left( \int_Q |\nabla \eta|^2 \right)^{\frac{1}{2}}.$$
Now if $V \in L^\infty_t(\mathbb{R}^n)$ then the inequality (3.7) holds for all cubes. If $V \in B^\infty_t(\mathbb{R}^n)$, and $Q \in \Delta V$, we have
\[
\left( \int_Q V^\pm \right)^2 = |Q|^\pm \left( \int_Q V^\pm \right) \lesssim l(Q)^2 \int_Q V \leq 1.
\]
Then inequality (3.7) holds. This completes the proof.

We also include a version of the Fefferman–Phong inequality on cubes as in [5]. This inequality is used to bound the local $L^p$-norm with the $\gamma_{loc}^{1,p}$-norm, where the constant depends on the property (3.6).

**Proposition 3.11 (Improved Fefferman–Phong Inequality).** Let $w \in A_\infty$, the set of all Muckenhoupt weights. Then there are constants $C > 0$ and $\beta \in (0, 1)$ depending only on the $A_\infty$ constant of $w$ and $n$, such that for all cubes $Q$ with side-length $l(Q)$ and $u \in C^1(\mathbb{R}^n)$ we have
\[
Cm_\beta(l(Q)^p \operatorname{av}_Q w) \int_Q |u|^p \leq \int_Q |\nabla u|^p + w|u|^p,
\]
where $m_\beta(x) = x$ for $x \leq 1$ and $m_\beta(x) = x^\beta$ for $x > 1$.

**3.2. Reduction to Carleson measure estimate.** We start by with the standard approach, as developed in [12], of reducing the quadratic estimate to proving a Carleson measure estimate. Our approach differs in that the Carleson measure will have to be adapted to the potential $V$, in the sense that the measure is only a Carleson measure on small cubes. The reason we treat the big and small cubes differently is that on the small cubes we have inequality (3.7) which is an important step in proving Lemmas 3.11 and 3.12. First, as in [12], we define $\gamma_t(x) w := (Q^B_t w)(x)$ for every $w \in C^n$. Here we view $w$ on the right-hand side of the above equation as the constant function defined on $\mathbb{R}^n$ by $w(x) := w$. We additionally define $\hat{\gamma}_t := \gamma_t \mathbb{P} = \gamma_t(\mathbb{P}_\perp + \mathbb{P}_\parallel)$, similar to as in [15].

**Proposition 3.12.** Let $V \in B^\infty_t(\mathbb{R}^n)$. If
\[
\int_0^\infty \sum_{Q \in \Delta V} \|I_Q \hat{\gamma}_t A_t u\|_2^2 \frac{dt}{t} \lesssim \|u\|_2^2, \quad \forall u \in \mathbb{R}(D),
\]
then we have
\[
\int_0^\infty \|Q^B_t u\|_2^2 \frac{dt}{t} \lesssim \|u\|_2^2, \quad \forall u \in L^2(\mathbb{R}^n).
\]

We proceed in proving Proposition 3.12 by introducing and proving the required lemmas. We will then assemble the lemmas to prove Proposition 3.12

**Lemma 3.13.** If $V \in L^\infty_{loc}(\mathbb{R}^n)$, then we have that
\[
\int_0^\infty \|Q^B_t (I - P_t) u\|_2^2 \frac{dt}{t} \lesssim \|u\|_2^2,
\]
for all $u \in \mathbb{R}(D)$.

**Proof.** Let $u = Dv$ for $v \in \mathbb{D}(D)$. Then, as $tQ^B_t D$ is uniformly bounded in $t$, $D$ is self-adjoint, and $I - P_t = t^2 D^2 P_t$, we have
\[
\int_0^\infty \|Q^B_t (I - P_t) Dv\|_2^2 \frac{dt}{t} = \int_0^\infty \|tQ^B_t D(I - P_t) v\|_2^2 \frac{dt}{t^3}
\]
\[
\lesssim \int_0^\infty \|(I - P_t) v\|_2^2 \frac{dt}{t^3} = \int_0^\infty \|Q_t Dv\|_2^2 \frac{dt}{t}
\]
\[
\lesssim \|Dv\|_2^2,
\]
as required.
Here we exploit the structure of $D$ to bound the third component. This follows a similar approach to [15], however, because our perturbation $B$ is not block-diagonal and as $B_{\perp\perp}$ is not necessarily 1 we cannot bound the first component in the same way. Therefore, unlike in [15] we do not reduce to a homogeneous differential operator and so we do not get Lemma 3.10 on all cubes, and so we need to introduce the big and small cubes.

**Lemma 3.14.** If $V \in B^{\frac{n}{2}}(\mathbb{R}^n)$, then we have
\[
\int_0^\infty \|Q_t^{B\mathbb{P}_\mu} P_t u\|_2^2 \frac{dt}{t} \lesssim \|u\|_2^2, \quad \forall u \in R(D).
\]

**Proof.** Let $u = Dv$ for $v \in D(D)$. Thus by the uniform boundedness of $P_t^B$, Lemma 3.6, and $D$ being self-adjoint, we have
\[
\int_0^\infty \|Q_t^{B\mathbb{P}_\mu} P_t Dv\|_2^2 \frac{dt}{t} = \int_0^\infty \|tP_t^BDB\mathbb{P}_\mu Dv\|_2^2 \frac{dt}{t} \\
\lesssim \int_0^\infty \|tDB\mathbb{P}_\mu Dv\|_2^2 \frac{dt}{t} \\
\lesssim \int_0^\infty \|tQ_tDv\|_2^2 \frac{dt}{t} \\
\lesssim \|Dv\|_2^2
\]
As required. \qed

We will need to be able to use the inequality (3.7). However, this is only available to us when we are on small cubes. Therefore, we need a bound on all large cubes. We do this by using the off-diagonal estimates, the Fefferman–Phong Inequality, and Lemma 3.6.

**Lemma 3.15.** If $V \in B^{\frac{n}{2}}(\mathbb{R}^n)$, then we have
\[
\int_0^\infty \sum_{Q \in \Delta \setminus \Delta'} \|\mathbf{1}_Q Q_t^{B\mathbb{P}} P_t u\|_2^2 \frac{dt}{t} \lesssim \|u\|_2^2,
\]
for all $u \in R(D)$.

**Proof.** Let $f = \mathbb{P}P_t u$. Let $M \in \mathbb{N}$ to be chosen later. Then, using off-diagonal estimates, and the Cauchy–Schwarz inequality we have
\[
\sum_{Q \in \Delta \setminus \Delta'} \|\mathbf{1}_Q Q_t^{B\mathbb{P}} P_t u\|_2^2 \lesssim \sum_{Q \in \Delta \setminus \Delta'} \left( \sum_{j=0}^\infty \|\mathbf{1}_Q Q_t^{B \mathfrak{P}} C_j(Q) \|_2 \|\mathbf{1}_C_j(Q) f\|_2 \right)^2 \\
\lesssim \sum_{Q \in \Delta \setminus \Delta'} \left( \sum_{j=0}^\infty \left( 1 + \frac{\text{dist}(Q, C_j(Q))}{t} \right)^{-M} \|\mathbf{1}_C_j(Q) f\|_2 \right)^2 \\
\lesssim \sum_{Q \in \Delta \setminus \Delta'} \left( \sum_{j=0}^\infty 2^{-jM} \|\mathbf{1}_C_j(Q) f\|_2 \right)^2 \\
\leq \sum_{Q \in \Delta \setminus \Delta'} \left( \sum_{j=0}^\infty 2^{-jM} \|\mathbf{1}_C_j(Q) f\|_2 \right)^2 \\
\lesssim \sum_{Q \in \Delta \setminus \Delta'} \left( \sum_{k \in \mathbb{N}; 2^kQ \in \Delta'} 2^{-jM} \|\mathbf{1}_C_j(Q) f\|_2 \right)^2 \\
\lesssim \sum_{Q \in \Delta \setminus \Delta'} \left( \sum_{k \in \mathbb{N}; 2^kQ \in \Delta'} 2^{-jM} \|\mathbf{1}_C_j(Q) f\|_2 \right)^2 + \sum_{k \in \mathbb{N}; 2^kQ \in \Delta \setminus \Delta'} 2^{-jM} \|\mathbf{1}_C_j(Q) f\|_2^2 \right)
For the large cubes we use the Fefferman–Phong inequality, the covering lemma, and choosing $M > n + 2$, to obtain

\[
\sum_{Q \in \Delta \setminus \Delta^Y} \sum_{k \in \mathbb{N}; \ 2^k Q \in \Delta \setminus \Delta^Y} 2^{-jM} \left\| \mathbb{I}_{2^j Q} f \right\|_2^2 \leq \sum_{Q \in \Delta \setminus \Delta^Y} \sum_{k \in \mathbb{N}; \ 2^k Q \in \Delta \setminus \Delta^Y} 2^{-jM} \left( l \left( \frac{2^j Q}{l} \right) \right)^2 \left\| \mathbb{I}_{2^j Q} f \right\|_2^2
\]

\[
\lesssim \sum_{Q \in \Delta \setminus \Delta^Y} \sum_{k \in \mathbb{N}; \ 2^k Q \in \Delta \setminus \Delta^Y} 2^{-j(M-2)} \left( \frac{2^j Q}{l} \right)^2 \left\| \mathbb{I}_{2^j Q} \nabla f \right\|_2^2
\]

\[
\lesssim t^2 \sum_{j=0}^{\infty} 2^{-j(M-2-n)} \left\| \nabla f \right\|_2^2
\]

\[
\lesssim t^2 \left\| \nabla f \right\|_2^2.
\]

For small cubes we use the largeness of $Q$, then the Fefferman–Phong inequality, the covering lemma, and choosing $M > 2n$, we have

\[
\sum_{Q \in \Delta \setminus \Delta^Y} \sum_{k \in \mathbb{N}; \ 2^k Q \in \Delta ^Y} 2^{-jM} \left\| \mathbb{I}_{2^j Q} f \right\|_2^2 \leq \sum_{Q \in \Delta \setminus \Delta^Y} \sum_{k \in \mathbb{N}; \ 2^k Q \in \Delta ^Y} 2^{-jM} \left( l \left( \frac{2^j Q}{l} \right) \right)^2 \left\| \mathbb{I}_{2^j Q} f \right\|_2^2
\]

\[
\leq \sum_{Q \in \Delta \setminus \Delta^Y} \sum_{k \in \mathbb{N}; \ 2^k Q \in \Delta ^Y} 2^{-j(M-n)} \left( \frac{2^j Q}{l} \right)^2 \left( l \left( \frac{2^j Q}{l} \right) \right)^2 \left\| \mathbb{I}_{2^j Q} f \right\|_2^2
\]

\[
\lesssim t^2 \sum_{Q \in \Delta \setminus \Delta^Y} \sum_{k \in \mathbb{N}; \ 2^k Q \in \Delta ^Y} 2^{-j(M-n)} \left\| \mathbb{I}_{2^j Q} \nabla f \right\|_2^2
\]

\[
\lesssim t^2 \sum_{j=0}^{\infty} 2^{-j(M-2n)} \left\| \nabla f \right\|_2^2
\]

\[
\lesssim t^2 \left\| \nabla f \right\|_2^2.
\]

Recalling that $f = \tilde{P} P u$, and that if $u \in R(D)$ then $P_t u \in R(D)$. Therefore, using lemma 3.6 we have

\[
\int_0^\infty \sum_{Q \in \Delta \setminus \Delta^Y} \left\| \mathbb{I}_Q \mathbb{P} \tilde{P} P u \right\|_2^2 \frac{dt}{t} \lesssim \int_0^\infty t^2 \left\| \nabla \mathbb{P} \tilde{P} P u \right\|_2^2 \frac{dt}{t}
\]

\[
\lesssim \int_0^\infty \left\| DP_t u \right\|_2^2 \frac{dt}{t}
\]

\[
\lesssim \int_0^\infty \left\| Q_t u \right\|_2^2 \frac{dt}{t}
\]

\[
\lesssim \left\| u \right\|_2^2.
\]

This completes the proof. □

Here is where having the projection $\tilde{P}$ is needed, otherwise, we would have $\nabla |V| \tilde{P}$ in the last component and this would force us to assume some differentiability $V$. In [13] the coercivity ((H8) in [13]) of the operators is used, however, in the inhomogeneous case we do not have coercivity of the operator but we do have coercivity in the sense of Lemma 3.6.

**Lemma 3.16.** If $V \in B\tilde{\mathbb{P}}(\mathbb{R}^n)$, then we have that

\[
\int_0^\infty \sum_{Q \in \Delta \setminus \Delta^Y} \left\| \mathbb{I}_Q (Q^B - \gamma_t A_t) \tilde{P} P u \right\|_2^2 \frac{dt}{t} \lesssim \left\| u \right\|_2^2,
\]

for all $u \in R(D)$. 
Proof. Let \( f = \tilde{P}_t u \). Then by off-diagonal estimates, the Cauchy–Schwarz inequality, the Poincare inequality, and Lemma 3.6, we have

\[
\sum_{Q \in \Delta^Y_t} \| \mathbb{1}_Q (Q_t^B - \gamma_t A_t) \tilde{P}_t u \|_2^2 \lesssim \sum_{Q \in \Delta^Y} \left( \sum_{j=0}^{\infty} \| \mathbb{1}_Q Q_t^B \mathbb{1}_{C_j(Q)} \|_2 \| \mathbb{1}_{C_j(Q)} (f - f_Q) \|_2 \right)^2 \\
\lesssim \sum_{Q \in \Delta^Y} \sum_{j=0}^{\infty} 2^{-jM} \| \mathbb{1}_{2^j Q} (f - f_Q) \|_2^2 \\
\lesssim \sum_{Q \in \Delta^Y} \sum_{j=0}^{\infty} 2^{-jM} (2^{jQ})^2 \| \mathbb{1}_{2^j Q} \nabla f \|_2^2 \\
\lesssim t^2 \sum_{j=0}^{\infty} 2^{-j(M-n-2)} \| \nabla f \|_2^2 \\
\lesssim t^2 \| \nabla \tilde{P}_t u \|_2^2 \\
\lesssim t^2 \| D \tilde{P}_t u \|_2^2
\]

Thus we have that

\[
\int_0^\infty \sum_{Q \in \Delta^Y_t} \| \mathbb{1}_Q (Q_t^B - \gamma_t A_t) \tilde{P}_t u \|_2^2 \frac{dt}{t} \lesssim \int_0^\infty \| Q_t u \|_2^2 \frac{dt}{t} \lesssim \| u \|_2^2.
\]

This completes the proof. \( \square \)

The following Lemma is analogous to [13, lemma 5.6]. This is where Lemma 3.10 is used. Therefore, it is important that have already reduced to proving the estimate on small cubes.

Lemma 3.17. If \( V \in B^\infty_2 (\mathbb{R}^n) \), then we have that

\[
\int_0^\infty \sum_{Q \in \Delta^Y_t} \| \mathbb{1}_Q \gamma_t A_t \tilde{P}_t (P_t - I) u \|_2^2 \frac{dt}{t} \lesssim \| u \|_2^2,
\]

for all \( u \in \mathbb{R}(D) \).

Proof. We will perform a Schur-type estimate after we have established the bound

\[
(3.9) \quad \sum_{Q \in \Delta^Y} \| \mathbb{1}_Q A_t \tilde{P}_t (P_t - I) Q_s u \|_2^2 \lesssim \min \left\{ \frac{s}{t}, \frac{t}{s} \right\}^{\frac{1}{2}}.
\]

Now \( (P_t - I) Q_s = \frac{t}{s} Q_s (I - P_s) \) and \( P_t Q_s = \frac{s}{t} Q_s P_t \). If \( t \leq s \) we use the uniform boundedness of \( Q_t \) and \( I - P_t \) to obtain

\[
\sum_{Q \in \Delta^Y} \| \mathbb{1}_Q A_t \tilde{P}_t (P_t - I) Q_s u \|_2^2 \lesssim \left( \frac{t}{s} \right)^{\frac{1}{2}} \| Q_s (I - P_s) u \|_2^2 \lesssim \left( \frac{t}{s} \right)^{\frac{1}{2}} \| u \|_2^2 \leq \frac{t}{s} \| u \|_2^2.
\]

If \( s \leq t \) then using the boundedness of \( P_t \) and \( Q_t \) we have

\[
\sum_{Q \in \Delta^Y} \| \mathbb{1}_Q A_t \tilde{P}_t (P_t - I) Q_s u \|_2^2 \lesssim \| P_t Q_s u \|_2^2 + \sum_{Q \in \Delta^Y} \| \mathbb{1}_Q A_t \tilde{P}_t Q_s u \|_2^2 \lesssim \frac{s}{t} \| u \|_2^2 + \sum_{Q \in \Delta^Y} \| \mathbb{1}_Q A_t \tilde{P}_t Q_s u \|_2^2.
\]
Then, using Lemma 3.10 for cubes in \( \Delta^V \) and the uniform boundedness of \( P_t \) and \( Q_s \), we have

\[
\sum_{Q \in \Delta^V_t} \|1_Q A_t \mathcal{P} Q_s u\|_2^2 = \sum_{Q \in \Delta^V_t} \int_Q \int_Q \mathcal{P} Q_s u = \int_Q \int_Q \mathcal{P} Q_s u \leq \sum_{Q \in \Delta^V_t} s^2 Q \int_Q |D P_s u| \leq \sum_{Q \in \Delta^V_t} s^2 \frac{Q}{l(Q)} \left( \int_Q |D P_s u|^2 \right)^{1/2} \left( \int_Q |P_s u|^2 \right)^{1/2} = \frac{s}{t} \|Q_s u\|_2 \|P_t u\|_2 \leq \frac{s}{t} \|u\|_2.
\]

Now we have the bound (3.9), let \( m := \min \left\{ \frac{s}{t}, \frac{1}{s} \right\}^{1/2} \). We begin a Schur-type estimate. Here we use the reproducing formula, Minkowski’s inequality and Tonelli’s Theorem

\[
\int_0^\infty \sum_{Q \in \Delta^V_t} \|1_Q A_t \mathcal{P} (P_t - I) u\|_2^2 \frac{dt}{t} \leq \int_0^\infty \sum_{Q \in \Delta^V_t} \|1_Q A_t \mathcal{P} (P_t - I)\|^{2} \left( \int_0^\infty 2^2 \frac{ds}{s} \right)^{2} \frac{dt}{t} \\
\leq \int_0^\infty \sum_{Q \in \Delta^V_t} \left( \int_0^\infty \|1_Q A_t \mathcal{P} (P_t - I)\|_2^2 \frac{ds}{s} \right)^{2} \frac{dt}{t} \\
\leq \int_0^\infty \left( \int_0^\infty m \frac{ds}{s} \right) \left( \int_0^\infty m \|Q_s u\|_2^2 \frac{ds}{s} \right) \frac{dt}{t} \\
\leq \int_0^\infty \|Q_s u\|_2^2 \frac{ds}{s} \leq \|u\|_2^2.
\]

This completes the proof. \( \Box \)

Combining all the previous lemmas we can now prove Proposition 3.12.

**Proof of Proposition 3.12.** First note that if \( u \in \mathbb{N}(DB) \) then we have that

\[
\int_0^\infty \|Q_t^B u\|_2^2 \frac{dt}{t} = \int_0^\infty \|tP_t^B DBu\|_2^2 \frac{dt}{t} = 0.
\]

Therefore, assume that \( u \in \mathbb{R}(D) \), we have

\[
\int_0^\infty \|Q_t^B u\|_2^2 \frac{dt}{t} \leq \int_0^\infty \|Q_t^B P_t u\|_2^2 \frac{dt}{t} + \int_0^\infty \|Q_t^B (I - P_t) u\|_2^2 \frac{dt}{t}.
\]

Then, by Lemma 3.13, the second term above is bounded by \( \|u\|_2^2 \). Now as \( I = \mathcal{P} + \mathcal{P}_\mu \)

\[
\int_0^\infty \|Q_t^B P_t u\|_2^2 \frac{dt}{t} \leq \int_0^\infty \|Q_t^B \mathcal{P} P_t u\|_2^2 \frac{dt}{t} + \int_0^\infty \|Q_t^B \mathcal{P}_\mu P_t u\|_2^2 \frac{dt}{t}.
\]

Then, by Lemma 3.14, the second term above is bounded by \( \|u\|_2^2 \). Now

\[
\int_0^\infty \|Q_t^B \mathcal{P} P_t u\|_2^2 \frac{dt}{t} \leq \int_0^\infty \sum_{Q \in \Delta^V_t} \|1_Q Q_t^B \mathcal{P} P_t u\|_2^2 \frac{dt}{t} + \int_0^\infty \sum_{Q \in \Delta^V_t \setminus \Delta^V_t} \|1_Q Q_t^B \mathcal{P} P_t u\|_2^2 \frac{dt}{t}.
\]
Then, by Lemma 3.15, the second term is bounded by \( \|u\|_2^2 \). Now
\[
\int_0^\infty \sum_{Q \in \Delta^V_t} \| \mathbb{I}_Q \tilde{\gamma}_t A_t \tilde{P} P_t u \|_2 \frac{dt}{t} \lesssim \int_0^\infty \sum_{Q \in \Delta^V_t} \| \mathbb{I}_Q \tilde{\gamma}_t A_t \tilde{P} P_t u \|_2 \frac{dt}{t} 
\]
\[
+ \int_0^\infty \sum_{Q \in \Delta^V_t} \| \mathbb{I}_Q (Q^P_t \tilde{P} - \tilde{\gamma}_t A_t) P_t u \|_2 \frac{dt}{t}.
\]
Then, by Lemma 3.16, the second term above is bounded by \( \|u\|_2^2 \). Now
\[
\int_0^\infty \sum_{Q \in \Delta^V_t} \| \mathbb{I}_Q \tilde{\gamma}_t A_t \tilde{P} P_t u \|_2 \frac{dt}{t} \lesssim \int_0^\infty \sum_{Q \in \Delta^V_t} \| \mathbb{I}_Q \tilde{\gamma}_t A_t \tilde{P} u \|_2 \frac{dt}{t} 
\]
\[
+ \int_0^\infty \sum_{Q \in \Delta^V_t} \| \mathbb{I}_Q \tilde{\gamma}_t A_t \tilde{P} (P_t - I) u \|_2 \frac{dt}{t} 
\]
\[
\lesssim \|u\|_2^2,
\]
by the hypothesis and Lemma 3.17, as required. \( \square \)

We note that the only part that depends on \( V \) being in the reverse Hölder class is Lemma 3.15, but if \( V \in L_2^\infty(\mathbb{R}^n) \) then we say all cubes are small. Therefore, the key is to note that the second inequality in Lemma 3.10 holds for all cubes in this case. We also use the smallness of the norm to obtain the Riesz Transform estimates in Proposition 3.7. Hence, we have the following proposition.

**Proposition 3.18.** Let \( V \in L_2^\infty(\mathbb{R}^n) \) with small norm. If
\[
\int_0^\infty \| \tilde{\gamma}_t A_t u \|_2^2 \lesssim \|u\|_2^2,
\]
for all \( u \in \mathcal{R}(D) \), then we have
\[
\int_0^\infty \| Q^P_t u \|_2^2 \lesssim \|u\|_2^2,
\]
for all \( u \in L^2(\mathbb{R}^2) \).

### 3.3. Carleson Measure Estimate

To prove the quadratic estimate we are left to prove the estimate (3.8). We will do this by reducing to a Carleson measure type estimate adapted to the potential \( V \). We will do this in a similar manner as Axelson, Keith and McIntosh in [12, Section 5.3] by constructing tests functions and using a stopping time argument.

**Definition 3.19.** Let \( \mu \) be a measure on \( \mathbb{R}_+^{n+1} := \mathbb{R}^n \times \mathbb{R}_+ \). Then we will say that \( \mu \) is \( V \)-Carleson if
\[
\| \mu \|_{C_V} := \sup_{Q \in \Delta^V} \frac{1}{|Q|} \mu(\mathcal{C}(Q)) < \infty,
\]
where \( \mathcal{C}(Q) := Q \times (0, t(Q)) \), is the Carleson box of the cube \( Q \).

That is \( \mu \) is \( V \)-Carleson if \( \mu \) is Carleson when restricted to small cubes. The following proposition is adapted to our case from [30, p. 59], and, is stating that if \( |\tilde{\gamma}_t(x)|^2 \frac{dt}{dx} \) is a \( V \)-Carleson measure then (3.8) is bounded above by \( \|u\|_2^2 \). We note that the following proposition, like the definition of \( V \)-Carleson, only considers small cubes.

