

GEOMETRY OF SUB-ALGEBRAS OF $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ AND ZEROS OF HOLOMORPHIC FUNCTIONS

BABHRUBAHAN BOSE, SAIKAT ROY, DEBMALYA SAIN

ABSTRACT. We study $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$, the normed algebra of all holomorphic functions defined on some simply connected neighborhood of a simple closed curve Γ in \mathbb{C} , equipped with the supremum norm on Γ . We explore the geometry of nowhere vanishing, point separating sub-algebras of $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$. We characterize the extreme points and the exposed points of the unit balls of the said sub-algebras for Γ analytic. We also characterize the smoothness of an element in these sub-algebras by using Birkhoff-James orthogonality techniques without any restriction on Γ . As a culmination of our study, we assimilate the geometry of the aforesaid sub-algebras with some classical concepts of complex analysis and establish a connection between Birkhoff-James orthogonality and zeros of holomorphic functions.

1. INTRODUCTION

The aim of the present article is to study the geometry of a family of normed algebras and to establish a connection between Birkhoff-James orthogonality and zeros of holomorphic functions. The mentioned normed algebras consist of holomorphic functions defined on any simply connected neighborhood of a simple closed curve in \mathbb{C} . We shall let $\mathcal{Hol}(K)$ denote the normed algebra of all continuous functions on a compact set $K \subset \mathbb{C}$ that can be extended to a holomorphic function on some neighborhood of K , equipped with the supremum norm on K . In the same spirit, we consider the normed algebra $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ for a simple closed curve $\Gamma \subset \mathbb{C}$, where $\text{Int}(\Gamma)$ denotes the simply connected

region enclosed by Γ , i.e.,

$\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma)) := \{f : \Gamma \cup \text{Int}(\Gamma) \rightarrow \mathbb{C} : \exists U_f \supset \Gamma \cup \text{Int}(\Gamma) \text{ open, } f \text{ holomorphic on } U_f\}$,

with the norm defined as:

$$\|f\| := \sup_{z \in \Gamma} |f(z)|, \quad f \in \mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma)).$$

Clearly, if $f \in \mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$, then $f^{(n)} \in \mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ for every $n \in \mathbb{N}$, where $f^{(n)}$ denotes the n -th order derivative of f .

A sub-algebra \mathfrak{A} of $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ is said to be nowhere vanishing and point separating at Γ if for every $z \in \Gamma$, there exists $f \in \mathfrak{A}$ such that $f(z) \neq 0$, and for every $z_1, z_2 \in \Gamma$, there exists $g \in \mathfrak{A}$ such that $g(z_1) \neq g(z_2)$. Throughout this article, we call these sub-algebras as nowhere vanishing point separating sub-algebras of $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$, without any ambiguity.

For a given choice of $\Gamma \subset \mathbb{C}$, define:

$$(1.1) \quad \mathcal{J}(\Gamma) := \{f \in \mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma)) : |f(z)| = \|f\| \quad \forall z \in \Gamma\},$$

and for a given $f \in \mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$, set:

$$(1.2) \quad M_f := \{z \in \Gamma : |f(z)| = \|f\|\},$$

$$(1.3) \quad \mathcal{Z}_f := \{z \in \Gamma \cup \text{Int}(\Gamma) : f(z) = 0\}.$$

For example, if $\Gamma = \{z \in \mathbb{C} : |z| = r\}$ for some $r > 0$, then $f \in \mathcal{J}(\Gamma)$ if and only if f is constant or

$$f(z) = c \prod_{k=1}^n \left(\frac{z - ra_k}{r - \overline{a_k}z} \right), \quad z \in \Gamma \cup \text{Int}(\Gamma),$$

for some $c \in \mathbb{C} \setminus \{0\}$, $n \in \mathbb{N}$ and $a_k \in \mathbb{D}$ for $1 \leq k \leq n$, where \mathbb{D} denotes the open unit disc in \mathbb{C} .

For a given $z \in \mathbb{C}$, the real and the imaginary parts of z are denoted by $\Re(z)$ and $\Im(z)$, respectively. If additionally, $z \neq 0$, let $\arg(z)$ denote the real number $\theta \in [0, 2\pi)$ such that $z = |z|e^{i\theta}$. Also, the sign function $\text{sgn} : \mathbb{C} \rightarrow \mathbb{C}$ is defined by

$$\text{sgn}(z) := \begin{cases} \frac{z}{|z|}, & z \neq 0, \\ 0, & z = 0. \end{cases}$$

Given a normed linear space X , let B_X and S_X denote the closed unit ball and the unit sphere of X respectively, i.e.,

$$B_X = \{x \in X : \|x\| \leq 1\}, \quad S_X = \{x \in X : \|x\| = 1\}.$$

Let X^* denote the continuous dual of X . For a non-zero element $x \in X$, we denote the collection of all support functionals at x by $J(x)$, i.e.,

$$J(x) = \{\Psi \in S_{X^*} : \Psi(x) = \|x\|\},$$

Let $\text{Ext}(X)$ denote the collection of all extreme points of B_X . An element $x \in B_X$ is said to be an exposed point of B_X if $\|x\| = 1$ and there exists $\Psi \in J(x)$ such that

$$|\Psi(y)| = \|y\| \text{ if and only if } y = cx \text{ for some } c \in \mathbb{C}.$$

We denote the collection of all exposed points of B_X by $\text{Exp}(X)$. It is well-known that $\text{Exp}(X) \subseteq \text{Ext}(X)$. For $x, y \in X$, x is said to be Birkhoff-James orthogonal to y , denoted by $x \perp_B y$, if

$$\|x + \lambda y\| \geq \|x\| \text{ for all } \lambda \in \mathbb{C}.$$

In [8], James proved that for $x, y \in X$, $x \perp_B y$ if and only if $x = 0$ or there exists some $\Psi \in J(x)$ such that $\Psi(y) = 0$. A non-zero element $x \in X$ is said to be smooth if $J(x)$ is singleton. James [8] proved that a non-zero $x \in X$ is smooth if and only if

$$x \perp_B y, x \perp_B z \implies x \perp_B (y + z) \text{ for all } y, z \in X.$$

In the first section of this article, we characterize the extreme points and the exposed points of any nowhere vanishing, point separating sub-algebra of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$ for Γ analytic. In the next section, we characterize Birkhoff-James orthogonality in the said sub-algebras and also identify its smooth points but for any simple closed curve Γ , not necessarily analytic. Characterizing the extreme points, the exposed points and the smooth points of the closed unit ball of a given normed linear space is of fundamental importance in determining the geometry of the space. We refer the readers to [1], [3], [4], [5], [7], [9], [10], [11], [12], [13], [14], [15] for some of the illustrative works in this regard.

