A NEW REGULARIZATION METHOD FOR A PARAMETER IDENTIFICATION PROBLEM IN A NON-LINEAR PARTIAL DIFFERENTIAL EQUATION

M. THAMBAN NAIR AND SAMPRITA DAS ROY

ABSTRACT. We consider a parameter identification problem related to a quasi-linear elliptic Neumann boundary value problem involving a parameter function $a(\cdot)$ and the solution $u(\cdot)$, where the problem is to identify $a(\cdot)$ on an interval $I := g(\Gamma)$ from the knowledge of the solution $u(\cdot)$ as $g$ on $\Gamma$, where $\Gamma$ is a given curve on the boundary of the domain $\Omega \subseteq \mathbb{R}^3$ of the problem and $g$ is a continuous function. For obtaining stable approximate solutions, we consider a new regularization method which gives error estimates similar to, and in certain cases better than, the classical Tikhonov regularization considered in the literature in recent past.

1. INTRODUCTION

Let $\Omega$ be a bounded domain in $\mathbb{R}^3$ with $C^{1,1}$ boundary. Let us consider the problem of finding a weak solution $u$ in $H^1(\Omega)$ of the partial differential equation

$$-\nabla \cdot (a(u)\nabla u) = 0 \quad \text{in } \Omega$$

with boundary condition

$$a(u) \frac{\partial u}{\partial \nu} = j \quad \text{on } \partial \Omega,$$

where $a \in H^1(\mathbb{R})$ and $j \in L^2(\partial \Omega)$. It is known that such a solution $u$ exists if $\int_{\partial \Omega} j = 0$ and $a \geq \kappa_0 > 0$ a.e. for some constant $\kappa_0$ (see [10], [7]). Under an additional assumption $j \in W^{(1-1/p),p}(\partial \Omega)$ with $p > 3$, $u \in C^1(\overline{\Omega})$ (cf. [4]). One can come across this type of problems in the steady state heat
transfer problem with \( u \) being the temperature, \( a(\cdot) \) the thermal conductivity which is a function of the temperature, and \( j \) the heat flux applied to the surface.

In this paper we consider one of the inverse problems corresponding to the above direct problem, namely the following:

**Problem (P):** Let \( \gamma : [0,1] \to \partial \Omega \) be a \( C^1 \)-curve on \( \partial \Omega \) and \( \Gamma \) be its range, that is, \( \Gamma := \gamma([0,1]) \). Given \( g : \Gamma \to \mathbb{R} \) such that \( g \circ \gamma \in C^1([0,1]) \) and \( j \in W^{1-1/p,p}(\partial \Omega) \) with \( p > 3 \) and \( \int_{\partial \Omega} j = 0 \), the problem is to identify \( \hat{a} \in H^1(I) \), where \( I := g(\Gamma) \), such that \( \hat{a} \) is the restriction of some \( a \in H^1(\mathbb{R}) \) on \( I \) so that \( a \) and \( u \) satisfy \((1.1)-(1.2)\) along with the requirement

\[
(1.3) \quad u = g \quad \text{on} \quad \Gamma.
\]

Thus, given a \( C^1 \)-curve \( \Gamma \) on the boundary \( \partial \Omega \) of \( \Omega \) and a continuous function \( g : \Gamma \to \mathbb{R} \) with certain properties, our aim is to identify the parameter function \( a(\cdot) \) on the interval \( I := g(\Gamma) \) such that the solution \( u \) of the Neumann boundary value problem \((1.1)-(1.2)\) is known as \( g \) on \( \Gamma \). From \([2]\) it is known that, with only the knowledge of \( u = g \) on \( \Gamma \) the parameter \( a \) can be identified uniquely only on \( I \).

We shall prove that the problem (P) is ill-posed, in the sense that the solution \( a_{|I} \) does not depend continuously on the data \( g \) and \( j \) (see Sections 2 and 3). To obtain a stable approximate solution for the Problem (P), we use a new regularization method which is different from some of the standard ones in the literature. We discuss this method in Section 3.

The existence and uniqueness of the solution for the Problem (P) is known under some additional conditions on \( \gamma \) and \( g \), as specified in Section 2 (c.f. \([2,4]\)). In \([7]\) and \([4]\) the problem of finding a stable approximate solution of the problem is studied by employing Tikhonov regularization. For the noisy \( g^\delta \), in place of \( g \), with \( \|g - g^\delta\|_{L^2(\Gamma)} \leq \delta \), convergence rate of order \( \sqrt{\delta} \) with respect to \( H^1(I) \) norm is obtained in \([7]\) when the exact solution \( a(\cdot) \) is in \( H^4(I) \) and its trace is Lipschitz on \( \partial \Omega \). In \([4]\), the rate \( \sqrt{\delta} \) is obtained with respect to \( L^2 \)-norm, without the additional assumption on \( a(\cdot) \), where noise in \( j \) as well as \( g \) is also considered. It is stated in \([4]\) that “the rate \( \sqrt{\delta} \) is possible with respect to \( H^1 \)-norm, provided some additional smoothness conditions are satisfied”; however, the details of the analysis is missing.

Under our newly introduced method, we obtain the above type of error estimates using appropriate smoothness assumptions. In particular we prove that, if \( a(g_1) \) is known or is close to some known value, and the perturbed data \( j^\delta \) and \( g^\delta \) belong to \( W^{1-1/p,p}(\partial \Omega) \) with \( p > 3 \), and \( C^1(\Gamma) \), respectively, with

\[
\|j - j^\delta\|_{L^2(\partial \Omega)} \leq \delta \quad \text{and} \quad \|g - g^\delta\|_{W^{1,\infty}(\Gamma)} \leq \delta,
\]

then the convergence rate is of order \( \sqrt{\delta} \) with respect to \( L^2 \) norm. With additional assumption that the exact solution is in \( H^3(I) \) we obtain a convergence rate of order \( \delta^{2/3} \) with respect to \( L^2(I) \) norm. Again, in particular, if \( g \circ \gamma \) is in \( H^4([0,1]) \), the rate of convergence \( \delta^{2/3} \) with respect to \( L^2(I) \) norm is obtained under a weaker condition on perturbed data \( g^\delta \), namely, \( g^\delta \in L^2(\Gamma) \) with \( \|g - g^\delta\|_{L^2(\Gamma)} \leq \delta \). Also in the new method we do not need the assumption on \( g^\gamma \) made in \([4]\) which is \( g^*(\Gamma) \subset g(\Gamma) \).

Thus some of the estimates obtained in this paper are improvements over the known estimates, and are also better than the expected best possible estimate, namely \( O(\delta^{3/5}) \), in the context of Tikhonov regularization, as mentioned in \([4]\).
The paper is organized as follows: In Section 2 we present a theorem which characterize the solution of the inverse problem (P) in terms of the solution of the Laplace equation with an appropriate Neumann condition and also show explicitly that the problem (P) is ill-posed. In Section 3, the inverse problem is represented as the problem of solving a linear operator equation, where the operator is written as a composition of three injective bounded operators one of which is a compact operator, and prove some properties of these operators. The new regularization method is defined in Section 4, and error estimates with noisy as well as exact data are derived. In Section 5 we present error analysis with some relaxed conditions on the perturbed data. In Section 6 a procedure is described to relax a condition on the exact data and corresponding error estimate is derived. In Section 7 we illustrate the procedure of obtaining a stable approximate solution to Problem (P).

2. Unique Identifiability and Ill-Posedness

Throughout the paper we denote by $I$ the range of the function $g : \Gamma \to \mathbb{R}$, and write it as $I = [g_0, g_1]$, that is $g_0$ and $g_1$ are the left and right end-points of the closed interval $g(\gamma([0,1]))$.

The following theorem, proved in [4], help us to identify the solution of Problem (P). It is known that if $j \in W^{1-1/p,p}(\partial \Omega)$, then $v$ satisfying (2.3) and (2.4) belongs to $W^{2,p}(\Omega)$, and

$$\|v\|_{W^{2,p}(\Omega)} \leq C\|j\|_{L^2(\partial \Omega)}$$

for some constant $C > 0$ (see Theorem 2.4.2.7 and 2.3.3.2 in [3]).

**Theorem 2.1.** Let $j, g$ and $\gamma$ be as defined in Problem (P). Then, Problem (P) has a unique solution $a \in H^1(I)$, and the unique $a \in H^1(I)$ is such that

$$v(\gamma(s)) = \int_{g_0}^{g(\gamma(s))} a(t) dt \quad \forall s \in [0,1],$$

where $v \in C^1(\overline{\Omega})$ is the unique function which satisfies

$$-\triangle v = 0 \quad \text{in } \Omega,$$

$$\frac{\partial v}{\partial \nu} = j \quad \text{on } \partial \Omega$$

and

$$v(g_0) = 0.$$  

**Theorem 2.2.** The inverse problem (P) is ill-posed.

**Proof.** Let $a \in H^1(\mathbb{R})$ and $u \in H^1(\Omega)$ be such that they satisfy (1.1)-(1.3) with $g$ and $j$ as in Problem (P). For each $n \in \mathbb{N}$, consider the data $g_n := \frac{g}{n}$ and $j_n := \frac{j}{n}$. Then, it can be easily seen that $a_n := n a$ is the solution of the problem (P) with $g_n$ and $j_n$ in place of $g$ and $j$ respectively. Note that

$$\|j_n\|_{L^2(\partial \Omega)} \to 0, \quad \|g_n\|_{W^{1,\infty}(\Gamma)} \to 0, \quad \|g_n\|_{L^2(\Gamma)} \to 0$$

as $n \to \infty$. However, $\|a_n\|_{H^1(\Omega)} \to \infty$ as $n \to \infty$. Thus, $(a_n)$ does not converge to the solution of the Problem (P) associated with the Neumann datum $j_0 := 0$ and Cauchy datum $g_0 := 0$. Consequently, Problem (P) is ill-posed. □
3. Operator Theoretic Formulation

In view of Theorem 2.1 the inverse problem (P) can be restated as follows: Given \( j \) and \( g \) as in Problem (P), let \( v \in C^1(\Omega) \) be the function satisfying (2.3), (2.4) and (2.5). Then, \( a \in H^1(I) \) is the solution of Problem (P) if and only if

\[
\int_{g_0}^{g(\gamma(s))} a(t) dt = v(\gamma(s)), \quad s \in [0,1].
\]

The above equation can be represented as an operator equation

\[
(Ta)(s) = v^j \circ \gamma,
\]

where \( v^j \) is the solution of (2.3)–(2.5) and the operator \( T : L^2(I) \to L^2[0,1] \) is defined by

\[
(Tw)(s) = \int_{g_0}^{g(\gamma(s))} w(t) dt, \quad w \in L^2(I), \quad s \in [0,1].
\]

**Theorem 3.1.** The operator \( T \) defined in (3.2) is a compact operator on \( L^2(I) \) of infinite rank. In particular, \( T : H^1(I) \to L^2[0,1] \) is a compact operator of infinite rank.

**Proof.** Note that for every \( w \in L^2(I) \) and for every \( s, \tau \in [0,1] \), we have

\[
| (Tw)(s) - (Tw)(\tau) | \leq \| w \|_{L^2(I)} | (g \circ \gamma)(s) - (g \circ \gamma)(\tau) |^{1/2}.
\]

Since \( g \circ \gamma \) is continuous, the set \( \{ Tw : \| w \|_{L^2(I)} \leq 1 \} \) is equicontinuous and uniformly bounded in \( C[0,1] \). Hence, \( T \) is a compact operator from \( L^2(I) \) to \( C[0,1] \). Since, the inclusion \( C[0,1] \subseteq L^2[0,1] \) is continuous, it follows that \( T : L^2(I) \to L^2[0,1] \) is also a compact operator. We note that \( T \) is injective. Hence, \( T \) is of infinite rank. \( \square \)

The above theorem shows that the Problem (P) is ill-posed.

In order to consider a new regularization method for obtaining stable approximate solutions, we represent the operator \( T \) as a composition of three operators, that is,

\[
T = T_3T_2T_1,
\]

where, for \( r \in \{0,1\} \),

\[
T_1 : H^r(I) \to H^{r+1}(I), \quad T_2 : H^{r+1}(I) \to L^2(I), \quad T_3 : L^2(I) \to L^2([0,1])
\]

are defined as follows:

\[
T_1(w)(\tau) := \int_{g_0}^{\tau} w(t) dt, \quad w \in H^r(I), \quad \tau \in I,
\]

\[
T_2(w) := w, \quad w \in H^{r+1}(I),
\]

\[
T_3(w) := w \circ g \circ \gamma, \quad w \in L^2(I).
\]

Clearly, \( T_1, T_2, T_3 \) are linear operators and

\[
(T_3T_2T_1w)(s) = \int_{g_0}^{g(\gamma(s))} w(t) dt = (Tw)(s), \quad s \in [0,1].
\]

Here, we used the convention that \( H^0(I) := L^2(I) \).
By the above representation of $T$, the operator equation (3.11) can be split into three equations:

\[(3.6)\quad T_3(\zeta) = v^j \circ \gamma,\]
\[(3.7)\quad T_2(b) = \zeta,\]
\[(3.8)\quad T_1(a) = b.\]

To prove some properties of the operators $T_1, T_2, T_3$, we specify the requirements on $j, g$ and $\gamma$, namely the following.

**Assumption 3.2.** Let $j \in W^{(1-{1/p})p}(\partial \Omega)$ with $p > 3$ and $\int_{\partial \Omega} j = 0$. Let $\gamma : [0,1] \to \partial \Omega$ be a $C^1$-curve on $\partial \Omega$ and $g : \Gamma \to \mathbb{R}$ be such that $g \in C^1(\Gamma)$,

\[(3.9)\quad C_\gamma \leq |\gamma'(s)| \leq C'_\gamma \quad \forall s \in [0,1],\]
\[(3.10)\quad C_g \leq |g'(\gamma(s))| \leq C'_g \quad \forall s \in [0,1],\]

for some positive constants $C_\gamma, C'_\gamma, C_g$ and $C'_g$.

Next we state a result from measure theory which will be used in the next result and also in many other results that follow.

**Lemma 3.3.** Let $h_1$ and $h_2$ be two continuous functions on intervals $J_1$ and $J_2$ respectively, such that $h_2(J_2) = J_1$. Also, let $h'_2 \neq 0$. Then, we have the following.

$$\int_{J_2} h_1(h_2(x))dx = \int_{J_1} \frac{h_1(y)}{|h'_2(h_2^{-1}(y))|}dy.$$  

We shall also make use of the following proposition.

**Proposition 3.4.** Let $C_g, C_\gamma, C'_g C'_\gamma$ be as in Assumption 3.2. Then for any $w \in L^2(I)$,

\[(3.11)\quad C_g C_\gamma \int_0^1 |w(g(\gamma(s)))|^2 ds \leq \int_I |w(y)|^2 dy \leq C'_g C'_\gamma \int_0^1 |w(g(\gamma(s)))|^2 ds.\]

**Proof.** By Lemma 3.3, (3.9) and (3.10),

$$\int_0^1 |w(g(\gamma(s)))|^2 ds = \int_{g_0}^{g_1} \frac{|w(y)|^2}{|g'(g^{-1}(y))\gamma'(\gamma^{-1}(g^{-1}(y)))|} dy \leq \frac{1}{C_g C_\gamma} \int_I |w(y)|^2 dy$$

and

$$\int_{g_0}^{g_1} |w(y)|^2 dy = \int_0^1 |w(g(\gamma(s)))|^2 |g'(\gamma(s))\gamma'(s)| ds \leq C'_g C'_\gamma \int_0^1 |w(g(\gamma(s)))|^2 ds.$$

From the above, we obtain the required inequalities in (3.11). \qed

**Theorem 3.5.** Let $r \in \{0,1\}$, and let

$$T_1 : H^r(I) \to H^{r+1}(I), \quad T_2 : H^{r+1}(I) \to L^2(I), \quad T_3 : L^2(I) \to L^2([0,1])$$

be defined as in (3.3), (3.4) and (3.3), respectively. Then, $T_2$ is a compact operator, and for every $w \in L^2(I)$,

\[(3.12)\quad \|w\|_{H^r(I)} \leq \|T_1(w)\|_{H^{r+1}(I)} \leq (1 + \sqrt{g_1 - g_0})\|w\|_{H^r(I)},\]
\[(3.13)\quad C_g C_\gamma \|T_3(w)\|_{L^2(I)} \leq \|w\|_{L^2(I)} \leq C'_g C'_\gamma \|T_3(w)\|_{L^2([0,1])},\]

In particular, $T_1$ and $T_3$ are bounded operators with bounded inverse from their ranges.
In particular, $T$ and so that $T$ Hence, using the fact that $(4.1)$, $T_2$ is a compact operator of infinite rank. Now, let $w \in H^1(I)$ and $\tau \in I$. Then
\[
|T_1(w)(\tau)| \leq \int_{g_0}^{\tau} |w(t)| dt \leq \|w\|_{L^2(I)} \sqrt{g_1 - g_0},
\]
so that
\[
\|T_1(w)\|_{L^2(I)} \leq \|w\|_{L^2(I)} \sqrt{g_1 - g_0}.
\]
Hence, using the fact that $(T_1(w))' = w$ and $(T_1(w))'' = w'$, we have
\[
\|w\|_{L^2(I)} \leq \|T_1(w)\|_{L^2(I)} + \|w\|_{L^2(I)} \leq (1 + \sqrt{g_1 - g_0})\|w\|_{L^2(I)}
\]
so that
\[
\|w\|_{L^2(I)} \leq \|T_1(w)\|_{H^1(I)} \leq (1 + \sqrt{g_1 - g_0})\|w\|_{L^2(I)}
\]
and
\[
\|w\|_{H^1(I)} \leq \|T_1(w)\|_{H^2(I)} \leq (1 + \sqrt{g_1 - g_0})\|w\|_{H^1(I)}.
\]
Thus, (3.12) is proved.

By the inequalities in (3.11) we obtain
\[
C_g C_1 \|T_3(w)\|_{L^2(I)} \leq \|w\|_{L^2(I)} \leq C_g C_1' \|T_3(w)\|_{L^2([0,1])}
\]
for every $w \in L^2(I)$. The inequalities in (3.12) and (3.14) also show that $T_1$ and $T_3$ are bounded operator with bounded inverse from their ranges. \hfill \Box

4. The New Regularization

Recall that the problem (P) is ill-posed (see Theorem 2.2). This is also seen from the reformulated operator equation (3.1) with $T = T_3 T_2 T_1$, as $T_3$ is a compact operator of infinite rank (see Theorem 3.9), and thereby the operator $T$ is also compact. We may also recall that the operator equation (3.1) is equivalent to the system of of operator equations (3.6)-(3.8), w herein equation (3.7) is ill-posed, since $T_2$ is a compact operator of infinite rank. Thus, in order to regularize (3.1), we shall replace the equation (3.7) by a regularized form of it using a family of bounded operators $T_2^\alpha$, $\alpha > 0$, which approximates the compact operator $T_2$ in norm. Note that $T_2 : H^2(I) \to L^2(I)$ is defined by
\[
T_2(w) = w, \quad w \in H^2(I).
\]
We consider $T_2^\alpha$ as a perturbed form of $T_2$, namely, $T_2^\alpha : H^2(I) \to L^2(I)$, defined by
\[
(4.1) \quad T_2^\alpha(w) = w - \alpha w'', \quad w \in H^2(I)
\]
for each $\alpha > 0$.

**Theorem 4.1.** For $\alpha > 0$, let $T_2^\alpha : H^2(I) \to L^2(I)$ be defined as in (4.1). Then,
\[
\|T_2^\alpha(w)\|_{L^2(I)} \leq \max\{1, \alpha\} \|w\|_{H^2(I)}, \quad w \in H^2(I).
\]
In particular, $T_2^\alpha$ is a bounded operator with $\|T_2^\alpha\| \leq \max\{1, \alpha\}$. Further,
\[
\|T_2^\alpha - T_2\| \to 0 \quad \text{as} \quad \alpha \to 0.
\]
Proof. We observe that, for any \( w \in H^2(I), \)
\[
\|T_2^\alpha(w)\|_{L^2(I)} = \|w - \alpha w''\|_{L^2(I)} \leq \|w\|_{L^2(I)} + \alpha \|w''\|_{L^2(I)} \leq \max\{1, \alpha\} \|w\|_{H^2(I)}.
\]
Thus, \( T_2^\alpha \) is a bounded operator with \( \|T_2^\alpha\| \leq \max\{1, \alpha\} \) for all \( \alpha > 0 \). Further,
\[
\|(T_2^\alpha - T_2)(w)\|_{L^2(I)} = \|\alpha w''\|_{L^2(I)} \leq \alpha \|w\|_{H^2(I)}.
\]
Hence, we also have \( \|T_2^\alpha - T_2\| \to 0 \) as \( \alpha \to 0 \). \hfill \Box

In order to define a regularization family for \( T_2 \), we introduce the space
\[
W := \{w \in H^2(I) : w(g_0) = 0, w'(g_1) = 0\}.
\]
Note that, for \( w \in H^2(I), w \in W \) if and only if
\[
w(t) = \int_{g_0}^t \xi(s)ds
\]
for some \( \xi \in H^1(I) \) satisfying \( \xi(g_1) = 0 \). We prove that \( W \) is a closed subspace of \( H^2(I) \) and \( T_2^\alpha \) as an operator from \( W \) to \( L^2(I) \) is bounded below with respect to \( H^2(I) \) norm.

**Proposition 4.2.** The space \( W \) defined in (4.2) is a closed subspace of \( H^2(I) \) and
\[
(T_2^\alpha|_W)^* = Q(T_2^\alpha)^*.
\]
where \( Q : H^2(I) \to H^2(I) \) is the orthogonal projection onto \( W \).

