# Coloring of ( $P_{5}, 4$-wheel)-free graphs 

Arnab Char* T. Karthick ${ }^{\dagger}$

January 3, 2022

#### Abstract

For a graph $G, \chi(G)(\omega(G))$ denote its chromatic (clique) number. A $P_{5}$ is the chordless path on five vertices, and a 4 -wheel is the graph consisting of a chordless cycle on four vertices $C_{4}$ plus an additional vertex adjacent to all the vertices of the $C_{4}$. In this paper, we show that every ( $P_{5}, 4$-wheel)-free graph $G$ satisfies $\chi(G) \leq \frac{3}{2} \omega(G)$. Moreover, this bound is almost tight. That is, there is a class of ( $P_{5}, 4$-wheel)-free graphs $\mathcal{L}$ such that every graph $H \in \mathcal{L}$ satisfies $\chi(H) \geq \frac{10}{7} \omega(H)$. This generalizes/improves several previously known results in the literature.

Keywords: Vertex coloring; $\chi$-boundedness; $P_{5}$-free graphs; Wheel-free graphs.

## 1 Introduction

All our graphs are simple and finite. Given a graph $G$, as usual, we write $\chi(G)$ to denote the chromatic number of $G$, and $\omega(G)$ to denote the size of a maximum clique in $G$. A graph $G$ is perfect, if every induced subgraph $H$ of $G$ satisfies $\chi(H)=\omega(H)$. As introduced by Gyárfás [15], a hereditary class of graphs $\mathcal{C}$ is said to be $\chi$-bounded, if there is a function $f: \mathbb{Z}^{+} \rightarrow \mathbb{Z}^{+}$(called a $\chi$-binding function for $\mathcal{C}$ ) such that every $G \in \mathcal{C}$ satisfies $\chi(G) \leq f(\omega(G))$. Obviously the class of perfect graphs is $\chi$-bounded with $f(x)=x$ as a $\chi$-binding function. Recently there has been much research on $\chi$-bounded classes of graphs; see [2, 7, 20, 21, 25] for examples. We refer to [22] for a comprehensive survey on $\chi$-bounded classes of graphs and their connections to other topics in graph theory.

Given a positive integer $k$, let $P_{k}$ denote the chordless (or induced) path on $k$ vertices, and for $k \geq 3, C_{k}$ denote the chordless (or induced) cycle on $k$ vertices. For $k \geq 4$, a $k$-wheel is the graph consisting of a cycle $C_{k}$ plus an additional vertex adjacent to all the vertices of the $C_{k}$. We say that a graph $G$ contains a graph $H$, if $G$ has an induced subgraph isomorphic to $H$. Given a family of graphs $\mathcal{F}$, a graph $G$ is $\mathcal{F}$-free if it does not contain any member of $\mathcal{F}$.

Gyárfás [15] showed that the class of $P_{t}$-free graphs is $\chi$-bounded with $\chi$-binding function $f(x)=(t-1)^{x-1}$. Gravier, Hoáng and Maffray [14] improved this result, and showed that for $t \geq 4$ and $\omega(G) \geq 2$, every $P_{t}$-free graph $G$ satisfies $\chi(G) \leq(t-2)^{\omega(G)-1}$. It is well-known that every $P_{4}$-free graph is perfect. Esperet, Lemoine, Maffray, Morel [10] showed that every $P_{5}$-free graph $G$ with $\omega(G) \geq 3$ satisfies $\chi(G) \leq 5 \cdot 3^{\omega(G)-3}$. Recently, Trotignon and Pham [25] posed the following question (see also [22]):

Problem 1 Is it true that, the class of $P_{5}$-free graphs is polynomially $\chi$-bounded?

[^0]More generally, Esperet [11] conjectured the following:
Conjecture 1 If $\mathcal{G}$ is a $\chi$-bounded class of graphs, then $\mathcal{G}$ is polynomially $\chi$-bounded.
Problem 1 is open even for a subclass of the class of $P_{5}$-free graphs, namely the class of $\left(P_{5}, C_{5}\right)$ free graphs. Chudnovsky and Sivaraman [9] showed that every ( $P_{5}, C_{5}$ )-free graph $G$ satisfies $\chi(G) \leq 2^{\omega(G)-1}$. Moreover, Fouquet, Giakoumakis, Maire and Thuillier [13] showed that there does not exist a linear $\chi$-binding function even for the class of $\left(P_{5}, P_{5}^{c}\right)$-free graphs. It is interesting to note that the existence of a polynomial $\chi$-binding function for the class of $P_{5}$-free graphs implies the Erdös-Hajnal conjecture for the class of $P_{5}$-free graphs; see [22]. Recently Scott, Seymour and Spirkl [23] showed that if $G$ is $P_{5}$-free and $\omega(G) \geq 3$, then $\chi(G) \leq \omega(G)^{\log _{2}(\omega(G))}$.

In this paper, we are interested in (smallest) $\chi$-binding functions for the class of $\left(P_{5}, H\right)$-free graphs, where $H$ is a connected graph on at most five vertices. Only very few graph classes have been investigated in this direction. It is well-known that every $P_{4}$-free graph is perfect. Esperet et al. [10] showed that every $\left(P_{5}, K_{4}\right)$-free graph $G$ satisfies $\chi(G) \leq 5$. It follows from a result of Randerath [19] that every ( $P_{5}$, paw)-free graph $G$ satisfies $\chi(G) \leq \omega(G)+1$. Recently, the second author with Chudnovsky, Maceli and Maffray [5] showed that every ( $P_{5}$, gem)-free graph $G$ satisfies $\chi(G) \leq\left\lceil\frac{5 \omega(G)}{4}\right\rceil$, and with Huang [16], he showed that every ( $P_{5}$, paraglider)-free graph $G$ satisfies $\chi(G) \leq \frac{3}{2} \omega(G)$. Chudnovsky and Sivaraman 9 showed that if a graph $G$ is ( $P_{5}$, bull)-free, then $\chi(G) \leq(\underset{2}{\omega(G)+1})$. Shiermeyer [24] recently studied the $\chi$-binding functions for ( $P_{5}$, butterfly)-free graphs and ( $P_{5}$, hammer)-free graphs. In this paper, we study the class of ( $P_{5}, 4$-wheel)-free graphs, and prove the following.

Theorem 1 If $G$ is a ( $P_{5}, 4$-wheel)-free graph, then $\chi(G) \leq \frac{3}{2} \omega(G)$. Moreover, there is a class of ( $P_{5}, 4$-wheel)-free graphs $\mathcal{L}$ such that every graph $H \in \mathcal{L}$ satisfies $\chi(H) \geq \frac{10}{7} \omega(H)$.

We note that Theorem 1 generalizes/improves the following known results.

- For every $\left(2 K_{2}, C_{4}\right)$-free graph $G, \chi(G)$ is either $\omega(G)$ or $\omega(G)+1$ [1, 15].
- Every $\left(2 K_{2}, 4\right.$-wheel)-free graph satisfies $\chi(G) \leq \omega(G)+5$ [18].
- Every ( $3 K_{1}, 4$-wheel)-free graph satisfies $\left.\chi(G) \leq 2 \omega(G) 4\right]$.
- Every ( $P_{5}$, diamond)-free graph satisfies $\chi(G) \leq \omega(G)+1$ [20].
- Every $\left(P_{5}, C_{4}\right)$-free graph $G$ satisfies $\chi(G) \leq\left\lceil\frac{5 \omega(G)}{4}\right\rceil[3]$.
- Every $\left(P_{5}, 4\right.$-wheel)-free graph $G$ satisfies $\chi(G) \leq 5\left\lceil\frac{5 \omega(G)}{4}\right\rceil[3]$.

The proof of Theorem 1 is derived from the structure theorem for the class of ( $P_{5}, 4$-wheel)-free graphs (Theorem 2) given below. Before stating it, we present some definitions. A clique (stable set) in $G$ is a set of pairwise adjacent (nonadjacent) vertices in $G$. A clique cutset in $G$ is a clique $Q$ in $G$ such that $G-Q$ has more connected components than $G$. A graph is an atom if it has no clique cutset. A graph $G$ is a quasi-line graph if for each $v \in V(G)$, the set of neighbors of $v$ can be expressed as the union of two cliques.

For any two sets $X, Y \subset V(G)$ of a graph $G$, we say that $X$ is complete (anticomplete) to $Y$ if every vertex in $X$ is adjacent (nonadjacent) to every vertex in $Y$. If $X$ is singleton, say $X=\{v\}$, then we simply write $v$ is complete (anticomplete) to $Y$, instead of $\{v\}$ is complete (anticomplete) to $Y$. Given two vertex-subsets $X$ and $Y$, we say that $X$ meets $Y$ if $X \cap Y \neq \emptyset$.

We say that a graph $G$ is nice if there are three disjoint stable sets $S_{1}, S_{2}$ and $S_{3}$ whose union meets each maximum clique of $G$ at least twice, and the other maximal cliques of $G$ at least once, that is, $\omega\left(G-\left(S_{1} \cup S_{2} \cup S_{3}\right)\right) \leq \omega(G)-2$.

Now we can state our structure theorem.

Figure 1: Example of a ( $P_{5}, 4$-wheel)-free graph $G^{*}$ with chromatic number 10 and clique number 7 (see also [4]). Here, a bold (or thick) line between two rectangles represents that every vertex inside a rectangle is adjacent to every vertex in the other. For example, the vertex $v_{5}$ is adjacent to both $b_{1}$ and $d_{1}$. Likewise, $v_{5}$ is adjacent to both $v_{7}$ and $v_{8}$.

Theorem 2 If $G$ is a connected ( $P_{5}, 4$-wheel)-free atom, then $G$ is either a perfect graph, a nice graph, or a quasi-line graph.

Theorem 2 is derived from Theorem 3 given below. (The proof of Theorem 3 is given in Section (4)

Theorem 3 If $G$ is a connected ( $P_{5}, 4$-wheel)-free atom, then one of the following holds:
(1) If $G$ has an induced 5 -wheel, then $G$ is a nice graph.
(2) If $G$ has an induced $C_{5}$ and has no induced 5 -wheel, then $G$ is either a nice graph or a quasi-line graph.
(3) If $G$ has an induced $C_{7}^{c}$ and has no induced $C_{5}$, then $G$ is a nice graph.

Proof of Theorem 2, assuming Theorem 3, Let $G$ be a connected ( $P_{5}, 4$-wheel)-free atom. We may assume that $G$ is not perfect. Then since $C_{2 k+1}$ for $k \geq 3$ contains an induced $P_{5}$, and since $C_{2 k+1}^{c}$ for $k \geq 4$ contains an induced 4 -wheel, by the Strong Perfect Graph Theorem [8], $G$ contains an induced $C_{5}\left(\cong C_{5}^{c}\right)$ or $C_{7}^{c}$. So it satisfies the hypothesis of one of the items of Theorem 3 and subsequently it satisfies the conclusion of this item. This proves Theorem 2,

Next we give a proof of Theorem 1 using Theorem 2, A blowup of a graph $H$ is any graph $G$ such that $V(G)$ can be partitioned into $|V(H)|$ (not necessarily nonempty) sets $Q_{v}, v \in V(H)$, such that each $Q_{v}$ induces a $P_{3}$-free graph, $Q_{u}$ is complete to $Q_{v}$ if $u v \in E(H)$, and $Q_{u}$ is anticomplete to $Q_{v}$ if $u v \notin E(H)$. A blowup is a clique-blowup if each $Q_{v}$ is a clique.
Proof of Theorem 1. Let $G$ be a ( $P_{5}, 4$-wheel)-free graph. We prove the first assertion by induction on $|V(G)|$. We may assume that $G$ is connected and not perfect. If $G$ has a clique cutset, say $Q$, let $V_{1}, V_{2}$ be a partition of $V(G) \backslash Q$ such that $V_{1}, V_{2} \neq \emptyset$, and $V_{1}$ is anticomplete to $V_{2}$. Then $\chi(G)=\max \left\{\chi\left(G\left[Q \cup V_{1}\right]\right), \chi\left(G\left[Q \cup V_{2}\right]\right)\right\} \leq \max \left\{\frac{3}{2} \omega\left(G\left[Q \cup V_{1}\right]\right), \frac{3}{2} \omega\left(G\left[Q \cup V_{2}\right]\right)\right\} \leq \frac{3}{2} \omega(G)$. So we may assume that $G$ is an atom, and we apply Theorem 2. If $G$ is a quasi-line graph, then by a
result of Chudnovsky and Ovetsky [6], we have $\chi(G) \leq \frac{3}{2} \omega(G)$. So suppose that $G$ is nice. Then $G$ has three stable sets $S_{1}, S_{2}$, and $S_{3}$ such that $\omega\left(G-\left(S_{1} \cup S_{2} \cup S_{3}\right)\right) \leq \omega(G)-2$. Consider any $\chi\left(G-\left(S_{1} \cup S_{2} \cup S_{3}\right)\right)$-coloring of $G-\left(S_{1} \cup S_{2} \cup S_{3}\right)$, and use $S_{1}, S_{2}$, and $S_{3}$ as three new color classes to get a coloring of $G$. Then we have $\chi(G) \leq \chi\left(G-\left(S_{1} \cup S_{2} \cup S_{3}\right)\right)+3 \leq \frac{3}{2}(\omega(G)-2)+3=\frac{3}{2} \omega(G)$. This proves the first assertion of Theorem [1.

To prove the second assertion of Theorem 1 , consider the clique-blowup $H$ of the graph $G^{*}$ shown in Figure 1 where $\left|Q_{v}\right|=k \geq 1$, for each $v \in V\left(G^{*}\right)$. Then it is shown in [4] that $H$ is ( $3 K_{1}, 4$-wheel)-free (and hence ( $P_{5}, 4$-wheel)-free), and that $\omega(H)=7 k$. Moreover, since $H$ has no stable set of size $3, \chi(H) \geq \frac{|V(H)|}{2}=\frac{20 k}{2}=10 k$. This completes the proof of Theorem $\mathbb{1}$.

The remainder of the paper is organized as follows. In Section 2, we give some preliminaries which are used in this paper. In Section 3, we present some useful structural properties of ( $P_{5}, 4$ -wheel)-free atoms that has an induced $C_{5}$, and finally in Section 4 we prove Theorem 3.

## 2 Preliminaries

We follow West [26] for standard notation and terminology. Let $G$ be a graph with vertex-set $V(G)$ and edge-set $E(G)$. The complement graph of $G$ is denoted by $G^{c}$. If $X \subseteq V(G)$, then $G[X]$ and $G-X$ respectively denote the subgraph induced by $X$ and $V(G) \backslash X$ in $G$. Given $u, v \in V(G)$, we say that a vertex $u$ is a neighbor of $v$ if $u$ and $v$ are adjacent in $G$. The neighborhood of a vertex $v$, denoted by $N_{G}(v)$, is the set of neighbors of $v$ in $G$ (and we drop the subscript $G$ when there is no ambiguity). If $X \subseteq V(G)$, then $N(X)$ denote the set $\{x \in V(G) \backslash X \mid x$ has a neighbor in $X\}$.

Given two vertex-disjoint graphs $G$ and $H$, the union $G \cup H$, is the graph with vertex-set $V(G) \cup V(H)$ and edge-set $E(G) \cup E(H)$. The union of $k$ graphs each isomorphic to $G$ is denoted by $k G$; for instance $2 K_{2}$ denotes the graph that consists union of two disjoint $K_{2}$ 's. An induced cycle $C_{k}$ with vertex-set $\left\{v_{1}, v_{2}, \ldots, v_{k}\right\}$ and edge-set $\left\{v_{1} v_{2}, v_{2} v_{3}, \ldots, v_{k-1} v_{k}, v_{k} v_{1}\right\}$ will be simply denoted by $v_{1}-v_{2} \cdots-v_{k}-v_{1}$. Likewise, an induced path $P_{k}$ with vertex-set $\left\{v_{1}, v_{2}, \ldots, v_{k}\right\}$ and edgeset $\left\{v_{1} v_{2}, v_{2} v_{3}, \ldots, v_{k-1} v_{k}\right\}$ will be simply denoted by $v_{1}-v_{2} \cdots \cdots-v_{k}$. For $k \geq 4$, a $k$-wheel is the graph with vertex-set $\left\{v_{1}, v_{2}, \ldots, v_{k}, c\right\}$ such that $v_{1}-v_{2}-\cdots-v_{k}-v_{1}$ is a $C_{k}$, and $c$ is complete to $\left\{v_{1}, \ldots, v_{k}\right\}$. A graph is said to be wheel-free if it has no induced $k$-wheel. A graph is chordal if it has no induced cycle of length at least four. For a positive integer $k$, we simply write $[k]$ to denote the set $\{1,2, \ldots, k\}$, and we say an index $i \in[k]$, if $i \in\{1,2, \ldots, k\}$ and $i$ modulo $k$.

For a set $U \subset V(G)$, let $R_{U}$ denote a maximum stable set of $U$, if $U \neq \emptyset$, otherwise let $R_{U}:=\emptyset$.
Let $G$ be a graph. Suppose $X$ is a subset of $V(G)$ that induces a $P_{3}$-free graph in $G$. Then each component of $G[X]$ is a complete subgraph of $G$, and so the set $X$ can be written as a disjoint union of (nonempty) cliques; each such clique is a maximal clique of $G[X]$, and we refer to such cliques as ' $X$-cliques'. We say that a set $S \subseteq V(G) \backslash X$ is complete to exactly one $X$-clique, if there is an $X$-clique, $K$, such that $S$ is complete to $K$, and anticomplete to $X \backslash K$. Let $v \in V(G) \backslash X$ be any vertex. We say that the vertex $v$ is good with respect to $X$ if it satisfy the following two conditions: (a) If $v$ has a neighbor in an $X$-clique, say $K$, then $v$ is complete to $K$, and (b) $v$ is complete to at least one $X$-clique.

We use the following simple observations often.
(O1) Let $G$ be a $P_{5}$-free graph. Let $A, B_{1}$ and $B_{2}$ be three disjoint, nonempty, and mutually anticomplete subsets of $V(G)$. Let $x$ and $y$ be two nonadjacent vertices in $V(G) \backslash\left(A \cup B_{1} \cup B_{2}\right)$ such that $x$ and $y$ have a common neighbor in $A, x$ has a neighbor in $B_{1}$, and $y$ has a neighbor in $B_{2}$. Then $x$ and $y$ must have a common neighbor in either $B_{1}$ or $B_{2}$.
(O2) Let $G$ be a 4 -wheel-free graph. Let $S$ be a subset of $V(G)$. If there are nonadjacent vertices $u, v \in V(G) \backslash S$ such that $\{u, v\}$ is complete to $S$, then $S$ induces a $P_{3}$-free graph.
(O3) Let $G$ be any graph. Let $D_{1}, D_{2}$ and $D_{3}$ be three disjoint, nonempty subsets of $V(G)$, each induces a $P_{3}$-free graph. Suppose that each $D_{i}$-clique is either complete or anticomplete to a $D_{j}$-clique, where $i \neq j \in\{1,2,3\}$. If $M$ is a maximal clique in $G$ containing at least one vertex from each $D_{1}$ and $D_{2}$, then $R_{D_{1}} \cup R_{D_{2}}$ meets $M$ twice.
Proof of (O3). If $M \cap D_{3}=\emptyset$, then clearly the assertion holds. So we may assume that $M \cap D_{3} \neq \emptyset$. Then by our assumption, $M$ is of the form $\cup_{i=1}^{3} D_{i}^{*}$, where $D_{i}^{*}$ is a $D_{i}$-clique. Since $R_{D_{1}}$ contains a vertex from $D_{1}^{*}$, and $R_{D_{2}}$ contains a vertex from $D_{2}^{*}$, we conclude that $R_{D_{1}} \cup R_{D_{2}}$ meets $M$ twice. This proves (O3), $\diamond$

Next we prove a structure theorem for a subclass of ( $P_{5}, 4$-wheel)-free graphs, namely the class of ( $3 K_{1}, 4$-wheel)-free graphs, and use it later.

Lemma 1 If $G$ is a ( $3 K_{1}, 4$-wheel)-free graph, then $G$ is either a quasi-line graph or a nice graph.
Proof of Lemma 1 Let $G$ be a ( $3 K_{1}, 4$-wheel)-free graph, and let $v \in V(G)$ be arbitrary. First suppose that $G[N(v)]$ is chordal. Since the complement graph of a $3 K_{1}$-free chordal graph is a $\left(K_{3}, 2 K_{2}, C_{5}\right)$-free graph (which is a bipartite graph), we see that $N(v)$ can be expressed as union of two cliques, and hence $G$ is a quasi-line graph, since $v$ is arbitrary. So we may assume that $G[N(v)]$ is not chordal. Then since $G$ does not contain a 4 -wheel, $G[N(v)]$ contains an induced $C_{k}$ for some $k \geq 5$. Since, for $k \geq 6, C_{k}$ contains an induced $3 K_{1}, G[N(v)]$ contains an induced $C_{5}$, say $C$. Hence $G$ contains a 5 -wheel, induced by the vertices $V(C) \cup\{v\}$. Then it is shown in Theorem 3 (Case 1.1) of [4] that $G$ is a clique-blowup of a 5 -wheel, say $W$ with the vertex-set $\left\{v_{1}, v_{2}, \ldots, v_{6}\right\}$ such that $v_{1}-v_{2}-\cdots-v_{5}-v_{1}$ is a $C_{5}$, and $v_{6}$ is complete to $\left\{v_{1}, \ldots, v_{5}\right\}$. By the definition of clique-blowup, $V(G)$ is partitioned into cliques $Q_{v_{i}}, v_{i} \in V(W)$. Then clearly $S_{1}:=R_{Q_{v_{1}}} \cup R_{Q_{v_{3}}}, S_{2}:=R_{Q_{v_{2}}} \cup R_{Q_{v_{4}}}$, and $S_{3}:=R_{Q_{v_{5}}}$ are three stable sets in $G$ such that $\omega\left(G-\left(S_{1} \cup S_{2} \cup S_{3}\right)\right) \leq \omega(G)-2$, and so $G$ is nice. This proves Lemma 1

We will also use the following lemma.
Lemma 2 ([17]) Let $G$ be a graph. Let $A$ and $B$ be two disjoint cliques such that $G[A \cup B]$ is $C_{4}$-free. If every vertex in $A$ has a neighbor in $B$, then some vertex in $B$ is complete to $A$.

