Abstract

Fuzzy hyperspheres $S^d_\Lambda$ of dimension $d > 2$ are constructed here generalizing the procedure adopted in [1, 2] for $d = 1, 2$. The starting point is an ordinary quantum particle in $\mathbb{R}^D$, $D := d + 1$, subject to a rotation invariant potential well $V(r)$ with a very sharp minimum on the sphere of radius $r = 1$. The subsequent imposition of a sufficiently low energy cutoff 'freezes' the radial excitations, this makes only a finite-dimensional Hilbert subspace $\mathcal{H}_{\Lambda,D}$ accessible and on it the coordinates noncommutative à la Snyder. In addition, the coordinate operators generate the whole algebra of observables $\mathcal{A}_{\Lambda,D}$ which turns out to be realizable through a suitable irreducible vector representation of $Uso(D+1)$. This construction is equivariant not only under $SO(D)$, but under the full orthogonal group $O(D)$, and making the cutoff and the depth of the well grow with a natural number $\Lambda$, the result is a sequence $S^d_\Lambda$ of fuzzy spheres converging to $S^d$ as $\Lambda \to \infty$ (where one recovers ordinary quantum mechanics on $S^d$).

1 Introduction

The aim of this work is to apply the general procedure used in [1, 2] to the $D$-dimensional case, when $D > 3$; in this way the fuzzy hypersphere constructed is equivariant not only under $SO(D)$, but under the full orthogonal group $O(D)$, obtaining then an $O(D)$—equivariant fuzzy hypersphere. Furthermore, the algebra of observables $\mathcal{A}_{\Lambda,D}$ is realized through a suitable irreducible vector representation of $Uso(D+1)$, and then there is the proof of the convergence (in a certain sense) of this new fuzzy hypersphere to ordinary quantum mechanics on the hypersphere $S^d$ (here and on $d := D - 1$).

First of all, a fuzzy space is a sequence $\{\mathcal{A}_n\}_{n \in \mathbb{N}}$ of finite-dimensional and noncommutative algebras such that $\mathcal{A}_n \xrightarrow{n \to \infty} \mathcal{A}$, which is the algebra of regular functions on an ordinary manifold, with $\dim(\mathcal{A}_n) \xrightarrow{n \to \infty} \infty$.

The first and seminal fuzzy space is the Fuzzy 2-Sphere (FS) of Madore and Hoppe [3, 4], where $\mathcal{A}_n \simeq M_n(\mathbb{C})$ is the algebra of complex $n \times n$ matrices and it is generated by coordinate
operators \( \{x_h\}_{h=1}^3 \) fulfilling

\[
[x_h, x_j] = \frac{2i}{\sqrt{n^2 - 1}} \varepsilon^{hjk} x_k \quad \text{and} \quad \sum_{h=1}^3 x_h x_h \equiv 1, \tag{1}
\]

with \( n \in \mathbb{N} \setminus \{1\} \).

In fact, these operators are obtained by the rescaling

\[
x_h = \frac{2L_h}{\sqrt{n^2 - 1}}, \quad h = 1, 2, 3 \tag{2}
\]

of the elements \( L_h \) of the standard basis of \( \mathfrak{so}(3) \) in the irrep \((\pi_l, V_{l,3})\) characterized by \( L_2 \equiv 2l(l+1)I \), or equivalently the one of dimension \( n = 2l + 1 \).

The relations (1) are covariant under \( SO(3) \), but not under the whole \( O(3) \), in particular not under parity \( x_i \mapsto -x_i \); this is in contrast with the \( O(3) \)-covariance of both the ordinary sphere \( S^2 \) [where the right-hand side of (1)_1 is zero] and our \( S^2_{\Lambda} \) [where the right-hand side of (1)_1 depends on the angular momentum components, as in Snyder [5] commutation relations]; in addition, the coordinate operators \( \{\hat{x}^i\}_{i=1}^D \) of our fuzzy spaces generate also the whole algebra of observables \( \mathcal{A}_{\Lambda,D} \), as for the FS.

Moreover, while the Hilbert space \( V_{l,3} \) of the FS carries an irreducible representation of \( SO(3) \), that \( \mathcal{L}^2(S^d) \) of a quantum particle on \( S^d \) decomposes as the direct sum of all the irreducible representations of \( SO(D) \):

\[
\mathcal{L}^2(S^d) = \bigoplus_{l=0}^{\infty} V_{l,D}. \tag{3}
\]

Furthermore, it turns out that the one \( \mathcal{H}_{\Lambda,D} \) of \( S^d_{\Lambda} \) decomposes as the direct sum \( \mathcal{H}_{\Lambda,D} = \bigoplus_{l=0}^{\Lambda} V_{l,D} \), and therefore also in this aspect \( S^d_{\Lambda} \) better approximates the configuration space \( S^d \) in the limit \( \Lambda \to \infty \).

The aforementioned general procedure does not strictly depend on the dimension of the carrier space, but one has to replace all the 2-dimensional and 3-dimensional objects by the corresponding \( D \)-dimensional ones; for instance, the \( D \)-dimensional spherical harmonics are needed, together with the action on them of the \( D \)-dimensional angular momentum operator components.

For this reason, let

\[
L_{h,j} := \frac{1}{i} \left( x_h \frac{\partial}{\partial x_j} - x_j \frac{\partial}{\partial x_h} \right) \quad \text{with} \quad h, j \in \{1, 2, \cdots, D\} \tag{4}
\]

be a component of the quantum angular momentum in \( \mathbb{R}^D \), and

\[
C_p := \sum_{1\leq h<j\leq p} L_{h,j}^2 \quad \text{with} \quad p \in \{2, 3, \cdots, D\} \tag{5}
\]

be the realization of the quadratic Casimir of \( U\mathfrak{so}(p) \); in particular, \( C_D \equiv \mathcal{L}^2 \) is the opposite of the Laplace-Beltrami operator \( \Delta_{S^d} \) on the sphere \( S^d \). This and the fact that the action
of \( C_D \) in \( S^{D-1} \) coincides with the one in \( S^d \) (see section 9.1) imply that \( C_p \) is the opposite of the Laplace-Beltrami operator \( \Delta_{S^{p-1}} \) on the sphere \( S^{p-1} \) in every dimension \( D \geq p \geq 2 \), and its eigenvalues (see [6], p. 169, theorem 22.1) are

\[
l_{p-1}(l_{p-1} + p - 2), \quad \text{with} \quad l_1 \in \mathbb{Z} \quad \text{and} \quad l_{p-1} \in \mathbb{N}_0 \quad \forall p > 2.
\]

Following [1, 2], start with a quantum particle in \( \mathbb{R}^D \) subject to a confining potential well \( V(r) \), which has a very deep minimum in \( r = 1 [\Rightarrow V'(1) = 0, V'(1) = 4k_D, \text{with} \ k_D \gg 0] \); assume that, when \( r \approx 1 \), it can be approximated with the potential of a one-dimensional harmonic oscillator, in symbols \( V(r) \approx V_0 + 2k_D(r-1)^2 \), where \( V_0 := V(1) \) and \( k_D \) plays the role of a confining parameter.

This choice of \( V(r) \) ensures that, in the limit \( k_D \to +\infty \), the quantum particle is forced to stay on the unit \( d \)-dimensional sphere \( S^d \), and this leads to prove also the convergence of this new fuzzy space to ordinary quantum mechanics on the sphere, in that limit.

Once introduced this \( V(r) \), one has to study the eigenvalue equation

\[
H \psi = \left[ -\frac{1}{2} \Delta + V(r) \right] \psi = E \psi,
\]

which is a PDE in the unknowns \( \psi, E \) and its resolution provides a basis of the Hilbert space of quantum states \( \mathcal{H}_D \); in addition, from

\[
[H, L_{i,j}] = 0 \quad \forall 1 \leq i < j \leq D,
\]

\[
[L_{1,2}, C_{p_2}] = [C_{p_1}, C_{p_2}] = 0, \quad \forall p_1, p_2 \in \{2, 3, \cdots, D\}
\]

it follows that \( H, L_{1,2} \) and all these \( C_p \) operators can be simultaneously diagonalized in the resolution of (7).

In order to do this, let’s look for an eigenfunction \( \psi \) in the form

\[
\psi = f(r)Y(\theta_d, \theta_{d-1}, \cdots, \theta_1),
\]

where \( Y \) is a common eigenfunction of the CSCO (Complete set of commuting observables, i.e. a set of commuting operators whose set of eigenvalues completely specify the state of a system) \( L_{1,2}, C_2, \cdots, C_d \) and \( L^2 \); while \( r, \theta_d, \theta_{d-1}, \cdots, \theta_1 \) are polar coordinates. It is obvious that, in order to have \( \psi \in L^2(\mathbb{R}^D) \), it is necessary that \( r^d f \in L^2(\mathbb{R}^+) \) and \( Y \in L^2(S^d) \).

The Ansatz (9) transforms the PDE \( H \psi = E \psi \) into an ODE in the unknown \( f \), which is solved in section 3.1; while in section 3.2 an orthonormal basis of \( L^2(S^d) \) of eigenfunctions of \( L^2 \) is determined, in particular I prove that every basis-function \( Y \) is uniquely determined by a collection of \( d \) indices \( l := (l_d, \cdots, l_2, l_1) \), fulfilling

\[
C_p Y_l = l_{p-1}(l_{p-1} + p - 2)Y_l, \quad l_d \geq \cdots \geq l_2 \geq |l_1| \quad \text{and} \quad l_i \in \mathbb{Z} \quad \forall i.
\]

Then, it turns out that an orthonormal basis \( \mathcal{B}_D \) of the space of quantum states \( \mathcal{H}_D \) is (here and later on \( l := l_d \))

\[
\mathcal{B}_D = \{ f_{n,l,D}(r)Y_l(\theta_d, \theta_{d-1}, \cdots, \theta_1) | n \in \mathbb{N}_0, l \geq l_{d-1} \geq \cdots \geq l_2 \geq |l_1|, l_i \in \mathbb{Z} \forall i \}.
\]
Furthermore, the consequence of the imposition of a sufficiently low energy cutoff $E \leq \overline{E}$ (see section 4) is that the Hilbert space of ‘admitted’ states $\mathcal{H}_{E,D} \subset \mathcal{H}_D$ becomes finite-dimensional and spanned by all the $H$-eigenstates having eigenvalues $E \leq \overline{E}$. I also replace every observable $A$ by the corresponding projected one $\overline{A} := P_{E,D} A P_{E,D}$ (here and later on $P_{E,D}$ is the projection on $\mathcal{H}_{E,D}$) and I give to $\overline{A}$ the same physical interpretation; in this way I have only states and operators that are ‘physical’.

The condition $\overline{E} < 2\sqrt{2}k_D$ implies that the Hamiltonian operator $H$ can be seen, in a first approximation, as the square angular momentum operator $L^2$ (in other words radial excitations are ‘frozen’), while two crucial steps, necessary to obtain a fuzzy space, are the choice of a $\Lambda$-dependent energy cutoff $\overline{E} := \overline{E}(\Lambda)$ so that $\overline{E}(\Lambda)$ diverges with $\Lambda \in \mathbb{N}$, and the assumption that also $k_D$ depends on $\Lambda$ in a way such that $\overline{E}(\Lambda) < 2\sqrt{2}k_D(\Lambda)$. This implies that the Hilbert space of admitted states can be definitively re-labeled as $\mathcal{H}_{\Lambda,D}$, and the corresponding algebra of observables $\text{End}(\mathcal{H}_{\Lambda,D})$ as $\mathcal{A}_{\Lambda,D}$; then the sequence $\{\mathcal{A}_{\Lambda,D}\}_{\Lambda \in \mathbb{N}}$ is made of finite-dimensional algebras, which become infinite dimensional in the limit $\Lambda \to +\infty$.

In order to calculate the algebraic relations between the generators of $\mathcal{A}_{\Lambda,D}$ I need to determine the action of every $\overline{T}_{h,j} \equiv L_{h,j}$ and $\overline{x}_h$ on a basis of $\mathcal{H}_{\Lambda,D}$. Because of (9), it is possible to use the knowledge of the action of $L_{h,j}$ on the spherical harmonics $Y_l$ obtained from the above CSCO, to recover the one on $\psi_{l,D}$; since I have not found the action of this in the literature when $D > 3$, I have explicitly calculated it in 5.1, while in section 5.2 I compute the action of coordinate operators $\overline{x}_h$.

As in [1, 2], in section 5.3 it is shown that $\overline{x}_h, \overline{x}_j$ fulfill Snyder commutation relations, in other words their commutator is proportional to the component $L_{h,j}$ of the $D$-dimensional angular momentum operator, up to a scalar operator depending on $L^2$. Then there is a list of all the relations involving the projectors of $\mathcal{A}_{\Lambda,D}$ which show that the $\overline{x}_h$ generate the whole algebra of observables, for instance every component of the angular momentum operator can be written as an ordered polynomial in the $\overline{x}_h$. The square distance from the origin operator $x^2 := \sum_h x_h x_h$ is not identically 1, but a function of $L^2$ such that nevertheless its spectrum is very close to 1 and collapses to 1 in the $k_D \to \infty$ limit.

Furthermore, in section 6 some tools of Lie algebra theory are used in order to realize the algebra of observables $\mathcal{A}_{\Lambda,D}$ through a suitable irreducible vector representation $\pi_{\Lambda,D+1}$ of $U\text{so}(D + 1)$; this is suggested by the fact that the dimension of $\mathcal{H}_{\Lambda,D}$ coincides with the one of the representation space $V_{\Lambda,D+1}$ of $\pi_{\Lambda,D+1}$; then (up to isomorphisms)

$$\mathcal{H}_{\Lambda,D} = \bigoplus_{l=0}^{\Lambda} V_{l,D} = V_{\Lambda,D+1}.$$  

That realization is $O(D)$-equivariant and the algebra isomorphism $\Phi$ fulfills

$$[\Phi(A)]^\dagger = \Phi\left(\overline{A}^\dagger\right).$$  

(10)

The proof of the aforementioned convergence is a sort of certification of the goodness of this approximation of quantum mechanics on the sphere $S^d$, and this job is done in section 7; this is inspired by the behavior of the potential $V(r)$ in the limit $k_D \to +\infty$, where it
forces the quantum particle to stay on the unit $d$-dimensional sphere $S^d$. The ‘projected’ spherical harmonics are firstly identified as a basis of a space of all spherical harmonics, $\mathcal{A}_{\Lambda,D}$ as a subalgebra of $\mathcal{B}(S^d)$, the algebra of bounded functions on $S^d$ [or $\mathcal{C}(S^d)$, the algebra of polynomial functions on $S^d$], and then I prove the convergence (in a certain sense) of the operators in $\mathcal{A}_{\Lambda,D}$ to the corresponding ones in $\mathcal{B}(S^d)$ [or $\mathcal{C}(S^d)$, respectively]; furthermore, I use a $k_D(\Lambda)$ growing faster with $\Lambda \in \mathbb{N}$ to prove this result.

Section 8 contains final remarks, conclusions and a comparison with literature; in section 9 (appendix) there are lengthy computations and proofs.

The construction of this work is valid for any $D$, but an explicit exhibition of the resulting $S^3_\Lambda$ and $S^4_\Lambda$ (see next section) may help to better understand how to move from the cases $D = 1, 2$ of [1, 2] to the dimensions $D > 3$, and also to see analogies and differences with other fuzzy 3- and 4-spheres.

## 2 Two particular cases: $D = 4$ and $D = 5$

### 2.1 $S^3_\Lambda$

When $D = 4$ the choices $E = E(\Lambda) := \Lambda(\Lambda + 2)$ and $k_4 = k_4(\Lambda) \geq [\Lambda(\Lambda + 2)]^2$ imply that the Hilbert space of admitted states $\mathcal{H}_{\Lambda,4}$ is generated by all the functions (see sections 3.1 and 3.2)

$$\psi_{l_1,l_2,l_3} = \psi_{l_1,l_2,l_3}^{(r,\theta_1,\theta_2,\theta_3)} := f_{l,4}(r)Y_{l_1,l_2,l_3}(\theta_1,\theta_2,\theta_3), \quad l \leq \Lambda$$

hence

$$\dim \mathcal{H}_{\Lambda,4} = \binom{(\Lambda + 2)2\Lambda + 3 \Lambda - 1}{\Lambda} = \frac{2\Lambda^3 + 9\Lambda^2 + 13\Lambda + 6}{6} = \frac{1}{3}(\Lambda + 1)(\Lambda + 2)(\Lambda + 3) \frac{2}{2}.$$
\[ L_{3,4} \psi_{l_2,l_1} = \frac{1}{i} \left[ d_{l_2,l_1} G(l_2, l_1, 2) \psi_{l_2,l_1-1,l_1} - d_{l_2,l_1+1} F(l_2, l_1, 2) \psi_{l_2,l_1+1,l_1} \right] , \]
\[ L_{+,4} \psi_{l_2,l_1} = -d_{l_2,l_1} B(l_2, l_1, 2) \psi_{l_2,l_1-1,l_1} + d_{l_2,l_1+1} A(l_2, l_1, 2) \psi_{l_2,l_1+1,l_1+1} , \]
\[ L_{-,4} \psi_{l_2,l_1} = d_{l_2,l_1} D(l_2, l_1, 2) \psi_{l_2,l_1-1,l_1-1} - d_{l_2,l_1+1} C(l_2, l_1, 2) \psi_{l_2,l_1+1,l_1-1} , \]

where \( d_{l_2,l_1} = \sqrt{(l - l_2 + 1)(l + l_2 + 1)} \).

They fulfill

\[ [L_{h,j}, L_{p,s}] \psi_{l_2,l_1} = i \left( \delta_{h,p} L_{j,s} + \delta_{j,s} L_{h,p} - \delta_{h,s} L_{j,p} - \delta_{j,p} L_{h,s} \right) \psi_{l_2,l_1} , \]
\[ L^2 \psi_{l_2,l_1} = l(l + 2) \psi_{l_2,l_1} , \quad C_3 \psi_{l_2,l_1} = l_2(l_2 + 1) \psi_{l_2,l_1} \quad \text{and} \quad C_2 \psi_{l_2,l_1} = l_1^2 \psi_{l_2,l_1} . \]

The coordinate operators are \( \bar{\pi}_1, \bar{\pi}_2, \bar{\pi}_3, \bar{\pi}_4, \bar{\pi}_\pm := \bar{\pi}_1 \pm i \bar{\pi}_2 \), and they act on \( \mathcal{H}_{A,4} \) as follows (see section 5.2):

\[ \bar{\pi}_1 \psi_{l_2,l_1} = \left[ \frac{c_{l_2,l_1}}{2i} D(l_2, l_1, 2) \psi_{l_2,l_1-1,l_1-1} - \frac{c_{l_2,l_1}}{2i} D(l_2, l_1, 2) \psi_{l_2,l_1-1,l_1+1} \right] , \]
\[ \bar{\pi}_2 \psi_{l_2,l_1} = \left[ \frac{c_{l_2,l_1}}{2i} B(l_2, l_1, 2) \psi_{l_2,l_1+1,l_1-1} - \frac{c_{l_2,l_1}}{2i} B(l_2, l_1, 2) \psi_{l_2,l_1+1,l_1+1} \right] , \]
\[ \bar{\pi}_3 \psi_{l_2,l_1} = \left[ \frac{c_{l_2,l_1}}{2i} G(l_2, l_1, 2) \psi_{l_2,l_1+1,l_1-1} + \frac{c_{l_2,l_1}}{2i} G(l_2, l_1, 2) \psi_{l_2,l_1+1,l_1+1} \right] , \]
\[ \bar{\pi}_4 \psi_{l_2,l_1} = \left[ \frac{c_{l_2,l_1}}{2i} F(l_2, l_1, 2) \psi_{l_2,l_1+1,l_1-1} + \frac{c_{l_2,l_1}}{2i} F(l_2, l_1, 2) \psi_{l_2,l_1+1,l_1+1} \right] . \]

where

\[ c_{l,4} ^{(37)} = \begin{cases} \sqrt{1 + \frac{l^2 + l^2 + 1}{k_4}} & \text{if } 1 \leq l \leq \Lambda, \\ 0 & \text{otherwise,} \end{cases} \]
and, according to (81),

\[
A(l, l_2, 3) = \sqrt{\frac{(l + l_2 + 2)(l + l_2 + 3)}{(2l + 2)(2l + 4)}},
\]

\[
B(l, l_2, 3) = -\sqrt{\frac{(l - l_2 - 1)(l - l_2)}{(2l + 2)(2l)}},
\]

\[
C(l, l_2, 3) = -\sqrt{\frac{(l - l_2 + 2)(l - l_2 + 1)}{(2l + 2)(2l + 4)}},
\]

\[
D(l, l_2, 3) = \sqrt{\frac{(l + l_2 + 1)(l + l_2)}{(2l + 2)(2l)}},
\]

\[
F(l, l_2, 3) = \sqrt{\frac{(l + l_2 + 2)(l - l_2 + 1)}{(2l + 2)(2l + 4)}},
\]

\[
G(l, l_2, 3) = \sqrt{\frac{(l - l_2)(l + l_2 + 1)}{(2l + 2)(2l)}}.
\]

They fulfill (see section 5.3)

\[
[x_h, x_j] = \left[ -\frac{I}{k_4} + \left( \frac{1}{k_4} + \frac{(c_{\Lambda,4})^2}{2\Lambda + 2} \right) \tilde{P}_{\Lambda,4} \right] L_{h,j}, \quad [L_{h,s}, x_j] = \frac{1}{i} \left( \delta_j^s x_h - \delta_h^s x_j \right),
\]

\[
x^2 := \sum_{h=1}^{4} x_h x_h = \left\{ 1 + \frac{4L^2 + 9}{4k_4(\Lambda)} - \left[ \left( 1 + \frac{4\Lambda^2 + 12\Lambda + 9}{4k_4(\Lambda)} \right) \frac{2\Lambda + 2}{2\Lambda + 2} \right] \tilde{P}_{\Lambda,4} \right\}
\]

and

\[
\prod_{l=0}^{\Lambda} \left[ L^2 - l(l + 2)I \right] = 0, \quad \prod_{l_2=0}^{l_2} \left[ C_3 - l_2(l_2 + 1)I \right] \tilde{P}_{1,l_2} = 0,
\]

\[
\prod_{l_1=-l_2}^{l_2} \left[ L_{1,2} - l_1I \right] \tilde{P}_{2,l_2} = 0, \quad (x_{\pm})^{2\Lambda+1} = 0, \quad \text{and} \quad (L_{\nu,\pm})^{2\Lambda+1} = 0, \forall \nu \geq 3,
\]

where \( \tilde{P}_{h,j} \) is the projector on the eigenspace of \( C_{4-h} \) corresponding to \( l_{4-h} \equiv j \).

According to this, the algebra of observables is generated by the coordinate operators, in fact every projector can be written as an ordered polynomial in the \( x_{\nu} \).

Furthermore, the \( SO(5) \)-irrep \( \pi_{\Lambda,5} \), the one characterized by \( C_5 \equiv \Lambda(\Lambda + 3)I \) with representation space

\[
V_{\Lambda,5} := \text{span} \{ Y_{\Lambda,l,l_2,l_1}(\theta_4, \theta_3, \theta_2, \theta_1) : \Lambda \geq l \geq l_2 \geq |l_1|, l_i \in \mathbb{Z} \forall i \},
\]

can be used to identify \( \psi_{l,l_2,l_1} \equiv Y_{\Lambda,l,l_2,l_1} \), and also the operators

\[
L_{h,j} \equiv L_{h,j} \quad \text{for} \quad 1 \leq h < j \leq 4 \quad \text{and} \quad x_s \equiv p_4(\lambda)L_{s,5}p_4(\lambda),
\]

(12)
where
\[ \lambda := \frac{-2 + \sqrt{4 + 4L^2}}{2} = \sqrt{1 + L^2} - 1, \]
while \( p_4(\lambda) \) is an analytic function and the values \( p_4(l) \), when \( l \in \mathbb{N}_0 \), can be obtained recursively from (43) starting from \( p_4(0) := 1 \).

Furthermore, in order to prove the convergence of \( S^3_\Lambda \) to ordinary quantum mechanics on \( S^3 \), it is convenient to identify \( \psi_{l,l_2,l_1} \equiv Y_{l,l_2,l_1} \) and then to consider their fuzzy counterparts \( \hat{Y}_{l,l_2,l_1} \) [see (137)], which can be used to approximate a generic \( f \in B(S^3) \) or \( f \in C(S^3) \); this is possible because the \( Y_{l,l_2,l_1} \) are an orthonormal basis of \( L^2(S^3) \), and also homogeneous polynomials in the \( t := x_h/r \) variables. Then,
\[ \hat{f}_\Lambda := \sum_{l=0}^{2\Lambda} \sum_{l_2=0}^{l} \sum_{l_1=0}^{l_2} f_{l,l_2,l_1} \hat{Y}_{l,l_2,l_1}, \quad \text{where } f_{l,l_2,l_1} := \langle Y_{l,l_2,l_1}, f \rangle, \]
is an approximation of \( f \) because of the following two theorems (see section 7)

**Theorem 2.1.** Every projected coordinate operator \( \pi_h \) converges strongly to the corresponding \( t_h \) as \( \Lambda \to \infty \) if
\[ k_4(\Lambda) \geq \frac{1}{9}(\Lambda + 1)^2(\Lambda + 2)^2 \left( \Lambda + \frac{3}{2} \right)^2 \frac{4\Lambda(\Lambda + 2) + 3}{4} \Lambda \frac{1}{9}(\Lambda + 1)^2(\Lambda + 2)^2 \left( \Lambda + \frac{3}{2} \right)^3 \left( \Lambda + \frac{1}{2} \right). \]

**Theorem 2.2.** Choosing \( k_4(\Lambda) \) fulfilling (49) for \( D = 4 \), then for all \( f, g \in B(S^3) \) the following strong limits as \( \Lambda \to \infty \) hold: \( \hat{f}_\Lambda \to f \cdot, (fg)_\Lambda \to fg \cdot \) and \( \hat{f}_\Lambda \hat{g}_\Lambda \to fg \cdot \)

### 2.2 \( S^4_\Lambda \)

When \( D = 5 \) the choices \( \mathcal{E} = \mathcal{E}(\Lambda) := \Lambda(\Lambda + 3) \) and \( k_5 = k_5(\Lambda) \geq [\Lambda(\Lambda + 3)]^2 \) imply that the Hilbert space of admitted states \( \mathcal{H}_{\Lambda,5} \) is generated by all the functions
\[ \psi_{l,l_3,l_2,l_1,5} = \psi_{l,l_3,l_2,l_1,4}(r, \theta_1, \theta_2, \theta_3, \theta_4) := f_{l,5}(r)Y_{l,l_3,l_2,l_1}(\theta_1, \theta_2, \theta_3, \theta_4), \quad l \leq \Lambda \]
hence
\[ \dim \mathcal{H}_{\Lambda,5} = \left( \frac{\Lambda + 3}{\Lambda - 1} \right) \frac{2\Lambda + 4}{\Lambda} = \frac{1}{12} \Lambda(\Lambda + 1)(\Lambda + 2)^2(\Lambda + 3). \]
The angular momentum components are \( \{L_{h,j} : 1 \leq h < j \leq 5\} \), \( L_{\pm,5} := L_{2,5} \mp iL_{1,5} \) and they act as follows:

\[
L_{1,3} \psi_{l,3,2,l_1} = \frac{1}{i} \left[ \frac{d_{l_2,l_1,3}}{2} \psi_{l,3,2,l_1-1} - \frac{d_{l_2,l_1+1,3}}{2} \psi_{l,3,2,l_1+1} \right],
\]

\[

They fulfill (see section 5.3)

\[
[\overline{x}_h, \overline{x}_j] = \left[ -\frac{I}{k_5} + \left( \frac{1}{k_5} + \frac{(c_{A,5})^2}{2\Lambda + 3} \right) \hat{P}_{\Lambda,5} \right] L_{h,j}, \quad [L_{h,s}, \overline{x}_j] = \frac{1}{i} \left( \delta_j^s \overline{x}_h - \delta_j^h \overline{x}_s \right),
\]

\[
\overline{x}^2 := \sum_{h=1}^{5} \overline{x}_h \overline{x}_h = \left\{ 1 + \frac{2L^2 + 8}{4k_5(\Lambda)} - \left[ \left( 1 + \frac{2\Lambda^2 + 8\Lambda + 8}{4k_5(\Lambda)} \right) \frac{\Lambda + 3}{2\Lambda + 3} \right] \hat{P}_{\Lambda,4} \right\}
\]

and

\[
\prod_{l=0}^{L} \left[ L^2 - l(l + 2)I \right] = 0, \quad \prod_{l_2=0}^{L_2} \left[ C_3 - l_2(l_2 + 1)I \right] \hat{P}_{1,l_2} = 0,
\]

\[
\prod_{l_1=-l_2}^{l_2} \left[ L_{1,2} - l_1I \right] \hat{P}_{2,l_2} = 0, \quad (\overline{x}_\pm)^{2\Lambda+1} = 0, \quad \text{and} \quad (L_{\nu,\pm})^{2\Lambda+1} = 0, \forall \nu \geq 3,
\]

where \( \hat{P}_{h,j} \) is the projector on the eigenspace of \( C_{5-h} \) corresponding to \( l_{5-h} \equiv j \).