In the final section, we find an interrelation between Birkhoff-James orthogonality in nowhere vanishing, point separating sub-algebras of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$ with the zeros of holomorphic functions using some classical concepts of complex analysis.

2. GEOMETRY OF $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$ FOR Γ SIMPLE, CLOSED AND ANALYTIC

We begin with a couple of simple propositions. In the first one, we characterize the set $\mathcal{J}(\Gamma)$ for $\Gamma \subset \mathbb{C}$ analytic.

Proposition 2.1. *Let $\Gamma \subset \mathbb{C}$ be a simple closed analytic curve and let $f : \text{Int}(\Gamma) \rightarrow \mathbb{D}$ be an onto biholomorphic map. Then*

(i) *f extends to a biholomorphic function $F : U \rightarrow \mathbb{C}$ for some neighborhood U of $\Gamma \cup \text{Int}(\Gamma)$ such that $F(\Gamma \cup \text{Int}(\Gamma)) = \overline{\mathbb{D}}$.*

(ii) *$h \in \mathcal{J}(\Gamma)$ if and only if h is constant or*

$$h(z) = c \prod_{k=1}^n \left(\frac{F(z) - a_k}{1 - \overline{a_k} F(z)} \right), \quad z \in \Gamma \cup \text{Int}(\Gamma),$$

for some $c \in \mathbb{C} \setminus \{0\}$, $n \in \mathbb{N}$ and $a_k \in \mathbb{D}$ for $1 \leq k \leq n$.

Proof. The first part of the proposition follows from the observation that for every $z \in \Gamma$, there exists $U_z \subset \mathbb{C}$ open such that $\Gamma \cap U_z$ is a one-sided free arc of Γ containing z and hence f can be extended biholomorphically to some neighborhood V_z of $\Gamma \cap U_z$, using the Schwarz reflection principle (see [2, Theorem 4, p. 235] for details). The desired F is now obtained by considering the extensions on V_z for every $z \in \Gamma$ and restricting the function on a sufficiently small neighborhood of $\Gamma \cup \text{Int}(\Gamma)$ so that it remains injective.

The second part follows from the observation that $T : \mathcal{Hol}(\overline{\mathbb{D}}) \rightarrow \mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ given by

$$(2.1) \quad T(g)(z) := g \circ F(z), \quad z \in F^{-1}(U_g),$$

where $\overline{\mathbb{D}} \subset U_g$ open and $g : U_g \rightarrow \mathbb{C}$ holomorphic is an isometric isomorphism and $T(g) \in \mathcal{J}(\Gamma)$ if and only if $|g(z)| = \|g\|$ for every $|z| = 1$. \square

The second proposition pertains to the completion of $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ for arbitrary simple closed curves $\Gamma \subset \mathbb{C}$ (not necessarily analytic). The result follows easily from the observation that $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ contains all the polynomials.

Proposition 2.2. *If $\Gamma \subset \mathbb{C}$ is a simple closed curve, then $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ is incomplete and its completion is isometrically isomorphic to*

$$\mathcal{A}(\text{Int}(\Gamma)) := \{f \in \mathcal{Hol}(\text{Int}(\Gamma)) : f \text{ extends continuously on } \Gamma \cup \text{Int}(\Gamma)\},$$

equipped with the supremum norm.

Now, we characterize the extreme points and the exposed points of the closed unit ball of any nowhere vanishing, point separating sub-algebra of $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ for Γ simple, closed and analytic. We begin with a preliminary lemma.

Lemma 2.3. *Let $\Gamma \subset \mathbb{C}$ be a simple closed analytic curve. Let $X = \mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ and let $f \in S_X$. If $z_0 \in \Gamma$ is an isolated point of M_f (see (1.2)) and $f(z_0) = e^{i\theta_0}$ for some $\theta_0 \in [0, 2\pi)$, then*

$$(2.2) \quad \lim_{\substack{z \rightarrow z_0 \\ z \in \Gamma}} |z - z_0|^r \frac{|e^{i\theta_0} - f(z)|}{1 - |f(z)|} = 0,$$

for some natural number r .

Proof. Replacing f by $e^{-i\theta_0}f$, we may and do assume that $f(z_0) = 1$. Also, let f be holomorphic on the domain $\Omega \supset \Gamma \cup \text{Int}(\Gamma)$. Choose a neighborhood N of z_0 , contained in Ω such that $|f(z)| < 1$ for every $z \in (\Gamma \cap N) \setminus \{z_0\}$. Set $g(z) := 1 - f(z)$ on N . Then g is holomorphic on N and has a zero at $z = z_0$. Let m_0 be the multiplicity of the zero of g at $z = z_0$. Then there exists a

neighbourhood N' of z_0 and a holomorphic function $h : N' \rightarrow \mathbb{C}$ with $h(z_0) \neq 0$ such that:

$$g(z) = (z - z_0)^{m_0} h(z), \quad z \in N'.$$

Now, observe that

$$(2.3) \quad |z - z_0|^r \frac{|1 - f(z)|}{1 - |f(z)|} = |z - z_0|^{r+m_0} \frac{|h(z)|}{1 - |1 - g(z)|},$$

and

$$(2.4) \quad \begin{aligned} \frac{1}{1 - |1 - g(z)|} &= \frac{1 + |1 - g(z)|}{1 - |1 - g(z)|^2} \\ &= \frac{1 + |1 - g(z)|}{2\Re(g(z)) - |g(z)|^2} \end{aligned}$$

