# Orbits of Free Cyclic Submodules over Rings of Lower Triangular Matrices 

Edyta Bartnicka<br>Warsaw University of Life Sciences, Faculty of Applied Informatics and Mathematics<br>Warsaw, Poland<br>edytabartnicka@wp.pl

#### Abstract

Given a ring $T_{n}(n \geqslant 2)$ of lower triangular $n \times n$ matrices with entries from an arbitrary field $F$, we completely classify the orbits of free cyclic submodules of ${ }^{2} T_{n}$ under the action of the general linear group $G L_{2}\left(T_{n}\right)$. Interestingly, the total number of such orbits is found to be equal to the Bell number $B_{n}$. A representative of each orbit is also given.

Keywords: orbits of submodules - free cyclic submodules - associative rings with unity - lower triangular matrices

## 1 Introduction

The general linear group $G L_{2}(R)$ acts in natural way on the set of all free cyclic submodules of the two-dimensional left free module ${ }^{2} R$. In the case of an arbitrary associative ring $R$ with unity, $G L_{2}(R)$-orbit of free cyclic submodules generated by unimodular pairs is the projective line $\mathbb{P}(R)$, which has already been discussed in a number of papers (see, e.g., [4, 2, 3]). We also refer to [7, 5] for the definition of the unimodularity. There also exist rings features non-unimodular free cyclic submodules. In this note we investigate the case of a ring $T_{n}$ of lower triangular $n \times n$ matrices $A=\left[\begin{array}{cccc}a_{11} & 0 & \ldots & 0 \\ a_{21} & a_{22} & \ldots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ a_{n 1} & a_{n 2} & \ldots & a_{n n}\end{array}\right]$ over a fixed field $F$, where $n \geqslant 2$.

The main motivation for this paper is the work of Havlicek and Saniga [6], where a thorough classification of the vectors of the free left module ${ }^{2} T_{2}$ over a ring of ternions $T_{2}$ up to the natural action of $G L_{2}\left(T_{2}\right)$ was given; it was found that there exactly two (one unimodular and one non-unimodular) orbits of free cyclic submodules of ${ }^{2} T_{2}$ under the action of $G L_{2}\left(T_{2}\right)$.
In [1] there are described all orbits of free cyclic submodules in the ring $T_{3}$ under the action of $G L_{2}\left(T_{3}\right)$. Here we extend and generalize the findings of [1] to an arbitrary ring $T_{n}$ and provide the full classification of orbits of free cyclic submodules of ${ }^{2} T_{n}$. The starting point of our analysis is a complete characterization of free cyclic submodules, unimodular pairs and outliers generating free cyclic submodules in the case of $T_{n}$. Next, we will introduce representatives of all $G L_{2}\left(T_{n}\right)$-orbits (Theorems 1 and (2)). Finally, we will prove that the total number of $G L_{2}\left(T_{n}\right)$-orbits is equal to the Bell number $B_{n}$ (Theorem (3)).

## 2 Free cyclic submodules $T_{n}(A, B)$

Consider the free left module ${ }^{2} R$ over a ring $R$ with unity. Let $(a, b) \subset{ }^{2} R$, then the set $R(a, b)=\{r(a, b) ; r \in R\}$ is a left cyclic submodule of ${ }^{2} R$. If the equation $(r a, r b)=(0,0)$ implies that $r=0$, then $R(a, b)$ is called free. We give now the condition for a cyclic submodule $M_{n}(A, B) \subset{ }^{2} M_{n}$, where $M_{n}$ is the ring of $n \times n$ matrices over a fixed field $F$, to be free.

Lemma 1. A cyclic submodule $M_{n}(A, B)$ is free if, and only if, the rank of $[A \mid B]$ is $n$.

Proof. Let $k_{j}$ be the $j$-th column of $[A \mid B]$ and let $w_{i}=\left[x_{i 1} x_{i 2} \ldots x_{i n}\right], i=$ $1,2, \ldots, n$.
Then $[A \mid B]=\left[k_{1} k_{2} \ldots k_{2 n}\right]$ and $X=\left[\begin{array}{cccc}x_{11} & x_{12} & \ldots & x_{1 n} \\ x_{21} & x_{22} & \ldots & x_{2 n} \\ \vdots & \vdots & \vdots & \vdots \\ x_{n 1} & x_{n 2} & \ldots & x_{n n}\end{array}\right]=\left[\begin{array}{c}w_{1} \\ w_{2} \\ \vdots \\ w_{n}\end{array}\right]$.
$" \Leftarrow "$ Suppose that the rank of $[A \mid B]$ is $n$. Equivalently, exactly $n$ columns $k_{j}$ of $[A \mid B]$ represent a set of linearly independent vectors. Then the equation

$$
\left[\begin{array}{c}
w_{1} \\
w_{2} \\
\vdots \\
w_{n}
\end{array}\right]\left[k_{1} k_{2} \ldots k_{2 n}\right]=0
$$

(where 0 denotes the zero matrix of size $n \times 2 n$ ) implies that linear functionals $w_{1}, w_{2}, \ldots, w_{n}: F^{n} \rightarrow F$ are zeros on $n$ linearly independent vectors of the space $F^{n}$. So they are zero and hence $M_{n}(A, B)$ is free.
$" \Rightarrow$ " Assume that a submodule $M_{n}(A, B)$ is free. Then the fact that any set of linear functionals $w_{1}, w_{2}, \ldots, w_{n}: F^{n} \rightarrow F$ are zeros on vectors $k_{1}, k_{2}, \ldots, k_{2 n}$ implies $w_{1}=w_{2}=\ldots=w_{n}=0$. Consequently, there exists a set of $n$ linearly independent vectors $k_{j}$ and so the rank of $[A \mid B]$ is $n$.