According to this, the algebra of observables is generated by the coordinate operators, in fact every projector can be written as an ordered polynomial in the \( \overline{x}_\nu \).

Furthermore, the \( SO(6) \)-irrep \( \pi_{\Lambda,6} \), the one characterized by \( C_6 \equiv \Lambda(\Lambda + 4)I \) with representation space

\[
V_{\Lambda,6} := \text{span} \{ Y_{\Lambda,l,l_3,l_2,l_1}(\theta_5, \theta_4, \theta_3, \theta_2, \theta_1) : \Lambda \geq l \geq l_3 \geq l_2 \geq |l_1|, l_i \in \mathbb{Z} \forall i \},
\]

can be used to identify \( \psi_{l,l_3,l_2,l_1} \equiv Y_{\Lambda,l,l_3,l_2,l_1} \), and also the operators

\[
L_{h,j} \equiv L_{h,j} \quad \text{for} \quad 1 \leq h < j \leq 5 \quad \text{and} \quad \overline{x}_s \equiv p_5(\lambda) L_{s,6} p_5(\lambda),
\]

where

\[
\lambda := \frac{-3 + \sqrt{9 + 4L^2}}{2},
\]

while \( p_5(\lambda) \) is an analytic function and the values \( p_5(l) \), when \( l \in \mathbb{N}_0 \), can be obtained recursively from (43) starting from \( p_5(0) := 1 \).

Furthermore, in order to prove the convergence of \( S_A^4 \) to ordinary quantum mechanics on \( S^4 \), it is convenient to identify \( \psi_{l,l_3,l_2,l_1} \equiv Y_{l,l_3,l_2,l_1} \) and then to consider their fuzzy counterparts \( \hat{Y}_{l,l_3,l_2,l_1} \), which can be used to approximate a generic \( f \in B(S^4) \) or \( f \in C(S^4) \); this is possible because the \( \hat{Y}_{l,l_3,l_2,l_1} \) are an orthonormal basis of \( \mathcal{L}^2(S^4) \), and also homogeneous polynomials in the \( t = x_i/r \) variables. Then,

\[
\hat{f}_A := \sum_{l_0}^{2\Lambda} \sum_{l_3=0 \atop l_2=0}^{l_3} \sum_{l_1=-l_2}^{l_2} f_{l,l_3,l_2,l_1} \hat{Y}_{l,l_3,l_2,l_1}, \quad \text{where} \quad f_{l,l_3,l_2,l_1} := \langle Y_{l,l_3,l_2,l_1}, f \rangle,
\]

is an approximation of \( f \) because of the following two theorems (see section 7)
Theorem 2.3. Every projected coordinate operator $\pi_h$ converges strongly to the corresponding $t_h$ as $\Lambda \to \infty$ if

$$k_5(\Lambda) \geq \Lambda \frac{1}{144}(\Lambda + 1)^2(\Lambda + 2)^4(\Lambda + 3)^2 \frac{4\Lambda(\Lambda + 3) + 8}{4} = \frac{1}{144}(\Lambda + 1)^3(\Lambda + 2)^5(\Lambda + 3)^2.$$

Theorem 2.4. Choosing $k_5(\Lambda)$ fulfilling (49) for $D = 5$, then for all $f, g \in B(S^4)$ and $\mathcal{C}(S^4)$ the following strong limits as $\Lambda \to \infty$ hold: $\hat{f}_\Lambda \to f \cdot (\hat{f}g)_\Lambda \to fg$ and $\hat{f}_\Lambda \hat{g}_\Lambda \to fg$.

3 General setting

As mentioned before, consider a quantum particle in $\mathbb{R}^D$, with a Hamiltonian operator

$$H := -\frac{1}{2}\Delta + V(r)$$

such that the potential $V(r)$ has a very sharp minimum at $r = 1$ with a very large $k_D := V'(1)/4 > 0$, and fix $V_0 := V(1)$ so that the ground state has zero energy, i.e. $E_0 = 0$. In addition, impose here that the energy cutoff $E$ is chosen so that

$$V(r) \simeq V_0 + 2k_D(r - 1)^2 \text{ if } r \text{ fulfills } V(r) \leq E,$$

(15)

then one can neglect terms of order higher than 2 in the Taylor expansion of $V(r)$ around $r = 1$ and approximate the potential with a harmonic one in the classical region $b_E \subset \mathbb{R}^D$ compatible with the energy cutoff $V(r) \leq E$. The equality $L^2Y(\theta_d, \theta_{d-1}, \cdots, \theta_1) = l(l +

Figure 1: Three-dimensional plot of $V(r)$

$D - 2)Y(\theta_d, \theta_{d-1}, \cdots, \theta_1)$ and the Ansatz (9) are used to simplify the resolution of the PDE $H\psi = E\psi$, in fact this problem is consequently split in two:
1. Solve the corresponding ODE for \( f(r) \);

2. Determine all the eigenfunctions of \( L^2 \), which will be also square-integrable because \( S^2 \) is compact and \( L^2 \) is regular.

In addition, it is also necessary to verify if \( H \) is a self-adjoint operator on the Hilbert space \( H_D \) of pure quantum states.

### 3.1 Resolution of \( H\psi = E\psi \) – Step 1

The ODE for \( f(r) \) turns out to be equivalent to equation (9) in [1, 2]; this means that one has to solve

\[
-\partial_r^2 - (D - 1)\frac{1}{r}\partial_r + \frac{1}{r^2}l(l + D - 2) + V(r) \right] f(r) = Ef(r). \tag{16}
\]

In section 9.2 it is shown that the hypothesis \( r^2V(r) \overset{r\to 0^+}{\to} T \in \mathbb{R}^+ \) [which is obviously compatible with (15)] and the request that \( \psi \in D(H) \equiv D(H^*) \) (self-adjointness of \( H \)) imply that \( f(r) \) is regular at \( r = 0 \), and then the same applies to the function \( g(r) := f(r)\frac{D^{D-1}}{r^2} \).

Consequently, (16) becomes

\[
-g''(r) + g(r)\frac{D^2 - 4D + 3 + 4l(l + D - 2)}{4r^2} + V(r)g(r) = Eg(r). \tag{17}
\]

For the purposes of this thesis, the solution of this last equation is interesting only around \( r = 1 \); this means that one can use the equalities (at leading order)

\[
\frac{1}{r^2} = 1 - 2(r - 1)^2 + 3(r - 1)^2, \quad V(r) = V_0 + 2k_D(r - 1)^2,
\]

which lead to this 1-dimensional harmonic oscillator equation

\[
-g''(r) + g(r)k_{l,D}(r - \tilde{r}_{l,D})^2 = \tilde{E}_{l,D}g(r), \tag{18}
\]

where

\[
b(l, D) := \frac{D^2 - 4D + 3 + 4l(l + D - 2)}{4}, \quad k_{l,D} := 3b(l, D) + 2k_D, \\
\tilde{r}_{l,D} := \frac{4b(l, D) + 2k_D}{3b(l, D) + 2k_D}, \quad \tilde{E}_{l,D} := E - V_0 - \frac{2b(l, D) [k_D + b(l, D)]}{3b(l, D) + 2k_D}; \tag{19}
\]

so at leading order the lowest eigenvalues \( E \) are those of the 1-dimensional harmonic oscillator approximation of (17).

The (Hermite) square-integrable solutions of (18) are \((M_{n,l,D} \text{ is a suitable normalization constant})\)

\[
g_{n,l,D}(r) = M_{n,l,D} e^{-\frac{\sqrt{k_{l,D}}}{2}(r - \tilde{r}_{l,D})^2} \cdot H_n \left( (r - \tilde{r}_{l,D})\sqrt{k_{l,D}} \right) \quad \text{with } n \in \mathbb{N}_0. \tag{20}
\]
implying

$$f_{n,l,D}(r) = \frac{M_{n,l,D}}{r_{D,D}^{D-1}} e^{-\frac{\sqrt{k_{l,D}}}{2} (r-\bar{r}_{l,D})^2} \cdot H_n \left( (r - \bar{r}_{l,D}) \frac{\sqrt{k_{l,D}}}{2} \right) \text{ with } n \in \mathbb{N}_0. \quad (21)$$

The corresponding ‘eigenvalues’ in (18) are

$$\tilde{E}_{n,l,D} = (2n+1) \sqrt{k_{l,D}}$$

and this leads to energies

$$E_{n,l,D} = (2n+1) \sqrt{k_{l,D}} + V_0 + \frac{2b(l,D)[k_D + b(l,D)]}{3b(l,D) + 2k_D}. \quad (22)$$

As mentioned before, $V_0$ is fixed requiring that the lowest energy level, which corresponds to $n = l = 0$, is $E_{0,0,D} = 0$; this implies

$$V_0 = -\sqrt{k_{0,D}} - \frac{2b(0,D) [k_D + b(0,D)]}{3b(0,D) + 2k_D}; \quad (23)$$

while the expansions of $\tilde{r}_{l,D}$ and $E_{n,l,D}$ at leading order in $k_D$ are the following ones:

$$\tilde{r}_{l,D} = 1 + \frac{b(l,D)}{2k_D} - \frac{3b(l,D)^2}{4k_D^2} + O(k_D^{-3}),$$

$$V_0 = -\sqrt{2k_D} - b(0,D) - \frac{3b(0,D)}{2\sqrt{2k_D}} + \frac{b(0,D)^2}{2k_D^2} + \frac{9b(0,D)^3}{8(2k_D)^3} - \frac{3b(0,D)^3}{4k_D^3} + O(k_D^{-\frac{5}{2}}),$$

$$E_{n,l,D} = (2n+1) \sqrt{2k_D} + V_0 + b(l,D) + (2n+1) \frac{3b(l,D)}{2\sqrt{2k_D}} - \frac{b(l,D)^2}{2k_D} - (2n+1) \frac{9b(l,D)^3}{16k_D} + \frac{3b(l,D)^3}{4k_D^3} + O(k_D^{-\frac{5}{2}})$$

$$= 2n \sqrt{2k_D} + l(l + D - 2) + \frac{1}{2k_D} \left[ 3nb(l,D) + \frac{3}{2} l(l + D - 2) \right]$$

$$+ \frac{1}{2k_D} [-l(l + D - 2)] \left[ \frac{2D^2 - 8D + 6 + 4l(l + D - 2)}{4} \right] + O(k_D^{-\frac{3}{2}}). \quad (24)$$

### 3.2 Resolution of $H\psi = E\psi$ - Step 2

In section 9.3 it is shown that an orthonormal basis of $L^2(S^d)$, made up of $L^2$-eigenfunctions, is the collection of all the

$$Y = Y_l(\theta_d, \cdots, \theta_2, \theta_1) = \frac{e^{i\theta_1}}{\sqrt{2\pi}} \prod_{n=2}^{d} P_{l_n}^{\nu_{n-1}}(\theta_n), \quad l = (l_d, \cdots, l_2, l_1), \quad (25)$$

where

$$jP_L^M(\theta) := \sqrt{\frac{2L + j - 1}{2}} \sqrt{\frac{(L + M + j - 2)!}{(L - M)!}} \sin \theta \frac{2^j}{2^j} P_{L+\frac{j+2}{2}}^{-(M+\frac{j+2}{2})} (\cos \theta), \quad (26)$$
\(l_d \geq \cdots \geq l_2 \geq |l_1|, l_i \in \mathbb{Z} \ \forall i\) and \(P_i^m\) is the associated Legendre function of first kind (see [7] for a summary about these special functions).

They fulfill

\[
L_{1,2}Y_l = l_1Y_l \rightarrow C_2Y_l = Y_{l_1}^2, \quad C_pY_l = l_{p-1}(l_{p-1} + p - 2)Y_l,
\]

and

\[
\int_{S^d} Y_lY_l^*d\alpha = \delta_l^l,
\]

where \(d\alpha\) is the usual measure on \(S^d\),

\[
d\alpha = \left[\sin^{d-1}(\theta_d)\sin^{d-2}(\theta_{d-1}) \cdots \sin(\theta_2)\right]d\theta_1d\theta_2 \cdots d\theta_d.
\]

According to these last equations, every \(l \in \mathbb{N}_0\) identifies a

\[
V_{l,D} := \text{span}\left\{Y_l : \bar{l} := (l_d, \cdots, l_2, l_1), \bar{l} \geq l_{d-1} \geq \cdots \geq l_2 \geq |l_1|, l_i \in \mathbb{Z} \ \forall i\right\},
\]

which is the representation space of an irrep of \(\mathfrak{u} \mathfrak{s} \mathfrak{o}(D)\), and \(\{L_1,2, C_2, \cdots, C_D\}\) is a CSCO of this irrep, where CSCO stands for complete set of commuting observables, i.e. a set of commuting operators whose set of eigenvalues completely specify elements of a basis of \(\mathcal{H}_{\Lambda,D}\).

In addition, in section 9.3.4 it is shown that

\[
V_{l,D} \text{ is isomorphic to } \bigoplus_{m=0}^l V_{m,d} \text{ if } D > 3,
\]

while \(V_{l,3} \text{ is isomorphic to } \bigoplus_{m=-l}^l V_{m,2}\);

this decomposition can be also applied to \(\mathcal{H}_{\Lambda,D}\), up to isomorphisms, and this job is done in section 6.

So, the pure quantum states (the elements of an orthonormal basis of \(\mathcal{H}_D\)) are the following ones:

\[
\psi_{n,l,D}(r, \theta_d, \cdots, \theta_2, \theta_1) := f_{n,l,D}(r)Y_l(\theta_d, \cdots, \theta_2, \theta_1),
\]

with \(n \in \mathbb{N}_0, l \equiv l_d \geq \cdots \geq l_2 \geq |l_1|, l_i \in \mathbb{Z} \ \forall i\).

4 The imposition of the cutoff

As mentioned before, a low enough energy cutoff \(E \leq \overline{E}\) is imposed in a way such that it excludes all the states with \(n > 0\); according to this, it must be \(\overline{E} < 2\sqrt{2k_D}\), which (from the physical point of view) means that radial oscillations are ‘frozen’ \((\Rightarrow n = 0, \text{ as wanted})\), so that all corresponding classical trajectories are circles; the energies \(E\) below \(\overline{E}\) will therefore depend only on \(l\) and \(D\), and are consequently denoted by \(E_{l,D}\).

The Hilbert space of ‘admitted’ states is \(\mathcal{H}_{\overline{E},D} \subset \mathcal{H}\), it is finite-dimensional and spanned by the states \(\psi\) fulfilling the cutoff condition; on the other hand, one has also to replace
every observable $A$ by $\mathcal{A} := P_{E,D}AP_{E,D}$, where $P_{E,D}$ is the projection on $\mathcal{H}_{E,D}$, and I give to $\mathcal{A}$ the same physical interpretation.

Then, at leading orders in $1/\sqrt{k_D}$,

$$H = E_{l,D} = l(l + D - 2) + O\left(\frac{1}{\sqrt{k_D}}\right);$$

$$\psi_{l,D}(r, \theta_d, \cdots, \theta_1) = \frac{M_{l,D}}{r^{l+D-1}} e^{-\sqrt{k_{l,D}}(r-\tilde{r}_{l,D})^2} Y_l(\theta_d, \cdots, \theta_1),$$

(30)

where the normalization factor $M_{l,D}$ is fixed so that $M_{l,D} > 0$ and all $\psi_{l,D}$ have unit norm in $L^2(\mathbb{R}^D)$ (see section 9.5).

The choice of a $\Lambda$-dependent energy cutoff $E = \bar{E} (\Lambda) := \Lambda(\Lambda + D - 2)$, implies that the condition $E \leq \bar{E}$ becomes equivalent to the projection of the theory onto the Hilbert subspace $\mathcal{H}_{\Lambda,D} \equiv \mathcal{H}_{E,D}$ spanned by all the states $\psi_{l,D}$ with $l(l + D - 2) \leq \Lambda(\Lambda + D - 2) \Leftrightarrow l \leq \Lambda$. For consistency it must be

$$\Lambda(\Lambda + D - 2) < 2\sqrt{2k_D},$$

(31)

and for instance one can define $k_D(\Lambda) \geq [\Lambda(\Lambda + D - 2)]^2$, while in section 9.12 a larger $k_D(\Lambda)$ is used in order to prove the convergence to ordinary quantum mechanics on $S^d$. According to this first choice of $k_D(\Lambda)$, all $E_{l,D}$ are smaller than the energy levels corresponding to $n > 0$; this is also sufficient to guarantee that $k_{l,D} \gg 1$ for all $l \leq \Lambda$ [by the way, $k_{l,D} > 0$ is a necessary condition for (18) to be the eigenvalue equation of a harmonic oscillator];
furthermore, the spectrum of $H$ becomes the whole spectrum \{l(l + D - 2)\}_{l \in \mathbb{N}_0}$ of $L^2$ in the commutative limit, i.e. $\Lambda \to \infty$.

5 The algebra $\mathcal{A}_{\Lambda,D}$

5.1 The action of angular momentum components on $Y_l$

In the next lines there are the $R$ coefficients, they are determined in section 9.6 and used in the following definition (which is given by induction) of the action of a generic $L_{h,j}$ on a spherical harmonic $Y_l$.

**Definition 5.1.** For $D = 2$ there is only one angular momentum component, $L_{1,2}$, and its action is $L_{1,2}Y_{l_1} = l_1Y_{l_1}$. For $D > 2$, let

$$d_{L,l,D} := \sqrt{(L + 1)(L + D - 3) - l(l + D - 4)} = \sqrt{(L - l + 1)(L + l + D - 3)}$$

and

$$R_{h,D}(l,l') := \langle Y_{l'}, t_h Y_l \rangle;$$

the action of the angular momentum operators is defined in this way:

$$L_{\nu,D}Y_l := \frac{1}{i} \sum_{l' : |l_j - l'_j| = 1 \text{ for } j = \nu - 1, \ldots, d - 1} \left\{ d_{l,l,d-1,D}R_{\nu,d}(l,l')Y_{l'} - d_{l,l,d-1+1,D}R_{\nu,d}(l,l')Y_{l'} \right\}, \quad (32)$$

where

$$\tilde{u}_\nu := (l, l_{d-1} - 1, l_{d-2}, \ldots, l_{\nu - 1}, l_{\nu - 2}, \ldots, l_1),$$

$$\hat{u}_\nu := (l, l_{d-1} + 1, l_{d-2}, \ldots, l_{\nu - 1}, l_{\nu - 2}, \ldots, l_1),$$

for $\nu \in \{1, \ldots, d - 2\}$, $l_0 \equiv l_1$ and

$$\tilde{u}_{d-1} := (l, l_{d-1} - 1, l_{d-2}, \ldots, l_1), \quad \hat{u}_{d-1} := (l, l_{d-1} + 1, l_{d-2}, \ldots, l_1).$$

Furthermore,

$$L_{D,j} := -L_{j,D}, \quad L_{\pm,\nu} := \frac{L_{2,\nu} \mp iL_{1,\nu}}{\sqrt{2}} \quad \forall \nu \geq 3$$

and the action of $L_{h,\bar{D}}$ on a $D$-dimensional spherical harmonic, when $h < \bar{D} < D$, is defined as the same of $L_{h,\bar{D}}$ on a $\bar{D}$-spherical harmonic in $\mathbb{R}^\bar{D}$, then it, when acts in $\mathbb{R}^D$, does not ‘affect’ the indices $l, l_{d-1}, \ldots, l_{\bar{D}-1}$.

Summarizing,

- In section 9.6 the action in $\mathbb{R}^D$ of the coordinate operators $t_\nu := \frac{\partial}{\partial \bar{r}_\nu}$ on the $D$-dimensional spherical harmonics $Y_l$ is calculated, this action essentially defines the aforementioned $R_{\nu,D}$ coefficients;
This implies that one can easily derive the action in \( \mathbb{R}^{D-1} \) of coordinate operators \( t_h \) on a generic \((D-1)\)-dimensional spherical harmonic \( Y_{\ell_d-1,\ldots,\ell_1} \), which consequently uses the \( R_{h,d} \) coefficients;

So, in definition 5.1 the action of \( L_{\nu,D} \) on \( Y_I \) is the same, up to the \( \frac{d_{l_{\ell_d-1}+1,D}}{l_{\ell_d-1}} \) and \(-\frac{d_{l_{\ell_d-1}+1,D}}{l_{\ell_d-1}}\) coefficients, of \( t_\nu \) on \( Y_{\ell_d-1,\ldots,\ell_1} \); this is also in agreement with the Wigner-Eckart theorem, because

\[
\langle Y_{\nu}, L_{\nu,D} Y_I \rangle = \begin{cases} \\
\frac{1}{i} d_{l_{\ell_d-1},D} R_{\nu,d} \left( l, \tilde{\nu}' \right) & \text{if } l_{d-1}' = l_{d-1} - 1, \\
-\frac{1}{i} d_{l_{\ell_d-1}+1,D} R_{\nu,d} \left( l, \tilde{\nu}' \right) & \text{if } l_{d-1}' = l_{d-1} + 1, \\
0 & \text{otherwise}, 
\end{cases}
\]

where the first factor depends only on the index \( l_{d-1} \), which identifies the \( SO(d) \) irrep, while the second one is a Clebsch-Gordan coefficient.

In sections 9.7 and 9.8 the following relations are explicitly checked for the reader’s convenience:

\[
L^2 Y_I = \sum_{1 \leq h < j \leq D} L_{h,j}^2 Y_I = l (l + D - 2) Y_I, \tag{33}
\]

\[
[L_{h,j}, L_{p,s}] = i \left( \delta_{h,p} L_{j,s} + \delta_{j,s} L_{h,p} - \delta_{h,s} L_{j,p} - \delta_{j,p} L_{h,s} \right).
\]

### 5.2 The action of ‘projected’ operators on \( \mathcal{H}_{\Lambda,D} \)

The Hilbert space of admitted states \( \mathcal{H}_{\Lambda,D} \), constructed in section 4, is spanned by all the states \( \psi_{l,D} \) fulfilling \( l \leq \Lambda \). In the following lines I do a complete study of the action of the ‘projected’ angular momentum operators \( \bar{L}_{h,j} \) and of the ‘projected’ coordinate operators \( \bar{x}_h \) on the pure quantum states. The definition 5.1 implies \( \bar{L}_{h,j} \psi_{l,D} = L_{h,j} \psi_{l,D} \), which is a consequence of the invariance of \( H \) (and therefore \( P_{\mathcal{E},D} \)) with respect to rotations (i.e. they commute with every \( L_{h,j} \)); from this and the fact that the action of every \( L_{h,j} \) does not ‘affect’ the index \( l \) it follows that the action of \( L_{h,j} \) on a \( \psi_{l,D} \) essentially coincides with the one of \( Y_I \). Then

\[
L_{\nu,D} \psi_{l,D} := \frac{1}{i} \sum_{l':|l'_j-l_j|=1} \left\{ d_{l_{\ell_d-1},D} R_{\nu,d} \left( l, \tilde{\nu} \right) \psi_{\tilde{l},D} - d_{l_{\ell_d-1}+1,D} R_{\nu,d} \left( l, \tilde{\nu}' \right) \psi_{\tilde{l}',D} \right\};
\]

\[
L_{D,j} \psi_{l,D} := -L_{j,D} \psi_{l,D} \quad , \quad L_{\pm,\nu} \psi_{l,D} := (L_{2,\nu} \mp i L_{1,\nu}) \psi_{l,D} \quad \forall \nu \geq 3,
\]

and the action of \( L_{h,D} \) on a \( \psi_{l,D} \), when \( \tilde{D} < D \), is essentially the same of \( L_{h,\tilde{D}} \) on a \( \tilde{D} \)-spherical harmonic in \( \mathbb{R}^{\tilde{D}} \), as for (32) and (34).

On the other hand, the action of \( \bar{x}_h \) on a state \( \psi_{l,D} \) can be obtained from the one of the multiplication operator \( t_h \) on a \( D \)-dimensional spherical harmonic \( Y_I \) (see section 9.6), while sometimes it is useful to consider the operators

\[
\bar{x}_\pm := \bar{x}_1 \pm i \bar{x}_2.
\]
It is easy to see that the action of projected coordinate operators ‘affect’ the index \( l \), for this reason further calculations are needed, because in this case the integral
\[
\int_{0}^{+\infty} r f_{l,D}(r) f_{l',D}(r) dr
\]
is not trivial, unlike what happens for the action of \( L_{h,j} \).

According to this,
\[
\tau_h \psi_{l,D} = \sum_{l \in \{h'-1, \cdots, d-1\}} \left[ c_{l,D} R_{h,D} \left( l, \hat{\nu}'_h \right) \psi_{l,D} - c_{l+1,D} R_{h,D} \left( l, \hat{\nu}'_h \right) \psi_{l,D} \right], \tag{35}
\]
where
\[
\hat{\nu}'_h := (l-1, l'_d-1, \cdots, l'_h-1, l_{h-2} \cdots, l_1), \quad \hat{\nu}_h := (l+1, l'_d-1, \cdots, l'_h-1, l_{h-2} \cdots, l_1),
\]
\[
c_{l,D} := \int_{0}^{+\infty} r f_{l,D}(r) f_{l'-1,D}(r) dr, \quad c_{l+1,D} := \int_{0}^{+\infty} r f_{l,D}(r) f_{l',D}(r) dr,
\]
and the explicit values of \( c_{l,D} \) are calculated in section 9.9 and
\[
c_{l,D} = \sqrt{1 + \frac{b(l, D) + b(l-1, D)}{2k_D}} \text{ up to terms } O \left( \frac{1}{(k_D)^{\frac{3}{2}}} \right). \tag{37}
\]

### 5.3 The commutation relations and the action of \( x^2 \)

The calculations of section 9.8.1 can be used to determine the action of \([\tau_h, \tau_j]\) on \( \mathcal{H}_{\Lambda,D} \), this because the action of \( \tau_h \) on \( \psi_{l,D} \) is essentially the same of \( L_{h,D+1} \) on \( Y_{l,D+1} \); the only difference is the replacement of \(-\frac{1}{4} d_{l,d-1,D+1} + c_{l+1,D} \) and \( \frac{1}{2} d_{l,D-1,D+1} \) with \( c_{l,D} \), respectively. These arguments and (126) are sufficient to prove that (see section 9.10.1 for explicit calculations)
\[
[\tau_h, \tau_j] = \left[ -\frac{I}{k_D} + \left( \frac{1}{k_D} + \frac{(c_{\Lambda,D})^2}{2\Lambda + D - 2} \right) \tilde{P}_{\Lambda,D} \right] L_{h,j}, \tag{38}
\]
where \( \tilde{P}_{\Lambda,D} \) is the projector on the \( \Lambda(\Lambda + D - 2) \)-eigenspace of \( L^2 \).