**Proposition 3.20.** If \( \mu \) is a \( V \)-Carleson measure, then we have that
\[
\int_0^\infty \sum_{Q \in \Delta^V_t} \int_Q |A_t u(x)|^2 \, d\mu(x, t) \lesssim \| \mu \|_{C_V} \|u\|_2^2,
\]
for all \( u \in L^2(\mathbb{R}^n; C^{n+2}) \).
Proof. First, using the fact that $\Delta^V = \Delta^V_{2k}$ for $k \in \mathbb{Z}$ and $2^{k-1} < t \leq 2^k$ and Tonelli’s Theorem, we have that

$$\int_0^\infty \sum_{Q \in \Delta^V_t} \int_Q |A_Iu(x)|^2 \, d\mu(x,t) = \sum_{k=-\infty}^\infty \int_{2^{k-1}}^{2^k} \sum_{Q \in \Delta^V_t} \int_Q \left| \int_Q u(y) \, dy \right|^2 \, d\mu(x,t)$$

$$= \sum_{k=-\infty}^\infty \int_{2^{k-1}}^{2^k} \sum_{Q \in \Delta^V_{2k}} \int_Q \left| \int_Q u(y) \, dy \right|^2 \, d\mu(x,t)$$

$$\leq \sum_{k=-\infty}^\infty \sum_{Q \in \Delta^V_{2k}} \left( \int_Q |u(y)| \, dy \right)^2 \int_{2^{k-1}}^{2^k} \int_Q \, d\mu(x,t).$$

Now let $I^V_k \subseteq \mathbb{N}$ be an indexing set such that $\Delta^V_{2k} = \{Q^k_\alpha : \alpha \in I^V_k \}$. We also introduce the notation

$$u_{\alpha,k} = \int_{Q^k_\alpha} |u(y)| \, dy, \quad \text{and} \quad \mu_{\alpha,k} = \mu(Q^k_\alpha \times (2^{k-1}, 2^k)).$$

Therefore, rearranging and using Tonelli’s Theorem, we have that

$$\int_0^\infty \sum_{Q \in \Delta^V_{2k}} \int_Q |A_Iu(x)|^2 \, d\mu(x,t) \leq \sum_{k=-\infty}^\infty \sum_{\alpha \in I^V_k} u_{\alpha,k}^2 \mu_{\alpha,k}$$

$$= \sum_{k=-\infty}^\infty \sum_{\alpha \in I^V_k} \mu_{\alpha,k} \int_0^{u_{\alpha,k}} 2r \, dr$$

$$= \int_0^\infty \sum_{k=-\infty}^\infty \sum_{\alpha \in I^V_k} \mu_{\alpha,k} \mathbb{1}_{\{u_{\alpha,k} > r\}}(r) 2r \, dr,$$

where $dr$ denotes the Lebesgue measure on $(0, \infty)$. For each $r > 0$ let $\{R_j(r)\}_{j \in \mathbb{N}}$ be an enumeration of the collection of maximal dyadic cubes $Q^k_\alpha \in \Delta^V$ such that $u_{\alpha,k} > r$. Define

$$M_{\Delta^V} u(x) := \sup \left\{ \int_Q u : Q \in \Delta^V, \text{ with } x \in Q \right\}.$$

We claim that

$$\bigcup_{j=1}^\infty R_j(r) = \{x \in \mathbb{R}^n : (M_{\Delta^V}|u|)(x) > r\}.$$

Let $x \in \bigcup_{j=1}^\infty R_j$. Therefore $x \in Q$ such that $Q = R_j(r)$ for some $j \in \mathbb{N}$, then

$$r < \int_Q |u| \leq (M_{\Delta^V}|u|)(x).$$

Now if $x \in \mathbb{R}^n$ such that $(M_{\Delta^V}|u|)(x) > r$, then there exists $Q' \in \Delta^V$ with $x \in Q'$ such that

$$r < \int_{Q'} |u|.$$
Similarly we have \[Q\] with support in \(4\) such that \(\xi \in C\) and \(\nu > C\). By definition, and uniform boundedness of \(\mathcal{M}_{\Delta V}\), we have that
\[
\int_0^\infty \sum_{k=-\infty}^\infty \sum_{\alpha \in \mathcal{A}_k} \mu_{\alpha,k}(u_{\alpha,k}) dr \leq \int_0^\infty \sum_{j=1}^\infty \sum_{R \in \Delta V} \mu(R \in \{l(R)\}) 2r dr
\]
\[
\lesssim \int_0^\infty 2r \sum_{j=1}^\infty \mu(C(R_j(r))) dr
\]
\[
\lesssim ||\mu||_{C_V} \int_0^\infty 2r \sum_{j=1}^\infty |R_j(r)| dr
\]
\[
= ||\mu||_{C_V} \int_0^\infty 2r \left( \bigcup_{j=1}^\infty R_j(r) \right) dr
\]
\[
= ||\mu||_{C_V} \int_0^\infty 2r |\{x \in \mathbb{R}^n : \mathcal{M}_{\Delta V} u(x) > r\}| dr
\]
\[
\lesssim ||\mu||_{C_V} ||\mathcal{M}_{\Delta V} u||_2^2
\]
where \(C(R_j(r))\) is the Carleson box of \(R_j(r)\). This completes the proof. \(\square\)

Adapting the work of Bailey in [15, Section 4.1], which in turn is based on [12], we define the space
\[
\check{\mathcal{L}} := \{\nu \in \mathcal{L}((\mathbb{C}^{n+2}) \setminus \{0\}) : \nu \hat{\mathbb{P}} = \nu\}.
\]
Let \(\sigma > 0\) be a constant to be chosen later. Let \(\mathcal{V}_\sigma\) be a finite set containing \(\nu \in \check{\mathcal{L}}\), with \(|\nu| = 1\), such that \(\bigcup_{\nu \in \mathcal{V}} K_{\nu,\sigma} = \check{\mathcal{L}}\), where
\[
K_{\nu,\sigma} := \left\{ \mu \in \check{\mathcal{L}} : \left| \frac{\mu}{|\mu|} - \nu \right| \leq \sigma \right\}.
\]
Let \(\xi \in \mathbb{C}^{n+2}\) with \(|\xi| = 1\). Let \(\eta_Q : \mathbb{R}^{n+2} \to [0,1]\) be a smooth function equal to 1 on \(2\) with support in \(4Q\), and \(||\nabla \eta_Q||_\infty \lesssim \frac{1}{r}\), where \(l = l(Q)\). Define \(\xi_Q = \eta_Q \xi\). We define the test functions, in a similar way to those used in [10, Section 3.6], as follows, for \(\varepsilon > 0\), define the test functions as
\[
f_{Q,\varepsilon}^\xi := (I + (\varepsilon l)^2(DB)^2)^{-1}(\xi_Q) = P_{el}^{-1}(\xi_Q).
\]

We now present some useful properties of the test functions \(f_{Q,\varepsilon}^\xi\). The following lemma is adapted to accommodate the potential \(V\) from [13, Lemma 5.3] and [10, Lemma 3.16].

**Lemma 3.21.** There is a constant, \(C > 0\) such that
(1) \(||f_{Q,\varepsilon}^\xi||_2 \leq C|Q|^\frac{1}{2}\),
(2) \(||\varepsilon DB f_{Q,\varepsilon}^\xi||_2 \leq C|Q|^\frac{1}{2}\),
for all \(Q \in \Delta\). Also
(3) \(\int_Q f_{Q,\varepsilon}^\xi - \xi_Q \leq C\varepsilon^\frac{1}{2}\) for all \(Q \in \Delta\) if \(V \in B^{\frac{3}{2}}(\mathbb{R}^n)\).

**Proof.** By definition, and uniform boundedness of \(P_{el}\), we have that
\[||f_{Q,\varepsilon}^\xi||_2^2 = ||P_{el}^B \xi_Q||_2^2 \lesssim ||\xi_Q||_2^2 \lesssim |Q|\)
Similarly we have
\[||\varepsilon DB f_{Q,\varepsilon}^\xi||_2^2 = ||Q_{el}^B \xi_Q||_2^2 \lesssim ||\xi_Q||_2^2 \lesssim |Q|\]
For (3), we use the definition of $f_{Q,v}^\xi$, Lemma 3.10, and the uniform boundedness of $P_t^B - I$ and $Q_t^B$ to obtain
\[
\int_Q f_{Q,v}^\xi - \xi_Q)^2 = \int_Q \left( \epsilon l \right)^2 (DB)^2 P_{\xi_Q}^B = \frac{\epsilon}{l} \left( \int_Q \left| (DB)^2 P_{\xi_Q}^B \right|^2 \right)^{1/2} \leq \frac{\epsilon}{l} \left( \int_Q \left| (DB)^2 P_{\xi_Q}^B \right|^2 \right)^{1/2} = const.
\]
This completes the proof. \hfill \Box

It suffices to prove the Carleson measure estimate on each cone $K_{v,\sigma}$. That is, we need to prove
\begin{equation}
(3.10) \quad \int_{\gamma_t(x) \in C(Q)} |\hat{\gamma}_t(x)|^2 \frac{dx dt}{t} \lesssim |Q|,
\end{equation}
for every $v \in \mathcal{V}$. For each $Q \in \Delta^V$ we consider a sub-collection of disjoint subcubes which give us the following reduction of $(3.10)$.

**Proposition 3.22.** There exists $\tau \in (0,1)$ such that for all cubes $Q \in \Delta^V$ and for all $v \in \tilde{\mathcal{V}}$ with $|v| = 1$, there is a collection $\{Q_k\}_{k \in I_Q} \subset \Delta^V$ of disjoint subcubes of $Q$, where $I_Q$ is the indexing set of the collection, such that $|E_{Q,v}| > \tau |Q|$ where $E_{Q,v} = Q \setminus \bigcup_{k \in I_Q} Q_k$ and with
\[
\int_{\gamma_t(x) \in E_{Q,v}^*} |\hat{\gamma}_t(x)|^2 \frac{dx dt}{t} \lesssim |Q|,
\]
where $E_{Q,v}^* := C(Q) \setminus \bigcup_{k \in I_Q} C(Q_k)$.

To see that Proposition 3.22 proves $(3.10)$, consider an arbitrary $Q \in \Delta^V$. Then
\[
\int_0^{l(Q)} \int_Q 1_{(\delta,\delta^{-1})}(t) |\hat{\gamma}_t(x)|^2 \frac{dx dt}{t} \leq \frac{1}{\delta^2} \int_0^{\delta^{-1}} \int_Q |\hat{\gamma}_t(x)|^2 \frac{dx dt}{t} \leq \frac{1}{\delta^2} \sup \left\{ \int_Q |\hat{\gamma}_t(x)|^2 \frac{dx}{t} \right\} \lesssim \frac{1}{\delta^2} |Q|.
\]
Therefore we have that the measure $\mu_\delta := 1_{(\delta,\delta^{-1})}(t)|\hat{\gamma}_t(x)|^2 \frac{dx dt}{t}$ is $V$-Carleson. Therefore, as each $Q_k \in \Delta^V$ and by compactness, we have that
\[
\mu_\delta(C(Q)) = \mu_\delta(E_{Q,v}^*) + \sum_{k=1}^{\infty} \mu_\delta(C(Q_k)) \leq C|Q| + \|\nu_\delta\|_{C_v} \sum_{k=1}^{\infty} |Q_k| = C|Q| + \|\mu_\delta\|_{C_v} |Q| - E_{Q,v}.
\]
Then using the fact that $|E_{Q,v}| > \tau |Q|$, dividing by $|Q|$ and taking the supremum over all cubes $Q \in \Delta^V$, we have that
\[
\|\mu_\delta\|_{C_v} < C + \|\mu_\delta\|_{C_v} (1 - \tau).
\]
Rearranging then gives us
\[
\|\mu_\delta\|_{C_v} \lesssim \frac{1}{\tau}.
\]
That is $\mu_\delta$ is a Carleson measure with Carleson norm independent of $\delta$. Now, note that $\mu_\delta$ is a pointwise increasing function. Also, by construction we have that $\lim_{\delta \to 0} \mu_\delta(x,t) = |\hat{\gamma}_t(x)|^2 \frac{dx dt}{t}$. Thus, by the Monotone Convergence Theorem
\[
\int_0^l \int_Q |\hat{\gamma}_t(x)|^2 \frac{dx dt}{t} = \lim_{\delta \to 0} \nu_\delta(C(Q)) \lesssim |Q|.
\]
We will use a stopping-time argument to give a suitable collection of dyadic subcubes for Proposition 3.22. We note that unlike in \cite{[12]} we need all the bad cubes in the stopping time argument to be small, therefore, we give a lemma which gives a uniform bound on the number of times we need to subdivide a small dyadic cube until we can guarantee that the subcubes at that scale are also small. The proof builds on \cite{[28], Lemma 1.2].

**Lemma 3.23.** Let $V \in B^q(\mathbb{R}^n)$ for $q \geq \frac{n}{2}$. Then there exists $\tilde{c} \in (0, 1)$ such that for all $Q \in \Delta V$ and $\tilde{Q} \in \Delta \setminus \Delta V$ with $\tilde{Q} \subseteq Q$ we have that

$$c \bar{l}(Q) \leq l(\tilde{Q}).$$

**Proof.** Let $Q \in \Delta V$ and $\tilde{Q} \in \Delta \setminus \Delta V$ with $\tilde{Q} \subseteq Q$. As $V \in B^q(\mathbb{R}^n)$ for $q \geq \frac{n}{2}$ then there exists $p > \frac{n}{2}$ such that $V \in B^p(\mathbb{R}^n)$. Recall $[V]_p$ is the reverse Hölder constant for $V$ with exponent $p$. Then using Jensen’s inequality, $\tilde{Q} \subseteq Q$, and the reverse Hölder inequality, we have that

$$\int_{\tilde{Q}} V \leq \left( \int_{\tilde{Q}} V^p \right)^{\frac{1}{p}} \leq \left( \frac{\|Q\|_{Q} \int_{\tilde{Q}} V^p}{l(Q)} \right)^{\frac{1}{p}} \leq \left( \frac{l(Q)\|Q\|_{Q}}{l(\tilde{Q})} \right)^{\frac{p}{2}} [V]_p \int_{\tilde{Q}} V.$$

Then rearranging and as $Q \in \Delta V$ and $\tilde{Q} \in \Delta \setminus \Delta V$ we have

$$1 < \frac{l(\tilde{Q})^2}{p} \int_{\tilde{Q}} V \leq [V]_p \left( \frac{l(Q)}{l(\tilde{Q})} \right)^{\frac{p}{2}-2} \int_{\tilde{Q}} V \leq [V]_p \left( \frac{l(Q)}{l(\tilde{Q})} \right)^{\frac{p}{2}}.$$

Now as $p > \frac{n}{2}$ we have that $\frac{p}{2} - 2 < 0$. Thus rearranging gives

$$l(Q) < [V]_p^{\frac{1}{\frac{p}{2}}} l(\tilde{Q}).$$

Note that as $[V]_p > 1$ then $[V]_p^{\frac{1}{\frac{p}{2}}} > 1$; therefore, the above statement makes sense. This completes the proof. \hfill \Box

Now fix $\varepsilon_0 > 0$ such that

$$\left| \int_{\tilde{Q}} f_{Q, \varepsilon_0} - \xi \right| \leq \frac{1}{2};$$

and define $f_{Q, \varepsilon} := f_{Q, \varepsilon_0}$. Then by the polarisation identity and the Cauchy–Schwarz inequality, we have

$$\text{Re} \left( \xi, \int_{\tilde{Q}} f_{\tilde{Q}} \right) = \frac{1}{4} \left| \xi + \int_{\tilde{Q}} f_{\tilde{Q}} \right|^2 - \left| \int_{\tilde{Q}} f_{\tilde{Q}} - \xi \right|^2 \geq \frac{1}{4} \left( 2 \text{Re} \left( \xi, \int_{\tilde{Q}} f_{\tilde{Q}} \right) + \left| \int_{\tilde{Q}} f_{\tilde{Q}} \right|^2 + \frac{3}{4} \right).$$

Therefore, using Lemma 3.21, we have that

\begin{equation}
\text{Re} \left( \xi, \int_{\tilde{Q}} f_{\tilde{Q}} \right) \geq \frac{1}{2} \left( \left| \int_{\tilde{Q}} f_{\tilde{Q}} \right|^2 + \frac{3}{4} \right) \geq \frac{1}{2} \left( \frac{1}{4} + \frac{3}{4} \right) = \frac{1}{2}.
\end{equation}

We now describe the bad cubes which we will use in Proposition 3.22, using the above lemma so that we can make sure there are no big bad cubes.

**Lemma 3.24.** Let $Q \in \Delta V$ if $V \in B^p(\mathbb{R}^n)$. There are constants $c_1, c_2 > 0$, $\tau \in (0, 1)$ and a collection $\{Q_k : k \in \mathbb{N}\} \subset \Delta V$ such that

- $Q_k \subseteq Q$
- $|E_{Q, \nu}| = |Q \setminus \bigcup_k Q_k| > \tau|Q|$
- $l(Q_k) \leq \tilde{c} l(Q),$

where $\tilde{c}$ is the constant in Lemma 3.23, satisfying

$$\int_S |f_{\tilde{Q}}| \leq c_1, \quad \text{or} \quad \text{Re} \left( \xi, \int_S f_{\tilde{Q}} \right) \geq c_2,$$

for all dyadic subcubes $S$ for which $C(S) \cap \tilde{E}_{Q, \nu}^*$, where $\tilde{E}_{Q, \nu}^* := (Q \times [0, \tilde{c} l(Q))] \setminus \bigcup_k C(Q_k)$.
Proof. Let $\alpha \in (0, 1)$. Let $B_1$ be the maximal set of dyadic subcubes, with $l(Q_k) < \bar{d}(Q)$, for which
\[ \int_{Q_k} |f^\xi_Q| > \frac{1}{\alpha}. \]
Therefore
\[ \sum_{Q_k \in B_1} |Q_k| \leq \alpha \sum_{Q_k \in B_1} \int_{Q_k} |f^\xi_Q| \leq \int_{Q} |f^\xi_Q| \leq \alpha |Q|. \]
Now let $B_2$ be the maximal set of cubes, with $l(Q_k) < \bar{d}(Q)$, such that
\[ \text{Re} \left\langle \xi, \int_{Q_k} f^\xi_Q \right\rangle < \alpha. \]
Then, using (3.11), the properties of $B_2$, and Lemma 3.21 part (1), we have that
\[ \frac{1}{2} \leq \text{Re} \left\langle \xi, \int_{Q} f^\xi_Q \right\rangle = \sum_{Q_k \in B_2} \frac{|Q_k|}{|Q|} \text{Re} \left\langle \xi, \int_{Q_k} f^\xi_Q \right\rangle + \text{Re} \left\langle \xi, \frac{1}{|Q|} \int_{Q \setminus \bigcup B_2} f^\xi_Q \right\rangle \leq \alpha + \frac{1}{|Q|} \int_{Q \setminus \bigcup B_2} |f^\xi_Q| \lesssim \alpha + \left( \frac{|Q \setminus \bigcup B_2|}{|Q|} \right)^{\frac{1}{2}}. \]
Therefore, rearranging and taking $\alpha \in (0, 1)$ sufficiently small we have that
\[ |Q| \lesssim |Q \setminus \bigcup B_2|. \]
Then, there is $\tau \in (0, 1)$ such that
\[ |E_{Q, \nu}| \geq |Q \setminus \bigcup B_2| - |\bigcup B_1| \geq \tau |Q|. \]
As required. \hfill \square

We give a small technical lemma about some of the properties of $\tilde{\xi}$

**Lemma 3.25.** Let $\nu \in \tilde{\mathcal{C}}$ with $|\nu| = 1$. Then there exists $\xi, \zeta \in \mathbb{C}^{n+2}$ such that $|\xi| = |\zeta| = 1$, $\xi = \nu^*(\zeta)$, and $\tilde{\mathcal{P}}\xi = \xi$.

**Proof.** As $|\nu| = 1$ there exists $\eta \in \mathbb{C}^{n+2}$ such that $|\eta| = 1$ and $|\nu(\eta)| = 1$. Then define $\xi := \nu^*(\nu(\eta))$ and $\zeta := \nu(\eta)$. Then $\nu^*(\zeta) = \nu^*(\nu(\eta)) = \xi$ by definition. Now $|\xi| = |\nu(\eta)| = 1$. And $|\xi| \leq |\nu^*||\nu(\eta)| = 1$. Also, $1 = |\nu(\eta)|^2 = \langle \nu(\eta), \nu(\eta) \rangle = \langle \eta, \nu^*(\nu(\eta)) \rangle \leq |\eta||\nu^*(\nu(\eta))| = |\xi|$. Thus $|\xi| = 1$.

Let $z \in \mathbb{C}^{n+2}$. Then, since $\nu \in \tilde{\mathcal{C}}$, we have $\langle \xi, z \rangle = \langle \nu(\eta), \nu(z) \rangle = \langle \nu(\eta), \nu(\tilde{\mathcal{P}}z) \rangle = \langle \xi, \tilde{\mathcal{P}}z \rangle = (\tilde{\mathcal{P}}\xi, z)$. As $z \in \mathbb{C}^{n+2}$ was arbitrary we have that $\tilde{\xi} = \tilde{\mathcal{P}}\xi$. As required. \hfill \square

Now we choose $\sigma = \frac{\alpha_0^2}{2}$. The following lemma will allow us to introduce the test functions into our argument.

**Lemma 3.26.** Let $Q \in \Delta^V$ if $V \in B_2^n(\mathbb{R}^n)$. If $(x, t) \in \tilde{E}^*_Q, \nu(x) \in K_{v, \sigma}$, then
\[ |\tilde{\gamma}_t(x)(At^\xi_Q(x))| \geq \frac{1}{2} c_2 |\tilde{\gamma}_t(x)|. \]

**Proof.** As $(x, t) \in \tilde{E}^*_Q, \nu(x) \in \mathbb{C}(S) \cap \tilde{E}^*_Q, \nu(x) \not\in \emptyset$. Then by Lemmas 3.24 and 3.25 we have
\[ |\nu(At^\xi_Q(x))| \geq \text{Re} \left\langle \zeta, \nu(At^\xi_Q(x)) \right\rangle = \text{Re} \left\langle \xi, \int_S f^\xi_Q \right\rangle \geq c_2. \]
Then
\[ \left| \frac{\tilde{\gamma}_t(x)}{|\tilde{\gamma}_t(x)|}(A_t f^\xi_Q(x)) \right| \geq |\nu(A_t f^\xi_Q(x))| - \left| \left( \frac{\tilde{\gamma}_t(x)}{|\tilde{\gamma}_t(x)|} - \nu \right) (A_t f^\xi_Q(x)) \right| \geq c_2 - \frac{\sigma}{c_1} \geq \frac{1}{2} c_2. \]
As required. \( \square \)

We are now ready to give the final proof of the upper bounds for the quadratic estimate in Proposition 3.5. This is adapted from [12, Proof of Proposition 5.9] to the set \( \mathcal{E}_{Q,v}^n \) and to the presence of the potential \( V \).

**Proof of Proposition 3.5.** We are left to prove Proposition 3.22. Then we have
\[
\int_{(x,t) \in \mathcal{E}_{Q,v}^n} \left| \tilde{\gamma}_t(x) \right|^2 \frac{dx}{t} = \int_{(x,t) \in \mathcal{E}_{Q,v}^n} \left| \tilde{\gamma}_t(x) \right|^2 \frac{dx}{t} + \int_{(x,t) \in Q \times [\ell(Q), \ell(Q)]} \left| \tilde{\gamma}_t(x) \right|^2 \frac{dx}{t}.
\]
Then, using the lower bound for \( \tilde{\gamma} \), we have
\[
\int_{(x,t) \in Q \times [\ell(Q), \ell(Q)]} \left| \tilde{\gamma}_t(x) \right|^2 \frac{dx}{t} \leq \int_{\ell(Q)} \int_{Q} \left| \tilde{\gamma}_t(x) \right|^2 \frac{dx}{t} \leq \frac{1}{\ell(Q)} \int_{\ell(Q)} \left( \int_{Q} \left| \tilde{\gamma}_t(x) \right|^2 dx \right) dt \leq \frac{|Q|}{\ell(Q)} \int_{\ell(Q)} dt = |Q|.
\]
Therefore, by Lemma 3.26 we introduce the test functions to obtain
\[
\int_{(x,t) \in \mathcal{E}_{Q,v}^n} \left| \tilde{\gamma}_t(x) \right|^2 \frac{dx}{t} \leq \int_{C(Q)} \left| \tilde{\gamma}_t(x)(A_t f^\xi_Q(x)) \right|^2 \frac{dx}{t} \leq \int_{C(Q)} \left| (Q_t^B - \tilde{\gamma}_t(x)A_t)f^\xi_Q \right|^2 \frac{dx}{t} + \int_{C(Q)} |Q_t^B f^\xi_Q|^2 \frac{dx}{t}.
\]
Now, by the uniform boundedness of \( P_t^B \) and Lemma 3.21, we have
\[
\int_{C(Q)} \left| (Q_t^B - \tilde{\gamma}_t(x)A_t)f^\xi_Q \right|^2 \frac{dx}{t} \leq \int_{C(Q)} \left| (Q_t^B - \tilde{\gamma}_t(x)A_t)f^\xi_Q \right|^2 \frac{dx}{t} \leq \int_{C(Q)} \left| (Q_t^B - \tilde{\gamma}_t(x)A_t)f^\xi_Q \right|^2 \frac{dx}{t} + \int_{C(Q)} |Q_t^B f^\xi_Q|^2 \frac{dx}{t}.
\]
Also,
\[
\int_{C(Q)} \left| (Q_t^B - \tilde{\gamma}_t(x)A_t)f^\xi_Q \right|^2 \frac{dx}{t} \leq \int_{C(Q)} \left| (Q_t^B - \tilde{\gamma}_t(x)A_t)(f^\xi_Q - \xi_Q) \right|^2 \frac{dx}{t} + \int_{C(Q)} \left| (Q_t^B - \tilde{\gamma}_t(x)A_t)(f^\xi_Q - \xi_Q) \right|^2 \frac{dx}{t}.
\]
(3.12)
Now, for the first term in (3.12) we have
\[
\int_{C(Q)} \left| (Q_t^B - \tilde{\gamma}_t(x)A_t)(f^\xi_Q - \xi_Q) \right|^2 \frac{dx}{t} \leq \int_{C(Q)} \left| (Q_t^B P_t - \tilde{\gamma}_t(x)A_t)(f^\xi_Q - \xi_Q) \right|^2 \frac{dx}{t} + \int_{C(Q)} \left| (Q_t^B I - P_t)(f^\xi_Q - \xi_Q) \right|^2 \frac{dx}{t}.
\]
(3.13)
As \( f^\xi_Q - \xi_Q = (P_t^B - I)\xi_Q = (\epsilon dB)^2 P_t\xi_Q \in R(D) \), by Lemma 3.13 we have that the second term in (3.13) is bounded by \( \| f^\xi_Q - \xi_Q \|^2 \). Then, by definitions of \( \tilde{P} \) and \( P_\mu \), we obtain
\[
\int_{C(Q)} \left| (Q_t^B P_t - \tilde{\gamma}_t(x)A_t)(f^\xi_Q - \xi_Q) \right|^2 \frac{dx}{t} \leq \int_{C(Q)} \left| (Q_t^B \tilde{P} - \tilde{\gamma}_t(x)A_t)(f^\xi_Q - \xi_Q) \right|^2 \frac{dx}{t} + \int_{C(Q)} \left| (Q_t^B P_\mu P_t - \tilde{\gamma}_t(x)A_t)(f^\xi_Q - \xi_Q) \right|^2 \frac{dx}{t}.
\]
Then by Lemma 3.14 we have that the second term in (3.13) is bounded by $\|f^\xi_Q - \xi_Q\|_2^2$. Now using Lemmas 3.16 and 3.17 we obtain
\[
\int_{C(Q)} |(Q_t^B P_t - \tilde{\gamma}_t(x) A_t)(f^\xi_Q - \xi_Q)|^2 \frac{dx \, dt}{t} \leq \int_{C(Q)} |(Q_t^B P_t - \tilde{\gamma}_t(x) A_t)(f^\xi_Q - \xi_Q)|^2 \frac{dx \, dt}{t} + \int_{C(Q)} |\tilde{\gamma}_t(x) A_t(I - P_t)(f^\xi_Q - \xi_Q)|^2 \frac{dx \, dt}{t} \lesssim \|f^\xi_Q - \xi_Q\|_2^2.
\]

Therefore, by the uniform boundedness of $P_t^B - I$ we have that
\[
\int_{C(Q)} |(Q_t^B - \tilde{\gamma}_t(x) A_t)(f^\xi_Q - \xi_Q)|^2 \frac{dx \, dt}{t} \lesssim \|f^\xi_Q - \xi_Q\|_2^2 = \|(P_t^B - I)\xi_Q\|_2^2 \lesssim |Q|
\]

We now start to bound the second term in (3.12). Let $(x, t) \in C(Q)$. Then using that $\xi = \tilde{\xi}$, $(Q_t^B - \tilde{\gamma}_t A_t)\xi = 0$, and $\eta_Q = 1$ on $2Q$, we have that
\[
(Q_t^B - \tilde{\gamma}_t A_t)\xi_Q = (Q_t^B - \tilde{\gamma}_t A_t)((\eta_Q - 1)\tilde{\xi}) = (Q_t^B - \gamma_t A_t)\tilde{\xi}(\eta_Q - 1)\xi = Q_t^B((\eta_Q - 1)\xi)
\]

Therefore, since $\text{supp}((\eta_Q - 1)\xi) \cap 2Q = \emptyset$, using off-diagonal estimates, we have
\[
\|I_Q Q_t^B((\eta_Q - 1)\xi)\|_2^2 \leq \left(\sum_{j=1}^{\infty} \|I_Q Q_t^B I_{C_j(Q)}((\eta_Q - 1)\xi)\|_2\right)^2 \lesssim \frac{t}{\ell(Q)} \sum_{j=1}^{\infty} 2^{-jM} \|I_{C_j(Q)}((\eta_Q - 1)\xi)\|_2^2 \lesssim \frac{t}{\ell(Q)} \sum_{j=1}^{\infty} 2^{-j(M-n)}|Q| \lesssim \frac{t|Q|}{\ell(Q)}
\]

Thus
\[
\int_{C(Q)} |(Q_t^B f^\xi_Q - \tilde{\gamma}_t(x) A_t)\xi_Q|^2 \frac{dx \, dt}{t} \lesssim \int_0^t \frac{|Q|}{\ell(Q)} \, dt = |Q|
\]

Therefore
\[
\int_{(x,t) \in E_{Q,n}^{\bar{\gamma}_t}} |\tilde{\gamma}_t(x)|^{2} \frac{dx \, dt}{t} \lesssim |Q|.
\]

This completes the proof. \( \Box \)

Thus, we have proved Theorem 3.4. For $V \in L^2_\pm(\mathbb{R}^n)$ with sufficiently small norm we note that as all dyadic cubes are small then the bounds on the length of the cubes in Lemma 3.24 are not needed to remove all the big bad cubes. Therefore, the proof is similar but easier.

