Abstract. The weight of a coset of a code is the smallest Hamming weight of any vector in the coset. For a linear code of length n , we call *integral weight spectrum* the overall numbers of weight w vectors, $0 \leq w \leq n$, in all the cosets of a fixed weight. For maximum distance separable (MDS) codes, we obtained new convenient formulas of integral weight spectra of cosets of weight 1 and 2. Also, we give the spectra for the weight 3 cosets of MDS codes with minimum distance 5 and covering radius 3.

Keywords: cosets weight distribution, MDS codes.

Mathematics Subject Classification (2010). 94B05, 51E21, 51E22

1 Introduction

Let \mathbb{F}_q be the Galois field with q elements, $\mathbb{F}_q^* = \mathbb{F}_q \setminus \{0\}$. Let \mathbb{F}_q^n be the space of n -dimensional vectors over \mathbb{F}_q . We denote by $[n, k, d]_q R$ an \mathbb{F}_q -linear code of length n , dimension k , minimum distance d , and covering radius R . If $d = n - k + 1$, it is a maximum distance separable (MDS) code. For an introduction to coding theory see [2, 11, 16, 19].

*The research of A.A. Davydov was done at IITP RAS and supported by the Russian Government (Contract No 14.W03.31.0019).

[†]The research of S. Marcugini and F. Pambianco was supported in part by the Italian National Group for Algebraic and Geometric Structures and their Applications (GNSAGA - INDAM) (No U-UFMBAZ-2017-000532, 28.11.2017) and by University of Perugia (Project: Curve, codici e configurazioni di punti, Base Research Fund 2018, No 46459, 15.06.2018).

A *coset* of a code is a translation of the code. A coset \mathcal{V} of an $[n, k, d]_q R$ code \mathcal{C} can be represented as

$$\mathcal{V} = \{\mathbf{x} \in \mathbb{F}_q^n \mid \mathbf{x} = \mathbf{c} + \mathbf{v}, \mathbf{c} \in \mathcal{C}\} \subset \mathbb{F}_q^n \quad (1.1)$$

where $\mathbf{v} \in \mathcal{V}$ is a vector fixed for the given representation; see [2, 11, 16, 17, 19] and the references therein.

The weight distribution of code cosets is an important combinatorial property of a code. In particular, the distribution serves to estimate decoding results. There are many papers connected with distinct aspects of the weight distribution of cosets for codes over distinct fields and rings, see e.g. [1–7, 9, 10, 12–15, 20, 21], [8, Sect. 6.3], [11, Sect. 7], [16, Sections 5.5, 6.6, 6.9], [17, Sect. 10] and the references therein.

For a linear code of length n , we call *integral weight spectrum* the overall numbers of weight w vectors, $0 \leq w \leq n$, in all the cosets of a fixed weight.

In this work, for MDS codes, using and developing the results of [5], we obtain new convenient formulas of integral weight spectra of cosets of weight 1 and 2. The obtained formulas for weight 1 and 2 cosets, seem to be simple and expressive.

This paper is organized as follows. Section 2 contains preliminaries. In Section 3, we consider the integral weight spectrum of the weight 1 cosets of MDS codes with minimum distance $d \geq 3$. In Section 4, we obtain the integral weight spectrum of the weight 2 cosets of MDS codes with minimum distance $d \geq 5$. In Section 5, we give the spectra for the weight 3 cosets of MDS codes with minimum distance 5 and covering radius 3.

2 Preliminaries

2.1 Cosets of a linear code

We give a few known definitions and properties connected with cosets of linear codes, see e.g. [2, 11, 16, 17, 19] and the references therein.

We consider a coset \mathcal{V} of an $[n, k, d]_q R$ code \mathcal{C} in the form (1.1). We have $\#\mathcal{V} = \#\mathcal{C} = q^k$. One can take as \mathbf{v} any vector of \mathcal{V} . So, there are $\#\mathcal{V} = q^k$ formally distinct representations of the form (1.1); all they give the same coset \mathcal{V} . If $\mathbf{v} \in \mathcal{C}$, we have $\mathcal{V} = \mathcal{C}$. The distinct cosets of \mathcal{C} partition \mathbb{F}_q^n into q^{n-k} sets of size q^k .