Now, let $I \subset \mathbb{R}$ be some interval and $\gamma : I \rightarrow \mathbb{C}$ be an analytic parametrization of Γ in some neighborhood of z_0 . Since $g \circ \gamma$ is analytic on I , $\Re(g \circ \gamma)$ is a real-analytic function. Without loss of generality, we may and will assume that $0 \in I$ and $\gamma(0) = z_0$. Then $\Re(g \circ \gamma)$ has a zero at 0 and hence, there exist a natural number k , a neighbourhood $I' \subset I$ of 0 and a real-analytic function $\nu : I' \rightarrow \mathbb{R}$ with $\nu(0) \neq 0$ such that

$$(2.5) \quad g(\gamma(t)) = t^k \nu(t), \quad t \in I'.$$

Also, by the analyticity of the function $t \mapsto \gamma(t) - z_0$, there exist a natural number n , a neighbourhood $I'' \subset I$ of 0 and an analytic map $\psi : I'' \rightarrow \mathbb{C}$ with $\psi(0) \neq 0$ such that

$$(2.6) \quad \gamma(t) - z_0 = t^n \psi(t), \quad t \in I''.$$

Now, to show that (2.2) holds for some $r \in \mathbb{N}$, applying (2.3), (2.4), (2.5) and (2.6) we need to show:

$$\begin{aligned} \lim_{t \rightarrow 0} |\gamma(t) - z_0|^{r+m_0} \frac{h \circ \gamma(t) (1 + |1 - g \circ \gamma(t)|)}{2t^k \nu(t) - |\gamma(t) - z_0|^{2m_0} |h \circ \gamma(t)|^2} &= 0 \\ \Leftrightarrow \lim_{t \rightarrow 0} |t|^{n(r+m_0)} |\psi(t)|^{r+m_0} \frac{h \circ \gamma(t) (1 + |1 - g \circ \gamma(t)|)}{2t^k \nu(t) - |t^n \psi(t)|^{2m_0} |h \circ \gamma(t)|^2} &= 0 \end{aligned}$$

Clearly, choosing $r \in \mathbb{N}$ sufficiently large yields the result. \square

We now come to the first of our main results.

Theorem 2.4. *Let $\Gamma \subset \mathbb{C}$ be a simple closed analytic curve and let \mathfrak{A} be a nowhere vanishing, point separating sub-algebra of $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$. Then the following are equivalent:*

- (i) $f \in \text{Exp}(\mathfrak{A})$.
- (ii) $f \in \text{Ext}(\mathfrak{A})$.
- (iii) $\|f\| = 1$ and $f \in J(\Gamma)$, i.e., $|f(z)| = 1$ for every $z \in \Gamma$.

Proof. (i) \Rightarrow (ii)

Elementary as discussed before.

(ii) \Rightarrow (iii)

Suppose that $\Gamma \cup \text{Int}(\Gamma) \subset \Omega$ is open and $f : \Omega \rightarrow \mathbb{C}$ is holomorphic. If $f \in \text{Ext}(\mathfrak{A})$, clearly, $f \in S_{\mathfrak{A}}$.

We first prove that $f \in J(\Gamma)$ if and only if M_f is infinite. The only if part is clearly trivial and for the if part, let $z_n \in M_f$ be an infinite sequence such that $z_n \rightarrow z_0$. Consider an interval $I \subset \mathbb{R}$ such that $0 \in I$ and $\gamma : I \rightarrow \mathbb{C}$ is an analytic parametrization of Γ in some neighbourhood of the point z_0 with $\gamma(0) = z_0$. Clearly, $|f \circ \gamma(t)|^2 = (\Re(f \circ \gamma(t)))^2 + (\Im(f \circ \gamma(t)))^2$ is real analytic on I . Since $|f \circ \gamma(t)|^2 = 1$ for infinitely many $t \in I$, by the identity theorem for real-analytic functions, $|f \circ \gamma(t)| = 1$ for every $t \in I$. The result now follows using an elementary connectedness argument.

Now, assume for the sake of contradiction, $f \in S_{\mathfrak{A}}$ and $M_f = \{z_1, z_2, \dots, z_n\}$ for some $n \in \mathbb{N}$. Then by Lemma 2.3, there exist $r_k \in \mathbb{N}$ such that

$$(2.7) \quad \lim_{\substack{z \rightarrow z_k \\ z \in \Gamma}} |z - z_k|^{r_k} \frac{|e^{i\theta_k} - f(z)|}{1 - |f(z)|} = 0,$$

where $f(z_k) = e^{i\theta_k}$ for every $1 \leq k \leq n$. Also, let m_k denote the multiplicity of the zero z_k of the holomorphic map $e^{i\theta_k} - f(z)$, $z \in \Omega$ for every $1 \leq k \leq n$.

Now, let $w_1, w_2 \in \Gamma$ and $c_1, c_2 \in \mathbb{C}$. Since \mathfrak{A} is nowhere vanishing and point separating, there exist $h_1, h_2, h_3 \in \mathfrak{A}$ such that

$$h_1(w_1), h_2(w_2) \neq 0, \quad h_3(w_1) \neq h_3(w_2).$$

Then

$$h := \frac{c_1(h_1 h_3 - h_3(w_2) h_1)}{h_1(w_1)(h_3(w_1) - h_3(w_2))} + \frac{c_2(h_2 h_3 - h_3(w_1) h_2)}{h_2(w_2)(h_3(w_2) - h_3(w_1))},$$

is well-defined and belongs to \mathfrak{A} with $h(w_1) = c_1$ and $h(w_2) = c_2$.