For the reader's convenience, we give a sketch of the graph (in most cases), and we use the following representations: The shapes (circles or ovals) represent a collection of sets into which the vertex-set of the graph is partitioned. The sets inside an oval form a partition of that set. Each shaded shape represents a nonempty clique, and other shapes induce a $P_{3}$-free subgraph. A solid line between any two shapes represents that the respective sets are complete to each other. A dashed line between any two shapes represents that the adjacency between these sets are arbitrary, but are restricted with some conditions. The absence of a line between any two shapes represents that the respective sets are anticomplete to each other.

## 3 Structural properties of ( $P_{5}, 4$-wheel)-free atoms with a $C_{5}$

In this section, we present some important and useful structural properties of ( $P_{5}, 4$-wheel)-free atoms with an induced $C_{5}$, and use them in Section 4 .

Let $G$ be a connected ( $P_{5}, 4$-wheel)-free atom. Suppose that $G$ contains an induced $C_{5}$, say $v_{1}-v_{2}-v_{3}-v_{4}-v_{5}-v_{1}$. Then we may assume that there are five nonempty and pairwise disjoint sets
$A_{1}, A_{2}, \ldots, A_{5}$ such that for each $i$ modulo 5 the set $A_{i}$ is complete to $A_{i-1} \cup A_{i+1}$, and anticomplete to $A_{i-2} \cup A_{i+2}$. Let $A:=A_{1} \cup \cdots \cup A_{5}$. We choose these sets such that $A$ is maximal, and let $v_{i} \in A_{i}$. From now on, in this section, every subscript is understood modulo 5. Let $T:=\{x \in$ $V(G) \backslash A \mid x$ has no neighbor in $A\}, Z:=\left\{x \in V(G) \backslash A \mid x\right.$ has a neighbor in each $\left.A_{i}, i \in[5]\right\}$, and for each $i \in[5]$ : let $X_{i}:=\left\{x \in V(G) \backslash A \mid x\right.$ has a neighbor in each $A_{j}, j \in\{i, i+2, i-$ 2\}, and anticomplete to $\left.A_{i-1} \cup A_{i+1}\right\}$, and $Y_{i}:=\left\{x \in V(G) \backslash A \mid x\right.$ has a neighbor in each $A_{j}, j \in$ [5], $j \neq i$, and anticomplete to $\left.A_{i}\right\}$. Let $X:=X_{1} \cup \cdots \cup X_{5}$ and $Y:=Y_{1} \cup \cdots \cup Y_{5}$. Then:
(F1) $V(G)=A \cup X \cup Y \cup Z \cup T$.
Suppose there is a vertex $p \in V(G) \backslash(A \cup X \cup Y \cup Z \cup T)$. Since $p \notin T, p$ has a neighbor in $A$. Then since $p \notin X \cup Y \cup Z$, up to symmetry, we have two cases. (1) Suppose $p$ has a neighbor $a_{i} \in A_{i}$, and anticomplete to $A_{i-1} \cup A_{i-2} \cup A_{i+2}$. Then $p-a_{i}-v_{i-1}-v_{i-2}-v_{i+2}$ is a $P_{5}$, a contradiction. (2) Suppose $p$ has neighbors $a_{i-1} \in A_{i-1}$ and $a_{i+1} \in A_{i+1}$, and anticomplete to $A_{i-2} \cup A_{i+2}$. Then $p$ is complete to $A_{i-1}$ for otherwise for any nonneighbor of $p$ in $A_{i-1}$, say $b_{i-1}, b_{i-1}-v_{i-2}-v_{i+2}-a_{i+1}-p$ is a $P_{5}$, a contradiction. Likewise, $p$ is complete to $A_{i+1}$. But then $p$ can be added to $A_{i}$ contradicting the maximality of $A$. These contradictions complete the proof of (F1).

Moreover, the following statements hold, for each $i \in[5]$ :
(F2) $G\left[A_{i}\right]$ is $P_{3}$-free. So $G[A]$ is a blowup of $C_{5}$.
If $G\left[A_{i}\right]$ contains an induced $P_{3}$, say $u_{1}-u_{2}-u_{3}$, then $\left\{u_{1}, v_{i+1}, u_{3}, v_{i-1}, u_{2}\right\}$ induces a 4 -wheel, a contradiction. This proves (F2).
(F3) $X_{i}$ is complete to $A_{i}$.
If there are nonadjacent vertices, say $x \in X_{i}$ and $p \in A_{i}$, then for any neighbor of $x$ in $A_{i+2}$, say $a_{i+2}$, we see that $v_{i-1}-p-v_{i+1}-a_{i+2}-x$ is a $P_{5}$, a contradiction. This proves (F3).
(F4) If $K$ is an $A_{i+2}$-clique (or an $A_{i-2}$-clique), then any $x \in X_{i}$ which has a neighbor in $K$, is complete to $K$. In particular, if $A_{i+2}$ is a clique, then $X_{i}$ is complete to $A_{i+2}$. Likewise, if $A_{i-2}$ is a clique, then $X_{i}$ is complete to $A_{i-2}$.

By symmetry, it is enough to prove the assertion for $A_{i+2}$. If $x \in X_{i}$ is not complete to $K$, then by assumption, there are vertices $a, b$ in $K$ such that $a b, a x \in E$ and $b x \notin E$. But then by (F3), $b-a-x-v_{i}-v_{i-1}$ is a $P_{5}$, a contradiction. This proves (F4).
(F5) Each vertex $X_{i}$ is good with respect to $A_{i+2}$, and $A_{i-2}$.
The proof of (F5) follows from the definition of $X_{i}$, (F2) and (F4).
(F6) Each vertex in $X_{i}$ is complete to either $A_{i+2}$ or $A_{i-2}$.
Let $x \in X_{i}$, and suppose that the assertion is not true. Then there are vertices $p \in A_{i+2}$ and $q \in A_{i-2}$ such that $x$ is anticomplete to $\{p, q\}$. By the definition of $X_{i}, x$ has a neighbor in $A_{i+2}$, say $r$. Then by (F2) and (F4), $p r \notin E$. But then by (F3), $p-q-r-x-v_{i}$ is a $P_{5}$, a contradiction. This proves (F6).
(F7) Any two nonadjacent vertices in $X_{i}$ have a common neighbor in $A_{i+2}$, and in $A_{i-2}$.

The proof of (F7) follows from the definition of $X_{i},(\mathrm{~F} 2)$ to (F4), and by (O1).
(F8) If $X_{i}$ has two nonadjacent vertices which are complete to $A_{i+2} \cup A_{i-2}$, then $A_{i+2} \cup A_{i-2}$ is a clique.

Suppose there are nonadjacent vertices in $A_{i+2}$, say $a$ and $a^{\prime}$. Let $x, x^{\prime}$ be two nonadjacent vertices in $X_{i}$ which are complete to $A_{i+2} \cup A_{i-2}$. Then for any $a^{\prime \prime} \in A_{i-2},\left\{x, a, x^{\prime}, a^{\prime}, a^{\prime \prime}\right\}$ induces a 4 -wheel, a contradiction. So $A_{i+2}$ is a clique. Likewise, $A_{i-2}$ is a clique. This proves (F8).
(F9) If some $x \in X_{i}$ has a neighbor in $T$, then $x$ is complete to $A_{i-2} \cup A_{i+2}$.
Let $t \in T$ be a neighbor of $x$. By (F3) and (F6), we may assume that $x$ is complete to $A_{i} \cup A_{i-2}$. If $x$ has a nonneighbor in $A_{i+2}$, say $p$, then $p-v_{i+1}-v_{i}-x-t$ is a $P_{5}$, a contradiction. So $x$ is complete to $A_{i+2}$. This proves (F9).
(F10) $G\left[X_{i}\right]$ is $P_{3}$-free.
Suppose to the contrary that $G\left[X_{i}\right]$ induces a $P_{3}$ with vertex-set $\left\{a_{1}, a_{2}, a_{3}\right\}$. Then by (F6) and by the pigeonhole principle, we may assume that $\left\{a_{1}, a_{2}\right\}$ is complete to $A_{i-2}$. Also by the definition of $X_{i}, a_{3}$ has a neighbor in $A_{i-2}$, say $p$. Then by (F3), $\left\{v_{i}, a_{1}, a_{2}, a_{3}, p\right\}$ induces a 4-wheel, a contradiction. This proves (F10).
(F11) $X_{i}$ is complete to $X_{i+1} \cup X_{i-1}$.
Let $x \in X_{i}$ and $x^{\prime} \in X_{i+1}$, and suppose that $x, x^{\prime}$ are nonadjacent. By definition, pick a neighbor of $x^{\prime}$ in $A_{i-1}$, say $p$, and a neighbor of $x$ in $A_{i+2}$, say $q$. Then by (F3), $p-x^{\prime}-v_{i+1}-q-x$ is a $P_{5}$, a contradiction. So $X_{i}$ is complete to $X_{i+1}$. Likewise, $X_{i}$ is complete to $X_{i-1}$. This proves (F11). ■
(F12) Let $K$ be an $X_{i}$-clique. Then the following hold:
(a) Suppose that there is a vertex $x \in X_{i+2}$ which is anticomplete to $K$, and $Q$ is an $A_{i-2}$-clique such that $N(K) \cap Q \neq \emptyset$. Then $K$ is complete to $Q$.
(b) Suppose that there is a vertex $x \in X_{i-2}$ which is anticomplete to $K$, and $Q^{\prime}$ is an $A_{i+2}$-clique such that $N(K) \cap Q^{\prime} \neq \emptyset$. Then $K$ is complete to $Q^{\prime}$.

We prove $(a)$, and the proof of $(b)$ is similar. Suppose that the assertion is not true. Then there are vertices $p \in K$ and $r \in Q$ such that $p r \notin E$. By assumption, there is a vertex $q \in K$ such that $q$ has a neighbor in $Q$, and hence by (F4), $q r \in E$. Then for any neighbor of $x$ in $A_{i-1}$, say $a$, we see that $p-q-r-a-x$ is a $P_{5}$, a contradiction. This proves (F12).
(F13) Suppose $K$ is an $X_{i}$-clique and $K^{\prime}$ is an $X_{i+2}$-clique such that $K$ is complete to $K^{\prime}$. Then the following hold:
(a) $K$ is anticomplete to $X_{i+2} \backslash K^{\prime}$ (likewise, $K^{\prime}$ is anticomplete to $X_{i} \backslash K$ ), and $X_{i} \backslash K$ is anticomplete to $X_{i+2} \backslash K^{\prime}$.
(b) $K$ is complete to exactly one $A_{i+2}$-clique. Likewise, $K^{\prime}$ is complete to exactly one $A_{i}$-clique.
(c) $K$ is anticomplete to $X_{i-2}$. Likewise, $K^{\prime}$ is anticomplete to $X_{i-1}$.
(a): Suppose to the contrary that $K$ is not anticomplete to $X_{i+2} \backslash K^{\prime}$. Then there are vertices $u \in K, v \in K^{\prime}$ and $w \in X_{i+2} \backslash K^{\prime}$ such that $u v, u w \in E$ and $v w \notin E$. Then by (F7), $v$ and $w$ have a common neighbor in $A_{i}$, say $p$. But then for any neighbor of $u$ in $A_{i+2}$, say $q$, by (F3), $\{p, v, q, w, u\}$ induces a 4 -wheel, a contradiction. So $K$ is anticomplete to $X_{i+2} \backslash K^{\prime}$. Likewise, $K^{\prime}$ is anticomplete to $X_{i} \backslash K$. This proves the first assertion of $(a)$.

To prove the second assertion of (a), suppose there are adjacent vertices, say $u^{\prime} \in X_{i} \backslash K$ and $v^{\prime} \in X_{i+2} \backslash K^{\prime}$. Then for any $v \in K^{\prime}$, since $v v^{\prime} \notin E$, by (F7), $v$ and $v^{\prime}$ have a common neighbor in $A_{i-1}$, say $p$. But then for any $u \in K$, by using the first assertion of ( $a$ ), we see that $u-v-p-v^{\prime}-u^{\prime}$ is a $P_{5}$, a contradiction. This proves the second assertion of $(a)$.
(b): First we show that each vertex in $K$ is complete to exactly one $A_{i+2}$-clique. Suppose not. Then by (F5), there are vertices $p \in K$ and $a, a^{\prime} \in A_{i+2}$ such that $p a, p a^{\prime} \in E$ and $a a^{\prime} \notin E$. But then for any $q \in K^{\prime}$, and for any neighbor of $p$ in $A_{i-2}$, say $r$, by (F3), $\left\{r, a, q, a^{\prime}, p\right\}$ induces a 4 -wheel, a contradiction. So each vertex in $K$ is complete to exactly one $A_{i+2}$-clique. Now we show that $K$ is complete to exactly one $A_{i+2}$-clique. Suppose not. Then by (F4) and by the earlier argument, there are vertices $u, v \in K$ and $p \in A_{i+2}$ such that $u p \in E$ and $v p \notin E$. Then by (F6), $v$ is complete to $A_{i-2}$. But then for any neighbor of $u$ in $A_{i-2}$, say $a$, and for any $q \in K^{\prime}$, by (F3), $\{a, v, q, p, u\}$ induces a 4 -wheel, contradiction. This proves (b).
(c): Let $u \in K$ and $v \in X_{i-2}$, and suppose $u, v$ are adjacent. Let $r \in K^{\prime}$. By (F11), $v$ and $r$ are adjacent. Now pick any neighbor of $u$ in $A_{i+2}$, say $p$, and in $A_{i-2}$, say $q$. Then by (F3), $\{p, q, v, r, u\}$ induces a 4 -wheel, a contradiction. This proves ( $c$ ).

This completes the proof of (F13).
(F14) Let $K$ be an $X_{i}$-clique and $K^{\prime}$ be an $X_{i-1}$-clique. If $Q$ is an $A_{i+2}$-clique such that $N(K) \cap$ $Q \neq \emptyset$ and $N\left(K^{\prime}\right) \cap Q \neq \emptyset$, then $K \cup K^{\prime}$ is complete to $Q$.

We prove the assertion for $i=1$. Suppose that $K$ is not complete to $Q$. Then there are vertices $p \in K$ and $r \in Q$ such that $p r \notin E$. By assumption, there is a vertex $q \in K$ such that $q$ has a neighbor in $Q$, and so by (F4), $q r \in E$. Also by our assumption, there is a vertex $w \in K^{\prime}$ such that $w$ has a neighbor in $Q$, and again by (F4), $w r \in E$. Since $p$ is not complete to $A_{3}, p$ is complete to $A_{4}$, and so $p$ and $q$ share a common neighbor in $A_{4}$, say $x$. Then since $X_{1}$ is complete to $X_{5}$ (by (F11)), we see that $\{w, r, x, p, q\}$ induces a 4 -wheel, a contradiction. So $K$ is complete to $Q$. Likewise, $K^{\prime}$ is complete to $Q$. This proves (F14).

For each $i \in[5]$, if $X_{i} \neq \emptyset$, let $\mathbb{W}_{i}$ denote the set $\left\{X^{*} \cup A^{*} \mid X^{*}\right.$ is an $X_{i}$-clique and $A^{*}$ is an $A_{i}$-clique such that $\left.\left|X^{*} \cup A^{*}\right|=\omega(G)\right\}$, otherwise let $\mathbb{W}_{i}:=\emptyset$. Next we have the following:
(F15) Let $K$ be an $X_{i}$-clique and $K^{\prime}$ be an $X_{i+1}$-clique, and let $A_{i}^{*}$ be an $A_{i}$-clique, and $A_{i+1}^{*}$ be an $A_{i+1}$-clique. Suppose $K \cup A_{i}^{*} \in \mathbb{W}_{i}$ and $K^{\prime} \cup A_{i+1}^{*} \in \mathbb{W}_{i+1}$. Then for any $A_{i+2}$-clique $D_{i-2}$, $K \cup K^{\prime} \cup D_{i-2}$ is not a clique.

By (F11), $K \cup K^{\prime}$ is a clique. Suppose there is an $A_{i-2}$-clique, say $D$, such that $K \cup K^{\prime} \cup D$ is a clique. Let $q:=\omega(G)$. Then $\left|K \cup K^{\prime}\right|<q$ (since $D \neq \emptyset$ ). Then since $\left|K \cup A_{i}^{*}\right|+\left|K^{\prime} \cup A_{i+1}^{*}\right|=2 q$, we have $2 q=\left|A_{i}^{*} \cup A_{i+1}^{*}\right|+\left|K \cup K^{\prime}\right|<\left|A_{i}^{*} \cup A_{i+1}^{*}\right|+q$, and hence $\left|A_{i}^{*} \cup A_{i+1}^{*}\right|>q$, a contradiction since $A_{i}^{*} \cup A_{i+1}^{*}$ is a clique. This proves (F15).
(F16) Let $Q$ be the vertex-set of a component of $G[T]$. Then each vertex in $X_{i}$ is either complete or anticomplete to $Q$.

Otherwise, there are adjacent vertices $q, q^{\prime}$ in $Q$, and a vertex $x \in X_{i}$ such that $x q \in E$ and $x q^{\prime} \notin E$; but then by (F3), $q^{\prime}-q-x-v_{i}-v_{i-1}$ is a $P_{5}$, a contradiction. This proves (F16),
(F17) For $j \in\{i-1, i+1\}$, if $A_{j}$ is not a clique, then $Y_{i}$ is complete to $A_{j}$.
We may assume, up to symmetry, that $j=i+1$. Let $y \in Y_{i}$. Then by the definition of $Y_{i}, y$ has a neighbor in $A_{i+1}$, say $p$. Let $K$ be the $A_{i+1}$-clique containing $p$. Since $A_{i+1}$ is not a clique, $A_{i+1} \backslash K \neq \emptyset$. Now if $y$ is nonadjacent to some $q \in A_{i+1} \backslash K$ (say), then for any neighbor of $y$ in $A_{i-2}$, say $r$, we see that $q-v_{i}-p-y-r$ is a $P_{5}$, a contradiction; so $y$ is complete to $A_{i+1} \backslash K$. By the same argument, since $A_{i+1} \backslash K$ is nonempty, $y$ is complete to $K$. This proves (F17), since $y$ is arbitrary.
(F18) Each vertex in $Y_{i}$ is complete to either $A_{i-1}$ or $A_{i+1}$.
Let $y \in Y_{i}$. Suppose $y$ has a nonneighbor in each $A_{i-1}$ and $A_{i+1}$, say $a$ and $a^{\prime}$ respectively. So by (F17), $A_{i-1}$ and $A_{i+1}$ are cliques. Now by the definition of $Y_{i}$, pick any neighbor of $y$ in each $A_{i-1}$ and $A_{i+1}$, say $b$ and $b^{\prime}$ respectively. Then $a-b-y-b^{\prime}-a^{\prime}$ is a $P_{5}$, a contradiction. This proves (F18). -
(F19) Let $Q$ be the vertex-set of a component of $G[T]$. Then each vertex in $Y_{i}$ is either complete or anticomplete to $Q$.

Otherwise, there are adjacent vertices $q, q^{\prime}$ in $Q$, and a vertex $y \in Y_{i}$ such that $y q \in E$ and $y q^{\prime} \notin E$; but then for any neighbor of $y$ in $A_{i+1}$, say $a$, we see that $q^{\prime}-q-y-a-v_{i}$ is a $P_{5}$, a contradiction. This proves (F19).
(F20) If $Z=\emptyset$, then $G[T]$ is $P_{3}$-free.
Suppose that there is a component of $G[T]$ which has an induced $P_{3}$, say $t_{1}-t_{2}-t_{3}$, and let $Q$ be the vertex-set of that component. Since $G$ is connected, and since $N(Q) \cap(X \cup Y)$ is not a clique cutset, there are nonadjacent vertices in $N(Q) \cap(X \cup Y)$, say $u$ and $v$. Then by (F16) and (F19), $\{u, v\}$ is complete to $Q$; but then $\left\{u, t_{1}, v, t_{3}, t_{2}\right\}$ induces a 4 -wheel, a contradiction. This proves (F20).

So if $Z=\emptyset$, then, by (F20), (F16) and (F19), each vertex in $X \cup Y$ is either anticomplete or good with respect to $T$.
(F21) Suppose there are vertices $t \in T, u \in X_{i}$ and $v \in X_{i-2} \cup X_{i+2} \cup Y_{i} \cup Y_{i+1} \cup Y_{i-1} \cup Z$ such that $u t \in E$ and $u v \notin E$. Let $K$ be the $X_{i}$-clique containing $u$. Then the following hold:
(a) $t$ is adjacent to $v$.
(b) If $v$ is anticomplete to $K$, then $t$ is complete to $K$. Moreover, if $T^{*}$ is the component of $T$ containing $t$, then $T^{*}$ is complete to $K$.