**Proof.** Let \( (w_n) \) in \( W \) be such that \( w_n \to w_0 \) in \( H^2(I) \) for some \( w_0 \in H^2(I) \). By a Sobolev imbedding Theorem (cf. [6]), \( H^2(I) \) is continuously imbedded in the space \( C^1(I) \) with \( C^1 \)-norm. Therefore, \( w_0 \in C^1(I) \), and
\[
\sup_{t \in I} \{\|w_n(t) - w_0(t)\| + |w_n'(t) - w_0'(t)|\} \to 0 \quad \text{as } n \to \infty.
\]
Also,
\[
|w_n(g_0) - w_0(g_0)| \leq \sup_{t \in I} \{\|w_n(t) - w_0(t)\| + |w_n'(t) - w_0'(t)|\} \quad \forall n \in \mathbb{N}
\]
and
\[
|w_n'(g_1) - w_0'(g_1)| \leq \sup_{t \in I} \{\|w_n(t) - w_0(t)\| + |w_n'(t) - w_0'(t)|\} \quad \forall n \in \mathbb{N}.
\]
Thus, since \( w_n \in W \), in particular
\[
|w_0(g_0)| = \lim_{n \to \infty} w_n(g_0) = 0 \quad \text{and} \quad |w_0'(g_1)| = \lim_{n \to \infty} w_n'(g_1) = 0.
\]
Hence \( w_0 \in W \). Thus \( W \) is closed. Now, let \( Q : H^2(I) \to H^2(I) \) be the orthogonal projection onto \( W \). Then, for \( y \in L^2(I) \) and \( w \in W \) we have,
\[
\langle Q(T_2^\alpha)^*(y), w \rangle_{H^2(I)} = \langle y, (T_2^\alpha)Qw \rangle_{L^2(I)} = \langle y, (T_2^\alpha|_W)w \rangle_{L^2(I)} = \langle (T_2^\alpha|_W)^*y, w \rangle_{H^2(I)}
\]
Hence we have \( (T_2^\alpha|_W)^* = Q(T_2^\alpha)^* \). \hfill \Box

Let us see some other properties of the space \( W \) which shall be used in order to construct the regularization method.
Proposition 4.3. Let $\alpha > 0$. Let $L : H^2(I) \to H^2(I)$ be defined by

$$Lx(t) = x'(g_1) \left[ e^{\frac{\gamma t - g_0}{\sqrt{\alpha}}} - e^{-\frac{\gamma t - g_0}{\sqrt{\alpha}}} \right] + x(g_0) \left[ e^{\frac{\gamma t - g_1}{\sqrt{\alpha}}} - e^{-\frac{\gamma t - g_1}{\sqrt{\alpha}}} \right]$$

for every $x \in H^2(I)$, $t \in I$. Then we have the following:

- $L$ is a bounded linear map.
- For any $x \in H^2(I)$, $Lx \in C^\infty(I) \subset H^2(I)$ and $\alpha(Lx)' = Lx$. Hence, $Lx \in R(T_2^0|\mathcal{W})$.
- The map $id - L$ is a projection onto $\mathcal{W}$, where $id$ is the identity map on $H^2(I)$. Also, there exists $C_L > 0$ such that

$$\|x - Lx\|_{H^2(I)} \leq C_L \|x\|_{H^2(I)}.$$

Proof. By definition of $L$ we have that $L$ is linear, and for any $x \in H^2(I)$, $Lx \in C^\infty(I) \subset H^2(I)$ and $\alpha(Lx)' = Lx$. Now we need to show that $L$ is continuous. Let $\{x_n\}$ be a sequence in $H^2(I)$ such that $\|x_n - x\|_{H^2(I)} \to 0$ for some $x \in H^2(I)$. By a Sobolev imbedding Theorem (cf. [6]), $H^2(I)$ is continuously imbedded in the space $C^1(I)$ with $C^1$-norm, and so we have $|x_n(g_0) - x(g_0)| \to 0$ and $|x'_n(g_1) - x'(g_1)| \to 0$ as $n \to \infty$. Using this, it can be shown that the map $L$ is continuous. Hence, $L$ is a bounded linear map. Now again by definition of $L$, for any $x \in H^2(I)$ we have the following:

$$(x-Lx)(g_0) = x(g_0) - Lx(g_0) = x(g_0) - x(g_0) = 0 \quad \text{and} \quad (x-Lx)'(g_1) = x'(g_1) - (Lx)'(g_1) = x'(g_1) - x'(g_1) = 0,$$

and because of which we have

$$(id - L)(x - Lx) = x - Lx - L(x - Lx) = x - Lx.$$ 

Hence, using the definition of the space $\mathcal{W}$, we have $id - L$ is a projection onto $\mathcal{W}$. Also, as $L$ is a bounded linear map, there exists $C_L > 0$ such that

$$\|x - Lx\|_{H^2(I)} \leq C_L \|x\|_{H^2(I)}.$$

\hfill \Box

Theorem 4.4. Let $0 < \alpha < 1$. Then, for every $w \in \mathcal{W}$,

$$\|T_2^0(w)\|_{L^2(I)} \geq \alpha \|w\|_{H^2(I)},$$

(4.3)

and

$$\|T_2^0(w)\|_{L^2(I)} \geq \sqrt{\alpha} \|w\|_{H^1(I)}.$$ 

(4.4)

Proof. First we observe, by integration by parts, that for $w_1, w_2 \in \mathcal{W}$, $\int_I w_1 w_2'' = - \int_I w_1' w_2'$. Hence, for every $w \in \mathcal{W}$,

$$\|T_2^0(w)\|_{L^2(I)}^2 = \int_{g_0}^{g_1} \left| w - \alpha w'' \right|^2$$

$$= \int_{g_0}^{g_1} |w|^2 + \alpha^2 \int_{g_0}^{g_1} |w''|^2 - 2\alpha \int_{g_0}^{g_1} w w''$$

$$= \int_{g_0}^{g_1} |w|^2 + \alpha^2 \int_{g_0}^{g_1} |w''|^2 + 2\alpha \int_{g_0}^{g_1} |w'|^2.$$

Since $0 < \alpha < 1$, for every $w \in \mathcal{W}$,

$$\int_{g_0}^{g_1} |w|^2 + \alpha^2 \int_{g_0}^{g_1} |w''|^2 + 2\alpha \int_{g_0}^{g_1} |w'|^2 \geq \alpha^2 \|w\|_{H^2(I)}^2.$$
and
\[ \int_{g_0}^{g_1} |w|^2 + \alpha^2 \int_{g_0}^{g_1} |w''|^2 + 2\alpha \int_{g_0}^{g_1} |w'|^2 \geq \alpha\|w\|^2_{H^1(I)}. \]

This completes the proof. \qed

At this point let us note that, by (4.3), \( T_2^\alpha \) is bounded below on \( W \). Henceforth, we shall use the same notation for \( T_2^\alpha \) and its restriction to \( W \), that is,
\[ (4.5) \quad T_2^\alpha(w) = w - \alpha w'', \quad w \in W \]
and the adjoint of this operator will be denoted \( (T_2^\alpha)^* \).

In the following, we use the notations \( R(S) \) and \( N(S) \) for the range and null space, respectively, of the operator \( S \).

**Lemma 4.5.** Let \( H_1 \) and \( H_2 \) be Hilbert spaces and let \( S : H_1 \to H_2 \) be a bounded linear operator with closed range. Then,
\[ (4.6) \quad R(S^* S) = R(S^*) \]
Suppose, in addition, that there exist \( c > 0 \) such that \( \|Sx\| \geq c\|x\| \) for all \( x \in H_1 \). Then
\[ (4.7) \quad \|S^* Sx\| \geq c^2\|x\| \quad \forall x \in H_1, \]
Further, if \( \| \cdot \|_0 \) is any norm on \( H_1 \) and if \( c_0 > 0 \) is such that \( \|Sx\| \geq c_0\|x\|_0 \) for all \( x \in H_1 \), then
\[ (4.8) \quad \|S^\dagger y\|_0 \leq \frac{1}{c_0}\|y\| \quad \forall y \in H_2, \]
where \( S^\dagger := (S^* S)^{-1} S^* \), the generalized inverse of \( S \).

**Proof.** Clearly, \( R(S^* S) \subseteq R(S^*) \). Now, let \( x \in R(S^*) \), and let \( y \in H_2 \) be such that \( x = S^* y \). Let \( y_1 \in N(S^*) \) and \( y_2 \in N(S^*)^\perp \) such that \( y = y_1 + y_2 \). Hence, \( x = S^* y_2 \). Since \( R(S) \) is closed, \( N(S^*)^\perp = R(S) \). Hence, there exists \( x_2 \in H_1 \) such that \( y_2 = S x_2 \). So, \( x = S^* S x_2 \in R(S^* S) \). Thus, \( R(S^*) \subseteq R(S^* S) \). Thus, we have proved (4.6).

Next, suppose that there exist \( c > 0 \) such that \( \|Sx\| \geq c\|x\| \) for all \( x \in H_1 \). Then for every
\[ \|S^* Sx\| \|x\| \geq (S^* Sx, x)_{H_1} = \|Sx\|^2 \geq c^2\|x\|^2. \]
Thus, we obtain (4.7).

By (4.7), \( R(S^* S) \) is closed and \( S^* S \) has a bounded inverse from its range and hence, by (4.6), \( (S^* S)^{-1} S^* \) is well defined as a bounded operator from \( H_2 \) to \( H_1 \). Since \( R(S) \) is closed, it is known that for every \( y \in H_2 \), there exists \( x \in H_1 \) such that
\[ (4.9) \quad (S^* S)x = S^* y \quad \text{and} \quad Sx = Py, \]
where \( P : H_2 \to H_2 \) is the orthogonal projection onto \( R(S) = R(S) \), and this \( x \) is unique since \( S \) and \( S^* S \) are bounded below (see, e.g., Nair [8]). Now, assume that \( \| \cdot \|_0 \) is any norm on \( H_1 \) such that \( \|Sx\| \geq c_0\|x\|_0 \) for all \( x \in H_1 \) for some \( c_0 > 0 \). For \( y \in H_2 \), if \( x \) is as in (4.9), then
\[ \|(S^* S)^{-1} S^* y\|_0 = \|(S^* S)^{-1} S^* S x\|_0 = \|x\|_0 \leq \frac{1}{c_0}\|Sx\| = \frac{1}{c_0}\|Py\| \leq \frac{1}{c_0}\|y\|. \]
Thus, we obtain (4.8). \qed
Proof. Taking $H_1 = W$ and $H_2 = L^2(I)$ in Lemma 4.5, the inequalities in (4.10) and (4.11) follow from (4.8) by taking the norm $\| \cdot \|_0$ as $\| \cdot \|_{H^2(I)}$ and $\| \cdot \|_{H^1(I)}$ respectively, on $W$ and by using (4.3) and (4.4), respectively.

Let $R_\alpha : L^2(I) \to W$ for $\alpha > 0$ be defined by

$$
R_\alpha := (\bar{L}^\alpha T_2^\alpha)^{-1} T_2^\alpha, \quad \alpha > 0.
$$

We note that, by Corollary 4.6, $R_\alpha$ is a bounded operator from $L^2(I)$ to $W$ (with respect to the norm $\| \cdot \|_{H^2(I)}$), for each $\alpha > 0$. Since $(T_2 - T_2^\alpha)(w) = \alpha w''$, we have

$$
R_\alpha T_2 w - w = \alpha R_\alpha (w'').
$$

Next, we prove that $\{R_\alpha\}_{\alpha > 0}$, defined as in (4.12), is a regularization family for $T_2 : W \to L^2(I)$.

Towards this aim, we first prove the following theorem.

**Theorem 4.7.** For $\alpha > 0$, let $R_\alpha$ be as in (4.12). Then the following results hold.

1. $\|R_\alpha T_2 w\|_{H^2(I)} \leq 2\|w\|_{H^2(I)}$ for all $w \in W$.
2. $\|R_\alpha T_2 w - w\|_{H^2(I)} \leq (1 + C_L)\alpha \|w''\|_{H^2(I)}$ for all $w \in W \cap H^4(I)$.
3. $\|R_\alpha T_2 w - w\|_{H^1(I)} \leq \sqrt{\alpha} \|w''\|_{L^2(I)}$ for all $w \in W$.

**Proof.** (i) Let $w \in W$. By (4.13), we have

$$
\|R_\alpha T_2 w\|_{H^2(I)} = \|w - [w - R_\alpha T_2 (w)]\|_{H^2(I)} = \|w + \alpha R_\alpha (w'')\|_{H^2(I)}.
$$

Hence, using (4.10),

$$
\|R_\alpha T_2 w\|_{H^2(I)} \leq \|w\|_{H^2(I)} + \alpha \|R_\alpha (w'')\|_{H^2(I)} \leq \|w\|_{H^2(I)} + \|w''\|_{L^2(I)}.
$$

Thus, $\|R_\alpha T_2 w\|_{H^2(I)} \leq 2\|w\|_{H^2(I)}$ for every $w \in W$.

(ii) Let $w \in W \cap H^4(I)$. Let us note that $w''$ is in the domain of $T_2$ and hence is in $H^2(I)$ (may not be in $W$). By Proposition 4.3, $w'' - Lu'' \in W$ and $Lu'' = \alpha (Lw'')''$.

Thus, using the above fact, along with the fact that $w''$ is in the domain of $T_2$, by (4.13) and (i) above, we have

$$
\|R_\alpha T_2 w - w\|_{H^2(I)} = \alpha \|R_\alpha (w'')\|_{H^2(I)} = \alpha \|R_\alpha T_2 (w'')\|_{H^2(I)} \leq \alpha \|\alpha R_\alpha (w''')\|_{H^2(I)} + \alpha \|R_\alpha [(id - L)(w'')]\|_{H^2(I)}.
$$

Hence, using the fact that $(id - L)$ is a linear map on $H^2(I)$ (from Proposition 4.3), we have $\|R_\alpha T_2 w - w\|_{H^2(I)} \leq (1 + C_L)\alpha \|w''\|_{H^2(I)}$ for every $w \in W \cap H^4(I)$. 

(iii) For \( w \in W \), using (4.11), we have
\[
\| R_\alpha T_2 w - w \|_{H^1(I)} = \alpha \| R_\alpha (w'') \|_{H^1(I)} \leq \sqrt{\alpha} \| w'' \|_{L^2(I)}.
\]
Thus, the proof is complete. \( \square \)

**Lemma 4.8.** The space \( W \cap H^4(I) \) is dense in \( W \).

**Proof.** Let \( w \in W \). Since \( H^4(I) \) is dense in \( H^2(I) \) as a subspace of \( H^2(I) \) (cf. [6]), there exists a sequence \( (w_n) \) in \( H^4(I) \) such that
\[
\| w_n - w \|_{H^2(I)} \to 0 \quad \text{as} \quad n \to 0.
\]
Now, define \( P : H^2(I) \to W \) by
\[
P(w)(t) = w(t) - w(g_0) - w'(g_1)(t - g_0), \quad w \in H^2(I) \quad \text{and} \quad t \in I.
\]
Since \( H^2(I) \) is continuously imbedded in \( C^1(I) \) (cf. [6]), (4.14) implies that
\[
| w_n(g_0) - w(g_0) | \to 0 \quad \text{as} \quad n \to 0, \quad | w'_n(g_1) - w'(g_1) | \to 0
\]
as \( n \to 0 \). Thus, as \( I \) is bounded we have
\[
\| P(w_n) - P(w) \|_{H^2(I)} \to 0 \quad \text{as} \quad n \to 0.
\]
Again by definition of \( P \) and \( W \) we have \( Pw_n \in W \cap H^4(I) \) and \( Pw = w \). Hence from (4.14) and (4.15) we have the proof. \( \square \)

**Theorem 4.9.** Let \( w \in W \), and let \( \{ R_\alpha \}_{\alpha > 0} \) be as in (4.12). Then
\[
\| R_\alpha T_2 w - w \|_{H^2(I)} \to 0 \quad \text{as} \quad \alpha \to 0.
\]
In particular, \( \{ R_\alpha \}_{\alpha > 0} \) is a regularization family for \( T_2 \).

**Proof.** By Theorem 4.7 \( \{ R_\alpha T_2 \} \) is a uniformly bounded family of operators from \( W \) to \( W \) and
\[
\| R_\alpha T_2 w - w \|_{H^2(I)} \to 0 \quad \text{as} \quad \alpha \to 0 \quad \text{for every} \quad x \in W \cap H^4(I).
\]
Since \( W \cap H^4(I) \) is dense in \( W \) (see Lemma 4.8), by a result in functional analysis (see Theorem 3.11 in [8]), it follows that
\[
\| R_\alpha T_2 w - w \|_{H^2(I)} \to 0 \quad \text{as} \quad \alpha \to 0
\]
for every \( w \in W \). Thus \( \{ R_\alpha \}_{\alpha > 0} \) is a regularization family for \( T_2 \). \( \square \)

Throughout, we assume that \( a_0 \in H^1(I) \) is the unique solution of Problem (P).

Thus, equations (3.6)-(3.8) have solutions namely, \( \zeta_0, b_0 \) and \( a_0 \), respectively. That is,
\[
T_3(\zeta_0) = v^j \circ \gamma,
\]
\[
T_2(b_0) = \zeta_0,
\]
\[
T_1(a_0) = b_0.
\]
Having obtained the regularization family \( \{ R_\alpha \}_{\alpha > 0} \) for \( T_2 \) as in (4.12), we may replace the solution \( b_0 \) of the equation (3.7) by
\[
b_\alpha := R_\alpha \zeta_0.
\]
Thus, we may define the regularized solution \( a_\alpha \) for the Problem (P) as the solution of (4.8) with \( b_0 \) replaced by \( b_\alpha \). Thus the regularized solution \( a_\alpha \) for the Problem (P) is defined along the following lines:

\[
T_2(\zeta_0) = v^j \circ \gamma,
\]

\[
(T_2^\circ)^*T_2^\circ(b_\alpha) = (T_2^\circ)^*\zeta_0,
\]

\[
T_1(a_\alpha) = b_\alpha.
\]

Since \( b_\alpha \in W \subset R(T_1) \), each of the above equations has unique solution. In fact \( \zeta_0 = T_2 b_0 \) with \( b_0 = T_1 a_0 \), where \( a_0 \) is the unique solution of (3.1). Note that, the operator equation (4.20) has a unique solution because \( T_2^\circ \) is bounded below, and (4.21) has a unique solution as \( T_1 \) is injective with range \( W \), and \( b_\alpha \in W \). Hence we have, \( a_\alpha(g_1) = 0 \). Thus to obtain convergence of \( \{a_\alpha\} \) to \( a_0 \) as \( \alpha \to 0 \), it is necessary that \( a_0(g_1) = 0 \). Therefore, in this section, we assume that,

\[
a_0(g_1) = 0.
\]

We shall relax this condition in Section 6 by appropriately redefining regularized solutions.

4.1. **Error estimates under exact data.** For \( \alpha > 0 \), let \( a_\alpha \) be defined via equations (4.19)-(4.21). Also, Let \( a_0 \) be the unique solution to Problem (P) satisfying (4.22). Then, we look at the estimates for the error term \( (a_0 - a_\alpha) \) in both \( L^2(I) \) and \( H^1(I) \) norms in the following theorem.

**Theorem 4.10.** The following results hold.

1. \( \|a_0 - a_\alpha\|_{H^1(I)} \to 0 \) as \( \alpha \to 0 \).
2. \( \|a_0 - a_\alpha\|_{L^2(I)} \leq \sqrt{\alpha}\|a_0'\|_{L^2(I)} \).
3. If \( a_0 \in H^3(I) \), then
   
   (i) \( \|a_0 - a_\alpha\|_{H^1(I)} \leq (1 + C_L)\alpha\|a_0'\|_{H^2(I)} \),
   
   (ii) \( \|a_0 - a_\alpha\|_{L^2(I)} \leq (1 + C_L)\alpha\|a_0'\|_{H^1(I)} \).

**Proof.** By our assumption, \( a_0(g_1) = 0 \). Therefore, by definition of \( T_1 \) and the space \( W \), we have

\[
b_0 = T_1(a_0) \in W.
\]

Now let us first observe that, by the definition of \( b_\alpha \)

\[
T_1(a_0) - T_1(a_\alpha) = b_0 - b_\alpha = b_0 - R_\alpha\zeta_0 = b_0 - R_\alpha T_2 b_0.
\]

Hence, by the inequality (3.12), for \( r \in \{0, 1\} \), we have,

\[
\|a_0 - a_\alpha\|_{H^r(I)} \leq \|T_1(a_0) - T_1(a_\alpha)\|_{H^{r+1}(I)} = \|b_0 - R_\alpha T_2 b_0\|_{H^{r+1}(I)},
\]

and hence, by Theorem 4.9 \( \|a_0 - a_\alpha\|_{H^1(I)} \to 0 \) as \( \alpha \to 0 \). Thus we have proved (1).

Also, since \( b_0 \in W \), from (4.23) and Theorem 4.7(iii), we have

\[
\|a_0 - a_\alpha\|_{L^2(I)} \leq \|T_1(a_0) - T_1(a_\alpha)\|_{H^1(I)} = \|b_0 - R_\alpha T_2 b_0\|_{H^1(I)} \leq \sqrt{\alpha}\|b_0''\|_{L^2(I)} = \sqrt{\alpha}\|a_0''\|_{L^2(I)}.
\]

which proves (2).