Now, fix $z_0 \in \Gamma \setminus M_f$. Then, there exist $f_1, f_2, \dots, f_n \in \mathfrak{A}$, such that $f_k(z_k) = 0$ and $f_k(z_0) = 1$ for every $1 \leq k \leq n$. Suppose $\Gamma \cup \text{Int}(\Gamma) \subset U_k$ is open such that $f_k : U_k \rightarrow \mathbb{C}$ is holomorphic and μ_k is the multiplicity of the zero z_k of the holomorphic map f_k for every $1 \leq k \leq n$. Define $P : \Omega \cap \left(\bigcap_{k=1}^n U_k \right) \rightarrow \mathbb{C}$ by

$$P(z) := \prod_{k=1}^n (f_k(z))^{\left\lceil \frac{m_k + r_k}{\mu_k} \right\rceil}, \quad z \in \Omega \cap \left(\bigcap_{k=1}^n U_k \right),$$

where $\lceil \alpha \rceil = \min\{n \in \mathbb{Z} : \alpha \leq n\}$ for any $\alpha \in \mathbb{R}$. Then, since the multiplicity of the zero z_k of P is at least $m_k + r_k$, for every $1 \leq k \leq n$,

$$P(z) = (z - z_k)^{m_k + r_k} G_k(z), \quad z \in \Omega \cap \left(\bigcap_{k=1}^n U_k \right),$$

for some $G_k : \Omega \cap \left(\bigcap_{k=1}^n U_k \right) \rightarrow \mathbb{C}$ holomorphic. Note that $G_k(z_k)$ may be zero for some $1 \leq k \leq n$. Therefore, for any $1 \leq k \leq n$, by (2.7),

$$\lim_{\substack{z \rightarrow z_k \\ z \in \Gamma}} \frac{|P(z)|}{1 - |f(z)|} = G_k(z_k) \lim_{\substack{z \rightarrow z_k \\ z \in \Gamma}} \frac{|z - z_k|^{m_k}}{|e^{i\theta_k} - f(z)|} |z - z_k|^{r_k} \frac{|e^{i\theta_k} - f(z)|}{1 - |f(z)|} = 0.$$

Fix $\epsilon > 0$. Then there exist $N_1, N_2, \dots, N_n \subset \mathbb{C}$ open such that $z_k \in N_k$ and

$$\frac{|P(z)|}{1 - |f(z)|} < \epsilon, \quad z \in \Gamma \cap N_k \setminus \{z_k\}, \quad 1 \leq k \leq n.$$

Since $\Gamma \setminus \left(\bigcup_{k=1}^n N_k \right)$ is compact and $z \mapsto \frac{|P(z)|}{1 - |f(z)|}$ is continuous on $\Gamma \setminus \left(\bigcup_{k=1}^n N_k \right)$,

$$\frac{|P(z)|}{1 - |f(z)|} \leq M, \quad z \in \Gamma \setminus \left(\bigcup_{k=1}^n N_k \right),$$

for some $M > 0$. Set $K = \max\{M, \epsilon\}$. Then

$$|P(z)| \leq K(1 - |f(z)|), \quad z \in \Gamma.$$

Hence,

$$|f(z)| + \left| \frac{1}{K} P(z) \right| \leq 1, \quad z \in \Gamma.$$

Clearly, $\frac{1}{K} P \in \mathfrak{A}$ and $P(z_0) = 1$. Hence $P \neq 0$ proving $f \notin \text{Ext}(\mathfrak{A})$.

(iii) \Rightarrow (i)

Let $f \in S_{\mathfrak{A}} \cap J(\Gamma)$. Fix $\{z_n : n \in \mathbb{N}\} \subset M_f = \Gamma$ such that $z_n \rightarrow z_0$ for some z_0 .

Consider $\Psi : \mathfrak{A} \rightarrow \mathbb{C}$ given by

$$\Psi(h) := \sum_{n=1}^{\infty} \frac{\overline{\text{sgn}(f(z_n))}}{2^n} h(z_n), \quad h \in \mathfrak{A}.$$

Then clearly, Ψ is unit norm functional on \mathfrak{A} and $\Psi(f) = \|f\|$. Also, $|\Psi(h)| = \|h\|$ for some $h \in \mathfrak{A}$ if and only if

$$h(z_n) = e^{i\theta_0} \|h\| f(z_n),$$

for every $n \in \mathbb{N}$ and some fixed $\theta_0 \in [0, 2\pi)$. Since f and h are holomorphic on some connected neighborhood of $\Gamma \cup \text{Int}(\Gamma)$, by identity theorem, $h = e^{i\theta_0} \|h\| f$ proving $f \in \text{Exp}(\mathfrak{A})$. \square

Clearly, if Γ is not analytic, there exist functions $f \in \text{Ext}(\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma)))$ such that $M_f \neq \Gamma$. The following simple example illustrates this:

Example 2.5. Let $\Gamma := \{e^{it} : t \in [0, \pi]\} \cup [-1, 1]$. Then any monomial $h_n := z^n$, $z \in \mathbb{C}$ is not in $\mathcal{J}(\Gamma)$ but is an extreme point of the closed unit ball of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$, since $M_{h_n} = \{e^{it} : t \in [0, \pi]\}$ is an infinite set and therefore if $h_n = \frac{1}{2}(f + g)$ for some $f, g \in S_{\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))}$, then $h_n = f = g$ on M_{h_n} proving $f = h_n = g$ by the identity theorem.

Proposition 2.1 and Theorem 2.4 completely characterize the extreme points of the closed unit ball of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$ for simple closed analytic curves $\Gamma \subset \mathbb{C}$ as $B \circ F$ where B is a finite Blaschke product or a unimodular constant function on \mathbb{D} and F is a holomorphic extension of the Riemann map $f : \text{Int}(\Gamma) \rightarrow \mathbb{D}$ on some neighborhood of $\Gamma \cup \text{Int}(\Gamma)$. Let us recall the characterization of the extreme points of the closed unit ball of the disc algebra $\mathcal{A}(\mathbb{D})$ from [6, p.139] given by:

Theorem 2.6. A function $f \in \text{Ext}(\mathcal{A}(\mathbb{D}))$ if and only if $|f| \leq 1$ on $\overline{\mathbb{D}}$ and

$$\int_0^{2\pi} \ln(1 - |f(e^{it})|) dt = -\infty.$$

Hence clearly, if f is an extreme point of the closed unit ball of $\mathcal{H}ol(\overline{\mathbb{D}})$, $f \in \text{Ext}(\mathcal{A}(\mathbb{D}))$. Also observing that the map T defined in (2.1) can be extended to an isometric isomorphism from $\mathcal{A}(\mathbb{D})$ onto $\mathcal{A}(\text{Int}(\Gamma))$, we can conclude the following corollary:

Corollary 2.7. If $\Gamma \subset \mathbb{C}$ is a simple closed analytic curve, any extreme point of the closed unit ball of any nowhere vanishing, point separating sub-algebra of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$ is an extreme point of the closed unit ball of its completion $\mathcal{A}(\text{Int}(\Gamma))$.