**Proposition 3.27.** Let $V \in L^2_\pm(\mathbb{R}^n)$ with sufficiently small norm. Then we have the square function estimate
\[
\int_0^\infty \|t DB(I + t^2 DBDB)^{-1}u\|_2^2 \frac{dt}{t} \lesssim \|u\|_2^2,
\]

for all $u \in L^2(\mathbb{R}^n; C^{n+2})$.

### 3.4. Applications of the Quadratic Estimate.

We give some applications of Theorem 3.4. We prove that the operators $DB$ have a bounded holomorphic functional calculus and we prove a Kato type square root estimate. We note that the Kato result was proven for $V$ with small $L_\pm^2$-norm by Gesztesy, Hofmann, and Nichols in [18] and the results have recently been expanded by Bailey in [15] to include $B^2(\mathbb{R}^n)$ and $L^2_\pm(\mathbb{R}^n)$ for $n \geq 4$. We manage to improve the $L^2_\pm$ case by lowering the dimension to $n \geq 3$. 
Theorem 3.28. If \( V \in B_{\infty}^2(\mathbb{R}^n) \) or \( L_\infty^2(\mathbb{R}^n) \) with sufficiently small \( L_\infty^2 \)-norm, then we have there exists \( c_\mu > 0 \) which depends only on \( n, \kappa \), and \( \|B\|_\infty \), for all \( f \in H^\infty(S^\mu_0) \)
\[
\|f(DB)u\|_2 \leq C_\mu \|f\|_\infty \|u\|_2,
\]
for all \( u \in \overline{R(D)} \).

Proof. Define \( T: \overline{R(D)} \to L^2((\mathbb{R}^n; \mathbb{C}^{n+2}) \) defined by \( Tu := DBu \). That is \( T \) is the restriction of \( DB \to \overline{R(D)} \). Therefore, by Proposition 3.2 we have that \( T \) is a densely defined, closed, and injective operator. Also, by Theorem 3.4 we have that
\[
\int_0^\infty \|T(t + t^2T^-1)u\|^2 \frac{dt}{t} \approx \|u\|^2_2, \quad \text{for all } u \in \overline{R(D)}.
\]
Thus by Theorem 2.5 this is equivalent to \( T \) having bounded holomorphic functional calculus, as required. \( \square \)

We now give a Kato square root type estimate as a corollary of Theorem 3.28.

Corollary 3.29. Let \( V \in B_{\infty}^2(\mathbb{R}^n) \). Let \( A \in L^\infty(\mathbb{R}^n; \mathcal{L}(\mathbb{C}^n)) \) and \( a \in L^\infty(\mathbb{R}^n; \mathcal{L}(\mathbb{C})) \) be such that there exists \( \kappa > 0 \) satisfying
\[
\text{Re}(A \nabla u, \nabla u) + \text{Re}(a|V|^\frac{1}{2}u, |V|^\frac{1}{2}u) \geq \kappa(\|\nabla u\|^2_2 + |||V|^\frac{1}{2}u||^2_2),
\]
for all \( u \in \mathbb{V}^{1,2}(\mathbb{R}^n) \). Then we have that
\[
\|\sqrt{-\text{div}A\nabla + aV}u\|_2 \approx \|\nabla u\|_2 + \|\sqrt{V}u\|_2,
\]
for all \( u \in \mathbb{V}^{1,2}(\mathbb{R}^n) \).

Proof. Note that \( f: S^\mu_0 \to \mathbb{C} \) defined by \( f(z) = \frac{\sqrt{-z}}{z} \) is bounded. Then define
\[
D := \begin{pmatrix} 0 & \text{div} & -|V|^\frac{1}{2} \\ -\nabla & 0 & 0 \\ -|V|^\frac{1}{2} & 0 & 0 \end{pmatrix}, \quad B := \begin{pmatrix} I & 0 & 0 \\ 0 & A & 0 \\ 0 & 0 & a \end{pmatrix}.
\]
Now, let \( u \in \overline{R(D)} \), then by the ellipticity of \( A \) and \( a \) we have that
\[
\text{Re}(Bu, u) = \langle u_\perp, u_\perp \rangle + \text{Re}(A \nabla u, \nabla v) + \text{Re}(a|V|^\frac{1}{2}v, |V|^\frac{1}{2}v)
\geq \min\{1, \kappa\}(\|u_\perp\|^2_2 + \|\nabla v\|^2_2 + \|\sqrt{V}|v||^2_2)
= \min\{1, \kappa\}\|u\|^2_2.
\]
Therefore, by Theorem 3.28 we have that
\[
\|f(DB)u\|_2 \lesssim \|f\|_\infty \|u\|_2 = \|u\|_2.
\]
Now, restricting \( u \) to the first component, so \( u = (u_\perp, 0, 0)^T \)
\[
\|\sqrt{-\text{div}A\nabla + aV}u_\perp\|_2 \approx \|Du_\perp\|_2 = \|\nabla u_\perp\|_2 + \|\sqrt{V}|u_\perp||_2.
\]
The reverse estimate comes from considering \( g(z) = \frac{1}{\sqrt{z+2}} \). This completes the proof. \( \square \)

We also get a Kato square root type estimate when \( V \in L^\infty_\infty(\mathbb{R}^n) \) without the restriction of small norm. We remove this restriction by hiding the size of the norm in the perturbation \( a \) and proceeding as if \( V \) has small norm.

Corollary 3.30. Let \( V \in L^\infty_\infty(\mathbb{R}^n) \). Let \( A \in L^\infty(\mathbb{R}^n; \mathcal{L}(\mathbb{C}^n)) \) and \( a \in L^\infty(\mathbb{R}^n; \mathcal{L}(\mathbb{C})) \) be such that there exists \( \kappa > 0 \) satisfying
\[
\text{Re}(A \nabla u, \nabla u) + \text{Re}(a|V|^\frac{1}{2}u, |V|^\frac{1}{2}u) \geq \kappa(\|\nabla u\|^2_2 + |||V|^\frac{1}{2}u||^2_2),
\]
for all \( u \in W^{1,2}(\mathbb{R}^n) \). Then we have that
\[
\|\sqrt{-\text{div}A\nabla + aV}u\|_2 \approx \|\nabla u\|_2,
\]
for all \( u \in W^{1,2}(\mathbb{R}^n) \).
Proof. Define $\tilde{V}(x) := \varepsilon|V(x)|/|V(x)|$ and $\tilde{a} := \varepsilon^{\arg(V(x))} a(x)|V(x)|/\varepsilon$, where $\varepsilon > 0$ is such that $\|\tilde{V}\|_{L^2} = \varepsilon$ is sufficiently small. Then $\tilde{a}V = aV$. Then letting

$$D = \begin{bmatrix} 0 & \text{div} & -|\tilde{V}|^{\frac{1}{2}} \\ -\nabla & 0 & 0 \\ -|\tilde{V}|^{\frac{1}{2}} & 0 & 0 \end{bmatrix}, \quad B = \begin{bmatrix} I & 0 & 0 \\ 0 & A & 0 \\ 0 & 0 & \tilde{a} \end{bmatrix}. $$

Now, let $u \in \mathbb{R}(D)$, then by the ellipticity of $A$ and $a$ we have that

$$\text{Re}(Bu, u) = \langle u_\perp, u_\perp \rangle + \text{Re}(A\nabla, \nabla v) + \text{Re}(\tilde{a}|\tilde{V}|^{\frac{1}{2}}v, |\tilde{V}|^{\frac{1}{2}}v) = \langle u_\perp, u_\perp \rangle + \text{Re}(A\nabla, \nabla v) + \text{Re}(\tilde{a}|\tilde{V}|^{\frac{1}{2}}v, |\tilde{V}|^{\frac{1}{2}}v) \geq \min\{1, \kappa\}(\|u_\perp\|^2 + \|\nabla v\|^2) + \|\tilde{V}|^{\frac{1}{2}}v\|^2 / 2) = \min\{1, \kappa\}\|u\|^2_2. $$

Then the same argument as in Theorem 3.29 and then Hölder’s inequality, gives

$$\|\sqrt{-\text{div}A\nabla + \tilde{a}u}u\|_2 = \|\sqrt{-\text{div}A\nabla + \tilde{a}u}u\|_2 \approx \|\nabla u\|_2 + \|\tilde{V}|^{\frac{1}{2}}u\|_2 \approx \|\nabla u\|_2, $$

for all $u \in W^{1,2}(\mathbb{R}^n)$. As required.

3.5. Analytic Dependence and Lipschitz Estimates. Here we show that the functional calculus depends analytically on the perturbation $B$ equipped with the $L^\infty$-norm. We follow the same method as in [12, Section 6] by first showing that the resolvents depend analytically on $B$ and then building up to functions in the $\Phi(S^\circ_\mu)$ class and finally to all of $H^\infty(S^\circ_\mu)$.

**Theorem 3.31.** Let $D : D(D) \to L^2(\mathbb{R}^n; \mathbb{C}^{n+2})$, be a self-adjoint operator. Let $U \subseteq \mathbb{C}$ be open. Let $B : U \to L^\infty(\mathbb{R}^n; L(\mathbb{C}^n))$ be holomorphic, such that $B$ is uniformly bounded in $U$ and that there exists $\kappa > 0$ such that

$$\text{Re}(Bu, u) \geq \kappa\|u\|^2_2 \quad \forall u \in \mathbb{R}(D), \forall z \in U. $$

Then

1. $z \mapsto (I + tDB_z)^{-1}$ is holomorphic in $U$ for all $t \in \mathbb{C} \setminus S^\circ_\mu$,
2. $z \mapsto \mathbb{P}_{N(DB_z)}$ is holomorphic in $U$,
3. $z \mapsto \psi(DB_z)$ \quad $\forall \psi \in \Psi(S^\circ_\mu)$ is holomorphic in $U$.

Moreover, if $DB_z$ satisfies $\|f(DB_z)u\|_2 \leq C_\mu\|f\|_\infty\|u\|_2$ uniformly in $z \in U$, then $z \mapsto f(DB_z)$ is holomorphic in $U$.

**Proof.** Let $z \in U$ and $t \in \mathbb{C} \setminus S^\circ_\mu$. Then we have that

$$\frac{d}{dz}(I + tDB_z)^{-1}u = -(I + tDB_z)^{-1}tD \left(\frac{d}{dz}B_z\right) (I + tDB_z)^{-1}u. $$

Then, using the fact that $Q_t = P_tDB$ is uniformly bounded, we have

$$\left\|\frac{d}{dz}(I + tDB_z)^{-1}u\right\|_2 = \left\|(I + tDB_z)^{-1}tD \left(\frac{d}{dz}B_z\right) (I + tDB_z)^{-1}u\right\|_2,$n

$$= \left\|(I + tDB_z)^{-1}tD(\mathbb{P}_{\mathbb{R}(D)} + \mathbb{P}_{\mathbb{N}(D)}) \left(\frac{d}{dz}B_z\right) (I + tDB_z)^{-1}u\right\|_2,$n

$$= \left\|(I + tDB_z)^{-1}tDB_z \left(\mathbb{B}^{-1}\mathbb{P}_{\mathbb{R}(D)}\right) \left(\frac{d}{dz}B_z\right) (I + tDB_z)^{-1}u\right\|_2,$n

$$\lesssim \|u\|_2,$n

here the bound is independent of $z \in U$. Therefore, $z \mapsto (I + tDB_z)^{-1}$ is holomorphic on $U$. In particular, we have that $z \mapsto (I + inDB_z)^{-1}$ is holomorphic for all $n \in \mathbb{N}$.

We claim that $\mathbb{P}_{N(DB_z)}u = \lim_{n \to \infty}(I + tDB_z)^{-1}u$ in $L^2$ for all $u \in L^2(\mathbb{R}^n; \mathbb{C}^{n+2})$. Let $u \in N(DB_z).$ Then

$$(I + inDB_z)^{-1}u = (I + inDB_z)^{-1}(u + inDB_zu) = u,$n

"
for all \( n \in \mathbb{N} \). Now let \( u \in R(DB_z) \). Then, there exists \( v \in D(DB_z) \) such that \( u = DB_zv \). Therefore

\[
\|(I + inDB_z)^{-1}u\|_2 = \frac{1}{n}\|(I + inDB_z)^{-1}inDB_zv\|_2
\leq \frac{1}{n}\|(I + inDB_z)^{-1}(v + inDB_zv)\|_2 + \|v\|_2
\leq \frac{1}{n}\|v\|_2.
\]

That is \( \lim_{n \to \infty}(I + inDB_z)^{-1}u = 0 \) for all \( u \in R(DB_z) \). Now let \( u \in \overline{R(DB_z)} \). Then there exists \( \{u_m\}_{m \in \mathbb{N}} \subseteq R(DB_z) \) such that \( u_m \to u \) as \( m \to \infty \) in \( L^2 \). Let \( \varepsilon > 0 \). Then

\[
\|(I + inDB_z)^{-1}u\|_2 \leq \|(I + inDB_z)^{-1}(u - u_m)\|_2 + \|(I + inDB_z)^{-1}u_m\|_2
\leq \|u - u_m\|_2 + \|(I + inDB_z)^{-1}u_m\|_2.
\]

Now choose \( m \in \mathbb{N} \) be such that \( \|u - u_m\|_2 \leq \frac{\varepsilon}{2} \). Now let \( N \in \mathbb{N} \) be such that \( \|(I + inDB_z)^{-1}u_m\|_2 \leq \frac{\varepsilon}{2} \) for all \( n > N \). Thus \( \|(I + inDB_z)^{-1}u\|_2 \leq \varepsilon \) for all \( n > N \). This proves the claim. Then as \( \mathbb{P}_N(DB_z)u \) is the limit of holomorphic operators and so is holomorphic (see for example [22]).

Let \( \psi \in \Psi(S^o_{\mu}) \). Then

\[
\psi(DB_z) = \int \psi(\lambda)(\lambda - DB_z)^{-1} d\lambda.
\]

Using the approximation of the contour integral by Riemann sums and the fact that the Riemann sums are holomorphic gives the desired result.

Now assume further that \( \|f(DB_z)u\|_2 \leq C_\mu\|f\|_{L^\infty}\|u\|_2 \) for all \( f \in H^\infty(S^o_{\mu}) \). Let \( f \in H^\infty(S^o_{\mu}) \). Then choose uniformly bounded sequence \( \{\psi_n\} \subseteq \Psi(S^o_{\mu}) \) that converges uniformly on compact sets to \( f \). Then by the convergence lemma we have that \( f(DB_z)u = \lim_{n \to \infty} \psi_n(DB_z)u \) in \( L^2 \). Thus \( f(DB_z) \) is holomorphic on \( U \). This completes the proof

**Theorem 3.32.** Let \( D : D(D) \to L^2(\mathbb{R}^n; \mathcal{C}^{n+2}) \), be a self-adjoint operator. Also, let \( B \in L^\infty(\mathbb{R}^n; \mathcal{L}(\mathbb{C}^n)) \) be elliptic on \( R(D) \) as in (3.3). Suppose further that \( DB \) has a bounded holomorphic functional calculus. Let \( 0 < \delta < \kappa \). Let \( \tilde{B} \in L^\infty(\mathbb{R}^n; \mathcal{L}(\mathbb{C}^n)) \) such that \( \|B - \tilde{B}\|_{L^\infty} < \delta \). Then

\[
\|f(DB)u - f(\tilde{B})u\|_2 \leq \|B - \tilde{B}\|_{L^\infty}\|f\|_{L^\infty}\|u\|_2, \quad \forall f \in H^\infty(S^o_{\mu}),
\]

where the implicit constant depends only on \( n, \kappa, \|B\|_{L^\infty} \), and \( \delta \).

**Proof.** Let \( f \in H^\infty(S^o_{\mu}) \). Define \( B : \{z \in \mathbb{C} : |z| < \delta\} \to L^\infty(\mathbb{R}^n; \mathcal{L}(\mathbb{C}^n)) \), given by

\[
B(z) := B_z := B + \frac{z(\tilde{B} - B)}{\|B - \tilde{B}\|_{L^\infty}}
\]

Then \( B_z \) is holomorphic and we have that

\[
\text{Re}(B_zu, u) = \text{Re}(Bu, u) - \text{Re} \left( \frac{z}{\|B - \tilde{B}\|_{L^\infty}}(\tilde{B} - B)u, u \right) \geq \kappa\|u\|_2^2 - \delta \text{Re}(u, u) \geq (\kappa - \delta)\|u\|_2^2.
\]

We also have that

\[
\|B_z\| \leq \|B\|_{L^\infty} + |z| < \|B\|_{L^\infty} + \delta.
\]

Thus \( B_z \) is uniformly bounded and uniformly elliptic. Therefore, by Theorem 3.28 we have \( \|f(DB_z)u\|_2 \leq \|f\|_\infty\|u\|_2 \) uniformly in \( z \). Thus, by Theorem 3.31 \( z \mapsto f(DB_z) \) is holomorphic. Now fix \( u \in \overline{R(D)} \) and define \( G_u : \{z \in \mathbb{C} : |z| < \delta\} \to L^2(\mathbb{R}^n) \), given by

\[
G_u(z) := \frac{f(DB)u - f(DB_z)u}{2\|f\|_\infty\|u\|_2},
\]

where \( c \) is the uniform constant such that \( \|f(DB_z)u\|_2 \leq c\|f\|_\infty\|u\|_2 \). By Theorem 3.31 and the bounded holomorphic functional calculus of \( DB_z \), we have \( G_u \) is holomorphic and

\[
\|G_u(z)\| \leq \frac{1}{2c\|f\|_\infty\|u\|_2}\|f(DB)u - f(DB_z)u\|_2 \leq 1.
\]
As $G_u$ is holomorphic then the pairing $\langle G_u(z), f \rangle$ is holomorphic as a function for all $f \in L^2(\mathbb{R}^n; \mathbb{C}^{n+2})'$. In particular, we have for all $f \in L^2(\mathbb{R}^n; \mathbb{C}^{n+2})'$ with $\|f\| \leq 1$ then
\[
\|\langle G_u(z), f \rangle\|_2 \leq \|f\|_2 \leq 1.
\]
Therefore, by Schwarz’s lemma we have that
\[
\|G_u(z)\|_2 = \sup_{\|f\|=1} \|\langle G_u(z), f \rangle\| \leq |z|.
\]
Thus choosing $z = \|B - \tilde{B}\|_\infty < \delta$ gives
\[
\|f(DB)u - f(D\tilde{B})u\|_2 \leq 2\|f\|_\infty \|B - \tilde{B}\|_\infty \|u\|_2.
\]
Here we note that $u \in \mathbb{R}(D)$ was arbitrary and the constants are all independent of $u$. This completes the proof. \hfill \Box

4. Boundary Value Problems For the First-Order Equation

In this section, we consider solutions $F : \mathbb{R}_+ \to L^2(\mathbb{R}^n; \mathbb{C}^{n+2})$ of the Cauchy–Riemann systems
\[
\partial_tF + DBF = 0, \quad t \in \mathbb{R}_+, \tag{4.1}
\]
adapted to the first-order operators $DB$ in Theorem 3.4. The most important properties are an equivalence with solutions of the second-order equation $H_{A,a,V} u = 0$ and that solutions of the first-order equation come from semigroups generated by the operator $DB$ on a subspace of $\mathbb{R}(D)$. To begin, we make precise the definition of a weak solution of (4.1), adopting the convention for functions $\phi : \mathbb{R}^{n+1}_+ \to \mathbb{C}^{n+2}$ and $t \in \mathbb{R}_+$, whereby $\phi(t) : \mathbb{R}^n \to \mathbb{C}^{n+2}$ is defined by $(\phi(t))(x) := \phi(t,x)$ for all $x \in \mathbb{R}^n$.

**Definition 4.1.** We shall write that $F$ is a weak solution of $\partial_tF + DBF = 0$ in $\mathbb{R}_+$, or simply $\partial_tF + DBF = 0$ in $\mathbb{R}_+$, if $F \in L^2_{loc}(\mathbb{R}^{n+1}_+; \mathbb{C}^{n+2})$ and
\[
\int_0^{\pm \infty} \langle F(t), \partial_t\varphi(t) \rangle \, dt = \int_0^{\pm \infty} \langle BF(t), D\varphi(t) \rangle \, dt,
\]
for all $\varphi \in C^\infty_c(\mathbb{R}^{n+1}_+; \mathbb{C}^{n+2})$.

4.1. Reduction to a First-Order System. We now work towards showing that there is some equivalence between the first-order and second-order equations. We first need to choose the correct perturbation matrix $B$ depending on $A^V$. We do this in a similar way as in [4] where it was shown that if $A$ is bounded and elliptic then a transformed matrix, $\tilde{A}$, is also bounded and elliptic. We replicate these results using the bounded operators $A^V$, $\tilde{A}$ and $\tilde{A}^V$ defined on $L^2(\mathbb{R}^n, \mathbb{C}^{n+2})$ by
\[
A^V := \begin{bmatrix} A_{\perp\perp} & A_{\perp\parallel} & 0 \\ A_{\parallel\perp} & A_{\parallel\parallel} & 0 \\ 0 & 0 & a \end{bmatrix}, \quad \tilde{A} := \begin{bmatrix} A_{\perp\perp} & A_{\perp\parallel} & 0 \\ 0 & I & 0 \\ 0 & 0 & I \end{bmatrix}, \quad \text{and} \quad A^V := \begin{bmatrix} I & 0 & 0 \\ 0 & A_{\parallel\parallel} & 0 \\ 0 & 0 & ae^{i\arg V(x)} \end{bmatrix}.
\]

Note that since $A$ and $a$ are bounded then so are $A^V$, $\tilde{A}$ and $\tilde{A}^V$. Also, as $A_{\perp\perp}$ is pointwise strictly elliptic then $A_{\perp\perp}$ is invertible, and so $\tilde{A}$ is invertible with inverse,
\[
\tilde{A}^{-1} = \begin{bmatrix} A_{\perp\perp}^{-1} & -A_{\perp\parallel}^{-1} A_{\parallel\parallel} & 0 \\ 0 & I & 0 \\ 0 & 0 & I \end{bmatrix}.
\]

Now define
\[
\tilde{A}^V = A^V \tilde{A}^{-1} = \begin{bmatrix} A_{\perp\perp}^{-1} & -A_{\perp\parallel}^{-1} A_{\parallel\parallel} & 0 \\ A_{\parallel\perp} A_{\perp\parallel}^{-1} & A_{\parallel\parallel} - A_{\parallel\perp} A_{\perp\parallel} A_{\parallel\parallel} & 0 \\ 0 & 0 & ae^{i\arg V(x)} \end{bmatrix}.
\]
Let \( u \in R(D) \). Then, as \( A_{\perp}^{-1} (u_{\perp} + A_{\parallel} u_{\parallel}) \in L^2(\mathbb{R}^n) \), we have that

\[
v = \begin{bmatrix} A_{\perp}^{-1} (u_{\perp} + A_{\parallel} u_{\parallel}) \\
v_{\parallel} \\
u_{\mu}
\end{bmatrix} \in R(D).
\]

Then \( \tilde{A} v = u \). That is \( \tilde{A} : R(D) \rightarrow R(D) \) is surjective. Also, \( \tilde{A} \) is invertible and therefore is injective. Thus \( \tilde{A} : R(D) \rightarrow R(D) \) is an isomorphism. We now prove the result that \( \tilde{A} \) preserves the important properties of boundedness and ellipticity from \( A^\perp \).