Now, let \( a_0 \in H^3(I) \). Then \( b_0 \in H^4(I) \). Since \( b_0 \in W \), we have \( b_0 \in W \cap H^4(I) \). Hence proof of (3) follows from (4.23) and Theorem 4.7(ii). □
4.2. **Error estimates under noisy data.** In practical situations the observations of the data $j$ and $g$ may not be known accurately and we may have some noisy data instead. In this section we assume that the noisy data $g^\epsilon$ and $j^\delta$ are such that

\begin{equation}
\label{4.24}
\begin{aligned}
g^\epsilon &\in C^1(\Gamma), \\
j^\delta &\in W^{1-1/p,p}(\partial \Omega), \ p > 3
\end{aligned}
\end{equation}

satisfying

\begin{equation}
\label{4.25}
\|g - g^\epsilon\|_{W^{1,\infty}(\Gamma)} \leq \epsilon
\end{equation}

and

\begin{equation}
\label{4.26}
\|j - j^\delta\|_{L^2(\partial \Omega)} \leq \delta
\end{equation}

for some known noise level $\epsilon$ and $\delta$, respectively. At this point let us note that a weaker condition on perturbed data $j^\delta$, for example $j^\delta \in L^2(\partial \Omega)$, is not very feasible to work with, in this problem. This is because, in that case the corresponding solution $v^{j^\delta}$ of (2.4)-(2.5) with $j^\delta$ in place of $j$, is not continuous and hence its restriction on $\Gamma$ does not make sense. In practical situations if such a perturbed data arise we may work with its appropriate approximation which is in $W^{1-1/p,p}(\partial \Omega)$ with $p > 3$. For the perturbed data $g^\epsilon$, in the next section we consider the case when it is in a more general space which is $L^2(\Gamma)$.

Corresponding to the data $j, j^\delta$ as above, we denote

\begin{equation}
\label{4.27}
\begin{aligned}
f^j &:= v^j \circ \gamma, \\
f^{j^\delta} &:= v^{j^\delta} \circ \gamma.
\end{aligned}
\end{equation}

**Lemma 4.11.** Let $\gamma_0$ be a $C^1$ curve on $\mathbb{R}^2$ and let $\Gamma_0 = \{(x, \gamma_0(x)) : d_0 \leq x \leq d_1\}$ for some $d_0, d_1$ in $\mathbb{R}$ with $d_0 < d_1$. Then

\begin{equation}
\label{4.28}
\|w\|_{L^2(\Gamma_0)} \leq \|w\|_{H^1(\mathbb{R}^2)}, \ \forall w \in H^1(\mathbb{R}^2).
\end{equation}

**Proof.** Let $w \in C_c^\infty(\mathbb{R}^2)$. Then, using Hölder’s inequality we have

\begin{align*}
\|w\|^2_{L^2(\Gamma_0)} &= \int_{\Gamma_0} (w(z))^2 \, dz = \int_{d_0}^{d_1} (w(x, \gamma_0(x)))^2 \, dx \\
&= \int_{d_0}^{d_1} \left[ -\left( \int_{\gamma_0(x)}^{\infty} \frac{\partial}{\partial t} (w(x,t))^2 \, dt \right) \right] \, dx \\
&= \int_{d_0}^{d_1} \left( \int_{\gamma_0(x)}^{\infty} \left(-2w(x,t)\frac{\partial}{\partial t}w(x,t)\right) dt \right) \, dx \\
&\leq \int_{d_0}^{d_1} \left( \int_{\gamma_0(x)}^{\infty} |w(x,t)|^2 \, dt + \int_{\gamma_0(x)}^{\infty} \left|\frac{\partial}{\partial t}(w(x,t))\right|^2 \, dt \right) \, dx \\
&\leq \|w\|^2_{L^2(\mathbb{R}^2)} + \|
abla w\|^2_{L^2(\mathbb{R}^2)} \\
&\leq \|w\|^2_{H^1(\mathbb{R}^2)}
\end{align*}

Hence, $C_c^\infty(\mathbb{R}^2)$ being dense in $H^1(\mathbb{R}^2)$, we have the proof. \(\square\)

**Lemma 4.12.** Let $w \in H^1(\partial \Omega)$ and $\gamma$ be a curve on $\partial \Omega$ such that $|\gamma'(t)|$ is bounded away from 0 as in (3.9). Then there exists $C_0 > 0$ such that

\[ \|w \circ \gamma\|_{L^2([0,1])} \leq C_0\|w\|_{H^1(\partial \Omega)}. \]
Proof. Let \( w \in H^1(\partial \Omega) \). Since \( \Omega \) is with \( C^1 \) boundary,
\[
\|w\|_{H^1(\partial \Omega)} := \sum_{i=1}^{m} \|\omega_i\|_{H^1(\mathbb{R}^2)}
\]
for some elements \( \omega_1, \omega_2, \ldots, \omega_m \in H^1(\mathbb{R}^2) \) (cf. [3], [6]). Also, there exists a set \( \{\sigma_1, \ldots, \sigma_m\} \) of diffeomorphisms from some neighbourhoods in \( \partial \Omega \) to \( \mathbb{R}^2 \), which satisfies
\[
\|w \circ \gamma\|_{L^2([0,1])} = \sum_{i=1}^{m} \|\omega_i \circ \sigma_i \circ \gamma\|_{L^2([0,1])}.
\]

For any \( i \in \{1, \ldots, m\} \), since \( \sigma_i \) is a diffeomorphism, \( \sigma_i \circ \gamma \) is a curve in \( \mathbb{R}^2 \). Since \( |\gamma'| \) is bounded away from 0, there exists constant \( C_\gamma > 0 \) such that \( |\gamma'(t)| \geq C_\gamma \) for all \( t \in [0,1] \). Also, as \( \sigma_i'(\Gamma) \) is compact and \( \sigma_i \) is one-one there exists constant \( C_\sigma > 0 \) such that \( |\sigma_i'(x)| \geq C_\sigma \) for all \( x \in \gamma([0,1]) \) and \( 1 \leq i \leq m \). Hence, by Lemma 3.3 and (4.30), we obtain
\[
\|w \circ \gamma\|_{L^2([0,1])} = \sum_{i=1}^{m} \|\omega_i \circ \sigma_i \circ \gamma\|_{L^2([0,1])} \leq \frac{1}{\sqrt{C_\sigma C_\gamma}} \sum_{i=1}^{m} \|\omega_i\|_{L^2(\sigma_i(\Gamma))}.
\]
Hence, using (4.28) and (4.29), we get
\[
\|w \circ \gamma\|_{L^2([0,1])} \leq \frac{1}{\sqrt{C_\sigma C_\gamma}} \sum_{i=1}^{m} \|\omega_i\|_{H^1(\mathbb{R}^2)} = \frac{1}{\sqrt{C_\sigma C_\gamma}} \|w\|_{H^1(\partial \Omega)}.
\]
This completes the proof. \( \square \)

Proposition 4.13. Let \( \tilde{j} \in W^{1-1/p, p}(\partial \Omega) \). Let \( \tilde{v} \in W^1(\Omega) \) be the solution of (2.4)–(2.5) with \( \tilde{j} \) in place of \( j \), such that it satisfies (2.2). Then there exists \( \tilde{C}_\gamma > 0 \) such that
\[
\|\tilde{v} \circ \gamma\|_{L^2([0,1])} \leq \tilde{C}_\gamma \|\tilde{j}\|_{L^2(\partial \Omega)}.
\]

Proof. Since \( \tilde{j} \) is in \( W^{1-1/p, p}(\partial \Omega) \), we know that \( v^j \in W^{2, p}(\Omega) \) and
\[
\|v^j\|_{W^{2, p}(\Omega)} \leq C_5 \|\tilde{j}\|_{L^2(\partial \Omega)}
\]
for some constant \( C_5 > 0 \) (see inequality 2.1). By trace theorem for Sobolev Spaces (cf. [3]), and by continuous imbedding of \( W^{(2-1/p), p}(\partial \Omega) \) into \( W^1(\partial \Omega) \), we have \( v^j|_{\partial \Omega} \in W^{2-1/p, p}(\partial \Omega) \) \( \subseteq W^{1, p}(\partial \Omega) \) and
\[
\|v^j|_{\partial \Omega}\|_{W^{1, p}(\partial \Omega)} \leq C_6 \|v^j|_{\partial \Omega}\|_{W^{2-1/p, p}(\partial \Omega)} \leq C_7 \|v^j\|_{L^2(\Omega)}
\]
for some constants \( C_6, C_7 > 0 \). Now, as \( p > 3 \), \( v^j|_{\partial \Omega} \in H^1(\partial \Omega) \) and there exists constant \( C_8 > 0 \) such that
\[
\|v^j|_{\partial \Omega}\|_{H^1(\partial \Omega)} \leq C_8 \|v^j|_{\partial \Omega}\|_{W^{1, p}(\partial \Omega)}.
\]
Thus, using (4.31), (4.32) and with \( v \) in place of \( w \) in Lemma 4.12 we have,
\[
\|v^j \circ \gamma\|_{L^2([0,1])} \leq \frac{1}{\sqrt{C_\sigma C_\gamma}} \|v^j|_{\partial \Omega}\|_{H^1(\partial \Omega)} \leq \frac{C_8}{\sqrt{C_\sigma C_\gamma}} \|v^j|_{\partial \Omega}\|_{W^{1, p}(\partial \Omega)} \leq \tilde{C}_\gamma \|\tilde{j}\|_{L^2(\partial \Omega)},
\]
where \( \tilde{C}_\gamma = C_8 C_7 C_5 / \sqrt{C_\sigma C_\gamma} \). \( \square \)
Corollary 4.14. Let $j$ be as in Assumption 3.2 and $j^a$ satisfy (4.24) and (4.26). Let $f$ and $f^a$ be as in (4.27). Then

$$
\|f^j - f^a\|_{L^2([0,1])} \leq C_\gamma \delta,
$$

where $C_\gamma > 0$ is as in Proposition 4.13.

Proof. By Proposition 4.13 we have

$$
\|f^j - f^a\|_{L^2([0,1])} \leq C_\gamma j - j^a \|_{L^2(\partial\Omega)} \leq C_\gamma \delta.
$$

Hence, $\|f^j - f^a\|_{L^2([0,1])} \leq C_\gamma \delta$. \qed

Lemma 4.15. For $\varepsilon > 0$,

$$
C_g - \varepsilon \leq |g^{\varepsilon'}(\gamma(s))| \leq C_g' + \varepsilon,
$$

where $C_g$ and $C_g'$ are as in (4.10). In particular, if $0 < \varepsilon \leq C_g/2$ then

$$
\frac{C_g}{2} \leq |g^{\varepsilon'}(\gamma(s))| \leq 2C_g' \forall s \in [0,1].
$$

Proof. For any $s$ in $[0,1]$, we have

$$
|g'(\gamma(s))| - |g'(\gamma(s)) - g^{\varepsilon'}(\gamma(s))| \leq |g^{\varepsilon'}(\gamma(s))| \leq |g^{\varepsilon'}(\gamma(s)) - g'(\gamma(s))| + |g'(\gamma(s))|.
$$

Since

$$
|g'(\gamma(s)) - g^{\varepsilon'}(\gamma(s))| \leq \|g - g^{\varepsilon'}\|_{W^{1,\infty}(\Gamma)} < \varepsilon,
$$

by (3.10), we obtain (4.34). The relations in (4.35) are obvious by the assumption on $\varepsilon$. \qed

Remark 4.16. Since, $\gamma'$ satisfies (3.9), and, $(g^{\varepsilon'})'$ satisfies (4.35) for $\varepsilon < C_g/2$, $g^{\varepsilon'}(\Gamma)$ is a non-degenerate closed interval, that is, $I_{\varepsilon} := g^{\varepsilon'}(\Gamma) = [g_{\varepsilon0}^{\varepsilon}, g_{\varepsilon1}^{\varepsilon}]$ for some $g_{\varepsilon0}^{\varepsilon}, g_{\varepsilon1}^{\varepsilon}$ with $g_{\varepsilon0}^{\varepsilon} < g_{\varepsilon1}^{\varepsilon}$. \diamond

The following lemma will help us in showing that $I \cap I_{\varepsilon}$ is a closed and bounded (non-degenerate) interval.

Lemma 4.17. Let $\phi_1, \phi_2$ be in $C([\xi_1, \xi_2])$ for some $\xi_1$ and $\xi_2$ in $\mathbb{R}$, and let $\eta > 0$ be such that

$$
\|\phi_1 - \phi_2\|_{L^\infty([\xi_1, \xi_2])} \leq \eta.
$$

Let $I_1 := [a_1, b_1]$ and $I_2 := [a_2, b_2]$ for some $a_1, b_1, a_2$ and $b_2$ in $\mathbb{R}$. We assume that $I_1$ and $I_2$ are non-degenerate intervals, that is, $a_1 < b_1$ and $a_2 < b_2$, and

$$
2\eta < \min\{(b_1 - a_1), (b_2 - a_2)\}.
$$

Then

$$
\max\{|a_1 - a_2|, |b_1 - b_2|\} \leq \eta
$$

and $I_1 \cap I_2 = [a, b]$ is a non-degenerate interval, that is, $a < b$.

Proof. Suppose $a_1 < b_1$ and $a_2 < b_2$. Since $a_1 = \phi_1(s_1), a_2 = \phi_2(s_2), b_1 = \phi_1(s_1'), b_2 = \phi_2(s_2')$, for some $s_1, s_2, s_1', s_2' \in [\xi_1, \xi_2]$, and since $a_1 \leq \phi_1(s_2), a_2 \leq \phi_2(s_1), b_1 \geq \phi_1(s_2')$ and $b_2 \geq \phi_2(s_1')$, we obtain

$$
|a_1 - a_2| \leq \|\phi_1 - \phi_2\|_{L^\infty([\xi_1, \xi_2])} \leq \eta,
$$

$$
|b_1 - b_2| \leq \|\phi_1 - \phi_2\|_{L^\infty([\xi_1, \xi_2])} \leq \eta.
$$
Hence, combining both the cases, we have the proof.

Thus, (4.38) is proved.

To prove the remaining, let us first consider the case $a_1 \leq a_2$. Then, $I_1 \cap I_2 = [a_2, \tilde{b}]$, where $\tilde{b} := \min\{b_2, b_1\}$. Note that, by (4.37) and (4.39), we have
\begin{equation*}
    b_1 - a_2 = (b_1 - a_1) - (a_2 - a_1) \geq 2\eta - \eta = \eta.
\end{equation*}
Thus, $b_1 > a_2$, and also, as $b_2 > a_2$ we have,
\begin{equation*}
    I_1 \cap I_2 = [a_2, \tilde{b}] \text{ with } \tilde{b} > a_2.
\end{equation*}
Next, let $a_1 > a_2$. In this case, $I_1 \cap I_2 = [a_1, \tilde{b}]$, where $\tilde{b} := \min\{b_2, b_1\}$. Note, again by (4.37) and (4.39), that
\begin{equation*}
    b_2 - a_1 = (b_2 - a_2) - (a_1 - a_2) \geq 2\eta - \eta = \eta.
\end{equation*}
Thus, $b_2 > a_1$, and also, as $b_1 > a_1$ we have,
\begin{equation*}
    I_1 \cap I_2 = [a_1, \tilde{b}] \text{ with } \tilde{b} > a_1.
\end{equation*}
Hence, combining both the cases, we have the proof. \hfill \Box

**Remark 4.18.** Let $s_1$ and $s_0$ in $[0, 1]$ be such that $g_0 = g(\gamma(s_0))$ and $g_1 = g(\gamma(s_1))$. Let us recall that $I := [g_0, g_1]$ and $I_\varepsilon := [g_0^\varepsilon, g_1^\varepsilon]$. Since $g$ and $g^\varepsilon$ are in $C^4(\Gamma)$, we have $g \circ \gamma$ and $g^\varepsilon \circ \gamma$ are in $C^4([0, 1])$. Also,
\begin{equation*}
    \|g \circ \gamma - g^\varepsilon \circ \gamma\|_{L^\infty([0, 1])} \leq \|g - g^\varepsilon\|_{W^{1, \infty}(\Gamma)} \leq \varepsilon.
\end{equation*}
Thus, by Lemma 4.17 we have
\begin{equation*}
    |g_0 - g_0^\varepsilon| < \varepsilon \quad \text{and} \quad |g_1 - g_1^\varepsilon| < \varepsilon.
\end{equation*}
Hence, taking $\varepsilon < (g_1 - g_0)/4$, we have
\begin{equation*}
    (g_1^\varepsilon - g_0^\varepsilon) \geq |g^\varepsilon(\gamma(s_0)) - g^\varepsilon(\gamma(s_1))| \geq |g_1 - g_0| - |g(\gamma(s_0)) - g^\varepsilon(\gamma(s_0))| - |g(\gamma(s_1)) - g^\varepsilon(\gamma(s_1))| \geq 4\varepsilon - 2\|g - g^\varepsilon\|_{W^{1, \infty}(\Gamma)} > 4\varepsilon - 2\varepsilon = 2\varepsilon,
\end{equation*}
and thus, $2\varepsilon < \min\{(g_1 - g_0), (g_1^\varepsilon - g_0^\varepsilon)\}$. Hence by Lemma 4.17 $I \cap I_\varepsilon$ is a closed and bounded non-degenerate interval. Let us denote this interval by $\tilde{I}_\varepsilon$. Thus,
\begin{equation}
    \tilde{I}_\varepsilon = I \cap I_\varepsilon = [\tilde{g}_0^\varepsilon, \tilde{g}_1^\varepsilon]\label{eq:4.41}
\end{equation}
for some $\tilde{g}_0^\varepsilon, \tilde{g}_1^\varepsilon \in \mathbb{R}$ with $\tilde{g}_0^\varepsilon < \tilde{g}_1^\varepsilon$. Also, by Lemma 4.17 we have,
\begin{equation*}
    |g_0 - \tilde{g}_0^\varepsilon| \leq |g_0 - g_0^\varepsilon| < \varepsilon \quad \text{and} \quad |g_1 - \tilde{g}_1^\varepsilon| \leq |g_1 - g_1^\varepsilon| < \varepsilon. \hfill \Box
\end{equation*}

Next, we shall make use of the following lemma whose proof is given in the appendix.

**Lemma 4.19.** There exists a constant $C > 0$ such that for any closed interval $J$,
\begin{equation*}
    \|y\|_{L^\infty(J)} \leq C \|y\|_{H^1(J)},
\end{equation*}
where $C_J := C \max\{4, (2|J| + 1)\}$. In particular, for any interval $J_0$ such that $J_0 \subseteq J$,
\begin{equation}
    \|y\|_{L^\infty(J_0)} \leq C \|y\|_{H^1(J_0)}. \label{eq:4.42}
\end{equation}
If \( y \in W^{1,\infty}(J_1) \) then using (4.42) we obtain
\[
\|y\|_{L^{\infty}(J_0)}^2 \leq (C J_1)^2 \left[ \int_{J_0} y^2 + \int_{J_0} (y')^2 \right]
\leq (C J_1)^2 |J_0| \left[ \|y\|_{L^\infty(J_0)}^2 + \|y'\|_{L^\infty(J_0)}^2 \right]
\]
Thus
\[
(4.43) \quad \|y\|_{L^2(J_0)} \leq \sqrt{|J_0|} \|y\|_{L^\infty([a,c])} \leq |J_0| C J_1 \left[ \|y\|_{L^\infty(J_0)}^2 + \|y'\|_{L^\infty(J_0)}^2 \right]^{1/2} \leq |J_0| \sqrt{2} C J_1 \|y\|_{W^{1,\infty}(J_0)}
\]
and additionally if \( y'' \in L^\infty(J_1) \)
\[
\|y\|_{L^2(J_0)} \leq |J_0| (C J_1)^2 \left( \|y\|_{L^\infty(J_0)}^2 + \|y'\|_{L^\infty(J_0)}^2 \right)
\leq |J_0|^3 C J_1^4 \left[ \|y\|_{L^\infty(J_0)}^2 + \|y'\|_{L^\infty(J_0)}^2 + \|y''\|_{L^\infty(J_0)}^2 \right]
\leq 4 |J_0|^3 C J_1^4 \|y\|_{W^2,\infty(J_0)}^2
\]
which implies
\[
(4.44) \quad \|y\|_{L^2(J_0)} \leq 2 |J_0|^3/2 (C J_1)^2 \|y\|_{W^2,\infty(J_0)}
\]

**Lemma 4.20.** Let \( J_1 \) and \( J_2 \) be closed intervals such that \( J_2 \subseteq J_1 \). Let \( y \in H^2(J_1) \). Then we have the following.

(i) \( \|y\|_{L^2(J_1 \setminus J_2)} \leq \sqrt{2} C J_1 \|y\|_{W^{1,\infty}(J_1)}|J_1 \setminus J_2| \).

