# STRUCTURE OF MULTICORRELATION SEQUENCES WITH INTEGER PART POLYNOMIAL ITERATES ALONG PRIMES 

ANDREAS KOUTSOGIANNIS, ANH N. LE, JOEL MOREIRA, AND FLORIAN K. RICHTER

#### Abstract

Let $T$ be a measure preserving $\mathbb{Z}^{\ell}$-action on the probability space $(X, \mathcal{B}, \mu)$, $q_{1}, \ldots, q_{m}: \mathbb{R} \rightarrow \mathbb{R}^{\ell}$ vector polynomials, and $f_{0}, \ldots, f_{m} \in L^{\infty}(X)$. For any $\epsilon>0$ and multicorrelation sequences of the form $\alpha(n)=\int_{X} f_{0} \cdot T^{\left\lfloor q_{1}(n)\right\rfloor} f_{1} \cdots T^{\left\lfloor q_{m}(n)\right\rfloor} f_{m} d \mu$ we show that there exists a nilsequence $\psi$ for which $\lim _{N-M \rightarrow \infty} \frac{1}{N-M} \sum_{n=M}^{N-1}|\alpha(n)-\psi(n)| \leq \epsilon$ and $\lim _{N \rightarrow \infty} \frac{1}{\pi(N)} \sum_{p \in \mathbb{P} \cap[1, N]}|\alpha(p)-\psi(p)| \leq \epsilon$. This result simultaneously generalizes previous results of Frantzikinakis [2] and the authors [11, 13].

## 1. Introduction and main result

Since Furstenberg's ergodic theoretic proof of Szemerédi's theorem [5], there has been much interest in understanding the structure of multicorrelation sequences, i.e., sequences of the form

$$
\begin{equation*}
\alpha(n)=\int_{X} f_{0} \cdot T^{n} f_{1} \cdots T^{k n} f_{k} d \mu, \quad n \in \mathbb{N} \tag{1}
\end{equation*}
$$

where $(X, \mathcal{B}, \mu, T)$ is a measure preserving system and $f_{0}, \ldots, f_{k} \in L^{\infty}(X)$. The first to provide deeper insight into the algebraic structure of such sequences were Bergelson, Host, and Kra, who showed in 1 that if the system $(X, \mu, T)$ is ergodic then for any multicorrelation sequence $\alpha$ as in (1) there exists a uniform limit of $k$-step nilsequences $\phi$ such that

$$
\begin{equation*}
\lim _{N-M \rightarrow \infty} \frac{1}{N-M} \sum_{n=M}^{N-1}|\alpha(n)-\phi(n)|=0 \tag{2}
\end{equation*}
$$

Here, a $k$-step nilsequence is a sequence of the form $\psi(n)=F\left(g^{n} x\right), n \in \mathbb{N}$, where $F$ is a continuous function on a $k$-step nilmanifold $X=G / \Gamma, 1] \in, x \in X$. A uniform limit of $k$-step nilsequences is a sequence $\phi$ such that for every $\epsilon>0$ there exists a $k$-step nilsequence $\psi$ with $\sup _{n \in \mathbb{N}}|\phi(n)-\psi(n)| \leq \epsilon$.

Later, Leibman extended the result of Bergelson, Host and Kra to polynomial iterates in [14], and removed the ergodicity assumption in [15]. Another extension was obtained by the second author in [12], and independently by Tao and Teräväinen in [17], answering a question raised in [3]. There, it was shown that in addition to (2) one also has

$$
\begin{equation*}
\lim _{N \rightarrow \infty} \frac{1}{\pi(N)} \sum_{p \in \mathbb{P} \cap[1, N]}|\alpha(p)-\phi(p)|=0, \tag{3}
\end{equation*}
$$

where $\mathbb{P}$ denotes the set of prime numbers, $[1, N]:=\{1, \ldots, N\}$, and $\pi(N):=|\mathbb{P} \cap[1, N]|$.
The proofs of all the aforementioned results depend crucially on the structure theory of Host and Kra, who established in [7] that the building blocks of the factors that control