We remind that the *Hamming weight* of the vector $\mathbf{x} \in \mathbb{F}_q^n$ is the number of nonzero entries in \mathbf{x} .

Notation 2.1. For an $[n, k, d]_q R$ code \mathcal{C} and its coset \mathcal{V} of the form (1.1), the following notation is used:

$$t = \left\lfloor \frac{d-1}{2} \right\rfloor \quad \text{the number of correctable errors;}$$

$A_w(\mathcal{C})$	the number of weight w codewords of the code \mathcal{C} ;
$A_w(\mathcal{V})$	the number of weight w vectors in the coset \mathcal{V} ;
the weight of a coset	the smallest Hamming weight of any vector in the coset;
$\mathcal{V}^{(W)}$	a coset of weight W ; $A_w(\mathcal{V}^{(W)}) = 0$ if $w < W$;
a coset leader	a vector in the coset of the smallest Hamming weight;
$\mathcal{A}_w^\Sigma(\mathcal{V}^{(W)})$	the overall number of weight w vectors in all cosets of weight W ;
$\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq W})$	the overall number of weight w vectors in all cosets of weight $\leq W$.

In cosets of weight $> t$, a vector of the minimal weight is not necessarily unique. Cosets of weight $\leq t$ have a unique leader.

The code \mathcal{C} is the coset of weight zero. The leader of \mathcal{C} is the zero vector of \mathbb{F}_q^n .

Definition 2.2. Let \mathcal{C} be an $[n, k, d]_q R$ code and let $\mathcal{V}^{(W)}$ be its coset of weight W . Let $\mathcal{A}_w^\Sigma(\mathcal{V}^{(W)})$ be the overall number of weight w vectors in all cosets of weight W . For a fixed W , we call the set $\{\mathcal{A}_w^\Sigma(\mathcal{V}^{(W)}) | w = 0, 1, \dots, n\}$ *integral weight spectrum* of the code cosets of weight W .

Distinct representations of the integral weight spectra $\mathcal{A}_w^\Sigma(\mathcal{V}^{(W)})$ and values of $\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq W})$ are considered in the literature, see e.g. [2, Th. 14.2.2], [5, 6], [15, Lem. 2.14], [16, Th. 6.22]. For instance, in [5, Eqs. (11)–(13)], for an MDS code correcting t -fold errors, the value D_u gives $\mathcal{A}_u^\Sigma(\mathcal{V}^{\leq t})$.

2.2 Some useful relations

For $w \geq d$, the weight distribution $A_w(\mathcal{C})$ of an $[n, k, d = n - k + 1]_q$ MDS code \mathcal{C} has the following form, see e.g. [11, Th. 7.4.1], [16, Th. 11.3.6]:

$$A_w(\mathcal{C}) = \binom{n}{w} \sum_{j=0}^{w-d} (-1)^j \binom{w}{j} (q^{w-d+1-j} - 1). \quad (2.1)$$

In \mathbb{F}_q^n , the volume of a sphere of radius t is

$$V_n(t) = \sum_{i=0}^t (q-1)^i \binom{n}{i}. \quad (2.2)$$

The following combinatorial identities are well known, see e.g. [18, Sect. 1, Eqs. (I),(IV), Problem 9(a)]:

$$\binom{n}{k} = \binom{n-1}{k} + \binom{n-1}{k-1}. \quad (2.3)$$

$$\binom{n}{m} \binom{m}{p} = \binom{n}{p} \binom{n-p}{m-p} = \binom{n}{m-p} \binom{n-m+p}{p}. \quad (2.4)$$

