The Hodge realization functor on the derived category of relative motives

Johann Bouali

July 7, 2020

Abstract

We give, for a complex algebraic variety $S$, a Hodge realization functor $F^{Hdg}_S$ from the (unbounded) derived category of constructible motives $DA_c(S)$ over $S$ to the (unbounded) derived category $D(MHM(S))$ of algebraic mixed Hodge modules over $S$. Moreover, for $f : T \to S$ a morphism of complex quasi-projective algebraic varieties, $F^{Hdg}_S$ commutes with the four operations $f^*, f_*, f^!, f_!$ on $DA_c(-)$ and $D(MHM(-))$, making in particular the Hodge realization functor a morphism of 2-functor on the category of complex quasi-projective algebraic varieties which for a given $S$ sends $DA_c(S)$ to $D(MHM(S))$, moreover $F^{Hdg}_S$ commutes with tensor product. We also give an algebraic and analytic Gauss-Manin realization functor from which we obtain a base change theorem for algebraic De Rham cohomology and for all smooth morphisms a relative version of the comparison theorem of Grothendieck between the algebraic De Rham cohomology and the analytic De Rham cohomology.

1 Introduction

Saito’s theory of mixed Hodge modules associate to each complex algebraic variety $S$ a category $MHM(S)$ which is a full subcategory of $\text{PSh}_{D(1,0)}^{\text{fil,rb}}(\overline{S}/\overline{S}_1) \times _1 C_{fil}(S)$ which extend variations of mixed Hodge structure and admits a canonical monoidal structure given by tensor product, and associate to each morphism of complex algebraic varieties $f : X \to S$, four functors $Rf^*_\text{Hdg}, Rf^!\text{Hdg}, f^*\text{Hdg}, f^*\text{Hdg}$. In the case of a smooth proper morphism $f : X \to S$ with $S$ and $X$ smooth, $H^n Rf^!\text{Hdg}(\mathbb{Z}_X)$ is the variation of Hodge structure given by the Gauss-Manin connexion and the local system $H^n Rf^*\mathbb{Z}_X$. Moreover, these functors induce the six functor formalism of Grothendieck. We thus have, for a complex algebraic variety $S$ a canonical functor

$$MH(\mathbb{C})/S \to D(MHM(S)), \ (f : X \to S) \mapsto Rf^*_\text{Hdg}(\mathbb{Z}_X)$$

and

$$MH(\mathbb{C}) \to \text{TriCat}, \ S \mapsto (MH(S) : \text{Var}(\mathbb{C})/S \to D(MHM(S)))$$

is a morphism of 2-functor. In this work, we extend $MH(\mathbb{C})$ to motives by constructing, for each complex algebraic variety $S$, a canonical functor $\mathcal{F}^{\text{Hdg}}_S : DA(S) \to D(MHM(S))$ which is monoidal, that is commutes with tensor product, together with, for each morphism of complex algebraic varieties $g : T \to S$ a canonical transformation map $T(g, \mathcal{F}^{\text{Hdg}})$, which make

$$\mathcal{F}^{\text{Hdg}}_S(\mathbb{C}) \to \text{TriCat}, \ S \mapsto (\mathcal{F}^{\text{Hdg}}_S : DA(S) \to D(MHM(S)))$$

is a morphism of 2-functor: this is the contain of theorem 45. A partial result in this direction has been obtained by Ivorra in [17] using a different approach. We already have a Betti realization functor

$$\text{Bti}_- : \text{Var}(\mathbb{C}) \to \text{TriCat}, \ S \mapsto (\text{Bti}_S^* : DA(S) \to D(S)),$$

which extend the Betti realization. The functor $\mathcal{F}^{\text{Hdg}}_S := (\mathcal{F}^{\text{FRD}}_S, \text{Bti}_-)$ is obtained by constructing the De Rham part

$$\mathcal{F}^{\text{FRD}}_S(\mathbb{C}) \to \text{TriCat}, \ S \mapsto (\mathcal{F}^{\text{FRD}}_S : DA(S) \to D_{D(1,0)}^{\text{fil,rb}}(S)),$$

which takes values in the derived category of filtered algebraic $D$-modules obtained by inverting $\infty$-filtered Zariski local equivalence. This method can be seen as a relative version of the construction of F. Lecompte and N. Wach in [20].

In section 6.1.1 and 6.2.1, we construct an algebraic and analytic Gauss-Manin realization functor, but this functor does NOT give a complex of filtered $D$-module, BUT a complex of filtered $O$-modules whose cohomology sheaves have a structure of filtered $D_S$ modules. Hence, it does NOT get to the
desired category. However this functor gives some interesting results. Let \( S \in \text{Var}(\mathbb{C}) \) and \( S = \bigcup_{i=1}^{l} S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \) smooth. For \( I \subset [1, \ldots, l] \), denote by \( S_I = \cap_{i \in I} S_i \) and \( j_I : S_I \hookrightarrow S \) the open embedding. We then have closed embeddings \( i_I : S_I \hookrightarrow \tilde{S}_I := \Pi_{i \in I} \tilde{S}_i \). We define the filtered algebraic Gauss-Manin realization functor defined as

\[
\mathcal{F}_S^\text{GM} : \text{DA}_c(S)^{op} \to D_{\text{fil}, D, \infty}(S/\tilde{S}_I)' \quad M \mapsto \mathcal{F}_S^\text{GM}(M) := (\langle e(\tilde{S}_I)_\ast \text{Hom}^\bullet(\Lambda(i_I)_J^* F), E_{\text{et}}(\Omega^\bullet_{/\tilde{S}_I}, F_b) \rangle[-d_{\tilde{S}_I}], u^M_J(F))
\]

where \( F \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S) \) is such that \( M = D(\mathbb{A}^1, \text{et})(F) \), see definition 104 and corollary 4. We then prove (theorem 30):

**Theorem 1.**
(i) Let \( g : T \to S \) is a morphism with \( T, S \in \text{Var}(\mathbb{C}) \). Assume there exist a factorization
\[
g : T \xrightarrow{i} Y \times S \xrightarrow{p_S} \text{with } Y \in \text{SmVar}(\mathbb{C}), \text{ i a closed embedding and } p_S \text{ the projection. Let } S = \bigcup_{i=1}^l S_i \text{ be an open cover such that there exists closed embeddings } i_i : S_i \hookrightarrow \tilde{S}_i \text{ with } \tilde{S}_i \in \text{SmVar}(\mathbb{C}). \text{ Then, for } M \in \text{DA}_c(S) \]

\[
T(g, \mathcal{F}^\text{GM})(M) : Rg^\text{mod[-1]} \mathcal{F}_S^\text{GM}(M) \to \mathcal{F}_T^\text{GM}(g^\ast M)
\]

is an isomorphism in \( D_{\text{fil}, D, \infty}(T/(Y \times \tilde{S}_I)) \).

(ii) Let \( g : T \to S \) is a morphism with \( T, S \in \text{SmVar}(\mathbb{C}) \). Then, for \( M \in \text{DA}_c(S) \)

\[
T^O(g, \mathcal{F}^\text{GM})(M) : Lg^\text{mod} \mathcal{F}_S^\text{GM}(M) \to \mathcal{F}_T^\text{GM}(g^\ast M)
\]

is an isomorphism in \( D_{O_T}(T) \).

(iii) A base change theorem for algebraic De Rham cohomology: Let \( g : T \to S \) is a morphism with \( T, S \in \text{SmVar}(\mathbb{C}) \). Let \( h : U \to S \) a smooth morphism with \( U \in \text{Var}(\mathbb{C}) \). Then the map (see definition 31)

\[
T^O_w(g, h) : Lg^\text{mod} \text{R}h_\ast(\Omega^\bullet_{U/S}, F_b) \to R^\ast(h_\ast(\Omega^\bullet_{U/T}, F_b))
\]

is an isomorphism in \( D_{O_T}(T) \).

Another consequence is the following (theorem 31):

**Theorem 2.** Let \( X \in \text{PSmVar}(\mathbb{C}) \) and \( D = \bigcup D_i \subset X \) a normal crossing divisor. Consider the open embedding \( j : U := X \setminus D \hookrightarrow X \). Then, the inclusion

\[
j^\ast : \Gamma(X, E_{\text{zar}}(\Omega^\bullet_X(\log D), F_b)) \to \Gamma(U, E_{\text{zar}}(\Omega^\bullet_U, F_b))
\]

is an \( \infty \)-filtered quasi-isomorphism, that is

\[
j^\ast : F^p H^n(U, \mathbb{C}) := F^p H^n(\Gamma(X, E_{\text{zar}}(\Omega^\bullet_X(\log D), F_b))) \sim F^p H^n(\Gamma(U, E_{\text{zar}}(\Omega^\bullet_U, F_b))) =: F^p H^n(U, \mathbb{C})
\]

is an isomorphism for all \( n, p \in \mathbb{Z} \) (note that it is obviously injective since \( j^\ast : H^n(\Gamma(X, E_{\text{zar}}(\Omega^\bullet_X(\log D)))) \sim H^n(\Gamma(U, E_{\text{zar}}(\Omega^\bullet_U))) \) is an isomorphism if we forgot filtrations). Note that however, it is NOT a filtered quasi-isomorphism (for example if \( U \) is affine \( H^q(U, \mathbb{C}) = 0 \) for \( q > 0 \)) that it is not an isomorphism on the \( E_1 \) terms of the spectral sequences in general.

Let \( S \in \text{Var}(\mathbb{C}) \) and \( S = \bigcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). For \( I \subset [1, \ldots, l] \), denote by \( S_I = \cap_{i \in I} S_i \) and \( j_I : S_I \hookrightarrow S \) the open embedding. We then have closed embeddings \( i_I : S_I \hookrightarrow \tilde{S}_I := \Pi_{i \in I} \tilde{S}_i \). We define the filtered analytic Gauss-Manin realization functor defined as

\[
\mathcal{F}_S^\text{GM} : \text{DA}_c(S)^{op} \to D_{\text{fil}, D, \infty}(S/\tilde{S}_I)' \quad M \mapsto \mathcal{F}_S^\text{GM}(M) := (\langle e(\tilde{S}_I)_\ast \text{Hom}^\bullet(\Lambda(i_I)_J^* F), E_{\text{et}}(\Omega^\bullet_{/\tilde{S}_I}, F_b) \rangle[-d_{\tilde{S}_I}], u^M_J(F))
\]

where \( F \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S) \) is such that \( M = D(\mathbb{A}^1, \text{et})(F) \), see definition 104 and corollary 7. We then prove (theorem 35):
**Theorem 3.** (i) Let \( g : T \to S \) is a morphism with \( T, S \in \text{Var}(\mathbb{C}) \). Assume there exist a factorization \( g : T \xrightarrow{1} Y \times S \xrightarrow{p_S} S \), with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \bigcup_{i=1}^l S_i \) be an open cover such that there exist closed embeddings \( i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). Then, for \( M \in \text{DA}_c(S) \)

\[
T(g, F^{GM}_{an})(M) : Rg^{\ast\text{mod}[-,1]}F^{GM}_{S,an}(M) \to F^{GM}_{T,an}(g^{\ast}M)
\]

is an isomorphism in \( D_{\text{Orf}, d, \infty}(T/\{Y \times \tilde{S}_i\}) \).