Remark 1. The statement of Lemma 1 remains true if one replaces the ring $M_{n}$ by any of its subrings, in particular by the ring $T_{n}$.

It is well known that any unimodular pair generates a free cyclic submodule; we shall call such free cyclic submodules unimodular. Now, we will introduce the condition of unimodularity in the case of $T_{n}$.

Remark 2. A pair $(A, B) \subset{ }^{2} T_{n}$ is unimodular if, and only if, $a_{i i} \neq 0 \vee b_{i i} \neq 0$ for any $i=1,2, \ldots, n$.

Proof. According to the general definition of unimodularity, a pair $(A, B) \subset$ ${ }^{2} T_{n}$ is unimodular if there exist matrices $X, Y \in T_{n}$ such that $A X+B Y=$ $U \in T_{n}^{*}$, where $T_{n}^{*}$ denotes the group of invertible elements of the ring $T_{n}$. As

$$
A X+B Y=\left[\begin{array}{ccc}
a_{11} x_{11}+b_{11} y_{11} & & 0 \\
& \ddots & \\
* & & a_{n n} x_{22}+b_{n n} y_{n n}
\end{array}\right]
$$

for any $X, Y \in T_{n}(q)$, then $A X+B Y=U \Leftrightarrow a_{i i} x_{i i}+b_{i i} y_{i i} \neq 0$ for any $i=1,2, \ldots, n$. This is equivalent to $a_{i i} x_{i i} \neq-b_{i i} y_{i i}$ for any $i=1,2, \ldots, n$. Hence $(A, B) \subset{ }^{2} T_{n}$ is unimodular if, and only if, $a_{i i} \neq 0 \vee b_{i i} \neq 0$ for any $i=1,2, \ldots, n$.

Another type of free cyclic submodules is the one represented by pairs that are not contained in any cyclic submodule generated by a unimodular pair, so-called outliers (first introduced in [8]). As it was pointed out in [6, 1], the number of such non-unimodular free cyclic submodules can be quite large although, of course, not all outliers generate free cyclic submodules.

Lemma 2. A pair $(A, B) \subset{ }^{2} T_{n}$ is an outlier generating a free cyclic submodule if, and only if, $(A, B)$ is non-unimodular and $\operatorname{rank}[A \mid B]=n$.

Proof. According to [1, Theorem 1(2)] if a non-unimodular pair $(A, B) \subset{ }^{2} T_{n}$ generates a free cyclic submodule, then $(A, B)$ is an outlier. Lemma 1 and Remark 1 then yield the desired claim.

It also follows that there are no other free cyclic submodules $T_{n}(A, B)$ apart from those generated by unimodular pairs or outliers. Moreover, a cyclic submodule $T_{n}(A, B)$ generated by a unimodular pair cannot have nonunimodular generators (see [1, Corollary 1]).

## 3 Representatives of $G L_{2}\left(T_{n}\right)$-orbits

The general linear group $G L_{2}\left(T_{n}\right)$ acts in a natural way (from the right) on the free left $T_{n}$-module. Orbits of the set of all free cyclic submodules $T_{n}(q)(A, B) \subset{ }^{2} T_{n}(q)$ under the action of $G L_{2}\left(T_{n}\right)$ are called $G L_{2}\left(T_{n}\right)$-orbits. To show the explicit form of representatives of such orbits, we will use the following remark:

Remark 3. Let $X, Y, W, Z \in T_{n}$. The matrix $\left[\begin{array}{cc}X & Y \\ W & Z\end{array}\right]$ is invertible, i.e. it is an element of the group $G L_{2}\left(T_{n}\right)$, if, and only if, $x_{i i} z_{i i}-y_{i i} w_{i i} \neq 0$ for all $i=1,2, \ldots, n$.

Let (A, B) be a pair of ${ }^{2} T_{n}$ such that for all $i=1,2, \ldots, n, j=1,2, \ldots, i-1$ :

- $a_{i i}, b_{i j} \in\{0,1\}$,
- $a_{i j}=b_{i i}=0$,
- the number of non-zero entries of $[\mathrm{A} \mid \mathrm{B}]$ is equal to its rank and it is $n$.

We will use the grotesk typeface for such pairs. According to Lemma 1 and Remark 1 any pair $(\mathrm{A}, \mathrm{B}) \in{ }^{2} T_{n}$ generates a free cyclic submodule.

Theorem 1. Let $(\mathrm{A}, \mathrm{B}),(\mathrm{C}, \mathrm{D}) \in{ }^{2} T_{n}$. Submodules $T_{n}(\mathrm{~A}, \mathrm{~B}), T_{n}(\mathrm{C}, \mathrm{D})$ are representatives of distinct $G L_{2}\left(T_{n}\right)$-orbits if, and only if, $(\mathrm{A}, \mathrm{B}) \neq(\mathrm{C}, \mathrm{D})$.