$$\sum_{k=0}^m (-1)^k \binom{n}{k} = (-1)^m \binom{n-1}{m}. \quad (2.5)$$

In [5, Eqs. (11)–(13)], for an $[n, k, d \geq 2t + 1]_q$ MDS code correcting t -fold errors, the following relations for $\mathcal{A}_u^\Sigma(\mathcal{V}^{\leq t})$ denoted by D_u are given:

$$\mathcal{A}_u^\Sigma(\mathcal{V}^{\leq t}) = D_u = \binom{n}{u} \sum_{j=0}^{u-d+t} (-1)^j N_j, \quad d-t \leq u \leq n, \quad (2.6)$$

where

$$N_j = \binom{u}{j} \left[q^{u-d+1-j} V_n(t) - \sum_{i=0}^t \binom{u-j}{i} (q-1)^i \right] \quad \text{if } 0 \leq j \leq u-d, \quad (2.7)$$

$$N_j = \binom{u}{j} \left[\sum_{w=d-u+j}^t \binom{n-u+j}{w} \sum_{i=0}^{w-d+u-j} (-1)^i \binom{w}{i} (q^{w-d+u-j-i+1} - 1) \right. \\ \left. \times \sum_{s=w}^t \binom{u-j}{s-w} (q-1)^{s-w} \right] \quad \text{if } u-d+1 \leq j \leq u-d+t. \quad (2.8)$$

3 The integral weight spectrum of the weight 1 cosets of MDS codes with minimum distance $d \geq 3$

In Sections 3–5, we represent the values $\mathcal{A}_w^\Sigma(\mathcal{V}^{(W)})$ in distinct forms that can be convenient in distinct utilizations, e.g. for estimates of the decoder error probability, see [5, 6] and the references therein.

We use (with some transformations) the results of [5, Eqs. (11)–(13)] where, for an MDS code correcting t -fold errors, the value D_u gives the overall number $\mathcal{A}_u^\Sigma(\mathcal{V}^{\leq t})$ of weight u vectors in all cosets of weight $\leq t$. We cite [5, Eqs. (11)–(13)] by formulas (2.6)–(2.8), respectively.

In the rest of the paper we put that a sum $\sum_{i=0}^A \dots$ is equal to zero if $A < 0$.

Lemma 3.1. [5, Eqs. (11)–(13)] *Let $d-1 \leq w \leq n$. For an $[n, k, d = n-k+1]_q$ MDS code \mathcal{C} of minimum distance $d \geq 3$, the overall number $\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 1})$ of weight w vectors in all cosets of weight ≤ 1 is as follows:*

$$\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 1}) = \binom{n}{w} \left[\sum_{j=0}^{w-d} (-1)^j \binom{w}{j} [q^{w-d+1-j} (1 + n(q-1)) - 1 - (w-j)(q-1)] \right] \quad (3.1)$$

$$-(-1)^{w-d} \binom{w}{d-1} (n-d+1)(q-1) \Big].$$

Proof. In the relations for D_u of [5] cited by (2.6)–(2.8), we put $t = 1$ and then use (2.2). In (2.8), we have $j = u - d + 1$ whence $w = 1$ in all terms. Finally, we change u by w to save the notations of this paper. \square

Lemma 3.2. *The following holds:*

$$\sum_{j=0}^m (-1)^j \binom{w}{j} \binom{w-j}{v} = (-1)^m \binom{w}{v} \binom{w-v-1}{m}. \quad (3.2)$$

Proof. In (2.4), we put $n = w$, $p = j$, $m - p = v$, and obtain

$$\sum_{j=0}^m (-1)^j \binom{w}{j} \binom{w-j}{v} = \binom{w}{v} \sum_{j=0}^m (-1)^j \binom{w-v}{j}.$$

Now we use (2.5). \square

Lemma 3.3. *Let $d - 1 \leq w \leq n$. The following holds:*

$$\sum_{j=0}^{w+1-d} (-1)^j \binom{w}{j} q^{w+1-d-j} = \sum_{j=0}^{w-d} (-1)^j \binom{w}{j} (q^{w+1-d-j} - 1) - (-1)^{w-d} \binom{w-1}{d-2}.$$