(ii) If \( y'' \in L^\infty(J_1) \) then
\[
\|y\|_{L^2(J_1 \setminus J_2)} \leq 2 (C J_1)^2 \|y\|_{W^2,\infty(J_1)}|J_1 \setminus J_2|^{3/2}.
\]

Here \( C J_1 \) is as in Lemma 4.19

**Proof.** Let \( J_1 = [a,b] \) and \( J_2 = [c,d] \) for some \( a \leq b \) and \( c \leq d \). If \( J_1 = J_2 \) then \( J_1 \setminus J_2 = \emptyset \), and in that case the result holds trivially. So let us consider the cases when either \( a < c \) or \( d < b \), or both holds. Without loss of generality let us assume that \( a < c \) and \( d < b \). Let \( y \in H^2(J_1) \). Then by (4.42) \( y \) and \( y' \) are in \( L^\infty(J_1) \). Thus taking \( J_0 = [a,c] \) in (4.43) we have
\[
\|y\|_{L^2([a,c])} \leq (c-a) \sqrt{2} C J_1 \|y\|_{W^{1,\infty}([a,c])} \leq (c-a) \sqrt{2} C J_1 \|y\|_{W^{1,\infty}(J_1)}
\]
and taking \( J_0 = [d,b] \) in (4.43) we have
\[
\|y\|_{L^2([d,b])} \leq (b-d) \sqrt{2} C J_1 \|y\|_{W^{1,\infty}([d,b])} \leq (b-d) \sqrt{2} C J_1 \|y\|_{W^{1,\infty}(J_1)}
\]
Hence we have (i). Next, additionally if, \( y'' \in L^\infty(J_1) \), having \( J_0 = [a,c] \) in (4.44) we obtain
\[
\|y\|_{L^2([a,c])} \leq 2 (c-a)^{3/2} (C J_1)^2 \|y\|_{W^2,\infty([a,c])} \leq 2 (c-a)^{3/2} (C J_1)^2 \|y\|_{W^2,\infty(J_1)}
\]
and having \( J_0 = [d,b] \) in (4.44) we obtain
\[
\|y\|_{L^2([d,b])} \leq 2 (b-d)^{3/2} (C J_1)^2 \|y\|_{W^2,\infty([d,b])} \leq 2 (b-d)^{3/2} (C J_1)^2 \|y\|_{W^2,\infty(J_1)}
\]
Hence we have (ii). \( \Box \)
Lemma 4.21. Let $\phi_1, \phi_2, I_1, I_2$ and $\eta$ be as in Lemma 4.17 satisfying all the assumptions there. Then, for any interval $I_3 \subset I_1 \cap I_2$ and $y \in C^1(I_1)$

$$\int_{I_3} |y(\phi_1(\xi)) \cdot y(\phi_2(\xi))|^2 d\xi \leq \|y\|_{L^\infty(I_1)}^2 \|\phi_1 - \phi_2\|_{L^2([\xi_1, \xi_2])}^2. \tag{4.45}$$

Assume, further, that $\phi_1, \phi_2 \in C^1([\xi_1, \xi_2])$ satisfying $|\phi'_1(\xi)| \geq C_{\phi_1}$ and $|\phi'_2(\xi)| \geq C_{\phi_2}$ for some constants $C_{\phi_1}, C_{\phi_2} > 0$. Then, for $y \in H^2(I_1)$

$$\|y \circ \phi_1 - y \odot \phi_2\|_{L^2([\xi_1, \xi_2])}^2 \leq C_1 \|y\|_{H^2(I_1)} \left(\|\phi_1 - \phi_2\|_{L^2([\xi_1, \xi_2])}^2 + \frac{2\sqrt{2}}{C_{\phi_1}} \right), \tag{4.46}$$

where

$$y \odot \phi_2(\xi) := \begin{cases} (y \circ \phi_2)(\xi) & \text{if } \xi \in [\xi_1, \xi_2], \\ 0 & \text{if } \xi \notin [\xi_1, \xi_2]. \end{cases}$$

with $[\xi_1, \xi_2] = (\phi_2)^{-1}(I_1 \cap I_2)$ and $C_1$ is as in Lemma 4.17.

Proof. By Lemma 4.17 we have $I_1 \cap I_2$ to be a closed non-degenerate interval. Let $I_3$ be an interval in $I_1 \cap I_2$. Then for $y \in C^1(I_1)$ using fundamental theorem of calculus and Hölder’s inequality we have

$$\int_{I_3} |y(\phi_1(\xi)) - y(\phi_2(\xi))|^2 d\xi = \int_{I_3} \left[ \int_{\phi_1(\xi)}^{\phi_2(\xi)} y'(\theta) d\theta \right]^2 d\xi \leq \int_{I_3} \|y'\|_{L^\infty(I_1)}^2 |\phi_1(\xi) - \phi_2(\xi)|^2 d\xi \leq \|y'\|_{L^2(I_1)}^2 \|\phi_1 - \phi_2\|_{L^2([\xi_1, \xi_2])}^2.$$
Hence, as (4.47) and (4.48) hold and (4.37) is assumed, taking $J_1 = I_1$ and $J_2 = \phi_1([\xi_1, \xi_2]) = [\tilde{a}_1, \tilde{b}_1]$ in Lemma 4.20 (i) we obtain

$$
\int_{[\xi_1, \xi_2]\setminus[\xi_1, \xi_2]} |y(\phi_1(\xi))|^2 d\xi \leq \frac{1}{C_{\phi_1}} \|y\|_{L^2(I_1 \setminus \phi_1([\xi_1, \xi_2]))}^2 \leq \frac{2(C_{I_1})^2}{C_{\phi_1}} \|y\|_{H^2(I_1)}^2 4\eta^2.
$$

Thus using (4.49), the fact that $H^2(I_1)$ is continuously imbedded in $C^1(I_1)$ and having $I_3 = [\tilde{\xi}_1, \tilde{\xi}_2]$ in (4.11) we obtain

$$
\|y \circ \phi_1 - y \circ \phi_2\|_{L^2([\tilde{\xi}_1, \tilde{\xi}_2])} \leq (\|y\|_{L^\infty(J_1)}^2 \|\phi_1 - \phi_2\|_{L^2([\xi_1, \xi_2])} + \|y\|_{H^2(I_1)}^2 2\sqrt{2}C_{I_1} \eta^2) \sup_{s \in [0,1]} |g' \circ \gamma(s)|. 
$$

Hence, using (4.32) we have (4.50).

Let us recall that $I = g(\gamma([0,1])) = [g_0, g_1]$, $I_\varepsilon = g^\varepsilon(\gamma([0,1])) = [g_0^\varepsilon, g_1^\varepsilon]$ and for $\varepsilon < (g_1 - g_0)/4$, let $\tilde{I}_\varepsilon = I \cap I_\varepsilon = [\tilde{g}_0^\varepsilon, g_1^\varepsilon]$ as in (4.11). By (4.23) we have $\|g - g^\varepsilon\|_{W^{1,\infty}(\gamma)} \leq \varepsilon$ and thus

$$
\|g \circ \gamma - g^\varepsilon \circ \gamma\|_{L^\infty([0,1])} = \sup_{s \in [0,1]} |g\circ \gamma(s) - g^\varepsilon \circ \gamma(s)| \leq \|g - g^\varepsilon\|_{W^{1,\infty}(\gamma)} \leq \varepsilon.
$$

Now, additionally let $\varepsilon \leq C_g/2$. Then, by (4.33) and (3.9) $g^\varepsilon$ and $\gamma$ are bijective, and so $(g^\varepsilon \circ \gamma)^{-1}$ is continuous. Thus $(g^\varepsilon \circ \gamma)^{-1}(\tilde{I}_\varepsilon)$ is a closed non-degenerate interval. In other words

$$
\tilde{I}_\varepsilon = [\tilde{g}_0^\varepsilon, g_1^\varepsilon] = g^\varepsilon(\gamma([t^*_0, t^*_1]))
$$

for some $t^*_0$ and $t^*_1$ in $[0,1]$ with $t^*_0 < t^*_1$.

Now, for $\varepsilon \leq \min\{(g_1 - g_0)/4, C_g/2\}$, let $T_3^\varepsilon : L^2(\tilde{I}_\varepsilon) \to L^2([0,1])$ be defined by

$$
T_3^\varepsilon(\zeta)(s) = \begin{cases} 
\zeta(g^\varepsilon(\gamma(s))) & s \in [t^*_0, t^*_1] \\
0 & g^\varepsilon(\gamma(s)) \in [0,1] \setminus [t^*_0, t^*_1].
\end{cases}
$$

Now, we prove some properties of $T_3^\varepsilon$.

**Theorem 4.22.** Let $T_3^\varepsilon$ be as defined in (4.52). Then, for $\zeta \in W$,

$$
\|T_3^\varepsilon \zeta - T_3^\varepsilon \zeta_\varepsilon\|_{L^2([0,1])} \leq (C_{g, \gamma, I} \|\zeta\|_{H^2(I)}) \varepsilon
$$

where $C_{g, \gamma, I} = C_I \left(1 + \frac{2\sqrt{2}}{\sqrt{C_g C_\gamma}}\right)$ with $C_I$ as in (4.42).

**Proof.** Let $\zeta \in W$. For any $s \in [0,1]$, by (3.11) and (3.9), we have

$$
|\zeta(g^\varepsilon(\gamma(s)))| \geq \zeta(g(\gamma(s))).
$$

By (4.50) and (4.51), we have $\|g \circ \gamma - g^\varepsilon \circ \gamma\| \leq \varepsilon$ and $\tilde{I}_\varepsilon = I \cap I_\varepsilon = (g^\varepsilon \circ \gamma)([t^*_0, t^*_1])$, respectively. Now $\zeta \in W \subset H^2(I)$. Then, by definition of $T_3$ and $T_3^\varepsilon$, we have

$$
T_3(\zeta) = \zeta \circ g \circ \gamma \in L^2([0,1]) \quad \text{and} \quad (\zeta \circ g^\varepsilon \circ \gamma)|_{[t^*_0, t^*_1]} = (T_3^\varepsilon(\zeta)|_{[t^*_0, t^*_1]})|_{[t^*_0, t^*_1]} \in L^2([t^*_0, t^*_1]).
$$

Hence, taking $\phi_1$ as $g \circ \gamma$ and $\phi_2$ as $g^\varepsilon \circ \gamma$ in Lemma 4.21, we have

$$
\|T_3^\varepsilon \zeta - T_3^\varepsilon \zeta_\varepsilon\|_{L^2([0,1])} \leq C_I \left(1 + \frac{2\sqrt{2}}{\sqrt{C_g C_\gamma}}\right) \|\zeta\|_{H^2(I)} \varepsilon.
$$
This completes the proof. \[\square\]

**Theorem 4.23.** The map \(T_3^\varepsilon : L^2(\tilde{I}_\varepsilon) \to L^2([0, 1])\), defined as in (4.52), is bounded linear and bounded below. In fact, for every \(\zeta \in L^2(\tilde{I}_\varepsilon)\),

\[
\left(4.53\right) \quad \frac{C_g C_\gamma}{2} \|T_3^\varepsilon(\zeta)\|_{L^2([0,1])} \leq \|\zeta\|_{L^2(I_\varepsilon)} \leq \sqrt{2C_g C_\gamma} \|T_3^\varepsilon(\zeta)\|_{L^2([0,1])},
\]

where \(C_\gamma, C'_g\) and \(C_g, C'_\gamma\) are as in (3.9) and (3.10), respectively.

**Proof.** Clearly, \(T_3^\varepsilon\) is a linear map. Since (4.35) and (3.9) hold, using Lemma 3.3 and (4.52) we obtain

\[
\|T_3^\varepsilon(\zeta)\|_{L^2([0,1])} = \int_0^1 |T_3^\varepsilon(\zeta)(s)|^2 \, ds = \int_{t_0}^{t_1} |\zeta(g^c(\gamma(s)))|^2 \, ds
\]

\[
\leq \frac{2}{C_g C_\gamma} \int_{\tilde{g}_0}^{\tilde{g}_1} |\zeta(z)|^2 \, dz = \frac{2}{C_g C_\gamma} \|\zeta\|_{L^2([\tilde{g}_0, \tilde{g}_1])},
\]

\[
\|T_3^\varepsilon(\zeta)\|_{L^2([0,1])} \geq \frac{1}{2C_g C_\gamma} \int_{\tilde{g}_0}^{\tilde{g}_1} |\zeta(z)|^2 \, dz = \frac{1}{2C_g C_\gamma} \|\zeta\|_{L^2([\tilde{g}_0, \tilde{g}_1])}.
\]

Hence we have the proof. \[\square\]

Now, by Theorem 4.23 we know that \(T_3^\varepsilon\) is a bounded linear map which is bounded below. Thus using Lemma 4.5 the operator

\[
(T_3^\varepsilon)^\dagger := ((T_3^\varepsilon)^*)^{-1}(T_3^\varepsilon)^*
\]

is a bounded linear operator and is the generalized inverse of \(T_3^\varepsilon\). The following theorem, which also follows from Lemma 4.5, shows that the family

\[
\left\{ (T_3^\varepsilon)^\dagger : 0 < \varepsilon \leq \min\{\frac{C_g}{2}, \frac{g_1 - g_0}{4}\} \right\}
\]

is in fact uniformly bounded.

**Theorem 4.24.** For every \(\zeta \in L^2([0, 1])\),

\[
\left(4.54\right) \quad \|\left((T_3^\varepsilon\right)^\dagger \zeta\|_{L^2(I_\varepsilon)} \leq \sqrt{2C_g C_\gamma} \|\zeta\|_{L^2([0,1])},
\]

where \(C'_g\) and \(C'_\gamma\) are as in (3.9) and (3.10).

Thus, let us consider the following operator equation.

\[
\left(4.55\right) \quad (T_3^\varepsilon)^*(T_3^\varepsilon)\zeta = (T_3^\varepsilon)^* f^\varepsilon.
\]

Let \(\tilde{\zeta}_{\epsilon, \delta} \in L^2(\tilde{I}_\epsilon)\) be the unique solution of (4.55), that is, \(\tilde{\zeta}_{\epsilon, \delta} := (T_3^\varepsilon)^* f^\varepsilon\). Then \(\tilde{\zeta}_{\epsilon, \delta}\) defined as, \(\tilde{\zeta}_{\epsilon, \delta}\) on \(\tilde{I}_\varepsilon\) and 0 on \(I \setminus \tilde{I}_\varepsilon\), is in \(L^2(I)\).

Now let us recall that solving the operator equation (3.1) involves three operators \(T_1, T_2\) and \(T_3\). Hence, in order to obtain an approximate solution of (3.1) we consider the following operator equations. First of all we consider (4.55). Then, let us recall that \(T_2\) is a compact operator of infinite rank, and the family \(\{R_\alpha\}_{\alpha > 0}\) of operators defined by \(R_\alpha := ((T_2^\varepsilon)^*)^{-1}(T_2^\varepsilon)^*\) is a regularization family (by Theorem 4.9).
Thus we consider the equation
\[(T_2^\alpha)^*(T_2^\alpha)(w) = (T_2^\alpha)^*\zeta_{\epsilon, \delta}.\]

Let \(b_{\alpha,\epsilon,\delta}\) be the unique solution of equation (4.56).

Thus by solving the operator equations (4.55) and (4.56) we obtain \(b_{\alpha,\epsilon,\delta}\). After this, as \(b_{\alpha,\epsilon,\delta} \in \mathcal{W} \subset R(T_1)\), we obtain \(a_{\alpha,\epsilon,\delta} := b'_{\alpha,\epsilon,\delta}\) as the solution of the equation
\[T_1(a) = b_{\alpha,\epsilon,\delta}.\]

We show that \(a_{\alpha,\epsilon,\delta}\) is a candidate for an approximate solution to Problem (P).

**Lemma 4.25.** Under the assumptions in Assumption 3.2, let \(a_0 \in H^1(I)\) be such that \(a_0(g_1) = 0\), and \(a_0\) is the solution of \(T(a) = f^j\). Let \(\zeta \in L^2(I)\), \(b_{\alpha,\zeta} \in H^2(I)\) be the solution of the equation
\[(T_2^\alpha)^*(T_2^\alpha)(w) = (T_2^\alpha)^*\zeta,\]
and \(a_{\alpha,\zeta} = b'_{\alpha,\zeta}\). Then
\[(4.57) \quad \|a_0 - a_{\alpha,\zeta}\|_{H^1(I)} \leq C_\alpha + \frac{\|\zeta - b_0\|_{L^2(I)}}{\alpha},\]
\[(4.58) \quad \|a_0 - a_{\alpha,\zeta}\|_{L^2(I)} \leq \sqrt{\alpha}\|a_0'\|_{L^2(I)} + \frac{\|\zeta - b_0\|_{L^2(I)}}{\sqrt{\alpha}},\]
where \(C_\alpha > 0\) is such that \(C_\alpha \to 0\) as \(\alpha \to 0\). In addition, if \(a_0 \in H^2(I)\), then
\[(4.59) \quad \|a_0 - a_{\alpha,\zeta}\|_{H^1(I)} \leq (1 + C_L)\alpha\|a_0\|_{H^2(I)} + \frac{\|\zeta - b_0\|_{L^2(I)}}{\alpha},\]
\[(4.60) \quad \|a_0 - a_{\alpha,\zeta}\|_{L^2(I)} \leq (1 + C_L)\alpha\|a_0\|_{H^2(I)} + \frac{\|\zeta - b_0\|_{L^2(I)}}{\sqrt{\alpha}}.\]
Here \(C_L\) is as in Proposition 4.3.

**Proof.** Let \(b_0 = T_1(a_0)\). Then, as \(a_0(g_1) = 0\), we have \(b_0 \in \mathcal{W}\). Now, by definition of \(a_{\alpha,\zeta}\) and, \(H^1(I)\) and \(H^2(I)\) norms, for \(r \in \{0, 1\}\)
\[
\|a_0 - a_{\alpha,\zeta}\|_{H^r(I)} = \|a_0 - (((T_2^\alpha)^*T_2^\alpha)^{-1}(T_2^\alpha)^*\zeta)'\|_{H^r(I)} \\
\leq \|b_0 - (((T_2^\alpha)^*T_2^\alpha)^{-1}(T_2^\alpha)^*\zeta)'\|_{H^{r+1}(I)} \\
\leq \|b_0 - ((T_2^\alpha)^*T_2^\alpha)^{-1}(T_2^\alpha)^*T_2(b_0)\|_{H^{r+1}(I)} \\
+ \|((T_2^\alpha)^*T_2^\alpha)^{-1}(T_2^\alpha)^*(\zeta - T_2(b_0))\|_{H^{r+1}(I)}.
\]
Hence, for \(r \in \{0, 1\},
\[(4.61) \quad \|a_0 - a_{\alpha,\zeta}\|_{H^r(I)} \leq \|b_0 - ((T_2^\alpha)^*T_2^\alpha)^{-1}(T_2^\alpha)^*T_2(b_0)\|_{H^{r+1}(I)} \\
+ \|((T_2^\alpha)^*T_2^\alpha)^{-1}(T_2^\alpha)^*(\zeta - T_2(b_0))\|_{H^{r+1}(I)}.
\]
By Theorem 4.9 we have
\[(4.62) \quad \|b_0 - ((T_2^\alpha)^*T_2^\alpha)^{-1}(T_2^\alpha)^*T_2(b_0)\|_{H^2(I)} \to 0 \quad \text{as} \quad \alpha \to 0.
\]
Also, by Theorem 4.7(iii) we have
\[(4.63) \quad \|b_0 - ((T_2^\alpha)^*T_2^\alpha)^{-1}(T_2^\alpha)^*T_2(b_0)\|_{H^1(I)} \leq \|b_0^0\|_{L^2(I)}\sqrt{\alpha}.
\]
Again, using (4.10) and (4.11), we have

\begin{equation}
\|(T_{2}^{\alpha})^{*}T_{2}^{\alpha})^{-1}(T_{2}^{\alpha})^{*}(\zeta - T_{2}(b_{0}))\|_{L^{2}(I)} \leq \frac{1}{\alpha}\|\zeta - T_{2}(b_{0})\|_{L^{2}(I)}
\end{equation}

and

\begin{equation}
\|(T_{2}^{\alpha})^{*}T_{2}^{\alpha})^{-1}(T_{2}^{\alpha})^{*}(\zeta - T_{2}(b_{0}))\|_{H^{1}(I)} \leq \frac{1}{\alpha}\|\zeta - T_{2}(b_{0})\|_{L^{2}(I)}.
\end{equation}

Thus combining (4.61), (4.62) and (4.64) we have (4.64), and combining (4.61), (4.63) and (4.65) we have (4.58).

Now, let \(a_{0} \in H^{3}(I), b_{0} = T_{1}(a_{0}) \in \mathcal{W} \cap H^{4}(I)\). Then, using theorem (4.7) (ii) we have, for \(r \in \{0,1\},
\begin{equation}
\|b_{0} - ((T_{2}^{\alpha})^{*}T_{2}^{\alpha})^{-1}(T_{2}^{\alpha})^{*}T_{2}(b_{0})\|_{H^{r+1}(I)} \leq (1 + C_{L})\|b_{0}\|_{H^{2}(I)}\alpha.
\end{equation}

Thus combining (4.61), (4.66) and (4.64) we have (4.59), and combining (4.61), (4.66) and (4.65) we have (4.60). \(\Box\)

Now, we prove one of the main theorems of this paper.

**Theorem 4.26.** Let \(\varepsilon < \min\{(g_{1} - g_{0})/4, C_{g}/2\}\). Let \(a_{0}, g\) and \(j\) be as in Lemma 4.25. Let \(g^{e} \in C^{1}(\Gamma)\), \(j^{e} \in W^{1-1/p,p}(\Omega)\) with \(p > 3\), \(\zeta, \delta\) be the solution of (4.59), and \(a_{\alpha,\varepsilon,\delta} = b_{\alpha,\varepsilon,\delta}\) where \(b_{\alpha,\varepsilon,\delta}\) is the solution of (4.50). Also, let \(g^{e}\) and \(j^{e}\) satisfy (4.25) and (4.26), respectively. Then

\begin{equation}
\|a_{0} - a_{\alpha,\varepsilon,\delta}\|_{H^{1}(I)} \leq C_{\alpha} + \frac{1}{\alpha}\left[\sqrt{2C_{g}^{\prime}C_{\gamma}}(C_{1,\varepsilon,\gamma})\|b_{0}\|_{H^{2}(I)}\varepsilon + \tilde{C}_{\gamma}\delta + C_{I}\|b_{0}\|_{H^{2}(I)}\varepsilon\right],
\end{equation}

\begin{equation}
\|a_{0} - a_{\alpha,\varepsilon,\delta}\|_{L^{2}(I)} \leq \sqrt{\alpha}\|a_{0}\|_{L^{2}(I)} + \frac{1}{\alpha}\left[\sqrt{2C_{g}^{\prime}C_{\gamma}}(C_{1,\varepsilon,\gamma})\|b_{0}\|_{H^{2}(I)}\varepsilon + \tilde{C}_{\gamma}\delta + C_{I}\|b_{0}\|_{H^{2}(I)}\varepsilon\right],
\end{equation}

where \(C_{\alpha} > 0\) is such that \(C_{\alpha} \to 0\) as \(\alpha \to 0\).