Proof. " $\Rightarrow$ " This is obvious.
$" \Leftarrow "$ We give the proof by contradiction. Assume that $T_{n}(\mathrm{~A}, \mathrm{~B}), T_{n}(\mathrm{C}, \mathrm{D})$ are in the same $G L_{2}\left(T_{n}\right)$-orbit, i.e. there exists $\left[\begin{array}{cc}X & Y \\ W & Z\end{array}\right] \in G L_{2}\left(T_{n}\right)$ such that $(\mathrm{A}, \mathrm{B})\left[\begin{array}{cc}X & Y \\ W & Z\end{array}\right]=(\mathrm{C}, \mathrm{D})$. Hence,

$$
\left\{\begin{array}{l}
a_{i i} x_{i i}=c_{i i}, \\
a_{i i} y_{i i}=0,
\end{array}\right.
$$

for any $i \in\{1,2, \ldots, n\}$.

Submodules $T_{n}(\mathrm{~A}, \mathrm{~B}), T_{n}(\mathrm{C}, \mathrm{D})$ are free, thus $a_{11}, c_{11} \in F^{*}=F \backslash\{0\}$, and so $a_{11}=c_{11}=1$.
Let $i \in\{2,3, \ldots, n\}$. Consider two cases:

1. $a_{i i}=1$; Then by the above system of equations and according to Remark 3 we get $y_{i i}=0, x_{i i} \neq 0$ and $c_{i i} \neq 0$. Consequently, $c_{i i}=a_{i i}=1$ and so all the remaining entries in the $i$-th row of matrices $\mathrm{A}, \mathrm{B}, \mathrm{C}$, $D$ are equal to zero.
2. $a_{i i}=0$; Then we get immediately $c_{i i}=a_{i i}=0$. The form of $(\mathrm{A}, \mathrm{B}) \in{ }^{2} T_{n}$ implies that there exists exactly one non-zero entry $b_{i j}$ in the $i$-th row of the matrix B. Suppose then that $b_{i j}=1$ for some $j \in\{1,2, \ldots, i-1\}$. We obtain the following system of equations:

$$
\left\{\begin{aligned}
c_{i j} & =0=a_{i i} x_{i j}+b_{i j} w_{j j}+b_{i(j+1)} w_{(j+1) j}+\ldots+b_{i(i-1)} w_{(i-1) j}=b_{i j} w_{j j}, \\
d_{i j} & =a_{i i} y_{i j}+b_{i j} z_{j j}+b_{i(j+1)} z_{(j+1) j}+\ldots+b_{i(i-1)} z_{(i-1) j}=b_{i j} z_{j j}
\end{aligned}\right.
$$

Therefore $w_{j j}=0$. Remark 3 leads to $z_{j j} \neq 0$, and so $d_{i j} \neq 0$. Thus $d_{i j}=b_{i j}=1$ and all the remaining entries in the $i$-th row of matrices $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}$ are equal to zero.

This means that $(A, B)=(C, D)$, which completes the proof.
Theorem 2. Any $G L_{2}\left(T_{n}\right)$-orbit has a unique representative $T_{n}(\mathrm{~A}, \mathrm{~B}) \subset{ }^{2} T_{n}$.
Proof. Taking into account Theorem 1 it suffices to show that any $G L_{2}\left(T_{n}\right)-$ orbit has a representative of the form $T_{n}(\mathrm{~A}, \mathrm{~B}) \subset{ }^{2} T_{n}$. This is equivalent to saying that for any free cyclic submodule $T_{n}(A, B) \subset{ }^{2} T_{n}$ there exist matrices $Q \in G L_{2}\left(T_{n}\right)$ and $U \in T_{n}^{*}$ such that $U(A, B) Q=(\mathrm{A}, \mathrm{B})$. We will now show that this indeed holds.
Let $T_{n}(A, B)$ be any free cyclic submodule of ${ }^{2} T_{n}$. We multiply $(A, B) \in{ }^{2} T_{n}$ by $\left[\begin{array}{cc}X & Y \\ W & Z\end{array}\right] \in G L_{2}\left(T_{n}\right)$, with entries $y_{i i}=-a_{i i}^{-1} b_{i i} z_{i i}$ if $a_{i i} \neq 0$, and $z_{i i}=0$ if $a_{i i}=0, i=1,2, \ldots, n$. This yields

$$
(A, B)\left[\begin{array}{cc}
X & Y \\
W & Z
\end{array}\right]=(C, D)
$$

where $d_{i i}=0$ for any $i=1,2, \ldots, n$.
The next step is multiplying

$$
P^{-1}(C, D)\left[\begin{array}{cc}
P & 0 \\
0 & I
\end{array}\right]=\left(P^{-1} C P, P^{-1} D\right)=(J, E)
$$