Proof. We write the left sum of the assertion as

$$\sum_{j=0}^{w-d} (-1)^j \binom{w}{j} (q^{w+1-d-j} - 1 + 1) - (-1)^{w-d} \binom{w}{d-1}.$$

By (2.5),

$$\sum_{j=0}^{w-d} (-1)^j \binom{w}{j} = (-1)^{w-d} \binom{w-1}{d-1}.$$

Finally, we apply (2.3). \square

For an $[n, k, d]_q$ code \mathcal{C} , we denote

$$\Omega_w^{(j)}(\mathcal{C}) = (-1)^{w-d} \binom{n-j}{w-j} \binom{w-j-1}{d-j-2}. \quad (3.3)$$

Also, we denote

$$\Phi_w^{(j)} = (-1)^{w-5} \left[\binom{q+1}{w} \binom{w-1}{3} - \binom{q+1-j}{w-j} \binom{w-1-j}{3-j} \right]. \quad (3.4)$$

Theorem 3.4. (integral weight spectrum 1)

Let $d - 1 \leq w \leq n$. Let \mathcal{C} be an $[n, k, d = n - k + 1]_q$ MDS code of minimum distance $d \geq 3$.

(i) For the code \mathcal{C} , the overall number $\mathcal{A}_w^\Sigma(\mathcal{V}^{(1)})$ of weight w vectors in all weight 1 cosets is as follows:

$$\mathcal{A}_w^\Sigma(\mathcal{V}^{(1)}) = \binom{n}{w} (q - 1) \left[n \sum_{j=0}^{w+1-d} (-1)^j \binom{w}{j} q^{w+1-d-j} + (-1)^{w-d} w \binom{w-2}{d-3} \right] \quad (3.5)$$

$$= n(q - 1) \left[\binom{n}{w} \sum_{j=0}^{w+1-d} (-1)^j \binom{w}{j} q^{w+1-d-j} + \Omega_w^{(1)}(\mathcal{C}) \right] \quad (3.6)$$

$$= n(q - 1) \left[\binom{n}{w} \sum_{j=0}^{w-d} (-1)^j \binom{w}{j} (q^{w+1-d-j} - 1) - \Omega_w^{(0)}(\mathcal{C}) + \Omega_w^{(1)}(\mathcal{C}) \right] \quad (3.7)$$

$$= n(q - 1) [A_w(\mathcal{C}) - \Omega_w^{(0)}(\mathcal{C}) + \Omega_w^{(1)}(\mathcal{C})] \quad (3.8)$$

$$= n(q - 1) \left[A_w(\mathcal{C}) - (-1)^{w-d} \left(\binom{n}{w} \binom{w-1}{d-2} - \binom{n-1}{w-1} \binom{w-2}{d-3} \right) \right]. \quad (3.9)$$

(ii) Let the code \mathcal{C} be a $[q + 1, k, d = q + 2 - k]_q$ MDS code of length $n = q + 1$ and minimum distance $d \geq 3$. For \mathcal{C} , the overall number $\mathcal{A}_w^\Sigma(\mathcal{V}^{(1)})$ of weight w vectors in all weight 1 cosets is as follows

$$\begin{aligned} \mathcal{A}_w^\Sigma(\mathcal{V}^{(1)}) &= \binom{q+1}{w} (q - 1) \left[q^{w+2-d} - \sum_{i=0}^{w-d} (-1)^i \left(\binom{w}{i+1} - \binom{w}{i} \right) q^{w+1-d-i} \right. \\ &\quad \left. - (-1)^{w-d} \left(\binom{w}{d-1} - w \binom{w-2}{d-3} \right) \right], \quad d - 1 \leq w \leq q + 1. \end{aligned} \quad (3.10)$$

