

# Non-existence of dead cores in fully nonlinear elliptic models

by

João Vitor da Silva<sup>\*†</sup>, Disson dos Prazeres<sup>‡</sup> & Humberto Ramos Quoirin<sup>§</sup>

## Abstract

We investigate non-existence of nonnegative dead-core solutions for the problem

$$|Du|^\gamma F(x, D^2u) + a(x)u^q = 0 \quad \text{in } \Omega, \quad u = 0 \quad \text{on } \partial\Omega.$$

Here  $\Omega \subset \mathbb{R}^N$  is a bounded smooth domain,  $F$  is a fully nonlinear elliptic operator,  $a : \Omega \rightarrow \mathbb{R}$  is a sign-changing weight,  $\gamma \geq 0$ , and  $0 < q < \gamma + 1$ . We show that this problem has no non-trivial dead core solutions if either  $q$  is close enough to  $\gamma + 1$  or the negative part of  $a$  is sufficiently small. In addition, we obtain the existence and uniqueness of a positive solution under these conditions on  $q$  and  $a$ . Our results extend previous ones established in the semilinear case, and are new even for the simple model  $|Du(x)|^\gamma \text{Tr}(A(x)D^2u(x)) + a(x)u^q(x) = 0$ , where  $A \in C^0(\Omega; \text{Sym}(N))$  is a uniformly elliptic and non-negative matrix.

**Keywords:** Fully nonlinear operators of degenerate type, dead core problems, existence/non-existence of positive solutions.

**AMS Subject Classifications:** 35A01, 35D40, 35J15, 35J66, 35J70

## 1 Introduction

Let  $\Omega \subset \mathbb{R}^N$  be a bounded and smooth domain with  $N \geq 1$ . This work is devoted to the problem

$$(P_{a,q}) \quad \begin{cases} |Du|^\gamma F(x, D^2u) + a(x)u^q = 0 & \text{in } \Omega \\ u \geq 0 & \text{in } \Omega \\ u = 0 & \text{on } \partial\Omega, \end{cases}$$

where  $\gamma \geq 0$ ,  $q \in (0, \gamma + 1)$ ,  $a \in C(\overline{\Omega})$  changes sign, and  $F : \Omega \times \text{Sym}(N) \rightarrow \mathbb{R}$  is a second order fully nonlinear elliptic operator satisfying the following assumptions:

**(F1) [\$(\lambda, \Lambda)\$-Ellipticity condition]** There exist constants  $\Lambda \geq \lambda > 0$  (known as *ellipticity parameters*) such that for any  $x \in \Omega$  and  $X, Y \in \text{Sym}(N)$ , with  $Y \geq 0$  there holds

$$\mathcal{M}_{\lambda, \Lambda}^-(Y) \leq F(x, X+Y) - F(x, X) \leq \mathcal{M}_{\lambda, \Lambda}^+(Y),$$

where  $\mathcal{M}_{\lambda, \Lambda}^\pm$  denote the *Pucci's extremal operators*:

$$\mathcal{M}_{\lambda, \Lambda}^+(X) := \lambda \cdot \sum_{e_i < 0} e_i(X) + \Lambda \cdot \sum_{e_i > 0} e_i(X) \quad \text{and} \quad \mathcal{M}_{\lambda, \Lambda}^-(X) := \lambda \cdot \sum_{e_i > 0} e_i(X) + \Lambda \cdot \sum_{e_i < 0} e_i(X)$$

and  $\{e_i(X) : 1 \leq i \leq N\}$  are the eigenvalues of  $X$ .

**(F2) [1-Homogeneity condition]** For all  $s \in \mathbb{R}^*$ ,  $x \in \Omega$  and  $X \in \text{Sym}(N)$  there holds

$$F(x, sX) = |s|F(x, X).$$

**(F3) [Continuity condition]** There exists a modulus of continuity  $\omega : [0, \infty) \rightarrow [0, \infty)$  with  $\omega(0) = 0$  such that for all  $(x, y, X) \in \Omega \times \Omega \times \text{Sym}(N)$

$$|F(x, X) - F(y, X)| \leq \omega(|x - y|)\|X\|.$$

Some examples of operators satisfying our assumptions are given next:

### 1. Second order operators in non-divergence form:

$$F(x, D^2u) := \mathcal{L}u(x) = \sum_{i,j=1}^N a_{ij}(x) \partial_{ij}u(x),$$

where  $(a_{ij})_{i,j=1}^N$  is a uniformly elliptic and symmetric matrix with (uniformly) continuous coefficients.

### 2. Hamilton-Jacobi-Bellman and Isaac's type operators:

The following Hamilton-Jacobi-Bellman (HJB in short) and Isaac's type operators, which appear in control problems for stochastic systems and in the theory of (zero-sum two-player) stochastic differential games, see *e.g* [9, 22, 23, 24]:

$$F(x, D^2u) := \inf_{\hat{\alpha} \in \mathcal{A}} (\mathcal{L}_{\hat{\alpha}}u(x)) \quad \left( \text{respect.} \quad \sup_{\hat{\alpha} \in \mathcal{A}} (\mathcal{L}_{\hat{\alpha}}u(x)) \right),$$

and

$$F(x, D^2u) := \sup_{\hat{\beta} \in \mathcal{B}} \inf_{\hat{\alpha} \in \mathcal{A}} (\mathcal{L}_{\hat{\alpha}\hat{\beta}}u(x)) \quad \left( \text{respect.} \quad \inf_{\hat{\beta} \in \mathcal{B}} \sup_{\hat{\alpha} \in \mathcal{A}} (\mathcal{L}_{\hat{\alpha}\hat{\beta}}u(x)) \right).$$

Here  $\mathcal{L}_{\hat{\alpha}\hat{\beta}}u(x) = \sum_{i,j=1}^N a_{ij}^{\hat{\alpha}\hat{\beta}}(x) \partial_{ij}u(x)$  is a family of uniformly elliptic operators with coefficients enjoying a universal modulus of continuity and ellipticity constants  $\Lambda \geq \lambda > 0$ .