In addition if \(a_{0} \in H^{3}(I)\), then

\begin{equation}
\|a_{0} - a_{\alpha,\varepsilon,\delta}\|_{H^{1}(I)} \leq (1 + C_{L})\|a_{0}\|_{H^{2}(I)}\alpha + \frac{1}{\alpha}\left[\sqrt{2C_{g}^{\prime}C_{\gamma}}(C_{1,\varepsilon,\gamma})\|b_{0}\|_{H^{2}(I)}\varepsilon + \tilde{C}_{\gamma}\delta + C_{I}\|b_{0}\|_{H^{2}(I)}\varepsilon\right],
\end{equation}

\begin{equation}
\|a_{0} - a_{\alpha,\varepsilon,\delta}\|_{L^{2}(I)} \leq (1 + C_{L})\|a_{0}\|_{H^{2}(I)}\alpha + \frac{1}{\alpha}\left[\sqrt{2C_{g}^{\prime}C_{\gamma}}(C_{1,\varepsilon,\gamma})\|b_{0}\|_{H^{2}(I)}\varepsilon + \tilde{C}_{\gamma}\delta + C_{I}\|b_{0}\|_{H^{2}(I)}\varepsilon\right].
\end{equation}

Here, \(b_{0} = T_{1}(a_{0})\), and \(C_{L}, \tilde{C}_{\gamma}, C_{I}, C_{1,\varepsilon,\gamma}, C_{g}^{\prime}\) and \(C_{\gamma}^{\prime}\) are constants as defined in Proposition 4.3, Lemmas 4.13 and 4.17, Theorem 4.22, (3.9) and (3.10) respectively.

**Proof.** Since \(a_{0}(g_{1}) = 0\), we have \(b_{0} \in \mathcal{W}\). Now let us note that, by Remark 4.18, we have \(|g_{0} - \tilde{g}_{0}| < \varepsilon\) and \(|g_{1} - \tilde{g}_{1}| < \varepsilon\).

Hence, taking \(J_{1}\) and \(J_{2}\) as \(I\) and \(\tilde{I}_{\varepsilon}\) respectively in Lemma 4.20, and with our choice of \(\varepsilon\), by Lemma 4.20 (i) we have,

\begin{equation}
\|b_{0}\|_{L^{2}(I\backslash\tilde{I}_{\varepsilon})} \leq C_{I}\|b_{0}\|_{H^{2}(I)}\varepsilon.
\end{equation}
Since $\tilde{\zeta}_{\epsilon, \delta} = (T_\delta^*)^j f^j$, $T_3(T_2(b_0)) = f^j$, and $(T_\delta^*)^j T_\delta^*$ is identity, we have
\[
\|\tilde{\zeta}_{\epsilon, \delta} - b_0\|_{L^2(I_x)} = \|(T_\delta^*)^j f^j - (T_2(b_0))\|_{L^2(I_x)}
\leq \|(T_\delta^* T_3(T_2(b_0)) - (T_2(b_0))\|_{L^2(I_x)} + \|(T_\delta^*)^j (f^j - f^j)\|_{L^2(I_x)}
\leq \|(T_\delta^* T_3(T_2(b_0)) - T_3((T_2(b_0))T_2(b_0))\|_{L^2(I_x)}
+ \|(T_\delta^*)^j (f^j - f^j)\|_{L^2(I_x)}.
\]
Now, by (4.54) and Theorem 4.22 we obtain
\[
\|(T_\delta^*)^j (f^j - f^j)\|_{L^2(I_x)} \leq \sqrt{2C_\delta^* C_\gamma^* C_\gamma^* \delta},
\]
\[
\|T_\delta^* (T_3(T_2(b_0)) - T_3((T_2(b_0))T_2(b_0)))\|_{L^2(I_x)} \leq \sqrt{2C_\delta^* C_\gamma^* (C_{I,g,\gamma})\|b_0\|H^2(I)\epsilon}.
\]
Therefore,
\[
(4.72) \|\tilde{\zeta}_{\epsilon, \delta} - b_0\|_{L^2(I_x)} \leq \sqrt{2C_\delta^* C_\gamma^* (C_{I,g,\gamma})\|b_0\|H^2(I)\epsilon} + \tilde{C}_\gamma^* \delta.
\]
Now by definition of $\zeta_{\epsilon, \delta}$ we have
\[
\|\tilde{\zeta}_{\epsilon, \delta} - b_0\|_{L^2(I)} \leq \|\tilde{\zeta}_{\epsilon, \delta} - b_0\|_{L^2(I_x)} + \|b_0\|_{L^2(I\setminus I_x)}.
\]
Hence, by (4.71) and (4.72) we have,
\[
\|\zeta_{\epsilon, \delta} - b_0\|_{L^2(I)} \leq \sqrt{2C_\delta^* C_\gamma^* (C_{I,g,\gamma})\|b_0\|H^2(I)\epsilon} + \tilde{C}_\gamma^* \delta + C_I\|b_0\|H^2(I)\epsilon.
\]
Now by definition, $b_{\alpha, \epsilon, \delta}$ is the unique solution of equation (4.50). Thus, with $\tilde{\zeta}_{\epsilon, \delta}$ in place of $\zeta$ in Lemma 1.25 we have the proof. \hfill \Box

Remark 4.27. Let $a_0$ and $a_{\alpha, \epsilon, \delta}$ be as defined in Theorem 4.26. Then (4.67) and (4.68) take the forms
\[
\|a_0 - a_{\alpha, \epsilon, \delta}\|_{H^1(I)} \leq C_\alpha + K_1 \frac{\epsilon + \delta}{\alpha},
\]
\[
\|a_0 - a_{\alpha, \epsilon, \delta}\|_{L^2(I)} \leq \sqrt{\alpha}\|a_0\|_{L^2(I)} + K_2 \frac{\epsilon + \delta}{\sqrt{\alpha}},
\]
respectively, where $C_\alpha > 0$ is such that $C_\alpha \rightarrow 0$ as $\alpha \rightarrow 0$, and if, in addition, $a_0 \in H^3(I)$, then (4.69) and (4.70) take the forms
\[
\|a_0 - a_{\alpha, \epsilon, \delta}\|_{H^1(I)} \leq (1 + C_L)\|a_0\|_{H^2(I)} + K_3 \frac{\epsilon + \delta}{\alpha},
\]
\[
\|a_0 - a_{\alpha, \epsilon, \delta}\|_{L^2(I)} \leq (1 + C_L)\|a_0\|_{H^2(I)} + K_4 \frac{\epsilon + \delta}{\sqrt{\alpha}},
\]
respectively, where $C_L, K_1, K_2, K_3, K_4$ are positive constants independent of $\alpha, \epsilon, \delta$.

Then, choosing $\alpha = \sqrt{\delta}$ and $\epsilon = \delta$ in (4.67) we have
\[
\|a_0 - a_{\alpha, \epsilon, \delta}\|_{H^1(I)} = o(1).
\]
Thus using the new regularization method we obtain a result better than the order $O(1)$ in (4.4) obtained using Tikhonov regularization. On choosing $\alpha = \delta = \epsilon$ in (4.68) we have
\[
\|a_0 - a_{\alpha, \epsilon, \delta}\|_{L^2(I)} = O(\sqrt{\delta}),
\]
which is same as the estimate obtained in \[\text{[4]}\]. Next, under the source condition \(a_0 \in H^3(I)\) and for \(\alpha = \sqrt{\delta}\) and \(\varepsilon = \delta\), \((1.70)\) gives the order as

\[
\|a_0 - a_{\alpha,\varepsilon,\delta}\|_{H^1(I)} = O(\sqrt{\delta}).
\]

This estimate is similar to a result obtained in \([7]\) with source condition \(a_0 \in H^4(I)\) and trace of \(a_0\) being Lipschitz which is stronger than the source condition needed in our result, whereas under the same source condition \(a_0 \in H^3(I)\), the choice of \(\alpha = \delta^{2/3}\) and \(\varepsilon = \delta\) in \((1.70)\) gives the rate as

\[
\|a_0 - a_{\alpha,\varepsilon,\delta}\|_{L^2(I)} = O(\delta^{2/3}).
\]

This is better than the rate \(O(\delta^{3/5})\) mentioned in \([4]\) as the best possible estimate under \(L^2(I)\) norm (under realistic boundary condition) using Tikhonov regularization.

\[\square\]

5. RELAXATION OF ASSUMPTION ON PERTURBED DATA

In the previous section we have carried out our analysis assuming that the perturbed data \(g^\varepsilon\) is in \(C^1(\Gamma)\), along with \((1.25)\). This assumption can turn out to be too strong for implementation in practical problems. Hence, here we consider a weaker and practically relevant assumption on our perturbed data \(g^\varepsilon\), namely \(g^\varepsilon \in L^2(\Gamma)\) with

\[
(5.1) \quad \|g - g^\varepsilon\|_{L^2(\Gamma)} \leq \varepsilon.
\]

What we essentially used in our analysis in Section \([1]\) to derive the error estimates is that \(g^\varepsilon \circ \gamma\) is close to \(g \circ \gamma\) in appropriate norms. Here, we consider \(\tilde{g}^\varepsilon := \Pi_h(g^\varepsilon \circ \gamma)\) in place of \(g^\varepsilon \circ \gamma\), where \(\Pi_h : L^2([0, 1]) \rightarrow L^2([0, 1])\) is the orthogonal projection onto a subspace of \(W^{1,\infty}([0, 1])\), and we show that \(\tilde{g}^\varepsilon\) is close to \(g \circ \gamma\) in appropriate norms, and then obtain associated error estimates. For this purpose, we shall also assume more regularity on \(g \circ \gamma\), namely, \(g \circ \gamma \in H^4([0, 1])\).

Let \(\Pi_h : L^2([0, 1]) \rightarrow L^2([0, 1])\) be the orthogonal projection onto the space \(L_h\) which is the space of all continuous real valued piecewise linear functions \(w\) on \([0, 1]\) defined on a uniform partition \(0 = t_0 < t_1 < \cdots < t_N = 1\) of mesh size \(h\), that is, \(t_i := (i - 1)h\) for \(i = 1, \cdots N\) and \(h = 1/N\). Thus, \(w \in L_h\) if and only if \(w \in C[0, 1]\) such that \(w|_{(t_{i-1}, t_i]}\) is a polynomial of degree at most 1. Let \(T_h := \{[t_{i-1}, t_i] : i = 1, \cdots \lfloor \frac{1}{h} \rfloor + 1\}\).

In the following, for \(w \in L^2([0, 1])\), we use the notation \(\|w\|_{H^m(\tau_h)}\) and \(\|w\|_{W^{m,\infty}(\tau_h)}\) whenever \(w|_{\tau_h}\) belong to \(H^m(\tau_h)\) and \(W^{m,\infty}(\tau_h)\), respectively. As a particular case of inverse inequality stated in Lemma 4.5.3 in \([1]\), for \(m \in \{0, 1\}\), we have

\[
(5.2) \quad \|\Pi_h w\|_{W^{m,\infty}(\tau_h)} \leq C_m h^{(1/2+m)} \|\Pi_h w\|_{L^2(\tau_h)}
\]

where \(C_m\) is a positive constant.

**Proposition 5.1.** Let \(w \in L^2([0, 1]), m \in \mathbb{N} \cup \{0\}\) and \(\tau_h \in T_h\). Then the following inequalities hold.

\[
(5.3) \quad \|w\|_{H^m(\tau_h)} \leq h^{1/2} C_0 \|w\|_{H^{m+1}(\tau_h)} \quad \text{whenever } w|_{\tau_h} \in H^{m+1}(\tau_h),
\]

\[
(5.4) \quad \|w\|_{W^{m,\infty}(\tau_h)} \leq C_0 h^{1/2} \|w\|_{H^{m+2}(\tau_h)} \quad \text{whenever } w|_{\tau_h} \in W^{m,\infty}(\tau_h),
\]

\[
(5.5) \quad \|\Pi_h w\|_{W^{m,\infty}(\tau_h)} \leq C_m C_0 (2+2m) h^{1/2} \|w\|_{H^{2m+2}(\tau_h)} \quad \text{whenever } w|_{\tau_h} \in H^{2m+2}(\tau_h),
\]

where \(C_0 := 2C_{[0,1]}\) with \(C_{[0,1]}\) as in \((1.12)\) and \(C_m\) is as in \((5.2)\).
Proof. If \( w_j^{(j)} \in H^1(\tau_h) \) for some \( j \in \mathbb{N} \cup \{0\} \), then using (4.42) and the fact that \( \tau_h \) is of length \( h \), we obtain
\[
\|w_j^{(j)}\|_{L^2(\tau_h)} \leq h^{1/2} \|w_j^{(j)}\|_{L^\infty(\tau_h)} \leq h^{1/2} C h \|w_j^{(j)}\|_{H^1(\tau_h)},
\]
where \( J_0 := [0, 1] \). Hence, we have
\[
\|w\|_{H^m(\tau_h)} = \sum_{j=0}^m \|w_j^{(j)}\|_{L^2(\tau_h)} \leq \sum_{j=0}^m h^{1/2} C h \|w_j^{(j)}\|_{H^1(\tau_h)} \leq 2 C h \|w\|_{H^{m+1}(\tau_h)}.
\]
Thus, taking \( C_0 = 2 C h \), we have (5.3).

By repeatedly using (4.42) and then by (5.3), we obtain
\[
\|w\|_{W^{m, \infty}(\tau_h)} \leq 2 C h \|w\|_{H^{m+1}(\tau_h)} \leq 2 C h C_0 h^{1/2} \|w\|_{H^{m+2}(\tau_h)}.
\]
As we have taken \( C_0 = 2 C h \), we have the proof of (5.4).

Since \( \Pi_h \) is an orthogonal projection, from (5.2) we obtain,
\[
\|\Pi_h w\|_{W^{m, \infty}(\tau_h)} \leq \frac{C_m}{h^{1/2 + m/2}} \|\Pi_h w\|_{L^2(\tau_h)} \leq \frac{C_m}{h^{1/2 + m/2}} \|w\|_{L^2(\tau_h)},
\]
and, by repeatedly using (5.3) we have
\[
\|w\|_{L^2(\tau_h)} \leq C_0 \left( \frac{2 + 2m}{h^{1/2 + 1/2}} \right)^{1/2} \|w\|_{H^{2m+2}(\tau_h)} \leq C_0 \left( \frac{2 + 2m}{h^{1/2 + 1/2}} \right)^{1/2} \|w\|_{H^{2m+2}(\tau_h)}.
\]
Hence we have the proof of (5.5). \( \square \)

For simplifying the notation, we shall denote
\[
g_\gamma := g \circ \gamma, \quad g_\gamma^\varepsilon = g^\varepsilon \circ \gamma.
\]
By definition, \( \Pi_h(g_\gamma^\varepsilon) \in W^{1, \infty}([0, 1]) \). In order to show that \( \Pi_h(g_\gamma^\varepsilon) \) is close to \( g_\gamma \) with respect to appropriate norms, we assume that
\[
(5.6) \quad g_\gamma \in H^4([0, 1]).
\]

**Theorem 5.2.** Let \( \tau_h \in \mathcal{T}_h \) and (5.6) be satisfied. Then, the following inequalities hold.

(i) \( \|\Pi_h g_\gamma^\varepsilon - g_\gamma\|_{L^\infty(\tau_h)} \leq \tilde{C}_0 h^{3/2} \|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0}{C_\gamma h^{3/2}} \|g_\gamma\|_{H^4(\tau_h)} \)
(ii) \( \|\Pi_h g_\gamma^\varepsilon - g_\gamma\|_{W^{1, \infty}(\tau_h)} \leq \tilde{C}_1 h^{1/2} \|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0}{C_\gamma h^{3/2}} \|g_\gamma\|_{H^4(\tau_h)} \)
(iii) \( \|\Pi_h g_\gamma^\varepsilon(\cdot)\|_{L^\infty(\tau_h)} \leq C_0 \|g_\gamma(\cdot)\|_{H^4(\tau_h)} + \frac{C_0}{C_\gamma h^{3/2}} \|g_\gamma(\cdot)\|_{H^4(\tau_h)} \quad \forall \, s \in \tau_h \)
(iv) \( \|\Pi_h g_\gamma^\varepsilon(\cdot)\|_{W^{1, \infty}(\tau_h)} \leq C_0 \|g_\gamma(\cdot)\|_{H^4(\tau_h)} + \frac{C_0}{C_\gamma h^{3/2}} \|g_\gamma(\cdot)\|_{H^4(\tau_h)} \quad \forall \, s \in \tau_h \)

**Proof.** Using triangle inequality we have
\[
(5.7) \quad \|\Pi_h g_\gamma^\varepsilon - g_\gamma\|_{L^\infty(\tau_h)} \leq \|\Pi_h g_\gamma^\varepsilon - \Pi_h g_\gamma\|_{L^\infty(\tau_h)} + \|\Pi_h g_\gamma - g_\gamma\|_{L^\infty(\tau_h)}
\]
and
\[
(5.8) \quad \|\Pi_h g_\gamma^\varepsilon - g_\gamma\|_{W^{1, \infty}(\tau_h)} \leq \|\Pi_h g_\gamma^\varepsilon - \Pi_h g_\gamma\|_{W^{1, \infty}(\tau_h)} + \|\Pi_h g_\gamma - g_\gamma\|_{W^{1, \infty}(\tau_h)}
\]
Assumption (3.9), Lemma 3.3 and (5.1) imply
\[
(5.9) \quad C_\gamma \|g_\gamma^\varepsilon - g_\gamma\|_{L^2(\tau_h)} \leq \|g_\gamma^\varepsilon - g_\gamma\|_{L^2(\tau_h)} \leq \varepsilon
\]
so that, using (5.2) and the fact that \( \Pi_h \) is an orthogonal projection, we have
\[
(5.10) \quad \|\Pi_h g_\gamma^\varepsilon - \Pi_h g_\gamma\|_{L^\infty(\tau_h)} \leq C_0 \frac{1}{h^{1/2}} \|g_\gamma^\varepsilon - g_\gamma\|_{L^2(\tau_h)} \leq \frac{C_0}{C_\gamma h^{1/2}} \varepsilon
\]
and
\begin{equation}
\|\Pi h g_\tau - \Pi h g_\gamma\|_{W^{1,\infty}(\tau_h)} \leq C_1 \frac{1}{\sqrt{h}} \|g_\gamma - g_\tau\|_{L^2(\tau_h)} \leq \frac{C_1'}{C_\gamma} \frac{\varepsilon}{h^{3/2}}.
\end{equation}
By (5.3) and (5.5),
\begin{equation}
\|\Pi h g_\gamma - g_\gamma\|_{L^\infty(\tau_h)} \leq \|\Pi h g_\tau\|_{L^\infty(\tau_h)} + \|g_\gamma\|_{L^\infty(\tau_h)} \leq 2C_0^2 h^{1/2}\|g \circ \gamma\|_{H^2(\tau_h)}
\end{equation}
and, by (5.3), \(\|g \circ \gamma\|_{H^2(\tau_h)} \leq C_0^2 h \|g \circ \gamma\|_{H^4(\tau_h)}\). Hence,
\begin{equation}
\Pi h g_\gamma - g_\gamma\|_{L^\infty(\tau_h)} \leq 2C_0^4 h^{3/2}\|g \circ \gamma\|_{H^4(\tau_h)}.
\end{equation}
Thus, using (5.7), (5.10) and (5.12), and taking \(C_0 = 2C_0^4\), we have (i). By (5.4) and (5.5),
\begin{equation}
\Pi h g_\gamma - g_\gamma\|_{W^{1,\infty}(\tau_h)} \leq \|\Pi h g_\gamma\|_{W^{1,\infty}(\tau_h)} + \|g_\gamma\|_{W^{1,\infty}(\tau_h)} \leq C_0^2 h^{1/2}\|g \circ \gamma\|_{H^4(\tau_h)} + C_0^2 h^{1/2}\|g \circ \gamma\|_{H^4(\tau_h)}.
\end{equation}
Hence, using (5.11) and (5.8), and taking \(C_1 = C_0^4 + C_0^2\) we have (ii).
To prove (iii) and (iv), let \(s \in [0,1]\). Note that
\begin{equation}
|\langle g_\gamma \rangle'(s) - \langle \Pi h g_\gamma \rangle'(s)\|_{W^{1,\infty}(\tau_h)} \leq \|\Pi h g_\gamma\|_{L^\infty(\tau_h)} + \|g_\gamma\|_{W^{1,\infty}(\tau_h)}.
\end{equation}
Using (3.9) and (3.10) the above implies
\begin{equation}
C_0 C_\gamma - \|\Pi h g_\gamma - g_\gamma\|_{W^{1,\infty}(\tau_h)} \leq \|\Pi h g_\gamma\|_{L^\infty(\tau_h)} + \|\Pi h g_\gamma - g_\gamma\|_{W^{1,\infty}(\tau_h)}.
\end{equation}
Hence using (ii) we have (iii) and (iv).

From (iii) and (iv) in Theorem 5.2 we obtain the following corollary.