[^0]multiple ergodic averages are nilsystems. Since the analogous factors for $\mathbb{Z}^{\ell}$-actions are unknown, extending the results above from $\mathbb{Z}$-actions to $\mathbb{Z}^{\ell}$-actions proved to be a challenge. Nevertheless, in [2] Frantzikinakis concocted a different approach and gave a description of the structure of multicorrelation sequences of $\mathbb{Z}^{\ell}$-actions, which we now explain.

Henceforth, let $\ell \in \mathbb{N}$ and let $T$ be a measure preserving $\mathbb{Z}^{\ell}$-action on a probability space $(X, \mathcal{B}, \mu)$. The system $(X, \mathcal{B}, \mu, T)$ gives rise to a more general class of multicorrelation sequences,

$$
\begin{equation*}
\alpha(n)=\int_{X} f_{0} \cdot T^{q_{1}(n)} f_{1} \cdots T^{q_{m}(n)} f_{m} d \mu, \quad n \in \mathbb{N} \tag{4}
\end{equation*}
$$

where $q_{1}, \ldots, q_{m}: \mathbb{Z} \rightarrow \mathbb{Z}^{\ell}$ are integer-valued vector polynomials and $f_{0}, \ldots, f_{m} \in L^{\infty}(X)$. Note that (11) corresponds to the special case of (4) when $\ell=1$ and $q_{i}(n)=i n$. Frantzikinakis showed in [2] that for every $\alpha$ as in (4) and every $\epsilon>0$ there exists a $k$-step nilsequence $\psi$ such that

$$
\begin{equation*}
\lim _{N-M \rightarrow \infty} \frac{1}{N-M} \sum_{n=M}^{N-1}|\alpha(n)-\psi(n)| \leq \epsilon \tag{5}
\end{equation*}
$$

where $k$ only depends on $\ell, m$, and the maximal degree among the polynomials $q_{1}, \ldots, q_{m}$. Moreover, in the special case where each polynomial iterate is linear, it was proved in [2] that one can take $k=m$. It is still an open question whether in (5) one can replace $\epsilon$ with 0 after replacing the nilsequence $\psi$ with a uniform limit of such sequences (see Question 2 in Section (3).

For $x \in \mathbb{R}$ we denote by $\lfloor x\rfloor$ the largest integer which is smaller or equal to $x$, while for $x=\left(x_{1}, \ldots, x_{\ell}\right) \in \mathbb{R}^{\ell}$ we let $\lfloor x\rfloor:=\left(\left\lfloor x_{1}\right\rfloor, \ldots,\left\lfloor x_{\ell}\right\rfloor\right)$. In [11], the first author extended Frantzikinakis' results to all multicorrelation sequences of the form

$$
\begin{equation*}
\alpha(n)=\int_{X} f_{0} \cdot T^{\left\lfloor q_{1}(n)\right\rfloor} f_{1} \cdots T^{\left\lfloor q_{m}(n)\right\rfloor} f_{m} d \mu, \quad n \in \mathbb{N} \tag{6}
\end{equation*}
$$

where $q_{1}, \ldots, q_{m}: \mathbb{R} \rightarrow \mathbb{R}^{\ell}$ are real-valued vector polynomials.
More recently, the last three authors showed that the conclusion of Frantzikinakis' result also holds along the primes:

Theorem 1 ([13, Theorems A and B]). For every $\ell, m, d \in \mathbb{N}$ there exists $k \in \mathbb{N}$ with the following property. For any polynomials $q_{1}, \ldots, q_{m}: \mathbb{Z} \rightarrow \mathbb{Z}^{\ell}$ with degree at most $d$, measure preserving $\mathbb{Z}^{\ell}$-action $T$ on a probability space $(X, \mathcal{B}, \mu)$, functions $f_{0}, f_{1}, \ldots, f_{m} \in L^{\infty}(X)$, $\varepsilon>0, r \in \mathbb{N}$ and $s \in \mathbb{Z}$, letting $\alpha$ be as in (4), there exists a $k$-step nilsequence $\psi$ satisfying (5) and

$$
\begin{equation*}
\lim _{N \rightarrow \infty} \frac{1}{\pi(N)} \sum_{p \in \mathbb{P} \cap[1, N]}|\alpha(r p+s)-\psi(r p+s)| \leq \varepsilon \tag{7}
\end{equation*}
$$

In the special case $d=1$ one can choose $k=m$.
Our main theorem simultaneously generalizes the main results from [11] and [13].
Theorem A. For every $\ell, m, d \in \mathbb{N}$ there exists $k \in \mathbb{N}$ with the following property. For any polynomials $q_{1}, \ldots, q_{m}: \mathbb{R} \rightarrow \mathbb{R}^{\ell}$ with degree at most $d$, any measure preserving $\mathbb{Z}^{\ell}$ action $T$ on a probability space $(X, \mathcal{B}, \mu)$, functions $f_{0}, f_{1}, \ldots, f_{m} \in L^{\infty}(X), \varepsilon>0, r \in \mathbb{N}$ and $s \in \mathbb{Z}$, letting $\alpha$ be as in (6), there exists a $k$-step nilsequence $\psi$ satisfying (5) and (77). In the special case $d=1$ one can choose $k=m$.

The proof of Theorem A, presented in the next section, follows closely the strategy implemented in [11], but uses Theorem 1 instead of Walsh's theorem [18] as a blackbox.

Remark 2．Both Theorems $\square$ and $\AA$ are equivalent to seemingly stronger versions involv－ ing commuting actions．We say that two actions $T_{1}$ and $T_{2}$ of a group $G$ commute if for every $g, h \in G$ we have $T_{1}^{g} \circ T_{2}^{h}=T_{2}^{h} \circ T_{1}^{g}$ ．When $G$ is an abelian group，a collection of $m$ commuting $G$－actions $T_{1}, \ldots, T_{m}$ can be identified with a single $G^{m}$－action $T$ via $T^{\left(g_{1}, \ldots, g_{m}\right)}=T_{1}^{g_{1}} \cdots T_{m}^{g_{m}}$ ．Using this observation，and the identification $\left(\mathbb{Z}^{\ell}\right)^{m}=\mathbb{Z}^{\ell m}$ ， one sees that，given commuting measure preserving $\mathbb{Z}^{\ell}$－actions $T_{1}, \ldots, T_{m}$ in a probability space（ $X, \mu, T$ ），Theorem $⿴ 囗 十$ holds when（4）is replaced by

$$
\begin{equation*}
\alpha(n)=\int_{X} f_{0} \cdot T_{1}^{q_{1}(n)} f_{1} \cdots T_{m}^{q_{m}(n)} f_{m} d \mu \tag{8}
\end{equation*}
$$

and Theorem A holds when（6）is replaced by

$$
\alpha(n)=\int_{X} f_{0} \cdot T_{1}^{\left\lfloor q_{1}(n)\right\rfloor} f_{1} \cdots T_{m}^{\left\lfloor q_{m}(n)\right\rfloor} f_{m} d \mu .
$$

Remark 3．Let $\lceil x\rceil$ and $[x]$ denote the smallest integer $\geq x$ and the closest integer to $x$ ， respectively．Using the relations $\lceil x\rceil=-\lfloor-x\rfloor$ and $[x]=\lfloor x+1 / 2\rfloor$ ，we see that Theorem $\mathbf{A}$ remains true if（6）is replaced by

$$
\alpha(n)=\int_{X} f_{0} \cdot T^{\left[q_{1}(n)\right]_{1}} f_{1} \cdots T^{\left[q_{m}(n)\right]_{m}} f_{m} d \mu, \quad n \in \mathbb{N},
$$

where $[x]_{i}=\left(\left[x_{1}\right]_{i, 1}, \ldots,\left[x_{\ell}\right]_{i, \ell}\right)$ and $[\cdot]_{i, 1}, \ldots,[\cdot]_{i, \ell}$ are any of $\lfloor\cdot\rfloor,\lceil\cdot\rceil$ ，or $[\cdot]$ ．