First note that $v$ has a neighbor in one of $A_{i-1}, A_{i+1}$. We may assume, up to symmetry, that $v$ has a neighbor in $A_{i-1}$, say $p$. So $v \notin X_{i-2} \cup Y_{i-1}$.
(a): Suppose $t$ is nonadjacent to $v$. If $v$ is nonadjacent to some vertex in $A_{i}$, say $q$, then, by (F3), $v-p-q-u-t$ is a $P_{5}$, a contradiction; so $v$ is complete to $A_{i}$. Thus $v \notin Y_{i}$, and so $v \in X_{i+2} \cup Y_{i+1} \cup Z$. Then since $u t \in E$, by (F9), $u$ is complete to $A_{i+2}$, and so $u$ and $v$ have a common neighbor in $A_{i+2}$, say $r$. But then $t-u-r-v-p$ is a $P_{5}$, a contradiction. This proves (a).
$(b)$ : If there is a vertex $u^{\prime} \in K$ such that $u^{\prime} t \notin E$, then by $(a), u^{\prime}-u-t-v-p$ is a $P_{5}$, a contradiction. This proves the first assertion of $(b)$. The second assertion of (b) follows from (F16).

## 4 Structure of ( $P_{5}, 4$-wheel)-free atoms

In this section, we give a proof of Theorem 3. Indeed, we prove each of the item in Theorem 3 separately, and are given below in Theorems 4 , 5and 6 respectively. In most cases we show that $G$ is nice, and to do the same it is enough to find three stable sets $S_{1}, S_{2}$, and $S_{3}$ such that $S_{1} \cup S_{2} \cup S_{3}$ meets each maximum clique of $G$ at least twice, and other maximal cliques at least once.

### 4.1 Structure of ( $P_{5}, 4$-wheel)-free atoms with an induced 5 -wheel

Let $G$ be a connected ( $P_{5}, 4$-wheel)-free atom that contains an induced 5 -wheel, say with the 5 -cycle $v_{1}-v_{2}-v_{3}-v_{4}-v_{5}-v_{1}$ plus a vertex $z^{*}$ that is adjacent to $v_{i}$, for all $i \in[5]$. Then we define the sets $A$, $X, Y, Z$ and $T$ as in Section 3 with $v_{i} \in A_{i}$ for each $i \in[5]$, and we use the facts (F1) (F21) shown in Section 3. Note that $z^{*} \in Z$. Moreover, the graph $G$ has some more structural properties, and are given in Lemmas 3 to 5 below.

Lemma 3 For $i \in[5]$, the following properties hold:
(i) Let $K$ be an $A_{i}$-clique. If a vertex in $Z$ has a neighbor in $K$, then it is complete to $K$, and anticomplete to $A_{i} \backslash K$. More precisely, each vertex in $Z$ is complete to exactly one $A_{i}$-clique.
(ii) There is an index $j \in[5]$ such that $A_{j}, A_{j-2}$ and $A_{j+2}$ are cliques.
(iii) $Z$ is a clique.
(iv) There is an $A_{i}$-clique, say $A_{i}^{*}$, such that $Z$ is complete to $A_{i}^{*}$, and anticomplete to $A_{i} \backslash A_{i}^{*}$.
(v) $R_{A_{i+2}} \cup R_{A_{i-2}}$ meets each maximal clique of $G$ in $G\left[Z \cup A_{i+2} \cup A_{i-2}\right]$ twice.

Proof of Lemma 3 (i): Let $z \in Z$, and suppose $z$ has a neighbor in $K$, say $p$. Pick a neighbor of $z$ in each $A_{i+1}$ and $A_{i-1}$, say $a$ and $a^{\prime}$ respectively. If there is a vertex $q \in K$ which is nonadjacent to $z$, then since $K$ is a clique, $p q \in E$, and then $\left\{a, z, a^{\prime}, q, p\right\}$ induces a 4 -wheel, a contradiction; so $z$ is complete to $K$. Next, if there is a vertex $r \in A_{i} \backslash K$ which is adjacent to $z$, then clearly $p q \notin E$, and then $\left\{p, a, q, a^{\prime}, z\right\}$ induces a 4 -wheel, a contradiction; So $z$ is anticomplete to $A_{i} \backslash K$. This proves Lemma 3:(i), $\diamond$
(ii): We first show that, for $i \in[5]$, each vertex in $Z$ is complete to either $A_{i}$ or $A_{i+1}$. Suppose not. Then there are vertices $b \in A_{i}$ and $b^{\prime} \in A_{i+1}$ such that $z b, z b^{\prime} \notin E$. Now pick a neighbor of $z$ in each $A_{i}$ and $A_{i-2}$, say $a$ and $a^{\prime}$, respectively. Then by Lemma $3:(i), a b \notin E$; but then $b-b^{\prime}-a-z-a^{\prime}$ is a $P_{5}$, a contradiction. So each vertex in $Z$ is complete to either $A_{i}$ or $A_{i+1}$. Then for $i \in[5]$, since $z^{*} \in Z$ is complete to exactly one $A_{i}$-clique (by Lemma $\left.3:(i)\right)$, we see that either $A_{i}$ or $A_{i+1}$ is a clique, and so Lemma 3:(ii) holds. $\diamond$
(iii): Suppose there are nonadjacent vertices, say $z_{1}, z_{2}$ in $Z$. Then by Lemma $3:(i i)$, we may assume that $A_{1}$ and $A_{3}$ are cliques. So by Lemma 3:(i), $\left\{z_{1}, z_{2}\right\}$ is complete to $A_{1} \cup A_{3}$. Also, by the definition of $Z,(\mathrm{O} 1)$ and by Lemma $3:(i)$, it follows that $z_{1}$ and $z_{2}$ have a common neighbor in $A_{2}$, say $p$. Then $\left\{v_{1}, z_{1}, v_{3}, z_{2}, p\right\}$ induces a 4 -wheel, a contradiction. This proves Lemma 3:(iii), $\diamond$ (iv): By Lemma 3:(ii), we may assume that $A_{1}, A_{3}$ and $A_{4}$ are cliques. So by Lemma 3:(i), for $j \in\{1,3,4\}, A_{j}$ is our required $A_{j}^{*}$. This implies that $Z$ is complete to $A_{j}$, for $j \in\{1,3,4\}$. Next we prove that $A_{2}^{*}$ and $A_{5}^{*}$ exist. Suppose, up to symmetry, $A_{2}^{*}$ does not exist. Then by Lemma 3: $(i)$, there are vertices $z_{1}, z_{2} \in Z$, and a vertex $p \in A_{2}$ such that $z_{1} p \in E$ and $z_{2} p \notin E$. By Lemma 3:(iii), $z_{1} z_{2} \in E$. Then $\left\{v_{1}, p, v_{3}, z_{2}, z_{1}\right\}$ induces a 4 -wheel, a contradiction. So $A_{2}^{*}$ exists. This proves Lemma 3:(iv), $\diamond$
$(v)$ : The proof follows from (F2), Lemma 3:(iii) and Lemma 3:(iv).

Throughout this subsection, for $i \in[5], A_{i}^{*}$ is an $A_{i}$-clique as in Lemma 3:(iv), Note that by Lemma 3:(iv), since $z^{*} \in Z$, for $i \in[5]$, we have $v_{i} \in A_{i}^{*}, Z$ is complete to $\left\{v_{1}, v_{2}, \ldots, v_{5}\right\}$, and if $A_{i}$ is a clique, then $A_{i}=A_{i}^{*}$ and $Z$ is complete to $A_{i}$.

Lemma 4 For $i \in[5]$, the following properties hold:
(i) $X_{i}$ is anticomplete to $Z$.
(ii) For $j \in\{i-2, i+2\}, X_{i}$ is complete to $A_{j}^{*}$, and anticomplete to $A_{j} \backslash A_{j}^{*}$.
(iii) $R_{A_{i+2}} \cup R_{A_{i-2}}$ meets each maximum clique of $G$ in $G\left[X_{i} \cup A_{i+2} \cup A_{i-2}\right]$ twice.
(iv) $X_{i}$ is anticomplete to $X_{i+2} \cup X_{i-2}$.
(v) $Y$ is empty.
(vi) If a vertex in $X_{i}$ has a neighbor in $T$, then $A_{i-2}$ and $A_{i+2}$ are cliques.

Proof of Lemma 4 ( $i$ ): Let $x \in X_{i}$ and $z \in Z$, and suppose $x, z$ are adjacent. By (F3) and (F6), we may assume that $x$ is complete to $A_{i} \cup A_{i+2}$. Then $\left\{v_{i}, v_{i+1}, v_{i+2}, x, z\right\}$ induces a 4 -wheel, a contradiction. This proves Lemma 4:(i). $\diamond$
(ii): By Lemma 3:(ii), we may assume that $A_{i-2}$ is a clique; so $A_{i-2}=A_{i-2}^{*}$. Then by (F4), $X_{i}$ is complete to $A_{i-2}$. Next we prove for $j=i+2$. Pick any $x \in X_{i}$. Then by Lemma 4:(i), $z^{*} x \notin E$. Also by (F3), $x$ and $z^{*}$ have a common neighbor in $A_{i}$. Then by definitions of $X_{i}$ and $Z$, Lemma $3:(i v)$, and by (O1), $x$ and $z^{*}$ must have a common neighbor in $A_{i+2}^{*}$, say $p$. So by (F4), $x$ is complete to $A_{i+2}^{*}$. Next, if $x$ is adjacent to some vertex in $A_{i+2} \backslash A_{i+2}^{*}$, say $q$, then $q-x-p-z^{*}-v_{i-1}$ is a $P_{5}$, a contradiction. So $x$ is anticomplete to $A_{i+2} \backslash A_{i+2}^{*}$. This proves Lemma 4:(ii), since $x \in X_{i}$ is arbitrary. $\diamond$
(iii): Since $R_{A_{i+2}}$ contains a vertex of $A_{i+2}^{*}$, and $R_{A_{i-2}}$ contains a vertex of $A_{i-2}^{*}$, the proof follows from (F2), (F10), and from Lemma 4:(ii). $\diamond$
(iv): Let $x \in X_{i}$ and $x^{\prime} \in X_{i+2}$, and suppose $x, x^{\prime}$ are adjacent. By Lemma 4:(i), $z^{*}$ is nonadjacent to both $x$ and $x^{\prime}$, and by Lemma 3:(iv) and Lemma 4:(ii), $v_{i-2}$ is complete to $\left\{x, z^{*}\right\}$. But now $v_{i+1}-z^{*}-v_{i-2}-x-x^{\prime}$ is a $P_{5}$, a contradiction. This proves Lemma 4:(iv). $\diamond$
$(v)$ : Suppose not, and let $y \in Y_{i}$. Then by (F17) and Lemma 3:(iv), $y$ and $z^{*}$ have a common neighbor in both $A_{i+1}$ and $A_{i-1}$, say $p$ and $q$, respectively. If $z^{*} y \in E$, then $\left\{y, q, v_{i}, p, z^{*}\right\}$ induces a 4 -wheel, a contradiction; so we may assume that $z^{*} y \notin E$. Then by definitions of $Y_{i}$ and $Z$, (F17), Lemma 3:(iv) and by (O1), $z^{*}$ and $y$ must have a common neighbor in $A_{i+2}^{*}$, say $b$, and in $A_{i-2}$, say $a$. Then $\left\{p, y, a, z^{*}, b\right\}$ induces a 4 -wheel, a contradiction. This proves Lemma 4:(v), $\diamond$
(vi): Let $x \in X_{i}$ be a vertex such that $x$ has a neighbor in $T$. Then by (F9), $x$ is complete to $A_{i-2} \cup A_{i+2}$. Now the conclusion follows from Lemma 4:(ii).

Lemma 5 The following properties hold:
(i) Let $Q$ be the vertex-set of a component of $G[T]$. Then there is an index $j \in[5]$ such that $N(Q) \cap X_{j}$ is nonempty, and is complete to $Q$. In particular, every vertex in $T$ has a neighbor in $X$.
(ii) $Z$ is complete to $T$.
(iii) $G[T]$ is $P_{3}$-free.

Proof of Lemma區 ( $i$ : We know, by Lemma 4:(v), that $Y=\emptyset$. Since $Z$ is a clique (by Lemma 3:(iii)), and since $N(Q) \cap Z$ is not a clique cutset, we see that $N(Q) \cap X \neq \emptyset$. So there is an index $j \in[5]$ such that $N(Q) \cap X_{j} \neq \emptyset$. Pick any $x \in N(Q) \cap X_{j}$. Then, by (F16), $x$ is complete to $Q$. This proves Lemma 5: $(i)$, $\diamond$
(ii): Since $X$ is anticomplete to $Z$ (by Lemma 4:(i)), the proof follows from Lemma 5:(i) and (F21): $(a) . \diamond$
(iii): Let $Q$ be the vertex-set of a component of $G[T]$. Suppose to the contrary that $G[Q]$ contains a $P_{3}$, say $p-q-r$. Then by Lemma $5:(i)$, for some $j \in[5]$, there is a vertex $x \in X_{j}$ which is complete to $Q$. But then by Lemma 4:(i) and Lemma 5:(ii), $\left\{p, z^{*}, r, x, q\right\}$ induces a 4 -wheel, a contradiction. This proves Lemma 5:(iii), since $Q$ is arbitrary.

(b)

Figure 2: Sketch of the graph $G$ in Theorem 4. (a) When $T=\emptyset$. (b) Case 1. (c) Case 2.
Now we give our main result of this subsection, and is given below.
Theorem 4 If a connected ( $P_{5}, 4$-wheel)-free atom $G$ contains an induced 5 -wheel, then $G$ is nice.
Proof of Theorem 4. Let $G$ be a connected ( $P_{5}, 4$-wheel)-free atom that contains an induced 5 wheel, say with the 5 -cycle $v_{1}-v_{2}-v_{3}-v_{4}-v_{5}-v_{1}$ plus a vertex $z^{*}$ that is adjacent to $v_{i}$, for all $i \in[5]$. Then we define the sets $A, X, Y, Z$ and $T$ as in Section 3 with $v_{i} \in A_{i}$ for each $i \in[5]$. We use the facts (F1) (F21) shown in Section 3, and properties in Lemmas 3 to 5. Let $\mathcal{M}$ denote the set of maximum cliques in $G$. To prove the theorem, it is enough to find three stable sets $S_{1}, S_{2}$, and $S_{3}$ such that $S_{1} \cup S_{2} \cup S_{3}$ meets each maximum clique of $G$ at least twice, and other maximal cliques at least once. First suppose that $T=\emptyset$. (See Figure 2; (a) for a sketch of $G$.) By Lemma 3:(ii) and up to relabeling, we may assume that $A_{3}$ is a clique. Then, by (F15), one of $\mathbb{W}_{1}, \mathbb{W}_{5}$ is empty. We may assume that $\mathbb{W}_{5}=\emptyset$, and so either $X_{5}=\emptyset$ or no maximum clique of $G$ is in $G\left[X_{5} \cup A_{5}\right]$. Now we let $S_{1}:=R_{A_{1}} \cup R_{A_{3}} \cup R_{X_{2}}, S_{2}:=R_{A_{2}} \cup R_{A_{4}} \cup R_{X_{3}}, S_{3}:=R_{A_{5}} \cup R_{X_{1}} \cup R_{X_{4}}$, and let $S:=S_{1} \cup S_{2} \cup S_{3}$. Clearly $S_{1}, S_{2}$ and $S_{3}$ are stable sets. By Lemma 4:(ii) and Lemma 4:(iii), $S$ meets each maximal clique of $G$ in $G[A \cup X]$ twice. Also, by Lemma 3:(v), $S$ meets each maximal clique of $G$ in $G[A \cup Z]$ twice. So, by Lemma $4:(i)$, we see that $S_{1}, S_{2}$ and $S_{3}$ are the required stable sets. Hence we may assume that $T \neq \emptyset$. By Lemma 5:(iii), we know that $G[T]$ is $P_{3}$-free. Let $L$ consist of one vertex from each $T$-clique. Let $L^{\prime}$ consist of one vertex (which is not in $L$ ) from each nontrivial $T$-clique; otherwise we let $L^{\prime}:=\emptyset$. Moreover:

Claim 1 Let $Q$ be a $T$-clique and let $K$ be an $X_{i}$-clique. Then $Q$ is either complete or anticomplete to $K$.

Proof of Claim 1. Since $Z \neq \emptyset$, the proof follows from Lemma 4:(i) and from (F21) (b). $\diamond$
So any maximal clique containing vertices from both an $X_{i}$-clique $X_{i}^{*}$ and a $T$-clique $T^{*}$ is $X_{i}^{*} \cup T^{*}$.

Claim 2 If $T^{*}$ is a $T$-clique such that $Z \cup T^{*} \in \mathcal{M}$ or $X_{i}^{*} \cup T^{*} \in \mathcal{M}$, where $X_{i}^{*}$ is an $X_{i}$-clique and $i \in[5]$, then $\left|T^{*}\right| \geq 2$.

Proof of Claim 图 If $Z \cup T^{*} \in \mathcal{M}$, then since $Z \cup A_{1}^{*} \cup A_{2}^{*}$ is a clique (by Lemma 3:(iii) and Lemma $3:(i v) \mid$, we have $\left|Z \cup T^{*}\right| \geq\left|Z \cup A_{1}^{*} \cup A_{2}^{*}\right|$, and thus $\left|T^{*}\right| \geq 2$. Now if $X_{i}^{*} \cup T^{*} \in \mathcal{M}$, then since $X_{i}^{*} \cup A_{i+2} \cup A_{i-2}$ is a clique (by Lemma 4:(ii) and Lemma 4:(vi) , we have $\left|X_{i}^{*} \cup T^{*}\right| \geq$ $\left|X_{i}^{*} \cup A_{i+2} \cup A_{i-2}\right|$, and so $\left|T^{*}\right| \geq 2$. This proves Claim 2 $\diamond$

Now we prove the theorem in two cases:
Case 1 Suppose there is an index $j \in[5], X_{j}, X_{j+2}, X_{j-2} \neq \emptyset$.
Then by Lemma 4:(iv), Lemma 5:(i) and (F21), we see that $T$ is complete to $X$. So by Lemma 4:(vi), for each $i \in[5], A_{i}$ is a clique (so $A_{i}=A_{i}^{*}$ ), and so by (F4), $X_{i}$ is complete to $A_{i-2} \cup A_{i+2}$. See Figure 22( $(b)$ for a sketch of $G$. First suppose that for any $T$-clique $T^{*}, Z \cup T^{*} \notin \mathcal{M}$. Now if there is an index $i \in[5]$ such that $\mathbb{W}_{i} \neq \emptyset$, then we let $k=i$, otherwise we let $k=j$. Then since for each $i \in[5], A_{i}$ is a clique, by (F15), $\mathbb{W}_{k-1}, \mathbb{W}_{k+1}=\emptyset$. So we let $S_{1}:=R_{A_{k}} \cup R_{A_{k+2}} \cup R_{T}$, $S_{2}:=R_{A_{k+1}} \cup R_{A_{k-2}} \cup R_{X_{k+2}}$, and $S_{3}:=R_{A_{k-1}} \cup R_{X_{k}} \cup R_{X_{k-2}}$. Then, since $R_{T} \cup R_{X_{k}} \cup R_{X_{k+2}} \cup R_{X_{k-2}}$ meets each maximum clique of $G$ in $G[X \cup Z \cup T]$ twice, and the other maximal cliques in $G[X \cup Z \cup T]$ once, by Lemma 4:(iii) and Lemma 3:(v), we see that $S_{1}, S_{2}$ and $S_{3}$ are the desired stable sets. So suppose that there is a $T$-clique $T^{*}$ such that $Z \cup T^{*} \in \mathcal{M}$. Then, by Claim 2, $\left|T^{*}\right| \geq 2$. Now for any $X_{i}$-clique $X_{i}^{*}$, and for any $X_{i+1}$-clique $X_{i+1}^{*}$, by (F11), $\left|Z \cup T^{*}\right| \geq\left|X_{i}^{*} \cup X_{i+1}^{*} \cup T^{*}\right|$, and thus $|Z| \geq\left|X_{i}^{*} \cup X_{i+1}^{*}\right|$. So, the following hold:
(a) For each $i \in[5]$, since $Z \cup A_{i} \cup A_{i+1}$ is a larger clique than $X_{i}^{*} \cup A_{i}$, we have $\mathbb{W}_{i}=\emptyset$.
(b) For each $i \in[5]$, since $Z \cup A_{i+2} \cup A_{i-2}$ is a larger clique than $X_{i}^{*} \cup X_{i+1}^{*} \cup A_{i-2}$, we have $X_{i}^{*} \cup X_{i+1}^{*} \cup A_{i-2} \notin \mathcal{M}$.
(c) If there is a $T$-clique $T_{1}$ such that $X_{i}^{*} \cup X_{i+1}^{*} \cup T_{1} \in \mathcal{M}$, then since $|Z| \geq\left|X_{i}^{*} \cup X_{i+1}^{*}\right|$, we have $Z \cup T_{1} \in \mathcal{M}$; so $\left|T_{1}\right| \geq 2$ (by Claim 2).