On the other hand, it is obvious that \( \tilde{P}_{\Lambda,D} := \tilde{P}_{\mathcal{E},D} \) commutes with \( L_{h,j} \), for all \( 1 \leq h < j \leq D \); this and
\[
[L_{h,s}, x^j] = \left( \frac{1}{2} \right) \left( \delta^s_j x^j - \delta^h_j x^j \right) \tag{39}
\]
imply
\[
[\tau_{h,s}, \tau_j] = \tilde{P}_{\Lambda,D} L_{h,s} \tilde{P}_{\Lambda,D} \tilde{P}_{\Lambda,D} x_j \tilde{P}_{\Lambda,D} - \tilde{P}_{\Lambda,D} x_h \tilde{P}_{\Lambda,D} \tilde{P}_{\Lambda,D} L_{h,s} \tilde{P}_{\Lambda,D}
\]
\[
= \tilde{P}_{\Lambda,D} L_{h,s} x_j \tilde{P}_{\Lambda,D} - \tilde{P}_{\Lambda,D} x_h \tilde{P}_{\Lambda,D}
\]
\[
= \tilde{P}_{\Lambda,D} [L_{h,s}, x_j] \tilde{P}_{\Lambda,D}
\]
\[
= \left( \frac{1}{2} \right) \left( \delta^s_j \tau_h - \delta^h_j \tau_s \right).
\]
Furthermore, if one defines $x^2 := \sum_h \bar{x}_h \bar{x}_h$, then the calculations of section 9.7 can be used to prove that [see section 9.10.2 for the explicit calculations, while here the $b(l, D)$ coefficients are the ones defined in (19)]

$$x^2 \psi_{l,D} = \left\{ 1 + \frac{b(l, D) + [b(l + 1, D)]}{2k_D(\Lambda)} \frac{l+D-2}{2l+D-2} + \frac{b(l - 1, D)}{2l+D-2} \right\} \psi_{l,D}. \quad (40)$$

In addition (here $\tilde{P}_{h,j}$ is the projector on the eigenspace of $C_{D-h}$ corresponding to $l_{D-h} \equiv j$),

$$\prod_{l=0}^\Lambda [L^2 - l(l + D - 2)] = 0, \quad \prod_{l_{d-1}=0}^l [C_{D-1} - l_{d-1}(l_{d-1} + D - 3)] \tilde{P}_{l,l} = 0, \quad (41)$$

$$\cdots, \quad \prod_{l_{t_2}=l_{t_1}}^l [L_{1,2} - l_1] \tilde{P}_{D-2,2} = 0, \quad (\bar{x}_\pm)^{2\Lambda+1} = 0, \quad \text{and} \quad (L_{\nu,\pm})^{2\Lambda+1} = 0, \forall \nu \geq 3$$

The relations (38)-(41) imply that the coordinate operators generate the whole algebra of observables $\mathcal{A}_{\Lambda,D}$, in fact every $L_{h,j}$ can be written in terms of $[\bar{x}_h, \bar{x}_j]$ and therefore every projector $\tilde{P}_{h,j}$ can be written as a non-ordered polynomial in the $\bar{x}_p$.

6 Realization of $\mathcal{A}_{\Lambda,D}$ through $Uso(D + 1)$

Let $\Lambda \in \mathbb{N}$, $\pi_{\Lambda,D+1}$ be the irreducible representation of $Uso(D+1)$ having $l_D \equiv \Lambda$ and $V_{\Lambda,D+1}$ be the corresponding representation space [see (28)]. First of all, in section 9.3.4 it is shown that $\dim \mathcal{H}_{\Lambda,D} = \dim V_{\Lambda,D+1}$, and if one identifies $\psi_{l,D} \equiv Y_{\Lambda,l} \in V_{\Lambda,D+1}$, then the operators on $\mathcal{H}_{\Lambda,D}$, in particular $L_{h,j}$ and $\bar{x}_h$, are naturally realized in $\pi_{\Lambda,D+1}[Uso(D + 1)]$.

In fact one has [here the $L_{h,j}$s are seen as basis elements of $so(D + 1)$]

$$\bar{T}_{h,j} = L_{h,j} \quad \text{if} \ h < j < D + 1 \quad \text{and} \quad \bar{x}_h = p^*_D(\lambda) L_{h,D+1}p_D(\lambda), \quad (42)$$

where $\lambda := \frac{2 - D + \sqrt{(D - 2)^2 + 4L^2}}{2}$.

It turns out that the function $p_D$ has to fulfill

$$p^*_D(l + 1)p_D(l) = \frac{1}{i} \frac{c_{l+1,D+1}}{d_{\Lambda+1,D+1}} = \frac{1}{i} \frac{\sqrt{1 + \frac{b(l,D)+b(l+1,D)}{4k_D(\Lambda)}}}{\sqrt{(\Lambda - l)(\Lambda + l + D - 1)}}, \quad (43)$$

$$p^*_D(l - 1)p_D(l) = \frac{1}{i} \frac{c_{l,D}}{d_{\Lambda,l+1}} = \frac{1}{i} \frac{\sqrt{1 + \frac{b(l,D)+b(l-1,D)}{4k_D(\Lambda)}}}{\sqrt{(\Lambda - l + 1)(\Lambda + l + D - 2)}},$$

it can be determined recursively, starting from $p_D(0) := 1$ and then using the last formulas. This means that
Theorem 6.1. Formulas (42), (43) and section define an $O(D)$-equivariant $*$-algebra isomorphism between the algebra $A_\Lambda = \text{End}(H_\Lambda)$ of observables (endomorphisms) on $H_\Lambda$ and the $C_{D+1} = \Lambda [\Lambda + (D + 1) - 2]$ irreducible representation $\pi_{\Lambda,D+1}$ of $USO(D + 1)$:

$$A_\Lambda := \text{End}(H_\Lambda) \simeq M_N(\mathbb{C}) \simeq \pi_\Lambda[Uso(D + 1)],$$

where $\dim H_{\Lambda,D} \equiv N : \equiv \left(\begin{array}{c} \Lambda + D - 2 \\ \Lambda - 1 \end{array}\right) \frac{2\Lambda + D - 1}{\Lambda}.$ (44)

As already recalled, the group of $*$-automorphisms of $M_N(\mathbb{C}) \simeq A_\Lambda$ is inner and isomorphic to $SU(N)$, i.e. of the type

$$a \mapsto g a g^{-1}, \quad a \in A_\Lambda,$$

with $g$ an unitary $N \times N$ matrix with unit determinant. A special role is played by the subgroup $SO(D + 1)$ acting in the representation $\pi_\Lambda$, namely $g = \pi_\Lambda[e^{i\alpha}]$, where $\alpha \in so(D + 1)$. In particular, choosing $\alpha = \alpha_{h,j} L_{h,j}$ ($\alpha_{h,j} \in \mathbb{R}$ and $h < j \leq D$) the automorphism amounts to a $SO(D) \subset SO(D + 1)$ transformation (a rotation in $D$-dimensional space). Parity $(L_{h,j}, L_{p,D+1}) \mapsto (L_{h,j}, -L_{p,D+1})$, is an $O(D) \subset SO(D + 1)$ transformation with determinant $-1$ in the $L_{p,D+1}$ space, and therefore also in the $\bar{x}_p$ space. This shows that (42) is equivariant under $O(D)$, which plays the role of isometry group of this fuzzy sphere.

7 Convergence to $O(D)$-equivariant quantum mechanics on $S^d$

Here it is explained how this new fuzzy space converges to $O(D)$-equivariant quantum mechanics on the sphere $S^d$ as $\Lambda \to \infty$.

The fuzzy analogs of the vector spaces $B(S^d), C(S^d)$ are defined as [see (137) for the explicit definition of $\hat{Y}_l$]

$$C_{\Lambda,D} := \text{span}_\mathbb{C} \left\{ \hat{Y}_l : 2\Lambda \geq l \equiv l_d \geq \cdots \geq l_2 \geq |l_1|, l_i \in \mathbb{Z} \forall i \right\} \subset A_{\Lambda,D} \subset B[L^2(S^d)],$$ (45)

and here the highest $l$ is $2\Lambda$ because $\hat{Y}_{2\Lambda,2\Lambda,\cdots,2\Lambda}$ is the ‘highest’ multiplying operator acting nontrivially on $H_{\Lambda,D}$ (it does not annihilate $\psi_{2\Lambda,\Lambda,\cdots,\Lambda,D}$).

So

$$C_{\Lambda,D} = \bigoplus_{l=0}^{2\Lambda} V_{l,D}$$ (46)

is the decomposition of $C_{\Lambda,D}$ into irreducible components under $O(D)$; furthermore, $V_{l,D}$ is trace-free for all $l > 0$, i.e. its projection on the single component $V_{0,D}$ is zero and it is easy to see that (140) becomes the decomposition of $B(S^d), C(S^d)$ in the limit $\Lambda \to \infty$. 24
In addition, the fuzzy analog of \( f \in B(S^d) \) is

\[
\hat{f}_\Lambda := \sum_{l=0}^{2\Lambda} \sum_{l_{d-1} \leq l} f_l \hat{Y}_l \in A_{\Lambda,D} \subset B[\mathcal{L}^2(S^2)]; \tag{47}
\]

while the \( \psi_{l,D} \in H_{\Lambda,D} \) are the fuzzy analogs of the spherical harmonics \( Y_l \) considered just as elements of an orthonormal basis of the Hilbert space \( \mathcal{L}^2(S^d) \); for this reason, consider the \( O(D) \)-covariant embedding \( \mathcal{I} : H_{\Lambda,D} \to \mathcal{L}^2(S^d) \) defined by

\[
\mathcal{I} \left( \sum_{l=0}^{\Lambda} \sum_{l_{d-1} \leq l} \phi_l \psi_{l,D} \right) = \sum_{l=0}^{\Lambda} \sum_{l_{d-1} \leq l} \phi_l Y_l,
\]

and below the symbol \( \mathcal{I} \) is dropped and then simply identified \( \psi_{l,D} = Y_l \).

The decomposition of \( H_{\Lambda,D} \) into irreducible components under \( O(D) \) reads

\[
H_{\Lambda,D} = \bigoplus_{l=0}^{\Lambda} V_l, \quad V_l := \left\{ \sum_{l_{d-1} \leq l} \phi_l \psi_{l,D} : \phi_l \in \mathbb{C} \right\}, \tag{48}
\]

and (48)_1 becomes the decomposition of \( \mathcal{L}^2(S^d) \) in the limit \( \Lambda \to \infty \).

For all \( \phi \in \mathcal{L}^2(S^d) \) let

\[
\phi_\Lambda := \sum_{l=0}^{\Lambda} \sum_{l_{d-1} \leq l} \phi_l \psi_{l,D},
\]

where \( \phi_l \) are the coefficients of the decomposition of \( \phi \) in the orthonormal basis of spherical harmonics; clearly \( \phi_\Lambda \to \phi \) in the \( \mathcal{L}^2(S^d) \)-norm \( || \) \( || \), and in this sense \( H_{\Lambda,D} \) invades \( \mathcal{L}^2(S^d) \) as \( \Lambda \to \infty \).

Let \( B[\mathcal{L}^2(S^d)] \) be the algebra of bounded operators on \( \mathcal{L}^2(S^d) \), the embedding \( \mathcal{I} \) induces the one \( \mathcal{J} : A_{\Lambda,D} \to B[\mathcal{L}^2(S^d)] \) and by construction \( A_{\Lambda,D} \) annihilates \( H_{\Lambda,D}^\perp \); the operators \( L_{h,j}, \overline{L}_{h,j} \) coincide on \( H_{\Lambda,D} \), while one can easily check that \( \overline{L}_{h,j} \to L_{h,j} \) strongly as \( \Lambda \to \infty \) on the domain \( D(L_{h,j}) \subset \mathcal{L}^2(S^d) \) and, similarly, \( f(\overline{L}_{h,j}) \to f(L_{h,j}) \) strongly on \( D[f(L_{h,j})] \) for all measurable function \( f(s) \).

\(^1\)The strict inclusion it follows from the fact that \( L_{h,j} \) is unbounded; for example \( \phi \in D(L_{1,2}) \) only if \( \sum_{l=0}^{\infty} \sum_{l_{d-1} \leq l} ||l||^2 |\phi_l|^2 < +\infty \).
Bounded (in particular, continuous) functions \( f \) on the sphere \( S^d \), acting as multiplication operators \( f \cdot : \phi \in \mathcal{L}^2(S^d) \mapsto f\phi \in \mathcal{L}^2(S^d) \), make up a subalgebra \( B(S^d) \) [resp. \( C(S^d) \)] of \( B[\mathcal{L}^2(S^d)] \). An element of \( B(S^d) \) is actually an equivalence class \([f]\) of bounded functions differing from \( f \) only on a set of zero measure, because this ensures that for any \( f_1, f_2 \in [f] \), and \( \phi \in \mathcal{L}^2(S^d) \), \( f_1\phi \) and \( f_2\phi \) differ only on a set of zero measure, and therefore are two equivalent representatives of the same element of \( \mathcal{L}^2(S^d) \). Since \( f \) belongs also to \( \mathcal{L}^2(S^d) \), then

\[
f_N(\theta_d, \cdots, \theta_1) := \sum_{l=0}^{N} \sum_{l_{d-1} \leq l} f_l Y_l(\theta_d, \cdots, \theta_1)
\]

converges to \( f(\theta_d, \cdots, \theta_1) \) in the \( \mathcal{L}^2(S^d) \) norm as \( N \to \infty \).

In section 9.12 it is shown that every projected coordinate operator \( \pi_h \) converges strongly to the corresponding \( t_h \) as \( \Lambda \to \infty \) if

\[
k_D(\Lambda) \geq \Lambda \left[ \dim \mathcal{H}_{\Lambda,D} \right]^2 b(\Lambda, D).
\]

Again, since for all \( \Lambda > 0 \) the operator \( \pi_h \) annihilates \( \mathcal{H}_{\Lambda,D} \), \( \pi_h \) does not converge to \( t_h \) in \textit{operator norm}. It is possible to prove also this more general result:

**Theorem 7.1.** Choosing

\[
k_D(\Lambda) \geq \Lambda^2 [\dim \mathcal{H}_{2\Lambda,D}]^3 [(2\Lambda)!]^D 2^{\Lambda D} [(2\Lambda + 1)!!]^{2D} b(\Lambda, D) \sqrt{\dim \mathcal{H}_{\Lambda,D}},
\]

then for all \( f, g \in B(S^d) \) the following strong limits as \( \Lambda \to \infty \) hold: \( \hat{f}_\Lambda \to f \cdot \), \( (\hat{f}g)_\Lambda \to fg \cdot \) and \( \hat{f}_\Lambda \hat{g}_\Lambda \to \hat{fg} \cdot \).

In other words, the product in \( \mathcal{A}_{\Lambda,D} \) between the approximations \( \hat{f}_\Lambda \) and \( \hat{g}_\Lambda \) goes to the product in \( B[\mathcal{L}^2(S^d)] \) between \( f \cdot \) and \( g \cdot \) [although \( (\hat{f}g)_\Lambda \neq \hat{f}_\Lambda \hat{g}_\Lambda \)].

### 8 Conclusions, outlook and comparison with literature

The construction of the \( O(D) \)-equivariant fuzzy sphere in the second section has been done through the imposition of a sufficiently low (and \( \Lambda \)-dependent, with \( \Lambda \in \mathbb{N} \)) energy cutoff \( E := \Lambda (\Lambda + D - 2) \) on the quantum mechanics of a particle subject to a rotation-invariant potential \( V(r) \) having a very deep minimum in \( r = 1 \), and regulated by a confining parameter \( k(\Lambda) \geq [\Lambda(\Lambda + D - 2)]^2 \), which expresses the sharpness of that minimum.

The output is a sequence \( \{\mathcal{A}_{\Lambda,D}\}_{\Lambda \in \mathbb{N}} \) of finite-dimensional algebras. Every operator \( \Lambda \in \mathcal{A}_{\Lambda,D} \) acts on the corresponding Hilbert space of admitted states \( \mathcal{H}_{\Lambda,D} \), which is also finite-dimensional and can be realized using an irreducible representation of \( U so(D+1) \) (the one having \( l_D \equiv \Lambda \)), but also a reducible representation of \( U so(D) \); in fact it can be decomposed through the irreps of \( U so(D) \) having \( 0 \leq l \leq \Lambda \).

The algebraic relations involving \( T_{h,j} \) are invariant under parity, as well as under any \( O(D) \)-transformation of the coordinates, and this was expected because of the application
of a rotation-invariant energy-cutoff to a theory having the same covariance; then, as shown, the projected theory has inherited that symmetry. It is also important to underline that these relations are nothing but the generalizations, to the $D$-dimensional case, of the ones calculated for $D = 2$ and $D = 3$.

The focal point is the definition 5.1. It is inspired by the action of a generic coordinate $t_h$ on a spherical harmonic, and it allowed to repeat (in the generic $D$-dimensional case) what was done in [1, 2]; in fact, in almost all the proof it was fundamental that the action of $L_{h,D}$ on $Y_l$ coincides, more or less, with the one of the coordinate $t_h$ on $Y_{l_d-1,\cdots,l_1}$ this is also in agreement with the Wigner-Eckart theorem, and this is also in agreement with the Wigner-Eckart theorem, because both $t_h$ and $L_{h,D}$ transform in the same way under $SO(d)$.

Another crucial point of this section is the research of all the eigenfunctions of $L^2$ (section 9.3) on $S^d$, for this reason the goal was the determination of an orthonormal basis of eigenfunctions $\{Y_l\}_l$ for $L^2$ in $L^2(S^d)$; this returned an orthonormal basis of $\mathcal{H}_{A,D}$ and then the subsequent possibility of calculating explicitly the action of $\pi_p$ and $\overline{L}_{h,j}$ on every state $\psi$ (section 5.2).

On the other hand, every space (here $I$ is a fixed number of $\mathbb{N}_0$)

$$\text{span} \{ Y_l(\theta_d,\cdots,\theta_1) : I \equiv l_d \geq \cdots \geq l_2 \geq |l_1|, l_i \in \mathbb{Z} \forall i \}$$

is the representation space of an irrep of $so(D)$, the one corresponding to $L^2 \equiv \sum (l + D - 2) I$; it is important to underline that the Cartan subalgebra is too small to be a CSCO, which means that the sets of their eigenvalues do not univocally identify all spherical harmonics; then, in this case, one is not able to write down explicitly an orthonormal basis of $L^2$-eigenfunctions in $L^2(S^d)$ [as for (29)] and, consequently, to calculate the action of $\pi_h$ and $\overline{L}_{h,j}$ on every quantum state $\psi$.

The aforementioned definition of the components $L_{h,j}$ of the $D$-dimensional angular momentum operator was also fundamental to realize the algebra of observables $\mathcal{A}_{A,D}$ with a suitable irreducible representation of $U so(D + 1)$. In fact, in that realization the ‘projected’ coordinate operator $\pi_h$ is identified with $L_{h,D+1}$ up to some scalar left and right factors.

Finally, I do the proof of the convergence of this new fuzzy hypersphere to quantum mechanics on $S^d$ in the commutative limit $\Lambda \to +\infty$, this was also expected because in that limit the potential $V(r)$ forces the particle to stay on the unit sphere, which (from the mathematical point of view) is represented by $c_{l,D} \to 1$, and then that every operator $\overline{\pi}_h$ converges to the corresponding $t_h$.

I now compare our fuzzy spheres with with other ones appeared in the literature; in [8] the authors build their two fuzzy versions of $S^3$:

- In the first case, from $\mathbb{C}P^3_F$ they firstly obtain a fuzzy $S^1_F$ using the fact that $\mathbb{C}P^3$ is a $S^2$ bundle over $S^4$ and that there is a well defined matrix approximation of $\mathbb{C}P^3 \simeq SU(4)/U(3)$, then they construct $S^3_F$ from this $S^1_F$.

- In the second case, they obtain $S^3_F$ starting from the orthogonal Grassmanian $SO(5)/SO(3) \times SO(3)$ and then using the existence of a well defined matrix approximation of the algebra of
functions on this Grassmanian, in other words they consider fuzzy orthogonal Grassmanians.

A well-known fuzzy 4-sphere is built in [9], and it essentially coincides with [10]; there the author considers the Dirac $\Gamma$ matrices, which form the 4-dimensional spin representation of $\mathfrak{so}(5)$, and are used in the $n$-fold symmetric tensor representation of $\Gamma$ (here $\text{Sym}$ means the restriction to the completely symmetrized tensor product space)

$$G_i^{(n)} := (\Gamma_i \otimes I \otimes \cdots \otimes I + I \otimes \Gamma_i \otimes \cdots \otimes I + \cdots + I \otimes \cdots \otimes I \otimes \Gamma_i)_{\text{Sym}},$$

for $i = 1, \cdots, 5$. The $G_i^{(n)}$ defined above are $N \times N$ matrices, with

$$N = \frac{(n + 1)(n + 2)(n + 3)}{6},$$

and they fulfill

$$\sum_i [G_i^{(n)}]^2 = n(n + 4)I_N.$$

Then, from

$$X_i := \frac{r}{n} G_i^{(n)}$$

it follows

$$\sum_i X_i^2 = r^2I_N + O\left(\frac{1}{n}\right).$$

The representations of $\text{Spin}(5)$ [or equivalently $\text{Sp}(2)$] are considered in [11] in order to build another fuzzy $S^4$; in particular, the irrep $(\frac{L}{2}, \frac{L}{2})$ contains the 5 Dirac matrices $J_a$, $a = 1, \cdots, 5$, which can be realized as the symmetrization of $L$ copies of the $\Gamma$ matrices in the $\text{Spin}(5)$ fundamental representation:

$$J_a := (\Gamma_a \otimes I \otimes \cdots \otimes I + I \otimes \Gamma_a \otimes \cdots \otimes I + \cdots + I \otimes \cdots \otimes I \otimes \Gamma_a)_{\text{Sym}},$$

where $\text{Sym}$ means the projection in the totally symmetrized irreducible representation.

The $J_a$ fulfill $J_aJ_a = L(L+4)I$, then from $X_a := \frac{R}{\sqrt{L(L+4)}} J_a$, it follows $X_aX_A = R^2I$ and that in the limit $L \to +\infty$ the algebra becomes commutative.

In [12] the authors approximate the sphere $S^N \simeq \frac{\text{SO}(N+1)}{\text{SO}(N)}$ starting from the cartesian co-ordinates $X^a$, the angular momentum components $L_{a,b}$ in $\mathbb{R}^{N+1}$, with $a,b \in \{1,2,\cdots,N+1\}$, and then also the $L_{A,B}$ in $\mathbb{R}^{N+2}$, with $A,B \in \{1,2,\cdots,N+2\}$. The definition $X_a := \mu L_{a,N+2}$, with $\mu \in \mathbb{R}$, returns Snyder-type commutation relations

$$[X^a, X^b] = -i\mu^2 L_{a,b},$$

and also that (here $C_2^{N'}$ is the square angular momentum in $\mathbb{R}^{N'}$)

$$X_aX_a = \mu^2 \left[ C_2^{N+2} - C_2^{N+1} \right],$$

which is central in the fundamental spinor representation of $\text{Spin}(N+2)$

$$X_aX_a = \frac{\mu^2(N + 1)}{2}I.$$
In agreement with the above construction, Sperling and Steinacker [13, 14] build their approximation $S^4_N$ of $S^4$ with a reducible representation of $Uso(5)$ (as for the above $S^4_A$) on a Hilbert space $V$ obtained decomposing an irreducible representation $\pi$ of $Uso(6)$ characterized by a triple of highest weights $(n_1, n_2, N)$; so $End(V) \simeq \pi[Uso(6)]$, in analogy with our scheme. The elements $X^a := rM^a_6$ play the role of noncommutative cartesian coordinates and they fulfill Snyder-type commutation relations (as for the above $S^4_A \Lambda$). As a consequence the $O(5)$-scalar $R^2 = X^aX^a$ is no longer central, but its spectrum is still very close to 1 if $N \gg n_1, n_2$ [because then the decomposition of $V$ contains few irreducible representations under $SO(5)$].

On the other hand, if $n_1 = n_2 = 0$, the representation of $Uso(5)$ turns out to be irreducible (unlike the above $S^4_A$) [the highest weight is $(0, 0, N)$], and one obtain the basic fuzzy 4-sphere $S^4_N$, which is essentially the same of [9, 12], but in the case $N \equiv 4$:

$$X^aX_a = R^2 = \frac{1}{4}N(N + 4)I,$$

so the coordinates can be trivially ‘normalized’; furthermore, from $su(4) \simeq so(6)$ it follows

$$H_\Lambda = (0, 0, N)_{su(4)} = (0, N)_{so(5)}.$$

The authors fuzzy approximate the quantum mechanics on the 4-sphere with the algebra $End(H_N)$, and it fulfills

$$End(H_N) = (0, 0, N) \otimes (N, 0, 0) = \bigoplus_{n=0}^{N} (n, 0, n),$$

which is its decomposition in the $su(4)$ harmonics.

In turn, every $(n, 0, n)$ decomposes in this way in the $so(5)$ harmonics:

$$(n, 0, n) = \bigoplus_{m=0}^{n} (n - m, 2m).$$

So, in $End(H_N)$, there are

$$\bigoplus_{n=0}^{N} (n, 0),$$

which corresponds to the algebra $A_{N,D}$ when $D = 5$, but there are also ‘further modes’, i.e. the representations $(n, 2s)$ with $s \geq 1$, that can be seen as higher spin algebras in the Vasiliev theory.

Their physical interpretation of $End(V)$ is that it represents a fuzzy approximation of some fiber bundle on a sphere $S^4$ (rather than of the algebra of observables of a quantum particle on a $S^4$).

Acknowledgments

I am grateful to G. Fiore and H. Steinacker for useful discussions.
9 Appendix

9.1 The action of $C_{\tilde{D}}$ in $\mathbb{R}^D$ and in $\mathbb{R}^{\tilde{D}}$, when $2 \leq \tilde{D} < D$

Let $(x_1, \cdots, x_D)$ be the rectangular coordinates in $\mathbb{R}^D$ and $(r, \theta_d, \cdots, \theta_1)$ the spherical ones:

\begin{align*}
    x_1 &= r \sin \theta_d \sin \theta_{d-1} \cdots \sin \theta_2 \cos \theta_1, \\
    x_2 &= r \sin \theta_d \sin \theta_{d-1} \cdots \sin \theta_2 \sin \theta_1, \\
    x_3 &= r \sin \theta_d \sin \theta_{d-1} \cdots \cos \theta_2, \\
    \vdots \\
    x_d &= r \sin \theta_d \cos \theta_{d-1}, \\
    x_D &= r \cos \theta_d,
\end{align*}

with $r \geq 0$, $\theta_1 \in [0, 2\pi[$ and $\theta_2, \cdots, \theta_d \in [0, \pi[.$

First of all, in both $\mathbb{R}^{\tilde{D}}$ and $\mathbb{R}^D$ the equality

$$C_{\tilde{D}} = \sum_{1 \leq j < h \leq \tilde{D}} L_{j,h}^2$$

holds, but the crucial difference is that the expression of $x_p$ in polar coordinates (50) changes when one passes from $\mathbb{R}^{\tilde{D}}$ to $\mathbb{R}^D$

$$\tilde{x}_p := r' \sin \theta_{\tilde{D}-1} \cdots \sin \theta_p \cos \theta_{p-1},$$

to $\mathbb{R}^D$

$$x_p := r \sin \theta_d \cdots \sin \theta_{\tilde{D}} \sin \theta_{\tilde{D}-1} \cdots \sin \theta_p \cos \theta_{p-1} = \frac{r}{r'} \sin \theta_d \cdots \sin \theta_{\tilde{D}} \tilde{x}_p,$$

where

$$r' := \sqrt{\sum_{p=1}^{\tilde{D}} \tilde{x}_p^2} \quad \text{and} \quad r := \sqrt{\sum_{p=1}^{D} x_p^2}.$$

This means that, in order to understand the difference between the action of the operator $C_{\tilde{D}}$ in the two ambient spaces, one can focus the attention only on the differences between the action (♣) of $L_{j,h}$ in $\mathbb{R}^{\tilde{D}}$ and the one (♠) in $\mathbb{R}^D$.