**Proposition 4.2.** We have that \( A^\perp \) is bounded and elliptic on \( R(D) \) if and only if the matrix \( \tilde{A}^\perp \) is bounded and elliptic on \( R(D) \).

**Proof.** We first prove that if \( A^\perp \) is bounded and elliptic on \( R(D) \) then so is \( \tilde{A}^\perp \). Now for any \( f \in R(D) \), let \( g \in R(D) \) such that \( A g = f \) recalling that \( \tilde{A} : R(D) \rightarrow R(D) \) is an isomorphism. Then

\[
\text{Re}(\tilde{A}^\perp f, f) = \text{Re}(\tilde{A}^\perp g, \tilde{A} g)
\]

\[
= \text{Re}(\tilde{A}^\perp g, \tilde{A} g)
\]

\[
= \text{Re}
\left[
\begin{bmatrix}
g_{\perp} \\
A_{\parallel} g_{\perp} + A_{\parallel} g_{\parallel} \\
ae^{i \arg V(x)} g_{\mu}
\end{bmatrix}
\right]
\cdot
\begin{bmatrix}
A_{\parallel} g_{\perp} + A_{\parallel} g_{\parallel} \\
g_{\parallel} \\
g_{\mu}
\end{bmatrix}
\]

\[
= \text{Re}(\langle g_{\perp}, A_{\parallel} g_{\perp} + A_{\parallel} g_{\parallel} \rangle + \langle A_{\parallel} g_{\perp} + A_{\parallel} g_{\parallel}, g_{\parallel} \rangle + \langle ae^{i \arg V(x)} g_{\mu}, g_{\mu} \rangle)
\]

\[
= \text{Re}(\langle A_{\parallel} g_{\perp} + A_{\parallel} g_{\parallel}, g_{\parallel} \rangle + \langle A_{\parallel} g_{\perp} + A_{\parallel} g_{\parallel}, g_{\parallel} \rangle + \langle ae^{i \arg V(x)} g_{\mu}, g_{\mu} \rangle)
\]

We also have

\[
\text{Re}(\tilde{A}^\perp f, f) = \text{Re}(\tilde{A}^\perp g, \tilde{A} g)
\]

Now as \( A^\perp \) is elliptic we have that

\[
\kappa \| g \|^2 \leq \text{Re}(\tilde{A}^\perp g, g) = \text{Re}(\tilde{A}^\perp f, f).
\]

Then

\[
\| f \|^2 \leq \| \tilde{A}^\perp f \|^2 \leq \| \tilde{A} \|^2 \| g \|^2 \leq \text{Re}(\tilde{A}^\perp f, f).
\]

That is \( \tilde{A}^\perp \) is elliptic. Also as \( A \) is bounded then \( \tilde{A} \) and \( \tilde{A} \) are bounded and as \( \tilde{A} \) is invertible then \( \tilde{A}^{-1} \) is bounded. Then \( \tilde{A} = \tilde{A}^{-1} \) is bounded.

Note that \( (\tilde{A}^\perp) = A^\perp \). Therefore, if \( A^\perp \) is bounded and elliptic then so is \( A^\perp \), by the above argument. This completes the proof.

From now on we let \( B = \tilde{A}^\perp \), and so \( B \) is elliptic and bounded. We can now show that this is the correct \( B \) to obtain the correspondence between the first and second-order equations.

**Proposition 4.3.** Let \( u \) be such that \( H_{A,a} u = 0 \) in \( \mathbb{R}^{n+1}_+ \). Assume further that

\[
\nabla_{A,u} u := \begin{bmatrix}
\frac{\partial u}{\partial n} \\
\frac{\partial u}{\partial v} \\
\frac{\partial u}{\partial \mu}
\end{bmatrix}
\in L^2_{loc}(\mathbb{R}^n; L^2(\mathbb{R}^{n+1}; C^{n+2})),
\]

then \( F := \nabla_{A,u} u \) is a weak solution of \( \partial_t F + DBF = 0 \) in \( \mathbb{R}_\pm \). Conversely, if \( F \in L^2_{loc}(\mathbb{R}^n; R(D)) \) is a weak solution of \( \partial_t F + DBF = 0 \) in \( \mathbb{R}_\pm \), then there exists \( u \) such that \( H_{A,a} u = 0 \) in \( \mathbb{R}^{n+1}_\pm \) with \( F = \nabla_{A,u} u \).
Proof. Let \( u \) be such that \( H_{A,\mu} V u = 0 \) where \( \nabla_{A,\mu} u \in L^2_{\text{loc}}(\mathbb{R}_+; L^2(\mathbb{R}^{n+1}; \mathbb{C}^{n+2})) \). Define \( F := \nabla_{A,\mu} u \). Then for all \( \varphi \in C_c^\infty(\mathbb{R}^{n+1}) \) we have

\[
\int_0^\infty \int_{\mathbb{R}^n} \nabla_{t,x} u \cdot \nabla_{t,x} \varphi + a V u \langle \varphi \rangle \, dx \, dt = 0.
\]

Note that for each fixed \( t > 0 \) we have that \( F(t) \in \mathcal{R}(D) \). Therefore \( F \in L^2_{\text{loc}}(\mathbb{R}_+; \mathcal{R}(D)) \). Now for \( \varphi \in C_c^\infty(\mathbb{R}^{n+1}; \mathbb{R}^{n+2}) \), we have

\[
\int_0^\infty \langle F_\perp, \partial_t \varphi \rangle = \int_0^\infty \langle (A \nabla_{t,x} u)_\perp, \partial_t \varphi \rangle \, dt
\]

\[
= - \int_0^\infty \langle (A \nabla_{t,x} u)_\parallel, \nabla \varphi \rangle - \langle ae^i \text{arg} V(x) |V|^\frac{1}{2} u, |V|^\frac{1}{2} \varphi \rangle \, dt
\]

\[
= \int_0^\infty \langle (BF)_\parallel, (D \varphi)_\parallel \rangle + \langle (BF)_\perp, (D \varphi)_\perp \rangle \, dt.
\]

A direct calculation gives us that \( \partial_t u = (BF)_\perp \). Therefore,

\[
\int_0^\infty \langle F_\parallel, \partial_t \varphi \rangle \, dt = \int_0^\infty \langle \nabla u, \partial_t \varphi \rangle \, dt
\]

\[
= \int_0^\infty \langle \partial_t u, \text{div} \varphi \rangle - \langle |V|\frac{1}{2} \varphi, \partial_t u \rangle + \langle |V|\frac{1}{2} \varphi, \varphi \rangle \, dt
\]

\[
= \int_0^\infty \langle (BF)_\parallel, (D \varphi)_\parallel \rangle \, dt + \int_0^\infty \langle \partial_t u, |V|\frac{1}{2} \varphi \rangle \, dt.
\]

Also,

\[
\int_0^\infty \langle F_\parallel, \partial_t \varphi \rangle \, dt = \int_0^\infty \langle |V|\frac{1}{2} u, \partial_t \varphi \rangle \, dt = - \int_0^\infty \langle \partial_t u, |V|\frac{1}{2} \varphi \rangle \, dt.
\]

Combining these gives

\[
\int_0^\infty \langle F, \partial_t \varphi \rangle \, dt = \int_0^\infty \langle BF, D \varphi \rangle \, dt.
\]

Thus \( F \) is a weak solution of \( \partial_t F + DBF = 0 \) in \( \mathbb{R}_+ \).

Now let \( F \in L^2_{\text{loc}}(\mathbb{R}_+; \mathcal{R}(D)) \) be a weak solution of \( \partial_t F + DBF = 0 \) in \( \mathbb{R}_+ \). Then for each \( t > 0 \) there exists \( g_t \in V_{1,2}(\mathbb{R}^n) \) such that

\[
\begin{bmatrix}
F_\parallel(t,x) \\
F_\perp(t,x)
\end{bmatrix} =
\begin{bmatrix}
\nabla \psi(t) \\
|V|\frac{1}{2} \psi(t)
\end{bmatrix}.
\]

Define \( g(t,x) := g_t(x) \). Fix \( 0 < c_0 < c_1 < \infty \). Now define

\[
u(t,x) := \int_{c_0}^t (BF)_\perp(s,x) \, ds - \int_{c_0}^{c_1} (BF)_\perp(s,x) \, ds + g(c_1,x), \quad \forall t > 0, \text{ and a.e. } x \in \mathbb{R}^n.
\]

Then for fixed \( x_0 \in \mathbb{R}^n \) we have that \( u(t,x) \) is absolutely continuous in \( t \) and that \( \partial_t u(t,x_0) = (BF)_\perp(t,x_0) \). Let \( \psi \in C_c^\infty(\mathbb{R}_+) \) and \( \eta \in C_c^\infty(\mathbb{R}; \mathbb{R}^n) \) and

\[
\varphi(t,x) := \begin{bmatrix} \psi(t) \eta(x) \cr 0 \end{bmatrix} \in C_c^\infty(\mathbb{R}_+; \mathbb{R}^{n+2}).
\]

Therefore,

\[
\int_0^\infty \langle F(t), (\partial_t \varphi)(t) \rangle \, dt = \int_0^\infty \int_{\mathbb{R}^n} F_\parallel(t,x) \cdot \eta(x)(\partial_t \psi)(t) \, dx \, dt.
\]
Also, using Fubini’s Theorem and integrating by parts, we have that

\[
\int_0^\infty \langle (BF)(t),(D\varphi)(s) \rangle \, dt = \int_0^\infty \int_{\mathbb{R}^n} (BF)_\perp(t,x)\overline{\psi(t)}(\text{div}_\eta)(x) \, dx \, dt \\
= \int_{\mathbb{R}^n} \left( \int_0^\infty (\partial_t u)(t,x)\overline{\psi(t)} \, dt \right) (\text{div}_\eta)(x) \, dx \\
= -\int_{\mathbb{R}^n} \left( \int_0^\infty u(t,x)(\partial_t \psi)(t) \, dt \right) (\text{div}_\eta)(x) \, dx.
\]

Then, using the fact that \( F \) is a weak solution of \( \partial_t F + DBF = 0 \) in \( \mathbb{R}_+ \) we have

\[
\int_0^\infty \int_{\mathbb{R}^n} F_\parallel(t,x) \cdot \overline{\eta(x)}(\partial_t \psi)(t) \, dx \, dt = -\int_{\mathbb{R}^n} \left( \int_0^\infty u(t,x)(\partial_t \psi)(t) \, dt \right) (\text{div}_\eta)(x) \, dx.
\]

Then using Fubini’s Theorem and rearranging we have

\[
\int_0^\infty \left( \int_{\mathbb{R}^n} F_\parallel(t,x) \cdot \overline{\eta(x)} + u(t,x)(\text{div}_\eta)(x) \, dx \right) (\partial_t \psi)(t) \, dt = 0.
\]

Then as \( \psi \) was arbitrary we use integration by parts to obtain that there exists a constant \( c \) such that

\[
c = \int_{\mathbb{R}^n} F_\parallel(t,x) \cdot \overline{\eta(x)} + u(t,x)(\text{div}_\eta)(x) \, dx.
\]

Now as \( F \) is a weak solution of \( \partial_t F + DBF = 0 \) in \( \mathbb{R}_+ \) we have

\[
\int_0^\infty \left( \int_{\mathbb{R}^n} F_\parallel(t,x) \cdot \overline{\eta(x)} \, dx \right) (\partial_t \psi)(t) \, dt = \int_0^\infty \langle BF(t), D\varphi(t) \rangle \, dt \\
= \int_0^\infty \left( \int_{\mathbb{R}^n} (BF)_\perp(t,x)\overline{\eta(x)} \, dx \right) \overline{\psi(t)} \, dt.
\]

That is

\[
\partial_t \left( \int_{\mathbb{R}^n} F_\parallel(t,x) \cdot \overline{\eta(x)} \, dx \right) = -\int_{\mathbb{R}^n} (BF)_\perp(t,x)\overline{\eta(x)} \, dx,
\]

in the weak sense. Recalling that a function is weakly differentiable if and only if it is locally absolutely continuous (see [19]). Therefore, \( c_1 \) is a Lebesgue point for

\[
\int_{\mathbb{R}^n} F_\parallel(t,x) \cdot \overline{\eta(x)} \, dx \quad \text{for a.e.} \ x \in \mathbb{R}^n \text{ and } \forall \eta \in C_c^\infty(\mathbb{R}^n, \mathbb{R}^n).
\]

Let \( \varepsilon > 0 \). Let \( \delta \in (0, c_1 - c_0) \). Thus, using the Lebesgue differentiation Theorem we may choose \( \delta > 0 \) such that

\[
\left| \int_{c_1 - \delta}^{c_1 + \delta} \left( \int_{\mathbb{R}^n} F_\parallel(t,x) \cdot \overline{\eta(x)} \, dx \right) \, dt - \int_{\mathbb{R}^n} F_\parallel(c_1 + \delta, x) \cdot \overline{\eta(x)} \, dx \right| < \frac{\varepsilon}{2}, \quad \text{and}
\]

\[
\left| \int_{c_1 - \delta}^{c_1 + \delta} \int_{c_0}^t (BF)_\perp(s,x) \, ds \, dt - \int_{c_0}^{c_1} (BF)_\perp(s,x) \, ds \right| < \frac{\varepsilon}{2\|\text{div}_\eta\|_1}.
\]

Recalling the definition of \( u \), we have

\[
c = \int_{c_1 - \delta}^{c_1 + \delta} \int_{\mathbb{R}^n} F_\parallel(t,x) \cdot \overline{\eta(x)} + \nabla g(c_1 + \delta, x) \cdot \overline{\eta(x)} \\
- \left( \int_{c_0}^t (BF)_\perp(s,x) \, ds - \int_{c_0}^{c_1} (BF)_\perp(s,x) \, ds \right) (\text{div}_\eta)(x) \, dx \, dt.
\]
Using integration by parts, the definition of \( g \), and Fubini’s Theorem we get that
\[
\left| \int_{\mathbb{R}^n} \left( \frac{\partial c_1 + \delta}{c_1 - \delta} F(t,x) \cdot \eta(t) \, dt + \nabla \| g(c_1, x) \cdot \eta(x) \right) \, dx \right|
\]
\[
= \left| \int_{\mathbb{R}^n} \left( \int_{c_1 - \delta}^{c_1 + \delta} F(t,x) \, dt - \nabla \| g(c_1, x) \cdot \eta(x) \right) \, dx \right|
\]
\[
= \left| \int_{c_1 - \delta}^{c_1 + \delta} \left( \int_{\mathbb{R}^n} F(t,x) \cdot \eta(x) \, dx \right) \, dt - \int_{\mathbb{R}^n} F(c_1, x) \cdot \eta(x) \, dx \right|
\]
\[
< \frac{\varepsilon}{2}.
\]

Similarly, we have that
\[
\left| \int_{\mathbb{R}^n} \left( \int_{c_1 - \delta}^{c_1 + \delta} (BF)_{\perp}(s, x) \, ds \, dt - \int_{c_0}^{c_1} (BF)_{\perp}(s, x) \, ds \right) \left( \nabla \| \eta \| \right)(x) \, dx \right|
\]
\[
\leq \int_{\mathbb{R}^n} \left( \int_{c_1 - \delta}^{c_1 + \delta} (BF)_{\perp}(s, x) \, ds \, dt - \int_{c_0}^{c_1} (BF)_{\perp}(s, x) \, ds \right) \left( \nabla \| \eta \| \right)(x) \, dx
\]
\[
< \frac{\varepsilon}{2}.
\]

Thus \(|c| < \varepsilon\). As \( \varepsilon > 0 \) was arbitrary we have that \( c = 0 \). We now proceed in a similar manner for the third component. Redefine \( \eta \in C^\infty_c(\mathbb{R}^n) \) and
\[
\varphi(t,x) := \begin{bmatrix} 0 & 0 \\ \psi(t) \eta(x) \end{bmatrix} \in C^\infty_c(\mathbb{R}^{n+1}_+, \mathbb{R}^{n+2}).
\]

Then, using that \( F \) is a solution of \( \partial_t F + DBF = 0 \), \( \partial_t u = (BF)_{\perp} \), and integration by parts, we have that
\[
\int_{0}^{\infty} \left( \int_{\mathbb{R}^n} F_\mu(t,x) \eta(x) \, dx \right) \left( \partial_t \psi(t) \right) \, dt = \int_{0}^{\infty} \left( \int_{\mathbb{R}^n} u(t,x) \left( |V|^{\frac{1}{2}} \eta(x) \right) \, dx \right) \left( \partial_t \psi(t) \right) \, dt.
\]

Therefore, we have that
\[
c = \int_{\mathbb{R}^n} \left( F_\mu(t,x) - |V|^{\frac{1}{2}} u(t,x) \right) \eta(x) \, dx
\]

As before, let \( \varepsilon > 0 \). Let \( \delta \in (0, c_1 - c_0) \). And, using the Lebesgue differentiation Theorem we may choose \( \delta > 0 \) such that
\[
\left| \int_{c_1 - \delta}^{c_1 + \delta} \left( \int_{\mathbb{R}^n} F_\mu(t,x) \eta(x) \, dx \right) \, dt - \int_{\mathbb{R}^n} F_\mu(c_1, x) \eta(x) \, dx \right| < \frac{\varepsilon}{2}
\]
\[
\left| \int_{c_1 - \delta}^{c_1 + \delta} \int_{c_0}^{t} (BF)_{\perp}(s, x) \, ds \, dt - \int_{c_0}^{c_1} (BF)_{\perp}(s, x) \, ds \right| < \frac{\varepsilon}{2 || |V|^{\frac{1}{2}} \eta ||_1}.
\]

Replicating the argument for \( F_\parallel \), we obtain that \(|c| < \varepsilon\) for all \( \varepsilon > 0 \). Hence \( c = 0 \). That is \((BF)_{\perp}(t,x) = \partial_t u(t,x), F_\parallel(t,x) = \nabla \| u(t,x) \|,\) and \( F_\mu(t,x) = |V|^{\frac{1}{2}} u(t,x) \). Then, rearranging gives \( F_{\perp} = \partial_{\mu} u \). Therefore,
\[
F(t,x) = \nabla A_{\mu} u(t,x).
\]

Now, let \( \psi \in C^\infty_c(\mathbb{R}^{n+1}_+) \), and define
\[
\varphi = \begin{bmatrix} \psi \\ 0 \\ 0 \end{bmatrix} \in C^\infty_c(\mathbb{R}^{n+1}_+, C^{n+2}).
\]

Then, as \( F \) is a weak solution of \( \partial_t F + DBF = 0 \) in \( \mathbb{R}_+ \) we have
\[
\int_{0}^{\infty} \langle F, \partial_t \varphi \rangle \, dt = \int_{0}^{\infty} \langle BF, D \varphi \rangle \, dt.
\]
A direct calculation leads to \((BF)\parallel = (A\nabla_{t,x}u)\parallel\) and \((BF)_{\mu} = a|V|^{\frac{1}{2}}u\). Therefore,

\[
\int_0^\infty \int_{\mathbb{R}^n} \partial_{t,A}u \overline{\partial_t \psi} \, dx \, dt = -\int_0^\infty \int_{\mathbb{R}^n} (BF)\parallel \cdot \overline{\nabla \psi} - (BF)_{\mu}|V|^{\frac{1}{2}} \overline{\psi} \, dx \, dt \\
= -\int_0^\infty \int_{\mathbb{R}^n} (A\nabla_{t,x}u)\parallel \cdot \overline{\nabla \psi} - aVu \overline{\psi} \, dx \, dt.
\]

Thus

\[
\int_0^\infty \int_{\mathbb{R}^n} (A\nabla_{t,x}u) \cdot \overline{\nabla_{t,x} \psi} + aVu\overline{\psi} \, dx \, dt = 0.
\]

Hence, \(H_{A,a,V} u = 0\). This completes the proof. \(\square\)

Note that to go from a second-order solution of a first-order solution we need to assume some kind of control on the adapted gradient. A natural estimate to have is \(L^2\) control on the non-tangential maximal function of the adapted gradient. We give the proof of that this is sufficient in Proposition 6.1.

4.2. Global Well-posedness for the First-Order Initial Value Problem. We will use the theory of analytic semigroups to generate solutions to the equation (4.1). However, the operator \(DB\) is bisectorial and so may not generate an analytic semigroup which solves (4.1). To resolve this we restrict to a subspace of \(\tilde{R}(D)\) on which \(DB\) is sectorial and then the theory of analytic semigroups states that on this domain \(DB\) will generate an analytic semigroup solving (4.1). This is where the bounded holomorphic functional calculus of \(DB\) is seen to be critical as this provides a splitting of \(\tilde{R}(D)\). We start by defining the following holomorphic functions on \(S^0_{\mu}\) in a similar manner as in [4]:

\[
\chi^\pm(z) := \begin{cases} 1 & \text{if } \pm \Re(z) > 0, \\
0 & \text{if } \pm \Re(z) \leq 0. 
\end{cases}
\]

\(\text{sgn}(z) := \chi^+(z) - \chi^-(z),\) and \([z] := z \text{sgn}(z),\ \forall z \in S^0_{\mu}\).

Then let \(E_{DB}^\pm := \chi^\pm(DB)\) be the generalised Hardy-type projections of \(DB\). Let \(E_{DB} := \text{sgn}(DB) = E_{DB}^+ - E_{DB}^-\). Let \(\mathcal{H} := \tilde{R}(D)\), and define \(E_{DB}^\pm \mathcal{H} := \{E_{DB}^\pm f : f \in \mathcal{H}\}\). Note \(\chi^+(z) + \chi^-(z) = 1\) for all \(z \in S^0_{\mu}\). Then for \(f \in \mathcal{H}\) we have that \(f = E_{DB}^+ f + E_{DB}^- f\) so

\[
\|f\|_2 \leq \|E_{DB}^+ f\|_2 + \|E_{DB}^- f\|_2.
\]

Now as \(DB\) has bounded \(H^\infty(S^0_{\mu})\) functional calculus, then

\[
\|E_{DB}^+ f\|_2 + \|E_{DB}^- f\|_2 \lesssim (\|\chi^+\|_\infty + \|\chi^-\|_\infty)\|f\|_2 = 2\|f\|_2.
\]

Therefore we have the topological splitting \(\mathcal{H} = E_{DB}^+ \mathcal{H} \oplus E_{DB}^- \mathcal{H}\). We use the \(\mathcal{F}\)-functional calculus (as defined in (2.6)) to define the operator \([DB] = DB \text{sgn}(DB)\). We see that for \(f \in E_{DB}^\pm \mathcal{H}\)

\[
[DB]f = DB(\chi^+(DB) - \chi^-(DB))\chi^\pm(DB)f = \pm DB\chi^\pm(DB)f = \pm DBf.
\]

We give a notion of the Cauchy problem for the first-order equation so that we can solve the first-order initial value problems on \(E_{DB}^\pm \mathcal{H}\).

**Definition 4.4.** We shall write that (4.2) is globally well-posed in \(E_{DB}^\pm \mathcal{H}\) if for each \(f \in E_{DB}^\pm \mathcal{H}\), there exists a unique \(F \in C^1(\mathbb{R}_\pm; E_{DB}^\pm \mathcal{H})\) such that

\[
\begin{cases}
\partial_t F + DBF = 0 \text{ in } \mathbb{R}_\pm \\
\sup_{\pm t > 0} \int_t^{2t} \|F(s)\|^2_{L^2(\mathbb{R}^n; C^{n+2})} \, ds < \infty, \\
\lim_{t \to 0^+} F(t) = f,
\end{cases}
\]

where the limit converges in \(L^2(\mathbb{R}_\pm; L^2(\mathbb{R}^n; C^{n+2}))\) or pointwise on Whitney averages as in (1.5).
We introduce the idea of global well-posedness as we want to relate the boundary data for the second order equation with the initial data for the first order system. We will do this by constructing an analytic semigroup which solves (4.2). First note that as $f_t(z) := e^{-t[z]}$ is a bounded holomorphic function for all $t \in \mathbb{R}^n$ so can define the family of bounded operators $(e^{-t[DB]})_{t>0}$ by using the bounded holomorphic functional calculus of $DB$.

**Lemma 4.5.** Let $0 < \mu < \omega$. Then the family of operators $(e^{-z[DB]})$, where $z \in S^\omega_\mu(\mathbb{R}^n)$, forms an analytic semigroup on $L^2(\mathbb{R}^n; \mathbb{C}^{n+2})$ with generator $[DB]$. Moreover, $[DB]$ is a sectorial operator on $L^2(\mathbb{R}^n; \mathbb{C}^{n+2})$ of type $S^\mu_{\frac{\pi}{2}}$.

We list some of the properties of semigroups we will use.

**Proposition 4.6.** Let $0 < \omega < \mu$ and let $T(\lambda) := e^{-\lambda[DB]}$ for $\lambda \in S^\omega_{\pi(\mu)}$. Then the following are true:

1. The operator $T(0) = I$ and $T(\lambda)T(\mu) = T(\lambda + \mu)$;
2. The mapping $T := (\lambda \rightarrow T(\lambda)) : S^\omega_{\pi(\mu)} \rightarrow L(\mathcal{H})$ is holomorphic with $\partial_\lambda T = -[DB]T$;
3. If $\theta \in (\omega, \pi)$, then $\sup \{ T(\lambda) : \lambda \in S^\omega_{\pi(\mu)} \} < \infty$;
4. If $u \in \mathcal{D}(D)$, then
   \[ \lim_{|\lambda| \rightarrow 0, |\arg(\lambda)| < \theta} T(\lambda)u = u, \]
   for each $\theta \in (0, \pi - \mu)$;
5. If $u \in \mathcal{H}$, then
   \[ \lim_{|\lambda| \rightarrow \infty, |\arg(\lambda)| < \theta} T(\lambda)u = 0, \]
   for each $\theta \in (0, \pi - \mu)$.