The converse of this result is not true, i.e., there exist extreme points of the closed unit ball of the disc algebra $\mathcal{A}(\mathbb{D})$ that are not holomorphic on any neighborhood of $\overline{\mathbb{D}}$ as illustrated by the following example. Note that any function $f \in \text{Ext}(\mathcal{A}(\mathbb{D}))$ which is holomorphic in some neighborhood of $\overline{\mathbb{D}}$ must be an extreme point of the closed unit ball of $\mathcal{H}ol(\overline{\mathbb{D}})$, i.e., in particular, f must be a finite Blaschke product or a unimodular constant.

Example 2.8. Let $g : [0, 2\pi] \rightarrow [0, 1]$ be a continuous function such that $g(t) = e^{-n}$ on $[\frac{1}{2n}, \frac{1}{2n-1}]$; $n \in \mathbb{N}$ with $g(0) = g(2\pi) = 0$, g is increasing on $[0, 1]$ and strictly decreasing on $[1, 2\pi]$. Note that $\ln(1 - g(t))$ is continuous and of

bounded variation. Consider $f : \mathbb{D} \rightarrow \mathbb{C}$ given by

$$f(z) := \exp \left[\frac{1}{2\pi} \int_0^{2\pi} \left(\frac{e^{it} + z}{e^{it} - z} \right) \ln(1 - g(t)) dt \right], \quad z \in \mathbb{D}.$$

Then f is holomorphic on \mathbb{D} and has absolutely summable Taylor coefficients by Hardy's Theorem [6, p.70]. Hence f can be extended continuously to the boundary of \mathbb{D} , i.e., $f \in \mathcal{A}(\mathbb{D})$. Also, $|f(e^{it})| = 1 - g(t)$ for $t \in [0, 2\pi)$ and so $|f| \leq 1$ on $\overline{\mathbb{D}}$. Further,

$$\int_0^{2\pi} \ln(1 - |f(e^{it})|) dt = \int_0^{2\pi} \ln(g(t)) dt \leq \sum_{n=1}^{\infty} \frac{-n}{2n(2n-1)} = -\infty,$$

proving $f \in \text{Ext}(\mathcal{A}(\mathbb{D}))$. However, $f(e^{it}) = 1$ for $t \in [0, 2\pi)$ if and only if $t = 0$. Therefore, $f \notin \text{Ext}(\mathcal{Hol}(\overline{\mathbb{D}}))$, i.e., $f \notin \mathcal{Hol}(\overline{\mathbb{D}})$.

3. BIRKHOFF-JAMES ORTHOGONALITY AND CHARACTERIZATION OF SMOOTH POINTS OF $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$

Now, we characterize Birkhoff-James orthogonality of two elements in any nowhere vanishing, point separating sub-algebra of $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ for a simple closed curve $\Gamma \subset \mathbb{C}$. We begin by providing two sufficient conditions.

Proposition 3.1. *Let $\Gamma \subset \mathbb{C}$ be a simple closed curve, and \mathfrak{A} be a nowhere vanishing, point separating sub-algebra of $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$. Let $f_1, f_2 \in \mathfrak{A}$.*

(i) If for every $\theta \in [0, 2\pi)$ there exists $z \in M_{f_1}$ such that $\arg \frac{f_2(z)}{f_1(z)} = \theta$, then $f_1 \perp_B f_2$.

(ii) If there exists $z \in M_{f_1} \cap \mathcal{Z}_{f_2}$, then $f_1 \perp_B f_2$ (see (1.3) for definition of \mathcal{Z}_f).

Proof. (i) For $\lambda = 0$, $\|f_1 + \lambda f_2\| = \|f_1\|$. If instead, $\lambda = re^{i\phi}$ for some $r > 0$ and $\phi \in (0, 2\pi]$, then by the hypotheses, there exists $z \in M_{f_1}$ such that $\arg \frac{f_2(z)}{f_1(z)} = 2\pi - \phi$. Let $\frac{f_2(z)}{f_1(z)} = r_1 e^{i(2\pi - \phi)}$ for some $r_1 > 0$. Then clearly,

$$\|f_1 + \lambda f_2\| \geq |f_1(z) + \lambda f_2(z)| \geq \|f_1\|.$$

Since $\lambda \in \mathbb{C} \setminus \{0\}$ was chosen arbitrarily, $f_1 \perp_B f_2$.

(ii) This is immediate since for $\lambda \in \mathbb{C}$ arbitrary,

$$\|f_1 + \lambda f_2\| \geq |f_1(z) + \lambda f_2(z)| = \|f_1\|.$$

□

The following corollary follows directly from the first part of the above proposition.

Corollary 3.2. *Let $\Gamma := \{z \in \mathbb{C} : |z| = r\}$. Let $h_j(z) := z^j$, $z \in \mathbb{C}$ for $j \in \mathbb{N}$. Then $h_n \perp_B h_m$ for $m \neq n$ in any nowhere vanishing, point separating sub-algebra of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$ containing all the monomials.*

In order to completely characterize the Birkhoff-James orthogonality of two elements in any nowhere vanishing, point separating sub-algebra of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$, we introduce the following definition.

Definition 3.3. A subset $A \subseteq \mathbb{C}^2$ is said to be an *orthogonality covering set* if

$$\mathbb{C} = \bigcup_{(u,v) \in A} \{\lambda \in \mathbb{C} : |u + \lambda v| \geq |u|\}.$$

We furnish the following two examples illustrating the idea.

Example 3.4. $A = \{(z_1, z_2)\} \subset \mathbb{C}^2$ is an orthogonality covering set if and only if $z_1 = 0$ or $z_2 = 0$.

Example 3.5. $A = \{(z_1, z_2), (w_1, w_2)\} \subset \mathbb{C}^2$ is an orthogonality covering set if and only if $\overline{z_1}z_2w_1\overline{w_2} \in (-\infty, 0]$.