According to this, if $f(x_D, \cdots, x_1)$ is a differentiable function on $\mathbb{R}^D$ and $r' = r$, then

$$\tilde{x}_j \frac{\partial}{\partial \tilde{x}_h} f(x_D, \cdots, x_1) = \tilde{x}_j \sin \theta_d \cdots \sin \theta_{\tilde{D}} \frac{\partial f}{\partial x_h}(x_D, \cdots, x_1) = x_j \frac{\partial f}{\partial x_h}(x_D, \cdots, x_1);$$

which implies that the action ♣ on the sphere $S_{r^{\tilde{D}-1}}$ coincides with the one ♠ on $S_r^d$, in particular they coincide on the corresponding unit spheres.
9.2 About the regularity of $f(r)$ in (16)

In the case of a second order linear ODE

$$y''(z) + P(z)y'(z) + Q(z)y(z) = 0,$$  \hspace{1cm} (51)

a point $z_0 \in \mathbb{C}$ is singular for the equation if $P(z)$ and $Q(z)$ have an isolated singularity at $z = z_0$; $z_0$ is a fuchsian point if $P(z)$ has a pole of order at most 1 in $z = z_0$ and $Q(z)$ has a pole of order at most 2 in $z = z_0$.

Fuchs theorem states that in the neighborhood of a fuchsian point every solution of (51) is a combination of the two independent ones having the following behavior:

$$y_1(z) = (z - z_0)^{\alpha_1}w_1(z) \quad \text{and} \quad y_2(z) = (z - z_0)^{\alpha_2}w_2(z),$$

where $\alpha_i$ are the solutions of the algebraic equation

$$x^2 + (p_0 - 1)x + q_0 = 0,$$

$w_1(z)$ are holomorphic functions which do not vanish in $z = z_0$, 

$$p_0 = \lim_{z \to z_0} (z - z_0)P(z) \quad \text{and} \quad q_0 = \lim_{z \to z_0} (z - z_0)^2Q(z).$$

From this last theorem, applied to (16) under the hypothesis

$$\lim_{r \to 0^+} r^2V(r) = T \in \mathbb{R}^+, \hspace{1cm} (52)$$

it follows

$$p_0 = D - 1 \quad \text{and} \quad q_0 = -[l(l + D - 2) + T],$$

then

$$\alpha_1 = \frac{2 - D + \sqrt{(D - 2)^2 + 4[l(l + D - 2) + T]}}{2} \geq \frac{2 - D + \sqrt{(D - 2)^2}}{2} = 0,$$

$$\alpha_2 = \frac{2 - D - \sqrt{(D - 2)^2 + 4[l(l + D - 2) + T]}}{2} < 0.$$ 

Hence

$$f(r) = \gamma r^{\alpha_1}w_1(r) + \delta r^{\alpha_2}w_2(r) \quad \text{when} \quad r \to 0;$$

in addition, according to the self-adjointness of $H$, it must be

$$\psi \in D(H) \equiv D(H^*) = \{ \psi \in L^2(\mathbb{R}^D) : \psi \text{ is twice differentiable and } H\psi \in L^2(\mathbb{R}^D) \},$$

which implies $\delta \equiv 0$ and then $f(0) = 0.$

9.3 The $D$-dimensional spherical harmonics

In this section it is explained how to determine an orthonormal basis of $L^2(S^d)$ made up of eigenfunctions $Y$ of $L^2$ in $\mathbb{R}^D$. 

31
9.3.1 The resolution of $L^2Y = l(l + D - 2)Y$ by separation of variables

First of all, from (8) it follows that $L_{1,2}$ and all these $C_p$ operators can be simultaneously diagonalized; in addition, in section 9.1 there is the proof that $C_p$ coincides with the opposite of the Laplace-Beltrami operator $\Delta_{S^{p-1}}$ on the sphere $S^{p-1}$ in every dimension $D$, then from [15] p. 21, it follows

$$\Delta = \frac{\partial^2}{\partial r^2} + (D - 1)\frac{1}{r} \frac{\partial}{\partial r} - \frac{1}{r^2} L^2,$$

$$L^2 = -(1 - t^2) \frac{\partial^2}{\partial t^2} + (D - 1)t \frac{\partial}{\partial t} + \frac{1}{1 - t^2} C_d,$$

where $t = \cos \theta_d$.

Furthermore, when $\theta \in [0, \pi]$,

$$\frac{\partial}{\partial \cos \theta} = \frac{\partial \theta}{\partial \cos \theta} \frac{\partial}{\partial \theta} = -\frac{1}{\sin \theta} \frac{\partial}{\partial \theta}$$

and

$$\frac{\partial^2}{\partial \cos^2 \theta} = -\frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \left( -\frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \right) = \frac{1}{\sin \theta} \left( -\frac{\cos \theta}{\sin^2 \theta} \frac{\partial}{\partial \theta} + \frac{1}{\sin \theta} \frac{\partial^2}{\partial \theta^2} \right) = -\frac{\cos \theta}{\sin^3 \theta} \frac{\partial}{\partial \theta} + \frac{1}{\sin^2 \theta} \frac{\partial^2}{\partial \theta^2}.$$ 

According to this,

$$C_D = L^2 = -(1 - t^2) \frac{\partial^2}{\partial t^2} + (D - 1)t \frac{\partial}{\partial t} + \frac{1}{1 - t^2} C_d$$

$$= -\frac{\partial^2}{\partial \theta_d^2} + \cos \theta_d \frac{\partial}{\sin \theta_d \partial \theta_d} - (D - 1)\frac{\cos \theta_d}{\sin \theta_d} \frac{\partial}{\partial \theta_d} + \frac{1}{\sin^2 \theta_d} C_d$$

$$= -\frac{\partial^2}{\partial \theta_d^2} - (D - 2)\frac{\cos \theta_d}{\sin \theta_d} \frac{\partial}{\partial \theta_d} + \frac{1}{\sin^2 \theta_d} C_d$$

$$= -\frac{1}{\sin^{d-1} \theta_d} \frac{\partial}{\partial \theta_d} \left( \sin^{d-1} \theta_d \frac{\partial}{\partial \theta_d} \right) + \frac{1}{\sin^2 \theta_d} C_d.$$ 

(54)

The aforementioned proof of $(53)_2$ and also $(54)$ can be trivially generalized to every dimension, which means that, when $n \in \{3, \cdots, D\}$,

$$C_n = -\frac{1}{\sin^{n-2} \theta_{n-1}} \frac{\partial}{\partial \theta_{n-1}} \left( \sin^{n-2} \theta_{n-1} \frac{\partial}{\partial \theta_{n-1}} \right) + \frac{1}{\sin^2 \theta_{n-1}} C_{n-1},$$

while $L_{1,2} = \frac{1}{i} \frac{\partial}{\partial \theta_1} \Rightarrow C_2 = -\frac{\partial^2}{\partial \theta_1^2}$.

(55)

Section 9.1 and $(55)_2$ suggest to apply a separation of variables in the resolution of $C_pY = l_p(l_p + p - 2)Y$ for $p = 2, \cdots, D$; then $Y = Y_1(\theta_d, \cdots, \theta_2)g_1(\theta_1)$, (6), $(55)_2$ and $C_2Y = L^2_{1,2}Y = l_1^2Y$ with $l_1 \in \mathbb{Z}$ imply $g_1(\theta_1) = Ce^{il_1 \theta_1}$, with $l_1 \in \mathbb{Z}$.
The constant $C$ can be fixed by requiring that

$$\int_0^{2\pi} g_1 g_1^* d\theta_1 = 1,$$

which implies $C = \frac{1}{\sqrt{2\pi}}$.

Furthermore

$$C_3 = -\frac{1}{\sin \theta_2} \frac{\partial}{\partial \theta_2} \left( \sin \theta_2 \frac{\partial}{\partial \theta_2} \right) + \frac{1}{\sin^2 \theta_2} C_2 \quad \text{and} \quad C_3 Y \overset{(6)}{=} l_2(l_2 + 1)Y,$$

while $L_{h,j}^\dagger = L_{h,j}$ and the fact that every operator $B := A^\dagger A$ has positive spectrum imply

$$\langle Y, C_3 Y \rangle \geq \langle Y, C_2 Y \rangle \iff l_2^2 + l_2 - l_1^2 \geq 0 \quad \text{with} \ l_1, l_2 \in \mathbb{Z},$$

and this is possible if and only if $l_2 \geq |l_1|$.

The separation of variables

$$Y_1(\theta_{D-1}, \cdots, \theta_2) = Y_2(\theta_{D-1}, \cdots, \theta_3) g_2(\theta_2),$$

returns

$$l_2(l_2 + 1) g_2 = -\frac{1}{\sin \theta_2} \frac{\partial}{\partial \theta_2} \left( \sin \theta_2 \frac{\partial g_2}{\partial \theta_2} \right) + \frac{1}{\sin^2 \theta_2} l_1^2 g_2,$$

and setting $z = \cos \theta_2$, then

$$\frac{\partial}{\partial \theta_2} = \frac{\partial z}{\partial \theta_2} \frac{\partial}{\partial z} = -\sqrt{1 - z^2} \frac{\partial}{\partial z},$$

so one has to solve

$$l_2(l_2 + 1) g_2 = \frac{\partial}{\partial z} \left( -(1 - z^2) \frac{\partial g_2}{\partial z} \right) + \frac{l_1^2}{1 - z^2} g_2,$$

which is equivalent to

$$\left[ (1 - z^2) \frac{\partial^2}{\partial z^2} - 2z \frac{\partial}{\partial z} + l_2(l_2 + 1) - \frac{l_1^2}{1 - z^2} \right] g_2 = 0.$$

This last equation is the general Legendre differential equation (see [16] formula 8.1.1 p. 332) and the solution is the associated Legendre function of first kind:

$$g_2(z) = C P_{l_2}^{l_1}(z) \implies g_2(\theta_2) = C P_{l_2}^{l_1}(\cos \theta_2).$$

The constant $C$ can be determined by requiring that

$$|C|^2 \int_0^{\pi} P_{l_2}^{l_1}(\cos \theta_2) \left[ P_{l_2}^{l_1}(\cos \theta_2) \right]^* \sin \theta_2 d\theta_2 = \delta_{l_2}^{l_2} \delta_{l_1}^{l_1},$$

33
and after the replacement \( z = \cos \theta_2 \) it becomes
\[
|C|^2 \int_{-1}^{1} P_{l_2}^{i_1}(z) \left[ P_{l_2}^{i_2}(z) \right]^* dz = \delta_{i_2}^{i_1} \delta_{l_2}^{l_1}.
\]

The equalities
\[
\int_{-1}^{1} P_m^n(x) P_l^m(x) dx = 0 \quad (l \neq n) \quad \text{and} \quad \int_{-1}^{1} [P_m^n(x)]^2 dx = \frac{2}{2n+1} \frac{(n+m)!}{(n-m)!}
\]
from [16] formulas 8.14.11, 8.14.13 p. 338 and \( P_l^m(x) \in \mathbb{R} \forall x \in \mathbb{R} \) imply
\[
|C| = \sqrt{\frac{2l_2 + 1}{2}} \frac{(l_2 - l_1)!}{(l_2 + l_1)!},
\]
then
\[
g_2(\cos \theta_2) = \sqrt{\frac{2l_2 + 1}{2}} \frac{(l_2 - l_1)!}{(l_2 + l_1)!} P_{l_2}^{i_1}(\cos \theta_2).
\]

On the other hand, \( l_2 \geq |l_1| \) and \( l_1, l_2 \in \mathbb{Z} \) imply that the formula 8.2.5 in [16] (here \( Q_{\nu}^\mu \) is the associated Legendre function of second kind)
\[
P_{\nu}^{-\mu}(z) = \frac{\Gamma(\nu - \mu + 1)}{\Gamma(\nu + \mu + 1)} \left[ P_{\nu}^\mu(z) - \frac{2}{\pi} e^{-i\mu\pi} \sin(\mu\pi) Q_{\nu}^\mu \right]
\]
becomes
\[
P_{\nu}^\mu(z) = \frac{(\nu + \mu)!}{(\nu - \mu)!} P_{\nu}^{-\mu}(z);
\]
then
\[
g_2(\cos \theta_2) = \sqrt{\frac{2l_2 + 1}{2}} \frac{(l_2 + l_1)!}{(l_2 - l_1)!} P_{l_2}^{-l_1}(\cos \theta_2).
\]

This last procedure can be repeated for the angular variables \( \theta_3, \ldots, \theta_d \), because (55) links every \( C_n \) with \( C_{n-1} \), for this reason one can now work with a generic \( C_n \).

From (55)_1,
\[
C_{n-1} Y \overset{(6)}{=} l_{n-2}(l_{n-2} + n - 3) Y \quad \text{and} \quad C_n Y \overset{(6)}{=} l_{n-1}(l_{n-1} + n - 2) Y
\]
it follows \( l_{n-1} \geq l_{n-2} \) and
\[
l_{n-1}(l_{n-1} + n - 2) g_{n-1} = \left[ -\frac{\partial^2}{\partial \theta_{n-1}^2} - (n-2) \frac{\cos \theta_{n-1}}{\sin \theta_{n-1}} \frac{\partial}{\partial \theta_{n-1}} + l_{n-2}(l_{n-2} + n - 3) \frac{\sin^2 \theta_{n-1}}{\sin^2 \theta_{n-1}} \right] g_{n-1}.
\]
The replacement \( z = \cos \theta_{n-1} \) implies
\[
\frac{\partial}{\partial \theta_{n-1}} = \frac{\partial z}{\partial \theta_{n-1}} \frac{\partial}{\partial z} = -\sqrt{1 - z^2} \frac{\partial}{\partial z}.
\]
and then the last ODE becomes
\[ l_{n-1}(l_{n-1} + n - 2)g_{n-1} = \frac{\partial}{\partial z} \left[ -(1 - z^2) \frac{\partial g_{n-1}}{\partial z} \right] + \frac{l_{n-2}(l_{n-2} + n - 3)}{1 - z^2} g_{n-1}, \]

which is equivalent to
\[
\left[ (1 - z^2) \frac{\partial^2}{\partial z^2} - (n - 1) z \frac{\partial}{\partial z} + l_{n-1}(l_{n-1} + n - 2) - \frac{l_{n-2}(l_{n-2} + n - 3)}{1 - z^2} \right] g_{n-1} = 0.
\]

Assume that
\[ g_{n-1}(z) = (1 - z^2)^{\frac{3-n}{4}} f_{n-1}(z) \] (59)

and that the function \( f_{n-1}(z) \) (which is determined in the following lines) has a zero in \( z = 1 \) of order higher than \( \frac{n-3}{4} \) (see section 9.4 for the proof of this); then
\[ g'_{n-1}(z) = \frac{z(n - 3)}{2} \left( 1 - z^2 \right)^{-\frac{1+n}{4}} f_{n-1}(z) + \left( 1 - z^2 \right)^{\frac{3-n}{4}} f'_{n-1}(z) \]

and
\[ g''_{n-1}(z) = \frac{n-3}{2} \left( 1 - z^2 \right)^{-\frac{1+n}{4}} f_{n-1}(z) + \frac{z(n - 3) z(n + 1)}{2} \left( 1 - z^2 \right)^{-\frac{5+n}{4}} f_{n-1}(z) 
\[ + z(n - 3) \left( 1 - z^2 \right)^{-\frac{1+n}{4}} f'_{n-1}(z) + \left( 1 - z^2 \right)^{\frac{3-n}{4}} f''_{n-1}(z), \]

which implies
\[-(n - 1) zg'_{n-1}(z) = -(n - 1) z \left[ \frac{z(n - 3)}{2} \left( 1 - z^2 \right)^{-\frac{1+n}{4}} f_{n-1}(z) + \left( 1 - z^2 \right)^{\frac{3-n}{4}} f'_{n-1}(z) \right] 
\[ = \left( 1 - z^2 \right)^{\frac{3-n}{4}} \left[ -\frac{z(n^2 - 4n + 3)}{2(1 - z^2)} f_{n-1}(z) - (n - 1) z f'_{n-1}(z) \right] \]

and, similarly,
\[ (1 - z^2) g''_{n-1} = \left( 1 - z^2 \right)^{\frac{3-n}{4}} \left[ \frac{n - 3}{2} f_{n-1}(z) + \frac{z^2(n^2 - 2n - 3)}{4(1 - z^2)} f_{n-1}(z) 
\[ + z(n - 3) f'_{n-1}(z) + (1 - z^2) f''_{n-1}(z) \right]. \]

Furthermore,
\[- \frac{l_{n-2}(l_{n-2} + n - 3)}{1 - z^2} + \frac{z^2(n^2 - 2n + 3)}{4(1 - z^2)} - \frac{z^2(n^2 - 4n + 3)}{2(1 - z^2)} \]
\[ = - \frac{l_{n-2}(l_{n-2} + n - 3)}{1 - z^2} + \frac{z^2(n^2 - 2n - 3 - 2n^2 + 8n - 6)}{4(1 - z^2)} \]
\[ = - \frac{l_{n-2}(l_{n-2} + n - 3)}{1 - z^2} + \frac{z^2(-n^2 + 6n - 9)}{4(1 - z^2)} \]
\[ = \frac{1}{4} (n^2 - 6n + 9) - \frac{l_{n-2}(l_{n-2} + n - 3) + \frac{3}{4} (n^2 - 6n + 9)}{1 - z^2}. \]
At this point, the first term of the ODE for $f_{n-1}$ [after deleting the common factor $(1 - z^2)^{3-n}$] is
\[
(1 - z^2)f''_{n-1}(z),
\]
the second term is
\[
z(n - 3)f'_{n-1}(z) - z(n - 1)f'_{n-1}(z) = -2zf'_{n-1}(z),
\]
the third term is
\[
l_{n-1}(l_{n-1} + n - 2)f_{n-1}(z) + \frac{n - 3}{2}f_{n-1}(z) + \frac{n^2 - 6n + 9}{4}f_{n-1}(z)
\]
\[
= \left( l_{n-1}^2 + l_{n-1}n - 2l_{n-1} + \frac{n^2 - 4n + 3}{4} \right) f_{n-1}(z)
\]
\[
= \left( l_{n-1} + \frac{n - 3}{2} \right) \left( l_{n-1} + \frac{n - 3}{2} + 1 \right) f_{n-1}(z)
\]
\[
= l'(l' + 1)f_{n-1}(z),
\]
with $l' := l_{n-1} + \frac{n - 3}{2}$, and the last term is
\[
\frac{l_{n-2}^2 + l_{n-2}n - 3l_{n-2} + n^2 - 6n + 9}{1 - z^2} f_{n-1}(z) = \frac{(l_{n-2} + \frac{n - 3}{2})^2}{1 - z^2} f_{n-1}(z) = \frac{(m')^2}{1 - z^2} f_{n-1}(z),
\]
with $m' := l_{n-2} + \frac{n - 3}{2}$.

This means that there is another associated Legendre equation:
\[
\left[ (1 - z^2) \frac{\partial^2}{\partial z^2} - 2z \frac{\partial}{\partial z} + (l' + 1) - \frac{(m')^2}{1 - z^2} \right] f_{n-1}(z) = 0,
\]
and then the solution is [here the constant $C$ is fixed as done in (57)]
\[
f_{n-1}(\cos \theta_{n-1}) = \sqrt{\frac{2l' + 1}{2}} \sqrt{\frac{(l' - m')!}{(l' + m')!}} P_{l'}^{m'}(\cos \theta_{n-1})
\]
\[
= \sqrt{\frac{2l_{n-1} + n - 2}{2}} \sqrt{\frac{(l_{n-1} - l_{n-2})!}{(l_{n-1} + l_{n-2} + n - 3)!}} P_{l_{n-1} + \frac{n - 3}{2}}^{l_{n-2} + \frac{n - 3}{2}}(\cos \theta_{n-1}),
\]
which implies
\[
g_{n-1}(\cos \theta_{n-1}) = \sqrt{\frac{2l_{n-1} + n - 2}{2}} \sqrt{\frac{(l_{n-1} - l_{n-2})!}{(l_{n-1} + l_{n-2} + n - 3)!}} [\sin \theta_{n-1}]^{\frac{3-n}{2}} P_{l_{n-1} + \frac{n - 3}{2}}^{l_{n-2} + \frac{n - 3}{2}}(\cos \theta_{n-1}).
\]
It is obvious that $l' + m', l' - m' \in \mathbb{N}_0$, so
\[
g_{n-1}(\cos \theta_{n-1}) \overset{(58)}{=} \sqrt{\frac{2l_{n-1} + n - 2}{2}} \sqrt{\frac{(l_{n-1} + l_{n-2} + n - 3)!}{(l_{n-1} - l_{n-2})!}} [\sin \theta_{n-1}]^{\frac{3-n}{2}} P_{l_{n-1} + \frac{n - 3}{2}}^{-(l_{n-2} + \frac{n - 3}{2})}(\cos \theta_{n-1}).
\]
Summarizing,
\[ Y_l(\theta, \cdots, \theta_2, \theta_1) = \frac{e^{i\ell_1 \theta_1}}{\sqrt{2\pi}} \prod_{n=2}^{D-1} \frac{\prod_{n=2}^{D-1} P_{l_n}^{n-1}(\theta_n)}{2\pi} \cdot \left(\prod_{n=2}^{D-1} P_{l_n}^{n-1}(\theta_n) \right) \cdot \left(\prod_{n=2}^{D-1} P_{l_n}^{n-1}(\theta_n) \right) \cdot \sin^{n-1} \theta_n d\theta_n \right]. \] (60)

where
\[ j \cdot P_{l_1}^{M}(\theta) := \sqrt{\frac{2L + j - 1}{2}} \cdot \sqrt{(L + M + j - 2)!} \cdot (L - M)! \cdot [\sin \theta]^{2-j} \cdot P_{l_1}^{M+\frac{j-2}{2}}(\cos \theta). \] (61)

9.3.2 The orthonormality of \( Y_l \)

The \( Y_l \) built above are eigenvectors of self-adjoint operators, so
\[ \int_{S^d} Y_l Y_l^* d\alpha = 0 \quad \text{if} \quad l \neq l'; \]
in order to prove (27)_3 it remains to show that
\[ \int_{S^d} Y_l Y_l^* d\alpha = 1, \]
and this is done recursively.

First of all, it is important to underline that from (60-61) it follows
\[ \int_{S^d} Y_l Y_l^* d\alpha = \prod_{n=2}^{D-1} \frac{\prod_{n=2}^{D-1} P_{l_n}^{n-1}(\theta_n)}{2\pi} \cdot \left(\prod_{n=2}^{D-1} P_{l_n}^{n-1}(\theta_n) \right) \cdot \sin^{n-1} \theta_n d\theta_n \]

While from
\[ \int_0^{2\pi} e^{i(l_1 - l_1') \theta_1} d\theta_1 = \delta_{l_1 \theta_1}, \]
it follows that, if \( l_1 \neq l_1' \), then (27)_3 vanishes; otherwise, if \( l_1 = l_1' \geq 0 \) (the case \( l_1 < 0 \) is essentially the same), then
\[ \int_0^{\pi} 2P_{l_2}^{l_1}(\theta_2) \cdot 2P_{l_2'}^{l_1}(\theta_2) \sin \theta_2 d\theta_2 = \frac{2l_2 + 1 (l_2 + l_1)!}{2 (l_2 - l_1)!} \cdot \frac{2l_2' + 1 (l_2' + l_1)!}{2 (l_2' - l_1)!} \cdot \prod_{n=2}^{D-1} \frac{\prod_{n=2}^{D-1} P_{l_n}^{n-1}(\theta_n)}{2\pi} \cdot \left(\prod_{n=2}^{D-1} P_{l_n}^{n-1}(\theta_n) \right) \cdot \sin^{n-1} \theta_n d\theta_n \]
\[ = \frac{2l_2 + 1 (l_2 - l_1)!}{2 (l_2 + l_1)!} \cdot \frac{2l_2' + 1 (l_2' - l_1)!}{2 (l_2' + l_1)!} \cdot \prod_{n=2}^{D-1} \frac{\prod_{n=2}^{D-1} P_{l_n}^{n-1}(\theta_n)}{2\pi} \cdot \left(\prod_{n=2}^{D-1} P_{l_n}^{n-1}(\theta_n) \right) \cdot \sin^{n-1} \theta_n d\theta_n \]
\[ x = \cos \theta_2 \]
\[ \delta_{l_2}^{l_2'} \]
and if \( l_2 \neq l_2' \), then (27)_3 vanishes.
In general, if \( l_i = l_i' \) for \( i \in \{1, \ldots, n - 1\} \),

\[
\int_0^\pi 2^l \overline{P}_{l_n - 1}^{m - 1} (\theta_n) \overline{P}_{l_n}^{m - 1} (\theta_n) \sin \theta_n d\theta_n \overset{(61)}{=} \sqrt{\frac{2l_n + n - 1}{2} (l_n - l_n - 1)!} \sqrt{\frac{2l_n + 1}{2} (l_n' - l_n - 1)!} \]

\[
\cdot \int_0^\pi P_{l_n + \frac{n - 2}{2}} ((\theta_n) P_{l_n + \frac{n - 2}{2}} (\theta_n) \sin \theta_n d\theta_n \overset{(58)}{=} \sqrt{\frac{2l_n + n - 1}{2} (l_n - l_n - 1)!} \sqrt{\frac{2l_n + 1}{2} (l_n' - l_n - 1)!} \]

\[
\cdot \int_0^\pi P_{l_n + \frac{n - 2}{2}} ((\theta_n) P_{l_n + \frac{n - 2}{2}} (\theta_n) \sin \theta_n d\theta_n \]

\[
x = \cos \theta_n \]

\[
\int_{-1}^1 P_{l_n + \frac{n - 2}{2}} (x) P_{l_n + \frac{n - 2}{2}} (x) dx \overset{(56)}{=} \delta_{P_{l_n}^{m}}^{l_n'} ;
\]

and this proves \((27)_3\).

**9.3.3 The \( Y_l \) seen as homogeneous polynomials**

The next proposition uses the equality (see section 9.4 for its proof)

\[
hP_{l}^{m} (\theta) = (\sin \theta)^m \overline{P}_{l + \frac{m + 2}{2}} (\cos \theta) \equiv (\sin \theta)^m \left\{ [\cos \theta]^{l-m} + [\cos \theta]^{l-m-2} + \cdots \right\} , \tag{62}
\]

which is true up to any multiplicative constant before every power of \( \cos \theta \) and \( \sin \theta \).

**Proposition 9.1.** Every \( D \)-dimensional spherical harmonic \( Y_l \) can be written as a homogeneous polynomial of degree \( l \) in the \( t \) variables.

*Proof.* This proof is given by induction over \( D \); if \( D = 3 \) and \( m \geq 0 \) [the assumption \( m < 0 \) is essentially equivalent, because of \((58)\)], then \((62)\) implies

\[
2^l \overline{P}_{l}^{m} (\theta_2) = (\sin \theta_2)^m \left( [\cos \theta_2]^{l-m} + [\cos \theta_2]^{l-m-2} + [\cos \theta_2]^{l-m-4} + \cdots \right) ,
\]

so

\[
Y_l^{m} (\theta_2, \theta_1) = 2^l \overline{P}_{l}^{m} (\theta_2) e^{imn_1}
\]

\[
= \left( t_1 + it_2 \right)^m \left( \left( t_3 \right)^{l-m} + \left( t_3 \right)^{l-m-2} \left( t_1 t_1 + t_2 t_2 + t_3 t_3 \right) + \left( t_3 \right)^{l-m-4} \left( t_1 t_1 + t_2 t_2 + t_3 t_3 \right)^2 \right) ;
\]

which means that the claim is true for \( D = 3 \).
Let \( D > 3 \) and assume that the claim is true for \( D - 1 \), then there exists \( \hat{P}_{l_d-1, \ldots, l_1} \), a suitable homogeneous polynomial of degree \( l_d-1 \) in the \( t_1, \ldots, t_d \) variables, such that

\[
Y_{l_{d-1}, \ldots, l_1} = \prod_{h=2}^{d-1} P_{l_h-1}^{h-1}(\theta_h) \cdot e^{il_1\theta_1} = \hat{P}_{l_{d-1}, \ldots, l_1}(t_1, \ldots, t_d).
\]

On the other hand, the polar system of coordinates (50) depends on the dimension of the carrier space, and then, in \( \mathbb{R}^D \),

\[
\prod_{h=2}^{d-1} P_{l_h-1}^{h-1}(\theta_h) \cdot e^{il_1\theta_1} = (\sin \theta_d)^{l_{d-1}} \hat{P}_{l_{d-1}, \ldots, l_1}(t_1, \ldots, t_d),
\]

for the same \( \hat{P} \).