Now, by Claim 2 and (c), $L \cup L^{\prime}$ meets each maximum clique of $G$ in $G[X \cup Z \cup T]$ twice, and the other maximal cliques in $G[X \cup Z \cup T]$ once. So we let $S_{1}:=R_{A_{1}} \cup R_{A_{3}}, S_{2}:=R_{A_{2}} \cup R_{A_{5}} \cup L$, and $S_{3}:=R_{A_{4}} \cup L^{\prime}$. Then, by (a), (b), Lemma 4:(iii) and Lemma 3:(v), we see that $S_{1}, S_{2}$ and $S_{3}$ are the required stable sets.
Case 2 For each $j \in[5]$, at least one of $X_{j}, X_{j+2}, X_{j-2}$ is empty.
Then there is an index $i \in[5]$ such that $X_{i} \neq \emptyset$ and $X \backslash X_{i}=\emptyset$ or $X_{i-1}, X_{i} \cup X_{i+1} \neq \emptyset$ and $X \backslash\left(X_{i-1} \cup X_{i} \cup X_{i+1}\right)=\emptyset$, say $i=1$. By Lemma 5:(i), Lemma 4:(vi) and by (F21), we may assume that $A_{3}$ is a clique. By Claim 11 any $T$-clique $T^{*}$ that is anticomplete to $X_{1}$, is complete to an $X_{2}$-clique or an $X_{5}$-clique (or to both, if $X_{2} \cup X_{5} \neq \emptyset$, by (F21)); so by Lemma 4:(vi), $A_{4}$ is a clique (if $X_{2} \neq \emptyset$ ), and $\left|T^{\prime}\right| \geq 2$ (by Claim 2). See Figure 2) $(c)$. Now if $\mathbb{W}_{1} \neq \emptyset$, then by (F15), $\mathbb{W}_{2} \cup \mathbb{W}_{5}=\emptyset$, and we let $S_{1}:=R_{A_{2}} \cup R_{A_{5}} \cup R_{X_{1}}, S_{2}:=R_{A_{1}} \cup R_{A_{4}} \cup L$ and $S_{3}:=R_{A_{3}} \cup L^{\prime}$, and if $\mathbb{W}_{1}=\emptyset$, then we let $S_{1}:=R_{A_{1}} \cup R_{X_{2}} \cup R_{X_{5}}, S_{2}:=R_{A_{2}} \cup R_{A_{4}} \cup L$ and $S_{3}:=R_{A_{3}} \cup R_{A_{5}} \cup L^{\prime}$. Then, as earlier by using Lemma 4:(iii), it is not hard to verify that $S_{1}, S_{2}$ and $S_{3}$ are the desired stable sets.

This completes the proof of Theorem (4)

## 4.2 ( $P_{5}$, wheel)-free atoms that contains an induced $C_{5}$

Since each $k$-wheel, for $k \geq 6$ has an induced $P_{5}$, by Theorem 4, we consider only ( $P_{5}$, wheel)-free atoms. Let $G$ be a connected ( $P_{5}$, wheel)-free atom that contains an induced $C_{5}$, say $v_{1}-v_{2}-v_{3}-v_{4}{ }^{-}$ $v_{5}-v_{1}$. Then we define the sets $A, X, Y, Z$ and $T$ as in Section 3 with $v_{i} \in A_{i}$, for each $i$, and we use the facts (F1) (F21) shown in Section 3. Let $\mathcal{M}$ be the set of maximum cliques of $G$. Since $G$ is 5 -wheel-free, clearly $Z=\emptyset$. Thus, if $T \neq \emptyset$, then $G[T]$ is $P_{3}$-free (by (F20) , and recall that
by (F16) and (F19), each vertex in $X \cup Y$ is either anticomplete or good with respect to $T$. Let $L$ consist of one vertex from each $T$-clique; otherwise let $L:=\emptyset$, and let $L^{\prime}$ consist of one vertex (which is not in $L$ ) from each nontrivial $T$-clique; otherwise let $L^{\prime}:=\emptyset$. Moreover, the graph $G$ has some more structural properties, and are given in Lemmas 6 to 14 below.

Lemma 6 For $i \in[5]$, the following properties hold:
(i) Suppose that $X_{i}$ and $X_{i+1}$ are nonempty. If there is a vertex $p \in A_{i-2}$ that is complete to $X_{i} \cup X_{i+1}$, then $X_{i} \cup X_{i+1}$ is a clique.
(ii) Suppose $K$ is an $X_{i}$-clique and $K^{\prime}$ is an $X_{i+2}$-clique. Then $K$ is complete to $K^{\prime}$ or $K$ is anticomplete to $K^{\prime}$.
(iii) Let $K$ be an $X_{i}$-clique, and let $K^{\prime}$ be an $X_{i+2}$-clique such that $K$ is anticomplete to $K^{\prime}$. Then either $K$ is complete to $A_{i+2}$ or $K^{\prime}$ is complete to $A_{i}$.
(iv) If $X_{i+1} \neq \emptyset$, then $X_{i}$ is anticomplete to $X_{i+2}$.
(v) No vertex in $T$ has neighbors in three consecutive $X_{i}$ 's.

Proof of Lemma 6. (i): If $X_{i}$ and $X_{i+1}$ are cliques, then by (F11), the assertion holds. So, up to symmetry, suppose that there are nonadjacent vertices in $X_{i}$, say $x$ and $x^{\prime}$. Let $x^{\prime \prime} \in X_{i+1}$. Then by (F11), $x^{\prime \prime}$ is complete to $\left\{x, x^{\prime}\right\}$. Also, by our assumption, $p$ is complete to $\left\{x, x^{\prime}, x^{\prime \prime}\right\}$. Moreover, by (F7), $x$ and $x^{\prime}$ have a common neighbor in $A_{i+2}$, say $q$. Now $\left\{x, q, x^{\prime}, x^{\prime \prime}, p\right\}$ induces a 4-wheel, a contradiction. So $X_{i}$ is a clique, and by (F11), $X_{i} \cup X_{i+1}$ is a clique. This proves Lemma 6:(i). $\diamond$ (ii): It is enough to show that if a vertex in $K$ has a neighbor in $K^{\prime}$, then it is complete to $K^{\prime}$. Suppose not. Then there are vertices $u \in K$ and $v, w \in K^{\prime}$ such that $u v, v w \in E$ and $u w \notin E$. If $v$ and $w$ have a common neighbor in $A_{i}$, say $p$, then for any neighbor of $u$ in $A_{i+2}$, say $q$, by (F3), $\{p, u, q, w, v\}$ induces a 4 -wheel, a contradiction. So we may assume that $v$ and $w$ do not share a common neighbor in $A_{i}$. So by the definition of $X_{i+2}$ and (F6), both $v$ and $w$ are complete to $A_{i-1}$. Also there is a vertex $r \in A_{i}$ such that $r v \in E$ and $r w \notin E$. But then for any neighbor of $u$ in $A_{i+2}$, say $a$, by (F3), $\left\{u, r, v_{i-1}, w, a, v\right\}$ induces a 5 -wheel, a contradiction. This proves Lemma 6:(ii). $\diamond$ (iii): Suppose there are vertices, say $x \in K, a \in A_{i+2}, a^{\prime} \in A_{i}$ and $x^{\prime} \in K^{\prime}$ such that $x a, x^{\prime} a^{\prime} \notin E$. Let $a^{\prime \prime} \in A_{i+2}$ be a neighbor of $x$. Then by (F4), $a a^{\prime \prime} \notin E$. But then by (F3), $a-x^{\prime}-a^{\prime \prime}-x-a^{\prime}$ is a $P_{5}$, a contradiction. This proves Lemma 6:(iii). $\diamond$
(iv): Let $x \in X_{i}$ and $x^{\prime} \in X_{i+2}$, and suppose $x, x^{\prime}$ are adjacent. Let $u \in X_{i+1}$. By (F6), we may assume that $u$ is complete to $A_{i-2}$. Now pick a neighbor of $x$ in $A_{i+2}$, say $p$, and a neighbor of $x$ in $A_{i-2}$, say $q$. Then by (F3) and (F11), $\left\{q, u, x^{\prime}, p, x\right\}$ induces a 4 -wheel, a contradiction. This proves Lemma 6:(iv), $\diamond$
$(v)$ : Suppose there is a vertex, say $t \in T$ which has neighbors, say $x_{1} \in X_{1}, x_{2} \in X_{2}$ and $x_{3} \in X_{3}$. By Lemma 6:(iv), $x_{1} x_{3} \notin E$. Pick any $a \in A_{4}$ and $a^{\prime} \in A_{5}$. Then by (F9), $x_{1} a, x_{2} a^{\prime}, x_{3} a^{\prime} \in E$, and then $\left\{t, x_{1}, a, a^{\prime}, x_{3}, x_{2}\right\}$ induce a 5 -wheel, a contradiction. This proves Lemma 6:(v).

Lemma 7 For $i \in[5]$, let $j, k \in\{i+2, i-2\}$ and $j \neq k$, and let $G\left[X_{i} \cup A_{i+2} \cup A_{i-2}\right] \cong H$. Then the following hold.
(i) If $M$ is a maximum clique in $H$ such that $M \cap A_{i+2} \neq \emptyset$ and $M \cap A_{i-2} \neq \emptyset$, then $R_{A_{i+2}} \cup R_{A_{i-2}}$ meets $M$ twice.
(ii) Let $X^{*} \subseteq X_{i}$ be a nonempty clique. If every vertex in $A_{j}$ has a nonneighbor in $X^{*}$, then $A_{k}$ is a clique.
(iii) If $M$ is a maximum clique in $H$ with $M \cap A_{j}=\emptyset$, then $M \cap X_{i} \neq \emptyset, A_{k}$ is a clique, and $M \cap A_{k}=A_{k}$. Moreover, $R_{X_{i}} \cup R_{A_{i+2}} \cup R_{A_{i-2}}$ meets each maximum clique in $H$ twice, and $R_{A_{i+2}} \cup R_{A_{i-2}}$ meets each maximal clique in $H$ at least once.
(iv) If $Y=\emptyset$, and if there is a maximum clique $M$ in $H$ with $|M|=\omega(G)$ and $M \cap A_{i-2}=\emptyset$ (or $\left.M \cap A_{i+2}=\emptyset\right)$, then $G$ is a nice graph .

Proof of Lemma 7 ( $i$ ): If $M \cap X_{i}=\emptyset$, then, by (F2), clearly the assertion holds; so assume that $M \cap X_{i} \neq \emptyset$. Let $K$ be an $A_{i+2}$-clique such that $M \cap A_{i+2} \subseteq K$. We claim that $M \cap A_{i+2}=K$. Suppose not, and let $b \in K \backslash\left(M \cap A_{i+2}\right)$. Since $K$ is a clique, $b$ is complete to $M \cap A_{i+2}$. By (F4), $M \cap X_{i}$ is complete to $b$. By the definition of $A, b$ is complete to $M \cap A_{i-2}$. So $b$ is complete to $M$, and hence $M \cup\{b\}$ is a larger clique in $G\left[X_{i} \cup A_{i+2} \cup A_{i-2}\right]$, a contradiction; so $M \cap A_{i+2}$ is an $A_{i+2}$-clique. By (F2), $R_{A_{i+2}}$ contains a vertex from each $A_{i+2}$ clique, and $R_{A_{i-2}}$ contains a vertex from each $A_{i-2}$ clique, we see that $R_{A_{i+2}} \cup R_{A_{i-2}}$ meets $M$ twice. This proves Lemma 7:(i)., $\diamond$
(ii): Suppose that $i=1, j=4$, and there are nonadjacent vertices in $A_{3}$, say $a, a^{\prime}$. Since $v_{4} \in A_{4}$, $v_{4}$ has a nonneighbor in $X^{*}$, say $x$. Let $p$ be a neighbor of $x$ in $A_{4}$, and let $x^{\prime}$ be a nonneighbor of $p$ in $X^{*}$. Then, by (F6), $\left\{x, x^{\prime}\right\}$ is complete to $\left\{a, a^{\prime}\right\}$, and then $\left\{p, a, x^{\prime}, a^{\prime}, x\right\}$ induces a 4 -wheel, a contradiction. This proves Lemma 7:(ii). $\diamond$
( $i i i$ ): To prove the first assertion, we let $j=i-2$. Since $A_{i-2}$ is complete to $A_{i+2}$, clearly $M \cap X_{i} \neq \emptyset$. Since $M \cap A_{i-2}=\emptyset$, every vertex in $A_{i-2}$ has a nonneighbor in $M \cap X_{i}$, and hence, by Lemma 7:(ii), $A_{i+2}$ is a clique. Then, by (F4), $M \cap X_{i}$ is complete to $A_{i+2}$; so $M \cap A_{i+2}=A_{i+2}$. To prove the second assertion, let $M^{\prime}$ be a maximum clique in $H$. By Lemma $7:(i)$, we may assume that one of $M^{\prime} \cap A_{i+2}=\emptyset, M^{\prime} \cap A_{i-2}=\emptyset$. If $M^{\prime} \cap A_{i-2}=\emptyset$, then by the first assertion, since $A_{i+2}$ is a clique, $M^{\prime}=X^{*} \cup A_{i+2}$, where $X^{*}$ is an $X_{i}$-clique. Thus $R_{X_{i}} \cup R_{A_{i+2}}$ meets $M^{\prime}$ twice, and $R_{A_{i+2}}$ meets $M^{\prime}$ at least once. Likewise, if $M^{\prime} \cap A_{i+2}=\emptyset$, then $R_{X_{i}} \cup R_{A_{i-2}}$ meets $M^{\prime}$ twice, and $R_{A_{i-2}}$ meets $M^{\prime}$ at least once. This proves Lemma $7:(i i i)$, $\diamond$
(iv): To prove the assertion, we let $i=1$, and suppose that $M \cap A_{4}=\emptyset$. As shown in the proof of second assertion of Lemma $7:(i i i), M=X^{*} \cup A_{3}$, where $X^{*}$ is an $X_{1}$-clique. Let $x \in X^{*}$, and let $a \in A_{4}$ be a neighbor of $x$. Then $a$ has a non-neighbor in $X^{*}$, say $x^{\prime}$. Then:
(a) For any $p \in X_{5}$, by (F11) and (F4), $M \cup\{p\}$ is a clique, a contradiction; so $X_{5}=\emptyset$.
(b) If there is a vertex $p \in X_{3}$, for any neighbor of $p$ in $A_{5}$, say $q$, since $p-q-a-x-x^{\prime}$ is not a $P_{5}$, $p$ is adjacent to one of $x, x^{\prime}$, then, by Lemma 6:(ii), $p$ is complete to $X^{*}$, and then, by (F3), $M \cup\{p\}$ is a clique, a contradiction; so $X_{3}=\emptyset$.
(c) Suppose there is a vertex $p \in X_{4}$. Then for any neighbor of $p$ in $A_{2}$, say $q, q-p-a-x-x^{\prime}$ is not a $P_{5}, p$ is adjacent to one of $x, x^{\prime}$. Let $K$ be the $X_{4}$-clique containing $p$. Then, by Lemma 6:(ii), $K$ is complete to $X^{*}$, and then, by (F13), $X^{*}$ is complete to exactly one $A_{4}$-clique, say $K^{\prime}$. Then since $M \cup K^{\prime}$ is a clique, a contradiction. So $X_{4}=\emptyset$.
(d) If there are adjacent vertices, say $t \in T$ and $x_{2} \in X_{2}$, and if $K$ is the $X_{2}$-clique containing $x_{2}$, and $Q$ is the $A_{4}$-clique containing $a$, then by (F9), $x_{2}$ is complete to $A_{4}$, and then since $N(K) \cap Q \neq \emptyset$ and $N\left(X^{*}\right) \cap Q \neq \emptyset$, by (F14), $a x^{\prime} \in E$, a contradiction; so $X_{2}$ is anticomplete to $T$.
(e) If $M^{\prime}$ is a maximal clique in $G$ such that $M^{\prime} \cap T \neq \emptyset$, then since $G$ is an atom, by ( $d$ ), $M^{\prime} \cap X_{1} \neq$ $\emptyset$, then, by (F9), for any $A_{3}$-clique $D$, and any $A_{4}$-clique $D^{\prime},\left|\left(M^{\prime} \cap X_{1}\right) \cup D \cup D^{\prime}\right| \leq M$. Hence $\left|M^{\prime} \cap T\right| \geq 2$.

Now by (F3), (F16) and Lemma 7:(iii), the sets $S_{1}:=R_{A_{2}} \cup R_{A_{5}} \cup R_{X_{1}}, S_{2}:=R_{A_{1}} \cup R_{A_{3}} \cup R_{X_{2}} \cup L$, and $S_{3}:=R_{A_{4}} \cup L^{\prime}$ are the required stable sets. So $G$ is nice. This proves Lemma 7:(iv).

Lemma 8 If $Y$ is empty, and if there is an $i \in[5]$ such that $X_{i}$ is not anticomplete to $X_{i+2}$, then $G$ is nice.

Proof of Lemma 8. We may assume that $i=1$. Then there are vertices $x_{1} \in X_{1}$ and $x_{3} \in X_{3}$ such that $x_{1} x_{3} \in E$. Then by Lemma $6:(i v), X_{2}=\emptyset$; so $X=X_{1} \cup X_{3} \cup X_{4} \cup X_{5}$. Let $Q_{1}$ be the $X_{1}$-clique containing $x_{1}$, and let $Q_{3}$ be the $X_{3}$-clique containing $x_{3}$. Then by Lemma 6:(ii) and (F13), $Q_{1}$ is complete to $Q_{3}$, and anticomplete to $\left(X_{3} \backslash Q_{3}\right) \cup X_{4}, Q_{3}$ is anticomplete to $\left(X_{1} \backslash Q_{1}\right) \cup X_{5}$, and $X_{1} \backslash Q_{1}$ is anticomplete to $X_{3} \backslash Q_{3}$. By (F13), let $A_{1}^{*}$ be the $A_{1}$-clique such that $Q_{3}$ is complete to $A_{1}^{*}$, and anticomplete to $A_{1} \backslash A_{1}^{*}$, and let $A_{3}^{*}$ be the $A_{3}$-clique such that $Q_{1}$ is complete to $A_{3}^{*}$, and anticomplete to $A_{3} \backslash A_{3}^{*}$. By (F7) and (F5), $X_{1}$ is complete to $A_{3}^{*}$, and $X_{3}$ is complete to $A_{1}^{*}$.

Note that any maximal clique containing at least one vertex from each $X_{1}$ and $X_{3}$ is either $A_{1}^{*} \cup Q_{1} \cup Q_{3}$ or $A_{3}^{*} \cup Q_{1} \cup Q_{3}$. By (F13), any maximal clique containing at least one vertex from each $X_{1}$ and $X_{4}$ is of the form $D_{1} \cup X_{1}^{*} \cup X_{4}^{*}$ or $D_{4} \cup X_{1}^{*} \cup X_{4}^{*}$, where $D_{1}, D_{4}, X_{1}^{*}$ and $X_{4}^{*}$ are $A_{1}$, $A_{4}, X_{1}$ and $X_{4}$-cliques respectively, and $X_{1}^{*} \neq Q_{1}$. Also, any maximal clique containing at least one vertex from each $X_{3}$ and $X_{5}$ is of the form $D_{3} \cup X_{3}^{*} \cup X_{5}^{*}$ or $D_{5} \cup X_{3}^{*} \cup X_{5}^{*}$, where $D_{3}, D_{5}, X_{3}^{*}$, $X_{5}^{*}$ are $A_{3}, A_{5}, X_{3}$ and $X_{5}$-cliques respectively, and $X_{3}^{*} \neq Q_{3}$.

By Lemma $7:(i v)$, we may assume that each maximal clique of $G$ in $G\left[X_{i} \cup A_{i+2} \cup A_{i+2}\right]$ has nonempty intersection with both $A_{i+2}$ and $A_{i-2}$; and by Lemma 7:(iii), $R_{A_{i+2}} \cup R_{A_{i-2}}$ meets rest of the maximal cliques in $G\left[X_{i} \cup A_{i+2} \cup A_{i+2}\right]$ at least once.