where $P \in T_{n}$ and $J$ is a Jordan normal form of $C$ with block matrices $\lambda_{i}$, which are just elements of $F$. Of course, $e_{i i}=0$ for any $i=1,2, \ldots, n$.
Let $J^{\prime}$ be the matrix obtained from $J$ by replacing any $\lambda_{i} \neq 0$ by $\lambda_{i}^{-1}$, and $\lambda_{i}=0$ by 1 . The result of multiplication $J^{\prime}(J, E)=\left(J^{\prime} J, J^{\prime} E\right)$ is a pair (A,F), where, for any $i=1,2, \ldots, n, a_{i i}=\left\{\begin{array}{l}1, \lambda_{i} \neq 0 \\ 0, \lambda_{i}=0\end{array}\right.$ and $f_{i i}=0$.
We multiply again the last pair $(\mathrm{A}, F)$ by $\left[\begin{array}{cc}I & -F \\ 0 & I\end{array}\right]$ and obtain a pair $(\mathrm{A},-\mathrm{A} F+F)=(\mathrm{A}, G)$, where $g_{i j}=0$ for any $i, j=1,2, \ldots, n$ such that $a_{i i}=1$.
Suppose that $i_{t}, t \in T$ are the numbers of non-zero rows of matrix $G$, where $i_{t}<i_{s}$ if $t<s$. Let now

1. $j_{t}=j_{1}$ be the number of column of $G$ such that $g_{i_{1} j_{1}} \neq 0$ and $g_{i_{1} k}=0$ for any $k>j_{1}$;
2. $j_{t}, t>1$ be the numbers of columns of $G$ which fulfils all the requirements set:
a. $j_{t} \neq j_{r}$ for any $r=1,2, \ldots, t-1$,
b. $g_{i t j_{t}} \neq 0$,
c. $g_{i_{t} k}=0$ for any $k$ satisfying the two conditions: $k>j_{t}$ and $k \neq j_{r}$ for any $r=1,2, \ldots, t-1$,
d. a sequence of vectors $\left[\begin{array}{c}g_{i_{1} j_{1}} \\ g_{i_{2} j_{1}} \\ \vdots \\ g_{i_{t} j_{1}}\end{array}\right],\left[\begin{array}{c}g_{i_{1} j_{2}} \\ g_{i_{2} j_{2}} \\ \vdots \\ g_{i_{t} j_{2}}\end{array}\right], \ldots,\left[\begin{array}{c}g_{i_{1} j_{t}} \\ g_{i_{2} j_{t}} \\ \vdots \\ g_{i t j_{t}}\end{array}\right]$ is linearly independent (the possibility of choice of such $j_{t}$ is guaranteed because the rank of $G$ is $|T|$ by the Lemma 1 and Remark (1)).

Consider the matrix $V$ of $T_{n}$ such that

$$
\sum_{\alpha=j_{t}}^{i_{t}-1} g_{i t \alpha} v_{\alpha j_{t}}=1
$$

and

$$
\sum_{\alpha=l}^{i_{t}-1} g_{i_{t} \alpha} v_{\alpha l}=0
$$

for any $t \in T, l=1,2, \ldots, j_{t}-1$.

We prove now that $V$ is invertible, i.e. we show that $v_{j_{t} j_{t}} \neq 0$ for each $j_{t}$ one by one, from the greatest to the smallest, by using the method described below. Let $j_{t_{m}}=\max \left\{j_{t}, t \in T\right\}$ and let $t$ be a fixed element of $T$. Assume that $j_{t_{1}}<j_{t_{2}}<\cdots<j_{t_{m}}$ be all numbers of columns of $G$ greater then $j_{t}$ and meet the above requirements 2ad - 2d . From the conditions for $V$ we obtain a system of equations:

$$
\left\{\begin{array}{l}
g_{i t j_{t}} v_{j_{t j} j_{t}}+g_{i t j_{t_{1}}} v_{j_{t_{1}} j_{t}}+\cdots+g_{i_{t} j_{t_{m}}} v_{j_{t_{m} j_{t}}}=1 \\
g_{i_{t_{1}} j_{t}} v_{j_{t} j_{t}}+g_{i_{t_{1}} j_{t_{1}}} v_{j_{t_{1}} j_{t}}+\cdots+g_{i_{1} j_{m} t_{m}} v_{j_{t_{m}} j_{t}}=0 \\
g_{i_{t_{2}} j_{t}}^{v_{j_{t} j_{t}}}+g_{i_{t_{2}} j_{t_{1}}} v_{j_{t_{1}} j_{t}}+\cdots+g_{i_{t_{2}} j_{m}} v_{j_{t_{m}} j_{t}}=0 \\
\vdots \\
g_{i_{t_{m}} j_{t}} v_{j_{t j j_{t}}}+g_{i_{t_{m}} j j_{1}} v_{j_{t_{1}} j_{t}}+\cdots+g_{i_{t_{m}} j_{t_{m}}} v_{j_{t_{m}} j_{t}}=0
\end{array}\right.
$$

Obviously, $v_{j_{t} j_{t}}=g_{i t j_{t}}^{-1}$ if $j_{t}=j_{t_{m}}$, otherwise we solve these equations from the last to the first one for $v_{j_{t_{m}} j_{t}}, v_{j_{t_{m-1}} j_{t}}, \ldots, v_{j_{t_{1}} j_{t}}$, respectively. Plugging these solutions to the first equation and making simple calculations yields