This,

\[
d_{l_d-1}^D(\theta_d) = (\sin \theta_d)^{l_{d-1}} \left[ (\cos \theta_d)^{l_{d-1}} + (\cos \theta_d)^{l_{d-1}-2} + (\cos \theta_d)^{l_{d-1}-4} + \cdots \right] \\
= (\sin \theta_d)^{l_{d-1}} \left[ (t^D)^{l_{d-1}} + (t^D)^{l_{d-1}-2} \left( t^1 t^1 + \cdots + t^D t^D \right) \right. \\
\left. + (t^D)^{l_{d-1}-4} \left( t^1 t^1 + \cdots + t^D t^D \right)^2 + \cdots \right]
\]

and (25) imply the claim. \( \square \)

9.3.4 The \( Y_l \) are a basis of \( \mathcal{L}^2(S^d) \)

Let

- \( P_l^D \) be the vector space of polynomials in the \( x_1, \ldots, x_D \) variables of degree at most \( l \);
- \( Q_l^D \) be the vector space of homogeneous polynomials in the \( x_1, \ldots, x_D \) variables of degree \( l \);
- \( T_l^D \) be the vector space of homogeneous harmonic polynomials in the \( x_1, \ldots, x_D \) variables of degree \( l \) (the \( q \in Q_l^D \) fulfilling \( \Delta q = 0 \));
- \( \tilde{P}_l^D, \tilde{Q}_l^D \) and \( \tilde{T}_l^D \) be the restriction to the sphere \( S^d \) of \( P_l^D, Q_l^D \) and \( T_l^D \), respectively;
- \( \Omega_{l,D} := \bigoplus_{m=0}^{l} \tilde{T}_m^D, \ \hat{\Omega}_{l,D} := \bigoplus_{m=0}^{l} V_{m,D} \). \hfill (63)

The goal is to show that

\[
\forall f \in \mathcal{L}^2(S^d), \forall \epsilon > 0 \exists l \in \mathbb{N}_0, \exists g \in \hat{\Omega}_{l,D} \text{ such that } \| f - g \|_2 < \epsilon. \hfill (64)
\]

The density of \( C^0(S^d) \) in \( \mathcal{L}^2(S^d) \) implies that it is sufficient to show (64) for a generic continuous function on the unit sphere; on the other hand, from the Stone-Weierstrass
theorem it follows that the function $f$ can be replaced with a polynomial, without loss of
generality. According to this and

$$\mathcal{P}_l^D = \bigoplus_{m=0}^{l} \mathcal{Q}_m^D$$

it remains to show that every homogeneous polynomial can be approximated by the harmonic
homogeneous ones, and then that $\Omega_{l,D} \equiv \tilde{\Omega}_{l,D} \forall l, D$.

In order to do this, let

$$L : p(x_1, \ldots, x_D) \in \mathcal{P}_l^D \longrightarrow (x_1^2 + \cdots + x_D^2) p(x_1, \ldots, x_D) \mathcal{P}_{l+2}^D,$$

and define in this way an internal product in $\mathcal{P}_l^D$:

$$\langle x_1^{n_1} \cdots x_D^{n_D}, x_1^{m_1} \cdots x_D^{m_D} \rangle_l := \frac{(n_1)! \cdots (n_D)!}{(m_1)! \cdots (m_D)!} \text{ if } n_1 = m_1, \ldots, n_D = m_D,$$

0 otherwise.

$L$ is linear and

$$\langle L[p], q \rangle_{l+2} = \langle p, \Delta q \rangle_l \quad \forall p \in \mathcal{P}_l^D \quad \text{and} \quad q \in \mathcal{P}_{l+2}^D,$$

which means that $L^* = \Delta$; then

$$\mathcal{Q}_{l+2}^D = L (\mathcal{Q}_l^D) \oplus \text{Ker} (L^*) = r^2 \mathcal{Q}_l^D \oplus \mathcal{T}_{l+2}^D.$$

This implies (the dimension of $\mathcal{Q}_l^D$ is the the number of ways to sample $l$ elements from a
set of $D$ elements allowing for duplicates, but disregarding different orderings)

$$\dim (\mathcal{T}_l^D) = \dim (\mathcal{Q}_l^D) - \dim (\mathcal{Q}_{l-2}^D) = \left( \begin{array}{c} D+l-1 \\ l \end{array} \right) - \left( \begin{array}{c} D+l-3 \\ l-2 \end{array} \right) = \frac{(D+l-3)(D+2l-2)(D-1)}{l(l-1)}$$

(65)

and also that

$$\mathcal{P}_l^D = \mathcal{T}_l^D \oplus r^2 \mathcal{T}_{l-2}^D \oplus r^4 \mathcal{T}_{l-4}^D \oplus \cdots \quad \Rightarrow \quad \tilde{\mathcal{Q}}_l^D = \tilde{\mathcal{T}}_l^D \oplus \tilde{\mathcal{T}}_{l-2}^D \oplus \tilde{\mathcal{T}}_{l-4}^D \oplus \cdots,$$

in other words, every homogeneous polynomial on the sphere is a linear combination of
homogeneous harmonic polynomials.

Furthermore,

$$h \in \mathcal{T}_l^D \quad \Rightarrow \quad p = r^l q, \quad \Delta p = 0 \quad \text{and with} \quad q \in \tilde{\mathcal{T}}_l^D;$$

this and (53) imply

$$L^2 q = l(l + D - 2) q.$$

Then, both $q \in \tilde{\mathcal{T}}_l^D$ and $Y_l$ are eigenfunctions of $L^2$ with eigenvalue $l(l + D - 2)$ and
homogeneous polynomials in the $t^h$ variables of degree $l$; this and (63) imply that $\Omega_{l,D} \equiv \tilde{\Omega}_{l,D}$
$\forall l, D$ is equivalent to the proof of the following
Theorem 9.1.
\[ T^D_l = V_{l,D} \quad \forall \alpha \in N_0, \forall D \in N. \] (66)

Proof. This proof is by induction on the dimension \( D \) of the carrier space \( \mathbb{R}^D \). When \( D = 3 \),
\[
\dim \left( T^3_l \right) = \dim \left( \tilde{T}^3_l \right) = \binom{l}{l-1} \frac{2l+1}{l} = 2l + 1,
\]
and
\[
V_{l,D} = \text{span} \left\{ Y_l : \alpha \equiv l \geq l_{d-1} \geq \cdots \geq l_2 \geq |l_1|, l_i \in \mathbb{Z} \forall i \right\} = \text{span} \left\{ Y^m_l : |m| \leq \alpha, m \in \mathbb{Z} \right\},
\]
so (66) is true when \( D = 3 \).

Assume that it is true for \( d \), this means that
\[
\dim V_{d-1,d} = \binom{D + l_{d-1} - 4}{l_{d-1} - 1} \frac{D + 2l_{d-1} - 3}{l_{d-1}}; (67)
\]
this, the hockey stick identity (see [17] formula (2))
\[
\binom{n + 1}{r + 1} = \sum_{i=r}^{n} \binom{i}{r} = \sum_{i=r}^{n} i! \binom{i-r}{r} = \sum_{m=0}^{n-r} \frac{(m+r)!}{m!} = \sum_{m=0}^{n-r} \binom{m+r}{m} \quad (r \geq 0, n \geq r) \quad (68)
\]
and (60) imply
\[
\dim V_{l,D} = \sum_{m=0}^{l} \dim V_{m,d} \overset{(67)}{=} \sum_{m=0}^{l} \binom{D + m - 4}{m - 1} \frac{D + 2m - 3}{m} = \frac{(D + l_{d-1} - 4)!}{(D - 3)!(m-1)!} \frac{D + 2m - 3}{m} = \sum_{m=0}^{l} \binom{D + m - 4}{m} \frac{(D + m - 4)!}{(D - 4)!m!} + 2 \sum_{m=0}^{l} \frac{m(D + m - 4)!}{(D - 3)!m!} = \sum_{m=0}^{l} \binom{D - 4 + m}{m} + 2 \sum_{m=1}^{l} \binom{D - 4 + m}{m-1} = \sum_{m=0}^{l} \binom{D - 4 + m}{m} + 2 \sum_{n=0}^{l-1} \binom{D - 3 + n}{n} = \binom{l + D - 4 + 1}{D - 4 + 1} + 2 \binom{l - 1 + D - 3 + 1}{D - 3 + 1} = \binom{l + D - 3}{D - 3} + 2 \binom{D + l - 3}{D - 2} = (D + l - 3)! \binom{(D - 3)!l}{(D - 3)!} \binom{D + l - 3}{D - 2} \binom{(D - 2)!l}{(D - 2)!} = \binom{D + l - 3}{D - 3} \frac{2l + D - 2}{l} = \dim T^D_l,
\]
so the proof is finished. \( \square \)

According to this last proof
• The spherical harmonics $Y_l$ are the harmonic homogeneous polynomials on the unit sphere $S^d$;
• The spherical harmonics are an orthonormal basis of $L^2(S^d)$;
• The collection of operators $\{L_{1,2}, C_2, \ldots, C_D\}$ is a CSCO for the $L^2$-eigenfunctions in $L^2(S^d)$;
• The dimension of $H_{\Lambda,D}$ coincides with the one of $T_{\Lambda}^{D+1}$ (and then also with the one of $V_{\Lambda,D+1}$), so
  \[
  \dim H_{\Lambda,D} = \left( \frac{D + \Lambda - 2}{\Lambda - 1} \right) \frac{D + 2\Lambda - 1}{\Lambda}. \tag{69}
  \]
• Every $V_{l,D}$ is the representation space of a $SO(D)$-irrep, the one with $L^2 \equiv l(l+D-2)I$, and
  \[ V_{l,D} \text{ is isomorphic to } \bigoplus_{m=0}^{l} V_{m,d}. \]

9.4 The associated Legendre function of first kind

In this section $L, l, h \in \mathbb{N}_0$ and the behavior of $\overline{P}^j_L(\theta)$ is investigated, in order to prove the regularity of $g_{n-1}(z)$ in (59).

The equations (58) and (61) imply that $\overline{P}^j_L(\theta)$ basically coincides (up to a multiplicative constant, depending on $L, l$ and $h$) with

\[ [\sin \theta]^{\frac{2-h}{2}} P^{l + \frac{h-2}{2}}_{L + \frac{h-2}{2}}(\cos \theta) \]

where $P^s_r$ is the associated Legendre function of first kind, $L + \frac{h-2}{2}$ (and also $l + \frac{h-2}{2}$) is integer if and only if $h$ is even, while it is half-integer if and only if $h$ is odd; according to this, one has to analyze the following two cases.

9.4.1 The case $h$ even

When $h$ is even, then from eq. (6) pag. 148 and eq. (17) pag. 151 in [7]

\[ P^m_l(x) = (-1)^m (1 - x^2)^{\frac{m}{2}} \frac{d}{dx} P_x^m, \quad P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l \tag{70} \]

it follows (in the next equations there is not any multiplicative constant, depending on the indices of $P$, because they are not relevant in this case, except when that constant is 0)

\[ P^{-\left(l + \frac{h-2}{2}\right)}_{L + \frac{h-2}{2}}(\cos \theta) = (\sin \theta)^{l + \frac{h-2}{2}} \overline{P}^{l + \frac{h-2}{2}}_{L + \frac{h-2}{2}}(\cos \theta), \]
where $\tilde{P}_{L+\frac{h-2}{2}}^l (\cos \theta)$ is a polynomial of degree $L - l$ in $\cos \theta$ which does not contain any terms of degree $L - l - (2n + 1)$, with $n \in \mathbb{N}_0$; so,

$$h \tilde{P}_L^l (\theta) = (\sin \theta)^l \tilde{P}_{L+\frac{h-2}{2}}^l (\cos \theta).$$

In addition, from (58) and (70) it follows that the highest coefficient multiplying a power of $\cos \theta$ in $P_L^l (\cos \theta)$, when $L \geq |l|$ and $L, l \in \mathbb{Z}$ is

$$\frac{(2L)!}{2^L L!} \leq \frac{(2\Lambda)!}{2^\Lambda \Lambda!} < 2^\Lambda \left[(2\Lambda + 1)!!\right]^2.$$

### 9.4.2 The case $h$ odd

In [7] eq. (7) pag. 122 there is another explicit expression of the associated Legendre function of first kind (pay attention to the different fonts $P$ and $\mathcal{P}$, while here $\mathcal{F}$ is the Gauss hypergeometric function)

$$P_L^l (z) = \frac{2^l}{\Gamma(1-l)} \left(\frac{z+1}{z-1}\right)^{\frac{l}{2}} \mathcal{F} \left(1-l+L,-l-L,1-l,\frac{1-z}{2}\right) \quad (71)$$

while in [7] eq. (5) pag. 143 there is the following definition

$$P_L^l(x) := e^{\frac{i}{2} \pi} P_L^l(x+i0). \quad (72)$$

So, putting together (71) and (72),

$$P_L^l(x) = e^{\frac{i}{2} \pi} \frac{2^l}{\Gamma(1-l)} \frac{1}{(x^2-1)^{\frac{l}{2}}} \mathcal{F} \left(1-l+L,-l-L,1-l,\frac{1-x}{2}\right) \quad (73)$$

in this work there the $P$ font is always used, but this is only a stylistic choice, in fact it is always referring to this ‘real’ function $P$ of (73).

In addition, from [7] p. 161 (12)-(14) it follows

$$\sqrt{1-x^2} P_L^l(x) = \frac{1}{2L+1} \left[ (L-l+1)(L-l+2)P_{L+1}^{l-1}(x) - (L+l-1)(L+l)P_{L-1}^{l-1}(x) \right],$$

$$\sqrt{1-x^2} P_L^l(x) = \frac{1}{2L+1} \left[ -P_{L+1}^{l+1}(x) + P_{L-1}^{l+1}(x) \right],$$

$$xP_L^l(x) = \frac{1}{2L+1} \left[ (L-l+1)P_{L+1}^{l}(x) + (L+l)P_{L-1}^{l}(x) \right]; \quad (74)$$
so, if $L = l = \frac{1}{2}$, eq. (11) p. 101 in [7]

$$\cos az = F\left(\frac{1}{2}a, -\frac{1}{2}a, \frac{1}{2}, (\sin z)^2\right),$$

implies

$$P_{\frac{1}{2}}^\frac{1}{2}(\cos \theta) = \frac{\sqrt{2}}{\Gamma(\frac{3}{2})} \frac{1}{\sqrt{\sin \theta}} F\left(1, -1, \frac{1}{2}, \frac{1 - \cos \theta}{2}\right)$$
$$= \frac{\sqrt{2}}{\pi \sqrt{\sin \theta}} F\left(1, -1, \frac{1}{2}, \sin^2 \theta / 2\right) = \frac{\sqrt{2}}{\pi \sqrt{\sin \theta}}. \quad (75)$$

If $L = -l = \frac{1}{2}$, then eq. (4) p. 101, eq. (18) p. 102 and eq. (3) p. 105 in [7]

$$F(-a, b, b, z) = (1 + z)^a, \quad F(a, b, c, z) = F(b, a, c, z),$$

$$F(a, b, c, z) = (1 - z)^{-a} F\left(a - b, c, \frac{z}{z - 1}\right),$$

imply

$$F\left(2, 0, \frac{3}{2}, \frac{1 - x}{2}\right) = \left(1 - \frac{1 - x}{2}\right)^{-2} F\left(2, \frac{3}{2}, \frac{1 - x}{2}, \frac{1 - x}{2} - 1\right)$$
$$= \left(\frac{1 + x}{2}\right)^{-2} F\left[-(-2), \frac{3}{2}, \frac{3}{2}, -\left(-\frac{1 - x}{1 - x}\right)\right]$$
$$= \left(\frac{1 + x}{2}\right)^{-2} \left(1 - \frac{1 - x}{1 - x}\right)^{-2}$$
$$= \left(\frac{1 + x}{2}\right)^{-2} \left(\frac{1}{1 + x}\right)^{-2} = 1;$$

and then

$$P_{\frac{1}{2}}^{-\frac{1}{2}}(\cos \theta) = 2^{-\frac{1}{2}} \frac{\sqrt{\sin \theta}}{\sqrt{\Gamma(\frac{3}{2})}} F\left(2, 0, \frac{3}{2}, \frac{1 - \cos \theta}{2}\right) = \frac{\sqrt{2}}{\pi} \sqrt{\sin \theta}. \quad (76)$$

Once calculated these $P_{\frac{1}{2}}^{\pm \frac{1}{2}}$, (74) leads to

$$\cos \theta P_{\frac{1}{2}}^{-\frac{1}{2}}(\cos \theta) = P_{\frac{3}{2}}^{-\frac{1}{2}}(\cos \theta) = \sqrt{\frac{2}{\pi}} \cos \theta \sqrt{\sin \theta} \quad (77)$$

and

$$\sin \theta P_{\frac{1}{2}}^{-\frac{1}{2}}(\cos \theta) = \frac{1}{2}[2 \cdot 3] P_{\frac{3}{2}}^{-\frac{3}{2}}(\cos \theta) = \sqrt{\frac{2}{\pi}} \sin \theta \sqrt{\sin \theta}; \quad (78)$$

for completeness, according to (58),

$$P_{\frac{1}{2}}^{\frac{3}{2}}(\cos \theta) = 2 \sqrt{\frac{2}{\pi}} \sin \theta \sqrt{\sin \theta}, \quad P_{\frac{3}{2}}^{\frac{3}{2}}(\cos \theta) = 2 \sqrt{\frac{2}{\pi}} \cos \theta \sqrt{\sin \theta}. \quad (79)$$

At this point, in order to conclude the proof of the regularity of $g_{n-1}(z)$ in (59), it is necessary to the following
Proposition 9.2. Let $L$ and $l$ be half-integer and positive, $0 \leq l \leq L$, then

$$P_{L}^{-l}(\cos \theta) = (\sin \theta)^{l} \tilde{P}_{L}^{-l}(\cos \theta),$$

where $\tilde{P}_{L}^{-l}(\cos \theta)$ is a polynomial of degree $L - l$ in $\cos \theta$ which does not contain any term of degree $L - l - (2h + 1)$, with $h \in \mathbb{N}_0$.

Proof. This is proved by induction over $L$. When $L = \frac{1}{2}$ and $L = \frac{3}{2}$, (75)-(78) imply that the claim is true in these two cases. Let $L = \frac{1}{2} + n$, with $2 \leq n \in \mathbb{N}$ and assume that the claim is true for $n - 1$, then (74) implies, if $n > n' + 1 \in \mathbb{N}$ and $n' \in \mathbb{N}_0$,

$$\sin \theta P_{\frac{1}{2} + (n-1)}^{-[\frac{1}{2}+(n'-1)]} = P_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n')]} + P_{\frac{1}{2} + (n-2)}^{-[\frac{1}{2}+(n'-1)]},$$

then, from

$$\sin \theta P_{\frac{1}{2} + (n-1)}^{-[\frac{1}{2}+(n'-1)]} (\cos \theta) = (\sin \theta)^{\frac{1}{2}+n'} \tilde{P}_{\frac{1}{2} + (n-1)}^{-[\frac{1}{2}+(n'-1)]} (\cos \theta)$$

and

$$P_{\frac{1}{2} + (n-2)}^{-[\frac{1}{2}+(n'-1)]} (\cos \theta) = (\sin \theta)^{\frac{1}{2}+n'} \tilde{P}_{\frac{1}{2} + (n-2)}^{-[\frac{1}{2}+(n')]} (\cos \theta),$$

it follows that also

$$P_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n'+1)]} (\cos \theta) = (\sin \theta)^{\frac{1}{2}+n'} \tilde{P}_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n')]} (\cos \theta),$$

where $\tilde{P}_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n')]}$ is a polynomial of degree $n - n'$ in $\cos \theta$ which does not contain any term of degree $n - n' - (2h + 1)$, with $h \in \mathbb{N}_0$.

On the other hand, (74) implies

$$\cos \theta P_{\frac{1}{2} + (n-1)}^{-[\frac{1}{2}+(n'-1)]} (\cos \theta) = P_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n')]} (\cos \theta) + 0 = P_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n'-1)]} (\cos \theta);$$

so

$$P_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n'-1)]} (\cos \theta) = (\sin \theta)^{\frac{1}{2}+n} \tilde{P}_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n')]} (\cos \theta),$$

where $\tilde{P}_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n')]}$ is a polynomial in $\cos \theta$ of degree 1.

Furthermore, (74) implies

$$\sin \theta P_{\frac{1}{2} + (n-1)}^{-[\frac{1}{2}+(n'-1)]} (\cos \theta) = P_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n')]} (\cos \theta) + (\sin \theta)^{\frac{1}{2}+n} \tilde{P}_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n'-1)]} (\cos \theta),$$

so the claim is true also for $n$, because this last equality means that

$$P_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n'+1)]} (\cos \theta) = (\sin \theta)^{\frac{1}{2}+n} \tilde{P}_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n' + 1)]} (\cos \theta),$$

where $\tilde{P}_{\frac{1}{2} + n}^{-[\frac{1}{2}+(n' + 1)]} (\cos \theta)$ is a polynomial of degree $n - n$ in $\cos \theta$ which does not contain any term of degree $n - n - (2h + 1)$, with $h \in \mathbb{N}_0$. 

\hfill \Box
It is important to underline that the hypothesis \( l \geq 0 \) in the last proof is not stringent, in fact the same result can be proved also when \( l \) is negative, because of (58).

In addition, from (75)-(79) it turns out that the highest coefficient multiplying a power of \( \cos \theta \) in \( P_L^l(\cos \theta) \), when \( \frac{3}{2} \geq L \geq |l| \) and \( L, l \in \mathbb{Z} \) is always less or equal that \( 2L + 1 \); on the other hand, from (74) it follows

\[
P_{L+1}^l = \frac{2L + 1}{(L - l + 1)(L - l + 2)} \sqrt{1 - x^2}P_L(x) + \frac{(L + l - 1)(L + l)}{(L - l + 1)(L - l + 2)} P_{L-1}(x),
\]

\[
P_{L+1}^{l+1} = -\sqrt{1 - x^2}(2L + 1)P_L^l(x) + P_{L-1}^{l+1}(x),
\]

\[
P_{L+1}^{l+2} = \frac{2L + 1}{L - l + 1} xP_L^l(x) - \frac{L + l}{L - l + 1} P_{L-1}(x);
\]

and then that the highest coefficient multiplying a power of \( \cos \theta \) in \( P_{L+1}^l(\cos \theta) \) is less then \([2(L + 1) + 1]^2\) times the sum of the highest coefficient multiplying a power of \( \cos \theta \) in \( P_L^{l+1}(\cos \theta) \).

According to this, by recursion one has that the highest coefficient multiplying a power of \( \cos \theta \) in \( P_L^l(\cos \theta) \) is

\[c2^L [(2L + 1)!!]^2 \leq 2^L [(2\Lambda + 1)!!]^2.\]

### 9.5 The square-integrability of \( \psi_{l,D} \)

In this section there is the proof that that every \( \psi_{l,D} \) is square-integrable and also the explicit calculation of \( M_{l,D} \).

The integral

\[
\int_{\mathbb{R}^D} |\psi_{l,D}|^2 \, dx
\]

can be factorized in this way:

\[
\int_{\mathbb{R}^D} |\psi_{l,D}|^2 \, dx = |M_{l,D}|^2 \left( \int_{0}^{+\infty} \frac{|g_{0,l,D}(r)|^2}{r^d} r^d \, dr \right) \cdot \left[ \int_{S^d} |Y_l|^2 \left( \sin^{d-1} \theta_d \sin^{d-2} \theta_{d-1} \cdots \sin \theta_2 \right) \, d\theta_1 d\theta_2 \cdots d\theta_d \right]^{(27)2} |M_{l,D}|^2 \int_{0}^{+\infty} |g_{0,l,D}(r)|^2 \, dr.
\]

So, proceeding as in section 6.5 of [1],

\[
\int_{\mathbb{R}^D} |\psi_{l,D}|^2 \, dx = 1 \iff M_{l,D} = \frac{\xi L_{l,D}}{\sqrt{\pi}}.
\]

(80)
9.6 The action of $t^h$ on $Y_l$

First of all

**Definition 9.1.** Let $L \geq |l|$ and $2 \leq j \in \mathbb{N}$, then

\[
A(L, l, j) := \sqrt{\frac{(L + l + j - 1)(L + l + j)}{(2L + j - 1)(2L + j + 1)}} - \frac{(L - l - 1)(L - l)}{(2L + j - 1)(2L + j - 3)},
\]

\[
B(L, l, j) := -\sqrt{\frac{(L - l - 1)(L - l)}{(2L + j - 1)(2L + j - 3)}},
\]

\[
C(L, l, j) := -\sqrt{\frac{(L - l + 2)(L - l + 1)}{(2L + j - 1)(2L + j + 1)}},
\]

\[
D(L, l, j) := \sqrt{\frac{(L + l + j - 2)(L + l + j - 3)}{(2L + j - 1)(2L + j - 3)}},
\]

\[
F(L, l, j) := \sqrt{\frac{(L + l + j - 1)(L - l + 1)}{(2L + j - 1)(2L + j + 1)}},
\]

\[
G(L, l, j) := \sqrt{\frac{(L - l)(L + l + j - 2)}{(2L + j - 1)(2L + j - 3)}}.
\]

They fulfill

\[
A(L, l, j) = D(L + 1, l + 1, j), \quad B(L, l, j) = C(L - 1, l + 1, j),
\]

\[
F(L, l, j) = G(L + 1, l, j), \quad F(L, l, j)A(L + 1, l, j) = A(L, l, j)F(L + 1, l + 1, j), \quad (82)
\]

\[
G(L, l, j)B(L - 1, l, j) = B(L, l, j)G(L - 1, l + 1, j),
\]

but it is also important to point out something about the generalized associated Legendre functions $P^s_r$.