(iii) Let the code \mathcal{C} be a $[q + 1, q - 3, 5]_q$ MDS code of length $n = q + 1$ and minimum distance $d = 5$. For \mathcal{C} , the overall number $\mathcal{A}_w^\Sigma(\mathcal{V}^{(1)})$ of weight w vectors in all weight 1 cosets is as follows

$$\mathcal{A}_w^\Sigma(\mathcal{V}^{(1)}) = (q^2 - 1) [A_w(\mathcal{C}) - \Phi_w^{(1)}], \quad 4 \leq w \leq q + 1. \quad (3.11)$$

Proof. (i) By the definition of $\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 1})$, see Notation 2.1, for the code \mathcal{C} of Lemma 3.1, we have

$$\mathcal{A}_w^\Sigma(\mathcal{V}^{(1)}) = \mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 1}) - A_w(\mathcal{C}). \quad (3.12)$$

We subtract (2.1) from (3.1) that gives

$$\mathcal{A}_w^\Sigma(\mathcal{V}^{(1)}) = \binom{n}{w} (q - 1) \left[-(-1)^{w-d} \binom{w}{d-1} (n - d + 1) \right]$$

$$\begin{aligned}
& + \sum_{j=0}^{w-d} (-1)^j \binom{w}{j} (q^{w-d+1-j} n - w + j) \Bigg] \\
& = \binom{n}{w} (q-1) \left[n \sum_{j=0}^{w-d+1} (-1)^j \binom{w}{j} q^{w-d+1-j} - \sum_{j=0}^{w-d+1} (-1)^j \binom{w}{j} (w-j) \right].
\end{aligned}$$

Here some simple transformations are missed out. Now, for the 2-nd sum $\sum_{j=0}^{w-d+1} \dots$, we use Lemma 3.2 and obtain (3.5).

To form (3.6) from (3.5), we change $w \binom{n}{w}$ by $n \binom{n-1}{w-1}$, see (2.4). To obtain (3.7) from (3.6), we apply Lemma 3.3. For (3.8), we use (2.1). Finally, (3.9) is (3.8) in detail.

(ii) We substitute $n = q + 1$ to (3.5) that implies (3.10) after simple transformations.

(iii) We substitute $n = q + 1$ and $d = 5$ to (3.9) that gives (3.11). \square

For $\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 1})$, we give a formula alternative to (3.1).

Corollary 3.5. *Let $V_n(1)$ be as in (2.2). Let \mathcal{C} be an $[n, k, d = n - k + 1]_q$ MDS code of minimum distance $d \geq 3$. Then for \mathcal{C} , the overall number $\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 1})$ of weight w vectors in all cosets of weight ≤ 1 is as follows:*

$$\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 1}) = A_w(\mathcal{C}) \cdot V_n(1) - (-1)^{w-d} n (q-1) \sum_{j=0}^1 (-1)^j \binom{n-j}{w-j} \binom{w-j-1}{d-j-2}. \quad (3.13)$$

Proof. We use (3.12) and (3.9). \square

4 The integral weight spectrum of the weight 2 cosets of MDS codes with minimum distance $d \geq 5$

As well as in Lemma 3.1, we use the results of [5] with some transformations.

Lemma 4.1. [5, Eqs. (11)–(13)] *Let $d - 2 \leq w \leq n$. Let $V_n(t)$ be as in (2.2). For an $[n, k, d = n - k + 1]_q$ MDS code \mathcal{C} of minimum distance $d \geq 5$, the overall number $\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 2})$ of weight w vectors in all cosets of weight ≤ 2 is as follows:*

$$\begin{aligned}
\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 2}) & = \binom{n}{w} \left[\sum_{j=0}^{w-d} (-1)^j \binom{w}{j} [q^{w-d+1-j} \cdot V_n(2) - V_{w-j}(2)] \right. \\
& \quad \left. - (-1)^{w-d} \frac{(n-d+1)(q-1)}{2} \left(\binom{w}{d-1} [2 + (q-1)(n+d-2)] - \binom{w}{d-2} (n-d+2) \right) \right]. \quad (4.1)
\end{aligned}$$