## 2．Proof of main result

We start by proving a theorem concerning flows，which stands halfway in between Theorems 1 and A ．The idea behind this result is that for a real polynomial $q(x)=$ $a_{d} x^{d}+\ldots+a_{1} x+a_{0} \in \mathbb{R}[x]$ and a measure presenting flow $\left(S^{t}\right)_{t \in \mathbb{R}}$ we can write $S^{q(n)}=$ $\left(S^{a_{d}}\right)^{n^{d}} \cdots\left(S^{a_{0}}\right)^{1}$ ，an expression which can be handled by Theorem $\mathbb{\square}$
Theorem 4．For every $\ell, m, d \in \mathbb{N}$ there exists $k \in \mathbb{N}$ with the following property．For any polynomials $q_{1}, \ldots, q_{m}: \mathbb{R} \rightarrow \mathbb{R}^{\ell}$ with degree at most d，commuting measure preserving $\mathbb{R}^{\ell}$－actions $S_{1}, \ldots, S_{m}$ on a probability space $(X, \mathcal{B}, \mu)$ ，functions $f_{0}, f_{1}, \ldots, f_{m} \in L^{\infty}(X)$ ， $\varepsilon>0, r \in \mathbb{N}$ ，and $s \in \mathbb{Z}$ ，letting

$$
\begin{equation*}
\alpha(n)=\int_{X} f_{0} \cdot S_{1}^{q_{1}(n)} f_{1} \cdots S_{m}^{q_{m}(n)} f_{m} d \mu \tag{9}
\end{equation*}
$$

there exists a $k$－step nilsequence $\psi$ satisfying（5）and（7）．In the special case $d=1$ one can choose $k=m$ ．

Proof．For each $i \in[1, m]$ ，let $q_{i}=\left(q_{i, 1}, \ldots, q_{i, \ell}\right)$ for some $q_{i, j} \in \mathbb{R}[x]$ ．Next，for each $j \in[1, \ell]$ ，write $q_{i, j}(x)=\sum_{h=0}^{d} a_{i, j, h} x^{h}$ ，where the $a_{i, j, h}$＇s are real numbers．Also，for each $j \in[1, \ell]$ ，let $e_{j}$ be the $j$－th vector of the canonical basis of $\mathbb{R}^{\ell}$ and let $T_{i, j, h}$ be the measure preserving transformation defined by $T_{i, j, h}=S_{i}^{a_{i, j, h} e_{j}}$ ．Next，let $T_{i, h}$ be the composition $T_{i, h}=T_{i, 1, h} \cdots T_{i, \ell, h}$ ，let $T_{i}$ be the $\mathbb{Z}^{d+1}$－action defined by $T_{i}^{\left(n_{0} \ldots, n_{d}\right)}=T_{i, 0}^{n_{0}} \cdots T_{i, d}^{n_{d}}$ ，and let $q: \mathbb{Z} \rightarrow \mathbb{Z}^{d+1}$ be the polynomial $q(n)=\left(1, n, \ldots, n^{d}\right)$ ．

With this setup，for each $i \in[1, m]$ and $n \in \mathbb{N}$ ，we have

$$
S_{i}^{q_{i}(n)}=\prod_{j=1}^{\ell} S_{i}^{q_{i, j}(n) e_{j}}=\prod_{j=1}^{\ell} \prod_{h=0}^{d} T_{i, j, h}^{n^{h}}=\prod_{h=0}^{d} T_{i, h}^{n^{h}}=T_{i}^{q(n)} .
$$

Since the $\mathbb{R}^{\ell}$-actions $S_{1}, \ldots, S_{m}$ commute, so do the $\mathbb{Z}^{d+1}$-actions $T_{1}, \ldots, T_{m}$. This implies that the multicorrelation sequence $\alpha$ can be represented by an expression of the form (8). The conclusion now follows directly from Theorem 1 and Remark 2.