Theorem 3.6. *Let $\Gamma \subset \mathbb{C}$ be a simple closed curve, and \mathfrak{A} be a nowhere vanishing, point separating sub-algebra of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$. Let $f_1, f_2 \in \mathfrak{A}$. Then*

$$f_1 \perp_B f_2 \Leftrightarrow \{(f_1(z), f_2(z)) : z \in M_{f_1}\} \text{ is an orthogonality covering set.}$$

Proof. Let $A = \{(f_1(z), f_2(z)) : z \in M_{f_1}\}$. First we prove the necessity. Suppose by contradiction that A is not an orthogonality covering set. Then there exists $\lambda \in \mathbb{C}$ such that

$$|f_1(z) + \lambda f_2(z)| < |f_1(z)| \text{ for all } z \in M_{f_1}.$$

We claim that $|f_1(z) + \mu \lambda f_2(z)| < |f_1(z)|$ for all $z \in M_{f_1}$ and for all $\mu \in (0, 1)$. Indeed for $z_0 \in M_{f_1}$ and $\mu_0 \in (0, 1)$,

$$f_1(z_0) + \mu_0 \lambda f_2(z_0) = (1 - \mu_0)f_1(z_0) + \mu_0(f_1(z_0) + \lambda f_2(z_0)).$$

The claim now follows:

$$\begin{aligned} |f_1(z_0) + \mu_0 \lambda f_2(z_0)| &= |(1 - \mu_0)f_1(z_0) + \mu_0(f_1(z_0) + \lambda f_2(z_0))|, \\ &< (1 - \mu_0)|f_1(z_0)| + \mu_0|f_1(z_0)|, \\ &= |f_1(z_0)|. \end{aligned}$$

Now, let $g : \Gamma \times [-1, 1] \rightarrow \mathbb{R}$ be defined by

$$g(z, \mu) := |f_1(z) + \mu \lambda f_2(z)|, \quad z \in \Gamma, \quad -1 \leq \mu \leq 1.$$

Clearly, g is continuous. Let $z_0 \in M_{f_1}$ and $\mu_{z_0} \in (0, 1)$. Then from the claim,

$$g(z_0, \mu_{z_0}) < \|f_1\|.$$

From the continuity of g , there exist $\epsilon_{z_0} > 0$ and $\delta_{z_0} > 0$ such that

$$g(z, \sigma) < \|f_1\| \text{ for all } (z, \sigma) \in B(z_0, \epsilon_{z_0}) \times (\mu_{z_0} - \delta_{z_0}, \mu_{z_0} + \delta_{z_0}).$$

In particular, $g(z, \mu_{z_0}) < \|f_1\|$ for all $z \in B(z_0, \epsilon_{z_0})$. Thus, clearly from our claim,

$$g(z, \sigma) < \|f_1\| \text{ for all } (z, \sigma) \in B(z_0, \epsilon_{z_0}) \times (0, \mu_{z_0}).$$

Similarly, if $u_0 \in \Gamma \setminus M_{f_1}$, then $g(u_0, 0) < \|f_1\|$. Again, from the continuity of g , there exist $\epsilon_{u_0} > 0$ and $\delta_{u_0} > 0$ such that

$$g(z, \alpha) < \|f_1\| \text{ for all } (z, \alpha) \in B(u_0, \epsilon_{u_0}) \times (-\delta_{u_0}, \delta_{u_0}).$$

Now,

$$\Gamma \subseteq \bigcup_{z \in M_{f_1}} B(z, \epsilon_z) \cup \bigcup_{u \in \Gamma \setminus M_{f_1}} B(u, \epsilon_u).$$

Since Γ is compact, there exist $z_1, z_2, \dots, z_{k_1} \in M_{f_1}$ and $u_1, u_2, \dots, u_{k_2} \in \Gamma \setminus M_{f_1}$ such that

$$\Gamma \subseteq \bigcup_{i=1}^{k_1} B(z_i, \epsilon_{z_i}) \cup \bigcup_{j=1}^{k_2} B(u_j, \epsilon_{u_j}).$$

Choose $\sigma_0 > 0$ such that $\sigma_0 < \mu_{z_i}$ and $\sigma_0 < \delta_{u_j}$ for all $1 \leq i \leq k_1$ and $1 \leq j \leq k_2$. Clearly, $(f_1 + \sigma_0 \lambda f_2) \in \mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$. Let $w_0 \in M_{(f_1 + \sigma_0 \lambda f_2)}$.

Now, either $w_0 \in \bigcup_{i=1}^{k_1} B(z_i, \epsilon_{z_i})$, or $w_0 \in \bigcup_{j=1}^{k_2} B(u_j, \epsilon_{u_j})$. However, in either case, from the choice of σ_0 ,

$$\|f_1 + \sigma_0 \lambda f_2\| = |f_1(w_0) + \sigma_0 \lambda f_2(w_0)| < \|f_1\|,$$

proving $f_1 \not\perp_B f_2$.

We now prove the sufficiency. Let $\kappa \in \mathbb{C}$ be arbitrary. Since A is an orthogonality covering set, there exists $v \in M_{f_1}$ such that $|f_1(v) + \kappa f_2(v)| \geq |f_1(v)|$. Thus,

$$\|f_1 + \kappa f_2\| = \sup_{z \in \Gamma} |f_1(z) + \kappa f_2(z)| \geq |f_1(v) + \kappa f_2(v)| \geq \|f_1\|.$$

Since κ was chosen arbitrarily, $f_1 \perp_B f_2$. □

Next, we characterize the smoothness of an element in any nowhere vanishing, point separating sub-algebra of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$.

Theorem 3.7. *Let $\Gamma \subset \mathbb{C}$ be a simple closed curve, and \mathfrak{A} be a nowhere vanishing, point separating sub-algebra of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$. Let $f \in \mathfrak{A}$ be non-zero. Then f is a smooth point in $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$ if and only if M_f is a singleton set.*

Proof. We first prove the necessity. Suppose by contradiction that $z_1 \neq z_2 \in M_f$. Define $\Psi, \Phi : \mathfrak{A} \rightarrow \mathbb{C}$ by

$$\Psi(h) := \overline{\text{sgn}(f(z_1))}h(z_1), \quad \Phi(h) := \overline{\text{sgn}(f(z_2))}h(z_2), \quad h \in \mathfrak{A}.$$

Then Ψ and Φ are two support functionals of f . Also, $\Psi \neq \Phi$ since \mathfrak{A} is nowhere vanishing and point separating proving f is not a smooth point of \mathfrak{A} .