(ii) Let \( g : T \to S \) is a morphism with \( T, S \in \text{SmVar}(\mathbb{C}) \). Then, for \( M \in \text{DA}_c(S) \)

\[
T(g, F^{GM}_{an})(M) : Lg^{\ast\text{mod}[-]}F^{GM}_{S,an}(M) \to F^{GM}_{T,an}(g^{\ast}M)
\]

is an isomorphism in \( D_{\text{Orf}}(T) \).

A consequence of the construction of the transformation map between the algebraic and analytic Gauss-Manin realization functor is the following (theorem 40).

**Theorem 4.** (i) Let \( S \in \text{Var}(\mathbb{C}) \). Then, for \( M \in \text{DA}_c(S) \)

\[
J_S(-) \circ H^nT(\text{An}, F^{GM}_{an}(M)) : J_S(H^n(F^GM_S(M))^{an}) \sim \to H^nF^{GM}_{S,an}(M)
\]

is an isomorphism in \( \text{PShD}(\text{S}^{an}/(\tilde{S}^{an}_1)). \)

(ii) A relative version of Grothendieck GAGA theorem for De Rham cohomology Let \( h : U \to S \) a smooth morphism with \( S, U \in \text{SmVar}(\mathbb{C}) \). Then,

\[
J_S(-) \circ J_S T^O(\text{an}, h) : J_S((R^nh_*\Omega_U^{\ast}/S)^{an}) \sim \to R^n h_*\Omega_U^{\ast}/S_{an}
\]

is an isomorphism in \( \text{PShD}(\text{S}^{an}). \)

In section 6.1.2, using results of sections 2, 4 and 5, we construct the algebraic filtered De Rham realization functor \( F^{FDR}_{S} \). Let \( S \in \text{Var}(\mathbb{C}) \) and \( S = \bigcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). For \( I \subseteq [1, l] \), denote by \( S_I = \cap_{i \in I} S_i \) and \( j_I : S_I \hookrightarrow S \) the open embedding. We then have closed embeddings \( i : S_I \hookrightarrow \tilde{S}_I \) with \( \tilde{S}_I \in \text{SmVar}(\mathbb{C}) \). We define, by definition 116(ii) which use definition 112 and definition 26, proposition 105(ii) and corollary 5, the filtered algebraic De Rham realization functor defined as

\[
F^{FDR}_S : \text{DA}_c(S) \to D_{\text{Dfil, r, s}}(S/(\tilde{S}_1)), M \mapsto F^{FDR}_S(M) := \left( \lim_{r \to -} \mathcal{H}om^{\ast}(Lp_{S_I}, \text{Gr}^{12p_{S_I}} \text{LR}_{(\cdot, X^\ast, D^\ast)}(\tilde{S}_I, \omega_{\tilde{S}_I}^\ast L(i_{1, j_I}F)), E_{\text{et}}(\Omega^{\ast} / S_{\tilde{S}_I}, F^{FDR}(\omega_{\tilde{S}_I}^\ast L(i_{1, j_I}F)))) \right)
\]

where \( F \in C(\text{Var}(\mathbb{C})_{s^{an}}) \) is such that \( M = D(\mathbb{A}^1, \text{et})(F) \). By computing this functor an homological motive, we get by proposition 107, for \( S \in \text{Var}(\mathbb{C}) \) and \( M \in \text{DA}_c(S) \), \( F^{FDR}_S(M) \in \pi_S(D(\text{MHM}(S))) \), and the following (theorems 32, theorem 33 and theorem 34):

**Theorem 5.** (i) Let \( g : T \to S \) is a morphism, with \( S, T \in \text{Var}(\mathbb{C}) \). Assume we have a factorization \( g : T \xrightarrow{1} Y \times T = \text{proj}(S) \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Let \( M \in \text{DA}_c(S) \). Then map in \( \pi_T(D(\text{MHM}(T))) \)

\[
T(g, F^{FDR}_S)(M) : g^{\ast\text{mod}}F^{FDR}_S(M) \sim \to F^{FDR}_T(g^{\ast}M)
\]

given in definition 121 is an isomorphism.
Theorem 6.

(i) Let \( f : X \to S \) a morphism with \( X, S \in \mathbf{Var}(\mathbb{C}) \). Assume there exist a factorization \( f : X \xrightarrow{l} Y \times S \xrightarrow{p_S} S \) with \( Y \in \mathbf{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Then, for \( M \in \mathbf{DA}_c(X) \), the map given in definition \[\tag{122}\]

\[ T_l(f, \mathcal{F}^{	ext{FDR}})(M) : Rf_!^Hdg \mathcal{F}_X^{	ext{FDR}}(M) \xrightarrow{\sim} \mathcal{F}_S^{	ext{FDR}}(Rf_!M) \]

is an isomorphism in \( \pi_S(D(MHM(S))) \).

(ii) Let \( f : X \to S \) a morphism with \( X, S \in \mathbf{Var}(\mathbb{C}) \), \( S \) quasi-projective. Assume there exist a factorization \( f : X \xrightarrow{l} Y \times S \xrightarrow{p_S} S \) with \( Y \in \mathbf{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. We have, for \( M \in \mathbf{DA}_c(X) \), the map given in definition \[\tag{122}\]

\[ T^i(f, \mathcal{F}^{	ext{FDR}})(M) : \mathcal{F}_X^{	ext{FDR}}(f^iM) \xrightarrow{\sim} f^i_R^Hdg \mathcal{F}_S^{	ext{FDR}}(M) \]

is an isomorphism in \( \pi_X(D(MHM(X))) \).

(iii) Let \( f : X \to S \) a morphism with \( X, S \in \mathbf{Var}(\mathbb{C}) \), \( S \) quasi-projective. Assume there exist a factorization \( f : X \xrightarrow{l} Y \times S \xrightarrow{p_S} S \) with \( Y \in \mathbf{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Then, for \( M \in \mathbf{DA}_c(S) \), the map given in definition \[\tag{122}\]

\[ T(f, \mathcal{F}^{	ext{FDR}})(M) : \mathcal{F}_S^{	ext{FDR}}(M) \otimes_{\mathcal{F}_S^{	ext{FDR}}}(N) \xrightarrow{\sim} \mathcal{F}_S^{	ext{FDR}}(M \otimes N) \]

given in definition \[\tag{122}\] is an isomorphism.

Let \( S \in \mathbf{Var}(\mathbb{C}) \). Let \( S = \bigcup_{i=1}^f S_i \) an open affine covering and denote, for \( I \subset \{1, \ldots, f\} \), \( S_I = \cap_{i \in I} S_i \) and \( j_I : S_I \to S \) the open embedding. Let \( i_i : S_i \to S \) closed embeddings, with \( S_i \in \mathbf{SmVar}(\mathbb{C}) \). Then, for \( M, N \in \mathbf{DA}_c(S) \), the map in \( \pi_S(D(MHM(S))) \)

\[ T(f, \mathcal{F}^{	ext{FDR}})(M, N) : \mathcal{F}_S^{	ext{FDR}}(M) \otimes_{\mathcal{F}_S^{	ext{FDR}}}(N) \xrightarrow{\sim} \mathcal{F}_S^{	ext{FDR}}(M \otimes N) \]

given in definition \[\tag{122}\] is an isomorphism.

The main theorem of this article is the following (theorem \[\tag{45}\]):

**Theorem 6.**

(i) For \( S \in \mathbf{Var}(\mathbb{C}) \), we have \( \mathcal{F}_S^{Hdg}(\mathbf{DA}_c(S)) \subset D(MHM(S)) \).

(ii) The Hodge realization functor \( \mathcal{F}_S^{Hdg} \) define a morphism of 2-functor on \( \mathbf{Var}(\mathbb{C}) \)

\[ \mathcal{F}_S^{Hdg} : \mathbf{Var}(\mathbb{C}) \to (\mathbf{DA}_c(-) \to D(MHM(-))) \]

whose restriction to \( \mathbf{QPVar}(\mathbb{C}) \) is an homotopic 2-functor in sense of Ayoub. More precisely,

(iii0) for \( g : T \to S \) a morphism, with \( T, S \in \mathbf{QPVar}(\mathbb{C}) \), and \( M \in \mathbf{DA}_c(S) \), the the maps of definition \[\tag{122}\] and of definition \[\tag{122}\] induce an isomorphism in \( D(MHM(T)) \)

\[ T(g, \mathcal{F}_S^{Hdg})(M) := (T(g, \mathcal{F}_X^{	ext{FDR}})(M), T(g, bti)(M)) : \]

\[ g^*Hdg \mathcal{F}_S^{	ext{FDR}}(M) \rightarrow (\mathcal{F}_T^{	ext{FDR}}(g^*M), Bti_T(g^*M), \alpha(g^*M)) =: \mathcal{F}_T^{Hdg}(g^*M), \]
(ii) for $f : T \to S$ a morphism, with $T, S \in \text{QPVar}(\mathbb{C})$, and $M \in \text{DA}_*(T)$, the maps of definition \ref{definition:122} and of definition \ref{definition:153} induce an isomorphism in $D(\text{MMHM}(S))$

$$T_*(f, F^{Hdg}) (M) : = (T_*(f, F^{FDR})(M), T_*(f, bti)(M)) :$$

$$R f_{Hdg} F^T_{S}^{Hdg} (M) : = (R f_{Hdg} F^T_{S}^{FDR}(M), R f_{bti} Bti_s(M), f_s(\alpha(M)))$$

$$\simeq (F^T_{S}^{FDR}(R f_s M), Bti_s^*(R f_s M), \alpha(R f_s M)) : =: F^T_{S}^{Hdg}(R f_s M),$$

(ii) for $f : T \to S$ a morphism, with $T, S \in \text{QPVar}(\mathbb{C})$, and $M \in \text{DA}_*(T)$, the maps of definition \ref{definition:122} and of definition \ref{definition:153} induce an isomorphism in $D(\text{MMHM}(S))$

$$T_*(f, F^{Hdg}) (M) : = (T_*(f, F^{FDR})(M), T_*(f, bti)(M)) :$$

$$R f_{Hdg} F^T_{S}^{Hdg} (M) : = (R f_{Hdg} F^T_{S}^{FDR}(M), R f_{bti} Bti_s(M), f_s(\alpha(M)))$$

$$\simeq (F^T_{S}^{FDR}(R f_s M), Bti_s^*(R f_s M), \alpha(R f_s M)) : =: F^T_{S}^{Hdg}(R f_s M),$$

(iii) for $f : T \to S$ a morphism, with $T, S \in \text{QPVar}(\mathbb{C})$, and $M \in \text{DA}_*(S)$, the maps of definition \ref{definition:124} and of definition \ref{definition:154} induce an isomorphism in $D(\text{MMHM}(S))$

$$T(\otimes, F^{Hdg}) (M, N) : = (T(\otimes, F^{FDR})(M, N), T(\otimes, bti)(M, N)) :$$

$$(F^S_{S}^{FDR}(M) \otimes_{S} F^S_{S}^{FDR}(N), Bti_s(M) \otimes Bti_s(N), \alpha(M) \otimes \alpha(N))$$

$$\simeq (F^S_{S}^{Hdg}(M \otimes N) : = (F^S_{S}^{FDR}(M \otimes N), Bti_s(M \otimes N), \alpha(M \otimes N)).$$

(iii) For $S \in \text{Var}(\mathbb{C})$, the following diagram commutes :

$$\text{Var}(\mathbb{C})/S \xrightarrow{M \text{HH}(S)} D(\text{MMHM}(S))$$

$$\xrightarrow{M / S} \text{DA}(S) \xrightarrow{F^S_{S}^{Hdg}} D_{\text{dfil}, \infty}(S / (\tilde{S}_1)) \times_1 D_{\text{dfil}}(S^{an})$$

We obtain theorem \ref{theorem:6} from theorem \ref{theorem:5} and from the result on the Betti factor after checking the compatibility of these transformation maps with the isomorphisms $\alpha(M)$.