Next we need a result concerning the distribution of real polynomials.
Lemma 5. Let $q \in \mathbb{R}[x]$ be a non-constant real polynomial, $r \in \mathbb{N}$ and $s \in \mathbb{Z}$. Then, denoting by $\{\cdot\}$ the fractional part, we have

$$
\lim _{\delta \rightarrow 0^{+}} \lim _{N-M \rightarrow \infty} \frac{1}{N-M}|\{n \in[M, N):\{q(n)\} \in[1-\delta, 1)\}|=0
$$

and

$$
\lim _{\delta \rightarrow 0^{+}} \lim _{N \rightarrow \infty} \frac{1}{\pi(N)}|\{p \in \mathbb{P} \cap[1, N]:\{q(r p+s)\} \in[1-\delta, 1)\}|=0 .
$$

Proof. Let

$$
A(\delta)=\lim _{N-M \rightarrow \infty} \frac{1}{N-M}|\{n \in[M, N):\{q(n)\} \in[1-\delta, 1)\}|,
$$

and

$$
B(\delta)=\lim _{N \rightarrow \infty} \frac{1}{\pi(N)}|\{p \in \mathbb{P} \cap[1, N]:\{q(r p+s)\} \in[1-\delta, 1)\}| .
$$

If $q-q(0)$ has an irrational coefficient, then by Weyl's Uniform Distribution Theorem 19 and Rhin's Theorem [16] we have $A(\delta)=B(\delta)=\delta$ which approach 0 as $\delta \rightarrow 0^{+}$.
Assume otherwise that $q \in \mathbb{R}[x]$ satisfies $q-q(0) \in \mathbb{Q}[x]$, say $q(x)=q(0)+b^{-1} \sum_{j=1}^{\ell} a_{j} x^{j}$ where $b \in \mathbb{N}, a_{j} \in \mathbb{Z}$ for $1 \leq j \leq \ell$, and $q(0) \in \mathbb{R}$. It follows that for all $n \in \mathbb{N}$,

$$
q(n)-q(0) \bmod 1 \in\left\{0, \frac{1}{b}, \frac{2}{b}, \ldots, \frac{b-1}{b}\right\}
$$

In particular, the fractional part $\{q(n)\}$ takes only finitely many values. Therefore, if $\delta$ is small enough, for every $n \in \mathbb{N}$ we have $\{q(n)\} \notin[1-\delta, 1)$ and hence $A(\delta)=B(\delta)=0$, which implies the desired conclusion.

For the proof of Theorem A we adapt arguments from [10, 11, i.e., we use a multidimensional suspension flow to approximate $\alpha$ by a multicorrelation sequence of the form (9). The arising error consists of terms of the form $1_{\{n \in \mathbb{N}: q(n) \in[1-\delta, 1)\}}$ that can be controlled by Lemma 5
Proof of Theorem A. Given $\ell, m, d \in \mathbb{N}$, let $k$ be as guaranteed by Theorem (4) Let $q_{1}, \ldots, q_{m}, T, f_{0}, \ldots, f_{m}, \epsilon>0, r \in \mathbb{N}, s \in \mathbb{Z}$ and $\alpha$ be as in the statement. By multiplying each function by a constant if needed, we can assume without loss of generality that $\left\|f_{i}\right\|_{\infty} \leq 1$ for each $i \in[1, m]$.