### 3. Pucci's extremal operators:

$$\mathcal{M}_{\lambda,\Lambda}^+(X) = \max \{ \text{Tr}(AX) : \lambda I \leq A \leq \Lambda I \text{ for } A \in \text{Sym}(N) \}$$

$$\mathcal{M}_{\lambda,\Lambda}^-(X) = \min \{ \text{Tr}(AX) : \lambda I \leq A \leq \Lambda I \text{ for } A \in \text{Sym}(N) \}$$

### 4. $p$ -Laplacian type operators:

Other interesting examples are given by the  $p$ -Laplacian operator (in non-divergence form) with  $\gamma = p - 2$  (for  $p > 1$ )

$$G_p(\xi, X) = |\xi|^\gamma F_p(\xi, X)$$

where

$$\begin{aligned} F_p(\xi, X) &:= (\text{Tr}(X) + (p-2)|\xi|^{-2} \langle X\xi, \xi \rangle) \\ &= \text{Tr} \left[ \left( I + (p-2) \frac{\xi \otimes \xi}{|\xi|^2} \right) X \right]. \end{aligned}$$

Furthermore, we can also quote non-variational generalizations of the  $p$ -Laplacian operator, with continuous coefficients, as follows:

$$\begin{aligned} G_{c_0}(x, \xi, X) &:= \text{Tr}(\mathcal{A}_1(x)X) - c_0 |\xi|^{-2} \langle X \mathcal{A}_2(x) \xi, \mathcal{A}_2(x) \xi \rangle \\ &= \text{Tr} \left[ \left( \mathcal{A}_1(x) + c_0 \frac{\mathcal{A}_2(x) \xi \otimes \mathcal{A}_2(x) \xi}{|\xi|^2} \right) X \right]. \end{aligned}$$

where  $\mathcal{A}_1, \mathcal{A}_2 : \Omega \rightarrow \text{Sym}(N)$  are  $\theta$ -Hölderian functions with  $\theta > \frac{1}{2}$ ,  $\lambda I \leq \mathcal{A}_1 \leq \Lambda I$ ,  $-\sqrt{\lambda} I \leq \mathcal{A}_2 \leq \sqrt{\lambda} I$  and  $c_0 > -1$ .

We refer the reader to [1], [5], [6], [7], [10, Chapter 2], [26] and references therein for a number of examples of fully nonlinear operators with such structural properties.

Note that when  $\gamma > 0$  the operator  $|Du|^\gamma F(x, D^2u)$  is degenerate in the gradient. Thanks to (F1) this operator is  $(\gamma + 1)$ -homogeneous and since  $q < \gamma + 1$ , the reaction term in the equation is 'sub-homogeneous' in comparison with the operator. This fact, combined with the change of sign of  $a$ , prevents the use of the strong maximum principle and enables the existence of *dead core* solutions, i.e. nontrivial solutions vanishing in some part of the domain. It is worth pointing out that the condition  $a^+ \not\equiv 0$  is necessary for the existence of nontrivial solutions of  $(P_{a,q})$ . We refer to [3] for an essay on the validity of the strong maximum principle and [2, 13, 14, 15, 16] for several features on dead core type problems.

Specifically, our main aim in this manuscript is to extend the positivity results established in [21], where a simplified semilinear version of  $(P_{a,q})$  has been considered for  $\Delta$ , the Laplace operator. Based on a continuity argument, it was proved in [21, Theorems 1.1 and 1.3] that the positivity property obtained via the strong maximum principle still holds for nonnegative solutions of the equation

$$\Delta u + a(x)u^q = 0 \quad \text{in } \Omega$$

as long as  $a$  and  $q$  nearly satisfy the conditions to apply this principle (i.e.  $a \geq 0$  or  $q = 1$ ). Such continuity argument combines some ingredients that turn out to be available for  $(P_{a,q})$  as well, namely:  $C^{1,\alpha}$  regularity estimates up to the boundary, the sub-supersolution method, the strong maximum principle (with  $q = \gamma + 1$  or  $a \geq 0$ ), and the homogeneity of the reaction term and the operator.

In view of the non-divergence nature of our equations, we are not allowed to employ the classical theory of weak solutions in Sobolev spaces. Solutions of  $(P_{a,q})$  will then be considered in the viscosity sense, as follows:

**Definition 1.1 (Viscosity solutions).** Let  $G : \Omega \times \mathbb{R} \times \mathbb{R}^N \times \text{Sym}(N)$  be continuous. Then  $u \in C(\Omega)$  is a viscosity super-solution (respect. sub-solution) of

$$(1.1) \quad G(x, u, Du, D^2u) = 0 \quad \text{in } \Omega$$

if for every  $x_0 \in \Omega$  and  $\phi \in C^2(\Omega)$  such that  $u - \phi$  has a local minimum at  $x_0$  (resp. local maximum at  $x_0$ ), one has

$$G(x_0, u(x_0), D\phi(x_0), D^2\phi(x_0)) \leq 0 \quad (\text{respect. } \geq 0).$$

Finally,  $u$  is said to be a viscosity solution of the above equation if it is simultaneously a viscosity super-solution and a viscosity sub-solution.

A solution  $u$  of  $(P_{a,q})$  is said to be:

- non-trivial if  $u \not\equiv 0$ ;
- positive if  $u > 0$  in  $\Omega$ .
- a *dead core* solution if it vanishes in an open subset of  $\Omega$ .

We state now our main results. Our first result, proved by the method of sub-solution and super-solution, guarantees that  $(P_{a,q})$  has a nontrivial solution.

**Theorem 1.2 (Existence of nontrivial solutions).** Assume (F1) and (F2). Then  $(P_{a,q})$  has a non-trivial viscosity solution.

By adapting some ideas from [11] and [19], we are able to ensure that  $(P_{a,q})$  has at most one positive solution.

**Theorem 1.3 (Uniqueness of positive solution).** Assume (F1) and (F2). Then  $(P_{a,q})$  has at most one positive solution.

Let us set  $\Omega^+ := \{x \in \Omega : a(x) > 0\}$  and

$$\mathcal{P}^\circ(\Omega) := \left\{ u \in C_0^1(\overline{\Omega}) : u > 0 \text{ in } \Omega, \text{ and } \frac{\partial u}{\partial \nu} < 0 \text{ on } \partial\Omega \right\},$$

which is the interior of the *positivity cone* of  $C_0^1(\overline{\Omega})$ , where  $\frac{\partial u}{\partial \nu}$  denotes the exterior normal derivative.

The next theorem states that  $(P_{a,q})$  has no non-trivial dead-core solution if either  $\|a^-\|_\infty$  is sufficiently small or  $q$  is close enough to  $\gamma + 1$ .

**Theorem 1.4 (Non-existence of dead-core solutions).** Assume (F1), (F2), (F3), and that  $\Omega_+$  has finitely many connected components. Then:

1. There exists  $\delta = \delta(N, \lambda, \Lambda, \gamma, q, a^+, \Omega) > 0$  such that every nontrivial solution of  $(P_{a,q})$  belongs to  $\mathcal{P}^\circ(\Omega)$  if  $\|a^-\|_\infty < \delta$ .
2. There exists  $q_0 = q_0(N, a, \gamma, \lambda, \Lambda, \Omega) \in [0, \gamma + 1)$  such that every nontrivial solution of  $(P_{a,q})$  belongs to  $\mathcal{P}^\circ(\Omega)$  if  $q \in (q_0, \gamma + 1]$ .

Thanks to the previous results, we deduce the existence and uniqueness of a positive solution under the aforementioned conditions on  $a$  and  $q$ .