Proof. In the relations for D_u of [5] cited by (2.6)–(2.8), we put $t = 2$ that gives, in (2.8), $j = u - d + 1$ and $j = u - d + 2$, whence $w = 1, 2$ and $w = 2$, respectively. Then we do simple transformations. Finally, we change u by w to save the notations of this paper. \square

For an $[n, k, d]_q$ code \mathcal{C} , we denote

$$\begin{aligned}\Delta_w(\mathcal{C}) &= (-1)^{w-d} \binom{n}{w} \binom{w}{d-2} \binom{n-d+2}{2} (q-1); \\ \Delta_w^*(\mathcal{C}) &= \frac{\Delta_w(\mathcal{C})}{\binom{n}{2} (q-1)^2}.\end{aligned}\tag{4.2}$$

Lemma 4.2. *The following holds:*

$$\Delta_w^*(\mathcal{C}) = (-1)^{w-d} \binom{n-d+2}{n-w} \binom{n-2}{d-2} \frac{1}{q-1}.\tag{4.3}$$

Proof. By (2.4), we have

$$\begin{aligned}\binom{n}{w} \binom{w}{d-2} &= \binom{n}{d-2} \binom{n-d+2}{w-d-2} = \binom{n}{d-2} \binom{n-d+2}{n-w}, \\ \binom{n}{d-2} \binom{n-d+2}{2} &= \binom{n}{d} \binom{d}{d-2} = \binom{n}{d} \binom{d}{2} = \binom{n}{2} \binom{n-2}{d-2}.\end{aligned}$$

□

Theorem 4.3. (integral weight spectrum 2)

Let $d-2 \leq w \leq n$. Let \mathcal{C} be an $[n, k, d = n - k + 1]_q$ MDS code of minimum distance $d \geq 5$. Let $\Omega_w^{(j)}(\mathcal{C})$ and $\Phi_w^{(j)}$ be as in (3.3) and (3.4).

(i) For the code \mathcal{C} , the overall number $\mathcal{A}_w^\Sigma(\mathcal{V}^{(2)})$ of weight w vectors in all weight 2 cosets is as follows:

$$\mathcal{A}_w^\Sigma(\mathcal{V}^{(2)}) = \binom{n}{w} (q-1)^2 \left[\binom{n}{2} \sum_{j=0}^{w+1-d} (-1)^j \binom{w}{j} q^{w+1-d-j} + (-1)^{w-d} \binom{w}{2} \binom{w-3}{d-4} \right] \tag{4.4}$$

$$+ \Delta_w(\mathcal{C}).$$

$$= \binom{n}{2} (q-1)^2 \left[\binom{n}{w} \sum_{j=0}^{w+1-d} (-1)^j \binom{w}{j} q^{w+1-d-j} + \Omega_w^{(2)}(\mathcal{C}) \right] + \Delta_w(\mathcal{C}). \tag{4.5}$$

$$= \binom{n}{2} (q-1)^2 \left[\binom{n}{w} \sum_{j=0}^{w-d} (-1)^j \binom{w}{j} (q^{w+1-d-j} - 1) - \Omega_w^{(0)}(\mathcal{C}) + \Omega_w^{(2)}(\mathcal{C}) \right] + \Delta_w(\mathcal{C}) \tag{4.6}$$

$$= \binom{n}{2} (q-1)^2 [A_w(\mathcal{C}) - \Omega_w^{(0)}(\mathcal{C}) + \Omega_w^{(2)}(\mathcal{C})] + \binom{n}{2} (q-1)^2 \Delta_w^*(\mathcal{C}) \tag{4.7}$$

$$\begin{aligned}
&= \binom{n}{2} (q-1)^2 \left[A_w(\mathcal{C}) - (-1)^{w-d} \left(\binom{n}{w} \binom{w-1}{d-2} - \binom{n-2}{w-2} \binom{w-3}{d-4} \right) \right] \\
&+ (-1)^{w-d} \binom{n}{2} (q-1) \binom{n-d+2}{n-w} \binom{n-2}{d-2}.
\end{aligned} \tag{4.8}$$