I thank F. Mokrane for his help and support during his work as well as J. Wildeshaus for the interest and remarks that he made on a first version of this text.

## 2 Generalities and Notations

### 2.1 Notations

- After fixing a universe, we denote by
  - Set the category of sets,
  - Top the category of topological spaces,
  - Ring the category of rings and cRing $\subset$ Ring the full subcategory of commutative rings,
• RTop the category of ringed spaces,
  * whose set of objects is RTop := \{(X,O_X) \mid X \in \text{Top}, O_X \in \text{PSh}(X, \text{Ring})\}
  * whose set of morphism is Hom((T,O_T),(S,O_S)) := \{((f:T \to S),(a_f : f^*O_S \to O_T))\}
and by ts : RTop \to \text{Top} the forgetful functor.
• Cat the category of small categories which comes with the forgetful functor o : Cat \to \text{Fun}(\Delta^1, \text{Set})$, where Fun(\Delta^1, \text{Set}) is the category of simplicial sets,
• RCat the category of ringed topos
  * whose set of objects is RCat := \{(X,O_X), X \in \text{Cat}, O_X \in \text{PSh}(X, \text{Ring})\},
  * whose set of morphism is Hom((T,O_T),(S,O_S)) := \{((f:T \to S),(a_f : f^*O_S \to O_T))\},
and by tc : RCat \to Cat the forgetful functor.

Let $F : C \to C'$ be a functor with $C,C' \in \text{Cat}$. For $X \in C$, we denote by $F(X) \in C'$ the image of $X$, and for $X,Y \in C$, we denote by $F^X,Y : \text{Hom}(X,Y) \to \text{Hom}(F(X),F(Y))$ the corresponding map.

Let $C \in \text{Cat}$. For $S \in C$, we denote by $C/S$ the category

- whose set of objects $(C/S)_0 = \{X/S = (X,h)\}$ consist of the morphisms $h : X \to S$ with $X \in C$,
- whose set of morphism $\text{Hom}(X'/S, X/S)$ between $X'/S = (X',h'), X/S = (X,h) \in C/S$ consists of the morphisms $(g : X' \to X) \in \text{Hom}(X',X)$ such that $h \circ g = h'$.

We have then, for $S \in C$, the canonical forgetful functor

$$r(S) : C/S \to C, \quad X/S \mapsto r(S)(X/S) = X, \quad (g : X'/S \to X/S) \mapsto r(S)(g) = g$$

and we denote again $r(S) : C \to C/S$ the corresponding morphism of (pre)sites.

Let $F : C \to C'$ be a functor with $C,C' \in \text{Cat}$. Then for $S \in C$, we have the canonical functor

$$F_S : C/S \to C'/F(S), \quad X/S \mapsto F(X/S) = F(X)/F(S),$$

$$(g : X'/S \to X/S) \mapsto (F(g) : F(X')/F(S) \to F(X)/F(S))$$

Let $S \in \text{Cat}$. Then, for a morphism $f : X' \to X$ with $X,X' \in S$ we have the functor

$$C(f) : S/X' \to S/X, \quad Y/X' \mapsto (Y,f_1) \mapsto C(f)(Y/X') := (Y,f \circ f_1) \in S/X,$$

$$(g : Y_1/X' \to Y_2/X') \mapsto (C(f)(g) := g : Y_1/X \to Y_2/X)$$

Let $S \in \text{Cat}$ a category which admits fiber products. Then, for a morphism $f : X' \to X$ with $X,X' \in S$, we have the pullback functor

$$P(f) : S/X \to S/X', \quad Y/X \mapsto P(f)(Y/X) := Y \times_X X'/X' \in S/X',$$

$$(g : Y_1/X \to Y_2/X) \mapsto (P(f)(g) := (g \times I) : Y_1 \times_X X' \to Y_2 \times_X X')$$

which is right adjoint to $C(f) : S/X' \to S/X$, and we denote again $P(f) : S/X' \to S/X$ the corresponding morphism of (pre)sites.

Let $C,I \in \text{Cat}$. Assume that $C$ admits fiber products. For $(S_\bullet) \in \text{Fun}(I^{\text{op}}, C)$, we denote by $C/(S_\bullet) \in \text{Fun}(I, \text{Cat})$ the diagram of category given by

- for $I \in I$, $C/(S_\bullet)(I) := C/S_I$,
- for $r_{IJ} : I \to J$, $C/(S_\bullet)(r_{IJ}) := P(r_{IJ}) : C/S_I \to C/S_J$, where we denoted again $r_{IJ} : S_J \to S_I$ the associated morphism in $C$. 

8
• Let \((F,G) : \mathcal{C} \to \mathcal{C}'\) an adjunction between two categories.
  
  For \(X \in \mathcal{C}\) and \(Y \in \mathcal{C}'\), we consider the adjunction isomorphisms
  
  * \(I(F,G)(X,Y) : \text{Hom}(F(X),Y) \to \text{Hom}(X,G(Y)), (u : F(X) \to Y) \mapsto (I(F,G)(X,Y))(u) : X \to G(Y)\)
  * \(I(F,G)(X,Y) : \text{Hom}(X,G(Y)) \to \text{Hom}(F(X),Y), (v : X \to G(Y)) \mapsto (I(F,G)(X,Y))(v) : F(X) \to Y\).

  For \(X \in \mathcal{C}\), we denote by \(\text{ad}(F,G)(X) := I(F,G)(X,F(X))(I_{F(X)})(X) : X \to G \circ F(X)\).

  For \(Y \in \mathcal{C}'\) we denote also by \(\text{ad}(F,G)(Y) := I(F,G)(G(Y),Y)(I_{G(Y)})(Y) : F \circ G(Y) \to Y\).

  Hence,

  For \(u : F(X) \to Y\) a morphism with \(X \in \mathcal{C}\) and \(Y \in \mathcal{C}'\), we have \(I(F,G)(X,Y)(u) = G(u) \circ \text{ad}(F,G)(X)\).

  For \(v : X \to G(Y)\) a morphism with \(X \in \mathcal{C}\) and \(Y \in \mathcal{C}'\), we have \(I(F,G)(X,Y)(v) = \text{ad}(F,G)(Y) \circ F(v)\).

• Let \(\mathcal{C}\) a category.

  We denote by \((\mathcal{C},F)\) the category of filtered objects : \((X,F) \in (\mathcal{C},F)\) is a sequence \((F^\bullet X)\) indexed by \(\mathbb{Z}\) with value in \(\mathcal{C}\) together with monomorphisms \(a_p : F^p X \hookrightarrow F^{p-1} X \hookleftarrow X\).

  We denote by \((\mathcal{C},F,W)\) the category of bifiltered objects : \((X,F,W) \in (\mathcal{C},F,W)\) is a sequence \((W^p F^\bullet X)\) indexed by \(\mathbb{Z}^2\) with value in \(\mathcal{C}\) together with monomorphisms \(W^q F^p X \hookrightarrow F^{p-1} X, W^q F^p X \hookleftarrow W^{q-1} F^p X\).

• For \(\mathcal{C}\) a category and \(\Sigma : \mathcal{C} \to \mathcal{C}\) an endofunctor, we denote by \((\mathcal{C},\Sigma)\) the corresponding category of spectra, whose objects are sequence of objects of \(\mathcal{C}\) \((T_i)_{i \in \mathbb{Z}} \in \text{Fun}(\mathbb{Z},\mathcal{C})\) together with morphisms \(s_i : T_i \to \Sigma T_{i+1}\), and whose morphism from \((T_i)\) to \((T'_i)\) are sequence of morphisms \(T_i \to T'_i\) which commutes with the \(s_i\).

• Let \(\mathcal{A}\) an additive category.

  We denote by \(C(\mathcal{A}) := \text{Fun}(\mathbb{Z},\mathcal{A})\) the category of (unbounded) complexes with value in \(\mathcal{A}\), where we have denoted \(\mathbb{Z}\) the category whose set of objects is \(\mathbb{Z}\), and whose set of morphism between \(m,n \in \mathbb{Z}\) consists of one element (identity) if \(n = m\), of one element if \(n = m+1\) and is \(\emptyset\) in the other cases.

  We have the full subcategories \(C^b(\mathcal{A}), C^-(\mathcal{A}), C^+(\mathcal{A})\) of \(C(\mathcal{A})\) consisting of bounded, resp. bounded above, resp. bounded below complexes.

  We denote by \(K(\mathcal{A}) := \text{Ho}(C(\mathcal{A}))\) the homotopy category of \(C(\mathcal{A})\) and by \(\text{Ho} : C(\mathcal{A}) \to K(\mathcal{A})\) the full homotopy functor. The category \(K(\mathcal{A})\) is in the standard way a triangulated category.

• Let \(\mathcal{A}\) an additive category.

  We denote by \(C_{fil}(\mathcal{A}) \subset (C(\mathcal{A}),F) = C(\mathcal{A},F)\) the full additive subcategory of filtered complexes of \(\mathcal{A}\) such that the filtration is biregular : for \((A^\bullet,F) \in (C(\mathcal{A}),F)\), we say that \(F\) is biregular if \(F^\bullet A^r\) is finite for all \(r \in \mathbb{Z}\).

  We denote by \(C_{2fil}(\mathcal{A}) \subset (C(\mathcal{A}),F,W) = C(\mathcal{A},F,W)\) the full subcategory of bifiltered complexes of \(\mathcal{A}\) such that the filtration is biregular.