We start by considering a multidimensional suspension flow with a constant 1 ceiling function. More precisely, let $Y:=X \times[0,1)^{m \times \ell}$ and $\nu=\mu \otimes \lambda$, where $\lambda$ denotes the Lebesgue measure on $[0,1)^{m \times \ell}$. For each $i \in[1, m]$ define the measure preserving $\mathbb{R}^{\ell}$ action $S_{i}$ on $(Y, \nu)$ as follows: for any $t \in \mathbb{R}^{\ell}$ and $\left(x ; b_{1}, \ldots, b_{m}\right) \in Y=X \times\left([0,1)^{\ell}\right)^{m}$, let

$$
S_{i}^{t}\left(x ; b_{1}, \ldots, b_{m}\right):=\left(T^{\left\lfloor b_{i}+t\right\rfloor} x ; b_{1}, \ldots, b_{i-1},\left\{b_{i}+t\right\}, b_{i+1}, \ldots, b_{m}\right),
$$

where $\{u\}:=u-\lfloor u\rfloor$ for any $u \in \mathbb{R}^{\ell}$. Observe that the actions $S_{1}, \ldots, S_{m}$ commute.
Let $\pi: Y \rightarrow X$ be the natural projection and $\delta>0$ a small parameter to be determined later. For each $i \in[1, m]$ let $\hat{f}_{i} \in L^{\infty}(Y)$ be the composition $\hat{f}_{i}:=f_{i} \circ \pi$, and $\hat{f}_{0}:=$ $1_{X \times[0, \delta] m \times \ell} \cdot f_{0} \circ \pi$. Define

$$
\tilde{\alpha}(n)=\int_{Y} \hat{f}_{0} \cdot S_{1}^{q_{1}(n)} \hat{f}_{1} \cdots S_{m}^{q_{m}(n)} \hat{f}_{m} d \nu
$$

By Theorem 4 there exists a $k$-step nilsequence $\tilde{\psi}$ such that

$$
\begin{equation*}
\lim _{N-M \rightarrow \infty} \frac{1}{N-M} \sum_{n=M}^{N-1}|\tilde{\alpha}(n)-\tilde{\psi}(n)| \leq \delta^{\ell m} \epsilon / 2 \tag{10}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{N \rightarrow \infty} \frac{1}{\pi(N)} \sum_{p \in \mathbb{P} \cap[1, N]}|\tilde{\alpha}(r p+s)-\tilde{\psi}(r p+s)| \leq \delta^{\ell m} \epsilon / 2 \tag{11}
\end{equation*}
$$

On the other hand,

$$
\tilde{\alpha}(n)=\int_{[0, \delta]^{\ell_{m}}} \int_{X} f_{0}(x) f_{1}\left(T^{\left\lfloor q_{1}(n)+b_{1}\right\rfloor} x\right) \cdots f_{m}\left(T^{\left\lfloor q_{m}(n)+b_{m}\right\rfloor} x\right) d \mu(x) d \lambda\left(b_{1}, \ldots, b_{m}\right)
$$

which implies

$$
\begin{equation*}
\alpha(n)-\frac{\tilde{\alpha}(n)}{\delta^{\ell m}}=\frac{1}{\delta^{\ell m}} \int_{[0, \delta]^{\ell m}} \int_{X} f_{0}(x)\left(\prod_{i=1}^{m} f_{i}\left(T^{\left\lfloor q_{i}(n)\right\rfloor} x\right)-\prod_{i=1}^{m} f_{i}\left(T^{\left\lfloor q_{i}(n)+b_{i}\right\rfloor} x\right)\right) d \mu d \lambda \tag{12}
\end{equation*}
$$