From (74) and (81), it follows

\[
[sin \theta]_j P^j_L (\theta) = \sqrt{\frac{2L + j - 1}{2} \sqrt{\frac{(L + l + j - 2)!}{(L - l)!}}} [sin \theta]^{2 \frac{j}{2}} \frac{1}{2L + j - 1}
\]

\[
\cdot \left\{ (L + l + j - 1)(L + l + j)P_{\left[(L+1)+\frac{L+2}{2}\right]}^{-[l+1]+\frac{L+2}{2}}(\cos \theta)
\]

\[
- (L - l)(L - l - 1)P_{\left[(L-1)+\frac{L+2}{2}\right]}^{-[l+1]+\frac{L+2}{2}}(\cos \theta) \right\}
\]

\[
= \sqrt{\frac{2L + j + 1}{2} \sqrt{\frac{(L + l + j)!}{(L - l)!}}} [sin \theta]^{2 \frac{j}{2}} P_{\left[(L+1)+\frac{L+2}{2}\right]}^{-[l+1]+\frac{L+2}{2}}(\cos \theta) \sqrt{\frac{(L + l + j - 1)(L + l + j)}{(2L + j - 1)(2L + j + 1)}},
\]

\[
- \sqrt{\frac{2L + j - 3}{2} \sqrt{\frac{(L + l + j)!}{(L - l - 2)!}}} [sin \theta]^{2 \frac{j}{2}} P_{\left[(L-1)+\frac{L+2}{2}\right]}^{-[l+1]+\frac{L+2}{2}}(\cos \theta) \sqrt{\frac{(L - l - 1)(L - l)}{(2L + j - 1)(2L + j - 3)}},
\]

\[
= \sqrt{\frac{(L + l + j - 1)(L + l + j)}{(2L + j - 1)(2L + j + 1)}} jP^{-1}_{L+1}(\theta) + \left[ - \sqrt{\frac{(L - l - 1)(L - l)}{(2L + j - 1)(2L + j - 3)}} jP^{-1}_{L-1}(\theta)
\]

\[
= A(L, l, j)jP^{-1}_{L+1}(\theta) + B(L, l, j)jP^{-1}_{L-1}(\theta);
\]

(83)
\[ [\sin \theta]_j P_{L}^j (\theta) = \sqrt{\frac{2L + j - 1}{2}} \sqrt{\frac{(L + l + j - 2)!}{(L - l)!}} [\sin \theta]^{2\pi j} \frac{1}{2L + j - 1} \cdot \left\{ P_{L + \frac{j - 2}{2}}^{-(l + \frac{j - 2}{2})} (\cos \theta) \right\} \]

\[ = \sqrt{\frac{2L + j - 1}{2}} \sqrt{\frac{(L + l + j - 2)!}{(L - l)!}} [\sin \theta]^{2\pi j} \frac{1}{2L + j - 1} \cdot \left\{ P_{L + \frac{j - 2}{2}}^{-(l + \frac{j - 2}{2})} (\cos \theta) \right\} \]

\[ = \sqrt{\frac{2L + j - 1}{2}} \sqrt{\frac{(L + l + j - 2)!}{(L - l)!}} [\sin \theta]^{2\pi j} \frac{1}{2L + j - 1} \cdot \left\{ P_{L + \frac{j - 2}{2}}^{-(l + \frac{j - 2}{2})} (\cos \theta) \right\} \]

\[ = \sqrt{\frac{2L + j - 3}{2}} \sqrt{\frac{(L + l + j - 4)!}{(L - l)!}} [\sin \theta]^{2\pi j} \frac{1}{2L + j - 1} \cdot \left\{ P_{L + \frac{j - 2}{2}}^{-(l + \frac{j - 2}{2})} (\cos \theta) \right\} \]

\[ = \frac{2L + j - 3}{2} \sqrt{\frac{(L + l + j - 4)!}{(L - l)!}} [\sin \theta]^{2\pi j} \frac{1}{2L + j - 1} \cdot \left\{ P_{L + \frac{j - 2}{2}}^{-(l + \frac{j - 2}{2})} (\cos \theta) \right\} \]

\[ = C(L, l, j) \overline{P}_{L+1}^{L-1} (\theta) + D(L, l, j) \overline{P}_{L-1}^{L-1} (\theta); \]

\[ [\cos \theta]_j P_{L}^j (\theta) = \sqrt{\frac{2L + j - 1}{2}} \sqrt{\frac{(L + l + j - 2)!}{(L - l)!}} [\sin \theta]^{2\pi j} \frac{1}{2L + j - 1} \cdot \left\{ P_{L + \frac{j - 2}{2}}^{-(l + \frac{j - 2}{2})} (\cos \theta) \right\} \]

\[ = \sqrt{\frac{2L + j - 1}{2}} \sqrt{\frac{(L + l + j - 2)!}{(L - l)!}} [\sin \theta]^{2\pi j} \frac{1}{2L + j - 1} \cdot \left\{ P_{L + \frac{j - 2}{2}}^{-(l + \frac{j - 2}{2})} (\cos \theta) \right\} \]

\[ = \sqrt{\frac{2L + j - 1}{2}} \sqrt{\frac{(L + l + j - 2)!}{(L - l)!}} [\sin \theta]^{2\pi j} \frac{1}{2L + j - 1} \cdot \left\{ P_{L + \frac{j - 2}{2}}^{-(l + \frac{j - 2}{2})} (\cos \theta) \right\} \]

\[ = \sqrt{\frac{2L + j - 1}{2}} \sqrt{\frac{(L + l + j - 2)!}{(L - l)!}} [\sin \theta]^{2\pi j} \frac{1}{2L + j - 1} \cdot \left\{ P_{L + \frac{j - 2}{2}}^{-(l + \frac{j - 2}{2})} (\cos \theta) \right\} \]

\[ = F(L, l, j) \overline{P}_{L+1}^{L} (\theta) + G(L, l, j) \overline{P}_{L-1}^{L} (\theta). \]

These last relations are fundamental, in fact they are used in order to understand the action of a coordinate \( t^h \) (seen as a multiplication operator) on a \( D \)-dimensional spherical harmonic \( Y_l \).

**Remark 1.** Let \( t^\pm := \frac{v^2}{\sqrt{2r}} \) and \( t^\nu := \frac{v^\nu}{r} \), when \( \nu \in \{1, 2, \ldots, D\} \); obviously \( t^+ t^- + t^- t^+ = (t^1)^2 + (t^2)^2 \), so (83)-(85) can be used to write \( t^h Y_l \) in terms of other \( D \)-dimensional spherical harmonics, for instance

\[ t^+ Y_l = \sin \theta_d \sin \theta_{d-1} \cdots \sin \theta_2 \sum_{n=2}^{d} \prod_{n=2}^{d} \overline{P}_{l_2}^{l_1} (\theta_n) \frac{1}{\sqrt{2\pi}} e^{i(l_1 + 1)\theta_1} ; \]

then in the product \( \sin (\theta_2) \cdot \overline{P}_{l_2}^{l_1} (\theta_2) \) it is necessary to use (83), because \( t^+ \) changes \( e^{i\theta_1} \) to
and this definition implies that, in general

\[ t^+ Y_l = \sin \theta_1 \sin \theta_2 \cdots \sin \theta_3 \left[ A(l_2, l_1, 2) 2P_{l_2+1}^l(\theta_1) + B(l_2, l_1, 2) 2P_{l_2+1}^{l+1}(\theta_1) \right] \cdot \prod_{n=3}^{d} P_{l_n+1}^{l_n-1}(\theta_n) \frac{1}{\sqrt{2\pi}} e^{i(l_1+1)\theta_1}, \]

and so on with the remaining factors \( \sin \theta_j \cdot P_{l_j}^{l_j-1}(\theta_j) \).

Of course, this last procedure can be repeated also for \( t^- \) and then for every \( t^\nu \) with \( \nu \in \{3, \ldots, D\} \), while the actions of \( t^1 \) and \( t^2 \) can be recovered from the ones of \( t^+ \) and \( t^- \).

According to this, let

\[ R_{h,D}(l; l') := \langle Y_{l'}, t^h Y_l \rangle \] (86)

and this definition implies that, in general

\[ t^\nu Y_l = \sum_{l'; |l_l - l'_l| = 1} R_{\nu,D}(l; l') \cdot Y_{l'}, \quad \text{where} \quad l' := (l', l'_d-1, \ldots, l'_\nu-1, l'_\nu-2, \ldots, l_1). \] (87)

Remark 1 and (86) suggest that every \( R_{\nu,D} \) can be written as a sum of elements, where every addend is a product of several \( A, B, C, D, F, G \); it is important to note that there are some simple rules, reported in the next lines, which help to calculate every \( R_{\nu,D} \).

The first rule is that the generic term of a \( R_{\nu,D} \) is always written in an ‘ordered’ way, in fact the factors appear in this ‘order’:

\[ R_{\nu,D}(\cdots; \cdots) = \cdots + \cdots D(l_{j+2}, l_{j+1}, j+2)B(l_{j+1}, l_j, j+1)A(l_j, l_{j-1}, j) \cdots + \cdots \]

in other words a factor having third argument \( j+1 \) is always right-multiplied by a factor having third argument \( j \) and always left-multiplied by a factor having there argument \( j+2 \).

**Remark 2.** The other rules are these ones:

- Every \( A(l_j, l_{j-1}, j) \) is always left-multiplied by an \( A(l_{j+1}, l_j, j+1) \) or \( B(l_{j+1}, l_j, j+1) \);
- Every \( B(l_j, l_{j-1}, j) \) is always left-multiplied by an \( C(l_{j+1}, l_j, j+1) \) or \( D(l_{j+1}, l_j, j+1) \);
- Every \( C(l_j, l_{j-1}, j) \) is always left-multiplied by an \( A(l_{j+1}, l_j, j+1) \) or \( B(l_{j+1}, l_j, j+1) \);
- Every \( D(l_j, l_{j-1}, j) \) is always left-multiplied by an \( C(l_{j+1}, l_j, j+1) \) or \( D(l_{j+1}, l_j, j+1) \);
- In \( R_{1,D} \) the first factor (from right to left) is \( A(l_2, l_1, 2) \), or \( B(l_2, l_1, 2) \), or \( C(l_2, l_1, 2) \), or \( D(l_2, l_1, 2) \);
- In \( R_{2,D} \) the first factor (from right to left) is \( A(l_2, l_1, 2) \), or \( B(l_2, l_1, 2) \), or \( C(l_2, l_1, 2) \), or \( D(l_2, l_1, 2) \);
- If \( \nu \geq 3 \), in order to calculate \( R_{\nu,D} \), it is better to start by using (85) with \( \theta = \theta_{\nu-1} \), and then go ‘backward’.
9.7 Proof of (33)\textsuperscript{1}

The definition 5.1 (which uses the \( R \) coefficients) allows to take the relations among the coordinates \( t^{\text{th}} \) (seen as multiplication operators) and obtain from them some relations among the components \( L_{h,j} \) of the \( D \)-dimensional angular momentum operator.

In particular,

\[
(t^1)^2 + (t^2)^2 + \cdots + (t^D)^2 = t^+t^- + t^-t^+ + (t^3)^2 + \cdots + (t^D)^2 = 1
\]

implies

\[
\left[ (t^1)^2 + (t^2)^2 + \cdots + (t^D)^2 \right] Y_I = Y_I; \tag{88}
\]

but (87) implies also that [here \( Z (l, l') \) are suitable coefficients, which can be obtained from the \( Rs \)]

\[
\left[ (t^1)^2 + (t^2)^2 + \cdots + (t^D)^2 \right] Y_I = \sum_{j=1, \ldots, d} \sum_{|l_j-l'_j| \leq 2} Z (l, l') Y_{l'}; \tag{89}
\]

in addition, (88) and (89) imply \( Z (l, l') = 0 \) if there is at least one \( j \) such that \( l_j \neq l'_j \). On the other hand, it is obvious that

\[
Z (l, l) =: Z (l) = 1; \tag{90}
\]

so only the \( Z (l) \) are relevant.

Remark 3. Equations (83)-(85) imply that

- if \( R_{h,D} (\cdots, l_j, l_{j-1}, \cdots; \cdots, l'_j, l'_{j-1}, \cdots) \) contains a factor \( A(l_j, l_{j-1}, j) \), then \( l'_j = l_j + 1 \) and \( l'_{j-1} = l_{j-1} + 1 \);
- if \( R_{h,D} (\cdots, l_j, l_{j-1}, \cdots; \cdots, l'_j, l'_{j-1}, \cdots) \) contains a factor \( B(l_j, l_{j-1}, j) \), then \( l'_j = l_j + 1 \) and \( l'_{j-1} = l_{j-1} + 1 \);
- if \( R_{h,D} (\cdots, l_j, l_{j-1}, \cdots; \cdots, l'_j, l'_{j-1}, \cdots) \) contains a factor \( C(l_j, l_{j-1}, j) \), then \( l'_j = l_j + 1 \) and \( l'_{j-1} = l_{j-1} - 1 \);
- if \( R_{h,D} (\cdots, l_j, l_{j-1}, \cdots; \cdots, l'_j, l'_{j-1}, \cdots) \) contains a factor \( D(l_j, l_{j-1}, j) \), then \( l'_j = l_j + 1 \) and \( l'_{j-1} = l_{j-1} - 1 \);
- if \( R_{h,D} (\cdots, l_j, l_{j-1}, \cdots; \cdots, l'_j, l'_{j-1}, \cdots) \) contains a factor \( F(l_j, l_{j-1}, j) \), then \( l'_j = l_j + 1 \) and \( l'_{j-1} = l_{j-1} - 1 \);
- if \( R_{h,D} (\cdots, l_j, l_{j-1}, \cdots; \cdots, l'_j, l'_{j-1}, \cdots) \) contains a factor \( G(l_j, l_{j-1}, j) \), then \( l'_j = l_j + 1 \) and \( l'_{j-1} = l_{j-1} - 1 \);

in other words, these \( A, B, C, D, F, G \) express that an index is raising or lowering, as in remark 1.
Furthermore
\[ 1 = t^+ t^- + t^- t^+ + (t^3)^2 + \cdots + (t^D)^2 \]
\[ = [\cos \theta_d]^2 + [\sin \theta_d]^2 \{ [\cos \theta_{d-1}]^2 + [\sin \theta_{d-1}]^2 \{ \cdots \{ [\cos \theta_2]^2 + [\sin \theta_2]^2 \} \cdots \} \} \]
implies
\[ \{ [\cos \theta_2]^2 + [\sin \theta_2]^2 \} Y_1 = \{ [F(l_2, l_1, 1, 2)]^2 + [A(l_2, l_1, 1, 2)]^2 + [C(l_2, l_1, 1, 2)]^2 \]
\[ + [G(l_2, l_1, 1, 2)]^2 + [B(l_2, l_1, 1, 2)]^2 + [D(l_2, l_1, 1, 2)]^2 \}
\[ \cdot Y_1 \]
\[ =: \{ Z_{1,2} (l_2) + Z_{2,2} (l_2) \} Y_1; \]
while remark 2 implies
\[ \{ [\cos \theta_3]^2 + [\sin \theta_3]^2 \{ [\cos \theta_2]^2 + [\sin \theta_2]^2 \} \} Y_1 = \]
\[ \{ [F(l_3, l_2, 3)]^2 + [A(l_3, l_2, 3)]^2 Z_{1,2} (l_2) + [C(l_3, l_2, 3)]^2 Z_{2,2} (l_2) \]
\[ + [G(l_3, l_2, 3)]^2 + [B(l_3, l_2, 3)]^2 Z_{1,2} (l_2) + [D(l_3, l_2, 3)]^2 Z_{2,2} (l_2) \}
\[ \cdot Y_1 \]
\[ =: \{ Z_{1,3} (l_3, l_2) + Z_{2,3} (l_3, l_2) \} Y_1; \]
and so on with the other elements of (91), so
\[ \{ [\cos \theta_j]^2 + [\sin \theta_j]^2 \{ [\cos \theta_{j-1}]^2 + [\sin \theta_{j-1}]^2 \{ \cdots \{ [\cos \theta_2]^2 + [\sin \theta_2]^2 \} \cdots \} \} Y_1 = \]
\[ \{ [F(l_j, l_{j-1}, j)]^2 + [A(l_j, l_{j-1}, j)]^2 Z_{1,j-1} (l_{j-1}, l_{j-2}, \cdots, l_2) + [C(l_j, l_{j-1}, j)]^2 Z_{2,j-1} (l_{j-1}, l_{j-2}, \cdots, l_2) \]
\[ + [G(l_j, l_{j-1}, j)]^2 + [B(l_j, l_{j-1}, j)]^2 Z_{1,j-1} (l_{j-1}, l_{j-2}, \cdots, l_2) + [D(l_j, l_{j-1}, j)]^2 Z_{2,j-1} (l_{j-1}, l_{j-2}, \cdots, l_2) \}
\[ \cdot Y_1 \]
\[ =: \{ Z_{1,j} (l_j, l_{j-1}, \cdots, l_2) + Z_{2,j} (l_j, l_{j-1}, \cdots, l_2) \} Y_1. \]
\[ (94) \]

It is important to underline that every \( Z_{h,j} \) defined above does not depend on the dimension \( D \) of the ambient space, and this is a direct consequence of the factorization in (60).

A crucial result of this section is the following

**Proposition 9.3.**
\[ Z_{1,d} (l) = \frac{l + d - 1}{2l + d - 1}, \quad Z_{2,d} (l) = \frac{l}{2l + d - 1}. \]
\[ (95) \]

**Proof.** The proof is by induction on the dimension \( D \) of the carrier space \( \mathbb{R}^D \). If \( D = 3 \), then
\[ t^+ Y_{l_2,l_1} = A(l_2, l_1, 2) Y_{l_2+1,l_1+1} + B(l_2, l_1, 2) Y_{l_2-1,l_1+1}, \]
\[ t^- Y_{l_2,l_1} = C(l_2, l_1, 2) Y_{l_2+1,l_1-1} + D(l_2, l_1, 2) Y_{l_2-1,l_1-1}, \]
\[ t^3 Y_{l_2,l_1} = F(l_2, l_1, 2) Y_{l_2+1,l_1} + G(l_2, l_1, 2) Y_{l_2-1,l_1}; \]
and
\[
\left[ t^+t^- + t^-t^+ + (t^3)^2 \right] Y_{t_2,t_1} = \left\{ \frac{1}{2} [A(l_2,l_1,2)]^2 + \frac{1}{2} [B(l_2,l_1,2)]^2 + \frac{1}{2} [C(l_2,l_1,2)]^2 + \frac{1}{2} [D(l_2,l_1,2)]^2 + [F(l_2,l_1,2)]^2 + [G(l_2,l_1,2)]^2 \right\} Y_{t_2,t_1}.
\]

so
\[
Z_{1,2}(l_2) = \frac{l_2 + 3 - 3}{2l_2 + 3 - 3} = \frac{1}{2}, \quad Z_{2,2}(l_2) = \frac{l_2}{2l_2 + 3 - 3} = \frac{1}{2},
\]
then (95) is true when \( D = 3 \). Let \( D > 3 \) and assume that (95) is true for \( D - 1 \), from (94) it follows
\[
Z_{1,d}(l,l_{d-1},\cdots,l_2) = [F(l,l_{d-1},d)]^2 \]
\[
+ [A(l,l_{d-1},d)]^2 Z_{1,d-1}(l_{d-1},l_{d-2},\cdots,l_2)
\]
\[
+ [C(l,l_{d-1},d)]^2 Z_{2,d-1}(l_{d-1},l_{d-2},\cdots,l_2)
\]
\[
(1 + l_{d-1} + d - 1)(l - l_{d-1} + 1)
\]
\[
(2l + d - 1)(2l + D)
\]
\[
+ \frac{(l + l_{d-1} + d - 1)(l + l_{d-1} + d)}{2l_{d-1} + d - 2}
\]
\[
+ \frac{(l - l_{d-1} + 2)(l - l_{d-1} + 1)}{2l + d - 1)(2l + D)}
\]
\[
= \frac{l + d - 1}{2l + d - 1};
\]
and
\[
Z_{2,d}(l,l_{d-1},\cdots,l_2) = [G(l,l_{d-1},d)]^2
\]
\[
+ [B(l,l_{d-1},d)]^2 Z_{1,d-1}(l_{d-1},l_{d-2},\cdots,l_2)
\]
\[
+ [D(l,l_{d-1},d)]^2 Z_{2,d-1}(l_{d-1},l_{d-2},\cdots,l_2)
\]
\[
(1 - l_{d-1})(l + l_{d-1} + d - 2)
\]
\[
(2l + d - 1)(2l + D - 4)
\]
\[
+ \frac{(l - l_{d-1} - 1)(l - l_{d-1})}{2l + d - 1)(2l + D - 4)(2l_{d-1} + d - 2)}
\]
\[
+ \frac{(l + l_{d-1} + d - 2)(l + l_{d-1} + D - 4)}{2l + d - 1)(2l + D - 4)}
\]
\[
= \frac{l}{2l + d - 1};
\]
so the proof is finished. 

It is interesting to note that, because of this last proposition,
\[
Z_{1,d}(l) + Z_{2,d}(l) = 1,
\]
which agrees with
\[
Y_l = \left[ t^+ t^- + t^- t^+ + (t^3)^2 + \cdots + (t^D)^2 \right] Y_l = \{Z_{1,d}(l) + Z_{2,d}(l)\} Y_l. \tag{99}
\]

Here comes the proof of (33).$_1$.

**Theorem 9.2.** The definition 5.1 implies
\[
L^2 Y_l := \sum_{1 \leq i < j \leq D} L^2_{h,j} Y_l = l (l + D - 2) Y_l. \tag{100}
\]

**Proof.** This proof is by induction on the dimension $D$ of the carrier space; if $D = 2$, then
\[
L^2 Y_l = L^2_{1,2} Y_l = (l_1)^2 Y_l;
\]
so (100) is true for $D = 2$. Let $D > 2$ and assume that (100) is true for $D - 1$, which means that
\[
\sum_{1 \leq i < j \leq D} L^2_{h,j} Y_l = l_{d-1} (l_{d-1} + D - 3) Y_l. \tag{101}
\]

From remark 3, proposition 9.3 and definition 5.1 it follows
\[
\sum_{i=1}^{d} L^2_{h,D} Y_l = (d_{l_{d-1},d})^2 Z_{2,d-1} (l_{d-1}, \cdots, l_1) Y_l
\]
\[
+ (d_{l_{d-1+1,d}})^2 Z_{1,d-1} (l_{d-1}, \cdots, l_1) Y_l
\]
\[
= \left\{ [l + 1](l + D - 3) - l_{d-1}(l_{d-1} + D - 4) \right\} \frac{l_{d-1}}{2l_{d-1} + D - 3} Y_l
\]
\[
+ \left\{ [(l + 1)(l + D - 3) - (l_{d-1} + 1)(l_{d-1} + D - 3)] \frac{l_{d-1} + D - 3}{2l_{d-1} + D - 3} \right\} Y_l
\]
\[
= [l (l + D - 2) - l_{d-1} (l_{d-1} + D - 3)] Y_l.
\]

The proof can be now completed because
\[
L^2 Y_l = \sum_{1 \leq h < j \leq D} L^2_{h,j} Y_l = \sum_{1 \leq h < j \leq d} L^2_{h,j} Y_l + \sum_{j=1}^{d} L^2_{j,D} Y_l \overset{(101) \& (102)}{=} l (l + D - 2) Y_l. \tag{103}
\]

\[\square\]

**9.8 Proof of (33)$_2$**

The definition 5.1 is given by induction on the dimension $D$ of the carrier space $\mathbb{R}^D$, this means that, in order to prove (33)$_2$, it is sufficient to show that
\[
[L_{h,D}, L_{j,D}] = i L_{h,j} \quad [L_{h,j}, L_{j,D}] = \frac{1}{i} L_{h,D},
\]
\[
[L_{h,j}, L_{p,D}] = 0 \text{ if } D \neq h,j \text{ and } p \neq h,j. \tag{104}
\]
9.8.1 Proof of (104)_1

Let \( h < j \), of course \([t^h, t^j]Y_t = 0 \) \( \forall h, j \), but this and (87) can be used to obtain some informations about the action of \([L_{h,D}, L_{j,D}]\) on a spherical harmonic \( Y_t \).

It is important to point out that

**Remark 4.** Let \( 1 \leq h < j \leq d \), then \( t^h t^j Y_{l_{d-1}, l_{d-2}, \ldots, l_1} \) can be written as a linear combination of \((D-1)\)-dimensional spherical harmonics \( Y_{l_{d-1}, \ldots, l_1} \) with, in principle, \( |l_h - l'_h| \leq 2 \), \( \forall h \leq d - 1 \).

More precisely, \( t^h \) on \( Y_{l_{d-1}, l_{d-2}, \ldots, l_1} \), ‘modifies’ only the integers \( l_{d-1}, \ldots, l_{h-1} \), while \( t^j \) ‘modifies’ only \( l_{d-1}, \ldots, l_{j-1} \). Then the ‘modified’ integers from the action of \( t^h t^j \), as the ones from the action of \( t^j t^h \), are \( l_{d-1}, \ldots, l_{h-1} \) and, in particular, \( |l_p - l'_p| \leq 2 \) if \( p \in \{d - 1, \ldots, j - 1\} \), while \( |l_p - l'_p| = 1 \) if \( p \in \{j - 1, \ldots, h - 1\} \).

Then

\[
0 = [t^h, t^j] Y_{d} = \sum_{|l'_p - l_p| \leq 2, \begin{smallmatrix} p_1 = d-1, \ldots, j-1 \\ p_2 = j-2, \ldots, h-1 \end{smallmatrix}} Q_{D,h,j}(d l, d l'_h) Y_{d l'_h}, \tag{105}
\]

where

\[
d l := (l_{d-1}, \ldots, l_1) \quad \text{and} \quad d l'_h := (l'_{d-1}, \ldots, l'_{h-2}, \ldots, l_1).
\]

Anyway, the definition 5.1 implies that the action of \( L_{h,D} \) on \( Y_t \) is similar to the action of the coordinate \( t^h \) on \( Y_d \), the only difference is given by the presence of the \( d \) coefficients; so

\[
[L_{h,D}, L_{j,D}] Y_t = \sum_{|l'_p - l_p| \leq 2, \begin{smallmatrix} p_1 = d-1, \ldots, j-1 \\ p_2 = j-2, \ldots, h-1 \end{smallmatrix}} \bar{Q}_{D,h,j}(l, l'_h) Y_{l'_h}, \tag{106}
\]

where

\[
l'_h := (l, l'_{d-1}, \ldots, l'_{h-2}, \ldots, l_1).
\]

It is necessary to prove the following

**Proposition 9.4.**

\[
\bar{Q}_{D,h,j}(l, l'_h) = 0
\]

if there exists at least one \( p \in \{d - 1, \ldots, j - 1\} \) such that \( |l_p - l'_p| = 2 \).

**Proof.** First of all, if \( l_{d-1} \neq l'_{d-1} \), for example \( l'_{d-1} = l_{d-1} + 2 \) (the case \( l'_{d-1} = l_{d-1} - 2 \) is similar), then

\[
\bar{Q}_{D,h,j}(l, l'_h) = - d_{l,l_{d-1}+1} \bar{Q}_{D,h,j}(l, l'_h),
\]

but \( Q_{D,h,j}(l, l'_h) = 0 \) because of (105), and this implies \( \bar{Q}_{D,h,j}(l, l'_h) = 0 \).
Furthermore, if \( j \leq d-1 \) and \( l_{d-1} = l'_d-1 \), while \( l'_{d-2} = l_{d-2} + 2 \) (the case \( l'_{d-2} = l_{d-2} - 2 \) is similar), then it must be

\[
\langle Y_{l'_h}, L_{h,D} L_j D Y_l \rangle = [d_{l,l'_h,1,D} B (l_{d-1}, l_{d-2}, d-1) d_{l,l'_h,1,D} A (l_{d-1}, l_{d-2} + 1, d-1]
\]

for a certain function \( g \) and, similarly,

\[
\langle Y_{l'_h}, L_{j,D} L_h D Y_l \rangle = [d_{l,l'_h,1,D} B (l_{d-1}, l_{d-2}, d-1) d_{l,l'_h,1,D} A (l_{d-1}, l_{d-2} + 1, d-1)
\]

for the same function \( g \), because \( Q_{D,h,j}(l,l'_h) = 0 \); so, also in this case \( \tilde{Q}_{D,h,j}(l,l'_h) = 0 \).

In general, if there is a \( p \in \{d-1, \cdots, j+1\} \) such that \( l'_{p-1} = l_{p-1} + 2 \) (the case \( l'_{p-1} = l_{p-1} - 2 \) is similar), while \( l_q = l'_q \) \( \forall q \geq p \), then

\[
\langle Y_{l'_h}, L_{j,D} L_h D Y_l \rangle = g_1 (l, l_{d-1}, \cdots, l_p)
\]

and

\[
\langle Y_{l'_h}, L_{j,D} L_h D Y_l \rangle = g_1 (l, l_{d-1}, \cdots, l_p)
\]

for the same functions \( g_1 \) (because \( l_q = l'_q \) \( \forall q \geq p \)) and \( g_2 \) [because \( Q_{D,h,j}(l,l'_h) = 0 \)]; so, also in this case, \( \tilde{Q}_{D,h,j}(l,l'_h) = 0 \).