  For \(A^\bullet \in C(\mathcal{A})\), we denote by \((A^\bullet,F_0) \in (C(\mathcal{A}),F)\) the complex endowed with the trivial filtration (filtration bete) : \(F_p A^n = 0\) if \(p \geq n + 1\) and \(F_p A^n = A^n\) if \(p \leq n\).
Let $\mathcal{A}$ be an abelian category. Then the additive category $(\mathcal{A}, F)$ is an exact category which admits kernel and cokernel (but is NOT an abelian category). A morphism $\phi : (M, F) \to (N, F)$ with $(M, F) \in (\mathcal{A}, F)$ is strict if the inclusion $\phi(F^n M) \subset F^n N \cap \text{Im}(\phi)$ is an equality, i.e. if $\phi(F^n M) = F^n N \cap \text{Im}(\phi)$.

Let $\mathcal{A}$ be an abelian category.

- For $(A^\bullet, F) \in C(\mathcal{A}, F)$, considering $a_p : F^p A^\bullet \to A^\bullet$ the structural monomorphism of of the filtration, we denote by, for $n \in \mathbb{N}$,

$$H^n(A^\bullet, F) \in (\mathcal{A}, F), \ F^n H^n(A^\bullet, F) := \text{Im}(H^n(a_p) : H^n(F^p A^\bullet) \to H^n(A^\bullet)) \subset H^n(A^\bullet)$$

the filtration induced on the cohomology objects of the complex. In the case $(A^\bullet, F) \in C_{fil}(\mathcal{A})$, the spectral sequence $E^{p,q}_r(A^\bullet, F)$ associated to $(A^\bullet, F)$ converge to $\text{Gr}^p_r H^{p+q}(A^\bullet, F)$, that is for all $p, q \in \mathbb{Z}$, there exist $r_{p,q} \in \mathbb{N}$, such that $E^{p,q}_s(A^\bullet, F) = \text{Gr}^p_r H^{p+q}(A^\bullet, F)$ for all $s \leq r_{p,q}$.

- Let $r \in \mathbb{N}$. A morphism $m : (A^\bullet, F) \to (B^\bullet, F)$ with $(A^\bullet, F), (B^\bullet, F) \in C(\mathcal{A}, F)$ is said to be an $r$-filtered quasi-isomorphism if for all $p, q \in \mathbb{Z}$,

$$E^{p,q}_r(m) : E^{p,q}_r(A^\bullet, F) \sim \to E^{p,q}_r(B^\bullet, F)$$

is an isomorphism in $\mathcal{A}$, note that by definition this $r$ does NOT depend on $p$ and $q$. A filtered quasi-isomorphism is by definition an 1-filtered quasi-isomorphism.

- A morphism $m : (A^\bullet, F) \to (B^\bullet, F)$ with $(A^\bullet, F), (B^\bullet, F) \in C(\mathcal{A}, F)$ is said to be an $\infty$-filtered quasi-isomorphism if there exist $r \in \mathbb{N}$ such that for all $p, q \in \mathbb{Z}$,

$$E^{p,q}_r(m) : E^{p,q}(A^\bullet, F) \sim \to E^{p,q}(B^\bullet, F)$$

is an isomorphism in $\mathcal{A}$, note that by definition this $r$ does NOT depend on $p$ and $q$. If a morphism $m : (A^\bullet, F) \to (B^\bullet, F)$, with $(A^\bullet, F), (B^\bullet, F) \in C_{fil}(\mathcal{A})$ is an $\infty$-filtered quasi-isomorphism, then for all $n \in \mathbb{Z}$

$$H^n(m) : H^n(A^\bullet, F) \sim \to H^n(B^\bullet, F)$$

is a filtered isomorphism, i.e. an isomorphism in $(\mathcal{A}, F)$. Note that the converse is NOT true since the integer $r_{p,q} \in \mathbb{N}$ such that $E^{p,q}_s(A^\bullet, F) = \text{Gr}^p_r H^{p+q}(A^\bullet, F)$ and $E^{p,q}_s(B^\bullet, F) = \text{Gr}^p_r H^{p+q}(B^\bullet, F)$ for $s \leq r_{p,q}$ depends on $p$ and $q$.

Let $\mathcal{A}$ be an abelian category.

- We denote by $D(\mathcal{A})$ the localization of $K(\mathcal{A})$ with respect to the quasi-isomorphisms and by $D : K(\mathcal{A}) \to D(\mathcal{A})$ the localization functor. The category $D(\mathcal{A})$ is a triangulated category in the unique way such that $D$ a triangulated functor.

- We denote by $D_{fil,r}(\mathcal{A})$ the localization of $K_{fil}(\mathcal{A})$ with respect to the $r$-filtered quasi-isomorphisms and by $D : K_{fil}(\mathcal{A}) \to D_{fil,r}(\mathcal{A})$ the localization functor.

- We denote by $D_{fil,\infty}(\mathcal{A})$ the localization of $K_{fil}(\mathcal{A})$ with respect to the $\infty$-filtered quasi-isomorphisms and by $D : K_{fil}(\mathcal{A}) \to D_{fil,\infty}(\mathcal{A})$ the localization functor.

Let $\mathcal{A}$ be an abelian category. We denote by $\text{Inj}(\mathcal{A}) \subset \mathcal{A}$ the full subcategory of injective objects, and by $\text{Proj}(\mathcal{A}) \subset \mathcal{A}$ the full subcategory of projective objects.

For $\mathcal{S}$ a small category, we denote by

- $\text{PSh}(\mathcal{S}) := \text{PSh}(\mathcal{S}, \text{Ab}) := \text{Fun}(\mathcal{S}, \text{Ab})$ the category of presheaves on $\mathcal{S}$, i.e. the category of presheaves of abelian groups on $\mathcal{S}$.
For $S$ consider the adjonctions given by the direct and inverse image functors:

- $\text{PSh}(\mathcal{S}, \text{Ring}) := \text{Fun}(\mathcal{S}, \text{Ring})$ the category of presheaves of ring on $\mathcal{S}$, and $\text{PSh}(\mathcal{S}, \text{cRing}) \subset \text{PSh}(\mathcal{S}, \text{Ring})$ the full subcategory of presheaves of commutative ring.

- For $F \in \text{PSh}(\mathcal{S})$ and $X \in \mathcal{S}$, $F(X) = \Gamma(X, F)$ the sections on $X$ and for $h : X' \to X$ a morphism with $X, X' \in \mathcal{S}$, $F(h) := F^{X,Y}(h) : F(X) \to F(X')$ the morphism of abelian groups,

- $C(\mathcal{S}) = \text{PSh}(\mathcal{S}, C(\mathbb{Z})) = C(\text{PSh}(\mathcal{S})) = \text{PSh}(\mathcal{S} \times \mathbb{Z})$ the big abelian category of complexes of presheaves on $\mathcal{S}$ with value in abelian groups,

- $K(\mathcal{S}) := K(\text{PSh}(\mathcal{S})) = \text{Ho}(C(\mathcal{S}))$ In particular, we have the full homotopy functor $\text{Ho} : C(\mathcal{S}) \to K(\mathcal{S})$,

- $C_{[2]}(\mathcal{S}) := C_{[2]}(\text{PSh}(\mathcal{S})) \subset C(\text{PSh}(\mathcal{S}), C, F, W)$ the big abelian category of (bi)filtered complexes of presheaves on $\mathcal{S}$ with value in abelian groups such that the filtration is biregular, and $\text{PSh}_{[2]}(\mathcal{S}) = (\text{PSh}(\mathcal{S}), C, F, W)$,

- $K_{[2]}(\mathcal{S}) := K(\text{PSh}_{[2]}(\mathcal{S})) = \text{Ho}(C_{[2]}(\mathcal{S}))$

For $f : \mathcal{T} \to \mathcal{S}$ a morphism a presite with $\mathcal{T}, \mathcal{S} \in \text{Cat}$, given by the functor $P(f) : \mathcal{S} \to \mathcal{T}$, we will consider the adjonctions given by the direct and inverse image functors:

- $(f^*, f_*) = (f^{-1}, f_*) : \text{PSh}(\mathcal{S}) \leftrightarrows \text{PSh}(\mathcal{T})$, which induces $(f^*, f_*) : C(\mathcal{S}) \leftrightarrows C(\mathcal{T})$, we denote, for $F \in C(\mathcal{S})$ and $G \in C(\mathcal{T})$

$$\text{ad}(f^*, f_*)(F) : F \to f_* f^* F, \text{ ad}(f^*, f_*)(G) : f^* f_* G \to G$$

the adjonction maps,

- $(f_*, f^+) : \text{PSh}(\mathcal{T}) \leftrightarrows \text{PSh}(\mathcal{S})$, which induces $(f_*, f^+) : C(\mathcal{T}) \leftrightarrows C(\mathcal{S})$, we denote for $F \in C(\mathcal{S})$ and $G \in C(\mathcal{T})$

$$\text{ad}(f_*, f^+)(F) : G \to f^+ f_* G, \text{ ad}(f_*, f^+)(G) : f_* f^+ F \to F$$

the adjonction maps.

- For $(\mathcal{S}, O_S) \in \text{RCat}$ a ringed topos, we denote by

  - $\text{PSh}_{O_S}(\mathcal{S})$ the category of presheaves of $O_S$ modules on $\mathcal{S}$, whose objects are $\text{PSh}_{O_S}(\mathcal{S})^0 := \{(M, m), M \in \text{PSh}(\mathcal{S}), m : M \otimes_{O_S} M \to M\}$, together with the forgetful functor $o : \text{PSh}(\mathcal{S}) \to \text{PSh}_{O_S}(\mathcal{S})$, $C_{O_S}(\mathcal{S}) := C(\text{PSh}_{O_S}(\mathcal{S}))$ the big abelian category of complexes of presheaves of $O_S$ modules on $\mathcal{S}$,

- $K_{O_S}(\mathcal{S}) := K(\text{PSh}_{O_S}(\mathcal{S})) = \text{Ho}(C_{O_S}(\mathcal{S}))$, in particular, we have the full homotopy functor $\text{Ho} : C_{O_S}(\mathcal{S}) \to K_{O_S}(\mathcal{S})$,

- $C_{O_S(2)}(\mathcal{S}) := C_{[2]}(\text{PSh}_{O_S}(\mathcal{S})) \subset C(\text{PSh}_{O_S}(\mathcal{S}), C, F, W)$, the big abelian category of (bi)filtered complexes of presheaves of $O_S$ modules on $\mathcal{S}$ such that the filtration is biregular and $\text{PSh}_{O_S(2)}(\mathcal{S}) = (\text{PSh}_{O_S}(\mathcal{S}), C, F, W)$,

- $K_{O_S(2)}(\mathcal{S}) := K(\text{PSh}_{O_S(2)}(\mathcal{S})) = \text{Ho}(C_{O_S(2)}(\mathcal{S}))$.