(ii) Let the code \mathcal{C} be a $[q+1, q-3, 5]_q$ MDS code of length $n = q+1$ and minimum distance $d = 5$. For \mathcal{C} , the overall number $\mathcal{A}_w^\Sigma(\mathcal{V}^{(1)})$ of weight w vectors in all weight 1 cosets is as follows

$$\begin{aligned}
\mathcal{A}_w^\Sigma(\mathcal{V}^{(2)}) &= \binom{q+1}{2} (q-1)^2 \left[A_w(\mathcal{C}) - \Phi_w^{(2)} + (-1)^{w-5} \frac{1}{3} \binom{q-2}{w-3} \binom{q-2}{2} \right], \\
&3 \leq w \leq q+1.
\end{aligned} \tag{4.9}$$

Proof. (i) By the definition of $\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 2})$, see Notation 2.1, for the code \mathcal{C} of Lemma 4.1, we have

$$\mathcal{A}_w^\Sigma(\mathcal{V}^{(2)}) = \mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 2}) - \mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 1}). \tag{4.10}$$

We subtract (3.1) from (4.1) that gives

$$\begin{aligned}
\mathcal{A}_w^\Sigma(\mathcal{V}^{(2)}) &= \binom{n}{w} \left[\sum_{j=0}^{w-d} (-1)^j \binom{w}{j} \left(q^{w+1-d-j} \binom{n}{2} (q-1)^2 - \binom{w-j}{2} (q-1)^2 \right) \right. \\
&+ (-1)^{w+1-d} \binom{w}{d-1} \frac{1}{2} (n-d+1) (q-1)^2 (n+d-2) \left. \right] + \Delta_w(\mathcal{C}) \\
&= \binom{n}{w} (q-1)^2 \left[\binom{n}{2} \sum_{j=0}^{w-d} (-1)^j \binom{w}{j} q^{w+1-d-j} - \sum_{j=0}^{w-d} (-1)^j \binom{w}{j} \binom{w-j}{2} \right. \\
&- (-1)^{w-d} \binom{w}{d-1} \left(\frac{1}{2} (n-d+1) (n+d-2) + \binom{n}{2} - \binom{n}{2} \right) \left. \right] + \Delta_w(\mathcal{C}).
\end{aligned}$$

Applying Lemma 3.2 to the 2-nd sum $\sum_{j=0}^{w-d} \dots$, after simple transformations we obtain

$$\begin{aligned}
\mathcal{A}_w^\Sigma(\mathcal{V}^{(2)}) &= \binom{n}{w} (q-1)^2 \left[\binom{n}{2} \sum_{j=0}^{w+1-d} (-1)^j \binom{w}{j} q^{w+1-d-j} - (-1)^{w-d} \binom{w}{2} \binom{w-3}{w-d} \right. \\
&+ (-1)^{w-d} \binom{w}{d-1} \binom{d-1}{2} \left. \right] + \Delta_w(\mathcal{C}).
\end{aligned}$$

Due to (2.4) and (2.3), we have

$$\binom{w}{d-1} \binom{d-1}{2} = \binom{w}{2} \binom{w-2}{d-3} = \binom{w}{2} \left[\binom{w-3}{d-4} + \binom{w-3}{d-3} \right].$$

Also, $\binom{w-3}{w-d} = \binom{w-3}{d-3}$. Now we can obtain (4.4). Moreover, by (2.4), we have

$$\binom{n}{w} \binom{w}{2} = \binom{n}{2} \binom{n-2}{w-2}$$

that gives (4.5).

To obtain (4.6) from (4.5), we apply Lemma 3.3. For (4.7), we use (2.1). Finally, (4.8) is (4.7) in detail.