**Corollary 1.5 (Existence and uniqueness of nontrivial solution).** *Under the assumptions of Theorem 1.4 the problem  $(P_{a,q})$  has a unique nontrivial solution (which belongs to  $\mathcal{P}^\circ(\Omega)$ ) if either  $\|a^-\|_\infty < \delta$  or  $q \in (q_0, \gamma + 1)$ .*

To the best of our knowledge and as far as degenerate elliptic models in non-divergence form are concerned, Theorems 1.2, 1.3, and 1.4 are a novelty even for the model

$$\begin{cases} |Du|^\gamma \text{Tr}(A(x)D^2u) + a(x)u(x)^q &= 0 & \text{in } \Omega \\ u &\geq 0 & \text{in } \Omega \\ u &= 0 & \text{on } \partial\Omega \end{cases}$$

with  $A \in C^0(\Omega; \text{Sym}(N))$  a uniformly elliptic and non-negative matrix.

Our paper is organized as follows: in Section 2 we recall some well-known results concerning the operators considered here. Such results help us in the proofs of our main results. In section 3 we prove the existence theorem and in section 4 we prove the uniqueness of positive solutions. Finally, in section 5 we prove of our main result and give an example of a problem with a dead-core solution.

## 2 Preliminaries

Throughout this section we recall the results we shall rely on. Let us start with a stability result, which claims that the limit of a sequence of viscosity solutions turns out to be a viscosity solution of the limiting equation, whose proof can be found in [8, Corollary 4.3] and [20, Proposition 2.1].

**Lemma 2.1 (Stability).** *Let  $G_k \in C(\Omega \times \mathbb{R} \times \mathbb{R}^N \times \text{Sym}(N))$  and  $u_k \in C(\overline{\Omega})$  be viscosity subsolutions (resp. supersolutions) of  $G_k(x, u, Du, D^2u) = 0$  in  $\Omega$  for  $k \in \mathbb{N}$ . Assume also that  $G_k(x, r, p, X) \rightarrow G(x, r, p, X)$  uniformly on compact subsets of  $\Omega \times \mathbb{R} \times \mathbb{R}^N \times \text{Sym}(N)$  and  $u_k \rightarrow u$  uniformly on  $\overline{\Omega}$  for some functions  $G$  and  $u$ , as  $k \rightarrow \infty$ . Then  $u$  is a viscosity subsolution (resp. supersolution) of (1.1).*

The following result states the existence of viscosity solutions via the sub-supersolutions method, cf. [20, Proposition 2.3].

**Lemma 2.2 (Existence of solutions via sub-supersolutions).** *Let  $G \in C(\Omega \times \mathbb{R} \times \mathbb{R}^N \times \text{Sym}(N))$  and suppose that there is a viscosity subsolution  $\underline{u}$  and a viscosity supersolution  $\overline{u}$  of (1.1) satisfying  $\underline{u} \leq \overline{u}$  and  $\underline{u}, \overline{u} \in C(\overline{\Omega})$ . Then (1.1) has a viscosity solution satisfying  $\underline{u} \leq u \leq \overline{u}$ .*

In [5] Birindelli and Demengel proved the following maximum principle result:

**Lemma 2.3 (Maximum Principle).** Assume (F1) and (F2). Let  $u$  be a positive viscosity solution of  $|Du|^\gamma F(x, D^2u) - ku^{1+\gamma} \leq 0$  in  $\Omega$ , for some constant  $k$ . Suppose that  $u(x_0) = 0$  for some  $x_0 \in \partial\Omega$  such that  $\Omega$  satisfies the interior sphere condition at  $x_0$ . Then there exists  $M > 0$  (depending only on the structural data) such that  $u(x) > Md_{\partial\Omega}(x)$ , where  $d_{\partial\Omega}$  is the distance to the boundary.

As a direct consequence, we are able to prove the following Hopf type lemma:

**Lemma 2.4 (Hopf Lemma).** Assume (F1) and (F2). Let  $u$  be a positive viscosity solution of  $|Du|^\gamma F(x, D^2u) + a(x)u^{1+\gamma} \leq 0$  in  $\Omega$ . If  $u(x_0) = 0$  for some  $x_0 \in \partial\Omega$  such that  $\Omega$  satisfies the interior sphere condition at  $x_0$ , then there exists  $M > 0$  (depending only on the structural data) such that  $u(x) > Md_{\partial\Omega}(x)$ , where  $d_{\partial\Omega}$  is the distance function to the boundary.

*Proof.* It is enough to see that

$$|Du|^\gamma F(D^2u) - \|a\|_\infty u^{1+\gamma} \leq |Du|^\gamma F(D^2u) + a(x)u^{1+\gamma} \leq 0.$$

in the viscosity sense. So the previous Lemma yields the conclusion.  $\square$

As a byproduct of Lemma 2.4 and the  $C^{1,\alpha}$  regularity estimates up to the boundary [7] for solutions of the limiting problem of  $(P_{a,q})$  with  $q = 1 + \gamma$ , namely,

$$(P_{a,1+\gamma}) \quad \begin{cases} |Du|^\gamma F(x, D^2u) + a(x)u^{1+\gamma}(x) &= 0 & \text{in } \Omega \\ u &\geq 0 & \text{in } \Omega \\ u &= 0 & \text{on } \partial\Omega, \end{cases}$$

we are able to deduce a *Hopf Maximum Principle* (or Hopf-Oleinik type result).

**Theorem 2.5 (Hopf Maximum Principle).** Assume (F1) and (F2). Let  $u$  be a non-trivial viscosity solution of  $(P_{a,1+\gamma})$ . Then  $u \in \mathcal{P}^\circ(\Omega)$ .

The next theorem, which plays a fundamental role in proving Theorem 1.4, can be found in [1, Theorem 3.1], [7, Theorem 1.1], [8, Theorem 1.1], [10, Section 8.2] and [19, Theorem 1].

**Theorem 2.6 (Gradient estimates).** Assume (F1), (F2), and (F3). Let  $u$  be a bounded viscosity solution of

$$|Du|^\gamma F(x, D^2u) = f \in L^\infty(B_1).$$

Then, for some universal  $\alpha \in (0, 1)$ , we have

$$[Du]_{C^{0,\alpha}(B_1)} \leq C(N, \gamma, \lambda, \Lambda) \left( \|u\|_{L^\infty(B_1)} + \|f\|_{L^\infty(B_1)}^{\frac{1}{\gamma+1}} \right).$$

Finally, let us consider an eigenvalue problem related to our class of operators. Given a smooth bounded domain  $\mathcal{D} \subset \mathbb{R}^N$ , we denote by  $(\lambda^+(\mathcal{D}), \phi^+(\mathcal{D}))$  the first eigenpair of the eigenvalue problem

$$(2.1) \quad \begin{cases} |D\phi|^\gamma F(x, D^2\phi) &= -\lambda \phi^{\gamma+1} & \text{in } \mathcal{D} \\ \phi &= 0 & \text{on } \partial\mathcal{D}, \end{cases}$$

with  $\phi^+(\mathcal{D}) > 0$  and  $\|\phi^+(\mathcal{D})\|_\infty = 1$ . For the existence of this eigenpair, see for instance [4], [6], [12], [17], [18], [25] and references therein.