**Corollary 5.3.** Let \(h\) be such that
\begin{equation}
C_1 h^2 \|g_\gamma\|_{H^4(\tau_h)} + \frac{C_1'}{C_\gamma} \frac{\varepsilon}{h^{3/2}} \leq \frac{C_0 C_\gamma}{2} h^{3/2}.
\end{equation}
Then,
\begin{equation}
C_0 C_\gamma \leq \|\Pi h g_\gamma\|_{L^\infty(\tau_h)} \leq 2C_0 C_\gamma.
\end{equation}

Since \(\langle g_\gamma \rangle' \neq 0\), for any \(\tau_h \in \mathbb{T}_h\), \(g(\gamma(\tau_h)) = [g_0^{h, \varepsilon}, g_1^{h, \varepsilon}]\) for some \(g_0^{h, \varepsilon} < g_1^{h, \varepsilon}\). Let us denote
\begin{equation}
I_h := [g_0^{h, \varepsilon}, g_1^{h, \varepsilon}], \quad I_\varepsilon := \Pi h g_\gamma(\tau_h)].
\end{equation}

**Proposition 5.4.** Let \(h\) and \(\varepsilon\) satisfy (5.2) and (5.3) and
\begin{equation}
C_0 h^2 \|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0'}{C_\gamma} \frac{\varepsilon}{h^{3/2}} < \frac{h^{3/2}}{2}.
\end{equation}
Then, for \(\tau_h \in \mathbb{T}_h\), \(I_h \cap I_\varepsilon^{h, \varepsilon}\) is a closed interval with non-empty interior, say \(\tilde{I}_h^{h, \varepsilon} = [g_0^{h, \varepsilon}, g_1^{h, \varepsilon}]\) for some \(g_0^{h, \varepsilon} < g_1^{h, \varepsilon}\), and
\begin{equation}
|g_0^{h, \varepsilon} - g_1^{h, \varepsilon}| < C_0^2 h^{3/2}\|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0'}{C_\gamma} \frac{\varepsilon}{h^{1/2}}.
\end{equation}
\begin{equation}
|g_1^{h, \varepsilon} - g_2^{h, \varepsilon}| < C_0^2 h^{3/2}\|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0'}{C_\gamma} \frac{\varepsilon}{h^{1/2}}.
\end{equation}

**Proof.** Since \(h\) satisfies (5.13), by Corollary 5.3 \(\Pi h g_\gamma\) satisfies (5.14). Thus \(I_\varepsilon^{h, \varepsilon}\) is a closed non-degenerate interval. So, by Lemma 4.17 taking \(\phi_1 = (g_\gamma)|_{\tau_h}\) and \(\phi_2 = (\Pi h g_\gamma)|_{\tau_h}\), we have the following. \(I_h \cap I_\varepsilon^{h, \varepsilon} = [g_0^{h, \varepsilon}, g_1^{h, \varepsilon}]\) for some \(g_0^{h, \varepsilon} < g_1^{h, \varepsilon}\). Also, since (5.16) is satisfied, we have (5.17).
Let us recall that, in Section \[4\] we have the perturbed operator \(T_3^h\) corresponding to the perturbed data \(g^\varepsilon\). Here, we are working with \(\Pi_h(g_\gamma^\varepsilon)\). Now, let us define the corresponding operator which shall be used in place of \(T_3^\varepsilon\), so that we can carry out the analysis similar to that of Section \[4\]. In order to do that, let us first observe the following.

Let \(h\) and \(\varepsilon\) satisfy \((5.13)\) and \((5.16)\). Then, by Corollary \[5.3\] \(\Pi_h g_\gamma^\varepsilon\) satisfies \((5.14)\). Thus, \(\Pi_h g_\gamma^\varepsilon\) is bijective and, for any \(\tau_h \in T_h\), \((\Pi_h g_\gamma^\varepsilon)^{-1}\) is continuous on \(\tilde{I}_\varepsilon\). Hence, there exists \(t_0^{h,\varepsilon}\) and \(t_1^{h,\varepsilon}\) in \(\tau_h\) such that

\[
(5.19) \quad \tilde{I}_\varepsilon^h = [g_0^{h,\varepsilon}, g_1^{h,\varepsilon}] = \Pi_h g_\gamma^\varepsilon([t_0^{h,\varepsilon}, t_1^{h,\varepsilon}]).
\]

For \(y \in L^2(\tilde{I}_\varepsilon)\), let

\[
S^{h,\varepsilon}(y)(s) = \begin{cases} y(\Pi_h g_\gamma^\varepsilon(s)) & s \in [t_0^{h,\varepsilon}, t_1^{h,\varepsilon}] \\ 0 & s \in \tau_h \setminus [t_0^{h,\varepsilon}, t_1^{h,\varepsilon}] \end{cases}
\]

and let

\[
(5.20) \quad (T_3^{h,\varepsilon} y)(s) = (S^{h,\varepsilon} y)(s) \quad \text{for} \quad s \in \tau_h, \tau_h \in T_h.
\]

We observe that \(T_3^{h,\varepsilon} : L^2(\tilde{I}_\varepsilon) \rightarrow L^2([0, 1])\) is a linear operator. We shall see some of its properties in the next Theorem.

**Theorem 5.5.** Let \(h\) and \(\varepsilon\) satisfy \((5.13)\) and \((5.16)\). Then, the operator \(T_3^{h,\varepsilon} : L^2(\tilde{I}_\varepsilon) \rightarrow L^2([0, 1])\) is bounded linear and bounded below. Further, we have the following.

(i) For \(\zeta \in L^2(\tilde{I}_\varepsilon)\),

\[
(5.21) \quad \|T_3^{h,\varepsilon}(\zeta)\|_{L^2([0, 1])} \leq \sqrt{\frac{2}{C_g C_\gamma}} \|\zeta\|_{L^2(\tilde{I}_\varepsilon)},
\]

\[
(5.22) \quad \sqrt{2C_g C_\gamma} \|T_3^{h,\varepsilon}(\zeta)\|_{L^2([0, 1])} \geq \|\zeta\|_{L^2(\tilde{I}_\varepsilon)},
\]

\[
(5.23) \quad \|(T_3^{h,\varepsilon})^* T_3^{h,\varepsilon}\|^{-1} \leq \sqrt{2C_g C_\gamma},
\]

(ii) For \(\zeta \in W\),

\[
(5.24) \quad \|T_3^{h,\varepsilon}(\zeta_{\tilde{I}_\varepsilon}) - T_0\zeta\|_{L^2([0, 1])} \leq D^{1}_{g,\varepsilon, h} \|\zeta\|_{H^1(I)} + \|\zeta\|_{H^2(I)} D^{2}_{g,\varepsilon, h},
\]

(iii) If \(\zeta \in W \cap H^3(I)\), then

\[
(5.25) \quad \|T_3^{h,\varepsilon}(\zeta_{\tilde{I}_\varepsilon}) - T_0\zeta\|_{L^2([0, 1])} \leq D^{1}_{g,\varepsilon, h} \|\zeta\|_{H^1(I)} + \|\zeta\|_{H^3(I)} D^{3}_{g,\varepsilon, h},
\]

where

\[
D^{1}_{g,\varepsilon, h} = C_I(\tilde{C}_0 \|g \circ \gamma\|_{H^3([0, 1])} h^2 + \frac{\varepsilon}{C_\gamma}),
\]

\[
D^{2}_{g,\varepsilon, h} = 4(C_I)^2 \sqrt{\frac{2}{C_g C_\gamma}} (\tilde{C}_0 h^{3/2} \|g_\gamma\|_{H^4([0, 1])} + \frac{C_0}{C_\gamma} \frac{\varepsilon}{h^{1/2}}),
\]

\[
D^{3}_{g,\varepsilon, h} = 8(C_I)^3 \sqrt{\frac{2}{C_g C_\gamma}} (\tilde{C}_0 h^{3/2} \|g_\gamma\|_{H^4([0, 1])} + \frac{C_0}{C_\gamma} \frac{\varepsilon}{h^{1/2}})^{3/2}.
\]

Here \(C_0, \tilde{C}_0, C'_I, C_g, C'_g, C_\gamma, \) and \(C_\gamma\) are constants as defined in \((5.3)\), Theorem \[5.2\] (ii), \[4.2\], \[5.10\] and \[5.7\] respectively.
Proof. Clearly, \( T^h_3 \) is a linear map. Now,

\[
\| T^h_3(\zeta) \|_{L^2(0,1)}^2 = \sum_{\tau_h \in T_h} \int_{\tau_h} |T^h_3(\zeta)(s)|^2 \, ds = \sum_{\tau_h \in T_h} \int_{t_0^h}^{t_1^h} |\gamma)(\Pi_h g^\tau_\gamma(s))|^2 \, ds.
\]

Since, \( h \) satisfies (5.13), by Corollary 5.3, \( \Pi_h g^\tau_\gamma \) satisfies (5.14). Hence, using Lemma 3.3 we have

\[
\sum_{\tau_h \in T_h} \int_{t_0^h}^{t_1^h} |\gamma)(\Pi_h(g^\tau_\gamma(s))|^2 \, ds \leq \frac{2}{C_y C_\gamma} \sum_{\tau_h \in T_h} \int_{I_h} |\zeta(z)|^2 \, dz = \frac{2}{C_y C_\gamma} \int_{I_h} |\zeta(z)|^2 \, dz
\]

and

\[
\sum_{\tau_h \in T_h} \int_{t_0^h}^{t_1^h} |\zeta)(\Pi_h(g^\tau_\gamma(s))|^2 \, ds \geq \frac{1}{2C_y C_\gamma} \sum_{\tau_h \in T_h} \int_{I_h} |\zeta(z)|^2 \, dz = \frac{1}{2C_y C_\gamma} \int_{I_h} |\zeta(z)|^2 \, dz.
\]

Hence, combining (5.26) and (5.27) we have (5.21), and combining (5.26) and (5.28) we have (5.22). Hence, \( T^h_3 \) is bounded linear and bounded below. Since, \( T^h_3 \) satisfies (5.21) and (5.22), from Lemma 4.3, we obtain (5.23).

Using the fact that \( \Pi_h \) is a projection, and Lemma 3.8 and 3.9, we obtain,

\[
\| \Pi_h g_\gamma - \Pi_h(g^\tau_\gamma) \|_{L^2(0,1)} \leq \| g_\gamma - g^\tau \circ \gamma \|_{L^2(0,1)} \leq \frac{\epsilon}{C_\gamma},
\]

and, using the fact that \( \Pi_h \) is an orthogonal projection, and (5.5),

\[
\| g_\gamma - \Pi_h g_\gamma \|_{L^2(0,1)} = \sum_{\tau_h \in T_h} \| g_\gamma - \Pi_h g_\gamma \|_{L^2(\tau_h)} \leq \sum_{\tau_h \in T_h} \| g_\gamma \|_{L^2(\tau_h)} \leq h^2(C_0)^4 \sum_{\tau_h \in T_h} \| g_\gamma \|_{H^1(\tau_h)} \leq 2(C_0)^4 h^2 \| g_\gamma \|_{H^1(0,1)}
\]

Taking \( \tilde{C}_0 = 2(C_0)^4 \), (5.29) and (5.30) imply

\[
\| g_\gamma - \Pi h g^\tau_\gamma \|_{L^2(0,1)} \leq h^2 \tilde{C}_0 \| g_\gamma \|_{H^1(0,1)} + \frac{\epsilon}{C_\gamma}.
\]

Now, \( \zeta \in \mathcal{W} \) implies \( \zeta|_{J_h} \in H^2(J_h) \). Hence, taking \( \phi_1 \) and \( \phi_2 \) as \( g \circ \gamma|_{\tau_h} \) and \( \Pi_h g^\tau_\gamma|_{\tau_h} \) respectively, in the first part of Lemma 4.41 and (5.31), and (5.42), we have,

\[
\| T^h_3(\zeta|_{J_h}) - T_3 \zeta \|_{L^2(J_h \cap T_h, t_0^h, t_1^h)}^2 = \sum_{\tau_h \in T_h} \| \zeta \circ g_\gamma - \zeta \circ \Pi_h(g^\tau_\gamma) \|_{L^2(J_h \cap \tau_h)}^2 \leq \left( h^2 \tilde{C}_0 \| g_\gamma \|_{H^1(0,1)} + \frac{\epsilon}{C_\gamma} \right)^2 \sum_{\tau_h \in T_h} \| \zeta' \|_{L^\infty(g(\gamma(\tau_h)))}^2
\]

\[
\leq \left( C_1 \right)^2 \left( h^2 \tilde{C}_0 \| g_\gamma \|_{H^1(0,1)} + \frac{\epsilon}{C_\gamma} \right)^2 \sum_{\tau_h \in T_h} \| \zeta' \|_{H^1(g(\gamma(\tau_h)))}^2
\]

\[
\leq \left( C_1 \right)^2 \left( h^2 \tilde{C}_0 \| g_\gamma \|_{H^1(0,1)} + \frac{\epsilon}{C_\gamma} \right)^2 \| \zeta' \|_{H^1(I)}^2
\]

Hence,

\[
\| T^h_3(\zeta|_{J_h}) - T_3 \zeta \|_{L^2(J_h \cap T_h, t_0^h, t_1^h)} \leq C_1 \left( h^2 \tilde{C}_0 \| g \circ \gamma \|_{H^1(0,1)} + \frac{\epsilon}{C_\gamma} \right) \| \zeta' \|_{H^1(I)}.
\]
Since $g' \geq 0$, we have $g(\gamma([h_0, t_0 \gamma], [t_0, t_1 \gamma])) = [g_{h_0}^\gamma, g_1^\gamma] \subset I_h$ for some $g_0 \leq g_1$. As $h$ and $\varepsilon$ satisfy (5.13) and (5.10), taking $\phi_1 = (g \circ \gamma)([h_0, t_0 \gamma], [t_0, t_1 \gamma])$ and $\phi_2 = \Pi_c g(\gamma(\cdot, t_1 \gamma))$ in Lemma 3.17, we have,

$$|g_0^h - g_0^\gamma| < \tilde{C} h^{3/2} \|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0'}{C_7} h^{1/2},$$

$$|g_1^h - g_1^\gamma| < \tilde{C} h^{3/2} \|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0'}{C_7} h^{1/2}.$$

Hence,

$$|g_0^h - g_0^\gamma| < 2\tilde{C} h^{3/2} \|g_\gamma\|_{H^4(\tau_h)} + \frac{2C_0'}{C_7} h^{1/2},$$

(5.33)

$$|g_1^h - g_1^\gamma| < 2\tilde{C} h^{3/2} \|g_\gamma\|_{H^4(\tau_h)} + \frac{2C_0'}{C_7} h^{1/2},$$

(5.34)

Since (3.3) and (3.10) hold, by Lemma 3.3,

$$\|\zeta \circ g_\gamma\|_{L^2([0,1] \setminus \cup_{\tau_h \in \tau_h} [t_0^h, t_1^h \gamma]))^2} = \int_{[0,1] \setminus \cup_{\tau_h \in \tau_h} (t_0^h, t_1^h \gamma))} \left| \zeta(g(\gamma(s))) \right|^2 ds \leq \frac{2}{C_7 g} \int_{\cup_{\tau_h \in \tau_h} (t_0^h, t_1^h \gamma))} \left| \zeta(z) \right|^2 dz \leq \frac{2}{C_7 g} \sum_{\tau_h \in \tau_h} \int_{[t_0^h, t_1^h \gamma)} \left| \zeta(z) \right|^2 dz \leq \frac{2}{C_7 g} \sum_{\tau_h \in \tau_h} \left[ \int_{g_0^h}^{g_1^h} \left| \zeta(z) \right|^2 dz + \int_{g_1^h}^{g_0^h} \left| \zeta(z) \right|^2 dz \right].$$

Hence,

$$\|\zeta \circ g_\gamma\|_{L^2([0,1] \setminus \cup_{\tau_h \in \tau_h} [t_0^h, t_1^h \gamma))}^2} \leq \frac{2}{C_7 g} \sum_{\tau_h \in \tau_h} \left[ \int_{g_0^h}^{g_1^h} \left| \zeta(z) \right|^2 dz + \int_{g_1^h}^{g_0^h} \left| \zeta(z) \right|^2 dz \right].$$

(5.35)

Now, by (4.32), $\zeta \in \mathcal{W}$ implies $\zeta \in W^{1,\infty}(I)$. Hence, as (5.33) and (5.34) hold, by Lemma 4.26 (i) and then by (4.32), we have

$$\int_{g_0^h}^{g_1^h} \left| \zeta(z) \right|^2 dz \leq (C_7 g)^2 \left( \tilde{C} h^{3/2} \|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0'}{C_7} h^{1/2} \right)^2 \|\zeta\|_{W^{1,\infty}(g_0^h, g_1^h)}^2 \leq 16(C_7 g)^4 \left( \tilde{C} h^{3/2} \|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0'}{C_7} h^{1/2} \right)^2 \|\zeta\|_{H^2(g_0^h, g_1^h)}^2,$$

and similarly,

$$\int_{g_1^h}^{g_0^h} \left| \zeta(z) \right|^2 dz \leq 16(C_7 g)^4 \left( \tilde{C} h^{3/2} \|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0'}{C_7} h^{1/2} \right)^2 \|\zeta\|_{H^2(g_0^h, g_1^h)}^2.$$

Thus, from (5.35) we have (5.24).

If $\zeta \in H^3(I)$, then, since (5.33) and (5.34) hold, by Lemma 4.26 (ii) and then by (4.32),

$$\int_{g_0^h}^{g_1^h} \left| \zeta(z) \right|^2 dz \leq 32(C_7 g)^4 \left( \tilde{C} h^{3/2} \|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0'}{C_7} h^{1/2} \right)^3 \|\zeta\|_{W^{2,\infty}(g_0^h, g_1^h)}^3 \leq 64(C_7 g)^6 \left( \tilde{C} h^{3/2} \|g_\gamma\|_{H^4(\tau_h)} + \frac{C_0'}{C_7} h^{1/2} \right)^3 \|\zeta\|_{H^3(g_0^h, g_1^h)}^3,$$
and, similarly,
\[ \int_{g_h^* \epsilon} |z(z)|^2 \, dz \leq 64(C_I)^6 \left( C_0 h^{3/2} \|g_h\| H^1(\tau_h) + \frac{C_0'}{C_\gamma h^{1/2}} \right)^3 \|g_h\|^2 _{H^3([\gamma_h^*, \gamma_h^{*,*}])}. \]

Thus, from (5.35) we have (5.25). \[ \square \]

Let \( \tilde{z}_{\eta, \delta, h} \in L^2(\tilde{I}_\epsilon) \) be the unique solution of the equation
\[ (5.36) \quad T_3^{h, \epsilon} f |T_3^{h, \epsilon} (\zeta) = T_3^{h, \epsilon} f s, \]
that is \( \tilde{z}_{\eta, \delta, h} := (T_3^{h, \epsilon})^* f s \). Now, let \( \zeta_{\eta, \delta, h} = \begin{cases} \tilde{z}_{\eta, \delta, h} & \text{on } \tilde{I}_\epsilon, \\ 0 & \text{on } I \setminus \tilde{I}_\epsilon. \end{cases} \)
Then, \( \zeta_{\eta, \delta, h} \in L^2(I) \). Let \( b_{\alpha, \eta, \delta, h} \) be the solution of the equation
\[ (5.37) \quad (T_3^{h, \epsilon})^* (T_3^{h, \epsilon}) (w) = (T_3^{h, \epsilon})^* \zeta_{\eta, \delta, h}. \]
We show that \( a_{\alpha, \eta, \delta, h} := b_{\alpha, \eta, \delta, h} \) is an approximate solution of (3.1). For this purpose, we shall make use of the following proposition.

**Proposition 5.6.** Let \( a_0 \) and \( g \) be as defined in Lemma 4.25. Let \( h \) and \( \epsilon \) satisfy the relations in (5.13) and (5.10). Let \( g^\epsilon \in L^2(I) \) be such that (5.1) is satisfied. Then, \( b_0 = T_1(a_0) \) satisfies,
\[ (5.38) \quad \|b_0\|_{L^2(I \setminus \tilde{I}_\epsilon)} \leq \|b_0\|_{H^2(I)} (C_I)^2 \left( C_0 h^{3/2} \|g_h\| H^1([0,1]) + \frac{C_0'}{C_\gamma h^{1/2}} \right), \]
and, in addition, if \( a_0 \in H^2(I) \), then,
\[ (5.39) \quad \|b_0\|_{L^2(I \setminus \tilde{I}_\epsilon)} \leq \|b_0\|_{H^2(I)} (C_I)^3 \left( C_0 h^{3/2} \|g_h\| H^1([0,1]) + \frac{C_0'}{C_\gamma h^{1/2}} \right)^{3/2}, \]

**Proof.** Since, \( h \) and \( \epsilon \) satisfy (5.13), for any \( \tau_h \in T_h \), as (5.11) holds, by Lemma 4.20 (i) and then by (4.42), we have
\[ \|b_0\|_{L^2(I \setminus \tilde{I}_\epsilon)} \leq C_I \|b_0\|_{W^{1, \infty}(I_h)} \left( C_0 h^{3/2} \|g_h\| H^1(\tau_h) + \frac{C_0'}{C_\gamma h^{1/2}} \right) \leq (C_I)^2 \|b_0\|_{H^2(I_h)} \left( C_0 h^{3/2} \|g_h\| H^1(\tau_h) + \frac{C_0'}{C_\gamma h^{1/2}} \right), \]
and, if \( a_0 \in H^2(I) \), \( b_0 \in H^2(I) \) and so, by Lemma 4.20 (ii) and then by (4.42),
\[ \|b_0\|_{L^2(I \setminus \tilde{I}_\epsilon)} \leq 2(C_I)^3 \|b_0\|_{W^{2, \infty}(I_h)} \left( C_0 h^{3/2} \|g_h\| H^1(\tau_h) + \frac{C_0'}{C_\gamma h^{1/2}} \right)^{3/2} \leq 2(C_I)^3 \|b_0\|_{H^2(I_h)} \left( C_0 h^{3/2} \|g_h\| H^1(\tau_h) + \frac{C_0'}{C_\gamma h^{1/2}} \right)^{3/2}. \]
Since \( \|b_0\|_{L^2(I \setminus \tilde{I}_\epsilon)} = \sum_{\tau_h \in T_h} \|b_0\|_{L^2(I \setminus \tilde{I}_\epsilon)} \), the required inequalities follow. \[ \square \]

**Theorem 5.7.** Let \( a_0 \), \( g \) and \( j \) be as in Lemma 4.25. Let \( g^\epsilon \in L^2(I) \), \( j^\delta \in W^{1-1/p, p}(\partial \Omega) \) with \( p > 3 \).
Also, let \( g^\epsilon \) and \( j^\delta \) satisfy (5.1) and (4.20), respectively, and \( h \) and \( \epsilon \) satisfy the relations in (5.10) and (5.13), and \( a_{\alpha, \eta, \delta, h} = b_{\alpha, \eta, \delta, h} \). Then the following results hold.
(i) With the original assumption that \( a_0 \in H^1(I) \),

\[
\| a_0 - a_{\alpha, \epsilon, \delta, h} \|_{H^1(I)} \leq C_\alpha + \frac{2}{\alpha} \| b_0 \|_{H^2(I)} (C_1^2 C_{g, \epsilon, h})
\]

\[
+ \frac{2}{\alpha} \sqrt{C_\gamma^2 C_\delta^2} \| D_{g, \epsilon, h} \|_{H^1(I)} + \| b_0 \|_{H^2(I)} + \tilde{C}_\gamma \delta,
\]

(5.40)

\[
\| a_0 - a_{\alpha, \epsilon, \delta, h} \|_{L^2(I)} \leq \sqrt{\alpha} \| a_0' \|_{L^2(I)} + \frac{2}{\sqrt{\alpha}} \| b_0 \|_{H^2(I)} (C_1^2 C_{g, \epsilon, h})
\]

\[
+ \frac{2}{\sqrt{\alpha}} \sqrt{C_\gamma^2 C_\delta^2} \| D_{g, \epsilon, h} \|_{H^1(I)} + \| b_0 \|_{H^2(I)} + \tilde{C}_\gamma \delta,
\]

(5.41)

where \( C_\alpha > 0 \) is such that \( C_\alpha \to 0 \) as \( \alpha \to 0 \).