- For $\mathcal{S}_* \in \text{Fun}(\mathcal{I}, \text{Cat})$ a diagram of (pre)sites, with $\mathcal{I} \in \text{Cat}$ a small category, we denote by

  - $\text{PSh}(\mathcal{S}_*) := \text{PSh}(\mathcal{S}_*, \text{Ab})$ the category of presheaves on $\mathcal{S}_*$,

* whose objects are $\text{PSh}(\mathcal{S}_*)^0 := \{(F_I, u_{IJ})_{I \in \mathcal{I}}\}$, with $F_I \in \text{PSh}(\mathcal{S}_I)$, and for $r_{IJ} : I \to J$ with $I, J \in \mathcal{I}$, $u_{IJ} : F_I \to F_J$, $r_{IJ}$ are morphism in $\text{PSh}(\mathcal{S}_I)$, noting again $r_{IJ} : S_J \to S_I$ the associated morphism of presite,

* whose morphism are $m = (m_I) : (F_I, u_{IJ}) \to (G_I, v_{IJ})$ satisfying $v_{IJ} \circ m_I = r_{IJ} \circ m_J \circ u_{IJ}$ in $\text{PSh}(\mathcal{S}_I)$,
\[- \text{PSh}(\mathcal{S}_\bullet, \text{Ring}) \text{ the category of presheaves of ring on } \mathcal{S}_\bullet \text{ given in the same way, and } \text{PSh}(\mathcal{S}_\bullet, \text{cRing}) \subset \text{PSh}(\mathcal{S}_\bullet, \text{Ring}) \text{ the full subcategory of presheaves of commutative ring.} \]

\[- C(\mathcal{S}_\bullet) := C(\text{PSh}(\mathcal{S}_\bullet)) \text{ the big abelian category of complexes of presheaves on } \mathcal{S}_\bullet \text{ with value in abelian groups,} \]

\[- K(\mathcal{S}_\bullet) := K(\text{PSh}(\mathcal{S}_\bullet)) = \text{Ho}(C(\mathcal{S}_\bullet)), \text{ in particular, we have the full homotopy functor } \text{Ho} : C(\mathcal{S}_\bullet) \rightarrow K(\mathcal{S}_\bullet), \]

\[- C_{(2)}f_{fil}(\mathcal{S}_\bullet) := C_{(2)}f_{fil}(\text{PSh}(\mathcal{S}_\bullet)) \subset C(\text{PSh}(\mathcal{S}_\bullet), F, W) \text{ the big abelian category of (bi)filtered complexes of presheaves on } \mathcal{S}_\bullet \text{ with value in abelian groups such that the filtration is bireregular, and} \]

\[- \text{PSh}_{(2)}f_{fil}(\mathcal{S}_\bullet) = (\text{PSh}(\mathcal{S}_\bullet), F, W), \text{ by definition } C_{(2)}f_{fil}(\mathcal{S}_\bullet) \text{ is the category} \]

\[- * \text{ whose objects are } C_{(2)}f_{fil}(\mathcal{S}_\bullet)^0 := \{(F_I, F, W), u_{IJ}\}_{I \in \mathcal{T}}, \text{ with } (F_I, F, W) \in C_{(2)}f_{fil}(\mathcal{S}_I), \]

\[- \text{and for } r_{IJ} : I \rightarrow J \text{ with } I, J \in \mathcal{T}, u_{IJ} : (F_I, F, W) \rightarrow r_{IJ}^*(F_I, F, W) \text{ are morphism in} C_{(2)}f_{fil}(\mathcal{S}_I), \text{ noting again } r_{IJ} : S_J \rightarrow S_I \text{ the associated morphism of presite}, \]

\[- * \text{ whose morphism are } m = (m_I) : ((F_I, F, W), u_{IJ}) \rightarrow ((G_I, F, W), v_{IJ}) \text{ satisfying } v_{IJ} \circ m_I = r_{IJ}^*m_J \circ u_{IJ} \text{ in } C_{(2)}f_{fil}(\mathcal{S}_I), \]

\[- K_{f_{fil}}(\mathcal{S}_\bullet) := K(\text{PSh}_{f_{fil}}(\mathcal{S}_\bullet)) = \text{Ho}(C_{f_{fil}}(\mathcal{S}_\bullet)) \]

\[\text{Let } \mathcal{T}, \mathcal{T}' \in \text{Cat} \text{ be small categories. Let } (f_s, s) : \mathcal{T} \rightarrow \mathcal{S}_\bullet \text{ a morphism a diagrams of (pre)site with } \mathcal{T}_s \in \text{Fun}([\mathcal{T}, \text{Cat}]), \mathcal{S}_\bullet \in \text{Fun}([\mathcal{T}', \text{Cat}]), \text{ which is by definition given by a functor } s : \mathcal{T} \rightarrow \mathcal{T}' \text{ and morphism of functor } P(f_s) : S_{\bullet(s)} := \mathcal{S}_\bullet \circ s \rightarrow \mathcal{T}_s. \text{ Here, we denote for short, } S_{\bullet(s)} := \mathcal{S}_\bullet \circ s \in \text{Fun}([\mathcal{T}, \text{Cat}]). \text{ We have then, for } r_{IJ} : I \rightarrow J \text{ a morphism, with } I, J \in \mathcal{T}, \text{ a commutative diagram in Cat}\]

\[
\begin{array}{ccc}
D_{IJ} := S_{\bullet(J)} & \xrightarrow{r_{IJ}} & S_{\bullet(I)} \\
T_J & \xrightarrow{f_J} & T_I \\
& \xrightarrow{r_{IJ}^*} & \\
\end{array}
\]

\[\text{We will consider the the adjunction given by the direct and inverse image functors :} \]

\[((f_s)^*, (f_s)^*) = ((f_s)^{-1}, (f_s)_s) : \text{PSh}(S_{\bullet(s)}) \Rightarrow \text{PSh}(\mathcal{T}_s), \]

\[F = (F_I, u_{IJ}) \mapsto (f_s)^*F := (f_s)^*F_I, T(D_{IJ})(f_s)^*u_{IJ}, \]

\[G = (G_I, v_{IJ}) \mapsto (f_s)_sG := (f_s)_sG_I, (f_s)_s^*v_{IJ}). \]

\[\text{It induces the adjunction } ((f_s)^*, (f_s)_s) : C(S_{\bullet(s)}) \Rightarrow C(\mathcal{T}_s). \text{ We denote, for } (F_I, u_{IJ}) \in C(S_{\bullet(s)}) \text{ and } (G_I, v_{IJ}) \in C(\mathcal{T}_s) \text{ by} \]

\[\text{ad}((f_s)^*, (f_s)_s)((F_I, u_{IJ})) : (F_I, u_{IJ}) \rightarrow (f_s)_s^*(f_s)_s^*(F_I, u_{IJ}), \]

\[\text{ad}((f_s)^*, (f_s)_s)((G_I, v_{IJ})) : (f_s)_s^*(f_s)_s^*(G_I, v_{IJ}) \rightarrow (G_I, v_{IJ}) \]

\[\text{the adjunction maps.} \]

\[\bullet \text{ Let } \mathcal{T} \in \text{Cat} \text{ a small category. For } (\mathcal{S}_\bullet, O_{\mathcal{S}_\bullet}) \in \text{Fun}(\mathcal{T}, \text{RCat}) \text{ a diagram of ringed topos, we denote by} \]

\[- \text{PSh}_{O_{\mathcal{S}_\bullet}}(\mathcal{S}_\bullet) \text{ the category of presheaves of modules on } (\mathcal{S}_\bullet, O_{\mathcal{S}_\bullet}), \]

\[- * \text{ whose objects are } \text{PSh}_{O_{\mathcal{S}_\bullet}}(\mathcal{S}_\bullet)^0 := \{(F_I, u_{IJ})\}_{I \in \mathcal{T}}, \text{ with } F_I \in \text{PSh}_{O_{\mathcal{S}_\bullet}}(\mathcal{S}_I), \text{ and for } r_{IJ} : I \rightarrow J \text{ with } I, J \in \mathcal{T}, u_{IJ} : F_I \rightarrow r_{IJ}^*F_I \text{ are morphism in } \text{PSh}_{O_{\mathcal{S}_\bullet}}(\mathcal{S}_I), \text{ noting again } r_{IJ} : S_J \rightarrow S_I \text{ the associated morphism of presite}, \]

\[- * \text{ whose morphism are } m = (m_I) : (F_I, u_{IJ}) \rightarrow (G_I, v_{IJ}) \text{ satisfying } v_{IJ} \circ m_I = r_{IJ}^*m_J \circ u_{IJ} \text{ in } \text{PSh}_{O_{\mathcal{S}_\bullet}}(\mathcal{S}_I), \]

\[- C_{O_{\mathcal{S}_\bullet}}(\mathcal{S}_\bullet) := C(\text{PSh}_{O_{\mathcal{S}_\bullet}}(\mathcal{S}_\bullet)), \]
$K_{O_{S}}(S) := K(\text{PSh}_{O_{S}}(S)) = \text{Ho}(\text{PSh}_{O_{S}}(S))$, in particular, we have the full homotopy functor $\text{Ho} : C(S) \rightarrow K(S)$,

$C_{O_{S}}(2)_{fil}(S) := C_{O_{S}}(2)_{fil}(\text{PSh}(S)) \subset C(\text{PSh}_{O_{S}}(S), F, W)$ the big abelian category of (bi)filtered complexes of presheaves of modules on $(S, O_{S})$ such that the filtration is birregular, and $\text{PSh}_{O_{S}}(2)_{fil}(S) = (\text{PSh}_{O_{S}}(S), F, W)$, by definition $C_{O_{S}}(2)_{fil}(S)$ is the category

* whose objects are $C_{O_{S}}(2)_{fil}(S)^{0} := \left\{ ((F_{I}, F, W), u_{IJ})_{I \in \mathcal{I}} \right\}$, with $(F_{I}, F, W) \in C_{O_{S}}(2)_{fil}(S)$, and for $r_{IJ} : I \rightarrow J$ with $I, J \in \mathcal{I}$, $u_{IJ} : (F_{I}, F, W) \rightarrow r_{IJ}^{*}(F_{J}, F, W)$ are morphism in $C_{O_{S}}(2)_{fil}(S)$, noting again $r_{IJ} : S_{I} \rightarrow S_{J}$ the associated morphism of pre-site,

* whose morphism are $m = (m_{I}) : ((F_{I}, F, W), u_{IJ}) \rightarrow ((G_{I}, F, W), v_{IJ})$ satisfying $v_{IJ} \circ m_{I} = r_{IJ}^{*}m_{J} \circ u_{IJ}$ in $C_{O_{S}}(2)_{fil}(S)$,

$K_{O_{S}}(2)_{fil}(S) := K(\text{PSh}_{O_{S}}(2)_{fil}(S)) = \text{Ho}(\text{PSh}_{O_{S}}(2)_{fil}(S))$.

Let $S \in \text{Cat}$. For $\Sigma : C(S) \rightarrow C(S)$ an endofunctor, we denote by $\Sigma(S) = (C(S), \Sigma)$ the corresponding category of spectra.