### 3 Existence of non-trivial solutions: Proof of Theorem 1.2

Let us establish the existence of non-trivial solutions to  $(P_{a,q})$ .

**Proof of Theorem 1.2.** First we construct a sub-solution of  $(P_{a,q})$ . Consider  $\tilde{\mathcal{B}} \subset \{a > 0\}$  a ball and  $(\lambda^+(\mathcal{B}), \phi^+(\mathcal{B}))$  the first eigenpair of the problem (2.1). We claim that for  $\varepsilon > 0$  sufficiently small  $\varepsilon\phi^+$  is a sub-solution of

$$|Du|^\gamma F(x, D^2u) + a(x)u^q(x) = 0 \quad \text{in } \mathcal{B}.$$

Indeed, since  $a > 0$  on  $\tilde{\mathcal{B}}$  we have

$$\lambda^+ \varepsilon^{1+\gamma} \phi^+ = \lambda^+ \varepsilon^{1+\gamma-q} (\phi^+)^{1-q} (\varepsilon\phi^+)^q \leq a(x) (\varepsilon\phi^+)^q \text{ in } \mathcal{B},$$

when  $\varepsilon > 0$  is small enough. In addition,

$$|D(\varepsilon\phi^+)|^\gamma F(x, D^2(\varepsilon\phi^+)) = -\varepsilon^{1+\gamma} \lambda^+ \phi^+.$$

So we can conclude that

$$|D(\varepsilon\phi^+)|^\gamma F(x, D^2(\varepsilon\phi^+)) \geq -a(x) (\varepsilon\phi^+)^q,$$

which proves the claim.

Now we are going to prove that the function

$$\underline{u}_\varepsilon = \begin{cases} \varepsilon\phi^+ & \text{in } \mathcal{B}, \\ 0 & \text{in } \Omega \setminus \mathcal{B} \end{cases}$$

is a viscosity sub-solution of  $(P_{a,q})$ . Let  $\varphi \in C^2(\Omega)$  touch  $\underline{u}_\varepsilon$  from above at  $x_0$ . If  $\varphi(x_0) = \underline{u}_\varepsilon(x_0) = 0$  then, since 0 is a viscosity solution of  $(P_{a,q})$ , we have

$$|D\varphi(x_0)|^\gamma F(x_0, D^2\varphi(x_0)) \geq 0 = -a(x_0) (\varphi(x_0))^q.$$

Now if  $\varphi(x_0) = \underline{u}_\varepsilon(x_0) > 0$  then  $x_0 \in \mathcal{B}$ , therefore  $\varphi$  touches  $\varepsilon\phi^+$  from above at  $x_0$ . Therefore, we have

$$|D\varphi(x_0)|^\gamma F(x_0, D^2\varphi(x_0)) = -a(x_0) \varphi^q(x_0),$$

which proves the claim.

We look now for a viscosity super-solution of  $(P_{a,q})$ . To this end, consider  $\psi > 0$  satisfying

$$\begin{cases} |D\psi|^\gamma F(x, D^2\psi) &= -\|a\|_\infty & \text{in } \Omega, \\ \psi &= 0 & \text{in } \partial\Omega. \end{cases}$$

and  $k \gg 1$  such that

$$k^{1+\gamma-q} > \psi^q,$$

so that

$$|D(k\psi)|^\gamma F(x, D^2(k\psi)) = -k^{1+\gamma} \|a\|_\infty \leq -\|a\|_\infty (k\psi)^q.$$

Since  $\|a\|_\infty \geq a(x)$  we have

$$|D(k\psi)|^\gamma F(x, D^2(k\psi)) \leq -a(x)(k\psi)^q.$$

Thus  $\bar{u}_k = k\psi$  is a super-solution of  $(P_{a,q})$ . As  $\underline{u}_\varepsilon = 0$  in a neighborhood of  $\partial\Omega$ , we see that taking  $\varepsilon$  smaller and  $k$  larger if necessary, we have  $\underline{u}_\varepsilon \leq \bar{u}_k$ .

By Lemma 2.2 we conclude that there exist a viscosity solution  $u$  of  $(P_{a,q})$  such that

$$\underline{u}_\varepsilon \leq u \leq \bar{u}_k,$$

and therefore  $u \geq 0$  is non-trivial, which proves the theorem.  $\square$

## 4 Uniqueness of positive solutions: Proof of Theorem 1.3

We adapt ideas from [11] and [19] to show that  $(P_{a,q})$  admits at most one positive solution. Nevertheless, the advantage of the method applied here is that we allow  $a$  to change sign.

**Lemma 4.1.** *Let  $0 < q < \gamma + 1$  and  $u$  be a positive viscosity solution of*

$$(4.1) \quad |Du|^\gamma F(x, D^2 u) + a(x)u^q(x) = 0 \quad \text{in } \Omega.$$

Then

$$w(x) = \frac{1}{1 - \frac{q}{1+\gamma}} u(x)^{1 - \frac{q}{1+\gamma}}$$

is a positive viscosity solution of

$$(4.2) \quad |Dw|^\gamma F\left(x, D^2 w + \left(\frac{q}{1+\gamma-q}\right) \frac{Dw \otimes Dw}{w}\right) + a(x) = 0.$$

*Proof.* We set  $\bar{q} = \frac{q}{1+\gamma}$ . Consider  $\Phi \in C^2(\Omega)$  a test function for (4.2) that touches  $w$  from below at  $x = x_0 \in \Omega$ , so that

$$\phi(x) = [(1 - \bar{q})\Phi(x)]^{\frac{1}{1-\bar{q}}}$$

touches  $u$  from below at  $x = x_0$ . Since  $u > 0$  and  $\Phi \in C^2(\Omega)$  we see that  $\phi \in C^2$  in a neighborhood of  $x_0$ , so it is a test function for (4.1). Besides, we remark that

$$D\phi(x) = [(1 - \bar{q})\Phi(x)]^{\frac{\bar{q}}{1-\bar{q}}} D\Phi(x)$$

and

$$D^2\phi(x) = [(1 - \bar{q})\Phi(x)]^{\frac{\bar{q}}{1-\bar{q}}} \left( D^2\Phi(x) + \left( \frac{\bar{q}}{1-\bar{q}} \right) \frac{D\Phi(x) \otimes D\Phi(x)}{\Phi(x)} \right).$$

Hence,

$$-a(x_0)u^q(x_0) \geq |D\phi(x_0)|^\gamma F(x_0, D^2\phi(x_0)),$$

and by the 1-homogeneity of the operator  $F$  we have

$$-a(x_0)u^q(x_0) \geq [(1-\bar{q})\Phi(x_0)]^{(1+\gamma)\frac{\bar{q}}{1-\bar{q}}} |D\Phi(x_0)|^\gamma F\left(x_0, D^2\Phi(x_0) + \left(\frac{\bar{q}}{1-\bar{q}}\right) \frac{D\Phi(x_0) \otimes D\Phi(x_0)}{\Phi(x_0)}\right).$$