Finally, if \( l'_{j-1} = l_{j-1} + 2 \) (the case \( l'_{j-1} = l_{j-1} - 2 \) is similar), \( l'_{j-2} = l_{j-2} + 1 \) (also here, the case \( l'_{j-2} = l_{j-2} - 1 \) is similar), while \( l_q = l'_q \forall q \geq j \), then

\[
\langle Y_{l'_h}, L_{j,D} L_h D Y_l \rangle = g_3 (l, l_{d-1}, \cdots, l_j)
\]

and

\[
\langle Y_{l'_h}, L_{j,D} L_h D Y_l \rangle = g_3 (l, l_{d-1}, \cdots, l_j)
\]

for the same functions \( g_3 \) (because \( l_q = l'_q \forall q \geq j \)) and \( g_4 \) [because \( Q_{D,h,j}(l,l'_h) = 0 \)]; so, because of (82), \( \tilde{Q}_{D,h,j}(l,l'_h) = 0 \).
The last proof implies

$$[L_{h,D}, L_{j,D}] Y_l = \sum_{|l'_p - l_p| = 1 \atop p = j - 2, \ldots, h - 1} \tilde{Q}_{D,h,j} (l, l'_h) Y_{l'_h}, \quad (107)$$

and from now on assume that $l'_p = l_p \forall p \geq j - 1$, otherwise $\tilde{Q}_{D,h,j} (l, l'_h) = 0$.

It is necessary to further investigate about these

$$\tilde{Q}_{D,h,j} (l, l'_h) \quad \text{when } |l'_p - l_p| = 1, p \in \{j - 2, \ldots, h - 1\}.$$ 

In order to do this, let

$$T_1^1(l_p, l_{p-1}, p) := A(l_p, l_{p-1}, p)G(l_p + 1, l_{p-1} + 1, p) - F(l_p, l_{p-1}, p)B(l_p + 1, l_{p-1}, p),$$

$$T_2^1(l_p, l_{p-1}, p) := B(l_p, l_{p-1}, p)F(l_p - 1, l_{p-1} + 1, p) - G(l_p, l_{p-1}, p)A(l_p - 1, l_{p-1}, p),$$

$$T_3^1(l_p, l_{p-1}, p) := C(l_p, l_{p-1}, p)G(l_p + 1, l_{p-1} - 1, p) - F(l_p, l_{p-1}, p)D(l_p + 1, l_{p-1}, p),$$

$$T_4^1(l_p, l_{p-1}, p) := D(l_p, l_{p-1}, p)F(l_p - 1, l_{p-1} - 1, p) - G(l_p, l_{p-1}, p)C(l_p - 1, l_{p-1}, p);$$

they fulfill

$$T_1^1(l_p, l_{p-1}, p) = \frac{\sqrt{(l_p + l_{p-1} + p - 1)(l_p - l_{p-1})}}{2l_p + p - 1} = \frac{d_{l_p,l_{p-1}+1,p+1}}{2l_p + p - 1},$$

$$T_2^1(l_p, l_{p-1}, p) = -\frac{\sqrt{(l_p + l_{p-1} + p - 1)(l_p - l_{p-1})}}{2l_p + p - 1} = -\frac{d_{l_p,l_{p-1}+1,p+1}}{2l_p + p - 1},$$

$$T_3^1(l_p, l_{p-1}, p) = -\frac{\sqrt{(l_p + l_{p-1} + p - 2)(l_p - l_{p-1} + 1)}}{2l_p + p - 1} = \frac{d_{l_p,l_{p-1}+p+1}}{2l_p + p - 1},$$

$$T_4^1(l_p, l_{p-1}, p) = \frac{\sqrt{(l_p + l_{p-1} + p - 2)(l_p - l_{p-1} + 1)}}{2l_p + p - 1} = \frac{d_{l_p,l_{p-1}+p+1}}{2l_p + p - 1}.$$
Similarly, for \( n \geq 2 \), let

\[
T^n_1(l_{p+n-1}, l_p, l_{p-1}, p) := [A(l_{p+n-1}, l_{p+n-2}, p + n - 1)]^2 T^{n-1}_{1}(l_{p+n-2}, l_p, l_{p-1}, p) \\
+ [C(l_{p+n-1}, l_{p+n-2}, p + n - 1)]^2 T^{n-1}_{2}(l_{p+n-2}, l_p, l_{p-1}, p) \\
= \frac{d_{l_p,l_{p-1}+1,p+1}}{2l_{p+n-1} + p + n - 2},
\]

\[
T^n_2(l_{p+n-1}, l_p, l_{p-1}, p) := [B(l_{p+n-1}, l_{p+n-2}, p + n - 1)]^2 T^{n-1}_{1}(l_{p+n-2}, l_p, l_{p-1}, p) \\
+ [D(l_{p+n-1}, l_{p+n-2}, p + n - 1)]^2 T^{n-1}_{2}(l_{p+n-2}, l_p, l_{p-1}, p) \\
= -\frac{d_{l_p,l_{p-1}+1,p+1}}{2l_{p+n-1} + p + n - 2},
\]

\[
T^n_3(l_{p+n-1}, l_p, l_{p-1}, p) := [A(l_{p+n-1}, l_{p+n-2}, p + n - 1)]^2 T^{n-1}_{3}(l_{p+n-2}, l_p, l_{p-1}, p) \\
+ [C(l_{p+n-1}, l_{p+n-2}, p + n - 1)]^2 T^{n-1}_{4}(l_{p+n-2}, l_p, l_{p-1}, p) \\
= -\frac{d_{l_p,l_{p-1}+1,p+1}}{2l_{p+n-1} + p + n - 2},
\]

\[
T^n_4(l_{p+n-1}, l_p, l_{p-1}, p) := [B(l_{p+n-1}, l_{p+n-2}, p + n - 1)]^2 T^{n-1}_{3}(l_{p+n-2}, l_p, l_{p-1}, p) \\
+ [D(l_{p+n-1}, l_{p+n-2}, p + n - 1)]^2 T^{n-1}_{4}(l_{p+n-2}, l_p, l_{p-1}, p) \\
= -\frac{d_{l_p,l_{p-1}+1,p+1}}{2l_{p+n-1} + p + n - 2}.
\]

Assume (without loss of generality) that \( l'_{j-2} = l_{j-2} - 1 \), then

\[
\bar{Q}_{D,h,j} (l, l'_h) = \left\{ (d_{l,l_{d-1}+1,D})^2 \left\{ [A(l_{d-1}, l_{d-2}, d-1)]^2 \left\{ [A(l_{d-2}, l_{d-3}, D-3)]^2 \{ \cdots \} \\
+ [C(l_{d-2}, l_{d-3}, D-3)]^2 \{ \cdots \} \right\} \\
+ [C(l_{d-1}, l_{d-2}, d-1)]^2 \left\{ [B(l_{d-2}, l_{d-3}, D-3)]^2 \{ \cdots \} \\
+ [D(l_{d-2}, l_{d-3}, D-3)]^2 \{ \cdots \} \right\} \right\} \\
+ (d_{l,l_{d-1},D})^2 \left\{ [B(l_{d-1}, l_{d-2}, d-1)]^2 \left\{ [A(l_{d-2}, l_{d-3}, D-3)]^2 \{ \cdots \} \\
+ [C(l_{d-2}, l_{d-3}, D-3)]^2 \{ \cdots \} \right\} \\
+ [D(l_{d-1}, l_{d-2}, d-1)]^2 \left\{ [B(l_{d-2}, l_{d-3}, D-3)]^2 \{ \cdots \} \\
+ [D(l_{d-2}, l_{d-3}, D-3)]^2 \{ \cdots \} \right\} \right\} \right\} \\
\cdot R_{h,j-1} (l|_{j,h}, \bar{v}'_{j,h}) ,
\]

(110)

where

\[
l|_{j,h} := (l_{j-2}, \cdots, l_{h-1}, l_{h-2}) , \quad \bar{v}'_{j,h} := (l'_{j-2} - 1, \cdots, l'_{h-1}, l_{h-2}) .
\]

**Remark 5.** The \{ \cdots \} in (110) is such that

- every \([A(l_h, l_{h-1}, h)]^2\) is always left-multiplied by \([A(l_{h+1}, l_h, h+1)]^2\) or \([B(l_{h+1}, l_h, h+1)]^2\);
• every \([B(l_h, l_{h-1}, h)]^2\) is always left-multiplied by \([C(l_{h+1}, l_h, h+1)]^2\) or \([D(l_{h+1}, l_h, h+1)]^2\);
• every \([C(l_h, l_{h-1}, h)]^2\) is always left-multiplied by \([A(l_{h+1}, l_h, h+1)]^2\) or \([B(l_{h+1}, l_h, h+1)]^2\);
• every \([D(l_h, l_{h-1}, h)]^2\) is always left-multiplied by \([C(l_{h+1}, l_h, h+1)]^2\) or \([D(l_{h+1}, l_h, h+1)]^2\);
• the most 'internal' term of \(\{\cdots\}\) is \(T_p(l_{j-1}, l_{j-2}, j)\), with \(p \in \{1, 2, 3, 4\}\);
• every \(T_1^1(l_{j-1}, l_{j-2}, j)\) and \(T_2^2(l_{j-1}, l_{j-2}, j)\) are always left-multiplied by \([A(l_j, l_{j-1}, j)]^2\) or \([B(l_j, l_{j-1}, j)]^2\);
• every \(T_3^1(l_{j-1}, l_{j-2}, j)\) and \(T_4^1(l_{j-1}, l_{j-2}, j)\) are always left-multiplied by \([C(l_j, l_{j-1}, b)]^2\) or \([D(l_j, l_{j-1}, j)]^2\).

This and (109) imply
\[
\tilde{Q}_{D,h,j}(l, l'_h) = \left\{ (d_{l,l_{d-1}+1,D})^2 \left\{ [A(l_{d-1}, l_{D-3}, D-2)]^2 T_3^{D-j-1}(l_{D-3}, l_{j-1}, l_{j-2}, j-1) \\
+ [C(l_{d-1}, l_{D-3}, D-2)]^2 T_4^{D-j-1}(l_{D-3}, l_{j-1}, l_{j-2}, j-1) \right\} \right. \\
+ (d_{l,l_{d-1},D})^2 \left\{ [B(l_{d-1}, l_{D-3}, D-2)]^2 T_3^{D-j-1}(l_{D-3}, l_{j-1}, l_{j-2}, j-1) \\
+ [D(l_{d-1}, l_{D-3}, D-2)]^2 T_4^{D-j-1}(l_{D-3}, l_{j-1}, l_{j-2}, j-1) \right\} \left. \right) \cdot R_{h,j-1}(l_{j,h}, \tilde{u}_{j,h}) \\
\overset{(109)}{=} \left[ - (d_{l,l_{d-1}+1,D})^2 + (d_{l,l_{d-1},D})^2 \right] \frac{d_{l_{j-1}l_{j-2}j}}{2l_{d-1} + D - 3} R_{h,j-1}(l_{j,h}, \tilde{u}_{j,h}) \\
= d_{l_{j-1}l_{j-2}j} R_{h,j-1}(l_{j,h}, \tilde{u}_{j,h});
\]

(111)

and this proves the following

**Theorem 9.3.** The equation (110), using the rules of remark 5, becomes
\[
\tilde{Q}_{D,h,j}(l, l'_h) = d_{l_{j-1}l_{j-2}j} R_{h,j-1}(l_{j,h}, \tilde{u}_{j,h}).
\]

(112)

The same job can be done with the assumption \(l'_{j-2} = l_{j-2} + 1\), in this case the result is an equation like (110), but with \(T_1\) and \(T_2\) instead of \(T_3\) and \(T_4\), respectively; and in this case it turns out that
\[
\tilde{Q}_{D,h,j}(l, l'_h) = -d_{l_{j-1}l_{j-2+1}j} \cdot R_{h,j-1}(l_{j,h}, \tilde{u}_{j,h}),
\]

(113)

where \(\tilde{u} := (l_{j-2} + 1, \cdots, l'_{h-1}, l_{h-2})\).

Finally, definition 5.1 and (112-113) imply
\[
[L_{h,D}, L_{j,D}] = i L_{h,j}.
\]

(114)
9.8.2 Proof of (104)\textsubscript{2} and (104)\textsubscript{3}

Let \(1 \leq h < j \leq d\), the definition 5.1 implies that the action of \(L_{j,D}\) in \(\mathbb{R}^D\) is the same of \(t^j\) in \(\mathbb{R}^d\), the only difference is given by the \(\frac{1}{i}d_{l',l-1,D}\) coefficients and their signs (here \(l'_{d-1} = l_{d-1}\) or \(l'_{d-1} = l_{d-1} + 1\)), but anyway the action of \(L_{h,j}\) on a \(Y_l\) does not change the indices \(l\) and \(l_{d-1}\).

According to this and (39), from

\[
[L_{h,j}, x^j] = \frac{1}{i} x^h
\]

it follows

\[
[L_{h,j}, L_{j,D}] = \frac{1}{i} L_{h,D},
\]

and from

\[
[L_{h,j}, x^p] = 0 \text{ if } p \neq h, j
\]

it follows

\[
[L_{h,j}, L_{p,D}] = 0 \text{ if } D \neq h, j \text{ and } p \neq h, j.
\]

9.9 On the action of ‘projected’ coordinate operators \(\overline{x}^h\)

The behavior (29)-(30) of a generic \(\psi_{l,D}\) and the expression of the integration measure \(d\mathbf{x}\) of \(\mathbb{R}^D\) in spherical coordinates

\[
d\mathbf{x} = r^{D-1} \sin^{d-1}(\theta_d) \sin^{d-2}(\theta_{d-1}) \cdots \sin(\theta_2) dr d\theta_1 d\theta_2 \cdots d\theta_d
\]

allow to factorize the scalar product \(\langle \psi_{\nu,D}, \overline{x}^h \psi_{l,D} \rangle_{\mathbb{R}^D}\) in this way:

\[
\langle \psi_{\nu,D}, \overline{x}^h \psi_{l,D} \rangle = \langle f_{0,\nu,D}, r f_{0,l,D} \rangle_{\mathbb{R}^+} \cdot \langle Y_{\nu}, t^h Y_l \rangle_{S^d},
\]

where

\[
\langle f_{0,\nu,D}, r f_{0,l,D} \rangle_{\mathbb{R}^+} := M_{l,D} M_{\nu,D} \int_0^{\infty} r e^{-\sqrt{k_{l,D}k_{\nu,D}}(r-\tilde{r}_{l,D})^2} e^{\sqrt{k_{l,D}k_{\nu,D}}(r-\tilde{r}_{\nu,D})^2} dr,
\]

while the value of the ‘angular’ scalar product

\[
\langle Y_{\nu}, t^h Y_l \rangle_{S^d} = \int_{S^d} Y_{\nu}^* t^h Y_l [\sin^{d-1}(\theta_d) \sin^{d-2}(\theta_{d-1}) \cdots \sin(\theta_2)] d\theta_1 d\theta_2 \cdots d\theta_d
\]

is

\[
\langle Y_{\nu}, t^h Y_l \rangle_{S^d} = R_{h,D}(l, l'),
\]

according to sections 9.3 and 9.6.

On the other hand, as for section 6.6 in [1],

\[
\langle f_{0,l\pm 1,D}, r f_{0,l,D} \rangle_{\mathbb{R}^+} = M_{l,D} M_{l\pm 1,D} e^{-\sqrt{k_{l,D}k_{l\pm 1,D}}(\tilde{r}_{l,D}-\tilde{r}_{l\pm 1,D})^2} \frac{2\pi}{\sqrt{k_{l,D} + k_{l\pm 1,D}}} \tilde{r}_{l,l\pm 1,D};
\]

with

\[
\tilde{r}_{l,l\pm 1,D} = \frac{\sqrt{k_{l,D}} \tilde{r}_{l,D} + \sqrt{k_{l\pm 1,D}} \tilde{r}_{l\pm 1,D}}{\sqrt{k_{l,D} + k_{l\pm 1,D}}}.
\]
Then, in order to calculate \( \langle f_{0,l\pm 1,D}, r f_{0,l,D} \rangle_{R^+} \) at leading orders in \( 1/\sqrt{k} \), the following steps are needed.

First of all

\[
\tilde{r}_{l,D} = 1 + \frac{b(l, D)}{2k} - 3 \frac{[b(l, D)]^2}{4k^2} + 9 \frac{[b(l, D)]^3}{8k^3} - \frac{27 [b(l, D)]^4}{16k^4} + O \left( k^{-5} \right); \tag{117}
\]

while

\[
\sqrt{k_{l,D}} = \sqrt{2k} + \frac{3}{2\sqrt{2k}} b(l, D) - \frac{9}{8} \frac{[b(l, D)]^2}{2k} + \frac{27 [b(l, D)]^3}{16 k^2 \sqrt{2k}} - \frac{405 [b(l, D)]^4}{128 8k^3 \sqrt{2k}} + O \left( k^{-4} \right), \tag{118}
\]

implies

\[
\sqrt{k_{l,D} k_{l\pm 1,D}} = 2k + \frac{3}{2} b(l, D) + b(l \pm 1, D) - \frac{9}{8} \frac{[b(l, D) - b(l \pm 1, D)]^2}{2k} + \frac{27 [b(l, D)]^3 + [b(l \pm 1, D)]^3 - [b(l, D)]^2 [b(l \pm 1, D)]}{4k^2} - \frac{405 [b(l, D)]^4 + [b(l \pm 1, D)]^4}{128 8k^3 \sqrt{2k}} + O \left( k^{-3} \right), \tag{119}
\]

\[
\sqrt{k_{l,D} + k_{l\pm 1,D}} = 2\sqrt{2k} + \frac{3}{2} b(l, D) + b(l \pm 1, D) - \frac{9}{8} \frac{\{ [b(l, D)]^2 + [b(l \pm 1, D)]^2 \}}{2k \sqrt{2k}} + \frac{27 \{ [b(l, D)]^3 + [b(l \pm 1, D)]^3 \}}{4k^2 \sqrt{2k}} - \frac{405 \{ [b(l, D)]^4 + [b(l \pm 1, D)]^4 \}}{128 8k^3 \sqrt{2k}} + O \left( k^{-3} \right), \tag{120}
\]

\[
\sqrt{k_{l,D} + k_{l\pm 1,D}} = \sqrt{2} \sqrt{2k} + \frac{3}{8} \frac{\sqrt{2} b(l, D) + b(l \pm 1, D)}{(2k)^{\frac{3}{2}}} - \frac{45 \sqrt{2} [b(l, D)]^2 + [b(l \pm 1, D)]^2 + \frac{7}{8} b(l, D) b(l \pm 1, D)}{128 (2k)^{\frac{4}{3}}} - \frac{567 \sqrt{2} [b(l, D)]^3 + [b(l + 1, D)]^2 + \frac{1}{3} [b(l, D)]^2 b(l \pm 1, D) + \frac{1}{3} b(l, D) [b(l \pm 1, D)]^2}{1024 (2k)^{\frac{11}{4}}} + O \left( k^{-3} \right),
\]
\[
\frac{1}{\sqrt{\sqrt{k_{l,D}} + \sqrt{k_{l\pm 1,D}}}} = \frac{1}{\sqrt{\sqrt{2\sqrt{2k}}} - \frac{3\sqrt{2} b(l, D) + b(l \pm 1, D)}{16 (2k)^{3/2}}}
\]
\[+ \frac{63\sqrt{2}}{256} \frac{{[b(l, D)]^2 + [b(l \pm 1, D)]^2 + \frac{3}{5} b(l, D)b(l \pm 1, D)}}{(2k)^{3/2}} + O(k^{-3}). \tag{121}\]

So, from (80) and (119), it follows
\[
\sqrt{\pi} M_{l,D} M_{l\pm 1,D} = \sqrt{k_{l,D} k_{l\pm 1,D}} = \sqrt{2k} + \frac{3}{8} \frac{[b(l, D) + b(l \pm 1, D)]}{(2k)^{3/2}}
\]
\[- \frac{63}{128} \frac{[b(l, D)]^2 + [b(l \pm 1, D)]^2 - \frac{2}{5} b(l, D)b(l \pm 1, D)}{(2k)^{3/2}}
\]
\[+ \frac{945}{1024} \frac{[b(l, D)]^3 + [b(l \pm 1, D)]^3 - \frac{1}{5} [b(l, D)]^2 b(l \pm 1, D)}{(2k)^{3/2}}
\]
\[- \frac{1}{5} \frac{[b(l \pm 1, D)]^2 b(l, D)}{(2k)^{11/4}} + O(k^{-3}), \tag{122}\]

and then
\[
M_{l,D} M_{l\pm 1,D} \sqrt{\sqrt{k_{l,D} + \sqrt{k_{l\pm 1,D}}} \left(121\right)} = 1 - \frac{9}{64} \frac{[b(l, D) - b(l \pm 1, D)]^2}{4k^2} + O(k^{-3}). \tag{123}\]

Furthermore, from
\[
\sqrt{k_{l,D} \tilde{r}_{l,D}} \left(117\right) \left(118\right) \equiv \sqrt{2k} + \frac{5 b(l, D)}{2\sqrt{2k}} - \frac{21}{8} \frac{[b(l, D)]^2}{2k\sqrt{2k}} + \frac{81}{16} \frac{[b(l, D)]^3}{4k^2\sqrt{2k}} + O(k^{-3}),
\]

it follows
\[
\sqrt{k_{l,D} \tilde{r}_{l,D}} + \sqrt{k_{l+1,D} \tilde{r}_{l+1,D}} = 2\sqrt{2k} + \frac{5 [b(l, D) + b(l \pm 1, D)]}{2\sqrt{2k}} - \frac{21}{8} \frac{\left\{ [b(l, D)]^2 + [b(l \pm 1, D)]^2 \right\}}{2k\sqrt{2k}}
\]
\[+ \frac{81}{16} \frac{\left\{ [b(l, D)]^3 + [b(l \pm 1, D)]^3 \right\}}{4k^2\sqrt{2k}} + O(k^{-3});
\]

then the last equalities and (116) imply
\[
\tilde{r}_{l\pm 1,D} = 1 + \frac{1}{2} \frac{b(l, D) + b(l \pm 1, D)}{2k} - \frac{9}{8} \frac{[b(l, D)]^2 + [b(l \pm 1, D)]^2 + \frac{2}{3} b(l, D)b(l \pm 1, D)}{4k^2}
\]
\[+ O(k^{-3}); \tag{124}\]

Similarly,
\[
(\tilde{r}_{l,D} - \tilde{r}_{l\pm 1,D})^2 \left(117\right) \frac{[b(l, D) - b(l \pm 1, D)]^2}{4k^2}
\]
\[\quad - 6 \frac{\left\{ [b(l, D)]^3 + [b(l \pm 1, D)]^3 - [b(l, D)]^2 b(l \pm 1, D) [b(l \pm 1, D)]^2 b(l, D) \right\}}{8k^3}
\]
\[+ O(k^{-4}), \tag{123}\]
which implies
\[
\frac{1}{2} \left[ b(l, D) - b(l \pm 1, D) \right]^2 + \frac{21}{16} \left[ b(l, D) \right]^3 + \left[ b(l \pm 1, D) \right]^3 - \left[ b(l, D) \right]^2 b(l \pm 1, D) - \left[ b(l \pm 1, D) \right]^2 b(l, D)
\]
\[= \frac{1}{4} \left( 2k \right)^{\frac{3}{2}} + O \left( k^{-3} \right). \tag{124} \]

So, according to the above equalities,
\[
\langle f_{0,l \pm 1,D}, r f_{0,l,D} \rangle_R^+ = 1 + \frac{1}{2} \left[ b(l, D) + b(l \pm 1, D) \right] - \frac{1}{4} \left[ b(l, D) - b(l \pm 1, D) \right]^2
\]
\[\quad - \frac{81}{64} \left[ b(l, D) \right]^2 + \left[ b(l \pm 1, D) \right]^2 + \frac{54}{5} b(l, D) b(l \pm 1, D)
\]
\[= 1 - \frac{1}{4} \left( 2k \right)^{\frac{3}{2}} + O \left( k^{-3} \right). \tag{125} \]

Furthermore, (36) and this last equality imply
\[
(c_{l+1,D})^2 - (c_{l,D})^2 = \frac{b(l + 1, D) - b(l - 1, D)}{2k} + O \left( \frac{1}{k^2} \right) = \frac{2l + D - 2}{k} + O \left( \frac{1}{k^2} \right). \tag{126} \]

Similarly, the scalar product \( \langle \psi_{l',D}, t^h \psi_{l,D} \rangle_R^D \) can be factorized, obtaining
\[
\langle \psi_{l',D}, t^h \psi_{l,D} \rangle = \langle f_{0,l',D}, f_{0,l,D} \rangle_R^+ \cdot \langle Y_{l'}, t^h Y_l \rangle_{S^d},
\]
and also in this case
\[
\langle Y_{l'}, t^h Y_l \rangle_{S^d} \equiv R_{l,h,D} (l, l')
\]
does not vanish if \( l' = \pm 1 \). On the other hand, as for the previous ‘radial’ scalar product,
\[
\langle f_{0,l \pm 1,D}, f_{0,l,D} \rangle_R^+ = M_{l,D} M_{l \pm 1,D} \int_0^{\infty} e^{-\frac{\sqrt{k_l,D}}{2} (r - \bar{r}_l,D)^2} e^{-\frac{\sqrt{k_{l \pm 1,D}}}{2} (r - \bar{r}_{l \pm 1,D})^2} dr
\]
\[\simeq M_{l,D} M_{l \pm 1,D} \int_{-\infty}^{\infty} e^{-\frac{\sqrt{k_l,D}}{2} (r - \bar{r}_l,D)^2} e^{-\frac{\sqrt{k_{l \pm 1,D}}}{2} (r - \bar{r}_{l \pm 1,D})^2} dr,
\]

62
with

\[
\int_{-\infty}^{+\infty} e^{-\frac{\sqrt{k_{i,D}}}{2}(r-\tilde{r}_{l,D})^2} - \frac{\sqrt{k_{l,D}}}{2}(r-\tilde{r}_{l,D})^2 dr
\]

\[
= e^{-\frac{\sqrt{k_{i,D}}}{2}r_{l,D}^2 + \frac{\sqrt{k_{l,D}}}{2}r_{l,D}^2} \int_{-\infty}^{+\infty} e^{-\frac{\sqrt{k_{i,D}}}{2}(r-\tilde{r}_{l,D})^2} + \frac{2r\sqrt{k_{i,D}}}{2} \sqrt{k_{l,D}} dr
\]

\[
= e^{-\frac{\sqrt{k_{i,D}}}{2}r_{l,D}^2 + \frac{\sqrt{k_{l,D}}}{2}r_{l,D}^2} \int_{-\infty}^{+\infty} e^{-\frac{\sqrt{k_{i,D}}}{2}(r-\tilde{r}_{l,D})^2} dr
\]

\[
= e^{-\frac{\sqrt{k_{i,D}}}{2}r_{l,D}^2 + \frac{\sqrt{k_{l,D}}}{2}r_{l,D}^2} \left( \sqrt{k_{i,D}} + \sqrt{k_{l,D}} \right) \int_{-\infty}^{+\infty} e^{-\frac{\sqrt{k_{i,D}}}{2}(r-\tilde{r}_{l,D})^2} dr
\]

\[
= e^{-\frac{\sqrt{k_{i,D}}}{2}r_{l,D}^2 + \frac{\sqrt{k_{l,D}}}{2}r_{l,D}^2} \left( \sqrt{k_{i,D}} + \sqrt{k_{l,D}} \right) \sqrt{2\pi k_{l,D}}
\]

then

\[
\langle f_{0,l+1,D}, f_{0,l,D} \rangle_{R^+} = M_{l,D} M_{l+1,D} e^{-\frac{\sqrt{k_{i,D}}}{2}r_{l,D}^2 + \frac{\sqrt{k_{l,D}}}{2}r_{l,D}^2} \left( \sqrt{k_{i,D}} + \sqrt{k_{l,D}} \right) \int_{-\infty}^{+\infty} e^{-\frac{\sqrt{k_{i,D}}}{2}(r-\tilde{r}_{l,D})^2} dr
\]

\[
= e^{-\frac{\sqrt{k_{i,D}}}{2}r_{l,D}^2 + \frac{\sqrt{k_{l,D}}}{2}r_{l,D}^2} \left( \sqrt{k_{i,D}} + \sqrt{k_{l,D}} \right) \sqrt{2\pi k_{l,D}}
\]

\[
\text{(122) to (124)}
\]

\[
1 + O \left( \frac{1}{k^2} \right)
\]

9.10 The algebraic relations fulfilled by \( \bar{L}_{h,j} \) and \( \bar{x}^s \)

9.10.1 Proof of (38)

The proofs of section 9.8.1 can be used here to calculate \( [\bar{x}^h, \bar{x}^j] \psi_{l,D} \) when \( h < j \) and \( l < \Lambda \); this is possible because definition 5.1 implies that the action of \( L_{h,D+1} \) in \( \mathbb{R}^{D+1} \) is very similar to the one of \( t^h \) (and also of \( \bar{x}^h \)) in \( \mathbb{R}^D \). In fact, the only difference is the replacement of \(-\frac{1}{i}d_{l,D,l+1,D+1} \) and \( \frac{1}{i}d_{l,D,l+1} \) with \( c_{l+1,D} \) and \( c_{l,D} \), respectively.