First suppose that $T=\emptyset$. Also assume that $Q_{1}$ is either complete or anticomplete to every $A_{4}$-clique, and $Q_{3}$ is either complete or anticomplete to every $A_{5}$-clique. Now suppose there is an $A_{2}$-clique, say $D_{2}$, such that either $A_{1}^{*} \cup D_{2} \in \mathcal{M}$ or $A_{3}^{*} \cup D_{2} \in \mathcal{M}$. Up to relabelling, we may assume that $A_{1}^{*} \cup D_{2} \in \mathcal{M}$. Then since $\left|A_{1}^{*} \cup D_{2}\right| \geq\left|A_{1}^{*} \cup Q_{1} \cup Q_{3}\right|$, we have $\left|D_{2}\right|>\left|Q_{1}\right|$. Further, we have the following:
(a) Any maximal clique that contain at least one vertex from each $A_{4}$ and $Q_{1}$ is of the form $A_{3}^{*} \cup Q_{1} \cup D_{4}$, where $D_{4}$ is an $A_{4}$-clique.
(b) For any $A_{1}$-clique $D_{1}$, since $\left|D_{2}\right|>\left|Q_{1}\right|$, we have $D_{1} \cup Q_{1} \notin \mathcal{M}$.
(c) If $X_{5} \neq \emptyset$, since $X_{5}$ is anticomplete to $Q_{3}$, by (F12), each $X_{5}$-clique is either complete or anticomplete to an $A_{3}$-clique. So for any $X_{5}$-clique $X_{5}^{*}$ which is anticomplete to $A_{3}^{*}$, by (F6), $X_{5}^{*}$ is complete to $D_{2}$, and $\left|Q_{1} \cup X_{5}^{*}\right|<\left|D_{2} \cup X_{5}^{*}\right|$ which implies that $Q_{1} \cup X_{5}^{*} \notin \mathcal{M}$. Moreover, for any $X_{5}$-clique $X_{5}^{* *}$ which is complete to $A_{3}^{*}$, any maximal clique that contain at least one vertex from each $X_{5}^{* *}$ and $Q_{1}$ is of the form $A_{3}^{*} \cup Q_{1} \cup X_{5}^{* *}$.
By $(a),(b)$ and $(c)$, it is not hard to verify that $S_{1}:=R_{A_{2}} \cup R_{X_{1} \backslash Q_{1}} \cup R_{X_{3}}, S_{2}:=R_{A_{3}} \cup R_{A_{5}} \cup R_{X_{4}}$, and $S_{3}:=R_{A_{1}} \cup R_{A_{4}} \cup R_{X_{5}}$ are the required stable sets. So we assume that for any $A_{2}$-clique $D_{2}$, $A_{1}^{*} \cup D_{2}, A_{3}^{*} \cup D_{2} \notin \mathcal{M}$. Next we claim the following:

Claim 1 Either for each $W \in \mathbb{W}_{1}, W \cap A_{1}^{*}=\emptyset$ or for each $W^{\prime} \in \mathbb{W}_{3}, W^{\prime} \cap A_{3}^{*}=\emptyset$.
Proof of Claim 1. Suppose there is an $X_{1}$-clique $K$ such that $K \cup A_{1}^{*} \in \mathbb{W}_{1}$, and there is an $X_{3}$-clique $K^{\prime}$ such that $K^{\prime} \cup A_{3}^{*} \in \mathbb{W}_{3}$. Note that $K \neq Q_{1}$ and $K^{\prime} \neq Q_{3}$. Then $K$ is anticomplete to $K^{\prime}$. Let $D_{5}$ be an $A_{5}$-clique such that $N\left(K^{\prime}\right) \cap D_{5} \neq \emptyset$. Then, by (F12), $K^{\prime}$ is complete to $D_{5}$. Now $\left|A_{1}^{*} \cup K\right| \geq\left|A_{1}^{*} \cup D_{5} \cup K^{\prime}\right|$, and so $|K|>\left|K^{\prime}\right|$. Then $A_{3}^{*} \cup K$ is a clique, and $\left|A_{3}^{*} \cup K\right|>\left|A_{3}^{*} \cup K^{\prime}\right|$ which is a contradiction. This proves Claim $\downarrow$

By Claim 11, we assume, up to symmetry, that for each $W \in \mathbb{W}_{1}$, we have $W \cap A_{1}^{*}=\emptyset$. Now if for each $A_{5}$-clique $D_{5}, D_{5} \cup A_{1}^{*} \notin \mathcal{M}$, then clearly $S_{1}:=R_{A_{1} \backslash A_{1}^{*}} \cup R_{A_{4}} \cup R_{Q_{3}} \cup R_{X_{5}}$, $S_{2}:=R_{A_{2}} \cup R_{X_{1}} \cup R_{X_{3} \backslash Q_{3}}$ and $S_{3}:=R_{A_{3}} \cup R_{A_{5}} \cup R_{X_{4}}$ are the required stable sets. So suppose that there is an $A_{5}$-clique $D_{5}$ such that $D_{5} \cup A_{1}^{*} \in \mathcal{M}$. Then since $Q_{3} \cup D_{5} \cup A_{1}^{*}$ is not a clique, $Q_{3}$ is anticomplete to $D_{5}$. Then, by (F6), $Q_{3}$ is complete to $A_{1}$; so $A_{1}=A_{1}^{*}$, and hence $\mathbb{W}_{1}=\emptyset$. Also, if $X_{5} \neq \emptyset$, then since $Q_{3}$ is anticomplete to $X_{5}$, by Lemma 6:(iii), $X_{5}$ is complete to $A_{3}$. Thus, by (F14), any maximum clique containing at least one vertex from each $X_{1}$ and $X_{5}$ is of the
form $D_{3} \cup X_{1}^{*} \cup X_{5}^{*}$, where $X_{1}^{*}, X_{5}^{*}$ and $D_{3}$ are $X_{1}, X_{5}$ and $A_{3}$-clique respectively. Now we let $S_{1}:=R_{A_{2}} \cup R_{A_{4}} \cup R_{X_{3}}, S_{2}:=R_{A_{3}} \cup R_{A_{5}} \cup R_{X_{4}}$ and $S_{3}:=R_{A_{1}} \cup R_{X_{5}}$, and we conclude that $S_{1}$, $S_{2}$ and $S_{3}$ are the required stable sets. So suppose that, up to relabelling, there is an $A_{5}$-clique, say $D_{5}$, such that $Q_{3}$ is neither complete nor anticomplete to $D_{5}$. Then since $\left(X_{1} \backslash Q_{1}\right) \cup X_{5}$ is anticomplete to $Q_{3}$, by (F12), $\left(X_{1} \backslash Q_{1}\right) \cup X_{5}=\emptyset$. So $X_{1}=Q_{1}$ and $X_{1}$ is anticomplete to $X_{4}$ (by (F13)). Now we let $S_{1}:=R_{A_{5}} \cup R_{X_{1}} \cup R_{X_{4}}, S_{2}:=R_{A_{2}} \cup R_{A_{4}} \cup R_{X_{3}}$ and $S_{3}:=R_{A_{1}} \cup R_{A_{3}}$. Then clearly $S_{1}, S_{2}$ and $S_{3}$ are the required stable sets.

Figure 3: Sketch of the graph $G$ in Lemma 8 when $T \neq \emptyset$, and: (a) $X_{4}, X_{5} \neq \emptyset$. (b) $X_{1}$ is not anticomplete to $X_{4}$. (c) $X_{1}$ is anticomplete to $X_{4}$.

So, we may assume that $T \neq \emptyset$. (We refer to Figure 3 for a sketch of the graph $G$.) Recall that each vertex in $X$ is either anticomplete or good with respect to $T$. First suppose $X_{4}, X_{5} \neq \emptyset$. So, by Lemma 6:(iv), $X_{1}$ is anticomplete to $X_{4}$, and $X_{3}$ is anticomplete to $X_{5}$. Let $T_{1}$ denote the union of $T$-cliques which are complete to $X_{1} \cup X_{4}$, and anticomplete to $X_{3} \cup X_{5}$, and let $T_{2}$ denote the union of $T$-cliques which are complete to $X_{3} \cup X_{5}$, and anticomplete to $X_{1} \cup X_{4}$. Clearly $T_{1} \cap T_{2}=\emptyset$. Moreover:

Claim $2 T=T_{1} \cup T_{2}$.
Proof of Claim 圆, Let $t \in T$, and let $T^{\prime}$ be the $T$-clique containing $t$. Since every vertex in $T$ has a neighbor in $X$, first assume that $t$ has a neighbor in $X_{1} \cup X_{4}$. Since $X_{1}$ is anticomplete to $X_{4}$, by (F21), $t$ is complete to $X_{1} \cup X_{4}$. So by Lemma 6:(v), $t$ is anticomplete to $X_{5}$, and since $X_{3}$ is anticomplete to $X_{5}$, by (F21), $t$ is anticomplete to $X_{3}$. Thus, by (F16), $T^{\prime}$ is complete to $X_{1} \cup X_{4}$, and anticomplete to $X_{3} \cup X_{5}$, and so $T^{\prime} \in T_{1}$. Similarly, if $t$ has a neighbor in $X_{3} \cup X_{5}$, then $T^{\prime}$ is complete to $X_{3} \cup X_{5}$, and anticomplete to $X_{1} \cup X_{4}$, and so $T^{\prime} \in T_{2}$. This proves Claim 2 $\diamond$

Since $T \neq \emptyset$, by (F9), for $j \in\{3,4,5\}$, either $X_{j}$ is complete to $A_{j-2}$ or $X_{j+1}$ is complete to $A_{j-2}$; so any maximal clique containing at least one vertex from each $X_{j}$ and $X_{j+1}$ must be complete to $A_{j-2}$ (by (F14)). Since at least one of $X_{4}$ and $X_{5}$ is complete to $A_{2}$, by (F14) and (F15), one of $\mathbb{W}_{4}$ and $\mathbb{W}_{5}$ is empty. Moreover, if $T^{*} \cup X^{*} \in \mathcal{M}$ for a $T$-clique $T^{*}$, and an $X_{i}$-clique $X^{*}$, where $i \in$ $\{1,3,4,5\}$, then by (F9), for any $p \in A_{i+2}$ and $q \in A_{i-2},\left|T^{*} \cup X^{*}\right| \geq\left|X^{*} \cup\{p, q\}\right|$, and thus $\left|T^{*}\right| \geq 2$. Now, if $\mathbb{W}_{5}=\emptyset$, then we let $S_{1}:=R_{A_{5}} \cup R_{X_{1}} \cup R_{X_{4}} \cup\left(L \cap T_{2}\right), S_{2}:=R_{A_{2}} \cup R_{A_{4}} \cup R_{X_{3}} \cap\left(L \cap T_{1}\right)$ and $S_{3}:=R_{A_{1}} \cup R_{A_{3}} \cup\left(L^{\prime} \cap T_{2}\right)$, and if $\mathbb{W}_{4}=\emptyset$, then we let $S_{1}:=R_{A_{4}} \cup R_{X_{3}} \cup R_{X_{5}} \cup\left(L \cap T_{1}\right)$, $S_{2}:=R_{A_{2}} \cup R_{A_{5}} \cup R_{X_{1}} \cup\left(L \cap T_{2}\right), S_{3}:=R_{A_{1}} \cup R_{A_{3}} \cup\left(L^{\prime} \cap T_{1}\right)$. Then we observe that $S_{1}, S_{2}$, and $S_{3}$ are the required stable sets.

Next we assume that one of $X_{4}$ and $X_{5}$ is empty, say $X_{5}=\emptyset$. First suppose that $X_{1}$ is not anticomplete to $X_{4}$. So there are vertices $x_{1}^{\prime} \in X_{1}, x_{4} \in X_{4}$ such that $x_{1}^{\prime} x_{4} \in E$. So $X=$ $X_{1} \cup X_{3} \cup X_{4}$. Let $Q_{1}^{\prime}$ be the $X_{1}$-clique containing $x_{1}^{\prime}$, and let $Q_{4}$ be the $X_{4}$-clique containing $x_{4}$. Then by (F13) and Lemma 6:(ii), $Q_{1} \neq Q_{1}^{\prime}, Q_{1}^{\prime}$ is complete to $Q_{4}, Q_{1}^{\prime}$ is anticomplete to $X_{4} \backslash Q_{4}, Q_{4}$
is anticomplete to $X_{1} \backslash Q_{1}^{\prime}, X_{1} \backslash Q_{1}^{\prime}$ is anticomplete to $X_{4} \backslash Q_{4}$. By (F13), let $A_{1}^{* *}$ be the $A_{1}$-clique such that $Q_{4}$ is complete to $A_{1}^{* *}$ and anticomplete to $A_{1} \backslash A_{1}^{* *}$, and let $A_{4}^{*}$ be the $A_{4}$-clique such that $Q_{1}^{\prime}$ is complete to $A_{4}^{*}$, and anticomplete to $A_{4} \backslash A_{4}^{*}$. By (F7) and (F5), $X_{4}$ is complete to $A_{1}^{* *}$. By (F21), each vertex in $T$ has a neighbor in $X_{1}$. Further we claim the following:

Claim $3 A_{1}, X_{3}$ and $X_{4}$ are cliques. Moreover, $T$ is complete to exactly one of $X_{3}$ and $X_{4}$.
Proof of Claim 3. We first show that, if $x_{3}$ is not anticomplete to $T$, then $x_{4}$ is anticomplete to $T$, and vice versa. Suppose not, and let $t, t^{\prime} \in T$ be such that $x_{3} t, x_{4} t^{\prime} \in E$. If $x_{4} t \in E$, then, by (F21), $x_{1} t \in E$, and then by (F9), for any $a \in A_{1},\left\{a, x_{1}, t, x_{4}, x_{3}\right\}$ induces a 4 -wheel, a contradiction; so $x_{4} t \notin E$. Likewise, $x_{3} t^{\prime} \notin E$. Also, by (F16), $t t^{\prime} \notin E$, and by (F21), $x_{1} t^{\prime}, x_{1}^{\prime} t \in E$ and $x_{1} t, x_{1}^{\prime} t^{\prime} \notin E$. But then $t-x_{1}^{\prime}-x_{4}-t^{\prime}-x_{1}$ is a $P_{5}$, a contradiction. By symmetry, we may assume that $x_{3}$ is not anticomplete to $T$. Then $x_{4}$ is anticomplete to $T$. Then, by (F21), $T$ is anticomplete to $X_{1} \backslash Q_{1}^{\prime}$. Since each vertex in $T$ has a neighbor in $X_{1}$, each vertex in $T$ has a neighbor in $Q_{1}^{\prime}$. So by (F16) and (F21), $T$ is complete to $Q_{1}^{\prime} \cup Q_{3}$. By (F9), $A_{1}=A_{1}^{*}=A_{1}^{* *}$ is a clique. So by Lemma 6:(i), $X_{3} \cup X_{4}$ is a clique, and hence $X_{3}=Q_{3}$ and $X_{4}=Q_{4}$ are cliques. Since $T$ is anticomplete to $X_{1} \backslash Q_{1}^{\prime}$, by (F21), $T$ is anticomplete to $Q_{4}=X_{4}$. This proves Claim 3, $\diamond$

By Claim 3, we may assume that $T$ is complete to $X_{3}\left(=Q_{3}\right)$, and anticomplete to $X_{4}\left(=Q_{4}\right)$. Then by (F21), it follows that, $T$ is complete to $Q_{1}^{\prime}$ (and anticomplete to $X_{1} \backslash Q_{1}^{\prime}$ ). Then by (F9), $Q_{1}^{\prime}$ is complete to $A_{4}$, and hence $A_{4}=A_{4}^{*}$ is a clique. Since $Q_{1}^{\prime} \cup Q_{4} \cup A_{4}$ is a larger clique than $Q_{4} \cup A_{4}$, we conclude that $\mathbb{W}_{4}=\emptyset$, and $R_{T} \cup R_{X_{3}} \cup R_{Q_{1}^{\prime}}$ meets each maximal clique of $G$ in $G[X \cup T]$ twice. Now we see that $S_{1}:=R_{A_{2}} \cup R_{A_{5}} \cup R_{X_{1}}, S_{2}:=R_{A_{4}} \cup R_{X_{3}}$, and $S_{3}:=R_{A_{1}} \cup R_{A_{3}} \cup R_{T}$ are the required stable sets.

Finally we assume that either $X_{1}$ is anticomplete to $X_{4}$ or $X_{4}=\emptyset$. We claim the following:
Claim 4 Each T-clique is complete to either $Q_{1}$ or $Q_{3}$.
Proof of Claim 4 Suppose not. Then there is a $T$-clique, say $T^{*}$, and vertices $x \in Q_{1}, x^{\prime} \in Q_{3}$, and $t, t^{\prime} \in T^{*}$ such that $x t, x t^{\prime} \notin E$. Then by (F16), $T^{*}$ is anticomplete to $\left\{x, x^{\prime}\right\}$. So by (F13) and (F21), $T^{*}$ is anticomplete to $\left(X_{1} \backslash Q_{1}\right) \cup\left(X_{3} \backslash Q_{3}\right) \cup X_{4}$. Since each vertex of $T$ has a neighbor in $X, N\left(T^{*}\right) \cap X \subseteq Q_{1} \cup Q_{3}$ which is a clique cutset, a contradiction. This proves Claim 4. $\diamond$

Moreover, if there is a $T$-clique $T^{*}$ such that $N\left(T^{*}\right) \cap\left(X_{4} \cup\left(X_{3} \backslash Q_{3}\right)\right) \neq \emptyset$, then by (F21), $T^{*}$ is complete to $Q_{1}$, and hence $T^{*}$ is complete to $X_{4} \cup\left(X_{3} \backslash Q_{3}\right)$. Now we let $S_{1}:=R_{A_{5}} \cup R_{X_{1}} \cup R_{X_{4}}$, $S_{2}:=R_{A_{2}} \cup R_{A_{4}} \cup R_{X_{3}}$, and $S_{3}:=R_{A_{1}} \cup R_{A_{3}} \cup R_{T}$. Then by Claim 4, we conclude that $S_{1}, S_{2}$ and $S_{3}$ are the desired stable sets. This completes the proof of Lemma 8 .

Lemma 9 If $X$ is nonempty and $Y$ is empty, then $G$ is a nice graph.
Proof of Lemma 9. By Lemma 7:(iv), we may assume that each maximal clique of $G$ in $G\left[X_{i} \cup A_{i+2} \cup\right.$ $A_{i+2}$ ] has nonempty intersection with both $A_{i+2}$ and $A_{i-2}$; and by Lemma 7:(iii), $R_{A_{i+2}} \cup R_{A_{i-2}}$ meets rest of the maximal cliques in $G\left[X_{i} \cup A_{i+2} \cup A_{i+2}\right]$ at least once. Recall that each vertex in $X$ is either anticomplete or good with respect to $T$. First suppose that $X \backslash X_{1}=\emptyset$. If $T^{*}$ is a $T$-clique such that $T^{*} \subset M \in \mathcal{M}$, then since each vertex in $X_{1}$ is either anticomplete or good with respect to $T, M=T^{*} \cup X_{1}^{*}$ where $X_{1}^{*}$ is a subset of some $X_{1}$-clique. Since $N\left(T^{*}\right) \cap X_{1}$ is not a clique cutset, there are nonadjacent vertices in $N\left(T^{*}\right) \cap X_{1}$. Then by (F8) and (F9), $A_{3} \cup A_{4}$ is clique, and so $A_{3} \cup A_{4} \cup X_{1}^{*}$ is a clique. Hence $\left|T^{*} \cup X_{1}^{*}\right| \geq\left|A_{3} \cup A_{4} \cup X_{1}^{*}\right|$, and thus $\left|T^{*}\right| \geq 2$. Then clearly $S_{1}:=R_{X_{1}} \cup R_{A_{2}} \cup R_{A_{5}}, S_{2}:=R_{A_{1}} \cup R_{A_{3}} \cup L$, and $S_{3}:=R_{A_{4}} \cup L^{\prime}$ are the desired stable sets. Let $J$ denote the set $\left\{i \in[5] \mid X_{i} \neq \emptyset\right\}$, and we may assume that $|J| \geq 2$. By Lemma 8 , we may assume that for each $i \in[5], X_{i}$ is anticomplete to $X_{i+2}$. See Figure 4; (a) and Figure 4: (b). First we claim the following.

Figure 4: Sketch of the graph $G$ in: (a) Lemma 9 when $T=\emptyset$. (b) Lemma 9 when $T \neq \emptyset$ and $\ell=5$. (c) Lemma 14 when $Y_{i}$ is anticomplete to $Y_{i+2} \cup Y_{i-2}$, for each $i \in[5]$.

Claim 1 There is an index $\ell \in[5]$ such that $\mathbb{W}_{\ell}=\emptyset$, and for $p \in\{\ell+1, \ell-1\}, R_{X_{p}} \cup R_{A_{1}} \cup \cdots \cup R_{A_{5}}$ meets each maximum clique of $G$ in $G\left[A \cup X_{\ell} \cup X_{p}\right]$ at least twice.

Proof of Claim 1. If there is an index $i \in[5]$ such that $X_{i}=\emptyset$, we choose $\ell=i$, and by Lemma 7:(i), we are done; so for each $i \in[5], X_{i} \neq \emptyset$. First suppose there is an index $i \in[5], X_{i}$ and $X_{i+1}$ is not complete to $A_{i-2}$, say $i=1$. Then by Lemma 6:(iii), $X_{4}$ is complete to $A_{1} \cup A_{2}$, and, up to relabelling, $X_{3}$ is complete to $A_{5}$. Since $X_{4}$ is complete to $A_{1}$, by (F15), one of $\mathbb{W}_{3}$ and $\mathbb{W}_{4}$ is empty. Now if $\mathbb{W}_{3}=\emptyset$, then we choose $\ell=3$, otherwise we choose $\ell=4$. Note that, by (F14), for $k \in\{2,3,4\}$, any maximal clique containing at least one vertex from each $X_{k}$ and $X_{k+1}$ must contain a vertex from $R_{A_{k-2}}$. Thus, by Lemma $7:(i)$, we conclude the proof. So we may assume that for each $i \in[5]$, one of $X_{i}$ or $X_{i+1}$ is complete to $A_{i-2}$. Then by (F15) and (F14), there is an index $k \in[5]$ such that $\mathbb{W}_{k}=\emptyset$. Since by (F14), for $i \in[5]$, any maximal clique containing at least one vertex from each $X_{i}$ and $X_{i+1}$ must contain a vertex from $R_{A_{i-2}}$, by Lemma 7:(i), we conclude that $\ell=k$ is our desired index. This proves Claim 1. $\diamond$

Claim 2 If $T \neq \emptyset$, then there is an index $j \in[5]$ such that $X_{j-1}=\emptyset\left(\right.$ so $\left.\mathbb{W}_{j-1}=\emptyset\right)$, and each $T$-clique is complete to $X_{j} \cup X_{j+2} \cup X_{j-2}$, and anticomplete to $X_{j+1}$.