Thus, using the definition of  $\phi$  we obtain

$$-a(x_0)[(1-\bar{q})\Phi(x_0)]^{\frac{q}{1-\bar{q}}} \geq [(1-\bar{q})\Phi(x_0)]^{\frac{(1+\gamma)\bar{q}}{1-\bar{q}}} |D\Phi(x_0)|^\gamma F\left(x_0, D^2\Phi(x_0) + \left(\frac{\bar{q}}{1-\bar{q}}\right) \frac{D\Phi(x_0) \otimes \Phi(x_0)}{\Phi(x_0)}\right).$$

Finally, as  $(1+\gamma)\bar{q} = q$ , we conclude that

$$-a(x_0) \geq |D\Phi(x_0)|^\gamma F\left(x_0, D^2\Phi(x_0) + \left(\frac{\bar{q}}{1-\bar{q}}\right) \frac{D\Phi(x_0) \otimes \Phi(x_0)}{\Phi(x_0)}\right),$$

which proves that  $w$  is a viscosity super-solution of (4.2). In a similar way, one proves that  $w$  is a viscosity sub-solution of (4.2).  $\square$

With a little help from Lemma 4.1 we are able to prove our uniqueness result.

**Proof of Theorem 1.3.** Suppose that (4.1) has two positive solutions  $u_1, u_2$ . By Lemma 4.1, it follows that (4.2) has two positive solutions  $w_1, w_2$ . Let  $x_0 \in \Omega$  be such that

$$(4.3) \quad \max_{\Omega} (w_1 - w_2) = (w_1 - w_2)(x_0) > 0$$

and  $\Omega_1$  be an open connected neighborhood of  $x_0$  where  $w_1 - w_2 > 0$ . We claim that

$$\mathcal{M}_{\lambda, \Lambda}^+(D^2(w_1 - w_2)) \geq 0 \text{ in } \Omega_1.$$

To this end we consider

$$\phi(x) = \frac{1}{2}x^T A x + bx + c, \quad (A, b, c) \in (\text{Sym}(N), \mathbb{R}^N, \mathbb{R})$$

a second order polynomial that touches  $w_1 - w_2$  from above at  $x_1 \in \Omega_1$ , i.e.  $\phi(x_1) = (w_1 - w_2)(x_1)$  and  $\phi > w_1 - w_2$  in  $B_r \setminus \{x_1\} \subset \Omega_1$  for some  $r \ll 1$ . We are going to show that

$$(4.4) \quad \mathcal{M}_{\lambda, \Lambda}^+(A) \geq 0.$$

We consider two cases:

First, if  $b \neq 0$  then  $w_1 - w_2(x_1) - \phi$  has a maximum point at  $x_1$ , so

$$|b|^\gamma F\left(x_1, A + \left(\frac{q}{1+\gamma-q}\right) \frac{b \otimes b}{w_1(x_1)}\right) \geq -a(x_1).$$

In a similar way,  $w_2 - w_1(x) + \phi$  has a minimum point at  $x_1$ , so that

$$|b|^\gamma F\left(x_1, -A + \left(\frac{q}{1+\gamma-q}\right) \frac{b \otimes b}{w_2(x_1)}\right) \leq -a(x_1),$$

Therefore, we obtain

$$|b|^{\gamma F} \left( x_1, A + \left( \frac{q}{1+\gamma-q} \right) \frac{b \otimes b}{w_1(x_1)} \right) - |b|^{\gamma F} \left( x_1, -A + \left( \frac{q}{1+\gamma-q} \right) \frac{b \otimes b}{w_2(x_1)} \right) \geq 0.$$

Now, using the condition **(F1)** we have

$$|b|^{\gamma} \mathcal{M}_{\lambda, \Lambda}^+ \left( 2A + \left( \frac{q}{1+\gamma-q} \right) \left( \frac{1}{w_1(x_1)} - \frac{1}{w_2(x_1)} \right) b \otimes b \right) \geq 0,$$

and therefore, since  $b \neq 0$ , we have

$$\mathcal{M}_{\lambda, \Lambda}^+ \left( 2A + \left( \frac{q}{1+\gamma-q} \right) \left( \frac{1}{w_1(x_1)} - \frac{1}{w_2(x_1)} \right) b \otimes b \right) \geq 0.$$

To simplify the notation, we set

$$B = \left( \frac{q}{1+\gamma-q} \right) \left( \frac{1}{w_1(x_1)} - \frac{1}{w_2(x_1)} \right) b \otimes b.$$

We know that  $b \otimes b$  is a non-negative symmetric matrix, and by (4.3),

$$\frac{1}{w_1(x_1)} - \frac{1}{w_2(x_1)} < 0,$$

so  $B$  is a non-positive, symmetric matrix.

On the other hand we know that  $\mathcal{M}_{\lambda, \Lambda}^+$  is a  $(\lambda, \Lambda)$ -elliptic operator, so

$$\mathcal{M}_{\lambda, \Lambda}^+(2A) + \Lambda \|B^+\| - \lambda \|B^-\| \geq \mathcal{M}_{\lambda, \Lambda}^+(2A + B) \geq 0.$$

As  $B$  is a non-positive, we have  $\|B^+\| = 0$ , and consequently

$$\mathcal{M}_{\lambda, \Lambda}^+(2A) \geq \lambda \|B^-\| = \lambda \| -B \|.$$

Thus  $\mathcal{M}_{\lambda, \Lambda}^+(A) \geq 0$ , as claimed.

Assume now that  $b = 0$  and suppose, for the sake of contradiction, that

$$(4.5) \quad \mathcal{M}_{\lambda, \Lambda}^+(A) < 0,$$

so that  $A$  has at least one non-positive eigenvalue. Let  $S$  be the direct sum of the subspaces associated with the non-positive eigenvalues of  $A$  and  $P_S$  be the orthogonal projection over  $S$ . Setting

$$\psi(x) = \phi(x) - \varepsilon |P_S x|$$

and recalling that  $\phi > w_1 - w_2$  in  $B_r \setminus \{x_1\}$ , we have that, for  $0 < \varepsilon \ll 1$  small enough,  $\psi$  touches  $w_1 - w_2$  from above at some  $x_2 \in \overline{B_r(x_1)}$  such that  $(w_1 - w_2)(x_2) > 0$ . This fact suggests us to use  $\psi$  as a test function at  $x_2$ . To this end, let us prove that  $|P_S x_2| \neq 0$ . In effect, by supposing the opposite, we use that

$$(4.6) \quad |P_S x| = \max_{|e|=1} P_S x \cdot e$$

to deduce that for all  $e \in \mathbb{S}^{N-1}$ , the test function

$$\phi(x) - \varepsilon P_S x \cdot e$$

touches  $w_1 - w_2$  from above at  $x_2$ . In fact, we use (4.6) to assure that

$$\phi - \varepsilon P_S x \cdot e \geq \phi - \varepsilon |P_S x|.$$

We also observe that

$$-|P_S x| \leq P_S x \cdot e \leq |P_S x|,$$

so, by the contradiction assumption,

$$P_S x_2 \cdot e = |P_S x_2| = 0.$$

Therefore, as

$$(w_1 - w_2) - (\phi - \varepsilon |P_S x|)$$

has a local minimum at  $x_2$ , we conclude that

$$(w_1 - w_2) - (\phi - \varepsilon P_S x \cdot e)$$

has also a local minimum at  $x_2$ , which shows that  $\phi - \varepsilon P_S x \cdot e$  touches  $w_1 - w_2$  from above at  $x_2$  for all  $e \in \mathbb{S}^{N-1}$ .