**Proof.** For (1) - (4) see [20, Theorem 3.4.1]. For (5) consider the family of bounded holomorphic functions defined by

\[ f_\lambda(z) := e^{-\lambda z} \quad \text{for } z \in S^\omega_{\mu} \quad \text{and} \quad \lambda \in S^\omega_{\pi(\mu)}. \]

Then, by the boundedness of exponential for our range of $\lambda$ and $z$, and the bounded holomorphic functional calculus of $DB$ we have that

\[ \sup_{\lambda \in S^\omega_{\pi(\mu)}} \| f_\lambda \|_\infty \leq 1, \quad \text{and} \quad \sup_{\lambda \in S^\omega_{\pi(\mu)}} \| f_\lambda(DB) \|_\infty \lesssim 1 \]

Also, for a compact set $K \subset S^\omega_{\mu}$, we have

\[ |e^{-\lambda z}| \leq |e^{-\text{Re}(\lambda)k}| \rightarrow 0, \text{ as } |\lambda| \rightarrow \infty, \text{ with } |\arg(\lambda)| < \theta, \]

where $k = \min_{z \in K} \text{Re}(z) > 0$. Thus, by the convergence lemma (see [1, Theorem D]) we have that

\[ e^{-\lambda[DB]}u \rightarrow 0, \text{ as } |\lambda| \rightarrow \infty, \text{ with } |\arg(\lambda)| < \theta, \]

for all $u \in \mathcal{H}$. \hfill \qed

We now give a proposition which shows that the semigroup is a solution of (4.1) and has some important estimates.

**Proposition 4.7.** Let $f \in E^+_{DB} \mathcal{H}$ and define $F(t, x) := e^{-tDB}f(x)$. Then $F \in C^\infty(\mathbb{R}_+: E^+_{DB} \mathcal{H})$ and $\partial_t F + DBF = 0$ on $\mathbb{R}^{n+1}_+$ in the strong sense with bounds

\[ \sup_{t>0} \| F(t) \|_2^2 \simeq \| f \|_2^2 = \sup_{t>0} \int_0^{2t} \| F(s) \|_2^2 \, ds, \]

and limits, where the convergence is in the $L^2$ sense,

\[ \lim_{t \rightarrow 0} F(t) = f, \quad \lim_{t \rightarrow \infty} F(t) = 0. \]
Proof. That fact that $\partial_t F + DBF = 0$ on $\mathbb{R}^{n+1}_+$ in the strong sense and the limits at 0 and infinity come from Proposition 4.6. Now using the bounded holomorphic functional calculus we have

$$\sup_{t>0} \|F(t)\|_2 \leq \sup_{t>0} \|e^{-t\xi}\|_\infty \|f\|_2 \leq \|f\|_\infty.$$ 

Similarly, we have

$$\sup_{t>0} \int_0^{2t} \|F(s)\|_2^2 \, ds \lesssim \|f\|_2^2.$$ 

Let $\varepsilon > 0$, and $T > 0$ be such that $\|f - F(s)\|_2 < \varepsilon$ for all $s < 2T$. Then

$$\|f\|_2^2 = \int_T^{2T} \|f\|_2^2 \, ds \leq \int_T^{2T} \|f - F(s)\|_2^2 \, ds + \int_T^{2T} \|F(s)\|_2^2 \, ds < \varepsilon + \sup_{t>0} \int_t^{2t} \|F(s)\|_2^2 \, ds.$$ 

Then as $\varepsilon > 0$ was arbitrary we have

$$\|f\|_2^2 \leq \sup_{t>0} \int_t^{2t} \|F(s)\|_2^2 \, ds.$$ 

A similar argument gives

$$\|f\|_2 \leq \sup_{t>0} \|F(t)\|_2.$$ 

This completes the proof. \hfill \Box

The following lemma is analogous to [2, Proposition 4.4].

Lemma 4.8. Let $t > 0$ and consider non-negative functions $\eta_+ \in C^\infty_c((0,t))$ and $\eta_- \in C^\infty_c((t,\infty))$. If $F \in L^2_{\text{loc}}(\mathbb{R}^n; \mathcal{H})$ is a weak solution of $\partial_t F + DBF = 0$ in $\mathbb{R}^n_+$, then

$$\int_0^t \eta_+(s)e^{-(t-s)[DB]}E_{DB}^+ F(s) \, ds = \int_t^\infty \eta_-^*(s)e^{-(s-t)[DB]}E_{DB}^- F(s) \, ds = 0.$$ 

Proof. Let $\psi \in C^\infty_c(\mathbb{R}^n)$. Let $t > 0$ and consider a test function $\eta_+ \in C^\infty_c(0,t)$. For $s \in (0,t)$, define $\varphi_s := \eta_+(s) \left( e^{-(t-s)[DB]} \right)^* \psi$. To see that this is a legitimate test function let $\eta \in C^\infty_0(\mathbb{R}^n)$ with $\eta(x) = 1$ on a neighbourhood of 0 and $\int_{\mathbb{R}^n} \eta = 1$, then define

$$\varphi^{R,\varepsilon,N}_s := \eta_+(s)\eta\left(\frac{X}{R}\right)\left( \eta_\varepsilon * g_N((e^{-(t-s)[DB]})^* \psi) \right)(x),$$

where $\eta_\varepsilon(x) := \varepsilon^{-n}\eta(\frac{x}{\varepsilon})$ and

$$g_N(x) := \begin{cases} x, & \text{if } |x| \leq N \\ N, & \text{if } |x| > N. \end{cases}$$

Then we take limits $N \to \infty$, $\varepsilon \to 0$, $R \to \infty$ and see that $\partial_t \varphi^{R,\varepsilon,N}_s \to \partial_t \varphi_s$ and $D\varphi^{R,\varepsilon,N}_s \to D\varphi_s$.

Now, as $F$ is a solution of the first-order equation (4.1) we have that

$$\int_0^t \langle \partial_s \varphi_s, F_s \rangle \, ds = \int_0^t \langle D\varphi_s, BF_s \rangle \, ds$$

Now

$$\int_0^t \langle D\varphi_s, BF_s \rangle \, ds = \int_0^t \eta_+(s)\langle \psi, DBe^{-(t-s)[DB]}E_{DB}^+ F_s \rangle \, ds.$$
As \( DB \) has bounded holomorphic functional calculus, then \( e^{-tDB} \in \mathcal{L}(\mathcal{H}) \) and so \( (e^{-tDB})^* = e^{-tDB^*} \). Therefore,
\[
\int_{0}^{t} (\partial_s \varphi_s, F_s) \, ds = \int_{0}^{t} \eta'_+(s) \left( \left( e^{-(t-s)DB} E_{DB}^+ \right)^* \psi, F_s \right) \, ds + \int_{0}^{t} \eta'_+(s) \left( \partial_s \left( e^{-(t-s)DB} E_{DB}^+ \right)^* \psi, F_s \right) \, ds = \int_{0}^{t} \eta'_+(s) \left( \left( e^{-(t-s)DB} E_{DB}^+ \right)^* \psi, F_s \right) \, ds + \int_{0}^{t} \eta_+(s) \left( \partial_s e^{-(t-s)B^*D} \psi, E_{DB}^+ F_s \right) \, ds
\]
\[
= \int_{0}^{t} \eta'_+(s) \left( \left( e^{-(t-s)DB} E_{DB}^+ \right)^* \psi, F_s \right) \, ds + \int_{0}^{t} \eta_+(s) \left( \partial_s e^{-(t-s)B^*D} \psi, E_{DB}^+ F_s \right) \, ds.
\]

Therefore, using Fubini’s Theorem, we have that
\[
0 = \int_{0}^{t} \eta'_+(s) \left( \left( e^{-(t-s)DB} E_{DB}^+ \right)^* \psi, F_s \right) \, ds = \int_{\mathbb{R}^n} \psi(x) \left( \int_{0}^{t} \eta'_+(s) \left( e^{-(t-s)DB} E_{DB}^+ F(s) \right) \, ds \right) \, dx.
\]
Then as \( \psi \) was an arbitrary test function we have
\[
\int_{0}^{t} \eta'_+(s)e^{-(t-s)||DB||} E_{DB}^+ F(s) \, ds = 0.
\]
A similar argument using \( \varphi_s := \eta_-(s) \left( e^{-(s-t)DB} E_{DB}^- \right)^* \psi \) as the test function, gives that
\[
\int_{t}^{\infty} \eta'_-(s)e^{-(s-t)||DB||} E_{DB}^- F(s) \, ds = 0.
\]
This completes the proof. \( \square \)

Now let \( \varepsilon > 0 \) and consider the functions \( \eta_{\pm}^\varepsilon \), in the same way as in [2], as follows: First define \( \eta^0 : [0, \infty) \to [0, 1] \) to be a smooth function supported in \([1, \infty)\), where \( \eta^0(t) = 1 \) for all \( t \in (2, \infty) \); then define \( \eta_\varepsilon(t) := \eta^0 \left( \frac{t}{\varepsilon} \right) (1 - \eta^0(2\varepsilon t)) \); finally we define
\[
\eta_{\pm}^\varepsilon(t, s) := \eta^0 \left( \pm \frac{t - s}{\varepsilon} \right) \eta_\varepsilon(t) \eta_\varepsilon(s).
\]
Then \( \eta_{\pm}^\varepsilon \) is uniformly bounded and compactly supported in the set \( \{(s, t) \in \mathbb{R}^2 : 0 < s < t\} \) and approximates the characteristic function of this set. Similarly \( \eta_{-}^\varepsilon \) approximates the characteristic function of the set \( \{(s, t) \in \mathbb{R}^2 : 0 < t < s\} \).

**Theorem 4.9.** If \( F \in L^2_{\text{loc}}(\mathbb{R}^n; \mathcal{H}(D)) \) is a weak solution of \( \partial_tF + DBF = 0 \) in \( \mathbb{R}^n_+ \) such that
\[
\sup_{t > 0} \int_{t}^{2t} \|F(s)\|^2_2 \, ds < \infty,
\]
then there exists \( f \in E_{DB}^+ \mathcal{H} \) such that \( \lim_{t \to 0} F(t) = f \) in \( L^2 \) and \( F(t, x) = e^{-tDB} f(x) \).

**Proof.** As \( F \in C^1(\mathbb{R}^n_+; \mathcal{H}(D)) \) is a weak solution of \( \partial_tF + DBF = 0 \) in \( \mathbb{R}^n_+ \), using Lemma 4.8 with \( \eta_{\pm}^\varepsilon \) used instead of \( \eta \), we obtain
\[
\int_{0}^{t} (\partial_s \eta_{\pm}^\varepsilon)(t, s)e^{-(t-s)||DB||} E_{DB}^+ F(s) \, ds + \int_{t}^{\infty} (\partial_s \eta_{\pm}^\varepsilon)(t, s)e^{-(s-t)||DB||} E_{DB}^- F(s) \, ds = 0.
\]
We can then follow the abstract approach in [2, Theorem 8.2 (i)], to complete the proof verbatim. \( \square \)

We are now ready to return to discuss the global well-posedness of (4.2). The following corollary is a consequence of Theorem 4.9 and Proposition 4.7.

**Corollary 4.10.** We have (4.2) is globally well-posed in \( E_{DB}^+ \mathcal{H} \) with convergence in \( L^2 \). Moreover, solutions to (4.2) are of the form \( e^{-tDB} f \) for \( t > 0 \) for initial data \( f \in E_{DB}^+ \mathcal{H} \).
Proof. Let $f \in E^+_{DB} \mathcal{H}$. Then by Proposition 4.7 we have that $F(t, x) := e^{-tDB}f(x)$ is such that $F \in C^1(\mathbb{R}^n; \mathbb{R}(D))$ with $\partial_t F + DBF = 0$ in $\mathbb{R}^{n+1}_+$ with limits $\lim_{t \to 0} \|F(t) - f\|_2 = \lim_{t \to \infty} \|F(t)\|_2 = 0$, and
$$\sup_{t>0} \int_0^{2t} \|F(s)\|_2^2 \, ds < \infty.$$ Thus for each $f \in E^+_{DB} \mathcal{H}$ there exists a solution satisfying (4.2).

We now turn our attention to uniqueness. Let $f \in E^+_{DB} \mathcal{H}$. Suppose there exists $F, G \in C^1(\mathbb{R}^n; \mathbb{R}(D))$ satisfying (4.2) with initial data $f$. Then, as we have
$$\sup_{t>0} \int_0^{2t} \|F(s)\|_2^2 \, ds < \infty,$$ applying Theorem 4.9 and Proposition 4.6 part (1) gives $F(t, x) = e^{-tDB}f(x) = G(t, x)$.

The case in the lower half-space is proved in the same way making the appropriate changes. $\square$

We also remark that Theorem 4.9 and Proposition 4.7 give a classification of the solutions for (4.2) as those that arise from the semigroup applied to the initial data. We now give a Fatou type result for the first-order equation.

**Proposition 4.11.** If $F$ is a solution of the first-order equation (4.1) such that
$$\sup_{t>0} \int_0^{2t} \|F(s)\|_2^2 \, ds < \infty,$$ then there exists $f \in E^+_{DB} \mathcal{H}$ such that
$$\lim_{t \to 0} \int_0^{2t} \|F(s) - f\|_2^2 \, ds = 0 = \lim_{t \to \infty} \int_0^{2t} \|F(s)\|_2 \, ds.$$ 

**Proof.** Fix $\varepsilon > 0$. Then by Theorem 4.9, there exists $f \in E^+_{DB} \mathcal{H}$ such that $\lim_{t \to 0} F(t) = f$ in $L^2$, in particular, we have $F(t) = e^{-tDB}f$. Now let $\delta > 0$ be such that $\|F(s) - f\|_2 < \varepsilon$ whenever $0 \leq s < \delta$. If $t < \frac{\delta}{2}$, then
$$\int_t^{2t} \|F(s) - f\|_2^2 \, ds < \int_t^{2t} \varepsilon \, ds = \varepsilon.$$ Thus
$$\lim_{t \to 0} \int_0^{2t} \|F(s) - f\|_2^2 \, ds = 0.$$ The other limit is proved similarly using Proposition 4.6 part (5). $\square$

### 4.3. Boundary Isomorphisms for Block Type Matrices

To recap, the set $E^+_{DB} \mathcal{H}$ is the set of all initial data for the solutions satisfying the first-order Cauchy problem (4.2) on $\mathbb{R}^{n+1}_+$. We also have solutions satisfying (4.2) arise from an analytic semigroup generated by $DB$ applied to the initial data in $E^+_{DB} \mathcal{H}$, and that these solutions are equal to the adapted gradients of a solution of second order equation (1.1). That is $F = e^{-tDB}f = \nabla A_{\mu}u$ for some $u$ such that $H_{A,a,V} u = 0$. We define the mappings
$$\Phi_N: E^+_{DB} \mathcal{H} \to L^2(\mathbb{R}^n), \text{ given by } \Phi_N(f) = f_\perp,$$
$$\Phi_R: E^+_{DB} \mathcal{H} \to \{\nabla u : u \in \mathcal{V}^{1,2}(\mathbb{R}^n)\}, \text{ given by } \Phi_R(f) = \left[\frac{f}{f_\mu}\right].$$

These mappings are seen to be sending the initial values for the Cauchy problem (4.1) to the boundary conditions for equation $H_{A,a,V} u = 0$. Therefore, if the mappings are isomorphisms we will be able to invert them and uniquely assign any given boundary data for the boundary value problem with a solution of the first-order equation. Then using Proposition 4.3 will give a solution $u$ such that $H_{A,a,V} u = 0$. In other words, if $\Phi_N$ and $\Phi_R$ are isomorphisms then the second-order equating is well-posed. We will formalise this in Section 6.
We now proceed by proving that the mappings \( \Phi_R \) and \( \Phi_N \) from (4.3) are isomorphisms in the case when \( A \) is block-type, that is \( A \) is of the form

\[
A^\omega = \begin{bmatrix}
A_{\perp\perp} & 0 & 0 \\
0 & A_{\parallel\parallel} & 0 \\
0 & 0 & ae^{i\arg(V(x))}
\end{bmatrix}, \quad \text{so} \quad \tilde{A}^\omega = B = \begin{bmatrix}
A_{\perp\perp}^{-1} & 0 & 0 \\
0 & A_{\parallel\parallel} & 0 \\
0 & 0 & ae^{i\arg(V(x))}
\end{bmatrix}.
\]

We do this in a similar way to the methods used in [4]. Define the bounded linear operator \( N: \mathcal{H} \to \mathcal{H} \) given by

\[
N := \begin{bmatrix}
-1 & 0 & 0 \\
0 & I & 0 \\
0 & 0 & 1
\end{bmatrix}.
\]

Note that \( N^{-1} = N \). We start with a lemma from the theory of functional calculus so that we may take advantage of the symmetry of the operator \( E_{DB} \).

**Lemma 4.12.** Let \( \omega \in (0, \frac{\pi}{2}) \). If \( T \) is a closed densely defined \( \omega \)-bisectorial operator with bounded holomorphic functional calculus, then \( S := NT \), is a closed densely defined \( \omega \)-bisectorial operator with bounded holomorphic functional calculus and \( f(S) = Nf(T)N \) for all \( f \in H^\infty(S^\omega_\mu) \) and all \( \mu \in (\omega, \frac{\pi}{2}) \).

Now as \( DB \) has bounded holomorphic functional calculus and \( \sgn \in H^\infty(S^\omega_\mu) \), then the previous lemma gives

\[
NE_{DB} = N \sgn(DB)NN = \sgn(NDBN)N = \sgn(-DB)N = -\sgn(DB)N = -E_{DB}N.
\]

Now define the bounded linear operators \( N^+: \mathcal{H} \to \mathcal{H} \) by

\[
N^- := \begin{bmatrix}
1 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 1
\end{bmatrix} = \frac{1}{2}(I - N), \quad N^+ := \begin{bmatrix}
0 & 0 & 0 \\
0 & I & 0 \\
0 & 0 & 1
\end{bmatrix} = \frac{1}{2}(I + N).
\]

We can see that if \( f \in E^*_DB\mathcal{H} \), then \( N^f \) corresponds to the Neumann and Regularity boundary conditions respectively. The next lemma formalises this idea.

**Lemma 4.13.** If \( N^+: E^*_DB\mathcal{H} \to N^+\mathcal{H} \) is an isomorphism, then the mapping \( \Phi_R: E^*_DB \to \{ \nabla_\mu u : u \in \tilde{V}^{1,2}(\mathbb{R}^n) \} \) is an isomorphism. Also, if \( N^-: E^*_DB\mathcal{H} \to N^-\mathcal{H} \) is an isomorphism, then the mapping \( \Phi_N: E^*_DB \to L^2(\mathbb{R}^n) \) is an isomorphism.

**Proof.** Suppose \( N^+ \) is an isomorphism. If \( u \in \tilde{V}(\mathbb{R}^n) \), then

\[
D \begin{bmatrix} u \\ 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ -\nabla u \|u\| \\ -|V|^\frac{1}{2}u \|u\| \end{bmatrix} \in N^+\mathcal{H}.
\]

Then as \( N^+ \) is an isomorphism we have that there exists a unique \( f \in E^*_DB\mathcal{H} \) such that \( N^+f = (0, \nabla u, |V|^\frac{1}{2}u)^T \). Therefore, \( \Phi_R(f) = (\nabla u, |V|^\frac{1}{2}u)^T \). That is \( \Phi_R \) is surjective. Now assume that there exists \( f, g \in E^*_DB\mathcal{H} \) such that \( \Phi_R(f) = \Phi_R(g) = (\nabla u, |V|^\frac{1}{2}u)^T \). Then \( N^+f = N^+g \). Thus as \( N^+ \) is an isomorphism we have that \( f = g \). Then \( \Phi_R \) is injective. Thus \( \Phi_R \) is an isomorphism.

The second statement is proved similarly. \( \square \)

We now prove that these mappings are indeed isomorphisms, in the block case.

**Proposition 4.14.** If \( A \) is block type then the mappings \( \Phi_R: E^*_DB\mathcal{H} \to \{ \nabla_\mu u : u \in \tilde{V}^{1,2}(\mathbb{R}^n) \} \) and \( \Phi_N: E^*_DB\mathcal{H} \to L^2(\mathbb{R}^n) \) are isomorphisms.

**Proof.** By Lemma 4.13 we need to show \( N^+: E^*_DB\mathcal{H} \to N^+\mathcal{H} \) and \( N^-: E^*_DB\mathcal{H} \to N^-\mathcal{H} \) are isomorphisms.
To prove surjectivity let \( g \in N^+H \) so \( g = (g_\parallel, g_\perp)^T \) and \( Ng = g \). We have \( 2E_{DB}^+g = E_{DB}g + g \). Then using (4.4) we have
\[
N^+(2E_{DB}^+g) = N^+(E_{DB}+I)g = \frac{1}{2}(I+N)(I+E_{DB})g = \frac{1}{2}(g+Ng) + \frac{1}{2}(E_{DB}g - E_{DB}Ng) = g.
\]
Then for any \( g \in N^+H \) we have that \( N^+(2E_{DB}^+g) = g \). That is \( N^+: E_{DB}^+H \to N^+H \) is surjective.

To prove injectivity let \( f \in E_{DB}^+H \) with \( N^+f = 0 \), so \( Nf = -f \) and \( f_\parallel = f_\mu = 0 \). Then, as \( E_{DB}f = f \) and (4.4), we have
\[
0 = E_{DB}Nf + NE_{DB}f = -E_{DB}f + Nf = -f - f = -2f.
\]
Thus \( f = 0 \). That is \( N^+ \) is injective and so bijective. Thus by Lemma 4.13 we have that \( \Phi_R: E_{DB}^+ \to \{\nabla_mu : u \in \dot{H}^{1,2}(\mathbb{R}^n)\} \) is an isomorphism.

The case for \( \Phi_N: E_{DB}^+ \to L^2(\mathbb{R}^n) \) is similar. \( \square \)

4.4. Boundary Isomorphisms for self-adjoint \( A \). We now move to the self adjoint case, that is \( A^* = A \). Note that for this to happen we must have \( V(x) \in \mathbb{R} \) for all \( x \in \mathbb{R}^n \). Then we have
\[
A^* = \begin{bmatrix} A & 0 \\ 0 & a \end{bmatrix}^* = \begin{bmatrix} A_{\perp\perp}^* & A_{\parallel\perp}^* & 0 \\ A_{\parallel\parallel}^* & A_{\parallel\perp}^* & 0 \\ 0 & 0 & a^* \end{bmatrix} = \begin{bmatrix} A_{\perp\perp} & A_{\parallel\perp} & 0 \\ A_{\parallel\parallel} & A_{\parallel\perp} & 0 \\ 0 & 0 & a \end{bmatrix} = A
\]
Then, by a direct computation we have
\[
(A^*)^* = B^* = NBN.
\]

We now aim to establish a Rellich type estimate. This will be used to prove that the mappings \( \Phi_N \) and \( \Phi_R \) from (4.3) are injective. We will then use the method of continuity to prove the surjectivity of the mappings.

**Proposition 4.15.** If \( A \) is self-adjoint then the mappings \( \Phi_R: E_{DB}^+H \to \{\nabla_mu : u \in \dot{H}^{1,2}(\mathbb{R}^n)\} \) and \( \Phi_N: E_{DB}^+H \to L^2(\mathbb{R}^n) \) are injective.

**Proof.** Let \( f \in E_{DB}^+H \). Then by Corollary 4.10 we have there exists a unique solution, \( F \in C^1(\mathbb{R}_+; H) \) satisfying (4.2), and in particular, \( F(t,x) = e^{-tDB}f(x) \) Then using the Fundamental Theorem of Calculus to get
\[
\int_0^\infty \partial_t \langle NBF(t), F(t) \rangle \, dt = \lim_{t \to \infty} \langle NBF(t), F(t) \rangle - \lim_{t \to 0} \langle NBF(t), F(t) \rangle = -\langle NBf, f \rangle.
\]
Now, using \( \partial_t F = -DBF \) (from Proposition 4.6), \( N^2 = I \), (4.5), and the fact that \( DN + ND = 0 \), we have
\[
-\int_0^\infty \partial_t \langle NBF(t), F(t) \rangle \, dt = -\int_0^\infty \langle NB\partial_t F(t), F(t) \rangle + \langle NBF(t), \partial_t F(t) \rangle \, dt
\]
\[
= \int_0^\infty \langle NDBBF(t), F(t) \rangle + \langle NBF(t), DBF(t) \rangle \, dt
\]
\[
= \int_0^\infty \langle NBNDBBF(t), F(t) \rangle + \langle DNB(t), BF(t) \rangle \, dt
\]
\[
= \int_0^\infty \langle NDBBF(t), BF(t) \rangle + \langle DNB(t), BF(t) \rangle \, dt
\]
\[
= \int_0^\infty \langle DNBF(t), BF(t) \rangle + \langle DNB(t), BF(t) \rangle \, dt
\]
\[
= 0.
\]
This shows that \( \langle NBf, f \rangle = 0 \). Or, equivalently \( \langle (Bf)_\perp, f_\perp \rangle = \langle (Bf)_\parallel, f_\parallel \rangle + \langle (Bf)_\mu, f_\mu \rangle \). Then as \( B \) is elliptic on \( \bar{R(D)} \), as in (3.3), we have
\[
\|f\|_2^2 \lesssim \text{Re} \langle Bf, f \rangle = 2 \text{Re} \langle (Bf)_\perp, f_\perp \rangle \lesssim \|Bf\|_2 \|f_\perp\|_2 \leq \|f\|_2 \|\Phi_N(f)\|_2.
\]
Thus \( \|f\|_2 \lesssim \|\Phi_N(f)\|_2 \) and so \( \Phi_N \) is injective. We also have
\[
\|f\|_2^2 \lesssim \text{Re}(Bf, f) = 2 \text{Re} \left( \langle (Bf)\|_1 + (Bf)\|_2 \rangle \right) \lesssim \|f\|_2 \|\Phi_R(f)\|_2.
\]
Hence \( \|f\|_2 \lesssim \|\Phi_R(f)\|_2 \) and so \( \Phi_R \) is injective. Together, this gives the Rellich estimate
\[
\|f\|_2 \approx \left\| \left[ \begin{array}{c} f_1 \\ f_2 \end{array} \right] \right\|_2.
\]

We now turn to surjectivity where we will use the method of continuity. It is important to note that this depends on the analytic dependence of the functional calculus of the operator \( DB \) as in Theorem 3.31. Define \( B_\tau := B + (1 - \tau)I \) for \( \tau \in [0, 1] \). For all \( u \in \mathcal{H} \), we have
\[
\text{Re}(B_\tau u, u) = \tau \text{Re}(Bu, u) + (1 - \tau)\|u\|_2^2 + (1 - \tau)\|u\|_2^2 \geq \min \{\kappa, 1\}\|u\|_2^2,
\]
and,
\[
\|B_\tau\|_\infty \leq \tau\|B\|_\infty + (1 - \tau)\|I\|_\infty \leq \|B\|_\infty + 1,
\]
So \( B_\tau \) is uniformly elliptic on \( \mathbb{R}(D) \) and \( B_\tau \) is uniformly bounded for all \( \tau \in [0, 1] \). If \( 0 < \omega < \mu \), then by Theorems 3.4 and 2.5, we have there exists \( c_\mu > 0 \) depending only on \( n, \kappa, \) and \( \|B\|_\infty \), such that
\[
(4.6) \quad \|f(DB_\tau)\| \leq c_\mu\|f\|_\infty,
\]
for all \( f \in \mathcal{H}(S^0_\mu) \) and for all \( \tau \in [0, 1] \). Here we use the fact that the constant in Theorem 3.4 depends only on \( \kappa \) and \( \|B\|_\infty \). Now, for every \( \tau \in [0, 1] \) define the spectral projection associated with \( DB_\tau \) by \( E_\tau := \chi^+(DB_\tau) \). Also, define the bounded linear operator
\[
\Phi_N : E_\tau^+ \mathcal{H} \to L^2(\mathbb{R}^n) \quad \text{given by} \quad \Phi_N(f) := f_\perp,
\]
\[
\Phi_R : E_\tau^+ \mathcal{H} \to \{ \nabla \mu u : u \in \mathcal{H} \} \quad \text{given by} \quad \Phi_R(f) := \left[ \begin{array}{c} f_1 \\ f_2 \end{array} \right],
\]
for all \( \tau \in [0, 1] \), so \( \Phi_N = \Phi_R \).