Proof of Claim 圆 Let $t \in T$. Let $T^{*}$ be the $T$-clique containing $t$. By Lemma 10:(vi), there is an $i \in[5]$ such that $N\left(T^{*}\right) \cap X_{i} \neq \emptyset$. Suppose $N\left(T^{*}\right) \cap X_{i+1} \neq \emptyset$. Then by (F16), (F21) and Lemma 6:(v), we may assume that $X_{i+2}$ and $X_{i-1}$ are empty. If $X_{i-2}=\emptyset$, then by (F9) and Lemma 6:(i), $X_{i} \cup X_{i+1}$ is a clique, and so $N\left(T^{*}\right) \cap\left(X_{i} \cup X_{i+1}\right)$ is a clique cutset, a contradiction; so $X_{i-2} \neq \emptyset$. Then by (F21), $T^{*}$ is complete to $X_{i} \cup X_{i+1} \cup X_{i-2}$. So we take $j=i-2$ and we are done. Thus, by (F16), we may assume that $N\left(T^{*}\right) \cap\left(X_{i-1} \cup X_{i+1}\right)=\emptyset$. We claim that $X_{i-2} \cup X_{i+2} \neq \emptyset$. Suppose not. Since $|J| \geq 2$, we may assume that $X_{i+1} \neq \emptyset$. Then since $N\left(T^{*}\right) \cap X_{i}$ is not a clique cutset, there are nonadjacent vertices, say $u, v \in X_{i}$ such that $u, v \in N\left(T^{*}\right)$. Then by (F8) and (F9), $A_{i-2}$ is a clique, and so $X_{i} \cup X_{i+1}$ is complete to $A_{i-2}$ (by (F4)). But then, by Lemma 6: (i), $X_{i}$ is a clique, a contradiction. Thus $X_{i-2} \cup X_{i+2} \neq \emptyset$. Then by (F21), $T^{*}$ is complete to $X_{i} \cup X_{i+2} \cup X_{i-2}$. Also, by Lemma 6:(v), $T^{*}$ is anticomplete to $X_{i+1}$. So we take $j=i$. This proves Claim 2, $\diamond$

By Claim 1, let $\ell \in[5]$ be the index such that $\mathbb{W}_{\ell}=\emptyset$, and for $p \in\{\ell+1, \ell-1\}, R_{X_{p}} \cup R_{A_{1}} \cup$ $\cdots \cup R_{A_{5}}$ meets each maximum clique of $G$ in $G\left[A \cup X_{\ell} \cup X_{p}\right]$ at least twice. If $T \neq \emptyset$, then we choose $\ell=j-1$ (by Claim 2). Now we let $S_{1}:=R_{X_{\ell-1}} \cup R_{A_{\ell}} \cup R_{X_{\ell+1}}, S_{2}:=R_{A_{\ell+1}} \cup R_{X_{\ell+2}} \cup$ $R_{A_{\ell-2}} \cup R_{T}$, and $S_{3}:=R_{A_{\ell+2}} \cup R_{X_{\ell-2}} \cup R_{A_{\ell-1}}$. Clearly $S_{1}, S_{2}$ and $S_{3}$ are stable sets. By Claim 2, $R_{X_{j-2}} \cup R_{X_{j}} \cup R_{X_{j+1}} \cup R_{X_{j+2}} \cup R_{T}$ meets each maximum clique of $G$ in $G[X \cup T]$ at least twice. Also, using Lemma 7:(i) and (F14), we see that $\left(\cup_{k=1}^{5} R_{A_{k}}\right) \cup R_{X_{\ell-2}} \cup R_{X_{\ell-1}} \cup R_{X_{\ell+1}} \cup R_{X_{\ell+2}}$ meets
each maximum clique of $G$ in $G\left[A \cup\left(X \backslash X_{\ell}\right)\right]$ twice. So, by Claim $\mathbb{1}$, we conclude that $S_{1} \cup S_{2} \cup S_{3}$ meets each maximum clique of $G$ at least twice, and other maximal cliques at least once. So $G$ is nice. This completes the proof of Lemma 9 ,

Lemma 10 For $i \in[5]$, the following properties hold:
(i) If $K$ is an $A_{i+2}$-clique (or an $A_{i-2}$-clique), then any vertex in $Y_{i}$ which has a neighbor in $K$ is complete to $K$.
(ii) For $j \in\{i-2, i+2\}$, each vertex in $Y_{i}$ is complete to exactly one $A_{j}$-clique.
(iii) If a vertex in $Y_{i}$ is not complete to $A_{i-1}$ (or $A_{i+1}$ ), then it is complete to $A_{i+2} \cup A_{i-2}$, and so $A_{i+2} \cup A_{i-2}$ is a clique.
(iv) $Y_{i}$ is a clique.
(v) $Y_{i}$ is complete to $Y_{i+1} \cup Y_{i-1}$.
(vi) Every vertex in $T$ has a neighbor in $X$.

Proof of Lemma 10, (i): The proof of Lemma 10: $(i)$ is similar to that of (F4), and we omit the details. $\diamond$
( $i i$ ): We may assume, up to symmetry, that $j=i+2$. Let $y \in Y_{i}$. By Lemma 10:(i), it is enough to show that $y$ has a neighbor in exactly one $A_{i+2}$-clique. Suppose not. Then there are nonadjacent vertices $a$ and $b$ in $A_{i+2}$ such that $y$ is adjacent to both $a$ and $b$. Then pick a neighbor of $y$ in each $A_{i-2}$ and $A_{i+1}$, say $p$ and $q$ respectively; but then $\{p, a, q, b, y\}$ induces a 4 -wheel which is a contradiction. This proves Lemma 10:(ii), $\diamond$
(iii): Let $y \in Y_{i}$. We may assume, up to symmetry, that $y$ is not complete to $A_{i-1}$, and let $p$ be a nonneighbor of $y$ in $A_{i-1}$. So by (F17), $A_{i-1}$ is a clique. Suppose to the contrary that $y$ has a nonneighbor in $A_{i-2} \cup A_{i+2}$, say $q$. If $q \in A_{i-2}$, then for any neighbor of $y$ in $A_{i+1}$, say $r$, we see that $q-p-v_{i}-r-y$ is a $P_{5}$, a contradiction; so $q \in A_{i+2}$. Pick a neighbor of $y$ in each $A_{i-1}$ and $A_{i+1}$, say $a$ and $b$ respectively. Since $A_{i-1}$ is a clique, $p a \in E$. Now we see that $p-a-y-b-q$ is a $P_{5}$, a contradiction. This proves the first assertion of Lemma 10:(iii), and the second assertion follows from Lemma 10:(ii). $\diamond$
(iv): Let $y, y^{\prime} \in Y_{i}$, and suppose $y, y^{\prime}$ are nonadjacent. By (F18), we may assume that $y$ is complete to $A_{i-1}$. Then by the definition of $Y_{i}$, clearly $y$ and $y^{\prime}$ have a common neighbor in $A_{i-1}$, say $p$. So by the definition of $Y_{i}$ and by (O1), $y$ and $y^{\prime}$ have a common neighbor in $A_{i+2}$, say $q$. By the same argument, if $y$ and $y^{\prime}$ have a common neighbor in $A_{i+1}$, then they have a common neighbor in $A_{i-2}$. If $y$ and $y^{\prime}$ do not share a common neighbor in $A_{i+1}$, then by Lemma 10:(iii), $A_{i-2}$ is a clique, and so by Lemma 10:(i), $y$ and $y^{\prime}$ have a common neighbor in $A_{i-2}$. In either case, $y$ and $y^{\prime}$ have a common neighbor in $A_{i-2}$, say $r$. Then $\left\{p, y, q, y^{\prime}, r\right\}$ induces a 4 -wheel, a contradiction. This proves Lemma 10:(iv), $\diamond$
$(v)$ : Let $y \in Y_{i}$ and $y^{\prime} \in Y_{i+1}$, and suppose $y$ and $y^{\prime}$ are nonadjacent. Let $p$ be a neighbor of $y$ in $A_{i-2}$. If $p y^{\prime} \notin E$, then for any neighbor of $y^{\prime}$ in $A_{i}$, say $a$, and for any neighbor of $y$ in $A_{i+1}$, say $b, p-y-b-a-y^{\prime}$ is a $P_{5}$, a contradiction; so we may assume that $p y^{\prime} \in E$. Also it follows from the definition of $Y_{i+1}$, and by (F17) and Lemma 10:(i), that $y$ and $y^{\prime}$ have a common neighbor in $A_{i-1}$, say $q$, and by the same argument, $y$ and $y^{\prime}$ have a common neighbor in $A_{i+2}$, say $r$. But then $\left\{y^{\prime}, q, y, r, p\right\}$ induces a 4 -wheel, a contradiction. So $Y_{i}$ is complete to $Y_{i+1}$. Likewise, $Y_{i}$ is complete to $Y_{i-1}$. This proves Lemma 10:(v), $\diamond$
(vi): Suppose there is a vertex $t \in T$ which has no neighbor in $X$. Let $Q$ be the vertex-set of the component of $G[T]$ containing $t$. Then by (F16), $Q$ is anticomplete to $X$. Then since $G$ is connected, $N(Q) \cap Y \neq \emptyset$. Since $N(Q) \cap Y$ is not a clique cutset between $A$ and $Q$, there are
nonadjacent vertices, say $y, y^{\prime} \in N(Q) \cap Y$. Then by Lemma $10:(i v)$ and Lemma $10:(v)$, we may assume that $y \in Y_{2}$ and $y^{\prime} \in Y_{5}$. Now pick a neighbor of $y$ in $A_{5}$, say $a$, and a neighbor of $y^{\prime}$ in $A_{2}$, say $a^{\prime}$. But then $a-y-t-y^{\prime}-a^{\prime}$ is a $P_{5}$, a contradiction. This proves Lemma 10:(vi).

Lemma 11 For each $i \in[5], Y_{i} \cup Y_{i+1}$ is complete to exactly one $A_{i-2}$-clique.
Proof of Lemma 11. First we show that for each $i, Y_{i}$ is complete to exactly one $A_{i-2}$-clique. Suppose not. Then by Lemma 10:(i), Lemma 10:(ii) and Lemma 10:(iv), there are adjacent vertices $y, y^{\prime}$ in $Y_{i}$, and nonadjacent vertices $a, b$ in $A_{i-2}$ such that $y a, y^{\prime} b \in E$ and $y b, y^{\prime} a \notin E$. Then by Lemma 10:(iii), $\left\{y, y^{\prime}\right\}$ is complete to $A_{i+1}$ and $A_{i-1}$. Now if $y$ and $y^{\prime}$ have a common neighbor in $A_{i+2}$, say $p$, then $\left\{p, y, v_{i-1}, b, y^{\prime}\right\}$ induces a 4 -wheel, a contradiction; so we may assume that there is a vertex $q \in A_{i+2}$ such that $y q \in E$ and $y^{\prime} q \notin E$. But then $\left\{v_{i+1}, q, a, v_{i-1}, y^{\prime}, y\right\}$ induces a 5 -wheel, a contradiction. So for each $i, Y_{i}$ is complete to exactly one $A_{i-2}$-clique.

Now suppose that the lemma is not true. Then by our preceding argument, there are $A_{i-2^{-}}$ cliques, say $B$ and $D$, such that $B \cap D=\emptyset, Y_{i}$ is complete to $B$, and anticomplete to $A_{i-2} \backslash B$, and $Y_{i+1}$ is complete to $D$, and anticomplete to $A_{i-2} \backslash D$. Then clearly $A_{i-2}$ is not a clique, and so by Lemma 10:(iii), $Y_{i}$ is complete to $A_{i-1}$, and $Y_{i+1}$ is complete to $A_{i+2}$. Now pick a vertex $y \in Y_{i}$, and a neighbor of $y$ in $A_{i+2}$, say $a$. Also, pick a vertex $y^{\prime} \in Y_{i+1}$, and neighbor of $y^{\prime}$ in $A_{i-1}$, say $a^{\prime}$. But now for any $b \in B$, by Lemma $10:(v),\left\{y^{\prime}, a, b, a^{\prime}, y\right\}$ induces a 4 -wheel, a contradiction. This proves Lemma 11.

If $Y \neq \emptyset$, by Lemma 11, for $i \in[5]$, let $B_{i-2}$ be the $A_{i-2}$-clique such that $Y_{i} \cup Y_{i+1}$ is complete to $B_{i-2}$, and anticomplete to $A_{i-2} \backslash B_{i-2}$, and let $B_{i+2}$ be the $A_{i+2}$-clique such that $Y_{i} \cup Y_{i-1}$ is complete to $B_{i+2}$, and anticomplete to $A_{i+2} \backslash B_{i+2}$.

Lemma 12 For $i \in[5]$, the following properties hold:
(i) For $j \in\{i-1, i+1\}$, each $A_{j}$-clique has a vertex which is complete to $Y_{i}$.
(ii) $Y_{i+1}$ is anticomplete to $X_{i} \cup X_{i+2}$.
(iii) At least one of $X_{i}, Y_{i+2} \cup Y_{i-2}$ is empty.
(iv) Each $y \in Y_{i+1}$ and $x \in X_{i}$ have a common neighbor in each $A_{i}, A_{i+2}$ and $A_{i-2}$, and each $y \in Y_{i+1}$ and $x \in X_{i+2}$ have a common neighbor in each $A_{i}, A_{i+2}$ and $A_{i-1}$.
(v) If $X_{i} \neq \emptyset$, then $Y_{i+1} \cup Y_{i-1}$ is complete to $A_{i}$.
(vi) If $X \neq \emptyset$, then $Y_{i}$ is anticomplete to $Y_{i+2} \cup Y_{i-2}$.
(vii) If $X \neq \emptyset$, then no vertex in $T$ has neighbors in both $Y_{i-1}$ and $Y_{i+1}$.

Proof of Lemma 12. ( $i$ : We prove the statement for $j=i+1$. If $A_{i+1}$ is not a clique, then by (F17), $Y_{i}$ is complete to $A_{i+1}$, and Lemma $12:(i)$ holds; so assume that $A_{i+1}$ is a clique. Now if $G\left[Y_{i} \cup A_{i+1}\right]$ contains an induced $C_{4}$, say with vertex-set $\{p, q, r, s\}$, then for any $a \in B_{i+2},\{p, q, r, s, a\}$ induces a 4-wheel, a contradiction; so $G\left[Y_{i} \cup A_{i+1}\right]$ is $C_{4}$-free. Since $Y_{i}$ is a clique (by Lemma 10:(iv)) and since each vertex in $Y_{i}$ has a neighbor in $A_{i+1}$ (which is a clique), by Lemma 2, $A_{i+1}$ has a vertex which is complete to $Y_{i}$. This proves Lemma 12:(i), $\diamond$
(ii): Suppose, up to symmetry, there are adjacent vertices, say $y \in Y_{i+1}$ and $x \in X_{i}$. Pick a neighbor of $y$ in each $A_{i-1}$ and $A_{i}$, say $p$ and $q$ respectively. If $x$ and $y$ have a common neighbor in $A_{i-2}$, say $r$, then, by (F3), $\{q, x, r, p, y\}$ induces a 4 -wheel, a contradiction; so there is a vertex $w \in A_{i-2}$ such that $y w \in E$ and $x w \notin E$. Then by (F6), $x$ is complete to $A_{i+2}$. Now pick any neighbor of $y$ in $A_{i+2}$, say $s$. Then, by (F3), $\{p, q, x, s, w, y\}$ induces a 5 -wheel, a contradiction. So $Y_{i+1}$ is anticomplete to $X_{i}$. Likewise, $Y_{i+1}$ is anticomplete to $X_{i+2}$. This proves Lemma 12:(ii), $\diamond$ (iii): Suppose not. Let $x \in X_{i}$, and, up to symmetry, let $y \in Y_{i+2}$. Pick any neighbor of $y$ in $A_{i-1}$, say $p$. It follows from (F4) and (F17) that $x$ and $y$ have a common neighbor in $A_{i-2}$, say $a$.

Now if $x y \in E$, then for any neighbor of $y$ in $A_{i}$, say $a^{\prime}$, by (F3), $\left\{p, a, x, a^{\prime}, y\right\}$ induces a 4-wheel, a contradiction; so we may assume that $x y \notin E$. Then pick a neighbor of $y$ in $A_{i+1}$, say $b$, and a neighbor of $x$ in $A_{i+2}$, say $b^{\prime}$; but then $p-y-b-b^{\prime}-x$ is a $P_{5}$ which is a contradiction. This proves Lemma 12:(iii). $\diamond$
(iv): We prove the first assertion, and the proof of the other is similar. Suppose $y \in Y_{i+1}$ and $x \in X_{i}$. By (F3), $x$ is complete to $A_{i}$, and so by the definition of $Y_{i+1}, x$ and $y$ have a common neighbor in $A_{i}$. By Lemma 12:(ii), we know that $y x \notin E$. Now $x$ and $y$ have a common neighbor in each $A_{i+2}$ and $A_{i-2}$, by (O1). This proves Lemma 12:(iv). $\diamond$
$(v):$ Let $x \in X_{i}$. Let $y \in Y_{i+1}$ and $a \in A_{i}$, and suppose $y, a$ are nonadjacent. By Lemma 12:(ii), $x y \notin E$, and by Lemma $12:(i v), x$ and $y$ have a common neighbor in $A_{i-2}$, say $a^{\prime}$. Then by (F3), $y-a^{\prime}-x-a-v_{i+1}$ is a $P_{5}$, a contradiction. So $Y_{i+1}$ is complete to $A_{i}$. Likewise, $Y_{i-1}$ is complete to $A_{i}$. This proves Lemma 12:(v), $\diamond$
$(v i)$ : Suppose not. We may assume that there are adjacent vertices, say $y \in Y_{i}$ and $y^{\prime} \in Y_{i+2}$. Since $Y_{i}, Y_{i+2} \neq \emptyset$, by Lemma $12:(i i i), X_{j}=\emptyset$, for $j \neq i+1$. Now we claim that $X_{i+1}=\emptyset$. Suppose not. Let $x \in X_{i+1}$. Then by Lemma $12:(i i),\left\{y, y^{\prime}\right\}$ is anticomplete to $x$, and by Lemma 12:(v), $\left\{y, y^{\prime}\right\}$ is complete to $v_{i+1}$. If $y$ and $y^{\prime}$ have a common neighbor in $A_{i-2}$, say $a$, then for any neighbor of $y$ in $A_{i+2}$, say $a^{\prime},\left\{a, a^{\prime}, v_{i+1}, y^{\prime}, y\right\}$ induces a 4 -wheel, a contradiction. So we may assume that $y$ and $y^{\prime}$ do not share a common neighbor in $A_{i-2}$. Now by Lemma 12:(iv), $x$ and $y$ have a common neighbor in $A_{i-2}$, say $p$. But then for any neighbor of $y^{\prime}$ in $A_{i}$, say $q$, we see that $x-p-y-y^{\prime}-q$ is a $P_{5}$, a contradiction; so $X_{i+1}=\emptyset$. Thus we conclude that $X=\emptyset$, a contradiction to our assumption that $X \neq \emptyset$. This proves Lemma 12:(vi). $\diamond$
(vii): We prove the assertion for $i=1$. If some vertex in $T$, say $t$, has neighbors in both $Y_{2}$ and $Y_{5}$, say $y$ and $y^{\prime}$, respectively. Then by Lemma $12:(v i), y y^{\prime} \notin E$. Now pick a neighbor of $y$ in $A_{5}$, say $a$, and a neighbor of $y^{\prime}$ in $A_{2}$, say $a^{\prime}$, and then $a-y-t-y^{\prime}-a^{\prime}$ is a $P_{5}$, a contradiction. This proves Lemma 12:(vii).

For $i \in[5]$, if $Y_{i} \cup Y_{i+2} \neq \emptyset$ and if there is a vertex in each $A_{i+1}$-clique which is complete to $Y_{i} \cup Y_{i+2}$, then we pick one such vertex, and let $\mathbb{A}_{i+1}$ be the union of those vertices; otherwise, we let $\mathbb{A}_{i+1}:=R_{A_{i+1}}$. (In any case, $\mathbb{A}_{i+1}$ is a maximum independent set of $A_{i+1}$.)

Lemma 13 The set $\mathbb{A}_{i-1} \cup \mathbb{A}_{i-2}$ meets each maximal clique of $G$ in $G\left[A_{i-1} \cup A_{i-2} \cup Y_{i} \cup Y_{i+1}\right]$ twice. Likewise, $\mathbb{A}_{i+1} \cup \mathbb{A}_{i+2}$ meets each maximal clique of $G$ in $G\left[A_{i+1} \cup A_{i+2} \cup Y_{i} \cup Y_{i-1}\right]$ twice.

Proof of Lemma 13. By Lemma 10:(iv) and Lemma 10:(v), $Y_{i} \cup Y_{i+1}$ is a clique. Also, we know that $Y_{i} \cup Y_{i+1}$ is complete to $B_{i-2}$, and anticomplete to $A_{i-2} \backslash B_{i-2}$. Also, $Y_{i+1}$ is complete to $B_{i-1}$, and anticomplete to $A_{i-1} \backslash B_{i-1}$. Let $M$ be a maximal clique in $G\left[A_{i-2} \cup A_{i-1} \cup Y_{i} \cup Y_{i+1}\right]$. If $M$ has no vertex from $Y_{i}$, clearly the assertion holds. So $M \cap Y_{i} \neq \emptyset$. If $M$ has no vertex from $Y_{i+1}$, then $M$ is of the form $Y_{i} \cup B_{i-2} \cup D_{i-1}$, where $D_{i-1}$ is a subset of some $A_{i-1}$-clique $A^{*}$, and is the set of vertices in $A^{*}$ which are complete to $Y_{i}$ (by Lemma $12:(i)$. Since $\mathbb{A}_{i-2} \cup \mathbb{A}_{i-1}$ contains vertices from both $B_{i-2}$ and $D_{i-1}$, the claim holds. Finally, if $M \cap Y_{i+1} \neq \emptyset$, then by Lemma 10:(v), $M$ is of the form $Y_{i} \cup Y_{i+1} \cup B_{i-2} \cup D_{i-1}$, where $D_{i-1}$ is a subset of $B_{i-1}$, and is the set of vertices in $B_{i-1}$ which are complete to $Y_{i}$ (by Lemma $\left.12:(i)\right)$. So again, as earlier, $\mathbb{A}_{i-2} \cup \mathbb{A}_{i-1}$ meets $M$ twice. This proves Lemma 13.