We should mention that the conditions 2a-2d for $j_{t}$ provide that the above determinant is different from zero.
The multiplication $(\mathrm{A}, G)\left[\begin{array}{cc}I & 0 \\ 0 & V\end{array}\right]$ gives a pair $(\mathrm{A}, H)$, where for any pair of indices $i_{t}, j_{t}, t \in T$ and for any $l=1,2, \ldots, j_{t}-1$ we have: $h_{i_{t} j_{t}}=g_{i_{t} j_{t}} v_{j_{t} j_{t}}=$ $g_{i_{t} j_{t}} g_{i_{t} j_{t}}^{-1}=1$ if $j_{t}=i_{t}-1$, otherwise

$$
\begin{gathered}
h_{i_{t} j_{t}}=g_{i_{t} j_{t}} v_{j_{t} j_{t}}+g_{i_{t}\left(j_{t}+1\right)} v_{\left(j_{t}+1\right) j_{t}}+\cdots+g_{i_{t}\left(i_{t}-1\right)} v_{\left(i_{t}-1\right) j_{t}}= \\
=g_{i_{t} j_{t} g_{i_{t} j_{t}}^{-1}\left(1-g_{i_{t}\left(j_{t}+1\right)} v_{\left(j_{t}+1\right) j_{t}}-g_{i_{t}\left(j_{t}+2\right)} v_{\left(j_{t}+2\right) j_{t}}-\cdots-g_{i_{t}\left(i_{t}-1\right)} v_{\left(i_{t}-1\right) j_{t}}\right)+}^{+g_{i_{t}\left(j_{t}+1\right)} v_{\left(j_{t}+1\right) j_{t}}+\cdots+g_{i_{t}\left(i_{t}-1\right)} v_{\left(i_{t}-1\right) j_{t}}=1,}
\end{gathered}
$$

and

$$
\begin{gathered}
h_{i_{t} l}=g_{i_{t} l} v_{l l}+g_{i_{t}(l+1)} v_{(l+1) l}+\cdots+g_{i_{t}\left(i_{t}-1\right)} v_{\left(i_{t}-1\right) l}= \\
=g_{i t l} v_{l l}+g_{i_{t}(l+1)} v_{(l+1) l}+\cdots+g_{i_{t}\left(j_{t}-1\right)} v_{\left(j_{t}-1\right) l}+g_{i_{t} j_{t}} v_{j_{t l} l}= \\
=g_{i_{t}} v_{l l}+g_{i t t^{(l+1)}} v_{(l+1) l}+\cdots+g_{i_{t}\left(j_{t-1}\right)} v_{\left(j_{t}-1\right) l}+ \\
+g_{i_{t} j_{t}}\left[-g_{i t j_{t}}^{-1}\left(g_{i_{t} l} v_{l l}+g_{i_{t}(l+1)} v_{(l+1) l}+\cdots+g_{i_{t}\left(j_{t}-1\right)} v_{\left(j_{t}-1\right) l}\right)\right]=0
\end{gathered}
$$

if $j_{t}=i_{t}-1$, otherwise

$$
\begin{gathered}
h_{i_{t} l}=g_{i_{t} l} v_{l l}+g_{i_{t}(l+1)} v_{(l+1) l}+\cdots+g_{i_{t}\left(i_{t}-1\right)} v_{\left(i_{t}-1\right) l}= \\
=g_{i_{t}} v_{l l}+g_{i_{t}(l+1)} v_{(l+1) l}+\cdots+g_{i_{t}\left(j_{t}-1\right)} v_{\left(j_{t}-1\right) l}+ \\
+g_{i_{t} j_{t}} v_{j_{t} l}+g_{i_{t}\left(j_{t}+1\right)} v_{\left(j_{t}+1\right) l}+\cdots+g_{i_{t}\left(i_{t}-1\right)} v_{\left(i_{t}-1\right) l}= \\
=g_{i_{t} t} v_{l l}+g_{i_{t}(l+1)} v_{(l+1) l}+\cdots+g_{i_{t}\left(j_{t}-1\right)} v_{\left(j_{t}-1\right) l}+ \\
+g_{i_{t} j_{t}}\left\{-g_{i_{t j} j_{t}}^{-1}\left[\left(g_{i_{t} l} v_{l l}+g_{i_{t}(l+1)} v_{(l+1) l}+\cdots+g_{i_{t}\left(j_{t}-1\right)} v_{\left(j_{t}-1\right) l}\right)+\right.\right. \\
\left.\left.+\left(g_{i_{t}\left(j_{t}+1\right)} v_{\left(j_{t}+1\right) l}+g_{i_{t}\left(j_{t}+2\right)} v_{\left(j_{t}+2\right) l}+\cdots+g_{i_{t}\left(i_{t}-1\right)} v_{\left(i_{t}-1\right) l}\right)\right]\right\}+ \\
+g_{i_{t}\left(j_{t}+1\right)} v_{\left(j_{t}+1\right) l}+g_{i_{t\left(j j_{t}+2\right)} v_{\left(j_{t}+2\right) l}+\cdots+g_{i_{t}\left(i_{t}-1\right)} v_{\left(i_{t}-1\right) l}=0 .} .
\end{gathered}
$$