**Lemma 4.16.** There exists \( \varepsilon > 0 \) such that, if \( |\tau - \sigma| < \varepsilon \), then \( E_\tau^+ : E_\sigma^+ \mathcal{H} \to E_\tau^+ \mathcal{H} \) is bijective.

**Proof.** We claim \( (I - E_\tau^+(E_\tau^+ - E_\sigma^+))^{-1}E_\sigma^+ \) and \( E_\tau^+(I - E_\tau^+(E_\tau^+ - E_\sigma^+))^{-1} \) are the left and the right inverse respectively. First, consider
\[
\|E_\tau^+(E_\tau^+ - E_\sigma^+)f\|_2 \leq c_\mu\|\chi^+(\mathcal{H})(E_\tau^+ - E_\sigma^+)f\|_2 \\
\leq c\|B_\tau - B_\sigma\|_\infty\|f\|_2 \\
= c|\tau - \sigma|\|B - I\|_\infty\|f\|_2.
\]
where \( c > 0 \) is the constant depending on the constant from the analytic dependence in Theorem 3.31 and on \( c_\mu > 0 \), the constant from (4.6). Thus, if \( |\tau - \sigma| < \frac{1}{c\|B - I\|_\infty} \), then the Neumann series gives us \( I - E_\tau^+(E_\tau^+ - E_\sigma^+) \) is invertible. Using a direct computation we see
\[
E_\tau^+ E_\sigma^+ = E_\tau^+(I - E_\tau^+(E_\tau^+ - E_\sigma^+)).
\]
And so, if \( f \in E_\tau^+ \mathcal{H} \), then we have
\[
E_\tau^+ E_\sigma^+(I - E_\tau^+(E_\tau^+ - E_\sigma^+))^{-1}f = E_\tau^+ f = f.
\]
Thus, \( E_\tau^+(I - E_\tau^+(E_\tau^+ - E_\sigma^+))^{-1} \) is the right inverse of \( E_\tau^+ : E_\sigma^+ \mathcal{H} \to E_\tau^+ \mathcal{H} \), that is \( E_\tau^+ : E_\tau^+ \mathcal{H} \to E_\tau^+ \mathcal{H} \) is surjective. Similarly, if \( |\tau - \sigma| < \frac{1}{c\|B - I\|_\infty} \), then \( I - E_\tau^+(E_\sigma^+ - E_\tau^+) \) is also invertible, again using the Neumann series. Now, another computation gives
\[
E_\tau^+ E_\tau^+ = (I - E_\sigma^+(E_\sigma^+ - E_\tau^+))E_\tau^+.
\]
So if \( f \in E_\tau^+ \mathcal{H} \), then
\[
(I - E_\sigma^+(E_\sigma^+ - E_\tau^+))^{-1}E_\tau^+ f = (I - E_\sigma^+(E_\sigma^+ - E_\tau^+))^{-1}E_\tau^+ E_\tau^+ f = E_\sigma^+ f = f.
\]
Thus \( (I - E_\sigma^+(E_\sigma^+ - E_\tau^+))^{-1}E_\tau^+ \) is the left inverse of \( E_\tau^+ : E_\sigma^+ \mathcal{H} \to E_\tau^+ \mathcal{H} \). That is \( E_\tau^+ : E_\sigma^+ \mathcal{H} \to E_\tau^+ \mathcal{H} \) is injective. Thus, \( E_\tau^+ : E_\sigma^+ \mathcal{H} \to E_\tau^+ \mathcal{H} \) is a bijection. \( \square \)
Lemma 4.17. If \( E^\tau_+ : E^\sigma_+ \mathcal{H} \to E^\tau_+ \mathcal{H} \) is a bijection, then

- \( \Phi^\tau_N : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is bijective if and only if \( \Phi_N E^\tau_+ : E^\sigma_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is bijective.
- \( \Phi^\tau_R : E^\tau_+ \mathcal{H} \to \{ \nabla_\mu u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \} \) is bijective if and only if \( \Phi_R E^\tau_+ : E^\sigma_+ \mathcal{H} \to \{ \nabla_\mu u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \} \) is bijective.

Proof. Suppose that \( \Phi^\tau_N : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is bijective. Therefore, \( \Phi_N E^\tau_+ : E^\sigma_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is the composition of two bijective operators and so is a bijection.

Suppose that \( \Phi_N E^\tau_+ : E^\sigma_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is bijective. Let \( f \in L^2(\mathbb{R}^n) \). Then as the mapping \( \Phi_N E^\tau_+ : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is bijective we have that there exists \( g \in E^\tau_+ \mathcal{H} \) such that \( \Phi_N E^\tau_+ g = f \). Then there exists \( h \in E^\tau_+ \mathcal{H} \) (namely \( h = E^\tau_+ g \)) such that \( \Phi_N h = f \). Thus \( \Phi^\tau_N : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is surjective. Let \( f \in E^\sigma_+ \mathcal{H} \) be such that \( \Phi^\tau_N f = 0 \). As \( E^\tau_+ : E^\tau_+ \mathcal{H} \to E^\tau_+ \mathcal{H} \) is a bijection, so invertible, we have that \( 0 = \Phi^\tau_N f = \Phi_N E^\tau_+ E^\tau_+^{-1} f \). Then as \( \Phi_N E^\tau_+ : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is bijective we have that \( E^\tau_+^{-1} f = 0 \). Thus \( f = 0 \) and \( \Phi^\tau_N : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is injective, and thus bijective.

The case for \( \Phi^\tau_R : E^\tau_+ \mathcal{H} \to \{ \nabla_\mu u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \} \) is similar. □

Lemma 4.18. Let \( \sigma \in [0,1] \). The following hold:

- If \( \Phi^\sigma_N : E^\sigma_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is bijective, then there exists \( \varepsilon > 0 \) such that for all \( |\tau - \sigma| < \varepsilon \) we have \( \Phi^\sigma_N : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is bijective.
- If \( \Phi^\sigma_R : E^\sigma_+ \mathcal{H} \to \{ \nabla_\mu u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \} \) is bijective, then there exists \( \varepsilon > 0 \) such that for all \( |\tau - \sigma| < \varepsilon \) we have \( \Phi^\sigma_R : E^\tau_+ \mathcal{H} \to \{ \nabla_\mu u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \} \) is bijective.

Proof. Consider \( \Phi^\sigma_N E^\tau_+ : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \). Now choose \( \varepsilon > 0 \) such that \( E^\tau_+ : E^\tau_+ \mathcal{H} \to E^\tau_+ \mathcal{H} \) is a bijection for all \( |\tau - \sigma| < \varepsilon \). Let \( f \in E^\sigma_+ \mathcal{H} \) such that \( \Phi^\sigma_N E^\tau_+ f = 0 \). Then, using the Rellich estimates Proposition 4.15 we have

\[
0 = \| \Phi^\sigma_N E^\tau_+ f \|_2 \geq \| E^\tau_+ f \|_2.
\]

Thus, \( E^\tau_+ f = 0 \) and as \( E^\tau_+ : E^\tau_+ \mathcal{H} \to E^\tau_+ \mathcal{H} \) is a bijection then \( f = 0 \). Hence, \( \Phi^\sigma_N E^\tau_+ : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is injective.

Let \( g \in L^2(\mathbb{R}^n) \). Then as \( \Phi^\sigma_N : E^\sigma_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is bijective we have there exists \( h \in E^\sigma_+ \mathcal{H} \) such that \( \Phi^\sigma_N h = g \). Therefore,

\[
g = \Phi^\sigma_N h = (E^\tau_+ h + (I - E^\tau_+) h)_{\perp} = \Phi^\tau_N E^\tau_+ h + ((I - E^\tau_+) h)_{\perp}.
\]

Now using the fact that \( E^\tau_+ \) and \( E^\sigma_+ \) are projections and \( h \in E^\sigma_+ \mathcal{H} \) we have

\[
(I - E^\tau_+) h = E^\tau_+^{-1} E^\sigma_+ (E^\sigma_+ - E^\tau_+) h = E^\sigma_+^{-1} (E^\tau_+ E^\sigma_+ - E^\tau_+ E^\tau_+) h = 0.
\]

Thus \( \Phi^\sigma_N E^\tau_+ h = g \). That is \( \Phi_N E^\tau_+ : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is surjective and so bijective. Then by Lemma 4.17 we have that \( \Phi^\sigma_N : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is a bijection.

A similar argument proves that \( \Phi^\tau_R : E^\tau_+ \mathcal{H} \to \{ \nabla_\mu u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \} \) is a bijection. □

Proposition 4.19. If \( \mathcal{A} \) is self-adjoint, then the mappings \( \Phi_R : E^{DB}_D \mathcal{H} \to \{ \nabla_\mu u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \} \) and \( \Phi_N : E^{DB}_D \mathcal{H} \to L^2(\mathbb{R}^n) \) are isomorphisms.

Proof. By Proposition 4.15 we have \( \Phi_R : E^{DB}_D \mathcal{H} \to \{ \nabla_\mu u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \} \) and \( \Phi_N : E^{DB}_D \mathcal{H} \to L^2(\mathbb{R}^n) \) are injective.

Now as \( \Phi^0_N \) corresponds to \( B = I \) and \( I \) is a block type matrix then by Proposition 4.14 we have \( \Phi^0_N : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is an isomorphism. Now by Lemma 4.18 we have there exists \( \varepsilon > 0 \) such that for all \( |\tau| < \varepsilon \) then \( \Phi^\tau_N : E^\tau_+ \mathcal{H} \to L^2(\mathbb{R}^n) \) is an isomorphism. We then iterate this argument a finite number of times to give us \( \Phi^1_N = \Phi_N : E^{DB}_D \mathcal{H} \to L^2(\mathbb{R}^n) \) is a bijection.

A similar argument gives that \( \Phi^\tau_R : E^\tau_+ \mathcal{H} \to \{ \nabla_\mu u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \} \) is also surjective and so an isomorphism. This completes the proof. □

5. Non-Tangential Maximal Function Bounds

We are now ready to prove the non-tangential maximal function bounds. These are needed to show that the equation is well-posed and we will also use these bounds to show that solutions converge pointwise on Whitney averages. We start by giving a Caccioppoli inequality adapted
to the potential $V$ in the sense that we bound $\nabla_{\mu}^*$ rather than $\nabla$, and the inhomogeneous term on right-hand side depends on $(\nabla_{\mu}^*)^*$ not $-\text{div}$. The result is proved similarly to the standard inhomogeneous Caccioppoli inequality. We will adapt the method from the parabolic equation in [6] to our case with a potential. From this point on we specialise to the case when $V \in B^2$. Therefore we have $A = A^V$.

5.1. Reverse Hölder Estimates for Solutions. Throughout this section, suppose that $d > 2$ is an integer and that $\Omega$ is an open subset of $\mathbb{R}^d$. We begin with the following version of Caccioppoli’s inequality to account for the presence of an inhomogeneity $f \in L^2(\Omega, \mathbb{C}^{d+1})$ from the domain $D(\nabla_{\mu}^*)$ in (3.1). In particular, we shall say that $u$ is a weak solution of $-\text{div} A \nabla u + V u = \nabla_{\mu}^* f$ in $\Omega$, or simply that $H_{A,a,V} u = \nabla_{\mu}^* f$ in $\Omega$, if $u \in \mathcal{V}^{1,2}_{\text{loc}}(\Omega)$ and $\int_{\Omega} A \nabla u \cdot \nabla v + aV u \overline{v} = \int_{\Omega} f \cdot \nabla_{\mu}^* v$ for all $v \in \mathcal{C}^{\infty}_c(\Omega)$.

Proposition 5.1. Suppose that $V \in L^1_{\text{loc}}(\mathbb{R}^d)$. If $f \in D(\nabla_{\mu}^*)$ and $H_{A,a,V} u = \nabla_{\mu}^* f$ in $\Omega$, then
\[
\int_Q |\nabla u|^2 + \int_Q |V||u|^2 \lesssim \frac{1}{|Q|^2} \int_{2Q} |u|^2 + \int_{2Q} |f|^2,
\]
for all cubes $Q \subset 2Q \subset \subset \Omega$, where the implicit constant depends only on $\kappa$, $||A||_{\infty}$ and $d$.

Proof. Let $\eta \in \mathcal{C}^{\infty}_c(\Omega)$ be supported in $2Q \subset \subset \Omega$ such that $0 \leq \eta(x) \leq 1$ for all $x \in \Omega$ and $\eta(x) = 1$ for all $x \in Q$ whilst $||\nabla \eta||_{\infty} \lesssim 1/|Q|$. If $H_{A,a,V} u = \nabla_{\mu}^* f$ in $\Omega$, then $\eta u \in \mathcal{V}^{1,2}_0(\Omega)$, so by the definition of a weak solution we have
\[
\int_{\Omega} A \nabla u \cdot \nabla_{\mu}^*(\eta u) = \int_{\Omega} f \cdot \nabla_{\mu}^*(\eta u),
\]
since $\mathcal{C}^{\infty}_c(\Omega)$ is dense in $\mathcal{V}^{1,2}_0(\Omega)$.

Now let $\varepsilon \in (0, 1)$ to be chosen. Using the ellipticity and boundedness of $A$, we have
\[
\int_{\Omega} |\nabla u|^2 = \int_{\Omega} (|\nabla u|^2 + |V|^2|u|^2) \eta \lesssim \int_{\Omega} (A \nabla u \cdot \nabla_{\mu}^*(\eta u)) + \int_{\Omega} |u|^2 |\nabla \eta|^2.
\]
Using (5.1), the product rule and the $\varepsilon$-version of Young’s inequality, we have
\[
\int_{\Omega} (A \nabla u \cdot \nabla_{\mu}^*(\eta u)) \lesssim - \int_{\Omega} A \nabla u \cdot (\nabla \eta \overline{u}) + \int_{\Omega} f \cdot \nabla_{\mu}^*(\eta u)
\]
\[
\lesssim \int_{\Omega} |\nabla u||\nabla \eta||u| + \int_{\Omega} |f| (|u||\nabla \eta| + |\nabla u||\eta| + |V|^2|u|^2)
\]
\[
\lesssim \varepsilon \int_{\Omega} |\nabla u|^2 \eta^2 + \int_{\Omega} |u|^2 |\nabla \eta|^2 + \varepsilon \int_{\Omega} |V|^2 |u|^2 \eta^2 + \frac{1}{\varepsilon} \int_{\Omega} |f|^2 \eta^2.
\]
Combining the above estimates gives
\[
\int_{\Omega} |\nabla u|^2 \eta^2 \lesssim \varepsilon \int_{\Omega} |\nabla u|^2 \eta^2 + \frac{1}{\varepsilon} \int_{\Omega} |u|^2 |\nabla \eta|^2 + \frac{1}{\varepsilon} \int_{\Omega} |f|^2 \eta^2,
\]
where the implicit constant depends only on $\kappa$, $||A||_{\infty}$ and $d$.

We now choose $\varepsilon \in (0, 1)$ sufficiently small, and recall the properties of $\eta$, to obtain
\[
\int_Q |\nabla u|^2 \lesssim \int_Q |\nabla u|^2 \eta^2 \lesssim \frac{1}{|Q|^2} \int_{2Q} |u|^2 + \int_{2Q} |f|^2,
\]
as required. \qed

We can use the Caccioppoli inequality to lower the exponent of a weak solution in a similar way to as in [9]. We recall that $2^* := 2d/(d-2)$ denotes the Sobolev exponent for $\mathbb{R}^d$.

Proposition 5.2. Suppose that $V \in L^1_{\text{loc}}(\mathbb{R}^d)$. If $\delta > 0$ and $H_{A,a,V} u = 0$ in $\Omega$, then
\[
\left(\int_{Q} |u|^{2^*}\right)^{1/2^*} \lesssim_{\delta} \left(\int_{2Q} |u|^\delta\right)^{1/\delta},
\]
for all cubes $Q \subset 2Q \subset \subset \Omega$, where the implicit constant depends only on $\kappa$, $||A||_{\infty}$, $d$ and $\delta$. 
Proof. If $u \in W^{1,2}(Q)$, then using the Sobolev–Poincaré inequality (see (7.45) in [19]) we have
\[
\left( \frac{\int_Q |u|^{2^*}}{} \right)^{1/2^*} \lesssim \left( \frac{\int_Q |u - (f_Q u)|^{2^*}}{} \right)^{1/2^*} + \frac{\int_Q |u|}{l(Q)} \left( \frac{\int_Q |\nabla u|^2}{2} \right)^{1/2} + \left( \frac{\int_Q |u|^2}{2} \right)^{1/2}.
\]
Therefore, by the version of Caccioppoli’s inequality in Proposition 5.1 in the case $f = 0$, we have the weak reverse Hölder estimate
\[
\left( \frac{\int_Q |u|^{2^*}}{} \right)^{1/2^*} \lesssim \left( \frac{\int_Q |u|^2}{2Q} \right)^{1/2},
\]
for all cubes $Q \subset 2Q \subset\subset \Omega$ whenever $H_{A,a,V} u = 0$. The self-improvement of the exponent in the right-hand side of such estimates (see [21, Theorem 2]) completes the proof. \qed

To prove the non-tangential maximal bounds we need to be able to lower the exponent, on the adapted gradient $\nabla_{\mu}$, from 2 to some $p < 2$. In the homogeneous case (when $V = 0$) this is relatively straightforward as if $u$ is a solution then $\text{div} A \nabla (u - u_W) = 0$. Therefore, we can use Caccioppoli on $u - u_W$ followed by the Poincare Inequality. However, in the inhomogeneous case we need to control the potential term. To do this we will use the Fefferman–Phong inequality (Proposition 3.11) with exponent 1. Moreover, we will make crucial use of the right-hand side self-improvement property, proved by Iwaniec and Nolder in [21, Theorem 2], for reverse Hölder inequalities. Specifically, if $\delta \in (0, \infty)$ and $V \in B^q(\mathbb{R}^d)$ for some $q \in (1,\infty)$, then $(\int_Q V^q)^{1/q} \lesssim_{\delta} (\int_Q V^{\delta})^{1/\delta}$ for all cubes $Q$ in $\mathbb{R}^d$. Hence, if $V \in A_{\infty}(\mathbb{R}^d) = \cup_{q>1} B^q(\mathbb{R}^d)$, then $V^s \in B^{\frac{s}{\delta}}(\mathbb{R}^d)$ for each $s \in (0,1)$ and
\[
(5.2)\quad \int_Q V \approx \left( \frac{\int_Q V_2}{2Q} \right)^2,
\]
for all cubes $Q$ in $\mathbb{R}^d$.

**Proposition 5.3.** Suppose that $V \in A_{\infty}(\mathbb{R}^d)$. If $\delta > 0$ and $H_{A,a,V} u = 0$ in $\Omega$, then
\[
\left( \frac{\int_Q |\nabla_{\mu} u|^2}{2Q} \right)^{1/2} \lesssim_{\delta} \left( \frac{\int_{2Q} |\nabla_{\mu} u|^s}{2Q} \right)^{1/\delta},
\]
for all cubes $Q \subset 2Q \subset\subset \Omega$, where the implicit constant depend only on $\kappa$, $||A||_{\infty}$, $d$ and $\delta$.

**Proof.** Suppose that $H_{A,a,V} u = 0$ in $\Omega$ and let $Q$ denote an arbitrary cube such that $2Q \subset\subset \Omega$. If $l(2Q)f_{2Q} V^{\frac{s}{\delta}} \geq 1$, then by Caccioppoli’s inequality in Lemma 5.1 with $f = 0$, followed by the reverse Hölder estimate in Proposition 5.2 with $\delta = 1$, we have
\[
\left( \frac{\int_Q |\nabla_{\mu} u|^2}{2Q} \right)^{1/2} \lesssim \frac{1}{l(Q)} \left( \frac{\int_{(3/2)Q} |u|^2}{2} \right)^{1/2} \lesssim \frac{1}{l(Q)} \frac{\int_{2Q} |u|}{2Q} \lesssim \frac{1}{l(2Q)} \left( l(2Q) \frac{\int_{2Q} V^{\frac{s}{\delta}}}{2Q} \right)^{\beta} \frac{\int_{2Q} |u|}{2Q} \lesssim \frac{\int_{2Q} |\nabla_{\mu} u|}{2Q},
\]
where $\beta \in (0,1)$ denotes the constant from the Fefferman–Phong inequality in Proposition 3.11 applied here with $p = 1$ and $\omega = V^{\frac{s}{\delta}} \in A_{\infty}(\mathbb{R}^d)$.

If $l(2Q)f_{2Q} V^{\frac{s}{\delta}} \leq 1$, then we set $u_Q := f_{2Q} u$ and write
\[
\int_Q |\nabla_{\mu} u|^2 \lesssim \int_Q |\nabla_{\mu} (u - u_Q)|^2 + \int_Q V |u_Q|^2.
\]
For all \( \varphi \in C_c^\infty(\Omega) \), since \( H_{A,a,V} u = 0 \) in \( \Omega \), we have
\[
\int_\Omega A \nabla u \cdot \nabla \varphi = \int_\Omega A \nabla u \cdot \nabla \varphi - \int \Omega V u \varphi.
\]
Thus, \( H_{A,a,V}(u - u_Q) = -V u_Q \) in \( \Omega \). We now define \( f = (f_1, \ldots, f_{d+1}) \in L^2(\Omega; \mathbb{C}^d) \) by setting \( f_1 = \ldots = f_d \equiv 0 \) and \( f_{d+1} = -V^{1/2} u_Q \), so \( -V u_Q = (-\text{div}, V^{1/2})(0, \ldots, 0, -V^{1/2} u_Q) = (\nabla)^* f \) and \( H_{A,a,V}(u - u_Q) = (\nabla)^* f \) in \( \Omega \). The inhomogeneous version of Caccioppoli’s inequality in Proposition 5.1 can then be applied to show that
\[
\int_Q |\nabla u|^2 \lesssim \frac{1}{f(Q)^2} \int_{2Q} |u - u_Q|^2 + \int_{2Q} V |u_Q|^2 \lesssim \left( \int_{2Q} |\nabla u|^2 \right)^{2/\ast} + \int_{2Q} V |u_Q|^2,
\]
where we used the Sobolev–Poincaré inequality (see (7.45) in [19]) in the second estimate with \( 2\ast := 2d/(d + 2) \). Using (5.2) followed by the Fefferman–Phong inequality in Proposition 3.11, applied again with \( p = 1 \) and \( \omega = V^{1/2} \) but now in the case when \( l(2Q) \int_{2Q} V^{1/2} \leq 1 \), we have
\[
\left( \int_{2Q} V |u_Q|^2 \right)^{1/2} \leq \left( \int_{2Q} V \right)^{1/2} \int_{2Q} |u| \lesssim \left( \int_{2Q} V^{1/2} \right) \int_{2Q} |u| \lesssim \int_{2Q} |\nabla u|.
\]
Combining these estimates with Jensen’s inequality we get
\[
\left( \int_Q |\nabla u|^2 \right)^{1/2} \lesssim \left( \int_{2Q} |\nabla u|^2 \right)^{1/2},
\]
since \( 1 < 2\ast < 2 \).

We can now conclude that the preceding weak reverse Hölder estimate holds for all cubes \( Q \subset 2Q \subset \subset \Omega \). The self-improvement of the exponent in the right-hand side of such estimates (see [21, Theorem 2]) completes the proof.

An inspection of the proofs in this section provides for the following routine extension. This will be used henceforth without further reference.

**Remark 5.4.** The results in Propositions 5.1, 5.2 and 5.3 also hold when \( 2Q \) is replaced by \( \alpha Q \) for any \( \alpha > 1 \), except then the implicit constants in the estimates will also depend on \( \alpha \).

**5.2. Off-Diagonal Estimates.** The next step to proving the non-tangential maximal bounds is to show that \( DB \) has \( L^q \to L^q \) off-diagonal estimates for some \( q < 2 \). First we need to know that \( DB \) is bisectorial in \( L^q \) and so we need to prove the \( L^q \)-resolvent bounds for \( DB \). To do this we follow the methods of [2] and [10], adapting them to the potential \( V \).

**Lemma 5.5.** There exists \( 1 < p_1 < 2 < p_2 \) such that for \( q \in (p_1, p_2) \) we have the \( L^q \to L^q \) resolvent bounds
\[
\| (I + itDB)^{-1} f \|_q \lesssim \| f \|_q,
\]
for all \( f \in L^q(\mathbb{R}^n; C^{n+2}) \).