(ii) If \( a_0 \in H^2(I) \), then,

\[
\| a_0 - a_{\alpha, \epsilon, \delta, h} \|_{L^2(I)} \leq \sqrt{\alpha} \| a_0' \|_{L^2(I)} + \frac{2}{\sqrt{\alpha}} \| b_0 \|_{H^2(I)} (C_1^3 (C_{g, \epsilon, h})^{3/2})
\]

\[
+ \frac{2}{\sqrt{\alpha}} \sqrt{C_\gamma^2 C_\delta^2} \| D_{g, \epsilon, h} \|_{H^1(I)} + \| b_0 \|_{H^2(I)} + \tilde{C}_\gamma \delta,
\]

(5.42)

where \( C_\alpha > 0 \) is such that \( C_\alpha \to 0 \) as \( \alpha \to 0 \).

(iii) If \( a_0 \in H^3(I) \), then

\[
\| a_0 - a_{\alpha, \epsilon, \delta, h} \|_{H^1(I)} \leq (1 + C_L) \| a_0' \|_{H^2(I)} \alpha + \frac{2}{\alpha} \| b_0 \|_{H^2(I)} (C_1^3 (C_{g, \epsilon, h})^{3/2})
\]

\[
+ \frac{2}{\alpha} \sqrt{C_\gamma^2 C_\delta^2} \| D_{g, \epsilon, h} \|_{H^1(I)} + \| b_0 \|_{H^2(I)} + \tilde{C}_\gamma \delta,
\]

(5.43)

\[
\| a_0 - a_{\alpha, \epsilon, \delta, h} \|_{L^2(I)} \leq (1 + C_L) \| a_0' \|_{H^2(I)} \alpha + \frac{2}{\sqrt{\alpha}} \| b_0 \|_{H^2(I)} (C_1^3 (C_{g, \epsilon, h})^{3/2})
\]

\[
+ \frac{2}{\sqrt{\alpha}} \sqrt{C_\gamma^2 C_\delta^2} \| D_{g, \epsilon, h} \|_{H^1(I)} + \| b_0 \|_{H^2(I)} + \tilde{C}_\gamma \delta.
\]

(5.44)

Here, \( b_0 = T_1(a_0) \),

\[
C_{g, \epsilon, h} = (\tilde{C}_0 h^{1/2} \| g \|_{H^2([0,1])} + \frac{C_0'}{C_\gamma h^{1/2}})
\]

\[
D_{g, \epsilon, h} = C_L (\tilde{C}_0 \| g \circ \gamma \|_{H^2([0,1])}) h^2 + \frac{C_0'}{C_\gamma h^{1/2}}
\]

\[
D_{g, \epsilon, h}^2 = 4(C_1^2) \left( \frac{1}{C_g C_\gamma} (\tilde{C}_0 h^{1/2} \| g \|_{H^2([0,1])} + \frac{C_0'}{C_\gamma h^{1/2}}) \right)
\]

\[
D_{g, \epsilon, h}^3 = 8(C_1^3) \left( \frac{1}{C_g C_\gamma^2} (\tilde{C}_0 h^{1/2} \| g \|_{H^2([0,1])} + \frac{C_0'}{C_\gamma h^{1/2}})^{3/2} \right)
\]

and \( C_0, C_L, \tilde{C}_0, C_0', C_1, C_1', C_g, C_g', C_\gamma, C_\gamma' \) are constants as defined in \( (5.9) \), Proposition \( 4.1 \), Theorem \( 5.2 \), Proposition \( 4.2 \), Theorem \( 5.3 \), \( 3.10 \) and \( 3.9 \) respectively.

Proof. By definition of \( \zeta_{\epsilon, \delta, h} \),

\[
\| \zeta_{\epsilon, \delta, h} - b_0 \|_{L^2(I)} \leq \| \zeta_{\epsilon, \delta, h} - b_0 \|_{L^2(\bar{I}_0)} + \| b_0 \|_{L^2(1 \setminus \bar{I}_0)}
\]

(5.45)
We use the notation \((T_3^{h,\varepsilon})^\dagger := ((T_3^{h,\varepsilon})^*)^{-1} (T_3^{h,\varepsilon})^*\). Then, by (5.23), and using the fact that \((T_3^{h,\varepsilon})^\dagger (T_3^{h,\varepsilon})^*\) is identity, we have
\[
\left\| (T_3^{h,\varepsilon})^\dagger(T_3(T_2(b_0)) - (T_2(b_0))) \right\|_{L^2(I_\varepsilon)} \leq \sqrt{2C_g^\iota C_{\gamma}} \| (T_3(T_2(b_0)) - (T_3^{h,\varepsilon})(T_2(b_0))) \|_{L^2([0,1])},
\]
and, in addition, using (4.33),
\[
(5.46) \quad \left\| (T_3^{h,\varepsilon})^\dagger(f^3 - f_\delta^3) \right\|_{L^2(I)} \leq \sqrt{2C_g^\iota C_{\gamma}} \| f^3 - f_\delta^3 \|_{L^2([0,1])} \leq \sqrt{2C_g^\iota C_{\gamma}} \delta.
\]
Also, since \(a_0(\eta_1) = 0\) we have \(b_0 = T_1(a_0) \in W\), so that, by (5.24) and (5.25),
\[
(5.47) \quad \left\| (T_3^{h,\varepsilon})^\dagger(T_3(T_2(b_0)) - (T_2(b_0))) \right\|_{L^2(I_\varepsilon)} \leq \sqrt{2C_g^\iota C_{\gamma}} \left\| \frac{1}{g_{\varepsilon,h,b_0}} \frac{b_0'}{H^1(I)} + D_{g,\varepsilon,h,b_0} \right\|,
\]
where,
\[
D_{g,\varepsilon,h,b_0} := \left\{ \begin{array}{ll} D_{g,\varepsilon,h}^2 \|b_0\|_{H^2(I)} & \text{if } b_0 \in W, \\ D_{g,\varepsilon,h}^3 \|b_0\|_{H^3(I)} & \text{if } b_0 \in H^3(I) \cap W. \end{array} \right.
\]
Now, by the definition of \(\tilde{\zeta}_{\varepsilon,\delta,h}\) and the fact that \(T_3(T_2(b_0)) = f^3\), we have
\[
\left\| \tilde{\zeta}_{\varepsilon,\delta,h} - b_0 \right\|_{L^2(I_\varepsilon)} \leq \left\| (T_3^{h,\varepsilon})^\dagger f^3 - (T_2(b_0)) \right\|_{L^2(I_\varepsilon)} \leq \left\| (T_3^{h,\varepsilon})^\dagger(T_3(T_2(b_0)) - (T_2(b_0))) \right\|_{L^2(I_\varepsilon)} + \left\| (T_3^{h,\varepsilon})^\dagger(f^3 - f_\delta^3) \right\|_{L^2(I)}
\]
Hence, from (5.47) and (5.46) we have
\[
(5.48) \quad \left\| \tilde{\zeta}_{\varepsilon,\delta,h} - b_0 \right\|_{L^2(I_\varepsilon)} \leq \sqrt{2C_g^\iota C_{\gamma}} \left\| \frac{1}{g_{\varepsilon,h}} \frac{b_0'}{H^1(I)} + D_{g,\varepsilon,h,b_0} + \hat{C}_\gamma \right\|.
\]
Thus, from (5.45), (5.38) and (5.48) we have
\[
\left\| \zeta_{\varepsilon,\delta,h} - b_0 \right\|_{L^2(I)} \leq \left\| b_0 \right\|_{H^2(I)} (C_1)^2 \left( \tilde{C}_0 \| g \circ \gamma \|_{H^4([0,1])} H^2 \right) + \frac{\varepsilon}{C_{\gamma}} \\
+ \sqrt{2C_g^\iota C_{\gamma}} \left\| \frac{1}{g_{\varepsilon,h}} \frac{b_0'}{H^1(I)} + D_{g,\varepsilon,h}^2 \|b_0\|_{H^2(I)} + \hat{C}_\gamma \right\|.
\]
If \(a_0 \in H^2(I)\) then \(b_0 \in H^3(I)\), and thus from (5.45), (5.39) and (5.48) we have,
\[
\left\| \zeta_{\varepsilon,\delta,h} - b_0 \right\|_{L^2(I)} \leq \left\| b_0 \right\|_{H^3(I)} (C_1)^3 \left( \tilde{C}_0 \| g \circ \gamma \|_{H^4([0,1])} H^2 \right) + \frac{\varepsilon}{C_{\gamma}} \right\|^{3/2} \\
+ \sqrt{2C_g^\iota C_{\gamma}} \left\| \frac{1}{g_{\varepsilon,h}} \frac{b_0'}{H^1(I)} + D_{g,\varepsilon,h}^3 \|b_0\|_{H^2(I)} + \hat{C}_\gamma \right\|.
\]
Our aim is to find an estimate for the error term \((a_0 - a_{\varepsilon,\delta,h})\) in \(L^2(I)\) and \(H^1(I)\) norms. Now \(b_{\varepsilon,\delta,h}\) is the unique solution of equation (5.37). Thus, by Lemma 4.25 we need an estimate of \(\| \zeta_{\varepsilon,\delta,h} - b_0 \|_{L^2(I)}\) in order to find our required estimates. Inequalities (5.49) and (5.49) give us estimates of \(\| \zeta_{\varepsilon,\delta,h} - b_0 \|_{L^2(I)}\) under different conditions on \(b_0\). Hence, taking \(\zeta_{\varepsilon,\delta,h}\) in place of \(\zeta\) in Lemma 4.25 we have the proof.

\[\square\]

**Remark 5.8.** Suppose
\[
2\varepsilon^{1/4} < \min \left\{ \left( \frac{C_{\gamma} C_g}{\tilde{C}_1 \| g \circ \gamma \|_{H^4([0,1])} + \frac{C_F^1}{C_{\gamma}} \right)^{1/2}, \quad \frac{1}{C_0 \| g \circ \gamma \|_{H^4([0,1])} + \frac{C_F}{C_{\gamma}}} \right\}.
\]
Then, for \(\varepsilon = \delta\) and \(h = \delta^{1/2}\), (5.16) and (5.13) are satisfied. Hence, by Theorem 5.7 we have the following:
(1) Choosing \( \alpha = \sqrt{\delta} \), we have
\[
\| a_0 - a_{\alpha,\varepsilon,\delta,h} \|_{H^1(I)} = o(1).
\]

(2) If \( a_0 \in H^3(I) \) and \( \alpha = \delta^{2/3} \), then
\[
\| a_0 - a_{\alpha,\varepsilon,\delta,h} \|_{H^1(I)} = O(\sqrt{\delta}),
\]
\[
\| a_0 - a_{\alpha,\varepsilon,\delta,h} \|_{L^2(I)} = O(\delta^{2/3}).
\]

(3) Choosing \( \alpha = \delta \), we have
\[
\| a_0 - a_{\alpha,\varepsilon,\delta,h} \|_{L^2(I)} = O(\delta^{1/4}).
\]

(4) If \( a_0 \in H^2(I) \), then
\[
\| a_0 - a_{\alpha,\varepsilon,\delta,h} \|_{L^2(I)} = O(\delta^{1/2}).
\]

Results in (1) and (2) above are analogous to the corresponding results for \( a_0 - a_{\alpha,\varepsilon,\delta} \) in Remark 4.27. The estimate in (4) is the same as the corresponding estimate in Remark 4.27, except for the fact that here we need an additional condition that \( a_0 \in H^2(I) \).

\[\diamondsuit\]

6. With exact solution having non-zero value at \( g_1 \)

In the previous two sections we have considered the exact solution with assumption that \( a_0(g_1) = 0 \). Here we consider the case when \( a_0(g_1) \neq 0 \) but is assumed to be known. Let \( a_0(g_1) = c \). Since \( a_0 \) is the solution to Problem (P), by (3.1) we have
\[
f^j = T(a_0)
\]
which implies
\[
(6.1) \quad f^j = T(a_0 - c + c) = T(a_0 - c) + cT(1)
\]
Now by definition of \( T \) we have
\[
(6.2) \quad T(1)(s) = \int_{g_0}^{g \circ \gamma(s)} dt = g \circ \gamma(s) - g_0, \quad s \in [0, 1].
\]
Thus, combining (6.1) and (6.2) we have
\[
(6.3) \quad T(a_0 - c) = f^j - c(g_\gamma - g_0)
\]
Hence \( a_0 - c \) is the solution of the following operator equation,
\[
(6.4) \quad T(a) = f^j - c(g_\gamma - g_0),
\]
where clearly \( f^j - c(g_\gamma - g_0) \in L^2([0, 1]) \). Also, \( (a_0 - c)(g_1) = 0 \). Now, let us define
\[
b_{0,c}(x) = \int_{g_0}^{x} (a_0(t) - c) dt, \quad x \in I.
\]
Then \( b_{0,c} \in W \). Thus, the analysis of the previous two sections can be applied here to obtain a stable approximate solution of equation (6.4). Let \( a_{c,\alpha} := b'_{c,\alpha} \), where \( b_{c,\alpha} \) is the solution to the following equation.
\[
(6.5) \quad (T_2^\alpha)^* (T_2^\alpha)(w) = (T_2^\alpha)^* \zeta_c,
\]
where $\zeta_c$ is the solution of the equation

$$T_3 \zeta = (f^l - c(g_\gamma - g_0)). \tag{6.6}$$

Now, let $g^c$ and $j^b$ be the perturbed data as defined in Theorem $5.7$. Also, let $g$ be such that $g \circ \gamma \in H^4([0,1])$. Let $\tilde{\zeta}_{c,\varepsilon,\delta,h}$ be the solution of the following equation

$$T_3^{h,\varepsilon,\delta}(T_3^{h,\varepsilon,\delta})^*(\zeta) = T_3^{h,\varepsilon,\delta}(\tilde{f}^{j^b} - c(P_h(g^c) - g_0)), \tag{6.7}$$

where $\Pi_h(g^c)$ is as defined in Section $3$. Now, $\zeta_{c,\varepsilon,\delta,h}$ defined as, $\tilde{\zeta}_{c,\varepsilon,\delta,h}$ on $\tilde{I}_\varepsilon$ and 0 on $I \setminus \tilde{I}_\varepsilon$, is in $L^2(I)$. Let $b_{c,\varepsilon,\delta,h}$ be the solution of the following equation

$$\left(T_2^{c,\varepsilon,\delta,h}\right)^*(T_2^{c,\varepsilon,\delta,h})(w) = \left(T_2^{c,\varepsilon,\delta,h}\right)^*(\zeta_{c,\varepsilon,\delta,h}) \tag{6.8}$$

Then we have the following theorem.

**Theorem 6.1.** Let $a_0$, $c$ and $b_{0,c}$ be as defined in the beginning of the section. Let $g$ and $j$ be as defined in Lemma $4.25$ and $g \circ \gamma \in H^4([0,1])$. Let $h$ and $\varepsilon$ satisfy $5.13$ and $5.16$. Also, let $g^c \in L^2(\Gamma)$, $j^b \in W^{1-1/p,p}(\partial\Omega)$ with $p > 3$, and $g^c$ and $j^b$ satisfy $5.7$ and $4.26$ respectively. Let $a_{c,\varepsilon,\delta,h} := b_{c,\varepsilon,\delta,h}$. Let

$$\mathcal{H}(c, \varepsilon, \delta, h) := \sqrt{C_g c_{\gamma} \left( D_{g,\varepsilon,\delta}^1 \| b_{0,c} \|_{H^1(I)} + D_{g,\varepsilon,\delta, b_{0,c}} + \tilde{C}_j \delta + c D_{g,\varepsilon,\delta}^1 \right)},$$

where

$$D_{g,\varepsilon,\delta, b_{0,c}} = \left\{ \begin{array}{ll}
4(C_1)^2 \sqrt{\frac{2}{1 - \varepsilon}} (\tilde{C}_0 h^{3/2} \| g_\gamma \|_{H^4(\gamma_n)} + \frac{C_{\gamma}}{C_{\gamma} \delta + \varepsilon}) & \text{if } b_{0,c} \in \mathcal{W}, \\
8(C_1)^3 \sqrt{\frac{1}{1 - \varepsilon}} (\tilde{C}_0 h^{3/2} \| g_\gamma \|_{H^4(\gamma_n)} + \frac{C_{\gamma}}{C_{\gamma} \delta + \varepsilon})^{3/2} & \text{if } b_{0,c} \in H^3(I) \cap \mathcal{W}.
\end{array} \right.$$
Proof. By definition of \( \zeta_{c, \varepsilon, \delta, h} \),

\[
(6.14) \quad \| \zeta_{c, \varepsilon, \delta, h} - b_{0, c} \|_{L^2(I)} \leq \| \tilde{\zeta}_{c, \varepsilon, \delta, h} - b_{0, c} \|_{L^2(I)} + \| b_{0, c} \|_{L^2(I)}.
\]

Here also we use the notation \((T_3^h)\) := \((T_3^{h, \varepsilon}) \) \( T_3^{h, \varepsilon} \) \( T_3^{h, \varepsilon} \). By (5.23),

\[
\|(T_3^h)_{T_3(T_2(b_0, c))} - (T_2(b_0, c)) \|_{L^2(I)} \leq \sqrt{2 C_0^\gamma C_1^\gamma \| T_3(T_2(b_0, c)) - T_3^{h, \varepsilon} ((T_2(b_0, c)) \|_{L^2([0,1])}},
\]

and

\[
\|(T_3^h)_{T_3(T_2(b_0, c))} - (T_2(b_0, c)) \|_{L^2(I)} \leq \sqrt{2 C_0^\gamma C_1^\gamma \| f - f^\varepsilon \|_{L^2([0,1])}}.
\]

Hence, by (5.33) and (5.31),

\[
(6.15) \quad \|(T_3^h)_{T_3(T_2(b_0, c))} - (T_2(b_0, c)) \|_{L^2(I)} \leq \sqrt{2 C_0^\gamma C_1^\gamma (C_2^\gamma + cD_1^\gamma, \varepsilon, h)},
\]

and, as \( a_0(g_1) = 0 \) we have \( b_0 = T_1(a_0) \in W \) and so, by (5.24) and (5.25)

\[
(6.16) \quad \|(T_3^h)_{T_3(T_2(b_0, c))} - (T_2(b_0, c)) \|_{L^2(I)} \leq \sqrt{2 C_0^\gamma C_1^\gamma (D_1^\gamma, \varepsilon, h, b_0, c) \| H^2(I)} + D_2^\gamma, \varepsilon, h, b_0, c].
\]

Now by definition of \( \tilde{\zeta}_{c, \varepsilon, \delta, h} \) and the fact that \( T_3(T_2(b_0, c)) = f^\varepsilon - c(g_\gamma - g_0) \), we have

\[
\| \tilde{\zeta}_{c, \varepsilon, \delta, h} - b_{0, c} \|_{L^2(I)} \leq \|(T_3^h)_{T_3(T_2(b_0, c))} - (T_2(b_0, c)) \|_{L^2(I)} \leq \sqrt{2 C_0^\gamma C_1^\gamma (D_1^\gamma, \varepsilon, h, b_0, c) \| H^2(I)} + D_2^\gamma, \varepsilon, h, b_0, c].
\]

Hence, from (6.16) and (6.15) we have

\[
(6.17) \quad \| \tilde{\zeta}_{c, \varepsilon, \delta, h} - b_{0, c} \|_{L^2(I)} \leq \sqrt{2 C_0^\gamma C_1^\gamma (D_1^\gamma, \varepsilon, h, b_0, c) \| H^2(I)} + D_2^\gamma, \varepsilon, h, b_0, c] + \tilde{C}_1^\gamma + cD_1^\gamma, \varepsilon, h, b_0, c].
\]

Thus, from (6.14), (5.38) and (6.17) we have

\[
(6.18) \quad \| \zeta_{c, \varepsilon, \delta, h} - b_{0, c} \|_{L^2(I)} \leq \| b_{0, c} \|_{H^2(I)} (C_1^3) 2 \left( \tilde{C}_0^\gamma (g_\varepsilon \gamma H^2([0,1]))^2 + \left( \varepsilon \right)^{3/2} \right) + H^2(I, \varepsilon, h).
\]

If \( a_{0, c} \in L^2(I) \), from (6.14), (5.39) and (6.17) we have,

\[
(6.19) \quad \| \zeta_{c, \varepsilon, \delta, h} - b_{0, c} \|_{L^2(I)} \leq \| b_{0, c} \|_{H^2(I)} (C_1^3) \left( \tilde{C}_0^\gamma (g_\varepsilon \gamma H^2([0,1]))^2 + \left( \varepsilon \right)^{3/2} \right) + H^2(I, \varepsilon, h).
\]

By definition, \( b_{0, c, \varepsilon, \delta, h} \) is the unique solution of equation (6.8). Also, \( a_{0, c} \in H^2(I) \cap W \) implies \( b_{0, c} \in H^3(I) \cap W \). Thus, putting \( \zeta_{c, \varepsilon, \delta, h} \) in place of \( \zeta \) in Lemma 4.25, we have the proof using (5.49) and (6.19). □
Let us note that \( a_0 - (a_{c,a,\varepsilon,\delta,h} + c) = (a_0 - c) - a_{c,a,\varepsilon,\delta,h} \). Thus from Theorem 6.1 \((a_{c,a,\varepsilon,\delta,h} + c)\) is a stable approximate solution of Problem \((P)\), with error estimates obtained from Theorem 6.1.