Lemma 14 If $Y$ is nonempty, and $X$ is empty, then $G$ is either a nice graph or a quasi-line graph.
Proof of Lemma 14. Since $X$ is empty, by Lemma 10:(vi), $T=\emptyset$. Now:

Claim 1 If there is an $i \in[5]$ such that $Y_{i}$ and $Y_{i+2}$ are not complete to $A_{i+1}$, then $A_{i}$ is a clique, for all $i \in[5]$.

Proof of Claim 1. Since $Y_{i}$ is not complete to $A_{i+1}$, by (F17), $A_{i+1}$ is a clique, and by Lemma 10:(iii), $A_{i+2} \cup A_{i-2}$ is a clique. Likewise, since $Y_{i+2}$ is not complete to $A_{i+1}$, by Lemma 10:(iii), $A_{i-1} \cup A_{i}$ is a clique. Thus we conclude that $A_{i}$ is a clique, for all $i$. This proves Claim $1, \diamond$

Claim 2 If $A_{i}$ is a clique, for all $i \in[5]$, then $G$ is $3 K_{1}-$ free.
Proof of Claim 圆 Suppose that $G$ contains a triad, say $\{u, v, w\}$. Since $G[A]$ is $3 K_{1}$-free, we may assume that $u \in Y_{j}$, for some $j$. Then by (F18) and Lemma 10:(i), $u$ is complete to either $A_{j+1} \cup A_{j+2} \cup A_{j-2}$ or $A_{j+2} \cup A_{j-1} \cup A_{j-2}$; we may assume, without loss of generality, that $u$ is complete to $A_{j+1} \cup A_{j+2} \cup A_{j-2}$. Since $A_{j} \cup A_{j-1} \cup Y_{j+2}$ is a clique (by Lemma 10:(i)), and since $Y_{j}$ is complete to $Y_{j+1} \cup Y_{j-1}$ (by Lemma 10:(v)d, one of $v, w$ belongs to $Y_{j-2}$; and we may assume that $v \in Y_{j-2}$. Then by Lemma 10:(i), $v$ is complete to $A_{j} \cup A_{j+1}$. So $w \in A_{j-1}$. But then for any neighbor of $u$ in $A_{j-2}$, say $a$, and for any neighbor of $v$ in $A_{j}$, say $b$, we see that $u-a-w-b-v$ is a $P_{5}$, a contradiction. This proves Claim 2, $\diamond$

First suppose that there is an $i \in[5]$ such that $Y_{i}$ is not anticomplete to $Y_{i+2}$. Let $y \in Y_{i}$ and $y^{\prime} \in Y_{i+2}$ be adjacent. Suppose $y$ and $y^{\prime}$ share a common neighbor in $A_{i+1}$, say $a$. We know, by (F17) and Lemma 10:(i), that $y$ and $y^{\prime}$ share a common neighbor in $A_{i-1}$, say $a^{\prime}$. Then for a neighbor of $y^{\prime}$ in $A_{i}$, say $a^{\prime \prime},\left\{a, y, a^{\prime}, a^{\prime \prime}, y^{\prime}\right\}$ induces a 4 -wheel, a contradiction; so suppose that $y$ and $y^{\prime}$ do not share a common neighbor in $A_{i+1}$. So $y$ and $y^{\prime}$ are not complete to $A_{i+1}$, hence $Y_{i}$ and $Y_{i+2}$ are not complete to $A_{i+1}$. Then by Claim 1, $A_{i}$ is a clique for all $i \in[5]$, and then, by Claim 2, $G$ is $3 K_{1}$-free. So, by Lemma 1, $G$ is either a quasi-line graph or a nice graph, and we are done.

Next we may assume that for each $i \in[5], Y_{i}$ is anticomplete to $Y_{i+2} \cup Y_{i-2}$. By Lemma $10:(v)$, $Y_{i}$ is complete to $Y_{i+1} \cup Y_{i-1}$. See Figure [4: $(c)$ for a sketch of $G$. Also, we may assume that if $Y_{i}$ and $Y_{i+2}$ are nonempty, then at least one of $Y_{i}, Y_{i+2}$ is complete to $A_{i+1}$ (for, otherwise, by Claim 1 1 and Claim [2, $G$ is $3 K_{1}$-free, and we conclude using Lemma (1). Now we define three sets $S_{1}:=\mathbb{A}_{1} \cup \mathbb{A}_{3}, S_{2}:=\mathbb{A}_{2} \cup \mathbb{A}_{4}$ and $S_{3}:=\mathbb{A}_{5}$. Then $S_{1}, S_{2}$ and $S_{3}$ are stable sets. Clearly, for $i \in[5]$, by Lemma 10:(iv) and Lemma 11, $\mathbb{A}_{i+2} \cup \mathbb{A}_{i-2}$ meets each maximal clique of $G$ in $G\left[Y_{i} \cup A_{i+2} \cup A_{i-2}\right]$ twice, and by Lemma [13, $\mathbb{A}_{i+1} \cup \mathbb{A}_{i+2}$ meets each maximal clique of $G$ in $G\left[Y_{i} \cup Y_{i-1} \cup A_{i+1} \cup A_{i+2}\right.$ ] twice. So we conclude that $S_{1} \cup S_{2} \cup S_{3}$ meets each maximum clique of $G$ at least twice, and other maximal cliques at least once, and that $G$ is nice. This completes the proof of Lemma 14 ,

Now we prove our main result of this subsection, and is given below.
Theorem 5 If a connected ( $P_{5}$, wheel)-free atom $G$ contains an induced $C_{5}$, then $G$ is either a nice graph or a quasi-line graph.

Proof of Theorem [5 Let $G$ be a connected ( $P_{5}$, wheel)-free atom that contains an induced $C_{5}$, say $v_{1}-v_{2}-v_{3}-v_{4}-v_{5}-v_{1}$. Then we define the sets $A, X, Y, Z$ and $T$ as in Section 3 with $v_{i} \in A_{i}$, for each $i$, and we use the facts (F1) (F21) shown in Section 3, and properties in Lemmas 6, 7 and 10 to 13 , Since $Z=\emptyset$, if $T \neq \emptyset$, then $G[T]$ is $P_{3}$-free (by (F20)). Let $\mathcal{M}$ be the set of maximum cliques of $G$. Let $L$ consist of one vertex from each $T$-clique, otherwise let $L:=\emptyset$, and let $L^{\prime}$ consist of one vertex (which is not in $L$ ) from each nontrivial $T$-clique, otherwise let $L^{\prime}:=\emptyset$. By (F14), for $j \in[5]$, if $X_{j}, X_{j+1} \neq \emptyset, R_{X_{j}} \cup R_{X_{j+1}} \cup R_{A_{j-2}}$ meets each maximal clique of $G$ in $G\left[X_{j} \cup X_{j+1} \cup A_{j-2}\right]$ at least twice. Now if $X \cup Y=\emptyset$, then since $G$ is connected, by Lemma 10:(vi), $T=\emptyset$, and then the sets $S_{1}:=R_{A_{1}} \cup R_{A_{3}}, S_{2}:=R_{A_{2}} \cup R_{A_{4}}$ and $S_{3}:=R_{A_{5}}$ are the desired stable sets, and we are done.

If one of $X, Y$ is empty, then the theorem follows from Lemmas 9 and 14 . So we may assume that both $X$ and $Y$ are nonempty. Now if $Y_{i+1} \neq \emptyset$, then by Lemma 12:(iv) and (F4), $X_{i}$ is complete to $B_{i-2}$, and $X_{i+2}$ is complete to $B_{i-1}$. Recall that since $X \neq \emptyset$, by Lemma 12:(vi), $Y_{i}$ is anticomplete to $Y_{i+2} \cup Y_{i-2}$. Now we split the proof into two cases.
Case 1 For each $i \in[5]$, one of $X_{i}, Y_{i}$ is empty.
Since $Y \neq \emptyset$, let $Y_{2} \neq \emptyset$; so $X_{2}=\emptyset$. By Lemma $12:\left(\right.$ iii) , $X_{4} \cup X_{5}=\emptyset$. Since $X \neq \emptyset, X_{1} \cup X_{3} \neq \emptyset$; we may assume that $X_{1} \neq \emptyset$; so $Y_{1}=\emptyset$. Again by Lemma 12:(iii), $Y_{3} \cup Y_{4}=\emptyset$. By Lemma 12:(v), $Y_{2} \cup Y_{5}$ is complete to $A_{1}$. By Lemma 12:(ii), $Y_{2} \cup Y_{5}$ is anticomplete to $X_{1} \cup X_{3}$. Recall that $Y_{2}$ is complete to $B_{4} \cup B_{5}$, and anticomplete to $\left(A_{4} \backslash B_{4}\right) \cup\left(A_{5} \backslash B_{5}\right)$, and since $Y_{2} \neq \emptyset, X_{1}$ is complete to $B_{4}$. Moreover, we have the following:

Claim 1 If $T \neq \emptyset$, then the following hold: (a) $T$ is complete to $Y_{2}$. (b) For $j \in\{1,3\}$, given an $X_{j}$-clique, $X_{j}^{*}$, each $T$-clique is either complete or anticomplete to $X_{j}^{*}$. (c) $Y_{5}=\emptyset$.

Proof of Claim (a): Let $T^{\prime}$ be a $T$-clique in $G$. Then by Lemma 10:(vi), $N\left(T^{\prime}\right) \cap\left(X_{1} \cup X_{3}\right) \neq \emptyset$. Since $Y_{2}$ is anticomplete to $X_{1} \cup X_{3}$ (by Lemma 12:(ii)), it follows from (F21); (a) that $T^{\prime}$ is complete to $Y_{2}$. This proves (a), since $T^{\prime}$ is arbitrary.
(b): Since $Y_{2}$ is anticomplete to $X_{1} \cup X_{3}$, (b) follows from (a), Lemma 10:(vi), and (F21);(b).
(c): Suppose that $Y_{5} \neq \emptyset$. Then, by Lemma 12:(iii), $X_{3}=\emptyset$. Let $t \in T$. Then by Lemma 10:(vi), $t$ has a neighbor in $X_{1}$. Since $Y_{2} \cup Y_{5}$ is anticomplete to $X_{1}$ (by Lemma 12:(ii)), it follows from (F21) that $t$ has neighbors in both $Y_{2}$ and $Y_{5}$ which is a contradiction to Lemma 12:(vii). This proves (c). $\diamond$

Claim 2 If $T \neq \emptyset$, then $Y_{2}$ is complete to either $A_{4}$ or $A_{5}$. So, if $T \neq \emptyset$, either $A_{4}$ or $A_{5}$ is a clique.

Proof of Claim 圆 Suppose not. Then there are vertices $y \in Y_{2}, p \in A_{4}$, and $q \in A_{5}$ such that $y p, y q \notin E$. Let $t \in T$. Then by Claim [1;(a), $y t \in E$. But then since $Y_{2}$ is complete to $A_{1}$, for any neighbor of $y$ in $A_{1}$, say $r$, we see that $p-q-r-y-t$ is a $P_{5}$, a contradiction. This proves Claim 2 $\diamond$

Claim 3 If $K$ is an $X_{1}$-clique, and $D$ is an $A_{3}$-clique, then either $K$ is complete to $D$ or $K$ is anticomplete to $D$. Likewise, if $K^{\prime}$ is an $X_{3}$-clique, and $D^{\prime}$ is an $A_{1}$-clique, then either $K^{\prime}$ is complete to $D^{\prime}$ or $K^{\prime}$ is anticomplete to $D^{\prime}$.

Proof of Claim 圆 Suppose that $K$ is not anticomplete to $D$. Then, there is an $x \in K$ which has a neighbor in $D$. Let $a \in D$ be such that $a \in \mathbb{A}_{3}$ (such a vertex exists, by Lemma 12:(i)). Then by (F4), $x$ is complete to $D$; so $x a \in E$. Let $x^{\prime}(\neq x) \in K$ be arbitrary. We claim that $x^{\prime}$ is complete to $D$. Suppose not. Then again by (F4), $x^{\prime}$ is anticomplete to $D$; so $x^{\prime} a \notin E$. But then, for any $y \in Y_{2}$ and $b \in B_{5}, x^{\prime}-x-a-y-b$ is a $P_{5}$, a contradiction. So $x^{\prime}$ is complete to $D$. Since $x^{\prime}$ is arbitrary, $K$ is complete to $D$. This proves Claim 3, $\diamond$

Claim 4 If $K$ is an $X_{1}$-clique, and $D$ is an $A_{4}$-clique, then either $K$ is complete to $D$ or $K$ is anticomplete to $D$. Likewise, if $K^{\prime}$ is an $X_{3}$-clique, and $D^{\prime}$ is an $A_{5}$-clique, then either $K^{\prime}$ is complete to $D^{\prime}$ or $K^{\prime}$ is anticomplete to $D^{\prime}$.

Proof of Claim 4 Suppose that $K$ is not anticomplete to $D$. We may assume that $D \neq B_{4}$. Then, there is an $x \in K$ which has a neighbor in $D$, say $a$. Let $x^{\prime}(\neq x) \in K$ be arbitrary. We claim that $x^{\prime}$ is complete to $D$. Suppose not. Then, by (F4), $x^{\prime}$ is anticomplete to $D$; so $x^{\prime} a \notin E$. But then,
for any $y \in Y_{2}$ and $b \in B_{5}, x^{\prime}-x-a-b-y$ is a $P_{5}$, a contradiction. So $x^{\prime}$ is complete to $D$. Since $x^{\prime}$ is arbitrary, $K$ is complete to $D$. This proves Claim (4. $\diamond$

Now consider any maximum clique of $G$ in $G\left[X_{i} \cup A_{i+2} \cup A_{i-2}\right]$, say $M$. Then by Claim 3 and Claim (4. $M \cap A_{i+2}, M \cap A_{i-2} \neq \emptyset, M \cap A_{i+2}$ is an $A_{i+2}$-clique and $M \cap A_{i-2}$ is an $A_{i-2}$-clique.

(c)

Figure 5: Sketch of the graph $G$ in Theorem 5 (a) Case 1 when $T=\emptyset$. (b) Case 1 when $T \neq \emptyset$. (c) Case 2 when $X_{2} \cup X_{5}=\emptyset$. (d) Case 2 when $X_{5} \neq \emptyset$.

See Figure $5(a)$ and Figure $5(b)$. By Lemma 6: $(i)$ and Claim 3, we conclude that each $X_{1}$ clique is either complete or anticomplete to $K$, where is $K$ is an $A_{3}$-clique or an $X_{3}$-clique. Likewise, each $X_{3}$-clique is either complete or anticomplete to $K^{\prime}$, where $K^{\prime}$ is an $A_{1}$-clique or an $X_{1}$-clique. Thus, by (F3) and (O3), for $j \in\{1,3\}, R_{X_{1}} \cup R_{X_{3}} \cup R_{A_{j}}$ meets each maximal clique of $G$ in $G\left[X_{1} \cup X_{3} \cup A_{j}\right]$ at least twice. Also, by Lemma 6:(ii), Claim 1 (b), and by (O3), $R_{X_{1}} \cup R_{X_{3}} \cup R_{T}$ meets each maximal clique of $G$ in $G\left[X_{1} \cup X_{3} \cup T\right]$ at least twice. Clearly $R_{A_{1}} \cup R_{A_{5}}$ meets each maximal clique of $G$ in $G\left[Y_{2} \cup A_{1} \cup A_{5}\right]$ twice. Likewise, $R_{A_{1}} \cup R_{A_{2}}$ meets each maximal clique of $G$ in $G\left[Y_{5} \cup A_{1} \cup A_{2}\right]$ twice.

Now if $T=\emptyset$, then using Lemma 7:(i) and by Lemma 13, we see that the sets $S_{1}:=R_{A_{2}} \cup$ $R_{A_{5}} \cup R_{X_{1}}, S_{2}:=R_{A_{1}} \cup \mathbb{A}_{3}$ and $S_{3}:=\mathbb{A}_{4} \cup R_{X_{3}}$ are the desired stable sets. So we may assume that $T \neq \emptyset$. By Claim 1, $Y_{5}=\emptyset$. By Claim 2, up to relabelling, we may assume that $A_{5}$ is a clique. Now we let $S_{1}:=R_{A_{2}} \cup R_{A_{5}} \cup R_{X_{1}}, S_{2}:=R_{A_{1}} \cup \mathbb{A}_{3} \cup R_{T}$ and $S_{3}:=R_{A_{4} \backslash B_{4}} \cup R_{X_{3}} \cup R_{Y_{2}}$. Clearly, $S_{1}, S_{2}$ and $S_{3}$ are stable sets. Let $S:=S_{1} \cup S_{2} \cup S_{3}$. To justify that $S$ meets each maximum clique of $G$ that has vertices from $A_{3} \cup B_{4}$, at least twice, we need the following.

Claim 5 If $M \in \mathcal{M}$ has vertices from both $B_{4}$ and an $A_{3}$-clique $A_{3}^{*}$, and no vertex from $Y_{2}$, then $M$ is of the form $X_{1}^{*} \cup B_{4} \cup A_{3}^{*}$, where $X_{1}^{*}$ is an $X_{1}$-clique, and $B_{4} \cup A_{3}^{*} \notin \mathcal{M}$.

Proof of Claim 55. If $X_{1}^{*}$ is complete to $A_{3}^{*}$, then $M$ is of the form $X_{1}^{*} \cup B_{4} \cup A_{3}^{*}$, and we are done. So, we may assume, by Claim 3, that $X_{1}^{*}$ is anticomplete to $A_{3}^{*}$. Then, by (F4), $A_{3}$ is not a clique, and then by (F17), $A_{3}$ is complete to $Y_{2}$. But now since $Y_{2} \cup B_{4} \cup A_{3}^{*}$ is a larger clique than $B_{4} \cup A_{3}^{*}$, we have $B_{4} \cup A_{3}^{*} \notin \mathcal{M}$. This proves Claim $5 \leqslant$

Now by Lemma 7:(i) and Claim 5, $R_{X_{1}} \cup R_{A_{4} \backslash B_{4}} \cup R_{A_{3}}$ meets each maximum clique of $G$ in $G\left[X_{1} \cup A_{3} \cup A_{4}\right]$ twice. Clearly, $R_{A_{5}} \cup R_{Y_{2}}$ meets each maximum clique of $G$ in $G\left[Y_{2} \cup B_{4} \cup A_{5}\right]$ twice, $\mathbb{A}_{3} \cup R_{Y_{2}}$ meets each maximum clique of $G$ in $G\left[Y_{2} \cup A_{3} \cup A_{4}\right]$ twice (by Lemma [13), $R_{A_{5}} \cup R_{A_{4} \backslash B_{4}}$ meets each maximum clique of $G$ in $G\left[\left(A_{4} \backslash B_{4}\right) \cup A_{5}\right]$, and $R_{Y_{2}} \cup R_{T}$ meets each maximum clique of $G$ in $G\left[Y_{2} \cup T\right]$ twice. Thus, we conclude that $S$ meets each maximum clique of $G$ at least twice, and other maximal cliques at least once, and that $G$ is nice.

Case 2 There is an index $i \in[5]$ such that $X_{i}$ and $Y_{i}$ are nonempty.
Let $i=1$. Then by Lemma 12:(iii), $X_{3} \cup X_{4} \cup Y_{3} \cup Y_{4}=\emptyset$. Recall that $Y_{1}$ is anticomplete to $X_{2} \cup X_{5}$ (by Lemma 12:(ii)), and complete to $Y_{2} \cup Y_{5}$ (by Lemma 10:(v)). Also $X_{1}$ is complete to
$X_{2} \cup X_{5}$ (by (F11)). By Lemma 11, $Y_{1} \cup Y_{2}$ is complete to $B_{4}$, and anticomplete to $A_{4} \backslash B_{4} ; Y_{1} \cup Y_{5}$ is complete to $B_{3}$, and anticomplete to $A_{3} \backslash B_{3}$. Also, by Lemma 12:(iv) and (F4), $X_{2}$ is complete to $B_{4}$, and $X_{5}$ is complete to $B_{3}$. Note that since $Y_{1} \neq \emptyset, B_{3}, B_{4} \neq \emptyset$. Since $X_{1} \neq \emptyset$, by Lemma 12:(v), $Y_{2} \cup Y_{5}$ is complete to $A_{1}$. Recall that since $Z=\emptyset$, each vertex in $X \cup Y$ is either anticomplete or good with respect to $T$. By Lemma $7:(i i i), R_{X_{i}} \cup R_{A_{i+2}} \cup R_{A_{i-2}}$ meet each maximum clique of $G$ in $G\left[X_{i} \cup A_{i+2} \cup A_{i-2}\right]$ twice, and other maximal cliques in $G\left[X_{i} \cup A_{i+2} \cup A_{i-2}\right]$ once. To proceed further we claim following:

Claim 6 Suppose $x \in X_{1}$ has a neighbor in $\left(A_{3} \backslash B_{3}\right) \cup\left(A_{4} \backslash B_{4}\right)$. Then $x$ is complete to $Y_{1}$.
Proof of Claim 6. We may assume, up to symmetry, that $x$ has a neighbor in $A_{3} \backslash B_{3}$, say $p$. Let $y \in Y_{1}$, and suppose $x, y$ are nonadjacent. Now pick a neighbor of $y$ in $A_{5}$, say $a$. Then for any $a^{\prime} \in A_{1}$, by (F3), $p-x-a^{\prime}-a-y$ is a $P_{5}$, a contradiction. This proves Claim 6. $\diamond$

Claim 7 Let $M$ be a maximal clique of $G$ containing at least one vertex from each of $X_{1}$ and $Y_{1}$, and no vertex from $T$. Then $R_{B_{3}} \cup R_{B_{4}} \cup R_{X_{1}}$ meets $M$ at least twice.