**Proof.** Let \( f \in L^2(\mathbb{R}^n) \cap L^q(\mathbb{R}^n) \) where \( q \) is to be chosen later. Then define \( \tilde{f} \) such that \( (I + itDB) \tilde{f} = f \). Define
\[
g = \begin{bmatrix} (Bf) \perp \\ f_\parallel \end{bmatrix}, \quad \tilde{g} = \begin{bmatrix} (B\tilde{f}) \perp \\ f_\parallel \end{bmatrix} \quad \text{then} \quad f = \begin{bmatrix} (Ag) \perp \\ g_\parallel \end{bmatrix}, \quad \tilde{f} = \begin{bmatrix} (A\tilde{g}) \perp \\ \tilde{g}_\parallel \end{bmatrix}.
\]
Now let \( \psi \in C_0^\infty(\mathbb{R}^n; C^{n+2}) \). Then
\[
(5.3) \quad \int f \cdot \psi = \int (I + itDB) \tilde{f} \cdot \psi = \int \tilde{f} \cdot \psi + \int B \tilde{f} \cdot (itD\psi).
\]
Now let \( \psi = (\varphi,0,0)^T \), where \( \varphi \in C_c^\infty(\mathbb{R}^n) \). Noting that \((B\tilde{f})_\| = (A\tilde{g})_\| \) and \((B\tilde{f})_\mu = (A\tilde{g})_\mu = a\tilde{g}_\mu \), then, by (5.3), we obtain

\[
\int (A\tilde{g})_\perp \varphi = \int \tilde{f}_\perp \varphi + \int (B\tilde{f})_\| \cdot (it\nabla_\| \varphi) + \int (B\tilde{f})_\mu \cdot (it|V|^\frac{1}{2} \varphi)
\]

\[
= \int_{\mathbb{R}^n} (A\tilde{g})_\perp \varphi + \int (A\tilde{g})_\| \cdot (it\nabla_\| \varphi) + \int (A\tilde{g})_\mu \cdot (it|V|^\frac{1}{2} \varphi)
\]

\[
\int \left[ \frac{(A\tilde{g})_\perp}{(A\tilde{g})_\|} \right] \cdot \begin{bmatrix} i t \nabla_\| \varphi \\ i t |V|^\frac{1}{2} \varphi \end{bmatrix}
\]

Letting \( \psi = (0,\varphi,0)^T \), where \( \varphi \in C_c^\infty(\mathbb{R}^n) \), in (5.3). Then we have that

\[
\int g_\| \cdot \varphi = \int \tilde{g}_\| \cdot \varphi + \int (B\tilde{f})_\| \cdot (it \nabla_\| \varphi) = \int \tilde{g}_\| \cdot \varphi - \int it \nabla_\| \tilde{g}_\perp \cdot \varphi.
\]

Similarly, letting \( \psi = (0,0,\varphi)^T \), where \( \varphi \in C_c^\infty(\mathbb{R}^n) \), in (5.3), we obtain

\[
\int g_\mu \varphi = \int \tilde{g}_\mu \varphi - \int (B\tilde{f})_\| \cdot (it|V|^\frac{1}{2} \varphi) = \int \tilde{g}_\mu \varphi - \int (it|V|^\frac{1}{2} \tilde{g}_\perp) \varphi.
\]

Therefore, we have that \( g_\| = \tilde{g}_\| - it \nabla_\| \tilde{g}_\perp \) and \( g_\mu = \tilde{g}_\mu - it|V|^\frac{1}{2} \tilde{g}_\perp \). For \( t > 0 \) we define the space \( \mathcal{V}^{1,q}_t(\mathbb{R}^n) \) to be \( \mathcal{V}^{1,q}(\mathbb{R}^n) \) equipped with the norm \( \|u\|_q + t\|\nabla u\|_q \). Also, define \( (\mathcal{V}^{1,q}_t(\mathbb{R}^n))^* \) to be the dual space equipped with the dual norm. Define the operator \( L_{t,V} : \mathcal{V}^{1,q}_t(\mathbb{R}^n) \to (\mathcal{V}^{1,q}_t(\mathbb{R}^n))^* \) such that for \( u \in \mathcal{V}^{1,q}_t(\mathbb{R}^n) \) and \( \varphi \in \mathcal{V}^{1,q}_t(\mathbb{R}^n) \), 0, then define

\[
(L_{t,V}u)(\varphi) := \int A \begin{bmatrix} u \\ it \nabla_\| u \\ it|V|^\frac{1}{2} \varphi \end{bmatrix}.
\]

Now, using Hölder’s inequality, we have

\[
| (L_{t,V}u)(\varphi) | \leq \|A\|_\infty \int |u| \varphi + t^2|\nabla_\mu u| \varphi,
\]

\[
\leq \|A\|_\infty (\|u\|_q \|\varphi\|_{q'} + t^2\|\nabla_\mu u\|_q \|\varphi\|_{q'}),
\]

\[
\leq \|A\|_\infty (\|u\|_q + t\|\nabla_\mu u\|_q) (\|\varphi\|_{q'} + t\|\varphi\|_{q'}),
\]

\[
= \|A\|_\infty \|u\|_{\mathcal{V}_t^{1,q}} \|\varphi\|_{\mathcal{V}_t^{1,q}}.
\]

Therefore, \( \|L_{t,V}u\|_{(\mathcal{V}_t^{1,q})^*} \leq \|A\|_\infty \|u\|_{\mathcal{V}_t^{1,q}} \). That is, \( L_{t,V} \) is bounded for \( q \in (1, \infty) \) independently of \( q \). Now recall

\[
\mathcal{R}(D) = \left\{ \begin{bmatrix} h \\ \nabla_\| g \\ |V|^\frac{1}{2} g \end{bmatrix} : h \in L^2(\mathbb{R}^n), g \in \mathcal{V}^{1,2}(\mathbb{R}^n) \right\}, \quad \text{then} \quad \begin{bmatrix} u \\ \nabla_\| (itu) \\ |V|^\frac{1}{2} (itu) \end{bmatrix} \in \mathcal{R}(D).
\]

Therefore, by the ellipticity of \( A \) we have for any \( u \in \mathcal{V}^{1,2}_t(\mathbb{R}^n) \), noting that \( \mathcal{V}^{1,2}_t \subseteq \mathcal{V}^{1,2} \), we have

\[
| (L_{t,V}u)(u) | \geq \Re \left( \int_{\mathbb{R}^n} A \begin{bmatrix} u \\ \nabla_\| (itu) \\ |V|^\frac{1}{2} (itu) \end{bmatrix} \cdot \begin{bmatrix} u \\ \nabla_\| (itu) \\ |V|^\frac{1}{2} (itu) \end{bmatrix} \right) \gtrsim \kappa(\|u\|_2^2 + t^2\|\nabla_\mu u\|_2^2) \approx \kappa \|u\|_{\mathcal{V}^{1,2}_t}^2.
\]

That is \( \|L_{t,V}u\|_{(\mathcal{V}^{1,2}_t)^*} \gtrsim \|u\|_{\mathcal{V}^{1,2}_t} \). There exists \( \varepsilon > 0 \) such that \( |V|^\frac{1}{2} \in B_{2+\varepsilon} \), therefore using [14] we have that \( \mathcal{V}^{1,q}_t(\mathbb{R}^n) \) is an interpolation space for \( q \in (1, 2+\varepsilon) \). Then by Šněberg’s Lemma we have that there exists \( p_1, p_2 \) with \( 1 < p_1 < 2 < p_2 < 2 + \varepsilon \) such that \( \|L_{t,V}u\|_{(\mathcal{V}^{1,q}_t)^*} \gtrsim_q \|u\|_{\mathcal{V}^{1,q}_t} \).
for all \( q \in (p_1, p_2) \). That is \( L_{t,V} \) is invertible for \( q \in (p_1, p_2) \). For \( \varphi \in \mathcal{V}_t^{1,q'}(\mathbb{R}^n) \) use (5.5) and (5.6), and then (5.4) to obtain
\[
(L_{t,V} \tilde{g}_\perp)(\varphi) = \int_{\mathbb{R}^n} A \begin{bmatrix} \tilde{g}_\perp \\ it\nabla_{\|g\|} \tilde{g}_\perp \end{bmatrix} \begin{bmatrix} \varphi \\ it\nabla_{\|g\|} \varphi \end{bmatrix} = \int_{\mathbb{R}^n} \begin{bmatrix} A_{\perp \|g\|} \tilde{g}_\perp + A_{\|g\|} (\tilde{g}_\perp - g_\perp) \\ A_{\|g\|} (\tilde{g}_\perp - g_\perp) \end{bmatrix} \begin{bmatrix} \varphi \\ it\nabla_{\|g\|} \varphi \end{bmatrix} = \int_{\mathbb{R}^n} \begin{bmatrix} A_{\|g\|} - A_{\perp \|g\|} \\ -a_{\|g\|} \end{bmatrix} \begin{bmatrix} \varphi \\ it\nabla_{\|g\|} \varphi \end{bmatrix}.
\]
Define \( F : L^q(\mathbb{R}^n; \mathbb{C}^{n+2}) \to (\mathcal{V}_t^{1,q'}(\mathbb{R}^n))^* \) such that for \( u \in L^q(\mathbb{R}^n; \mathbb{C}^{n+2}) \) and \( \varphi \in \mathcal{V}_t^{1,q'}(\mathbb{R}^n) \) then
\[
(Fu)(\varphi) := \int_{\mathbb{R}^n} \begin{bmatrix} A_{\perp \|u\|} u_\perp \\ -A_{\|u\|} u_\parallel \end{bmatrix} \begin{bmatrix} \varphi \\ it\nabla_{\|u\|} \varphi \end{bmatrix}.
\]
Therefore, \( L_{t,V} \tilde{g}_\perp = Fg \). Now for any \( \varphi \in \mathcal{V}_t^{1,q'}(\mathbb{R}^n) \), we have
\[
| (Fu)(\varphi) | \leq \|A\|_\infty \int_{\mathbb{R}^n} \left( |u_\perp| |\varphi| + t |u_\parallel| |\nabla_{\|\varphi|} + t |u_\parallel| |\nabla_{\|\varphi|} | \right) \\
\leq \|A\|_\infty \left( \|u\|_q |\varphi| + t |u|_q |\nabla_{\|\varphi|} | \right) \\
= \|A\|_\infty \|u\|_q |\varphi|_{\mathcal{V}_t^{1,q'}}.
\]
Thus
\[
(5.7) \quad \|Fu\|_{\mathcal{V}_t^{1,q'}} \leq \|A\|_\infty \|u\|_q.
\]
Therefore, using (5.4), (5.5), (5.6), the ellipticity of \( L_{t,V} \), (5.7), and the definition of \( g \), we obtain
\[
\|\tilde{f} \|_q \leq \|\tilde{g}_\perp\|_{\mathcal{V}_t^{1,q'}} + \|g\|_q \leq \|L_{t,V} \tilde{g}_\perp\|_{\mathcal{V}_t^{1,q'}} + \|g\|_q = \|Fg\|_{\mathcal{V}_t^{1,q'}} + \|g\|_q \leq \|g\|_q \leq \|f\|_q.
\]
Recalling the definition of \( \tilde{f} \), gives
\[
\|(I + itDB)^{-1}f\|_q \leq \|f\|_q.
\]
Now as \( L^2(\mathbb{R}^n) \cap L^q(\mathbb{R}^n) \) is dense in \( L^q(\mathbb{R}^n) \) a density argument completes the proof. \( \square \)

Therefore we have the off-diagonal estimates

**Proposition 5.6.** Let \( E, F \subset \mathbb{R}^n \) and \( f \in \mathcal{F}(\mathbb{R}^n) \) with \( \text{supp}(f) \subset F \). Then, there exists \( 1 < p_1 < 2 < p_2 \) such that for \( q \in (p_1, p_2) \), we have the following estimate
\[
\|(I + itDB)^{-1}f\|_{L^q(E)} \leq C_M \left( 1 + \frac{\text{dist}(E, F)}{t} \right)^{-M} \|f\|_{L^q(F)},
\]
where \( C_M \) does not depend on \( E, F, f, \) and \( t \).

**Proof.** By Lemma 5.5 we have there exists \( 1 < p_1 < 2 < p_2 \) such that, for \( p \in (p_1, p_2) \), we have
\[
\|(I + itDB)^{-1}f\|_{L^p(E)} \leq C_p \|(I + itDB)^{-1}f\|_p \leq C_p \|f\|_p = C_p \|f\|_{L^p(F)},
\]
where \( C_p \) is independent of \( E, F, f, \) and \( t \). We also have, from Proposition 3.9, for any \( N \in \mathbb{N} \) then
\[
\|(I + itDB)^{-1}f\|_{L^2(E)} \leq C_N \left( 1 + \frac{\text{dist}(E, F)}{t} \right)^{-N} \|f\|_{L^2(F)},
\]
where $C_N$ is independent of $E, F, f, \text{ and } t$. Then by Riesz–Thorin interpolation we have for any $\theta \in (0, 1)$ and $\frac{1}{q} = \frac{1-\theta}{p} + \frac{\theta}{2}$ then
\[
\|(I + itDB)^{-1} f\|_{L^q(E)} \leq C_{p, q} \left( 1 + \frac{\text{dist}(E, F)}{t} \right)^{-N\theta} \|f\|_{L^q(F)}.
\]
Now choosing $N \in \mathbb{N}$ such that $N\theta \geq M$ gives the required result. \hfill \Box

5.3. Non-Tangential Estimates. Now that we have weak reverse H"older estimates for the gradient of solutions and $L^q \rightarrow L^q$ off diagonal estimates we are ready to prove the non-tangential maximal function estimates. We first give the following lemma.

**Lemma 5.7.** If $F \in L^2_{loc}(\mathbb{R}^n; L^2(\mathbb{R}^n; C^{n+2}))$, then
\[
\sup_{t>0} \int_0^{2t} \|F(s)\|_2^2 ds \lesssim \|\widehat{N}_s F\|_2^2 \lesssim \int_0^\infty \|F(s)\|^2_2 ds.
\]

**Proof.** Firstly, by the definition of the non-tangential maximal function we have
\[
|\widehat{N}_s F(x)|^2 \approx \sup_{t>0} \int_t^{2t} |F(s, y)|^2 \frac{dy ds}{s} \lesssim \int_0^\infty \frac{1}{s^n} \int_{\mathbb{R}^n} 1_{B_s(y)}(x) |F(s, y)|^2 \frac{dy ds}{s}
\]

By integrating in $x$ and Tonelli’s Theorem we obtain
\[
\|\widehat{N}_s F\|_2^2 \lesssim \int_{\mathbb{R}^n} \frac{1}{s^n} \int_{\mathbb{R}^n} 1_{B_s(y)}(x) |F(s, y)|^2 \frac{dy ds}{s} dx
\]
\[
= \int_0^\infty \frac{1}{s^n} \int_{\mathbb{R}^n} |B_s(y)| |F(s, y)|^2 \frac{dy ds}{s}
\]
\[
\approx \int_0^\infty \|F(s)\|^2_2 ds.
\]

For the lower inequality let $t_0 > 0$ be fixed and arbitrary. Therefore
\[
|\widehat{N}_s F(x)|^2 \gtrsim \int_{t_0}^{2t_0} \int_{B_{t_0}(x)} |F(s, y)|^2 \frac{dy ds}{s} \approx \int_{t_0}^{2t_0} \frac{1}{s^n} \int_{\mathbb{R}^n} 1_{B_{t_0}(y)}(x) |F(s, y)|^2 \frac{dy ds}{s} dx
\]
Again, integrating in $x$ and Tonelli’s Theorem gives
\[
\|\widehat{N}_s F\|_2^2 \gtrsim \int_{t_0}^{2t_0} \frac{1}{s^n} \int_{\mathbb{R}^n} |B_{t_0}(y)| |F(s, y)|^2 \frac{dy ds}{s} \approx \int_{t_0}^{2t_0} \int_{\mathbb{R}^n} |F(s, y)|^2 dy ds = \int_{t_0}^{2t_0} \|F(s)\|^2_2 ds.
\]
Finally, noting that $t_0$ was arbitrary so the above is true for all $t_0 > 0$. Thus taking supremum over $t > 0$ completes the proof. \hfill \Box

We are finally ready to prove the non-tangential maximal function estimates for first order solutions when $V \in B^{\frac{q}{2}}_1(\mathbb{R}^n)$

**Theorem 5.8.** If $F \in L^2_{loc}(\mathbb{R}^+; \overline{R(D)})$ is a weak solution of $\partial_t F + DBF = 0$ in $\mathbb{R}^+$ such that
\[
\sup_{t>0} \int_0^{2t} \|F(s)\|^2_2 ds < \infty,
\]
then
\[
\int_0^\infty \|t\partial_t F\|^2_2 \frac{dt}{t} \approx \|f\|_2^2 \approx \|\widehat{N}_s F\|_2^2,
\]
where $f \in E^{1+}_DB$ and $F(t) = e^{-tDB} f$ as in Theorem 4.9.
3.28. Therefore, applying the equivalence in property 4 of Theorem 2.5 with \( \psi \in \Psi(S^0_\mu) \) defined by \( \psi(z) := [z] e^{-[z]} \), where \([z] := z \sgn z\), for all \( z \in S^0_\mu\), we have

\[
\int_0^\infty \| t \partial_t F \|_2^2 \frac{dt}{t} = \int_0^\infty \| t \partial_t (e^{-t|DB|} f) \|_2^2 \frac{dt}{t} = \int_0^\infty \| t|DB| e^{-t|DB|} f \|_2^2 \frac{dt}{t} \leq \int_0^\infty \| \psi(tDB) f \|_2^2 \frac{dt}{t} \approx \| f \|_2^2,
\]

where the differentiation in the second equality is justified because \( (e^{-t|DB|})_{t>0} \) is an analytic semi-group on \( \overline{R(D)} \) by Lemma 4.5.

It remains to prove that \( \| \tilde{N}_* F \|_2^2 \approx \| f \|_2^2 \). To begin, by Lemma 5.7 and Proposition 4.11, we have

\[
\| \tilde{N}_* F \|_2^2 \gtrsim \sup_{t>0} \int_0^{2t} \| F(s) \|_2^2 \, ds \geq \lim_{t \to 0} \int_0^{2t} \| F(s) \|_2^2 \, ds = \| f \|_2^2.
\]

To prove the reverse estimate, consider a Whitney box \( W(t,x) := [t,2t] \times Q(t,x) \subset \mathbb{R}^{n+1} \) for some \( x \in \mathbb{R}^n \) and \( t > 0 \). Using Proposition 4.3, since \( F \in L^2_{\text{loc}}(\mathbb{R}^n; \overline{R(D)}) \) is a weak solution of \( \partial_t F + DBF = 0 \) in \( \mathbb{R}^n_+ \), there exists a weak solution \( u \) of \( -\text{div} A\nabla u + Vu = 0 \) in \( \mathbb{R}^{n+1}_+ \) such that \( F = \nabla_A u \). We now choose \( p \in (p_1,2) \), where \( p_1 \) is the exponent from Lemma 5.4. Applying Proposition 5.3 on the cube \( W \), since \( 2W = [t/2,5t/2] \times Q(2t,x) \subset \mathbb{R}^{n+1}_+ \), and the fact that \( \overline{A} \) is bounded and invertible on \( \overline{R(D)} \), we have

\[
\left( \frac{\int_{2W} |F|^p \, dy \, ds}{\int_{2W} |F_s|^p \, dy \, ds} \right)^\frac{1}{p} = \left( \frac{\int_{2W} |\nabla_A u|^p \, dy \, ds}{\int_{2W} |\nabla A u|^p \, dy \, ds} \right)^\frac{1}{p} \lesssim \left( \frac{\int_{2W} |\nabla \mu|^p \, dy \, ds}{\int_{2W} |F|^p \, dy \, ds} \right)^\frac{1}{p}.
\]

Now using \( F(t) = e^{-t|DB|} f \) for some \( f \in \overline{R(D)} \), recalling that \( R_s = (1 + isDB)^{-1} \), then we have

\[
\left( \frac{\int_{2W} |F(s,y)|^p \, dy \, ds}{\int_{2W} |F(s,y)|^p \, dy \, ds} \right)^\frac{1}{p} = \left( \frac{\int_{2W} |e^{-s|DB|} f(y)|^p \, dy \, ds}{\int_{2W} |e^{-s|DB|} f(y)|^p \, dy \, ds} \right)^\frac{1}{p} \lesssim \left( \frac{\int_{2W} |(e^{-s|DB|} - R_s) f(y)|^p \, dy \, ds}{\int_{2W} |e^{-s|DB|} f(y)|^p \, dy \, ds} \right)^\frac{1}{p} + \left( \frac{\int_{2W} |R_s f(y)|^p \, dy \, ds}{\int_{2W} |e^{-s|DB|} f(y)|^p \, dy \, ds} \right)^\frac{1}{p}.
\]

Therefore,

\[
\| \tilde{N}_* F \|_2^2 \lesssim \| \tilde{N}_* ((e^{-t|DB|} - R_s) f) \|_2^2 + \left\| \sup_{t>0} \left( \frac{\int_{2W(t,x)} |R_s f(y)|^p \, dy \, ds}{\int_{2W(t,x)} |F(s,y)|^p \, dy \, ds} \right)^\frac{1}{p} \right\|_2.
\]

Then, by Lemma 5.7, letting \( \psi(z) := e^{-[z]} - (1 + iz)^{-1} \) so \( \psi \in \Psi(S^0_\mu) \), and the quadratic estimates for \( DB \) in Theorem 3.4, we have

\[
\left\| \tilde{N}_* \left( (e^{-t|DB|} - R_s) f \right) \right\|_2^2 \lesssim \int_0^\infty \left\| (e^{-t|DB|} - R_s) f \right\|_2^2 \frac{dt}{t} = \int_0^\infty \| \psi(tDB) f \|_2^2 \frac{dt}{t} \lesssim \| f \|_2^2.
\]

Now

\[
\left( \frac{\int_{2W(x,t)} |R_s f(y)|^p \, dy \, ds}{\int_{2W(x,t)} 1_{2Q(x,t)}(y) |R_s f(y)|^p \, dy \, ds} \right)^\frac{1}{p} \approx \left( \int_{\frac{2}{t}}^{\frac{2}{t}} \int_{\mathbb{R}^n} 1_{2Q(x,t)}(y) |R_s f(y)|^p \, dy \, ds \right)^\frac{1}{p}.
\]
If \( s \in (t/2, 5t/2) \), then using the off-diagonal estimates in Proposition 5.6, we have
\[
\left\| \mathbb{1}_{2Q(x,t)} R_s f \right\|_p \leq \sum_{j=0}^{\infty} \left\| \mathbb{1}_{Q(x,2t)} R_s \mathbb{1}_{C_j(Q(x,2t))} f \right\|_p \\
\leq \sum_{j=0}^{\infty} \left( 1 + \frac{\operatorname{dist}(Q(x, 2t), C_j(Q(x, 2t)))}{s} \right)^{-M} \left\| \mathbb{1}_{C_j(Q(x,2t))} f \right\|_p \\
\leq \sum_{j=0}^{\infty} 2^{-jM} (2^j t)^\frac{2}{p} \left( \int_{2^{j+1}Q(x,t)} |f|^p \right)^{\frac{1}{p}} \\
\leq 2^\frac{2}{p} \left( \mathcal{M}(|f|^p)(x) \right) \sum_{j=0}^{\infty} 2^{-j(M-\frac{2}{p})} 
\]
where \( C_0(Q(x,2t)) := Q(x,2t) \) and \( C_j(Q(x,t)) := Q(x,2^{j+1}t) \setminus Q(x,2jt) \) for all \( j \in \mathbb{N} \). Then taking \( M > \frac{2}{p} \) gives
\[
\left\| \mathbb{1}_{2Q(x,t)} R_s f \right\|_p \lesssim t^n \mathcal{M}(|f|^p)(x) \quad \forall s \in (t/2, 5t/2).
\]
Thus
\[
\left( \int_{t/2}^{5t/2} \int_{\mathbb{R}^n} \mathbb{1}_{2Q(x,t)}(y)|R_s f(y)|^p \frac{dy \, ds}{s^{n+1}} \right)^{\frac{1}{p}} = \left( \int_{t/2}^{5t/2} \left\| \mathbb{1}_{2Q(x,t)}(y) R_s f \right\|_p^p \frac{dy}{s^{n+1}} \right)^{\frac{1}{p}} \\
\lesssim \left( \int_{t/2}^{5t/2} (\mathcal{M}(|f|^p)(x)) \frac{ds}{t} \right)^{\frac{1}{p}} \\
\approx (\mathcal{M}(|f|^p)(x))^{\frac{1}{p}}.
\]
Therefore by the boundedness of the Hardy–Littlewood maximal function on \( \frac{2}{p} > 1 \) we have
\[
\left\| \sup_{t>0} \left( \iint_{2W(x,t)} |R_s f(y)|^p \, dy \, ds \right)^{\frac{1}{p}} \right\|_2 \lesssim \left\| (\mathcal{M}(|f|^p))^{\frac{1}{p}} \right\|_2 = \left\| (\mathcal{M}(|f|^p))^{\frac{1}{p}} \right\|_2 \lesssim \left\| |f|^p \right\|_2^{\frac{1}{p}} = \left\| f \right\|_2.
\]
Thus
\[
\left\| \tilde{N}_s(F) \right\|_2 \lesssim \left\| f \right\|_2.
\]
This completes the proof. \( \square \)

We are now left to prove that first order solutions, \( F \), converge pointwise on Whitney averages to the initial data \( f \).

**Proposition 5.9.** If \( F(t,x) = e^{-t|DB|} f(x) \) for some \( f \in \mathcal{R}(\mathcal{D}) \), then we have almost everywhere convergence of Whitney averages to \( f \) as \( t \to 0 \). That is
\[
\lim_{t \to 0} \iint_{W(t,x)} |F(s,y) - f(x)|^2 \, dy \, ds = 0,
\]
for almost every \( x \in \mathbb{R}^n \).