Arguing as above, we conclude that, for all  $e \in \mathbb{S}^{N-1}$ , we have

$$|Ax_2 - \varepsilon P_S e|^\gamma F \left( x_2, A + \left( \frac{q}{1 + \gamma - q} \right) \frac{Ax_2 - \varepsilon P_S e \otimes Ax_2 - \varepsilon P_S e}{w_1(x_2)} \right) \geq -a(x_2).$$

and

$$|Ax_2 - \varepsilon P_S e|^\gamma F \left( x_2, -A + \left( \frac{q}{1 + \gamma - q} \right) \frac{Ax_2 - \varepsilon P_S e \otimes Ax_2 - \varepsilon P_S e}{w_2(x_2)} \right) \leq -a(x_2).$$

So

$$|Ax_2 - \varepsilon P_S e|^\gamma \mathcal{M}_{\lambda, \Lambda}^+ \left( 2A + \left( \frac{q}{1 + \gamma - q} \right) \left( \frac{1}{w_1(x_2)} - \frac{1}{w_2(x_2)} \right) (Ax_2 - \varepsilon P_S e) \otimes (Ax_2 - \varepsilon P_S e) \right) \geq 0.$$

Since we can choose  $\hat{e} \in \mathbb{S}^{N-1}$  such that  $Ax_2 - \varepsilon P_S \hat{e} \neq 0$ , and we know that

$$\frac{1}{w_1(x_2)} - \frac{1}{w_2(x_2)} < 0,$$

arguing once more as above, we conclude that

$$\mathcal{M}_{\lambda, \Lambda}^+(A) \geq 0,$$

which contradicts (4.5). Therefore,  $|P_S x_2| \neq 0$ .

Now, we use  $\psi$  as a test function to obtain

$$|Ax_2 - \varepsilon e_1|^\gamma \mathcal{M}_{\lambda, \Lambda}^+ \left( 2(A - \varepsilon B) + \left( \frac{q}{1 + \gamma - q} \right) \left( \frac{1}{w_1(x_2)} - \frac{1}{w_2(x_2)} \right) (Ax_2 - \varepsilon e_1) \otimes (Ax_2 - \varepsilon e_1) \right) \geq 0,$$

where  $e_1 = \frac{P_S x_2}{|P_S x_2|}$  and  $B = D^2(|P_S x_2|) \geq 0$ , since  $|P_S x|$  is a convex function. Furthermore,

$$(Ax_2 - \varepsilon e_1) \cdot P_S x_2 = P_S A x_2 \cdot x_2 - \varepsilon |P_S x_2| \leq -\varepsilon |P_S x_2| < 0,$$

so  $(Ax_2 - \varepsilon e_1) \neq 0$ . Using once again

$$\frac{1}{w_1(x_2)} - \frac{1}{w_2(x_2)} < 0$$

and arguing as above we conclude that

$$\mathcal{M}_{\lambda, \Lambda}^+(A - \varepsilon B) > 0.$$

Since  $\mathcal{M}_{\lambda, \Lambda}^+(A) \geq \mathcal{M}_{\lambda, \Lambda}^+(A - \varepsilon B)$  we have that

$$\mathcal{M}_{\lambda, \Lambda}^+(A) \geq 0$$

which contradicts (4.5). Thus we conclude that

$$\mathcal{M}_{\lambda, \Lambda}^+(D^2(w_1 - w_2)) \geq 0 \text{ in } \Omega_1.$$

Now, we observe that  $w_1 - w_2 = 0$  on  $\partial\Omega_1$ , so that by the maximum principle

$$w_1 - w_2 \leq 0 \text{ in } \Omega_1,$$

which is a contradiction with (4.3). Therefore we have  $w_1 \leq w_2$ . The converse inequality is obtained similarly.  $\square$

## 5 Positivity results: Proof of Theorem 1.4

We start proving that nontrivial solutions of  $(P_{a,q})$  are positive in some component of  $\Omega^+$ .

**Lemma 5.1.** *Let  $u$  be a nontrivial viscosity solution of  $(P_{a,q})$ . Then, there exists a sub-domain  $\Omega' \subset \Omega^+$  such that  $u > 0$  in  $\Omega'$ .*

*Proof.* Assume, for the sake of contradiction, that  $u = 0$  in  $\Omega^+$ . Then  $\mathcal{A} = \{a < 0\} \cap \{u > 0\} \neq \emptyset$ , since otherwise we would have

$$\begin{cases} |Du|^\gamma F(x, D^2 u) = 0 & \text{in } \Omega, \\ u = 0 & \text{on } \partial\Omega, \end{cases}$$

which would imply  $u \equiv 0$ . Now, let  $x_0 \in \overline{\mathcal{A}}$  be such that  $u(x_0) = \max_{\overline{\mathcal{A}}} u$  and take  $\varphi(x) \equiv u(x_0)$  as a test function. Then the maximum of  $u - \varphi$  is achieved at  $x_0$ , so that

$$|D\varphi(x_0)|^\gamma F(x_0, D^2 \varphi(x_0)) \geq -a(x_0)u(x_0)^q > 0.$$

On the other hand,  $|D\varphi|^\gamma F(x_0, D^2 \varphi) \equiv 0$ , and we obtain a contradiction.  $\square$

The next lemma plays a fundamental role in proving our main results. It provides the existence of a “barrier from below”, which ensures that the set of nontrivial solutions of  $(P_{a,q})$  with  $q \in (0, \gamma + 1)$  stays away from zero as long as  $a$  is sufficiently positive in some ball of  $\Omega$ .

Let  $\tilde{\mathcal{B}} \subset \Omega^+$  and  $(\lambda^+(\mathcal{B}), \phi^+(\mathcal{B}))$  the first eigenpair of the problem (2.1).