In particular, it follows from (12) that $\left|\alpha(n)-\delta^{-\ell m} \tilde{\alpha}(n)\right| \leq 2$ for all $n \in \mathbb{N}$. If $b_{i} \in[0, \delta]^{\ell}$ and $\left\{q_{i}(n)\right\} \in[0,1-\delta)^{\ell}$ then $\left\lfloor q_{i}(n)+b_{i}\right\rfloor=\left\lfloor q_{i}(n)\right\rfloor$. Therefore (12) also implies that $\alpha(n)=\delta^{-\ell m} \tilde{\alpha}(n)$ whenever

$$
n \notin\left\{n \in \mathbb{N}:\left\{q_{i}(n)\right\} \in[1-\delta, 1)^{\ell} \text { for some } i \in[1, m]\right\}
$$

In view of Lemma 5, by choosing $\delta$ small enough, we have

$$
\begin{equation*}
\lim _{N-M \rightarrow \infty} \frac{1}{N-M} \sum_{n=M}^{N-1}\left|\alpha(n)-\delta^{-\ell m} \tilde{\alpha}(n)\right|<\frac{\epsilon}{2} \tag{13}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{N \rightarrow \infty} \frac{1}{\pi(N)} \sum_{p \in \mathbb{P} \cap[1, N]}\left|\alpha(r p+s)-\delta^{-\ell m} \tilde{\alpha}(r p+s)\right|<\frac{\epsilon}{2} \tag{14}
\end{equation*}
$$

Letting $\psi=\delta^{-m \ell} \tilde{\psi}$ and combining (10) with (13) and (11) with (14) we obtain the desired conclusion.

Remark 6. As it was already mentioned in Section 1 it is an open problem whether one can improve upon the approximation in Frantzikinakis' main result in [2] and Theorem [1] and take $\epsilon=0$ in (5) and (7) (see Question 2 below). However, as the following example shows, in the case of Theorem A it is not possible to improve upon the approximation in that manner.

Example 7. Take $X=\mathbb{T}:=\mathbb{R} / \mathbb{Z}, T(x)=x+1 / \sqrt{2}, q(n)=\sqrt{2} n, f_{0}(x)=e(x)$ and $f_{1}(x)=e(-x)$, where $e(x):=e^{2 \pi i x}$. Then we have

$$
\begin{aligned}
\alpha(n) & =\int f_{0} \cdot T^{\lfloor q(n)\rfloor} f_{1} d \mu=\int e(x) e\left(-x-\frac{1}{\sqrt{2}}\lfloor\sqrt{2} n\rfloor\right) d x \\
& =e\left(-\frac{1}{\sqrt{2}}\lfloor\sqrt{2} n\rfloor\right)=e\left(\frac{1}{\sqrt{2}}\{\sqrt{2} n\}\right)
\end{aligned}
$$

In particular, we can write $\alpha(n)$ as $F\left(T^{n} x_{0}\right)$ with $x_{0}=0 \in \mathbb{T}$ and $F(x)=e(\{x\} / \sqrt{2})$ for $x \in \mathbb{T}$. Assume for the sake of a contradiction that there exists a uniform limit of nilsequences $\phi$ for which

$$
\begin{equation*}
\lim _{N \rightarrow \infty} \frac{1}{N} \sum_{n=1}^{N}|\alpha(n)-\phi(n)|=0 \tag{15}
\end{equation*}
$$

By [9, Lemma 18], $\phi$ can be written as $\phi(n)=G\left(S^{n} y_{0}\right)$ for all $n \in \mathbb{N}$, where $G$ is a continuous function on an inverse limit of nilsystems $(Y, S)$ and $y_{0} \in Y$.

We claim that $\alpha(n)=\phi(n)$ for all $n \in \mathbb{N}$. If not, then there exists $\delta>0$ and $n_{0} \in \mathbb{N}$ such that

$$
\begin{equation*}
\left|\alpha\left(n_{0}\right)-\phi\left(n_{0}\right)\right|=\left|F\left(T^{n_{0}} x_{0}\right)-G\left(S^{n_{0}} y_{0}\right)\right| \geq \delta \tag{16}
\end{equation*}
$$