Clearly, for any $i=1,2, \ldots, n$, and $j=1,2, \ldots, i-1$ we have: $h_{i i}=g_{i i} v_{i i}=0$, and $h_{i j}=g_{i j} v_{j j}+g_{i(j+1)} v_{(j+1) j}+\cdots+g_{i(i-1)} v_{(i-1) j}=0$ if $g_{i j}=0$ for all $j=1,2, \ldots, i-1$.
Now, we will furnish the last part of the proof. Let $K$ be a matrix of $T_{n}^{*}$ such that $k_{i i}=1$ for all $i=1,2, \ldots, n$ and

$$
k_{i i^{\prime}}=-k_{i\left(i^{\prime}+1\right)} h_{\left(i^{\prime}+1\right) j}-k_{i\left(i^{\prime}+2\right)} h_{\left(i^{\prime}+2\right) j}-\cdots-k_{i i} h_{i j}
$$

if the $j$-th column of $H$ is of the form: $h_{i^{\prime} j}=1, h_{m j}=0$ for all $m<i^{\prime}$ and $h_{i j} \neq 0$ for some $i>i^{\prime}$. Then $K(\mathrm{~A}, H)=(\mathrm{A}, L)$, where

$$
\begin{gathered}
l_{i j}=k_{i(j+1)} h_{(j+1) j}+k_{i(j+2)} h_{(j+2) j}+\cdots+k_{i i} h_{i j}= \\
=k_{i i^{\prime}}+k_{i\left(i^{\prime}+1\right)} h_{\left(i^{\prime}+1\right) j}+k_{i\left(i^{\prime}+2\right)} h_{\left(i^{\prime}+2\right) j}+\cdots+k_{i i} h_{i j}=0 .
\end{gathered}
$$

Therefore, $(\mathrm{A}, L)=(\mathrm{A}, \mathrm{B})$, which completes the proof.
Corollary 1. The total number of $G L_{2}\left(T_{n}\right)$-orbits is equal to the number of pairs $(\mathrm{A}, \mathrm{B}) \in{ }^{2} T_{n}$.

Example 1. Consider the pair
$(\mathrm{A}, G)=\left(\left[\begin{array}{lllllll}1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0\end{array}\right],\left[\begin{array}{ccccccc}0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ g_{31} & g_{32} & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ g_{51} & g_{52} & g_{53} & g_{54} & 0 & 0 & 0 \\ g_{61} & g_{62} & g_{63} & g_{64} & 0 & 0 & 0 \\ g_{71} & g_{72} & g_{73} & g_{74} & 0 & 0 & 0\end{array}\right]\right) \in{ }^{2} T_{7}$
where $g_{32}, g_{54}, g_{63}, g_{71} \in F^{*}$. Based on the proof of Theorem 2 we find the indices $i_{t}, j_{t}, t \in T$ and determine the corresponding entries of $V \in T_{7}^{*}$ :

- $i_{1}=3, j_{1}=2$,
$v_{22}=g_{32}^{-1}$,
$v_{21}=-g_{32}^{-1} g_{31} v_{11} ;$
- $i_{2}=5, j_{2}=4$,
$v_{44}=g_{54}^{-1}$,
$v_{41}=-g_{54}^{-1}\left(g_{51} v_{11}+g_{52} v_{21}+g_{53} v_{31}\right)$,
$v_{42}=-g_{54}^{-1}\left(g_{52} v_{22}+g_{53} v_{32}\right)$,
$v_{43}=-g_{54}^{-1} g_{53} v_{33} ;$
- $i_{3}=6, j_{3}=3$,
$v_{33}=g_{63}^{-1}\left(1-g_{64} v_{43}\right)$,
$v_{31}=-g_{63}^{-1}\left(g_{61} v_{11}+g_{62} v_{21}+g_{64} v_{41}\right)$,
$v_{32}=-g_{63}^{-1}\left(g_{62} v_{22}+g_{64} v_{42}\right)$;
- $i_{4}=7, j_{4}=1$,
$v_{11}=g_{71}^{-1}\left(1-g_{72} v_{21}-g_{73} v_{31}-g_{74} v_{41}\right)$.
The result of multiplication $(\mathrm{A}, G)\left[\begin{array}{cc}I & 0 \\ 0 & V\end{array}\right]$ is a pair $(\mathrm{A}, H) \in{ }^{2} T_{7}$, where:
$h_{32}=g_{32} v_{22}=g_{32} g_{32}^{-1}=1, h_{31}=g_{31} v_{11}+g_{32} v_{21}=g_{31} v_{11}+g_{32}\left(-g_{32}^{-1} g_{31} v_{11}\right)=$ $=0$,
$h_{54}=g_{54} v_{44}=g_{54} g_{54}^{-1}=1, h_{51}=g_{51} v_{11}+g_{52} v_{21}+g_{53} v_{31}+g_{54} v_{41}=g_{51} v_{11}+$ $+g_{52} v_{21}+g_{53} v_{31}+g_{54}\left[-g_{54}^{-1}\left(g_{51} v_{11}+g_{52} v_{21}+g_{53} v_{31}\right)\right]=0, h_{52}=g_{52} v_{22}+$ $+g_{53} v_{32}+g_{54} v_{42}=g_{52} v_{22}+g_{53} v_{32}+g_{54}\left[-g_{54}^{-1}\left(g_{52} v_{22}+g_{53} v_{32}\right)\right]=0$,
$h_{53}=g_{53} v_{33}+g_{54} v_{43}=g_{53} v_{33}+g_{54}\left(-g_{54}^{-1} g_{53} v_{33}\right)=0$,
$h_{63}=g_{63} v_{33}+g_{64} v_{43}=g_{63} g_{63}^{-1}\left(1-g_{64} v_{43}\right)+g_{64} v_{43}=1, h_{61}=g_{61} v_{11}+g_{62} v_{21}+$ $+g_{63} v_{31}+g_{64} v_{41}=g_{61} v_{11}+g_{62} v_{21}+g_{63}\left[-g_{63}^{-1}\left(g_{61} v_{11}+g_{62} v_{21}+g_{64} v_{41}\right)\right]+$ $+g_{64} v_{41}=0, h_{62}=g_{62} v_{22}+g_{63} v_{32}+g_{64} v_{42}=g_{62} v_{22}+g_{63}\left[-g_{63}^{-1}\left(g_{62} v_{22}+g_{64} v_{42}\right)\right]+$ $+g_{64} v_{42}=0$,
$h_{71}=g_{71} v_{11}+g_{72} v_{21}+g_{73} v_{31}+g_{74} v_{41}=g_{71} g_{71}^{-1}\left(1-g_{72} v_{21}-g_{73} v_{31}-g_{74} v_{41}\right)+$ $+g_{72} v_{21}+g_{73} v_{31}+g_{74} v_{41}=1$.
We have $h_{i i}=g_{i i} v_{i i}=0$ for any $i=1,2, \ldots, 7$ and $h_{21}=g_{21} v_{11}=0$, $h_{4 j}=g_{4 j} v_{j j}+g_{4(j+1)} v_{(j+1) j}+\cdots+g_{43} v_{3 j}=0$ for $j=1,2,3$. Moreover,
$h_{65}=g_{65} v_{55}=0, h_{75}=g_{75} v_{55}+g_{76} v_{65}=0, h_{76}=g_{76} v_{66}=0$. Thus