To prove the sufficiency, let $M_f = \{z_1\}$. Let $f \perp_B g$ and $f \perp_B h$ for some $g, h \in \mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$. If either of g, h is zero, then trivially $f \perp_B (g + h)$. Let g, h be non-zero. From Theorem 3.6, $\{(f(z), g(z)) : z \in M_f\}$ is a singleton orthogonality covering set. Therefore, by Example 3.4, $g(z_1) = 0$. A similar argument shows $h(z_1) = 0$. Hence $z_1 \in \mathcal{Z}_{g+h}$ and consequently by Proposition 3.1, $f \perp_B (g + h)$. \square

4. $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$ AND ZEROS OF HOLOMORPHIC FUNCTIONS

We begin this section with a simple observation:

Proposition 4.1. *Let $\Gamma \subset \mathbb{C}$ be a simple closed curve. Let $f \in \mathcal{J}(\Gamma)$ (see (1.1)). Then either f is constant on $\Gamma \cup \text{Int}(\Gamma)$ or f has a zero enclosed by Γ .*

Proof. Suppose by contradiction that f is non-zero on $\Omega' := \text{Int}(\Gamma)$. Hence, the minimum modulus principle yields

$$\min_{z \in \Gamma \cup \Omega'} |f(z)| = \min_{z \in \Gamma} |f(z)| = \|f\|.$$

Thus, $f(\Omega') \subseteq \{\|f\|e^{i\theta} : \theta \in [0, 2\pi)\}$. Clearly, $f(\Omega')$ is not open in \mathbb{C} while Ω' is and hence, f must be constant on Ω . \square

The first result of this section shows that Birkhoff-James orthogonality in nowhere vanishing, point separating sub-algebras of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$ has a deep connection with the zeros of holomorphic functions.

Theorem 4.2. *Let $\Gamma \subset \mathbb{C}$ be a simple closed curve, and \mathfrak{A} be a nowhere vanishing, point separating sub-algebra of $\mathcal{H}ol(\Gamma \cup \text{Int}(\Gamma))$. Let $f \in \mathcal{J}(\Gamma) \cap \mathfrak{A}$ and let $g \in \mathfrak{A}$. Then $f \not\perp_B g$ implies f and g have the same number of zeros enclosed by Γ .*

Proof. Since $f \not\perp_B g$, there exists $\lambda \in \mathbb{C} \setminus \{0\}$ such that $\|f + \lambda g\| < \|f\|$. Now, since $f \in \mathcal{J}(\Gamma)$,

$$|f(z) + \lambda g(z)| \leq \|f + \lambda g\| < \|f\| = |f(z)|, \quad \forall z \in \Gamma.$$

Since, f and $-\lambda g$ are holomorphic within and on Γ , by Rouché's Theorem, they have the same number of zeros enclosed by Γ , establishing the result. \square

The converse of the above theorem is not true as illustrated in the following example:

Example 4.3. Let $\Gamma := \{z \in \mathbb{C} : |z| = 1\}$. Let $f_1(z) = z$ and let $f_2(z) = z(z-1)$. Clearly, $f_1 \in \mathcal{J}(\Gamma)$. Since $1 \in M_{f_1} \cap \mathcal{Z}_{f_2}$, by Proposition 3.1, $f_1 \perp_B f_2$. However, f_1 and f_2 have the same number of zeros enclosed by Γ .

It follows from the above theorem that if \mathfrak{A} is any nowhere vanishing, point separating sub-algebra of $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ with $f \in \mathcal{J}(\Gamma) \cap \mathfrak{A}$, then for any $g \in \mathfrak{A}$ with f and g having different number of zeros enclosed by Γ , $f \perp_B g$. We record this observation in form of the following theorem.

Theorem 4.4. *Let $\Gamma \subset \mathbb{C}$ be a simple closed curve, and \mathfrak{A} be a nowhere vanishing, point separating sub-algebra of $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$. Let $f \in \mathcal{J}(\Gamma) \cap \mathfrak{A}$ and let $g \in \mathfrak{A}$. If f and g have different number of zeros enclosed by Γ , then $f \perp_B g$.*

It is easy to see that Corollary 3.2 is also a direct consequence of Theorem 4.4. We derive from Theorem 4.4 the following important inequality regarding polynomials.

Corollary 4.5. *Let $\Gamma := \{z \in \mathbb{C} : |z| = r\}$. Let $h_j(z) := z^j$, $z \in \mathbb{C}$ for $j \in \mathbb{N}$. Then*

$$\inf_{\lambda \in \mathbb{C}} \max_{z \in \Gamma} |h_n(z) + \lambda Q_m(z)| \geq r^n \text{ for every polynomial } Q_m \text{ of degree } m < n.$$

Proof. Clearly, $h_j \in \mathcal{J}(\Gamma)$ for every $j \in \mathbb{N}$. Now, Q_m and h_n have different number of zeros enclosed by Γ . Therefore, by Theorem 4.4, $h_n \perp_B P_m$ in $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ for all $m < n$. Thus, we have for every $\lambda \in \mathbb{C}$,

$$\max_{z \in \Gamma} |h_n(z) + \lambda Q_m(z)| = \|h_n + \lambda Q_m\| \geq \|h_n\| = r^n,$$

and the result follows. \square

Our next result relates Birkhoff-James orthogonality in $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ for a simple closed curve $\Gamma \subset \mathbb{C}$ with the fundamental theorem of algebra.