**Lemma 5.2.** *Let  $q \in (0, \gamma + 1)$ . If  $a_0 := \min_{\tilde{\mathcal{B}}} a > \lambda^+(\mathcal{B}) > 0$  then there exists  $\Phi \in C(\overline{\mathcal{B}})$  such that  $u \geq \Phi > 0$  in  $\mathcal{B}$ , for every  $u$  satisfying  $u > 0$  in  $\mathcal{B}$  and  $|Du|^\gamma F(x, D^2 u) + a(x)u(x)^q = 0$  in  $\mathcal{B}$ .*

*Proof.* Let  $\theta > 0$  be such that  $a_0(\lambda^+)^{-1} - \theta > 1$ , where  $\lambda^+ = \lambda^+(\mathcal{B})$ . We consider  $\varepsilon\phi$ , with  $\phi = \phi^+(\mathcal{B})$  and

$$(5.1) \quad \varepsilon < \varepsilon_\theta := \{a_0(\lambda^+)^{-1} - \theta\}^{\frac{1}{\gamma+1-q}}.$$

Note that by our choice of  $\theta$  we have  $\varepsilon_\theta > 1$  for every  $q \in (0, \gamma + 1)$ . Moreover,

$$(5.2) \quad |D(\varepsilon\phi)|^\gamma F(D^2 \varepsilon\phi) = -\lambda^+(\varepsilon\phi)^{\gamma+1} > -a(x)(\varepsilon\phi)^q + \theta\lambda^+(\varepsilon\phi)^q \quad \text{in } \mathcal{B}$$

whenever  $0 < \varepsilon \leq \varepsilon_\theta$ . Let  $u$  be a positive solution of  $|Du|^\gamma F(x, D^2 u) = -a(x)u(x)^q$  in  $\mathcal{B}$ . We claim that  $u \geq \varepsilon_\theta\phi$  in  $\mathcal{B}$ . Indeed, otherwise we choose  $x_0 \in \mathcal{B}$  such that  $\varepsilon_\theta\phi(x_0) > u(x_0)$ . Now, since  $u > 0$  on  $\overline{\mathcal{B}}$  and  $\phi = 0$  on  $\partial\mathcal{B}$  we can find some  $s_0 \in (0, 1)$  such that  $s_0\varepsilon_\theta\phi(x_0) = u(x_0)$  and  $s_0\varepsilon_\theta\phi \leq u$  in  $\mathcal{B}$ . Thus, the function

$$\Theta(x) := s_0\varepsilon_\theta\phi(x)$$

touches  $u$  from below at  $x_0$ . Consequently, we have, in the viscosity sense,

$$|D\Theta(x_0)|^\gamma F(D^2 \Theta(x_0)) \leq -a(x_0)\Theta(x_0)^q.$$

On the other hand, by (5.2) we have

$$\begin{aligned} |D\Theta(x_0)|^\gamma F(D^2 \Theta(x_0)) &= |D\Theta(x_0)|^\gamma \mathcal{M}_{\lambda, \Lambda}^+(D^2 s_0\varepsilon_\theta\phi(x_0)) \\ &> -a(x_0)(s_0\varepsilon_\theta\phi(x_0))^q + \theta\lambda^+ s_0\varepsilon_\theta\phi(x_0), \end{aligned}$$

Moreover, since  $\Theta(x_0) = s_0\varepsilon_\theta\phi(x_0)$ , we obtain

$$-a(x_0)(s_0\varepsilon_\theta\phi(x_0))^q > -a(x_0)(s_0\varepsilon_\theta\phi(x_0))^q + \theta\lambda^+ s_0\varepsilon_\theta\phi(x_0),$$

which provides a contradiction. Therefore  $u \geq \Phi := \varepsilon_\theta\phi$  in  $\mathcal{B}$ . □

*Remark 5.3.* The previous lemma holds under the condition

$$(5.3) \quad a_0 := \min_{\tilde{\mathcal{B}}} a > \lambda^+(\mathcal{B}) > 0.$$

Let us show that, in the proof of Theorem 1.4, we can always assume such hypothesis. In fact, since  $F$  is an 1-homogeneous operator, we see that given  $c > 0$ ,  $u$  solves  $(P_{a,q})$  if and only if

$$\tilde{u}(x) := c^{\frac{1}{1+\gamma-q}} u(x)$$

solves  $(P_{ca,q})$ . Hence, for  $c$  sufficiently large, we have

$$a_0 := \min_{\mathcal{B}} ca > \lambda^+(\mathcal{B}).$$

Therefore (5.3) holds for  $(P_{ca,q})$ , i.e. for  $ca$  with  $c$  large enough. Since  $u$  is positive if and only if  $\tilde{u}$  is positive, we see that the above condition can be assumed without loss of generality.

**Proof of Theorem 1.4.**

1. Suppose, by contradiction, that there exists a sequence  $a_k \in C(\overline{\Omega})$  with

$$a_k^+ = a^+ \quad \text{and} \quad a_k^- \rightarrow 0 \text{ in } C(\overline{\Omega}),$$

and  $(P_{a_k,q})$  has viscosity solutions  $u_k$  such that  $u_k \notin \mathcal{P}^\circ$  for every  $k$ . Since  $\Omega_+$  has finitely many connected components, we can assume that  $u_k > 0$  in some sub-domain  $\Omega' \subset \Omega$  for every  $k$ . We split the analysis in two cases;

- (a) First suppose that  $\|u_k\|_{L^\infty(\Omega)} < C$ , for all  $k$ . In this case, from  $C^{1,\alpha}$  regularity estimates (see [1, Theorem 3.1] [7],[19, Theorem 1]), we obtain that

$$\|u_k\|_{C^{1,\alpha}(\Omega)} \leq C(N, \lambda, \Lambda, \gamma, \Omega) \left[ \|u_k\|_{L^\infty(\Omega)} + \|a_k u_k^q\|_{L^\infty(\Omega)}^{\frac{1}{q+1}} \right]$$

and

$$\begin{aligned} u_k &\rightarrow u_0 \quad \text{locally uniformly in } C^{1,\alpha}(\Omega), \\ F_k &\rightarrow F_0 \quad \text{locally uniformly in } \text{Sym}(N), \\ a_k^- &\rightarrow 0 \quad \text{locally uniformly in } \Omega. \end{aligned}$$

Thus, we have in the viscosity sense

$$|Du_0(x)|^\gamma F_0(x, D^2 u_0) + a^+(x) u_0^q(x) = 0 \quad \text{in } \Omega$$

Furthermore, by the Strong Maximum Principle we infer that either  $u_0 \in \mathcal{P}^\circ(\Omega)$  or  $u_0 \equiv 0$ . However, by Lemma 5.2, we know that there exists  $\Phi$  such that, for every  $k \in \mathbb{N}$ ,

$$u_k \geq \Phi > 0 \quad \text{in } \mathcal{B} \subset \text{supp}(a^+).$$

Hence, we conclude that  $u_0 \in \mathcal{P}^\circ(\Omega)$ . Thus, since  $u_k \rightarrow u_0$  locally uniformly in  $C^{1,\alpha}(\Omega)$  we see that  $u_k \in \mathcal{P}^\circ(\Omega)$  for  $k$  sufficiently large, which provides a contradiction and completes the proof in this case.