$$
H=\left[\begin{array}{ccccccc}
0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1 & 0 & 0 & 0 \\
0 & 0 & 1 & h_{64} & 0 & 0 & 0 \\
1 & h_{72} & h_{73} & h_{74} & 0 & 0 & 0
\end{array}\right]
$$

Then $K(\mathrm{~A}, H)=(\mathrm{A}, \mathrm{B})$, where

$$
K=\left[\begin{array}{cccccll}
1 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 1 & 0 & 0 \\
0 & 0 & 0 & 0 & -h_{64} & 0 & 0 \\
0 & 0 & -h_{72} & 0 & h_{73} h_{64}-h_{74} & -h_{73} & 1
\end{array}\right]
$$

and $(A, B)=\left(\left[\begin{array}{lllllll}1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0\end{array}\right],\left[\begin{array}{lllllll}0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0\end{array}\right]\right)$.
Theorem 3. The total number of $G L_{2}\left(T_{n}\right)$-orbits is equal to the Bell number $B_{n}$.

Proof. Recall that the Bell number $B_{n}$ is the number of partitions $\Pi$ of the set $\{1,2, \ldots n\}$. Therefore, in the light of Corollary $\mathbb{1}$ it suffices to show that the set of pairs (A, B) $\in{ }^{2} T_{n}$ and the family of partitions $\Pi$ are equipotent.
Let $A_{k}$ be the matrix obtained from $\mathrm{A}=\left(a_{k l}\right)$ by removing its rows and columns number $k+1, k+2, \ldots, n$ if $k=1,2, \ldots, n-1$, and let $A_{k}=\mathrm{A}$ if $k=n$. The rank of a matrix $A_{k}$ is denoted by $t_{k}$ and the expression $T$ means the set $\left\{t_{k} ; k=1,2, \ldots, n\right\}$. There exists a bijection that associates to every pair $(\mathrm{A}, \mathrm{B}) \in{ }^{2} T_{n}$ the partition $\Pi=\left\{U_{t_{k}}, t_{k} \in T\right\}$ such that for any $k \in\{1,2, \ldots n\}$ with $a_{k k}=1$

$$
U_{t_{k}}=\{k\} \cup\left\{i ; b_{i j}=1, t_{k}=j-\operatorname{rank} B_{i j}, 1 \leqslant i \leqslant n, 1 \leqslant j \leqslant n\right\},
$$

where $B_{i j}$ is the matrix obtained from $\mathrm{B}=\left(b_{i j}\right)$ by changing its rows number $i, i+1, \ldots, n$ and columns number $j, j+1, \ldots, n$ into zero rows and columns. Conversely, to a partition $\Pi=\left\{U_{s}, s \in S\right\}$ of the set $\{1,2, \ldots n\}$ corresponds exactly one pair $(\mathrm{A}, \mathrm{B}) \in{ }^{2} T_{n}$. To see this correspondence, suppose that $u_{s}$ is the smallest element of the set $U_{s}$, where $s \in S$. An entry $a_{i j}$ of $\mathrm{A}=\left(\mathrm{a}_{\mathrm{ij}}\right)$ is equal to 1 if $i=j=u_{s}$ for some $s \in S$, being equal to 0 otherwise.
Elements of the set