Theorem 4.6. *Let $\Gamma := \{z \in \mathbb{C} : |z| = r\}$ and $h_j(z) := z^j$, $z \in \mathbb{C}$ for $j \in \mathbb{N}$. If $Q(z) := a_n z^n + a_{n-1} z^{n-1} + \cdots + a_0$, $z \in \mathbb{C}$ with $a_n \neq 0$ and $r > \max\{1, \frac{1}{|a_n|} \sum_{k=0}^{n-1} |a_k|\}$, then $h_n \not\perp_B P$ in $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$.*

Proof. Since $r > \max\{1, \frac{1}{|a_n|} \sum_{k=0}^{n-1} |a_k|\}$,

$$\begin{aligned} \|a_n h_n - Q\| &= \|-(a_{n-1} h_{n-1} + a_{n-2} h_{n-2} + \cdots + a_0)\| \\ &\leq \|a_{n-1} h_{n-1}\| + \|a_{n-2} h_{n-2}\| + \cdots + \|a_1 h_1\| + \|a_0\| \\ &\leq r^{n-1} \{|a_{n-1}| + |a_{n-2}| + \cdots + |a_0|\} \\ &< r^n |a_n| \\ &= |a_n| \|h_n\|. \end{aligned}$$

Thus, $\|h_n - \frac{1}{a_n}Q\| < \|h_n\|$, giving $h_n \not\ll_B Q$. \square

We now obtain the fundamental theorem of algebra:

Corollary 4.7 (Fundamental Theorem of Algebra). *A polynomial of degree n has n zeros in \mathbb{C} .*

Proof. Let $Q(z) = a_n z^n + a_{n-1} z^{n-1} + \dots + a_0$, $a_n \neq 0$ and $r > \max\{1, \frac{1}{|a_n|} \sum_{k=0}^{n-1} |a_k|\}$.

Set $\Gamma := \{z \in \mathbb{C} : |z| = r\}$ and $h_j(z) := z^j$, $z \in \mathbb{C}$ for $j \in \mathbb{N}$. Then by Theorem 4.6, $h_n \not\ll_B Q$. Since $h_n \in \mathcal{J}(\Gamma)$, by Theorem 4.2, h_n and Q have the same number of zeros enclosed by Γ . Since $r > \max\{1, \frac{1}{|a_n|} \sum_{k=0}^{n-1} |a_k|\}$ was chosen arbitrarily, P has n number of zeros in \mathbb{C} . \square

Finally, we obtain a result regarding Birkhoff-James orthogonality between the n -th order derivatives of two holomorphic functions in $\mathcal{Hol}(\Gamma \cup \text{Int}(\Gamma))$ for a simple closed curve $\Gamma \subset \mathbb{C}$. The result also has a connection between Birkhoff-James orthogonality and zeros of the n -th order derivatives of holomorphic functions.

Theorem 4.8. *Let $\Gamma_1, \Gamma_2 \subset \mathbb{C}$ be two simple closed curves such that $\Gamma_2 \subset \text{Int}(\Gamma_1)$ and fix $0 < r < \text{dist}(\Gamma_1, \Gamma_2)$. Let $f, g \in \mathcal{Hol}(\Gamma_1 \cup \text{Int}(\Gamma_1))$ be such that $g^{(n)} \neq 0$ for some fixed natural number n and*

$$\max_{z \in \Gamma_1} |f(z) + \lambda_0 g(z)| < \frac{r^n}{n!} \max_{z \in \Gamma_2} |f^{(n)}(z)| \text{ for some } \lambda_0 \in \mathbb{C}.$$

Then $f^{(n)} \not\ll_B g^{(n)}$ in any nowhere vanishing, point separating sub-algebra of $\mathcal{Hol}(\Gamma_2 \cup \text{Int}(\Gamma_2))$ containing both the functions.

Using Theorem 4.2, we immediately derive the following:

Corollary 4.9. *Let Γ_1, Γ_2, r be as in Theorem 4.8. Let $f, g \in \mathcal{Hol}(\Gamma_1 \cup \text{Int}(\Gamma_1))$ be such that $f^{(n)} \in \mathcal{J}(\Gamma_2)$, $g^{(n)} \neq 0$ for some natural number n and*

$$\max_{z \in \Gamma_1} |f(z) + \lambda_0 g(z)| < \frac{r^n}{n!} \max_{z \in \Gamma_2} |f^{(n)}(z)| \text{ for some } \lambda_0 \in \mathbb{C}.$$

Then $f^{(n)}$ and $g^{(n)}$ have the same number of zeros enclosed by Γ_2 .

Proof of Theorem 4.8. We need to show that there exists some $\lambda \in \mathbb{C}$ such that

$$\max_{z \in \Gamma_2} |f^{(n)}(z) + \lambda g^{(n)}(z)| < \max_{z \in \Gamma_2} |f^{(n)}(z)|.$$

Since Γ_2 is compact,

$$\max_{z \in \Gamma_2} |f^{(n)}(z) + \lambda_0 g^{(n)}(z)| = |f^{(n)}(z_0) + \lambda_0 g^{(n)}(z_0)| \text{ for some } z_0 \in \Gamma_2.$$

Denote $\text{Int}(\Gamma_1)$ by Ω' . Let γ_r be the circle of radius r about z_0 . From hypotheses, $\gamma_r \subset \Omega'$. Now, by Cauchy's integral formula for the derivative, we have that

$$f^{(n)}(z_0) + \lambda_0 g^{(n)}(z_0) = \frac{n!}{2\pi i} \int_{\gamma_r} \frac{f(z) + \lambda_0 g(z)}{(z - z_0)^{n+1}} dz.$$

Taking modulus on both sides, we get

$$|f^{(n)}(z_0) + \lambda_0 g^{(n)}(z_0)| \leq \frac{n!}{r^n} \max_{z \in \gamma_r} |f(z) + \lambda_0 g(z)|,$$

since $\int_{\gamma_r} \left| \frac{dz}{(z - z_0)^{n+1}} \right| = \frac{2\pi}{r^n}$. Invoking the maximum modulus principle and noting $\gamma_r \subset \Omega'$ yields:

$$\max_{z \in \gamma_r} |f(z) + \lambda_0 g(z)| \leq \max_{z \in \Gamma_1} |f(z) + \lambda_0 g(z)|.$$

Thus,

$$|f^{(n)}(z_0) + \lambda_0 g^{(n)}(z_0)| < \frac{n!}{r^n} \max_{z \in \Gamma_1} |f(z) + \lambda_0 g(z)|.$$

Now, from the hypotheses,

$$\max_{z \in \Gamma_2} |f^{(n)}(z) + \lambda_0 g^{(n)}(z)| = |f^{(n)}(z_0) + \lambda_0 g^{(n)}(z_0)| < \max_{z \in \Gamma_2} |f^{(n)}(z)|.$$

Thus, $f^{(n)} \not\perp_B g^{(n)}$ in any nowhere vanishing, point separating sub-algebra of $\mathcal{Hol}(\Gamma_2 \cup \text{Int}(\Gamma_2))$ containing both the functions. \square