**Proof.** We proceed as in [6] by proving the estimate on a dense subspace of \( \mathcal{R}(\mathcal{D}) \), namely \( \{ h \in \mathcal{R}(\mathcal{D}) \cap \mathcal{D}(\mathcal{D}) : DBh \in L^p(\mathbb{R}^n; \mathbb{C}^{n+2}) \} \), for some \( p \in (2,p_2) \) where \( p_2 \) is as in Proposition 5.6. To prove that this set is dense. Let \( m \in \mathbb{N} \). Define \( T_m \in \mathcal{L}(L^2(\mathbb{R}^n; \mathbb{C}^{n+2})) \) by
\[
T_m h := R_m \mathcal{M} R_m Br_m h, 
\]
for each \( h \in \mathcal{R}(\mathcal{D}) \) where \( R_m := (I + imDB)^{-1} \). As \( DB \) is densely defined and bisectorial then the \( T_m \) are uniformly bounded with respect to \( m \). Now as \( h \in \mathcal{D}(\mathcal{D}) \) we have
\[
\left\| (I - R_m) h \right\|_2 = \left\| \frac{1}{m} DB R_m h \right\|_2 \lesssim \left\| DB h \right\|_2 \to 0,
\]
as \( m \to \infty \). Also, as \( h \in R(DB) \) then there exists \( u \in D(DB) \) such that \( h = DBu \). Then

\[
\|(I - imDBR_m)h\|_2 = \|R_mh\|_2 = \left\| \frac{im}{im}DBR_mu \right\|_2 = \frac{1}{m}\|(I - R_m)u\|_2 \to 0,
\]
as \( m \to \infty \). Therefore

\[
\|(I - T_m)h\|_2 \leq \|(I - R_m)h\|_2 + \| R_mh - \frac{1}{m}R_1imDBR_mh \| \lesssim \|(I - \frac{1}{m})h\|_2 + \|(I - imDBR_m)h\|_2.
\]
Thus \( \|(I - T_m)u\|_2 \to 0 \), as \( m \to \infty \). Hence we have proved \( T_m \) converges strongly to the identity as \( m \to \infty \). Now let \( h \in \mathcal{R}(D) \). Let \( h_m \in L^2(\mathbb{R}^n; \mathbb{C}^{n+2}) \cap L^p(\mathbb{R}^n; \mathbb{C}^{n+2}) \) such that \( h_m \to h \) in \( L^2 \) and \( p \in (2, p_2) \). Now, as \( T_m \) is uniformly bounded in \( m \) and converges to the identity we have that

\[
\|T_m h_m - h\|_2 \leq \|T_m h_m - T_m h\|_2 + \|T_m h - h\|_2 \lesssim \|h_m - h\|_2 + \|T_m h - h\|_2 \to 0,
\]
as \( m \to \infty \). Now by Lemma 5.5 we have that there exists \( p > 2 \) such that

\[
\|DBT_m h_m\|_p = \|DBR_m h_m\|_p = m \|(R_m - I)(I - R_m)h_m\|_p \lesssim m \|h_m\|_p < \infty.
\]
Thus \( DBT_m h_m \in L^p(\mathbb{R}^{n+1}; \mathbb{C}^{n+2}) \). Hence \( \{h \in R(DB) \cap D(DB) : DBh \in L^p(\mathbb{R}^n; \mathbb{C}^{n+2}) \} \) is a dense subspace of \( \mathcal{R}(D) \).

Now let \( f \in \{h \in R(DB) \cap D(DB) : DBh \in L^p(\mathbb{R}^n; \mathbb{C}^{n+2}) \} \) and let \( x \in \mathbb{R}^n \) be a Lebesgue point. Then

\[
\iint_{W(t,x)} |F(s,y) - f(x)|^2 \, dy \, ds \lesssim \iint_{W(t,x)} |e^{-tDB}f(y) - R_t f(y)|^2 \, dy \, ds
\]

\[
+ \iint_{W(t,x)} |R_t f(y) - f(x)|^2 \, dy \, ds
\]

\[
+ \iint_{W(t,x)} |f(y) - f(x)|^2 \, dy \, ds.
\]

Now the third term above converges to 0 by the Lebesgue differentiation theorem. For the first term let \( \psi \in \Psi(S^0) \) given by \( \psi(z) := e^{-z} - (1 + iz)^{-1} \). Now define

\[
h(t, x) := \int_{W(t,x)} |\psi(sDB)f(y)| \frac{dy \, ds}{s^{n+1}}.
\]

Note for almost all \( x \in \mathbb{R}^n \) we have that \( 0 \leq h(t_0, x) \leq h(t_1, x) \) for \( 0 \leq t_0 \leq t_1 \). Also by Proposition 5.7 the quadratic estimates for \( DB \) we have that

\[
\int_{\mathbb{R}^n} h(t, x) \, dx \lesssim \int_0^t \|\psi(sDB)f\|_2^2 \frac{ds}{s} \lesssim \|f\|_2^2.
\]

Therefore, by the monotone convergence theorem and \( h \) being continuous in \( t \), we have

\[
0 \leq \int_{\mathbb{R}^n} h(0, x) \, dx = \lim_{t \to 0} \int_{\mathbb{R}^n} h(t, x) \, dx \lesssim \lim_{t \to 0} \int_0^t \|\psi(sDB)f\|_2^2 \frac{ds}{s} = 0.
\]

Thus, \( h(0, x) = 0 \) for almost every \( x \in \mathbb{R}^n \). Therefore

\[
\lim_{t \to 0} \iint_{W(t,x)} |e^{-tDB}f(y) - R_t f(y)|^2 \, dy \, ds \approx \lim_{t \to 0} h(t, x) = 0,
\]

for almost every \( x \in \mathbb{R}^n \). Now for the second term we use the off diagonal argument used in the proof of Theorem 5.8 to obtain

\[
\iint_{W(t,x)} |R_t f(y) - f(y)|^2 \, dy \, ds = \iint_{W(t,x)} |sR_t DBf(y)|^2 \, dy \, ds
\]

\[
\approx t^2 \iint_{W(t,x)} |R_t DBf(y)|^2 \, dy \, ds
\]

\[
\lesssim t^2 (\mathcal{M}(|DBf|^2)(x))^2.
\]
As there exists $p > 2$ such that $DBf \in L^p(\mathbb{R}^{n+1}; C^{n+2})$ we have that $\mathcal{M}(|DBf|^2) \in L^p(\mathbb{R}^n)$. Thus $\mathcal{M}(|DBf|^2)(x) < \infty$ almost everywhere. Then, as $\mathcal{M}(|DBf|^2)$ is independent of $t$, we have that
\[
\lim_{t \to 0} \iint_{W(t,x)} |R_t f(y) - f(y)|^2 \, dy \, ds \lesssim \mathcal{M}(|DBf|^2)(x)^2 \lim_{t \to 0} t^2 = 0,
\]
for almost every $x \in \mathbb{R}^n$. This completes the proof. \hfill \Box

Combining Proposition 5.9 with Theorem 4.9 and Proposition 4.7 we gain the following corollary, which is equivalent to Corollary 4.10 with convergence on Whitney averages as in (1.5).

**Corollary 5.10.** We have (4.2) is globally well-posed in $E^\pm_{DB} \mathcal{H}$ with pointwise convergence on Whitney averages. Moreover, solutions to (4.2) are of the form $e^{-tDB}f$ for $t > 0$ for initial data $f \in E^\pm_{DB} \mathcal{H}$.

6. Return to the Second-Order Equation

Now we have proved results for the first order equation we need to transfer these results back to results for the original second order equation (1.1). We first show the equivalence between the invertability of the mappings (4.3) and the well-posedness of the first order equation as in definition 4.4.

### 6.1. Equivalences of well-posedness

We first show that non-tangential control is sufficient to give a correspondence between the first order and the second order solutions.

**Proposition 6.1.** If $H_{A,n}u \equiv 0$ and $\tilde{N}_s(\nabla u) \in L^2(\mathbb{R}^n)$, then $F := \nabla A_n u$ is a weak solution of $\partial_t F + DBF = 0$ in $\mathbb{R}^n$.

**Proof.** By Proposition 4.3, it suffices to prove that $\nabla A_n u \in L^2_{loc}(\mathbb{R}^n; L^2(\mathbb{R}^{n+1}; C^{n+2}))$. Now let $K \subset \mathbb{R}^n$ be compact. Then, there exists an interval $(t_0, t_1)$ such that $K \subseteq (t_0, t_1)$. Then, letting $l = \log_2(t_1) - \log_2(t_0)$ and using Lemma 5.7 we have that
\[
\int_K \int_{\mathbb{R}^n} |\nabla A_n u|^2 \, dx \, ds \lesssim \int_{t_0}^{t_1} \int_{\mathbb{R}^n} |\nabla u|^2 \, dx \, ds,
\]
\[
\leq \sum_{k=0}^{l} \int_{2^k t_0}^{2^{k+1} t_0} \|\nabla u\|^2_2 \, ds,
\]
\[
= \sum_{k=0}^{l} 2^k t_0 \int_{2^k t_0}^{2^{k+1} t_0} \|\nabla u\|^2_2 \, ds,
\]
\[
\leq \sum_{k=0}^{l} 2^k t_0 \sup_{t \geq 0} \int_{t}^{2^k t_0} \|\nabla u\|^2_2 \, ds,
\]
\[
\lesssim \sum_{k=0}^{l} 2^k t_0 \|\tilde{N}_s(\nabla u)\|^2_2,
\]
\[
< \infty.
\]
Thus $\nabla A_n u \in L^2_{loc}(\mathbb{R}^n; L^2(\mathbb{R}^{n+1}; C^{n+2}))$, as required. \hfill \Box

**Remark 6.2.** If $V \in L^{\frac{4}{3}}(\mathbb{R}^n)$ then we have that $V^{1,2}(\mathbb{R}^{n+1}) = W^{1,2}(\mathbb{R}^{n+1})$. That is, $\|\nabla u\|_2 \approx \|\nabla u\|_2$. Therefore, in the case when $V \in L^{\frac{4}{3}}(\mathbb{R}^n)$ we may replace the condition $\tilde{N}_s(\nabla u) \in L^2(\mathbb{R}^n)$ with $\tilde{N}_s(\nabla u) \in L^2(\mathbb{R}^n)$.

Now we show that the notions of well-posedness transfer across from the first to the second order equations.

**Proposition 6.3.** $(\mathcal{R})^A_{L^2}$ is well-posed if and only if $\Phi_R : E^+_D \mathcal{H} \to \{\nabla u : u \in \hat{V}^{1,2}(\mathbb{R}^n)\}$ is an isomorphism.
Proof. First suppose that \((R)_{f,t}^A\) is well-posed. Let \(\varphi \in \dot{V}^{1,2}(\mathbb{R}^n)\). Let \(u\) be the unique solution of the Regularity problem with boundary data \(\varphi\). As \(H_{A,a,V} u = 0\) and \(\tilde{N}_s(\nabla u) \in L^2(\mathbb{R}^n)\), then by Proposition 6.1, we have that \(F := \nabla_{A,a} u\) is a weak solution of \(\partial_t F + DDBF = 0\) in \(\mathbb{R}_+\).

Thus, by Theorem 4.9 we have that there exists \(f \in E_{DB}^+ \mathcal{H}\) such that \(\lim_{t \to 0^+} F(t) = f\) in \(L^2\). Now

\[
\left\| \left( \begin{array}{c} F(t, \cdot) \\ F_{\mu}(t, \cdot) \end{array} \right) - \nabla_{\mu} \varphi \right\|_2 = \left\| \nabla_{\mu} u(t, \cdot) - \nabla_{\mu} \varphi \right\|_2 \to 0,
\]

as \(t \to 0\). That is \((f_{\parallel}, f_{\mu})^T = \nabla_{\mu} \varphi\). That is \(\Phi_R : E_{DB}^+ \mathcal{H} \to \{ \nabla_{\mu} u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \}\) is surjective as for every \(\varphi \in \dot{V}^{1,2}(\mathbb{R}^n)\) there exists \(f \in E_{DB}^+ \mathcal{H}\) such that \(\Phi_R(f) = \nabla_{\mu} \varphi\).

Suppose there exists \(f \in E_{DB}^+ \mathcal{H}\) such that \(\Phi_R(f) = 0\). By Corollary 4.10 we have (4.2) is globally well-posed and so there exists a unique \(F\) which satisfies (4.2) with boundary data \(f\). Also, let \(u\) be the unique solution of the regularity problem with boundary data \(0\). Since \(H_{A,a,V} 0 = 0\) and the solution 0 satisfies the boundary data 0, therefore, by uniqueness, we have \(u = 0\). Then, \(G = \nabla_{A,a} u = 0\) satisfies (4.2) with initial data 0. Hence, by uniqueness, \(F = G = 0\). Thus, \(f = 0\). That is \(\Phi_R : E_{DB}^+ \mathcal{H} \to \{ \nabla_{\mu} u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \}\) is injective.

Conversely, suppose \(\Phi_R : E_{DB}^+ \mathcal{H} \to \{ \nabla_{\mu} u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \}\) is an isomorphism. Let \(\varphi \in \dot{V}^{1,2}(\mathbb{R}^n)\). Then we have a unique \(f \in E_{DB}^+ \mathcal{H}\) such that \(\Phi_R(f) = \nabla_{\mu} \varphi\). By corollary 4.10 there exists a unique \(F\) satisfying (4.2) with initial data \(f\). Then, by Proposition 4.3 there exists \(u\) such that \(H_{A,a,V} u = 0\) and \(F = \nabla_{A,a} u\).

\[
\left\| u(t, \cdot) - \varphi \right\|_{\dot{V}^{1,2}} = \left\| \left( \begin{array}{c} F_{\parallel}(t, \cdot) \\ F_{\mu}(t, \cdot) \end{array} \right) - \nabla_{\mu} \varphi \right\|_2 \to 0,
\]

as \(t \to 0\). We also have convergence pointwise on Whitney averages

\[
\lim_{t \to 0} \iint_{W(t,x)} |\nabla_{\mu} u - \nabla_{\mu} \varphi|^2 \, dy \, ds = \lim_{t \to 0} \iint_{W(t,x)} \left| \left( \begin{array}{c} F_{\parallel}(t, \cdot) \\ F_{\mu}(t, \cdot) \end{array} \right) - \nabla_{\mu} \varphi \right|^2 \, dy \, ds = 0.
\]

That is for each \(\varphi \in \dot{V}^{1,2}(\mathbb{R}^n)\) there exists a solution \(u\) to \(H_{A,a,V} u = 0\). Now by Theorem 4.9 we have that \(F(t) = e^{-tDB} f\). Thus, by Theorem 5.8 we have that \(\tilde{N}_s(F) \in L^2(\mathbb{R}^n)\). Therefore, as \(|\nabla_{\mu} u| = |\mathcal{A}^{-1}||\nabla_{A,a} u| \lesssim |F|\). And so we have \(\tilde{N}_s(\nabla_{\mu} u) \in L^2(\mathbb{R}^n)\). Thus, there exists \(u\) solving the problem \((R)_{f,t}^A\).

Let \(\varphi \in \dot{V}^{1,2}(\mathbb{R}^n)\) be such that there exists \(u, v\) such that \(H_{A,a,V} u = H_{A,a,V} v = 0\), where \(\tilde{N}_s(\nabla_{\mu} u), \tilde{N}_s(\nabla_{\mu} v) \in L^2(\mathbb{R}^n)\), and \(u\) and \(v\) converge to the boundary data \(\nabla_{A,a} \varphi\). Since, \(\Phi_R : E_{DB}^+ \mathcal{H} \to \{ \nabla_{\mu} u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \}\) is an isomorphism, then there exists a unique \(f \in E_{DB}^+ \mathcal{H}\) such that \(\Phi_R(f) = \nabla_{\mu} \varphi\). By Corollary 4.10 then there exists a unique \(F\) which satisfies (4.2).

Therefore, by Proposition 6.1 we have \(G = \nabla_{A,a} u \in \mathcal{L}^2_{\text{loc}}(\mathbb{R}_+; R(D))\) and \(H = \nabla_{A,a} v \in \mathcal{L}^2_{\text{loc}}(\mathbb{R}_+; R(D))\) are weak solutions to (4.1). Thus by Theorem 4.9 we have there exists \(g, h \in E_{DB}^+ \mathcal{H}\) such that \(G(t) = e^{-tDB} g\) and \(H(t) = e^{-tDB} h\). Now

\[
\left\| \left( \begin{array}{c} G(t, \cdot) \\ G_{\mu}(t, \cdot) \end{array} \right) - \nabla_{\mu} \varphi \right\|_2 = \left\| \nabla_{\mu} u(t, \cdot) - \nabla_{\mu} \varphi \right\|_2 \to 0,
\]

and

\[
\left\| \left( \begin{array}{c} H(t, \cdot) \\ H_{\mu}(t, \cdot) \end{array} \right) - \nabla_{\mu} \varphi \right\|_2 = \left\| \nabla_{\mu} v(t, \cdot) - \nabla_{\mu} \varphi \right\|_2 \to 0,
\]

as \(t \to 0\). Hence \(\Phi_R(g) = \Phi_R(h) = \nabla_{\mu} \varphi\). Then, as \(\Phi_R : E_{DB}^+ \mathcal{H} \to \{ \nabla_{\mu} u : u \in \dot{V}^{1,2}(\mathbb{R}^n) \}\) is an isomorphism, we have \(g = h = f\). Thus, \(G = H = F\). Therefore, \(\nabla_{A,a} u = \nabla_{A,a} v\). That is \(u = v\). Hence, \((R)_{f,t}^A\) is well-posed.

\(\square\)

**Proposition 6.4.** \((N)_{f,t}^A\) is well-posed if and only if \(\Phi_N : E_{DB}^+ \mathcal{H} \to L^2(\mathbb{R}^n)\) is an isomorphism.

**Proof.** Proved similarly to the regularity case. \(\square\)
6.2. Proofs of Main Theorems. We now give the proofs of the main theorems. We start with the well-posedness theorem

**Proof of Theorem 1.2.** Let $A$ be a block type matrix. Then by Lemma 4.14 we have the mappings $\Phi_R: E_{DB}^+H \to \{\nabla_\mu u : u \in \dot{W}^{1,2}(\mathbb{R}^n)\}$ and $\Phi_N: E_{DB}^+H \to L^2(\mathbb{R}^n)$ are isomorphisms. Thus by Propositions 6.3 and 6.4 we have $(\mathcal{N})^A_{L^2}$ and $(\mathcal{R})^A_{L^2}$ are well-posed.

Now let $\mathcal{A}$ be self-adjoint. Then by Proposition 4.19 we have that $\Phi_R: E_{DB}^+H \to \{\nabla_\mu u : u \in \dot{W}^{1,2}(\mathbb{R}^n)\}$ and $\Phi_N: E_{DB}^+H \to L^2(\mathbb{R}^n)$ are isomorphisms. Thus, by Propositions 6.3 and 6.4 we have $(\mathcal{N})^A_{L^2}$ and $(\mathcal{R})^A_{L^2}$ are well-posed.

To prove openness first let $A_0 \in W P(\mathcal{N})$. Let $A \in L^\infty(\mathbb{R}^n; \mathbb{C}^{n+2})$ with $\|A - A_0\|_\infty < \varepsilon$ for some $\varepsilon \in (0, \kappa)$, to be chosen later, where $\kappa$ is the ellipticity constant of $A_0$. Now define

$$A(z) := A_0 - \frac{z(A_0 - A)}{\|A_0 - A\|_\infty},$$

for $z \in \Omega := \{w \in \mathbb{C} : |w| < \varepsilon\}$. Then $z \mapsto A(z)$ is holomorphic in $\Omega$. $A(z)$ is bounded and elliptic (with ellipticity constant $\kappa - \varepsilon > 0$) uniformly in $\Omega$. Now define $B(z) := A(z)$. As $A(z)$ is elliptic uniformly in $\Omega$ then $A_{\perp\perp}(z)$ is invertible and $A_{\perp\perp}(z)^{-1}$ is holomorphic in $\Omega$. Therefore $B(z)$ is holomorphic in $\Omega$. Note

$$B_0 - B(z) = A_0^{-1} - A(z)A_0^{-1} + A(z)A_0^{-1} - A(z)A(z)^{-1} = (A_0 - A(z))A_0^{-1} + A(z)A_0^{-1}A(z)A(z)^{-1},$$

where $B_0 = \hat{A}_0$. Therefore, we have $\|B_0 - B(z)\|_\infty \leq C_0\|A_0 - A(z)\|_\infty$, where $C_0 > 0$ depends only on $n$, $\kappa$, and the bounds of $A_0^{-1}$, $A(z)^{-1}$, and $A(z)$. Note that, as $A = \hat{A}$ we have the lower bound as well so $\|B_0 - B(z)\|_\infty \approx \|A_0 - A(z)\|_\infty$. Now choose $z_0 = \|A_0 - A\|\|A\|$, so $A := A(z_0)$, and $\varepsilon < \frac{a}{c_0}$. Thus $\|B_0 - B\| < C_\varepsilon < \kappa$, where $B = \hat{A}$. Therefore, by Theorem 3.3 we have

$$\|f(DB_0)u - f(DB)u\|_2 \lesssim \|B_0 - B\|\|f\|_\infty\|u\|_2 \lesssim \|A_0 - A\|\|f\|_\infty\|u\|_2,$$

for all $f \in H^\infty(S^\mu_\nu)$. Choosing $f = \chi^+$ gives

$$\|E^+_{DB}u - E^+_{DB}u\|_\infty \lesssim \|A - A_0\|_\infty\|u\|_2.$$

That is the projections $E^+_{DB}$ depend continuously on $A$. Then as $A_0 \in W P(\mathcal{N})$ we have that $\Phi_N: E^+_{DB}H \to L^2(\mathbb{R}^n)$ is an isomorphism. Therefore, by [4, Lemma 4.3] we have for $A$ sufficiently close to $A_0$ then $\Phi_N: E^+_{DB}H \to L^2(\mathbb{R}^n)$ is an isomorphism as well. The Regularity case is identical.

We now prove the equivalence of norms for the Regularity problem. Let $A \in W P(\mathcal{R})$. Let $\varphi \in \dot{W}^{1,2}(\mathbb{R}^n)$ be the boundary data. Then, as $(\mathcal{R})^A_{L^2}$ is well-posed, we have $\bar{\nabla}_\mu(\nabla_\mu u) \in L^2(\mathbb{R}^n)$. Therefore, from Proposition 6.1, we have $F = \nabla_\mu u$ a solution of the first-order equation (4.1). By Theorem 4.9 we have there exists $f \in E^+_{DB}H$ such that $F_0 = e^{-tDB}f$. Then by Theorem 5.8 we have

$$\|\bar{\nabla}_\mu F\|_2^2 \simeq \int_0^\infty \|t\partial_tF\|_2^\frac{dt}{t} \approx \|f\|_2^2$$

As $A \in W P(\mathcal{R})$, then by Proposition 6.3, we have $\Phi_R: E^+_{DB}H \to \{\nabla_\mu u : u \in \dot{W}^{1,2}(\mathbb{R}^n)\}$ is an isomorphism and in particular $\Phi_R(f) = \nabla_\mu \varphi$. Also we have $\|\Phi_R(f)\|_2 \leq \|f\|_2$ and as $\{\nabla_\mu u : u \in \dot{W}^{1,2}(\mathbb{R}^n)\}$ is a closed subspace of $L^2(\mathbb{R}^{n+1})$ and so is a Banach space. Thus, by the bounded inverse theorem we have $\Phi_R^{-1}: \{\nabla_\mu u : u \in \dot{W}^{1,2}(\mathbb{R}^n)\} \to R(D)$ is bounded. That is $\|\Phi_R^{-1}(f)\|_2 \lesssim \|f\|_2$. Therefore, $\|f\|_2 \lesssim \|\Phi_R(f)\|_2$. Hence we have

$$\|f\|_2 \simeq \|\Phi_R(f)\|_2 = \left\|\begin{pmatrix} f_1 \\ f_2 \end{pmatrix} \right\|_2.$$

Then recalling that $f \in R(D)$ we have

$$\|\bar{\nabla}_\mu(\nabla_\mu u)\|_2^2 \simeq \int_0^\infty \|t\partial_t\nabla_\mu u\|_2^\frac{dt}{t} \approx \|\nabla_\mu \varphi\|_2^2.$$
The proof is similar for the Neumann problem. □

**Proposition 6.5.** Let $\mathcal{A} \in L^\infty(\mathbb{R}_+^n; L(\mathbb{C}^{n+2}))$ be elliptic. Let $u$ be such that $H_{A,a,V} u = 0$, with $\|\tilde{N}_s(\nabla u)\|_2 < \infty$. Then, there exist $\varphi \in L^2(\mathbb{R}^n; \mathbb{C}^{n+2})$, such that

$$
\lim_{t \to 0} \int_t^2 \|\nabla u(s) - \varphi\|_2^2 ds = 0 = \lim_{t \to \infty} \int_t^2 \|\nabla u(s)\|_2^2 ds.
$$

**Proof.** This follows from Proposition 6.1 and Proposition 4.11. □

**Proof of Theorem 1.3.** Let $U$ be a weak solution of $-\text{div} \ A \nabla u + V u = 0$ in $\mathbb{R}_+^{n+1}$ with $\tilde{N}_s(\nabla u) \in L^2(\mathbb{R}^n)$. By Proposition 6.1, there exists $F$ a weak solution of $\partial_t F + DBF = 0$ in $\mathbb{R}_+$ with $F = \nabla A_{A,a,V} u$. Note, as $F$ is a solution of the first-order equation (4.1) using Theorem 4.9 we have there exists $f \in E_{DB}^+ \mathcal{H}$ such that $F(t,x) = e^{-tDB} f$. Then by Proposition 5.9 we have

$$
\lim_{t \to 0} \iint_{W(t,x)} |F(s,y) - f(x)|^2 dy ds = 0,
$$

for almost every $x \in \mathbb{R}^n$. Note as $f \in \mathcal{R}(D)$ then for some $\varphi \in L^2(\mathbb{R}^n)$ and $\phi \in \dot{V}^{1,2}(\mathbb{R}^n)$, we have that

$$
f = \begin{bmatrix}
\varphi \\
\nabla \phi
\end{bmatrix}.
$$

Therefore,

$$
\lim_{t \to 0} \iint_{W(t,x)} |\partial_{\nu A} u(t,x) - \varphi(x)|^2 dx dt = \lim_{t \to 0} \iint_{W(t,x)} |\nabla u(t,x) - \nabla \phi(x)|^2 dx dt = 0.
$$

As required. □