$$
\{1,2, \ldots n\} \backslash\left\{u_{s}, s \in S\right\}=\left\{x_{m} ; m=1,2, \ldots, n-\operatorname{rank} \mathrm{A}\right\}
$$

where $x_{1}<x_{2}<\cdots<x_{n-r a n k A}$, are numbers of rows with entry 1 of the matrix $B$. Any other row of $B$ is a zero row. We have to indicate the column number $y_{m}$ containing entry 1 from a row $x_{m}$ for any $m=1,2, \ldots, n-r a n k \mathrm{~A}$. We do it for each row one by one, from the smallest $x_{m}$, i.e. $x_{1}$, to the greatest, i.e. $x_{n-r a n k \mathrm{~A}}$. This order is crucial. For any $m=1,2, \ldots, n-\operatorname{rank} \mathrm{A}$ the column $y_{m}$ is the $s$-th column without entry 1 (from the left). Thereby, entry 1 in the $x_{1}$-th row is in the $s$-th column, where $x_{1} \in U_{s}$.

Corollary 2. The orbit of unimodular cyclic submodules of ${ }^{2} T_{n}$ represented by the pair $(1,0)$ of ${ }^{2} T_{n}$ corresponds to the partition $\Pi=\{\{1\},\{2\}, \ldots,\{n\}\}$ of the set $\{1,2, \ldots n\}$.

Example 2. Choose the pair

$$
(A, B)=\left(\left[\begin{array}{llllll}
1 & 0 & 0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0
\end{array}\right],\left[\begin{array}{llllll}
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 & 0 & 0
\end{array}\right]\right) \in{ }^{2} T_{6} .
$$

We have $a_{k k}=1$ for $k=1,2,4$, so $\Pi=\left\{U_{t_{1}}, U_{t_{2}}, U_{t_{4}}\right\}$, where $t_{1}=1$, $t_{2}=2$, $t_{4}=3$. Of course, $1 \in U_{1}, 2 \in U_{2}, 4 \in U_{3}$. Moreover,

- $b_{32}=1$, thus $j-\operatorname{rank} B_{32}=2-0=2$ and hence $3 \in U_{2}$;
- $b_{54}=1$, thus $j-\operatorname{rank} B_{54}=4-1=3$ and hence $5 \in U_{3}$;
- $b_{63}=1$, thus $j-\operatorname{rank} B_{63}=3-1=2$ and hence $6 \in U_{2}$.

Therefore, the partition $\Pi=\{\{1\},\{2,3,6\},\{4,5\}\}$ corresponds to such a pair (A, B).
We will also show the converse correspondence. As $\left\{u_{s}, s \in S\right\}=\{1,2,4\}$, so $a_{11}=a_{22}=a_{44}=1$ and all the remaining entries of A are zero. Moreover,
$x_{1}=3, x_{2}=5, x_{3}=6$, hence rows 3,5 and 6 of B contain entry $1.3 \in U_{2}$, thus $b_{32}=1.5 \in U_{3}$ and the 3 rd column without entry 1 (from the left) is now the column number 4 , therefore $b_{54}=1$. By the same way we get that $b_{63}=1$, all the remaining entries of B being zero. Finally, the pair of ${ }^{2} T_{6}$ corresponding to $\Pi$ is equal to ( $\mathrm{A}, \mathrm{B}$ ).

Example 3. Consider the ring $T_{4}$. By Theorem 3 there are exactly $B_{4}=15$ $G L_{2}\left(T_{4}\right)$-orbits with the following representatives and corresponding partitions of the set $\{1,2,3,4\}$ :

$$
\begin{aligned}
& T_{4}\left(\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right],\left[\begin{array}{cccc}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0
\end{array}\right]\right), \Pi=\{\{1\},\{2\},\{3\},\{4\}\} ; \\
& T_{4}\left(\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 0
\end{array}\right],\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
1 & 0 & 0 & 0
\end{array}\right]\right), \Pi=\{\{1,4\},\{2\},\{3\}\} ; \\
& T_{4}\left(\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 0
\end{array}\right],\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0
\end{array}\right]\right), \Pi=\{\{1\},\{2,4\},\{3\}\} ; \\
& T_{4}\left(\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 0
\end{array}\right],\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 1 & 0
\end{array}\right]\right), \Pi=\{\{1\},\{2\},\{3,4\}\} ; \\
& T_{4}\left(\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right],\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0
\end{array}\right]\right), \Pi=\{\{1,3\},\{2\},\{4\}\} ; \\
& T_{4}\left(\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right],\left[\begin{array}{llll}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 0
\end{array}\right]\right), \Pi=\{\{1\},\{2,3\},\{4\}\} ;
\end{aligned}
$$

$$
\begin{aligned}
& T_{4}\left(\left[\begin{array}{cccc}
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right],\left[\begin{array}{cccc}
0 & 0 & 0 & 0 \\
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0
\end{array}\right]\right), \Pi=\{\{1,2\},\{3\},\{4\}\} ; \\
& T_{4}\left(\left[\begin{array}{cccc}