- (b) Suppose now that  $\|u_k\|_{L^\infty(\Omega)} \rightarrow \infty$  as  $k \rightarrow \infty$ . We set  $v_k(x) = \frac{u_k(x)}{\|u_k\|_{L^\infty(\Omega)}}$ , so that

$$Dv_k = \frac{Du_k}{\|u_k\|_{L^\infty(\Omega)}}.$$

By the 1-Homogeneity condition (see 1), we have

$$|Dv_k|^\gamma F(x, D^2 v_k) = \frac{1}{\|u_k\|_{L^\infty(\Omega)}^{1+\gamma}} |Du_k|^\gamma F(x, D^2 u_k) = -\frac{a(x)u_k^q}{\|u_k\|_\infty^{1+\gamma}} = -\frac{a(x)v_k^q}{\|u_k\|_{L^\infty(\Omega)}^{1+\gamma-q}}.$$

in the viscosity sense. By arguing as above, we conclude that

$$v_k \rightarrow v_0 \quad \text{locally uniformly in } C^{1,\alpha}(\Omega)$$

Moreover,  $\|u_k\|_{L^\infty(\Omega)}^{1+\gamma-q} \rightarrow \infty$  and  $a(x)v_k^q$  remains bounded. Therefore,

$$|Dv_0|^\gamma F(x, D^2 v_0) = 0.$$

From the Strong Maximum Principle, we infer either  $v_0 \in \mathcal{P}^\circ(\Omega)$  or  $v_0 \equiv 0$ . Since  $\|v_k\|_{L^\infty(\Omega)} = 1$  we rule out the second possibility, and therefore  $v_0 \in \mathcal{P}^\circ(\Omega)$ . As  $v_k \rightarrow v_0$  locally uniformly in  $C^{1,\alpha}(\Omega)$ , for  $k$  sufficiently large, we infer again that  $v_k \in \mathcal{P}^\circ(\Omega)$  and thus  $u_k \in \mathcal{P}^\circ(\Omega)$ , which yields another contradiction.

2. Let us assume, for the sake of contradiction, that there are sequences  $\{q_k\} \subset \mathbb{R}_+$  such that  $q_k \rightarrow (\gamma+1)^-$  and  $\{u_k\}_{k \in \mathbb{N}}$  are nontrivial viscosity solutions of  $(P_{a,q_k})$  with  $u_k \notin \mathcal{P}^\circ$  for every  $k$ . Since  $\Omega_+$  has finitely many connected components, we can assume that  $u_k > 0$  in some sub-domain  $\Omega' \subset \Omega$  for every  $k$ .

As in the previous item, we consider two cases:

- (a) First we assume that  $\{u_k\}_{k \in \mathbb{N}}$  is bounded in  $L^\infty(\Omega)$ . Then, as in the previous argument,  $\{u_k\}_{k \in \mathbb{N}}$  is bounded in  $C^{1,\alpha}(\overline{\Omega})$  for some  $\alpha \in (0,1)$ . By the Arzelà-Ascoli compactness criteria, up to a subsequence, we obtain that

$$u_k \rightarrow u_0 \quad \text{in } C^{1,\alpha}(\overline{\Omega}).$$

By Lemma 5.2, we know that

$$u_k > C \quad \text{in } \mathcal{B} \subset \text{supp}(a^+).$$

so that

$$u_0 > C \quad \text{in } \mathcal{B} \subset \text{supp}(a^+).$$

for some constant  $C > 0$ , i.e.  $u_0 \not\equiv 0$ . Moreover, by stability,  $u_0$  solves  $(P_{a,1+\gamma})$ . The Hopf Maximum Principle, yields that  $u_0 \in \mathcal{P}^\circ(\Omega)$ , and since  $u_k \rightarrow u_0$  in  $C^{1,\alpha}(\overline{\Omega})$ , it follows that  $u_k \in \mathcal{P}^\circ(\Omega)$  for  $k$  large enough, which yields a contradiction.

- (b) Now, suppose that  $\|u_k\|_\infty \rightarrow \infty$  and set

$$v_k = \frac{u_k}{\|u_k\|_\infty},$$

which solves

$$|Dv_k|^\gamma F(x, D^2 v_k) = -\frac{a(x)v_k^{q_k}}{\|u_k\|_\infty^{(\gamma+1)-q_k}} \text{ in } \Omega, \quad v_k = 0 \text{ on } \partial\Omega.$$

By the Arzelà-Ascoli theorem, we have, up to a subsequence,  $v_k \rightarrow v_0$  in  $C^{1,\alpha}(\overline{\Omega})$ .

Once again, we must analyse two possibilities:

- If  $\|u_k\|_\infty^{(\gamma+1)-q_k} \rightarrow +\infty$  then  $v_0$  solves

$$|Dv_0|^\gamma F(x, D^2 v_0) = 0, \text{ in } \Omega, \quad v_0 = 0 \text{ on } \partial\Omega.$$

Since  $v_0 \not\equiv 0$ , we deduce, again by the Hopf Maximum Principle, that  $v_0 \in \mathcal{P}^\circ(\Omega)$ , so that  $v_k \in \mathcal{P}^\circ(\Omega)$  for  $k$  large enough, which yields a contradiction.

- If  $\|u_k\|_\infty^{(\gamma+1)-q_k}$  is bounded then

$$\|u_k\|_\infty^{(\gamma+1)-q_k} \rightarrow C_0.$$

Note that  $C_0 \geq 1$  since  $\|u_k\|_\infty > 1$ , so  $v_0$  solves

$$|Dv_0|^\gamma F(x, D^2 v_0) = -\frac{a(x)v_0^{\gamma+1}}{C_0}, \text{ in } \Omega, \quad v_0 = 0 \text{ on } \partial\Omega.$$

As  $v_0 \not\equiv 0$ , by the Hopf Maximum Principle,  $v_0 \in \mathcal{P}^\circ(\Omega)$ , so that  $v_k \in \mathcal{P}^\circ(\Omega)$  for  $k$  large enough, which yields another contradiction. The proof is now complete.  $\square$

To conclude this paper we provide a simple example of a problem having a dead-core solution:

**Example 5.4.** Let  $0 \leq q < \gamma + 1$  and  $0 \leq \gamma < 2q$ . Consider  $v : [0, \pi] \rightarrow \mathbb{R}$  given by

$$v(x) = \frac{\sin^r(x)}{r}$$

where  $r := \frac{\gamma+2}{\gamma+1-q}$ . Then, it is easy to check that

$$v'(x) = \sin^{r-1} x \cdot \cos x \text{ and } v''(x) = (r \cos^2 x - 1) \sin^{r-2} x.$$

As  $r > 2$  we have that  $v \in C^2([0, \pi])$ , so we can extend  $v$  smoothly like 0 in  $(-\pi/2, 0]$ . Therefore

$$-|v'(x)|^\gamma v''(x) = a(x)v^q(x) \quad \text{in } (-\pi/2, \pi)$$

in the viscosity sense, where

$$a(x) = r^q |\cos(x)|^\gamma [-r \cos^2(x) + 1]$$

is a sign-changing weight. Clearly  $v$  is a solution of  $(P_{a,q})$  with dead core. Thus

$$\delta_0 < |a(0)| = r^q(r-1).$$