(ii) We substitute $n = q + 1$ and $d = 5$ to (4.8) that gives (4.9). \square

5 The integral weight spectrum of the weight 3 cosets of MDS codes with minimum distance $d = 5$ and covering radius $R = 3$

Theorem 5.1. (integral weight spectrum 3)

Let $d - 2 \leq w \leq n$. Let \mathcal{C} be an $[n, n - 4, 5]_q 3$ MDS code of minimum distance $d = 5$ and covering radius $R = 3$. Let $V_n(t)$, $\Phi_w^{(j)}$, $\mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 2})$, and $\Delta_w(\mathcal{C})$ be as in (2.2), (3.4), (4.1), and (4.2), respectively. Let $\mathcal{A}_w^\Sigma(\mathcal{V}^{(1)})$ and $\mathcal{A}_w^\Sigma(\mathcal{V}^{(2)})$ be as in Theorems 3.4 and 4.3, respectively.

(i) For the code \mathcal{C} , the overall number $\mathcal{A}_w^\Sigma(\mathcal{V}^3)$ of weight w vectors in all cosets of weight 3 is as follows:

$$\mathcal{A}_w^\Sigma(\mathcal{V}^{(3)}) = \binom{n}{w} (q - 1)^w - \mathcal{A}_w^\Sigma(\mathcal{V}^{\leq 2}) \quad (5.1)$$

$$= \binom{n}{w} (q - 1)^w - [A_w(\mathcal{C}) + \mathcal{A}_w^\Sigma(\mathcal{V}^{(1)}) + \mathcal{A}_w^\Sigma(\mathcal{V}^{(2)})] \quad (5.2)$$

$$= \binom{n}{w} (q - 1)^w - \left[\binom{n}{w} \sum_{j=0}^{w-5} (-1)^j \binom{w}{j} [q^{w-4-j} \cdot V_n(2) - V_{w-j}(2)] \right. \\ \left. - (-1)^{w-5} \frac{(n-4)(q-1)}{2} \left(\binom{w}{4} [2 + (q-1)(n+3)] - \binom{w}{3} (n-3) \right) \right]. \quad (5.3)$$

(ii) Let the code \mathcal{C} be a $[q+1, q-3, 5]_q 3$ MDS code of length $n = q+1$, minimum distance $d = 5$, and covering radius $R = 3$. For \mathcal{C} , the overall number $\mathcal{A}_w^\Sigma(\mathcal{V}^{(3)})$ of weight w vectors

in all weight 3 cosets is as follows

$$\mathcal{A}_w^\Sigma(\mathcal{V}^{(3)}) = \binom{q+1}{w} (q-1)^w - \left[\binom{q+1}{w} \sum_{j=0}^{w-5} (-1)^j \binom{w}{j} [q^{w-4-j} \cdot V_{q+1}(2) - V_{w-j}(2)] \right] \quad (5.4)$$

$$\begin{aligned} & -(-1)^{w-5} \frac{(q-3)(q-1)}{2} \left(\binom{w}{4} (q^2 + 3q - 2) - \binom{w}{3} (q-2) \right) \\ & = \binom{q+1}{w} (q-1)^w - \left[V_{q+1}(2) A_w(\mathcal{C}) - (q^2 - 1) \Phi_w^{(1)} - \binom{q+1}{2} (q-1)^2 \Phi_w^{(2)} - \Delta_w(\mathcal{C}) \right]. \end{aligned} \quad (5.5)$$

Proof. (i) Due to covering radius 3, in \mathcal{C} there are not cosets of weight > 3 ; therefore for \mathcal{C} we have (5.1) where $\binom{n}{w} (q-1)^w$ is the total number of weight w vectors in \mathbb{F}_q^n .

The relation (5.2) follows from (5.1), (3.12), and (4.10).

To form (5.3), we substitute (4.1) to (5.1) with $d = 5$.

(ii) We substitute $n = q + 1$ to (5.3) and obtain (5.4).

To obtain (5.5) from (5.2), we use (3.11), (4.9), (4.2), and (4.3) with $n = q + 1$, $d = 5$. \square