Denote by $\text{Sch} \subset \text{RTop}$ the full subcategory of schemes. For a field $k$, we consider $\text{Sch} / k := \text{Sch} / \text{Spec} k$ the category of schemes over $\text{Spec} k$. We then denote by

* $\text{Var}(k) \subset \text{Sch} / k$ the full subcategory consisting of algebraic varieties over $k$, i.e. schemes of finite type over $k$,

* $\text{QPVar}(k) \subset \text{QPVar}(k) \subset \text{Var}(k)$ the full subcategories consisting of quasi-projective varieties and projective varieties respectively;

* $\text{PSh}_{\text{Var}}(k) \subset \text{PSh}_{\text{Var}}(k) \subset \text{Var}(k)$ the full subcategories consisting of smooth varieties and smooth projective varieties respectively.

Denote by $\text{Top}^{2}$ the category whose set of objects is

$$(\text{Top}^{2})^{0} := \{(X, Z), Z \subset X \text{ closed} \} \subset \text{Top} \times \text{Top}$$

and whose set of morphism between $(X_{1}, Z_{1}),(X_{2}, Z_{2}) \in \text{Top}^{2}$ is

$$\text{Hom}_{\text{Top}^{2}}((X_{1}, Z_{1}),(X_{2}, Z_{2})) := \left\{ (f : X_{1} \rightarrow X_{2}), \text{ s.t. } Z_{1} \subset f^{-1}(Z_{2}) \right\} \subset \text{Hom}_{\text{Top}}(X_{1}, X_{2})$$

For $S \in \text{Top}$, $\text{Top}^{2}/S := \text{Top}^{2}/(S, S)$ is then by definition the category whose set of objects is

$$(\text{Top}^{2}/S)^{0} := \{(X, Z, h), h : X \rightarrow S, Z \subset X \text{ closed } \} \subset \text{Top}/S \times \text{Top}$$

and whose set of morphisms between $(X_{1}, Z_{1})/S = (X_{1}, Z_{1}, h_{1}),(X_{2}, Z_{2})/S = (X_{2}, Z_{2}, h_{2}) \in \text{Top}^{2}/S$ is the subset

$$\text{Hom}_{\text{Top}^{2}/S}((X_{1}, Z_{1})/S, (X_{2}, Z_{2})/S) := \left\{ (f : X_{1} \rightarrow X_{2}), \text{ s.t. } h_{1} \circ f = h_{2} \text{ and } Z_{1} \subset f^{-1}(Z_{2}) \right\} \subset \text{Hom}_{\text{Top}}(X_{1}, X_{2})$$

We denote by

$$\mu_{S} : \text{Top}^{2, pr}/S := \{((Y \times S, Z), p), p : Y \times S \rightarrow S, Z \subset Y \times S \text{ closed} \} \hookrightarrow \text{Top}^{2}/S$$

the full subcategory whose objects are those with $p : Y \times S \rightarrow S$ a projection, and again $\mu_{S} : \text{Top}^{2}/S \rightarrow \text{Top}^{2, pr}/S$ the corresponding morphism of sites. We denote by

$$\text{Gr}^{12}_{S} : \text{Top}/S \rightarrow \text{Top}^{2, pr}/S, X/S \mapsto \text{Gr}^{12}_{S}(X/S) := (X \times S, \tilde{X})/S,$$

$$(g : X/S \rightarrow X^{r}/S) \mapsto \text{Gr}^{12}_{S}(g) := (g \times I_{S} : (X \times S, \tilde{X}) \rightarrow (X^{r} \times S, \tilde{X}^{r}))$$

the graph functor, $X \mapsto X \times S$ being the graph embedding (which is a closed embedding if $X$ is separated), and again $\text{Gr}^{12}_{S} : \text{Top}^{2, pr}/S \rightarrow \text{Top}/S$ the corresponding morphism of sites.
Denote by $\mathbf{RTop}^2$ the category whose set of objects is

$$(\mathbf{RTop}^2)^0 := \{\{(X, O_X), Z) \in \mathbf{RTop} \times \mathbf{Top} \mid Z \subset X \text{ closed}\} \subset \mathbf{RTop} \times \mathbf{Top}$$

and whose set of morphisms between $\{(X_1, O_{X_1}), (Z_1), (X_2, O_{X_2}), (Z_2)\} \in \mathbf{RTop}^2$ is

$$\text{Hom}_{\mathbf{RTop}^2}(\{(X_1, O_{X_1}), (Z_1), (X_2, O_{X_2}), (Z_2)\}) := \{(f : (X_1, O_{X_1}) \to (X_2, O_{X_2})), \text{ s.t. } Z_1 \subset f^{-1}(Z_2)\} \subset \text{Hom}_{\mathbf{RTop}}((X_1, O_{X_1}), (X_2, O_{X_2}))$$

For $(S, O_S) \in \mathbf{RTop}$, $\mathbf{RTop}^2 / (S, O_S) := \mathbf{RTop}^2 / ((S, O_S), S)$ is then by definition the category whose set of objects is

$$(\mathbf{RTop}^2 / (S, O_S))^0 := \{\{(X, O_X), Z) \in \mathbf{RTop} \times \mathbf{Top} \mid Z \subset X \text{ closed}\} \subset \mathbf{RTop} / (S, O_S) \times \mathbf{Top}$$

and whose set of morphisms between $\{(X_1, O_{X_1}), (Z_1), (X_2, O_{X_2}), (Z_2)\} \in \mathbf{RTop}^2 / (S, O_S)$ is the subset

$$\text{Hom}_{\mathbf{RTop}^2 / (S, O_S)}(\{(X_1, O_{X_1}), (Z_1), (X_2, O_{X_2}), (Z_2)\}) := \{(f : (X_1, O_{X_1}) \to (X_2, O_{X_2})), \text{ s.t. } h_1 \circ f = h_2 \text{ and } Z_1 \subset f^{-1}(Z_2)\} \subset \text{Hom}_{\mathbf{RTop}}((X_1, O_{X_1}), (X_2, O_{X_2}))$$

We denote by

$$\mu_S : \mathbf{RTop}^{2,pr} / S := \{\{(Y \times S, q^*O_Y \otimes p^*O_S), Z\}, p : Y \times S \to S, Z \subset Y \times S \text{ closed}\} \to \mathbf{RTop}^2 / S$$

the full subcategory whose objects are those with $p : Y \times S \to S$ is a projection, and again

$$\mu_S : \mathbf{RTop}^2 / S \to \mathbf{RTop}^{2,pr} / S$$

the corresponding morphism of sites. We denote by

$$\text{Gr}_{S}^{12} : \mathbf{RTop} / S \to \mathbf{RTop}^{2,pr} / S,$$

$$(X, O_X) / (S, O_S) \to \text{Gr}_{S}^{12}(X, O_X) / (S, O_S) := ((X \times S, q^*O_X \otimes p^*O_S), \bar{X}) / (S, O_S),$$

$$\text{Gr}_{S}^{12}(g) := (g \times I_S : (X \times S, q^*O_X \otimes p^*O_S), \bar{X}) \to ((X' \times S, q^*O_X \otimes p^*O_S), \bar{X}')$$

the graph functor, $X \to X \times S$ being the graph embedding (which is a closed embedding if $X$ is separated), $p : X \times S \to S$, $q : X \times S \to X$ the projections, and again $\text{Gr}_{S}^{12} : \mathbf{RTop}^{2,pr} / S \to \mathbf{RTop} / S$ the corresponding morphism of sites.

We denote by $\mathbf{Sch}^2 \subset \mathbf{RTop}^2$ the full subcategory such that the first factors are schemes. For a field $k$, we denote by $\mathbf{Sch}^2 / k := \mathbf{Sch}^2 / (\text{Spec } k, \{\text{pt}\})$ and by

- $\text{Var}(k)^2 \subset \mathbf{Sch}^2 / k$ the full subcategory such that the first factors are algebraic varieties over $k$, i.e. schemes of finite type over $k$,
- $\text{PVar}(k)^2 \subset \text{QPVar}(k)^2 \subset \text{Var}(k)^2$ the full subcategories such that the first factors are quasi-projective varieties and projective varieties respectively,
- $\text{PSmVar}(k)^2 \subset \text{SmVar}(k)^2 \subset \text{Var}(k)^2$ the full subcategories such that the first factors are smooth varieties and smooth projective varieties respectively.

In particular we have, for $S \in \text{Var}(k)$, the graph functor

$$\text{Gr}_{S}^{12} : \text{Var}(k) / S \to \text{Var}(k)^{2,pr} / S,$$

$$\text{Gr}_{S}^{12}(g) := (g \times I_S : (X \times S, X) \to (X', S, X'))$$

the graph embedding $X \to X \times S$ is a closed embedding since $X$ is separated in the subcategory of schemes $\text{Sch} \subset \mathbf{RTop}$, and again $\text{Gr}_{S}^{12} : \text{Var}(k)^{2,pr} / S \to \text{Var}(k) / S$ the corresponding morphism of sites.
• Denote by $CW \subset \text{Top}$ the full subcategory of $CW$ complexes, by $CS \subset CW$ the full subcategory of $\Delta$ complexes, by $\text{TM}(\mathbb{R}) \subset CW$ the full subcategory of topological (real) manifolds which admits a $CW$ structure (a topological manifold admits a $CW$ structure if it admits a differential structure) and by $\text{Diff}(\mathbb{R}) \subset \text{RTop}$ the full subcategory of differentiable (real) manifold. We denote by $CW^2 \subset \text{Top}^2$ the full subcategory such that the first factors are $CW$ complexes, by $\text{TM}(\mathbb{R})^2 \subset CW^2$ the full subcategory such that the first factors are topological (real) manifolds and by $\text{Diff}(\mathbb{R})^2 \subset \text{RTop}^2$ the full subcategory such that the first factors are differentiable (real) manifold.

• Denote by $\text{AnSp}(\mathbb{C}) \subset \text{RTop}$ the full subcategory of analytic spaces over $\mathbb{C}$, and by $\text{AnSm}(\mathbb{C}) \subset \text{AnSp}(\mathbb{C})$ the full subcategory of smooth analytic spaces (i.e. complex analytic manifold). We denote by $\text{AnSp}(\mathbb{C})^2 \subset \text{RTop}^2$ the full subcategory such that the first factors are analytic spaces over $\mathbb{C}$, and by $\text{AnSm}(\mathbb{C})^2 \subset \text{AnSp}(\mathbb{C})^2$ the full subcategory such that the first factors are smooth analytic spaces (i.e. complex analytic manifold). In particular we have, for $S \in \text{AnSp}(\mathbb{C})$, the graph functor

$$\text{Gr}_S^{12} : \text{AnSp}(\mathbb{C})/S \to \text{AnSp}(\mathbb{C})^{2-pr}/S, \quad X/S \mapsto \text{Gr}_S^{12}(X/S) := (X \times S, X)/S,$$

$$(g : X/S \to X'/S) \mapsto \text{Gr}_S^{12}(g) := (g \times I_S : (X \times S, X) \to (X' \times S, X')).$$

the graph embedding $X \to X \times S$ is a closed embedding since $X$ is separated in $\text{RTop}$, and again $\text{Gr}_S^{12} : \text{AnSp}(\mathbb{C})^{2-pr}/S \to \text{AnSp}(\mathbb{C})/S$ the corresponding morphism of sites.