Since the system $(X \times Y, T \times S)$ is the product of two distal systems, is a distal system itself. This implies that the point $\left(T^{n_{0}} x_{0}, S^{n_{0}} y_{0}\right)$ is uniformly recurrent, i.e., the sequence ( $T^{n} x_{0}, S^{n} y_{0}$ ) visits any neighborhood of $\left(T^{n_{0}} x_{0}, S^{n_{0}} y_{0}\right)$ in a syndetic set. This fact together with (16) and the fact that both the real and imaginary parts of $F$ are almost everywhere continuous and semicontinuous imply that the set

$$
\left\{n \in \mathbb{N}:\left|F\left(T^{n} x_{0}\right)-G\left(S^{n} y_{0}\right)\right| \geq \delta / 2\right\}
$$

is syndetic, which contradicts (15). Hence $\alpha(n)=\phi(n)$ for all $n \in \mathbb{N}$. However, by [6, Proposition 4.2.5], the sequence $\alpha$ is not a distal sequence; in particular, it is not a uniform limit of nilsequences, contradicting our assumption.

## 3. Open questions

We close this article with three open questions. Theorem A provides an approximation result of multicorrelation sequences along an integer polynomial of degree one, evaluated at primes. We can ask whether a similar result is true along other classes of sequences.

Question 1. Let $q \in \mathbb{R}[x]$ be a non-constant real polynomial, $c>0$, and $p_{n}$ denote the $n$-th prime. Suppose $r_{n}=q(n), q\left(p_{n}\right),\left\lfloor n^{c}\right\rfloor$ or $\left\lfloor p_{n}^{c}\right\rfloor$ for $n \in \mathbb{N}$. Is it true that for any $\alpha$ as in (6) and $\epsilon>0$, there exists a nilsequence $\psi$ satisfying

$$
\lim _{N \rightarrow \infty} \frac{1}{N} \sum_{n=1}^{N}\left|\alpha\left(r_{n}\right)-\psi\left(r_{n}\right)\right| \leq \epsilon ?
$$

Variants of the following question have appeared several times in the literature, e.g., [2, Remark after Theorem 1.1], [3, Problem 20], [4, Problem 1], and [8, Page 398].

Question 2. Let $\alpha$ be as in (4). Does there exist a uniform limit of nilsequences $\phi$ such that

$$
\lim _{N-M \rightarrow \infty} \frac{1}{N-M} \sum_{n=M}^{N-1}|\alpha(n)-\phi(n)|=0 ?
$$

As mentioned in Example 7 the answer to Question 2 is negative when $\alpha$ is a multicorrelation sequence as in (6). Nevertheless, it makes sense to ask for the following modification of it.

Question 3. Let $\alpha$ be as in (6). Does there exist a uniform limit of Riemann integrable nilsequences $\phi$ satisfying

$$
\lim _{N-M \rightarrow \infty} \frac{1}{N-M} \sum_{n=M}^{N-1}|\alpha(n)-\phi(n)|=0 ?
$$

Here we say that $\phi$ is a uniform limit of Riemann integrable nilsequences if for every $\epsilon>0$ there exists a nilmanifold $X=G / \Gamma$, a point $x \in X, g \in G$ and a Riemann integrable function $F: X \rightarrow \mathbb{C}$ such that $\sup _{n \in \mathbb{N}}\left|\phi(n)-F\left(g^{n} x\right)\right|<\epsilon$.

[^0]:    2010 Mathematics Subject Classification. Primary: 37A45, 37A15; Secondary: 11B30.
    Key words and phrases. Multicorrelation sequences, nilsequences, integer part polynomials, prime numbers.
    ${ }^{1}$ A $k$-step nilmanifold is a homogeneous space $X=G / \Gamma$, where $G$ is a $k$-step nilpotent Lie group and $\Gamma$ is a discrete and co-compact subgroup of $G$.

[^1]:    ${ }^{2}$ A function $F$ is Riemann integrable on a nilmanifold if its points of discontinuity is a null set with respect to the Haar measure.