**Remark 6.2.** Let us relax the assumption on the exact solution \( a_0 \) even more. Let us assume that \( a_0(g_1) \) is not equal to the known number \( c \) but is known to be “close” to it, i.e,

\[
|a_0(g_1) - c| < \eta,
\]

for some \( \eta > 0 \). Let \( c_0 := a_0(g_1) \). Define \( b_{0,c_0}(x) = \int_0^x (a_0(t) - c_0) dt \) for \( x \in I \). Then \( b_{0,c_0} \in W \). Also, let \( g, j, g^\varepsilon, j^\delta, h, \zeta_{c,\varepsilon,\delta,h}, b_{c,a,\varepsilon,\delta,h} \) and \( a_{c,a,\varepsilon,\delta,h} \) be as defined in Theorem 6.1. Since (6.20) holds,

\[
\|(f^j - f^j)^\varepsilon - (c - c_0)(g_\gamma + g_0) - c(g \circ \gamma - \Pi_h g_\gamma^\varepsilon)\|_{L^2(I^\varepsilon)} \leq \|f^j - f^j\|_{L^2([0,1])} + c\|g \circ \gamma - \Pi_h g_\gamma^\varepsilon\|_{L^2([0,1])} + (\|g \circ \gamma\|_{L^2([0,1])} + |g_0|)\eta
\]

and, by (4.33) and (5.31),

\[
\|(f^j - f^j)^\varepsilon - (c - c_0)(g_\gamma + g_0) - c(g \circ \gamma - \Pi_h g_\gamma^\varepsilon)\|_{L^2(I^\varepsilon)} \leq C_\delta + a_0(g_1) D^1_{g,\varepsilon,h} + (\|g \circ \gamma\|_{L^2([0,1])} + |g_0|)\eta
\]

with \( D^1_{g,\varepsilon,h} \) as in Theorem 6.1. Now, as \( T_3(T_2(b_{0,c_0})) = f^j - c_0(g_\gamma - g_0) \),

\[
\|\tilde{\zeta}_{c,\varepsilon,\delta,h} - b_{0,c}\|_{L^2(I^\varepsilon)} \leq \|\tilde{\zeta}_{c,\varepsilon,\delta,h} - T_3(b_{0,c})\|_{L^2(I^\varepsilon)} \leq \|(T_3^{h,c})^\varepsilon T_3(b_{0,c}) - a_{c,a,\varepsilon,\delta,h}(g_\gamma + g_0) - c(g \circ \gamma - \Pi_h g_\gamma^\varepsilon)\|_{L^2(I^\varepsilon)} \leq C_\delta + a_0(g_1) D^1_{g,\varepsilon,h} + (\|g \circ \gamma\|_{L^2([0,1])} + |g_0|)\eta
\]

and, by (5.23), (5.24) and (5.25),

\[
\|(T_3^{h,c})^\varepsilon T_3(T_2(b_{0,c})) - (T_2(b_{0,c}))\|_{L^2(I^\varepsilon)} \leq \sqrt{2C_\gamma C_{\delta}^1} D^1_{g,\varepsilon,h} \|b_{0,c}\|_{H^1(I)} + D_{g,\varepsilon,h} \|b_{0,c}\|_{H^1(I)} + \|f^j - f^j\|_{L^2([0,1])} + (\|c - c_0\| + c(g \circ \gamma - \Pi_h g_\gamma^\varepsilon)\|_{L^2([0,1])})
\]

with \( D_{g,\varepsilon,h} \) as in Theorem 6.1. Hence, by (6.21)

\[
\|\tilde{\zeta}_{c,\varepsilon,\delta,h} - b_{0,c}\|_{L^2(I^\varepsilon)} \leq \sqrt{2C_\gamma C_{\delta}^1} D^1_{g,\varepsilon,h} \|b_{0,c}\|_{H^1(I)} + D_{g,\varepsilon,h} \|b_{0,c}\|_{H^1(I)} + \|f^j - f^j\|_{L^2([0,1])} + (\|c - c_0\| + c(g \circ \gamma - \Pi_h g_\gamma^\varepsilon)\|_{L^2([0,1])})
\]

Thus, using similar arguments as that in the proof of Theorem 6.1 we obtain estimates of \( \|(a_0 - c_0) - a_{c,a,\varepsilon,\delta,h}\|_{H^1(I)} \) and \( \|(a_0 - c_0) - a_{c,a,\varepsilon,\delta,h}\|_{L^2(I)} \). Using the fact that \( a_0 - (a_{c,a,\varepsilon,\delta,h} + c) = ((a_0 - c_0) - a_{c,a,\varepsilon,\delta,h}) + (c - c_0) \), we obtain \( (a_{c,a,\varepsilon,\delta,h} + c) \) as a stable approximate solution to Problem (P), and obtain the corresponding error estimates. \( \Box \)
7. Illustration of the Procedure

In order to find a stable approximate solution of Problem (P) using the new regularization method we have to undertake the following.

Let \( f^\delta \in W^{1-1/p,p}(\partial \Omega) \) with \( p > 3 \), \( g^\varepsilon \in L^2(\partial \Omega) \) be the perturbed data satisfying (7.20) and (5.1) respectively, and let \( f^\delta \circ \gamma = \nu^\delta \circ \gamma \). Also let us assume \( g \circ \gamma \in H^4([0,1]) \). Then, by the following steps we obtain the regularized solution \( a_{\alpha,\varepsilon,\delta} \).

**Step (i):** (a) Suppose \( g^\varepsilon \in W^{1,\infty}(\Gamma) \) and it satisfies (1.25). Let \( \tilde{\zeta}_{\varepsilon,\delta} \) be the unique element in \( L^2([0,1]) \) such that

\[
(T_3^\delta)^* (T_3^\delta) \tilde{\zeta}_{\varepsilon,\delta} = (T_3^\delta)^* f^\delta
\]

with \( T_3^\delta \) defined as in (4.52). Define \( \zeta_{\varepsilon,\delta} \) to be equal to \( \tilde{\zeta}_{\varepsilon,\delta} \) on \( \tilde{I}_\varepsilon \), and equal to 0 on \( I \setminus \tilde{I}_\varepsilon \).

(b) Suppose \( g^\varepsilon \in L^2(\Gamma) \setminus W^{1,\infty}(\Gamma) \). Then under the assumption \( g \in H^3(\Gamma) \), there exists a unique element \( \zeta_{\varepsilon,\delta,\alpha} \in L^2([0,1]) \) such that

\[
(T_3^{h,\varepsilon})^* (T_3^{h,\varepsilon}) \zeta_{\varepsilon,\delta,\alpha} = (T_3^{h,\varepsilon})^* f^\delta
\]

with \( T_3^{h,\varepsilon} \) defined as in (5.20). Define \( \zeta_{\varepsilon,\delta,\alpha} \) to be equal to \( \tilde{\zeta}_{\varepsilon,\delta,\alpha} \) on \( \tilde{I}_\varepsilon \), and equal to 0 on \( I \setminus \tilde{I}_\varepsilon \).

We denote the solution obtained in this step by \( \zeta_{\varepsilon,\delta} \).

**Step (ii):** Let \( \zeta_{\varepsilon,\delta} \) be as in Step (i). Let \( b_{\alpha,\varepsilon,\delta} \) be the unique element in \( H^2(I) \) such that

\[
(T_2^\alpha)^* (T_2^\alpha) b_{\alpha,\varepsilon,\delta} = (T_2^\alpha)^* \zeta_{\varepsilon,\delta}
\]

with \( T_2^\alpha \) defined as in (4.1).

**Step (iii):** Define \( a_{\alpha,\varepsilon,\delta} := b'_{\alpha,\varepsilon,\delta} \), the derivative of \( b_{\alpha,\varepsilon,\delta} \).

We now explain how to solve (7.1) and (7.2) and obtain \( \zeta_{\varepsilon,\delta} \). Let us observe that, for \( g^\varepsilon \in W^{1,\infty}(\Gamma) \) and for \( f \in L^2([0,1]) \),

\[
(T_3^\delta)^*(f)(z) = \begin{cases} 
\frac{f((g^\varepsilon \circ \gamma)^{-1}(z))}{(g^\varepsilon \circ \gamma)'(\gamma^{-1}((g^\varepsilon)^{-1}(z)))} & z \in \tilde{I}_\varepsilon \\
0 & z \in I \setminus \tilde{I}_\varepsilon.
\end{cases}
\]

Hence, it can be seen that,

\[
\zeta_{\varepsilon,\delta}(z) = \begin{cases} 
f^\delta((g^\varepsilon \circ \gamma)^{-1}(z)) & z \in \tilde{I}_\varepsilon \\
0 & z \in I \setminus \tilde{I}_\varepsilon.
\end{cases}
\]

For \( g^\varepsilon \in L^2(\Gamma) \setminus W^{1,\infty}(\Gamma) \), for any \( f \in L^2([0,1]) \)

\[
(T_3^{h,\varepsilon})^* (f)(z) := (S^{h,\varepsilon,\delta})^* (f)(z), \quad z \in \tilde{I}_\varepsilon^h,
\]

where

\[
(S^{h,\varepsilon,\delta})^* (f)(z) = \begin{cases} 
\frac{f((H_0 g^\varepsilon \circ \gamma)^{-1}(z))}{(H_0 g^\varepsilon \circ \gamma)'(\gamma^{-1}((H_0 g^\varepsilon)^{-1}(z)))} & z \in \tilde{I}_\varepsilon^h \\
0 & z \in I_h \setminus \tilde{I}_\varepsilon^h,
\end{cases}
\]

Hence, it can be seen that,

\[
\zeta_{h,\varepsilon,\delta}(z) = \lambda_{h,\varepsilon,\delta}(z), \quad z \in \tilde{I}_\varepsilon^h,
\]
where,
\[
\chi_{h,\varepsilon,\delta}(z) = \begin{cases} 
 f^j((\Pi_h g^\varepsilon \circ \gamma)^{-1}(z)) & z \in \tilde{I}_h^h \\
 0 & z \in I_h \setminus \tilde{I}_h^h.
\end{cases}
\]
Thus we have \( \zeta_{\varepsilon,\delta} \). Next let us consider Step (ii). Let us consider the case when \( \zeta_{\varepsilon,\delta} \in C(I) \). If \( \zeta_{\varepsilon,\delta} \in R(T_2^a) \) then the solution of
\[
T_2^a(b) = \zeta_{\varepsilon,\delta}
\]
is the solution of \( \zeta_{\varepsilon,\delta} \). Now let us note that, finding a solution of (7.4) is same as solving the ODE
\[
-\alpha b'' + b = \zeta_{\varepsilon,\delta}
\]
with boundary condition
\[
b(g_0) = 0
\]
and
\[
b'(g_1) = 0.
\]
Hence, if \( j^\delta \) and \( g^\varepsilon \) are such that \( \zeta_{\varepsilon,\delta} \in R(T_2^a) \cap C(I) \) then the solution of the ODE (7.5)-(7.7) gives us our desired \( b_{\alpha,\varepsilon,\delta} \). Also, by Step (iii) \( a_{\alpha,\varepsilon,\delta} = b_{\alpha,\varepsilon,\delta}' \) is our desired regularized solution. Now let us note that, if \( \zeta_{\varepsilon,\delta} \in L^2(I) \setminus C(I) \) then there exists \( \zeta_{\varepsilon,\delta}^n \in C(I) \) such that
\[
\|\zeta_{\varepsilon,\delta} - \zeta_{\varepsilon,\delta}^n\|_{L^2(I)} = O\left(\frac{1}{n}\right)
\]
for \( n \in \mathbb{N} \). Since by (4.3) we have
\[
\|((T_2^a)^*T_2^a)^{-1}(T_2^a)^*(\zeta_{\varepsilon,\delta} - \zeta_{\varepsilon,\delta}^n)\|_{L^2(I)} \leq \frac{1}{\alpha} \|s_{\varepsilon,\delta} - \zeta_{\varepsilon,\delta}^n\|_{L^2(I)},
\]
if \( \zeta_{\varepsilon,\delta}^n \in R(T_2^a) \) then the solution \( b_{\alpha,\varepsilon,\delta,n} \) of (7.5)-(7.7) with \( \zeta_{\varepsilon,\delta}^n \) in place of \( \zeta_{\varepsilon,\delta} \) is an approximation of \( b_{\alpha,\varepsilon,\delta} \). Again, as
\[
\|b_{\alpha,\varepsilon,\delta,n}' - b_{\alpha,\varepsilon,\delta}'\|_{H^1(I)} \leq \|b_{\alpha,\varepsilon,\delta,n} - b_{\alpha,\varepsilon,\delta}\|_{H^2(I)},
\]
executing Step (iii) \( b_{\alpha,\varepsilon,\delta,n}' \) is our desired approximate regularized solution. Hence, if \( j^\delta \) and \( g^\varepsilon \) are such that either \( \zeta_{\varepsilon,\delta} \) or \( \zeta_{\varepsilon,\delta}^n \) is in \( R(T_2^a) \cap C(I) \), then we have a stable approximate solution. Thus in this case we obtain a stable approximate solution to Problem (P) using steps among which the most critical one turns out to be that of solving an ODE.

8. Appendix

Lemma 8.1. Let \( J \) be a closed interval in \( \mathbb{R} \). Then,
\[
\|y\|_{L^\infty(J)} \leq C_J \|y\|_{H^1(J)},
\]
where
\[
C_J = C \max\{4, (2|J| + 1)\}.
\]
In particular, for any interval \( J' \) contained in \( J \),
\[
\|y\|_{L^\infty(J')} \leq C_J \|y\|_{H^1(J')}.
\]
**Proof.** Let $J = [c, d]$ for some $c < d$. Let $\tilde{c}, \tilde{d} \in \mathbb{R}$ be such that $\tilde{c} < c$, $\tilde{d} < \tilde{d}$ and

$$(8.3) \quad \max\{(c - \tilde{c}), (\tilde{d} - d)\} < (d - c).$$

Then, let us define the function

$$\tilde{y}(t) = \begin{cases} 0 & t \in \mathbb{R} \setminus [\tilde{c}, \tilde{d}] \\ y(c) \left(\frac{t - \tilde{c}}{c - \tilde{c}}\right) & t \in [\tilde{c}, c] \\ y(t) & t \in J \\ y(d) \left(\frac{d - t}{d - \tilde{d}}\right) & t \in [d, \tilde{d}] \end{cases}$$

Then, it can be seen that $\tilde{y} \in H^1(\mathbb{R})$ and

$$(8.4) \quad \|\tilde{y}\|_{L^2([\tilde{c}, \tilde{d}])}^2 = \frac{(y(c))^2}{(c - \tilde{c})^2} \int_{\tilde{c}}^c (t - \tilde{c})^2 dt + \|y\|_{L^2([c, d])}^2 + \frac{(y(d))^2}{(d - d)^2} \int_d^d (\tilde{d} - t)^2 dt.$$ 

Now,

$$(8.5) \quad \frac{(y(c))^2}{(c - \tilde{c})^2} \int_{\tilde{c}}^c (t - \tilde{c})^2 dt = \frac{(y(c))^2}{3(c - \tilde{c})^2}(c - \tilde{c})^3 = \frac{(y(c))^2}{3}(c - \tilde{c})$$

and

$$(8.6) \quad \frac{(y(d))^2}{(d - d)^2} \int_d^d (\tilde{d} - t)^2 dt = \frac{(y(d))^2}{3(d - d)^2}(\tilde{d} - d)^3 = \frac{(y(d))^2}{3}(\tilde{d} - d).$$

By the fundamental theorem of calculus, for any $t \in [c, d]$,

$$y(c) = -\int_c^t y'(s) ds + y(t),$$

which implies,

$$|y(c)|^2 = |y(t) - \int_c^t y'(s) ds|^2 \leq 2(|y(t)|^2 + |\int_c^t y'(s) ds|^2).$$

Hence, using Schwartz inequality as we have

$$|\int_c^t y'(s) ds|^2 \leq \left(\int_c^t |y'(s)| ds\right)^2 \leq (t - c)\|y'\|_{L^2([c, d])}^2,$$

holds. This implies

$$|y(c)|^2 (d - c) = \int_c^d |y(c)|^2 dt \leq 2 \left(\int_c^d |y(t)|^2 dt + \|y'\|_{L^2([c, d])}^2 \right) \int_c^d (t - c) dt.$$

Thus,

$$(8.7) \quad |y(c)|^2 (d - c) \leq 2(|y|_{L^2([c, d])}^2 + (d - c)^2\|y'\|_{L^2([c, d])}^2).$$

Again, by the fundamental theorem of calculus, for any $t \in [c, d]$,

$$y(d) = \int_t^d y'(s) ds + y(t),$$

which implies,

$$|y(d)|^2 = |y(t) + \int_t^d y'(s) ds|^2 \leq 2(|y(t)|^2 + |\int_t^d y'(s) ds|^2).$$
Hence, using Schwartz inequality as we have
\[
|\int_t^d y'(s)ds|^2 \leq \left(\int_t^d |y'(s)|ds\right)^2 \leq (d-t)\|y'\|^2_{L^2([c,d])},
\]

\[
|y(d)|^2 \leq 2(|y(t)|^2 + (d-t)\|y'\|^2_{L^2([c,d])})
\]
holds. This implies

\[
|y(d)|^2(d-c) = \int_c^d |y(d)|^2 dt \leq 2\left(\int_c^d |y(t)|^2 dt + \|y'\|^2_{L^2([c,d])}\int_c^d (d-t)dt\right).
\]

Thus,

(8.8)
\[
|y(d)|^2(d-c) \leq 2(\|y\|^2_{L^2([c,d])} + (d-c)^2\|y'\|^2_{L^2([c,d])}).
\]

Hence, combining (8.4), (8.5), (8.6), (8.7) and (8.8), we obtain

(8.9)
\[
\|\tilde{y}\|^2_{L^2([\tilde{c},\tilde{d}])} \leq \frac{4}{3}(\|y\|^2_{L^2([c,d])} + (d-c)^2\|y'\|^2_{L^2([c,d])}) + \|y\|^2_{L^2([c,d])} \leq \frac{7}{3}\|y\|_{L^2([c,d])} + \frac{4}{3}(d-c)^2\|y'\|^2_{L^2([c,d])}.
\]

Now,

\[
\tilde{y}'(t) = \begin{cases} 
0 & t \in \mathbb{R} \setminus [\tilde{c}, \tilde{d}] \\
y(c) & t \in [\tilde{c}, c] \\
y'(t) & t \in J \\
y'(d) & t \in [d, \tilde{d}]
\end{cases}
\]

Hence,

(8.10)
\[
\|\tilde{y}'\|^2_{L^2([\tilde{c},\tilde{d}])} \leq \int_{\tilde{c}}^c (y(c))^2 dt + \|y'\|^2_{L^2([c,d])} + \int_d^{\tilde{d}} (y(d))^2 dt \leq (y(c))^2(c-\tilde{c}) + \|y'\|^2_{L^2([c,d])} + (y(d))^2(\tilde{d} - d).
\]

Thus, from (8.7) and (8.8), we obtain

(8.11)
\[
\|\tilde{y}'\|^2_{L^2([\tilde{c},\tilde{d}])} \leq 2(|y|_{L^2([c,d])} + (d-c)^2\|y'\|^2_{L^2([c,d])}) + \|y\|^2_{L^2([c,d])} + \|y'\|^2_{L^2([c,d])} \leq 3\|y\|^2_{L^2([c,d])} + (2(d-c)^2 + 1)\|y'\|^2_{L^2([c,d])}.
\]

Thus, from (8.9) and (8.11), we obtain

\[
\|\tilde{y}\|_{H^1([\tilde{c},\tilde{d}])} \leq 4\|y\|_{L^2([c,d])} + \left(\sqrt{\frac{10}{3}(d-c)^2 + 1}\right)\|y'\|_{L^2([c,d])} \leq 4\|y\|_{L^2([c,d])} + (2(d-c) + 1)\|y'\|_{L^2([c,d])}.
\]

Hence,

(8.12)
\[
\|\tilde{y}\|_{H^1([\tilde{c},\tilde{d}])} \leq \max\{4, (2(d-c) + 1)\}\|y\|_{H^1([c,d])}.
\]

Since, $H^1(\mathbb{R})$ is continuously imbedded in $C(\mathbb{R})$ (cf. [6]), there exists $C > 0$ such that

\[
\|\tilde{y}\|_{L^\infty(\mathbb{R})} \leq C\|\tilde{y}\|_{H^1(\mathbb{R})},
\]

which, by definition of $\tilde{y}$, implies

\[
\|y\|_{L^\infty([c,d])} \leq \|\tilde{y}\|_{L^\infty(\mathbb{R})} \leq C\|\tilde{y}\|_{H^1(\mathbb{R})} = C\|y\|_{H^1([c,d])}.
\]

Hence, by (8.12)
\[
\|y\|_{L^\infty([c,d])} \leq C\max\{4, (2(d-c) + 1)\}\|y\|_{H^1([c,d])}.
\]