Then it must be \( l_p' = l_p \) \( \forall p \geq j - 1 \) and

\[
[\bar{x}^h; \bar{x}^j] \psi_{l,D} = \sum_{|l_p' - l_h| = 1} \hat{Q}_{D,h,j}(l, l_p') \psi_{h,D}.
\]

(128)
If \( l'_{j-2} = l_{j-2} - 1 \), then
\[
\widehat{Q}_{D,h,j} (l, l'_h) = \left\{ (c_{l+1,D})^2 \left\{ [A(l, l_{d-1}, D - 1)]^2 T_3^{D-j} (l_{d-1}, l_{j-1}, l_{j-2}, j - 1) \\
+ [C(l, l_{d-1}, D - 1)]^2 T_4^{D-j} (l_{d-1}, l_{j-1}, l_{j-2}, j - 1) \right\} \\
+ (c_{l,D})^2 \left\{ [B(l, l_{d-1}, D - 1)]^2 T_3^{D-j} (l_{d-1}, l_{j-1}, l_{j-2}, j - 1) \\
+ [D(l, l_{d-1}, D - 1)]^2 T_4^{D-j} (l_{d-1}, l_{j-1}, l_{j-2}, j - 1) \right\} \right\} \\
\cdot R_{h,j-1} \left( l|_{j,h}, \tilde{u}|_{j,h} \right).
\]

The equations (109) and (126) imply
\[
\widehat{Q}_{D,h,j} (l, l'_h) = \left\{ -(c_{l+1,D})^2 + (c_{l,D})^2 \right\} \frac{d_{l_{j-2},j}}{2l + D - 2} R_{h,j-1} \left( l|_{j,h}, \tilde{u}|_{j,h} \right) \\
= -\frac{d_{l_{j-2},j}}{k(\Lambda)} R_{h,j-1} \left( l|_{j,h}, \tilde{u}|_{j,h} \right); 
\]
similarly, if \( l'_{j-2} = l_{j-2} + 1 \), then
\[
\widehat{Q}_{D,h,j} (l, l'_h) = \frac{d_{l_{j-2},j}}{k(\Lambda)} R_{h,j-1} \left( l|_{j,h}, \tilde{u}|_{j,h} \right); 
\]
and then, when \( l < \Lambda \),
\[
[\tilde{x}^h, \tilde{x}^j] \psi_{l,D} = -i \frac{\bar{\Gamma}_{h,j}}{k(\Lambda)} \psi_{l,D}.
\]

On the other hand, if \( l = \Lambda \), the only difference is that \( c_{\Lambda+1,D} = 0 \) and then (of course, the calculations of section 9.8.1 are used also here)
\[
[\tilde{x}^h, \tilde{x}^j] \psi_{\Lambda,l_{d-1},\cdots,l_1,D} = i \frac{(c_{\Lambda,D})^2}{2\Lambda + D - 2} \bar{\Gamma}_{h,j} \psi_{\Lambda,l_{d-1},\cdots,l_1,D}.
\]

According to this,
\[
[\tilde{x}^h, \tilde{x}^j] = \left\{ -\frac{I}{k(\Lambda)} + \left( \frac{1}{k(\Lambda)} + \frac{(c_{\Lambda,D})^2}{2\Lambda + D - 2} \right) \bar{\Gamma}_{\Lambda,D} \right\} \Gamma_{h,j}.
\]

### 9.10.2 Proof of (40)

The proofs of section 9.7 can be used here to calculate the value of \( \mathcal{R}^2 \psi_{l,D} \); in fact it is easy to see that, when \( l < \Lambda \),
\[
\mathcal{R}^2 \psi_{l,D} = \left\{ (c_{l+1,D})^2 Z_{1,d} (l) + (c_{l,D})^2 Z_{2,d} (l) \right\} \psi_{l,D} \\
\stackrel{(98)}{=} \left\{ 1 + \frac{[b(l, D) + b(l + 1, D)]Z_{1,d} (l)}{2k(\Lambda)} + \frac{[b(l, D) + b(l - 1, D)]Z_{2,d} (l)}{2k(\Lambda)} + O \left( \frac{1}{k^2} \right) \right\} \psi_{l,D} \\
= \left\{ 1 + \frac{b(l, D) + b(l + 1, D)}{2l + D - 2} \frac{l + D - 2}{2k(\Lambda)} + \frac{b(l, D) + b(l - 1, D)}{2l + D - 2} \frac{l}{2l + D - 2} + O \left( \frac{1}{k^2} \right) \right\} \psi_{l,D}.
\]
On the other hand, if $l = \Lambda$, $c_{\Lambda+1,D} = 0$; so

$$R^2\psi_{\Lambda,l_{d-1},\ldots,l_1,D} = \left[(c_{\Lambda,D})^2 \frac{\Lambda}{2\Lambda + D - 2}\right] \psi_{\Lambda,l_{d-1},\ldots,l_1,D}.$$ 

And then, [up to $O\left(\frac{1}{R^2}\right)$]

$$R^2\psi_{l,D} = \left\{1 + \frac{b(l, D) + [b(l + 1, D)] \frac{l + D - 2}{2l + D - 2} + [b(l - 1, D)] \frac{l}{2l + D - 2}}{2k(\Lambda)} - \left[(1 + \frac{b(\Lambda, D) + b(\Lambda + 1, D)}{2k(\Lambda)}) \frac{\Lambda + D - 2}{2\Lambda + D - 2}\right] \tilde{P}_{\Lambda,D}\right\} \psi_{l,D}.$$

### 9.11 The product of two $D$-dimensional spherical harmonics

First of all, it is important to summarize that in section 9.4 it has been shown that (in the following equations there is not any multiplicative constant, depending on the indices of $P$, because they are not relevant also in this case, except when that constant is 0)

$$P_{l-m}^m(\cos \theta) = (\sin \theta)^m \tilde{P}_{l-m}^m(\cos \theta),$$

where $0 \leq m \leq l$, $\tilde{P}_{l-m}^m(\cos \theta)$ is a polynomial of degree $l - m$ in $\cos \theta$ which does not contain any term of degree $l - m - (2n + 1)$, with $n \in \mathbb{N}_0$; so, coming back to $jP_{l}^j(\theta)$,

$$iP_{l}^m(\theta) = (\sin \theta)^m \tilde{P}_{l+m}^{-\frac{m+b-2}{m+b+2}}(\cos \theta) = (\sin \theta)^m \left\{[\cos \theta]^{l-m} + [\cos \theta]^{l-m-2} + \cdots \right\}. \quad (132)$$

It is now possible to calculate the product of two spherical harmonics $Y_{l'}$ and $Y_l$; first of all, $e^{i\theta_1\hat{e}} e^{i\theta_2} = e^{i(l_1+l_2)\theta_1}$, then

$$2\tilde{P}_{l+1}^{l+1} (\theta_2) 2\tilde{P}_{l_2}^{l_2} (\theta_2) e^{-i(l_1+l_1)\theta_1}$$

$$\overset{(132)}{=} (\sin \theta_2)^{l_1} \left[(\cos \theta)^{l_2-l_1} + (\cos \theta)^{l_2-l_1-2} + (\cos \theta)^{l_2-l_1-4} + \cdots \right] 2\tilde{P}_{l_2}^{l_2} (\theta_2) e^{-i(l_1+l_1)\theta_1}$$

$$\overset{(74)}{=} \left[2\tilde{P}_{l+1}^{l+1} (\theta_2) + 2\tilde{P}_{l_2}^{l_2+l_2} (\theta_2) + 2\tilde{P}_{l_2}^{l_2+l_2} (\theta_2) + \cdots \right] e^{i(l_1+l_1)\theta_1}. \quad (133)$$

Similarly,

$$3\tilde{P}_{l_3}^{l_3} (\theta_3) 3\tilde{P}_{l_3}^{l_3} (\theta_3) 2\tilde{P}_{l+1}^{l+1} (\theta_2)$$

$$\overset{(132)}{=} (\sin \theta_3)^{l_3} \left[(\cos \theta)^{l_3-l_2} + (\cos \theta)^{l_3-l_2-2} + (\cos \theta)^{l_3-l_2-4} + \cdots \right] 2\tilde{P}_{l_2}^{l_2} (\theta_2) \quad (134)$$

$$\overset{(74)}{=} \left[3\tilde{P}_{l_3}^{l_3+l_3} (\theta_3) + 3\tilde{P}_{l_3}^{l_3+l_3} (\theta_3) + 3\tilde{P}_{l_3}^{l_3+l_3} (\theta_3) + \cdots \right] 2\tilde{P}_{l_2}^{l_2} (\theta_2).$$

Furthermore, in order to calculate

$$3\tilde{P}_{l_3}^{l_3} (\theta_3) 3\tilde{P}_{l_3}^{l_3} (\theta_3) 2\tilde{P}_{l_2}^{l_2} (\theta_2),$$

65
the formula \((74)\)_2 must be used \(l'_2 - 1\) times and then 1 time the formula \((74)\)_1 in correspondence of \(\sin \theta\); while the formula \((74)\)_3 must be used in correspondence of \(\cos \theta\); then

\[
3 P_{l_3}^{l'_2} (\theta_3) 3 P_{l_3}^{l'_2} (\theta_3) 2 P_{l_2+l'_2-2} (\theta_2)
\]

\[(132)\]  

\[
= (\sin \theta_3)^{l'_2} \left[ (\cos \theta_3)^{l'_3-l'_2} + (\cos \theta_3)^{l'_3-l'_2-2} + (\cos \theta_3)^{l'_3-l'_2-4} + \cdots \right] 3 P_{l_3}^{l'_2} (\theta_3) 2 P_{l_2+l'_2-2} (\theta_2)
\]

\[(74)\]  

\[
= \left[ 3 P_{l_3+l'_3}^{l'_2-l'_2-2} (\theta_3) + 3 P_{l_3+l'_3}^{l'_2-l'_2-2} (\theta_3) + 3 P_{l_3+l'_3}^{l'_2+l'_2-2} (\theta_3) + \cdots \right] 2 P_{l_2+l'_2-2} (\theta_2),
\]

(135)

and so on with the other angles and factors.

According to this,

\[
Y_{l''} Y_l = \sum_{l''_d=0}^{l_1} \cdots \sum_{l''_2=0}^{l_2} \gamma_{l''} Y_{l''}, \text{ where } l'' := (l''_d, \cdots, l''_2, l_1 + l'_1);
\]

so, this last equation describes the action of the generic multiplication operator \(Y_{l''}\) on the Hilbert space of \(D\)-dimensional spherical harmonics.

Furthermore, from section 9.3.3 and the fact that the \(t^h\) commute it follows

\[
Y_l = \sum_{\alpha \in (N_0)^D} c_l^\alpha (t^1)^{\alpha_1} (t^2)^{\alpha_2} \cdots (t^D)^{\alpha_D}
\]

\[
= \sum_{\alpha \in (N_0)^D} c_l^\alpha (\alpha_1)! (\alpha_2)! \cdots (\alpha_D)! \sum_h N (h, \alpha, t_1, t_2, \cdots, t_D),
\]

where \(c_l^\alpha\) is a suitable constant and \(N (h, \alpha, t_1, t_2, \cdots, t_D)\) is the ordered monomial obtained applying \(\pi_h\) (the permutation with repetition of \(l\) objects with \(\alpha_1\) identical objects of type 1, \(\alpha_2\) identical objects of type 2, ..., \(\alpha_D\) identical objects of type \(D\)) to the monomial \((t^1)^{\alpha_1} (t^2)^{\alpha_2} \cdots (t^D)^{\alpha_D}\).

Inspired by this, define the fuzzy approximations \(\hat{Y}_l\) of the spherical harmonics \(Y_l\) as

\[
\hat{Y}_l := \sum_{\alpha \in (N_0)^D} c_l^\alpha (\alpha_1)! (\alpha_2)! \cdots (\alpha_D)! \sum_h N (h, \alpha, \bar{x}_1, \bar{x}_2, \cdots, \bar{x}_D).
\]

(137)

It is also important to underline that

**Remark 6.** From \(|A|, |B|, |C|, |D|, |F|, |G| \leq 1\) it follows

\[
|\sin \theta_j \bar{P}_L^I (\theta)| \leq |j \bar{P}_{L+1}^{I+1} (\theta)| + |j \bar{P}_{L-1}^{I+1} (\theta)|,
\]

\[
|\sin \theta_j \bar{P}_L^I (\theta)| \leq |j \bar{P}_{L+1}^{I-1} (\theta)| + |j \bar{P}_{L-1}^{I-1} (\theta)|,
\]

\[
|\cos \theta_j \bar{P}_L^I (\theta)| \leq |j \bar{P}_{L+1}^I (\theta)| + |j \bar{P}_{L-1}^I (\theta)|.
\]

(138)
This, the recursive procedures of section 9.4 and the calculations of this section, imply that the product \( \bar{P}_L^{2L}(\theta) \bar{P}_L'(\theta) \) when \( \Lambda \geq L' \geq l' \geq 0 \) and \( \Lambda \geq L \geq l \geq 0 \) is the sum of (at most) \( \Lambda 2^\Lambda \) terms \( \bar{P}_l^{l'}(\theta) \), and some of them may have the same indices. Furthermore, (138) implies that the product of \( \bar{P}_L' \) by \( \sin \theta \) and \( \cos \theta \) returns coefficients that are bounded by 1, while in (27) every \( \bar{P}_L'(\theta) \) contains a normalization constant which is less or equal than (2\Lambda)!. 

9.12 Some proofs about convergence

Let \( \varphi \in \mathcal{H}_{\Lambda,D} \), with \( \| \varphi \|_2 = 1 \), and

\[
\varphi = \sum_{0 \leq l \leq \Lambda} \sum_{l_{h-1} \leq l_{h} \text{ for } h = d, \ldots, 3} \varphi_l \psi_{l,D}
\]

be the decomposition of \( \varphi \) in that orthonormal basis of \( \mathcal{H}_{\Lambda,D} \); of course, \( \| \varphi \|_2 = 1 \) implies \( |\varphi_l| \leq 1 \).

According to these statements,

\[
\left\| (\bar{x}^h - t^h) \varphi \right\|_2 \leq \sum_{0 \leq l \leq \Lambda} \sum_{l_{h-1} \leq l_{h} \text{ for } h = d, \ldots, 3} |\varphi_l| \left\| (\bar{x}^h - t^h) \psi_{l,D} \right\|_2
\]

\[
\leq \left( \sum_{0 \leq l \leq \Lambda} \sum_{l_{h-1} \leq l_{h} \text{ for } h = d, \ldots, 3} \right) \left\| (\bar{x}^h - t^h) \psi_{l,D} \right\|_2
\]

\[
\leq [\text{dim } \mathcal{H}_{\Lambda,D}]^2 \left( \frac{b(l + 1, D) + 2b(l, D) + b(l - 1, D)}{4k} \right)
\]

\[
\leq [\text{dim } \mathcal{H}_{\Lambda,D}]^2 \frac{b(\Lambda, D)}{k}
\]

where the * inequality follows from the fact that the sum is of \( \text{dim } \mathcal{H}_{\Lambda,D} \) elements, that both \( \bar{x}^h \psi_{l,D} \) and \( t^h \psi_{l,D} \) can be written as the linear combination of (at most) \( \text{dim } \mathcal{H}_{\Lambda,D} \) elements, that \( |A|, |B|, |C|, |D|, |F|, |G| \leq 1 \), that \( \langle \psi_{l,D}, \bar{x}^h \psi_{l,D} \rangle_{\mathcal{H}^D} \) and \( \langle \psi_{l,D}, t^h \psi_{l,D} \rangle_{\mathcal{H}^D} \) do not vanish if \( l' = l \pm 1 \), and the values of the corresponding ‘radial’ scatral product are

\[
\langle f_{0,l \pm 1,D}, r f_{0,l,D} \rangle_{\mathbb{R}^D} \overset{(125)}{=} 1 + \frac{1}{2} \left[ \frac{b(l, D) + b(l \pm 1, D)}{2k} \right] + O \left( \frac{1}{k^3} \right)
\]

and 

\[
\langle f_{0,l \pm D,D}, f_{0,l,D} \rangle_{\mathbb{R}^D} \overset{(127)}{=} 1 + O \left( \frac{1}{k^3} \right)
\]

while the # inequality follows from (19)_1.
So, if
\[ k(\Lambda) \geq \Lambda \dim \mathcal{H}_{\Lambda,D}^2 b(\Lambda, D), \text{ then } \| (\pi^h - t^h) \varphi \|_2^{\Lambda \to \infty} 0. \]

In section 9.11 there is the product between two generic \( D \)-dimensional spherical harmonics and the in section 9.3.3 it is shown that every \( D \)-dimensional spherical harmonic is a homogeneous polynomial in the \( t^h \) variables, this suggested the definition (137).

Those \( \hat{\mathcal{Y}}_l \) are the fuzzy spherical harmonics, they are elements of \( B[\mathcal{L}^2(S^d)] \) and, in particular,

**Remark 7.** The action of \( \hat{\mathcal{Y}}_l \) on \( Y_\nu \) can be obtained through the following replacements to \( Y_l \cdot Y_\nu \):

- **\( A \)** replace every \( A(l, l_{d-1}, D - 1) \) with \( c_{l+1,D}A(l, l_{d-1}, D - 1) \);
- **\( B \)** replace every \( B(l, l_{d-1}, D - 1) \) with \( c_{l,D}B(l, l_{d-1}, D - 1) \);
- **\( C \)** replace every \( C(l, l_{d-1}, D - 1) \) with \( c_{l+1,D}C(l, l_{d-1}, D - 1) \);
- **\( D \)** replace every \( D(l, l_{d-1}, D - 1) \) with \( c_{l,D}D(l, l_{d-1}, D - 1) \);
- **\( F \)** replace every \( F(l, l_{d-1}, D - 1) \) with \( c_{l+1,D}F(l, l_{d-1}, D - 1) \);
- **\( G \)** replace every \( G(l, l_{d-1}, D - 1) \) with \( c_{l,D}G(l, l_{d-1}, D - 1) \).

On the other hand, the fuzzy analogs of the vector space \( B(S^d) \) are defined as
\[
\mathcal{C}_{\Lambda,D} := \text{span}_C \left\{ \hat{\mathcal{Y}}_l : 2\Lambda \geq l \equiv l_d \geq \cdots \geq l_2 \geq |l_1|, l_i \in \mathbb{Z} \forall i \right\} \subset \mathcal{A}_{\Lambda,D} \subset B[\mathcal{L}^2(S^d)],
\]  
and here the highest \( l \) is \( 2\Lambda \) because \( \hat{\mathcal{Y}}_{2\Lambda,2\Lambda,\ldots,2\Lambda} \) is the ‘highest’ multiplying operator acting nontrivially on \( \mathcal{H}_{\Lambda,D} \) (it does not annihilate \( \psi_{\Lambda,\Lambda,\ldots,-\Lambda,D} \)).

So
\[
\mathcal{C}_{\Lambda,D} = \bigoplus_{l=0}^{2\Lambda} \mathcal{V}_{l,D} \tag{140}
\]
is the decomposition of \( \mathcal{C}_{\Lambda,D} \) into irreducible components under \( O(D) \); furthermore, \( \mathcal{V}_{l,D} \) is trace-free for all \( l > 0 \), i.e. its projection on the single component \( \mathcal{V}_{0,D} \) is zero and it is easy to see that (140) becomes the decomposition of \( B(S^d), C(S^d) \) in the limit \( \Lambda \to \infty \).

However, the fuzzy analog of \( f \in B(S^d) \) is
\[
\hat{f}_\Lambda := \sum_{l=0}^{2\Lambda} \sum_{l_{d-1} \leq l} f_l \hat{\mathcal{Y}}_l \in \mathcal{A}_{\Lambda,D} \subset B[\mathcal{L}^2(S^2)]. \tag{141}
\]
9.12.1 Proof of Proposition 7.1

Let \( \phi, f \in B(S^d) \), then

\[
(f - \hat{f}_\Lambda)\phi = \sum_{l=0}^{\Lambda} \sum_{l_d-1 \leq l \leq l_h} Y_l \chi_l + \sum_{l>\Lambda} Y_l(f\phi)_l.
\]

(142)

where

\[
\chi_l := (f\phi)_l - (\hat{f}_\Lambda\phi)_l , \quad (f\phi)_l = \langle Y_l, f\phi \rangle \quad \text{and} \quad (\hat{f}_\Lambda\phi)_l = \langle Y_l, \hat{f}_\Lambda\phi \rangle;
\]
in particular

\[
\chi_l = \langle Y_l, (f - \hat{f}_\Lambda) \phi \rangle = \langle Y_l, \sum_{l'=0}^{2\Lambda} \sum_{l'_{d-1} \leq l'} f_{l'} (Y_{l'} - \hat{Y}_{l'}) \phi \rangle
\]

(143)

\[
= \sum_{l'=0}^{2\Lambda} \sum_{l'_{d-1} \leq l'} +\infty \sum_{l''_{d-1} \leq l''} f_{l''} \phi_{l''} \langle Y_l, (Y_{l'} \pm \hat{Y}_{l'}) Y_{l''} \rangle.
\]

On the other hand,

\[
\|f - \hat{f}_\Lambda\|^2 = \sum_{l=0}^{\Lambda} \sum_{l_d-1 \leq l \leq l_h} |\chi_l|^2 + \sum_{l>\Lambda} \sum_{l_d-1 \leq l \leq l_h} |(f\phi)_l|^2,
\]

(144)

the second sum goes to zero as \( \Lambda \to \infty \), it remains to show that the first sum does as well.

The sum over \( l' \) in (143) consists of at most dim \( \mathcal{H}_{2\Lambda,D} \) elements, as for the one over \( l'' \) (because \( 0 \leq l \leq \Lambda \)), the equality (136) can be applied in this case, and it implies that both \( Y_l Y_{l''} \) and \( \hat{Y}_{l'} Y_{l''} \) can be written as a linear combination of, at most, \( \dim \mathcal{H}_{2\Lambda,D} \) basis elements, then the sum in (143) is made up by at most \([\dim \mathcal{H}_{2\Lambda,D}]^2\) non-vanishing addends, while the one over \( l \) in (144) is of at most dim \( \mathcal{H}_{\Lambda,D} \) elements.

In addition, the fact that in (27) every \( \overline{jP}_L(\theta) \) contains a normalization constant which is less or equal than \((2\Lambda)!\), that the highest coefficient multiplying a power of \( \cos \theta \) in \( P_L^j(\cos \theta) \) is less or equal than

\[
2^\Lambda [(2\Lambda + 1)!!]^2,
\]

that \(|A|, |B|, |C|, |D|, |F|, |G| \leq 1\), that \( \langle \psi_{l',D}, \overline{t^h}\psi_{l,D} \rangle_{\mathbb{R}^D} \) and \( \langle \psi_{l',D}, t^h\psi_{l,D} \rangle_{\mathbb{R}^D} \) do not vanish if \( l' = l \pm 1 \), and the values of the corresponding ‘radial’ scalar product are

\[
\langle f_{0,\pm 1,D}, f_{0,l,D} \rangle_{\mathbb{R}^D} \overset{(125)}{=} 1 + \frac{1}{2} \left[ b(l, D) + b(l \pm 1, D) \right] + O \left( \frac{1}{k^2} \right)
\]

and

\[
\langle f_{0,\pm 1,D}, f_{0,l,D} \rangle_{\mathbb{R}^D} \overset{(127)}{=} 1 + O \left( \frac{1}{k^2} \right)
\]

69
imply
\[
\sum_{l=0}^{\Lambda} \sum_{l_{h-1} \leq l_h \leq l} |\chi_l|^2 \leq [\dim \mathcal{H}_{\Lambda,D}] \left\{ [\dim \mathcal{H}_{2\Lambda,D}]^3 [(2\Lambda)!]^D 2^{\Lambda D} [(2\Lambda + 1)!]^{2D} \frac{\Lambda b(\Lambda, D)}{k(\Lambda)} \right\}^2
\]

So, if
\[
k(\Lambda) \geq \Lambda^2 [\dim \mathcal{H}_{2\Lambda,D}]^3 [(2\Lambda)!]^D 2^{\Lambda D} [(2\Lambda + 1)!]^{2D} b(\Lambda, D) \sqrt{\dim \mathcal{H}_{\Lambda,D}},
\]
then
\[
\| (f - \hat{f}_\Lambda) \phi \|^2 \leq \| f \|^2 \| \phi \|^2 \frac{1}{\Lambda^2} + \sum_{l > \Lambda} \sum_{l_{h-1} \leq l_h \leq l} |(f \phi)_l|^2 \xrightarrow{\Lambda \to \infty} 0, \tag{145}
\]
i.e. $\hat{f}_\Lambda \to f$ strongly for all $f \in B(S^d)$, as claimed.

The replacement $f \mapsto fg$, implies that $(fg)_\Lambda \to (fg)$ strongly for all $f, g \in B(S^d)$, while from (145) it follows
\[
\| (f - \hat{f}_\Lambda) \phi \|^2 \leq \| f \|^2 \| \phi \|^2 \frac{1}{\Lambda^2} + \| f \phi \|^2 \leq \left( \| f \|^2 \| \phi \|^2 \right) \| \phi \|^2, \tag{146}
\]
with
\[
\sqrt{\| f \|^2 \| \phi \|^2} \leq \sqrt{\| f \|^2 + \| f \|^2} \| \phi \|^2 \leq \| f \|^2 + \| f \|^2, \tag{147}
\]
and then
\[
\| \hat{f}_\Lambda \phi \| \leq \| (\hat{f}_\Lambda - f) \phi \| + \| f \phi \| \leq \| (\hat{f}_\Lambda - f) \phi \| + \| f \phi \| \| \phi \| \xrightarrow{(146)\&(147)} \| f \|^2 + 2 \| f \|^2 \| \phi \|, \tag{148}
\]
i.e. the operator norms $\| \hat{f}_\Lambda \|_{op}$ of the $\hat{f}_\Lambda$ are bounded uniformly in $\Lambda$: $\| \hat{f}_\Lambda \|_{op} \leq \| f \|^2 + 2 \| f \|^2$.

Therefore, as claimed, (145) implies
\[
\| (fg - \hat{f}_\Lambda \hat{g}_\Lambda) \phi \| \leq \| (f - \hat{f}_\Lambda) g \phi \| + \| \hat{f}_\Lambda (g - \hat{g}_\Lambda) \phi \| \xrightarrow{\Lambda \to \infty} 0. \tag{149}
\]