• For $V \in \text{Var}(\mathbb{C})$, we denote by $V^{an} \in \text{AnSp}(\mathbb{C})$ the complex analytic space associated to $V$ with the usual topology induced by the usual topology of $\mathbb{C}^N$. For $W \in \text{AnSp}(\mathbb{C})$, we denote by $W^{cw} \in \text{AnSp}(\mathbb{C})$ the topological space given by $W$ which is a $CW$ complex. For simplicity, for $V \in \text{Var}(\mathbb{C})$, we denote by $V^{cw} := (V^{an})^{cw} \in CW$. We have then

- the analytical functor $\text{An} : \text{Var}(\mathbb{C}) \to \text{AnSp}(\mathbb{C})$, $\text{An}(V) = V^{an}$,

- the forgetful functor $\text{Cw} = \text{tp} : \text{AnSp}(\mathbb{C}) \to \text{CW}$, $\text{Cw}(W) = W^{cw}$,

- the composite of these two functors $\text{Cw} = \text{Cw} \circ \text{An} : \text{Var}(\mathbb{C}) \to \text{CW}$, $\text{Cw}(V) = V^{cw}$.

We have then

- the analytical functor $\text{An} : \text{Var}(\mathbb{C})^2 \to \text{AnSp}(\mathbb{C})^2$, $\text{An}((V, Z)) = (V^{an}, Z^{an})$,

- the forgetful functor $\text{Cw} = \text{tp} : \text{AnSp}(\mathbb{C})^2 \to \text{CW}^2$, $\text{Cw}((V, Z)) = (W^{cw}, Z^{cw})$,

- the composite of these two functors $\text{Cw} = \text{Cw} \circ \text{An} : \text{Var}(\mathbb{C})^2 \to \text{CW}^2$, $\text{Cw}((V, Z)) = (V^{cw}, Z^{cw})$.

### 2.2 Additive categories, abelian categories and tensor triangulated categories

Let $\mathcal{A}$ an additive category.

• For $\phi : F^\bullet \to G^\bullet$ a morphism with $F^\bullet, G^\bullet \in C(\mathcal{A})$, we have the mapping cylinder $\text{Cyl}(\phi) := \{(F^n + F^{n+1} + G^{n+1}, \partial_F^n, \partial_F^{n+1}, \partial_G^{n+1} + \partial^n G) \in C(\mathcal{A})\}$ and the mapping cone $\text{Cone}(\phi) := \{(F^n + G^{n+1}, \partial_F^n, \partial_G^{n+1} + \partial^n G) \in C(\mathcal{A})\}$.

• The category $K(\mathcal{A}) := \text{Ho}(C(\mathcal{A}))$ is a triangulated category with distinguish triangles $F^\bullet \xrightarrow{i_{F^\bullet}} \text{Cyl}(\phi) \xrightarrow{q_{\phi}} \text{Cone}(\phi) \xrightarrow{r_{\phi}} F^\bullet[1]$.

• The category $(\mathcal{A}, F)$ is obviously again an additive category.

• Let $\phi : F^\bullet \to G^\bullet$ a morphism with $F^\bullet, G^\bullet \in C(\mathcal{A})$. Then it is obviously a morphism of filtered complex $\phi : (F^\bullet, F_b) \to (G^\bullet, F_b)$, where we recall that $F_b$ is the trivial filtration $(F^\bullet, F_b), (G^\bullet, F_b) \in C_{fil}(\mathcal{A})$. 

15
We recall the following property of the internal hom functor if it exists of a tensor triangulated category and the definition of compact and cocompact object.

**Proposition 1.** Let \((\mathcal{T}, \otimes)\) a tensor triangulated category admitting countable direct sum and product compatible with the triangulation. Assume that \(\mathcal{T}\) has an internal hom \((\text{bi})\text{functor } \mathcal{RHom}(\cdot, \cdot) : \mathcal{T}^2 \to \mathcal{T}\) which is by definition the right adjoint to \((\cdot \otimes \cdot) : \mathcal{T}^2 \to \mathcal{T}\). Then,

- for \(N \in \mathcal{T}\), the functor \(\mathcal{RHom}(\cdot, N) : \mathcal{T} \to \mathcal{T}\) commutes with homotopy colimits: for \(M = \text{hocolim}_{i \in I} M_i\), where \(I\) is a countable category, we have
  \[
  \mathcal{RHom}(M, N) \xrightarrow{\sim} \text{hocolim}_{i \in I} \mathcal{RHom}(M_i, N).
  \]

- dually, for \(M \in \mathcal{T}\), the functor \(\mathcal{RHom}(M, \cdot) : \mathcal{T} \to \mathcal{T}\) commutes with homotopy limits: for \(N = \text{holim}_{i \in I} N_i\), where \(I\) is a countable category, we have
  \[
  \mathcal{RHom}(M, N) \xrightarrow{\sim} \text{holim}_{i \in I} \mathcal{RHom}(M, N_i).
  \]

**Proof.** Standard.

Let \((\mathcal{T}, \otimes)\) a tensor triangulated category admitting countable direct sum and product compatible with the triangulation. Assume that \(\mathcal{T}\) has an internal hom \((\text{bi})\text{functor } \mathcal{RHom}(\cdot, \cdot) : \mathcal{T}^2 \to \mathcal{T}\).

- For \(N \in \mathcal{T}\), the functor \(\mathcal{RHom}(\cdot, N) : \mathcal{T} \to \mathcal{T}\) does not commutes in general with homotopy limits: for \(M = \text{hocolim}_{i \in I} M_i\), where \(I\) is a countable category, the canonical map
  \[
  \text{hocolim}_{i \in I} \mathcal{RHom}(M_i, N) \to \mathcal{RHom}(M, N)
  \]
  is not an isomorphism in general if \(I\) is infinite. It commutes if and only if \(N\) is compact.

- Dually, for \(M \in \mathcal{T}\), the functor \(\mathcal{RHom}(M, \cdot) : \mathcal{T} \to \mathcal{T}\) does not commutes in general with infinite homotopy colimits. It commutes if and only if \(M\) is cocompact.

Most triangulated category comes from the localization of the category of complexes of an abelian category with respect to quasi-isomorphisms. In the case where the abelian category have enough injective or projective object, the triangulated category is the homotopy category of the complexes of injective, resp. projective, objects.

**Proposition 2.** Let \(\mathcal{A}\) an abelian category with enough injective and projective.

- A quasi-isomorphism \(\phi : Q^\bullet \to F^\bullet\), with \(F^\bullet, Q^\bullet \in C^-\mathcal{A}\) such that the \(Q^n\) are projective is an homotopy equivalence.

- Dually, a quasi-isomorphism \(\phi : F^\bullet \to I^\bullet\), with \(F^\bullet, I^\bullet \in C^+\mathcal{A}\) such that the \(I^n\) are projective is an homotopy equivalence.

**Proof.** Standard.

**Proposition 3.** Let \(\mathcal{A}\) an abelian category with enough injective and projective satisfying \(AB3\) (i.e. countable direct sum of exact sequences are exact sequence).

- Let \(K(P) \subseteq K(\mathcal{A})\) be the thick subcategory generated by (unbounded) complexes of projective objects. Then \(K(P) \to K(\mathcal{A}) \xrightarrow{D} \mathcal{D}(\mathcal{A})\) is an equivalence of triangulated categories.

- Similarly, let \(K(I) \subseteq K(\mathcal{A})\) be the thick subcategory generated by (unbounded) complexes of injective objects. Then \(K(I) \to K(\mathcal{A}) \xrightarrow{D} \mathcal{D}(\mathcal{A})\) is an equivalence of triangulated categories.

**Proof.** It follows from proposition 2: see [2].
2.3 Presheaves on a site and on a ringed topos

2.3.1 Functorialities

Let $S \in \text{Cat}$ a small category. For $X \in S$ we denote by $\mathbb{Z}(X) \in \text{PSh}(S)$ the presheaf represented by $X$. By Yoneda lemma, a representable presheaf $\mathbb{Z}(X)$ is projective.

**Proposition 4.**

- Let $S \in \text{Cat}$ a small category. The projective presheaves $\text{Proj}(\text{PSh}(S)) \subset \text{PSh}(S)$ are the direct summand of the representable presheaves $\mathbb{Z}(X)$ with $X \in S$.

- More generally let $(S, O_S) \in \text{RCat}$ a ringed topos. The projective presheaves $\text{Proj}(\text{PSh}_{O_S}(S)) \subset \text{PSh}_{O_S}(S)$ of $O_S$ modules are the direct summand of the representable presheaves $\mathbb{Z}(X) \otimes O_S$ with $X \in S$.

**Proof.** Standard. □

Let $f : T \to S$ a morphism of presite with $T, S \in \text{Cat}$. For $h : U \to S$ a morphism with $U, S \in S$, we have $f^*\mathbb{Z}(U/S) = \mathbb{Z}(P(f)(U/S))$.

We will consider in this article filtered complexes of presheaves on a site. Let $f : T \to S$ a morphism of presite with $T, S \in \text{Cat}$.

- The functor $f_* : C(T) \to C(S)$ gives, by functoriality, the functor
  
  $f_* : C(\text{fil}(T)) \to C(\text{fil}(S)), \ (G, F) \mapsto f_*(G, F) := (f_* G, f_* F)$,
  
  since $f_*$ preserves monomorphisms.

- The functor $f^* : C(S) \to C(T)$ gives, by functoriality, the functor
  
  $f^* : C(\text{fil}(S)) \to C(\text{fil}(T)), \ (G, F) \mapsto f^*(G, F)$, $F^p(f^*(G, F)) := \text{Im}(f^* F^p G \to f^* G)$.

  In the particular case where $f^* : \text{PSh}(S) \to \text{PSh}(T)$ preserves monomorphisms, we have $f^*(G, F) = (f^* G, f^* F)$.

- The functor $f^\perp : C(S) \to C(T)$ gives, by functoriality, the functor
  
  $f^\perp : C(\text{fil}(T)) \to C(\text{fil}(S)), \ (G, F) \mapsto f^\perp(G, F) := (f^\perp G, f^\perp F)$,
  
  since $f^\perp : C(S) \to C(T)$ preserves monomorphisms.

Let $f : T \to S$ a morphism of presite with $T, S \in \text{Cat}$.