Proof of Claim 7, Let $M \cap X_{1}=X_{1}^{*}$ and let $D$ be the $X_{1}$-clique such that $X_{1}^{*} \subseteq D$. Recall that $Y_{1}$ is complete to $B_{3} \cup B_{4}$. Now we claim that $D$ is complete to either $B_{3}$ or $B_{4}$. Suppose not. Then by (F5) and (F6), there are vertices $x, x^{\prime} \in D$ such that $x$ is anticomplete to $B_{3}$, and $x^{\prime}$ is anticomplete to $B_{4}$. Then by the definition of $X_{1}, x$ has a neighbor in $A_{3} \backslash B_{3}$, and $x^{\prime}$ has a neighbor in $A_{4} \backslash B_{4}$. So, by Claim 6, $\left\{x, x^{\prime}\right\}$ is complete to $Y_{1}$. Then by Claim 6 and (F6), for any $y \in Y_{1}, b \in B_{3}$ and $b^{\prime} \in B_{4}$ then $\left\{x, b^{\prime}, b, x^{\prime}, y\right\}$ induces a 4 -wheel, a contradiction; so $D$ is complete to either $B_{3}$ or $B_{4}$. Now since $M$ is a maximal clique and $X_{1}^{*}$ is either complete to $B_{3}$ or $B_{4}$, we conclude that $M \cap\left(B_{3} \cup B_{4}\right) \neq \emptyset$. If $X_{1}^{*}$ is complete to $B_{3} \cup B_{4}$, then clearly the assertion holds. So we assume that $X_{1}^{*}$ is not complete to $B_{4}$, then there is an $x \in X_{1}^{*}$ such that $x$ is anticomplete to $B_{4}$ (by (F4)). So by a previous argument, $D$ is complete to $B_{3}$. Next we claim that $D$ is complete $Y_{1}$. Suppose there are vertices $x^{\prime} \in D$ and $y \in Y_{1}$ such that $x^{\prime} y \notin E$. By Claim [6, $x \neq x^{\prime}$, and $x^{\prime}$ is anticomplete to $A_{4} \backslash B_{4}$, so by the definition of $X_{1}, x^{\prime}$ must have a neighbor in $B_{4}$. Then by Claim 6 and (F5), for any $a \in B_{3}$ and $a^{\prime} \in B_{4},\left\{a^{\prime}, x^{\prime}, x, y, a\right\}$ induces a 4 -wheel, a contradiction. So $D$ is complete $Y_{1}$. Since $B_{3} \cup D \cup Y_{1}$ is a clique, and $M$ is a maximal clique, we have $X_{1}^{*}=D$, and hence $M=B_{3} \cup D \cup Y_{1}$. Then clearly $R_{B_{3}} \cup R_{B_{4}} \cup R_{X_{1}}$ meets $M$ at least twice. This proves Claim 7. $\diamond$

Claim 8 Suppose that $X_{2} \cup X_{5}=\emptyset$, and let $Q$ be a $T$-clique. If there is an $M \in \mathcal{M}$ such that $Q \subseteq M$, then $|Q| \geq 2$.

Proof of Claim 8. Recall that each vertex in $X \cup Y$ is either complete or anticomplete to $Q$. For $j \in\{1,2,5\}$, let $Y_{j}^{*}:=N(Q) \cap Y_{j}$. First suppose that $(M \backslash Q) \cap X=\emptyset$. If $M \backslash Q=Y_{1}^{*} \cup Y_{2}^{*}$, then $\left|Y_{1}^{*} \cup Y_{2}^{*} \cup Q\right| \geq\left|B_{4} \cup Y_{1} \cup Y_{2} \cup\left\{b_{3}\right\}\right|$, where $b_{3} \in B_{3}$ is the vertex which is complete to $Y_{2}$ (by Lemma 12:(i)), hence $|Q| \geq 2$. Likewise, if $M \backslash Q=Y_{1}^{*} \cup Y_{5}^{*}$, then $|Q| \geq 2$. So we assume $(M \backslash Q) \cap X \neq \emptyset$. Then $M \backslash Q=X_{1}^{*} \cup Y_{1}^{*}$ where $X_{1}^{*}$ is a subset of some $X_{1}$-clique such that $N(Q) \cap X_{1}^{*} \neq \emptyset$. Then by (F9), $X_{1}^{*}$ is complete to $A_{3} \cup A_{4}$; in particular $X_{1}^{*}$ is complete to $B_{3} \cup B_{4}$. So $\left|X_{1}^{*} \cup Y_{1}^{*} \cup Q\right| \geq\left|B_{3} \cup B_{4} \cup X_{1}^{*} \cup Y_{1}^{*}\right|$, thus $|Q| \geq 2$. This proves Claim 8 , $\diamond$

First suppose that $X_{2} \cup X_{5}=\emptyset$, and we apply Claim 8. We refer to Figure 5 ( (c) for a sketch of the graph $G$. Then, by Lemma [13, $\cup_{i=1}^{5} \mathbb{A}_{i}$ meets each maximum clique of $G$ in $G[A \cup Y]$ twice. Since $X_{1}$ is anticomplete to $Y_{2} \cup Y_{5}$, by Claim 77, and by Lemma 13, $\mathbb{A}_{3} \cup \mathbb{A}_{4} \cup R_{X_{1}}$ meets each maximum clique of $G$ in $G\left[X \cup Y \cup A_{3} \cup A_{4}\right]$ twice, and clearly, by (F3), $\mathbb{A}_{1} \cup R_{X_{1}}$ meets each maximum clique of $G$ in $G\left[X_{1} \cup A_{1}\right]$ twice. Then since each vertex in $X \cup Y$ is either complete or
anticomplete to a $T$-clique, by Claim 团, we conclude that $S_{1}:=\mathbb{A}_{2} \cup \mathbb{A}_{5} \cup R_{X_{1}}, S_{2}:=\mathbb{A}_{1} \cup \mathbb{A}_{4} \cup L$ and $S_{3}:=\mathbb{A}_{3} \cup L^{\prime}$ are the required stable sets. Next suppose that $X_{2} \cup X_{5} \neq \emptyset$. We may assume, up to symmetry, that $X_{5} \neq \emptyset$. Then, by Lemma 12:(iii), $Y_{2}=\emptyset$. Next we claim that $X_{1}$ is complete to $Y_{1}$. Suppose to the contrary that there are nonadjacent vertices, say $x \in X_{1}$ and $y \in Y_{1}$. Then, by Claim 6, $x$ is complete to $B_{3} \cup B_{4}$. Now pick any $x^{\prime} \in X_{5}, a \in B_{3}, a^{\prime} \in B_{4}$, and pick a common neighbor of $x^{\prime}$ and $y$ in $A_{2}$, say $a^{\prime \prime}$ (by Lemma 12:(iv)). Then since $X_{5}$ is complete to $B_{3}$, we see that $\left\{y, a^{\prime}, x, x^{\prime}, a^{\prime \prime}, a\right\}$ induces a 5 -wheel, a contradiction; so $X_{1}$ is complete to $Y_{1}$. Further, if there are adjacent vertices, say $x \in X_{1}$ and $b \in B_{3}$, then for any $x^{\prime} \in X_{5}, y \in Y_{1}$, by Lemma 12:(iv), $x^{\prime}$ and $y$ have a common neighbor in $A_{2}$, say $a$, and then, by (F11), $\left\{x, y, a, x^{\prime}, b\right\}$ induces a 4 -wheel, a contradiction; so $X_{1}$ is anticomplete to $B_{3}$. Likewise, if $X_{2} \neq \emptyset$, then $X_{1}$ is anticomplete to $B_{4}$, a contradiction to (F6); so $X_{2}=\emptyset$. Since $X_{1}$ is anticomplete to $B_{3}$, by Lemma 12:(iv), $Y_{5}=\emptyset$, and by (F9) $X_{1}$ is anticomplete to $T$. By Lemma 10:(vi), each vertex in $T$ has a neighbor in $X_{5}$, and so by (F21), $T$ is complete to $Y_{1}$. Hence again by (F21), each $T$-clique is either complete or anticomplete to an $X_{5}$-clique. See Figure 洍 $(d)$ for a sketch of the graph $G$. Moreover, if there is a $M \in \mathcal{M}$ which has vertices from a $T$-clique $T^{*}$ and from $Y_{1}$, then $\left|Y_{1} \cup T^{*}\right| \geq\left|Y_{1} \cup B_{3} \cup B_{4}\right|$, and so $\left|T^{*}\right| \geq 2$. Now we let $S_{1}:=\mathbb{A}_{2} \cup \mathbb{A}_{5} \cup R_{X_{1}} \cup L, S_{2}:=R_{A_{1}} \cup R_{A_{4}} \cup R_{X_{5}}$ and $S_{3}:=R_{A_{3}} \cup L^{\prime}$. Then $R_{X_{5}} \cup L \cup L^{\prime}$ meets each maximum clique of $G$ in $G[X \cup Y \cup T]$ at least twice, and the other maximal cliques once. Also, by Claim 7, $R_{A_{3}} \cup R_{A_{4}} \cup R_{X_{1}}$ meets each maximum clique of $G$ in $G\left[X_{1} \cup Y_{1} \cup A_{3} \cup A_{4}\right]$ twice, and the other maximal cliques once. By (F14), $R_{X_{1}} \cup R_{X_{5}} \cup R_{A_{3}}$ meets each maximal clique of $G$ in $G\left[X_{1} \cup X_{5} \cup A_{3}\right]$ at least twice. Now by using Lemma [13, we observe that $S_{1} \cup S_{2} \cup S_{3}$ meets each maximum clique of $G$ at least twice, and other maximal cliques at least once. So $G$ is nice. This completes the proof of Theorem 5.

### 4.3 Structure of ( $P_{5}, C_{5}, 4$-wheel)-free graphs that contain an induced $C_{7}^{c}$

Let $C^{*}$ be the $C_{7}^{c}$ with vertices $v_{1}, v_{2}, \ldots, v_{7}$ and edges $v_{i} v_{i+1}$ and $v_{i} v_{i+2}$ for each $i$ modulo 7 . Let $H^{*}$ be the graph obtained from $C^{*}$ by adding two vertices $v_{8}$ and $v_{9}$ and edges $v_{8} v_{1}, v_{8} v_{2}, v_{8} v_{5}, v_{9} v_{5}, v_{9} v_{6}$ and $v_{9} v_{2}$.

Theorem 6 If a connected ( $P_{5}, C_{5}, 4$-wheel)-free graph $G$ contains an induced $C_{7}^{c}$, then $G$ is a blowup of $H^{*}$, and hence $G$ is nice.

Proof of Theorem 6] For convenience, we consider the complement graph of $G$, say $H$. So $H$ is a $\left(P_{5}^{c}, C_{5}, 2 K_{2} \cup K_{1}\right)$-free graph such that $H^{c}(\cong G)$ is connected, and contains an induced $C_{7}$, say $u_{1}-u_{2}-u_{3}-u_{4}-u_{5}-u_{6}-u_{7}-u_{1}$. So we may assume that there are seven nonempty and pairwise disjoint sets $A_{1}, \ldots, A_{7}$ such that for each $i$ modulo 7 the set $A_{i}$ is complete to $A_{i-1} \cup A_{i+1}$, and anticomplete to $A_{i-2} \cup A_{i-3} \cup A_{i+2} \cup A_{i+3}$. Let $A:=A_{1} \cup \cdots \cup A_{7}$. We choose these sets such that $A$ is maximal, and let $u_{i} \in A_{i}$. For each $i \in[7]$, let $B_{i}$ denote the set $\{x \in V(H) \backslash A \mid x$ has a neighbor in each $A_{j}, j \in\{i, i+1, i+2, i+3\}$, and $x$ is anticomplete to $\left.A_{i-1} \cup A_{i-2} \cup A_{i-3}\right\}$. Let $B:=B_{1} \cup \cdots \cup B_{7}$. Let $D$ denote the set $\left\{x \in V(H) \backslash A \mid x\right.$ has a neighbor in $A_{i}$, for each $\left.i \in[7]\right\}$. Clearly, since the graph $H$ is $\left(P_{5}^{c}, C_{5}\right)$-free, we have the following simple observation:
(1) Let $P$ be a $P_{4}$ in $H$, say $a_{1}-a_{2}-a_{3}-a_{4}$. Then any vertex in $V(H) \backslash V(P)$ which is adjacent to both $a_{1}$ and $a_{4}$, is adjacent to both $a_{2}$ and $a_{3}$.

Moreover, the following hold, for each $i \in[7]$ :
(2) Each vertex in $V(H) \backslash A$ has a neighbor in $A$.

Proof of $\left[(2)\right.$. If some $x \in V(H) \backslash A$ has no neighbor in $A$, then $\left\{u_{1}, u_{2}, u_{4}, u_{5}, x\right\}$ induces a $2 K_{2} \cup K_{1}$, a contradiction. This proves (2), $\diamond$
(3) Let $x \in V(H) \backslash(A \cup D)$. Suppose $x$ has a neighbor in $A_{i}$. Then exactly one of $N(x) \cap A_{i-2}$, $N(x) \cap A_{i+2}$ is nonempty.

Proof of (3). Suppose not, and let $i=1$. Let $a$ be a neighbor of $x$ in $A_{1}$. If $N(x) \cap A_{3}=\emptyset$ and $N(x) \cap A_{6}=\emptyset$, then by (1), $N(x) \cap A_{5}=\emptyset$, and then $\left\{a, x, u_{5}, u_{6}, u_{3}\right\}$ induces a $2 K_{2} \cup K_{1}$, a contradiction; so we may assume that $N(x) \cap A_{3} \neq \emptyset$ and $N(x) \cap A_{6} \neq \emptyset$. Then by (1), $x$ is complete to $A_{4} \cup A_{5}$. Then, again by using (1), we see that $x$ is complete to $A_{2} \cup A_{7}$. But then $x \in D$, a contradiction. This proves (3), $\diamond$
(4) $V(H)=A \cup B \cup D$.

Proof of (4), Let $x \in V(H) \backslash(A \cup D)$. Then, by (2), we may assume that $x$ has a neighbor in $A_{i}$, say $a_{i}$. By (3), we may assume that $N(x) \cap A_{i+2} \neq \emptyset$ and $x$ is anticomplete to $A_{i-2}$. Then, by (1), $x$ is anticomplete $A_{i-3}$. Let $a_{i+2}$ be a neighbor of $x$ in $A_{i+2}$. We claim that $x$ has a neighbor in $A_{i+1}$. Suppose $x$ is anticomplete to $A_{i+1}$. Then, by (1), $x$ is anticomplete to $A_{i+3} \cup A_{i-1}$. Also, if $x$ has a nonneighbor, say $a_{i}^{\prime}$, in $A_{i}$, then $\left\{a_{i}^{\prime}, u_{i-1}, x, a_{i+2}, u_{i-3}\right\}$ induces a $2 K_{2} \cup K_{1}$, a contradiction; so $x$ is complete to $A_{i}$. Likewise, $x$ is complete to $A_{i+2}$. But then $x$ can be added to $A_{i}$, contradicting the maximality of $A$. So we may assume that $x$ has a neighbor in $A_{i+1}$, say $a_{i+1}$. Then by (1), $x$ has no neighbors in both $A_{i+3}$ and $A_{i-1}$. But since $\left\{x, a_{i+1}, u_{i+3}, u_{i-3}, u_{i-1}\right\}$ does not induce a $2 K_{2} \cup K_{1}, x$ has a neighbor in exactly one of $A_{i+3}$ and $A_{i-1}$, say $x$ has a neighbor in $A_{i+3}$. So $x \in B_{i}$. This proves (4), $\diamond$
(5) $A_{i}$ is a stable set.

Proof of (5). If there are adjacent vertices in $A_{i}$, say $p$ and $q$, then $\left\{p, q, u_{i+2}, u_{i+3}, u_{i-2}\right\}$ induces a $2 K_{2} \cup K_{1}$, a contradiction. This proves (5), $\diamond$
(6) $H\left[B_{i}\right]$ is $K_{2} \cup K_{1}$-free.

Proof of $(6)$. If there is a $K_{2} \cup K_{1}$ induced by the vertices, say $\{p, q, r\}$, in $B_{i}$, then $\left\{u_{i-1}, u_{i-2}, p, q, r\right\}$ induces a $2 K_{2} \cup K_{1}$, a contradiction. This proves (6), $\diamond$
(7) $B_{i}$ is complete to $A_{i} \cup A_{i+1} \cup A_{i+2} \cup A_{i+3}$.

Proof of (7). Let $x \in B_{i}$ and $y \in A_{i} \cup A_{i+1} \cup A_{i+2} \cup A_{i+3}$, and suppose $x, y$ are nonadjacent. Let $a_{i+1}$ and $a_{i+2}$ be neighbors of $x$ in $A_{i+1}$ and $A_{i+2}$ respectively. By symmetry, we may assume that $y \in A_{i} \cup A_{i+1}$. Now if $y \in A_{i}$, then $\left\{u_{i-1}, y, x, a_{i+2}, u_{i-3}\right\}$ induces a $2 K_{2} \cup K_{1}$, a contradiction, and if $y \in A_{i+1}$, then, by (5) $y a_{i+1} \notin E$, and then $\left\{u_{i-1}, u_{i-2}, x, a_{i+1}, y\right\}$ induces a $2 K_{2} \cup K_{1}$, a contradiction. This proves (7), $\diamond$
(8) $B_{i}$ is complete to $B_{i+1} \cup B_{i-1}$.

Proof of (8), Let $x \in B_{i}$ and $y \in B_{i+1} \cup B_{i-1}$, and suppose $x, y$ are nonadjacent. By symmetry, we may assume that $y \in B_{i+1}$. Then by (7), $\left\{x, u_{i+1}, y, u_{i+4}, u_{i+3}\right\}$ induces a $P_{5}^{c}$, a contradiction. This proves (8), $\diamond$
(9) If $B_{i} \neq \emptyset$, then $B_{i-3} \cup B_{i-2} \cup B_{i+2} \cup B_{i+3}$ is empty.

Proof of (9). Let $x \in B_{i}$. Suppose that there is a vertex $x^{\prime} \in B_{i+2}$. If $x x^{\prime} \in E$, then by (7), $x-u_{i}-u_{i-1}-u_{i-2}-x^{\prime}-x$ is a $C_{5}$, a contradiction; so $x x^{\prime} \notin E$, and then, by (7), $\left\{x, u_{i+1}, x^{\prime}, u_{i-3}, u_{i-1}\right\}$ induces a $2 K_{2} \cup K_{1}$, a contradiction. So $B_{i+2}=\emptyset$. Likewise, $B_{i-2}=\emptyset$. Also, if there is a vertex, say $y \in B_{i+3}$, then, by (7), $\left\{u_{i-1}, u_{i}, x, u_{i+3}, y\right\}$ induces a $C_{5}$ or a $P_{5}^{c}$, a contradiction. So $B_{i+3}=\emptyset$. Likewise, $B_{i-3}=\emptyset$. This proves (9). $\diamond$
(10) $D$ is complete to $A \cup B$.

Proof of (10). Suppose there are nonadjacent vertices, say $x \in D$ and $a \in A_{i}$. Pick neighbors of $x$ in each $A_{i+1}, A_{i+2}$ and $A_{i-1}$, say $p, q$, and $r$ respectively. Then $\{a, p, q, r, x\}$ induces a $P_{5}^{c}$, a contradiction. So $D$ is complete to $A$. Next, if there are nonadjacent vertices, say $x \in D$ and $x^{\prime} \in B_{i}$, then, by (7), and by the earlier argument, $\left\{x^{\prime}, u_{i}, u_{i-1}, x, u_{i+3}\right\}$ induces a $P_{5}^{c}$, a contradiction. This proves (10). $\diamond$

Now since $H^{c}$ is connected, we have $D=\emptyset$. So by above properties, if $B=\emptyset$, then $G$ is a clique-blowup of $C_{7}^{c}$. So we may assume that $B_{1} \neq \emptyset$. Then by (9), $B_{3} \cup B_{4} \cup B_{5} \cup B_{6}$ is empty, and one of $B_{2}, B_{7}$ is empty. Thus we conclude that $G$ is a blowup of $H^{*}$. Let $H^{*}$ be defined as earlier. By the definition of blowup, $V(G)$ is partitioned into $Q_{v_{i}}, v_{i} \in V\left(H^{*}\right)$, such that each $Q_{v_{i}}$ induces a $P_{3}$-free graph. Now we let $S_{1}:=R_{Q_{v_{1}}} \cup R_{Q_{v_{4}}} \cup R_{Q_{v_{9}}}, S_{2}:=R_{Q_{v_{2}}} \cup R_{Q_{v_{5}}}$, and $S_{3}:=R_{Q_{v_{3}}} \cup R_{Q_{v_{7}}} \cup R_{Q_{v_{8}}}$. Clearly $S_{1}, S_{2}$ and $S_{3}$ are stable sets such that $S_{1} \cup S_{2} \cup S_{3}$ meets each maximal clique of $G$ twice. So $G$ is nice. This completes the proof of Theorem 6,

Proof of Theorem [3. Since each $k$-wheel, for $k \geq 6$ has an induced $P_{5}$, the proof of each of the item in Theorem 3 follows from Theorems 4, 55 and 6 respectively.

Acknowledgements. This paper is dedicated to the memory of Professor Frédéric Maffray on his third death anniversary. The authors thank an anonymous referee for his/her helpful suggestions and comments.