- The adjunction $(f^*, f_*) = (f^{-1}, f_*) : C(S) \rightleftarrows C(T)$, gives an adjunction
  
  $(f^*, f_*) : C(\text{fil}(S)) \rightleftarrows C(\text{fil}(T)), \ (G, F) \mapsto f^*(G, F)$, $(G, F) \mapsto f_*(G, F)$,
  
  with adjunction maps, for $(G_1, F) \in C(\text{fil}(S))$ and $(G_2, F) \in C(\text{fil}(T))$
  
  $\text{ad}(f^*, f_*)(G_1, F) : (G_1, F) \to f_* f^*(G_1, F)$, $\text{ad}(f^*, f_*)(G_2, F) : f^* f_*(G_2, F) \to (G_2, F)$.

- The adjunction $(f_*, f^\perp) : C(S) \rightleftarrows C(T)$, gives an adjunction
  
  $(f_*, f^\perp) : C(\text{fil}(T)) \rightleftarrows C(\text{fil}(S)), \ (G, F) \mapsto f_*(G, F)$, $(G, F) \mapsto f^\perp(G, F)$,
  
  with adjunction maps, for $(G_1, F) \in C(\text{fil}(S))$ and $(G_2, F) \in C(\text{fil}(T))$
  
  $\text{ad}(f^*, f_*)(G_2, F) : (G_2, F) \to f^\perp f_*(G_2, F)$, $\text{ad}(f^*, f_*)(G_1, F) : f_* f^\perp(G_1, F) \to (G_1, F)$.
Remark 1. Let \( T, S \in \text{Cat} \) small categories and \( f : T \to S \) a morphism of presite. Then the functor \( f^* : \text{PSh}(S) \to \text{PSh}(T) \) preserve epimorphism but does NOT preserve monomorphism in general (the colimits involved are NOT filtered colimits). However it preserve monomorphism between projective modules on a ringed topos. We recall the definition in the filtrered case.

For a commutative diagram of presite:

\[
\begin{array}{ccc}
D & \overset{g_2}{\longrightarrow} & S' \\
\downarrow f_2 & & \downarrow f_1 \\
T & \overset{g_1}{\longrightarrow} & S
\end{array}
\]

with \( T, T'S, S' \in \text{Cat} \), we denote by, for \( F \in C(S') \),

\[
T(D)(F) : g_1^* f_1* F \overset{g_1^* f_1* \text{ad}(g_2^* g_2^*)(F)}{\longrightarrow} g_1^* f_1* g_2^* g_3^* F = g_1^* g_1* f_2* g_3^* F \overset{\text{ad}(g_1^* g_1*)(f_2* g_3^* F)}{\longrightarrow} f_2* g_3^* F
\]

the canonical transformation map in \( C(T) \), and for \( (G, F) \in C_{fil}(S') \),

\[
T(D)(G, F) : g_1^* f_1* (G, F) \overset{g_1^* f_1* \text{ad}(g_2^* g_2^*)(G, F)}{\longrightarrow} g_1^* f_1* g_2^* g_3^* (G, F) = g_1^* g_1* f_2* g_3^* (G, F) \overset{\text{ad}(g_1^* g_1*)(f_2* g_3^* (G, F))}{\longrightarrow} f_2* g_3^* (G, F)
\]

the canonical transformation map in \( C_{fil}(T) \) given by the adjunction maps.

We will use the internal hom functor and the tensor product for presheaves on a site or for presheaves of modules on a ringed topos. We recall the definition in the filtered case.

- Let \((S, O_S) \in \text{RCat}\). We have the tensor product bifunctor

\[
(\cdot) \otimes (\cdot) : \text{PSh}(S)^2 \to \text{PSh}(S), (F, G) \mapsto (X \in S \mapsto (F \otimes G)(X) := F(X) \otimes G(X)
\]

It induces a bifunctor:

\[
(\cdot) \otimes (\cdot) : C(S) \times C(S) \to C(S), (F, G) \mapsto F \otimes G := \text{Tot}(F^* \otimes G^*), (F \otimes G)^n = \oplus_{r \in \mathbb{Z}} F^r \otimes G^{n-r}
\]

and a bifunctor

\[
(\cdot) \otimes (\cdot) : C(S) \times C_{O_S}(S) \to C_{O_S}(S), \alpha.(F \otimes G) := F \otimes (\alpha.G)
\]

For \((G_1, F), (G_2, F) \in C_{fil}(S), G_3 \in C(S)\), we define (note that tensor product preserve monomorphism only after tensoring with \(O_S \in \text{PSh}(S)\))

\[
- F^p((G_1, F) \otimes G_3) := \text{Im}(F^p G_1 \otimes G_3 \to G_1 \otimes G_3) \text{ and } F^p(G_3 \otimes (G_1, F)) := \text{Im}(G_3 \otimes F^p G_1 \to G_3 \otimes G_1),
\]

\[
- F^p F^q((G_1, F) \otimes (G_2, F)) := \text{Im}(F^p G_1 \otimes F^q G_2 \to G_1 \otimes G_2) \text{ and } F^k((G_1, F) \otimes (G_2, F)) := F^k \text{Tot}_{F^p}((G_1, F) \otimes (G_2, F)) := \oplus_{p \in \mathbb{Z}} \text{Im}(F^p G_1 \otimes F^{k-p} G_2 \to G_1 \otimes G_2)
\]

Note that in the case where \(G^n = 0 \) for \( n < 0\), we have \((G_1, F) \otimes (G_2, F) = G_1 \otimes (G_2, F)\). We get the bifunctors

\[
(\cdot) \otimes (\cdot) : C_{fil}(S)^2 \to C_{fil}(S), \quad (\cdot) \otimes (\cdot) : C_{fil}(S) \times C_{O_S \text{fil}}(S) \to C_{O_S \text{fil}}(S).
\]

We have the tensor product bifunctor

\[
(\cdot) \otimes_{O_S} (\cdot) : \text{PSh}_{O_S}(S)^2 \to \text{PSh}(S), (F, G) \mapsto (X \in S \mapsto (F \otimes_{O_S} G)(X) := F(X) \otimes_{O_S(X)} G(X)
\]

18
It induces a bifunctor:

\[(·) \otimes_{O_S} (·) : C_{O_S}(S) \times C_{O_S}(S) \to C(S), (F,G) \mapsto F \otimes_{O_S} G := \text{Tot}(F^* \otimes_{O_S} G^*)\]

For \((G_1, F), (G_2, F) \in C_{O_S}(S), G_3 \in C_S(S), G_3 \otimes_{O_S} G_1, G_2 \otimes_{O_S} G_1, G_2\), and

\[F^k((G_1, F) \otimes_{O_S}(G_2, F)) := F^k \text{Tot}_{FF}((G_1, F) \otimes_{O_S}(G_2, F)) := \oplus_{p \in \mathbb{Z}} \text{Im}(F^pG_1 \otimes_{O_S} F^{k-p}G_2 \to G_1 \otimes_{O_S} G_2)\]

Note that in the case where \(G_1^n = 0\) for \(n < 0\), we have \((G_1, F_b) \otimes_{O_S}(G_2, F) = G_1 \otimes_{O_S}(G_2, F)\).

This gives

- in all case it gives the bifunctor \((-) \otimes_{O_S} (-) : C_{O_S}(S) \otimes C_{O_S}(S) \to C_{fil}(S)\).
- in the case \(O_S\) is commutative, it gives the bifunctor \((-) \otimes_{O_S} (-) : C_{O_S}(S)^2 \to C_{O_S}(S)\).

• Let \((S, O_S) \in R\text{Cat}\). We have the internal hom bifunctor

\[\mathcal{H}om(·, ·) : \text{PSh}(S)^2 \to \text{PSh}(S),\]

\[(F, G) \mapsto (X \in S \mapsto \mathcal{H}om(F, G)(X) := \text{Hom}(r(X)_*F, r(X)_*G)\]

with \(r(X) : S \to S/X\) (see subsection 2.1). It induces a bifunctors:

\[\mathcal{H}om(·, ·) : C(S) \times C(S) \to C(S), (F, G) \mapsto \mathcal{H}om^*(F, G)\]

and a bifunctor

\[\mathcal{H}om(·, ·) : C(S) \times C_{O_S}(S) \to C_{O_S}(S), \alpha.\mathcal{H}om(F, G) := \mathcal{H}om(F, \alpha.G)\]

For \((G_1, F), (G_2, F) \in C_{fil}(S), G_3 \in C(S), G_3 \otimes_{O_S} G_1, G_2 \otimes_{O_S} G_1, G_2\), we define

- \(F^p\mathcal{H}om(G_3, (G_1, F)) := \mathcal{H}om(G_3, F^pG_1) \to \mathcal{H}om(G_3, G_1)\), note that the functor \(G \to \mathcal{H}om(F, G)\) preserve monomorphism,

- the dual filtration \(F^{-p}\mathcal{H}om((G_1, F), G_3) := \ker(\mathcal{H}om(G_1, G_3) \to \mathcal{H}om(F^pG_1, G_3))\)

- \(F^pF^q\mathcal{H}om((G_1, F), (G_2, F)) := \ker(\mathcal{H}om(G_1, F^pG_2) \to \mathcal{H}om(F^qG_1, F^kG_2))\), and

\[F^k\mathcal{H}om^*((G_1, F), (G_2, F)) := \text{Tot}_{FF} \mathcal{H}om((G_1, F), (G_2, F)) := \oplus_{p \in \mathbb{Z}} \ker(\mathcal{H}om(G_1, F^k+pG_2) \to \mathcal{H}om(F^pG_1, F^{k+p}G_2))\]

We get the bifunctors

\[\mathcal{H}om(·, ·) : C_{fil}(S) \times C_{fil}(S) \to C_{fil}(S), \mathcal{H}om(·, ·) : C_{O_S}(S) \times C_{O_S}(S) \to C_{O_S}(S)\]

We have the internal hom bifunctor

\[\mathcal{H}om_{O_S}(·, ·) : \text{PSh}_{O_S}(S) \times \text{PSh}_{O_S}(S) \to \text{PSh}(S),\]

\[(F, G) \mapsto (X \in S \mapsto \mathcal{H}om_{O_S}(F, G)(X) := \mathcal{H}om_{O_S}(r(X)_*F, r(X)_*G)\).

It gives similarly

- in all case a bifunctor \(\mathcal{H}om_{O_S}(·, ·) : C_{filO_S}(S) \times C_{filO_S}(S) \to C_{fil}(S)\),

- the case \(O_S\) is commutative, a bifunctor \(\mathcal{H}om_{O_S}(·, ·) : C_{filO_S}(S) \times C_{filO_S}(S) \to C_{O_S}(S)\).

Let \(\phi : A \to B\) of rings.

• Let \(M\) a \(A\) module. We say that \(M\) admits a \(B\) module structure if there exits a structure of \(B\) module on the abelian group \(M\) which is compatible with \(\phi\) together with the \(A\) module structure on \(M\).
• For $N_1$ a $A$-module and $N_2$ a $B$ module. $I(A/B)(N_1, N_2) : \text{Hom}_A(N_1, N_2) \cong \text{Hom}_B(N_1 \otimes_A B, N_2)$ is the adjunction between the restriction of scalars and the extension of scalars.

• For $N', N''$ a $A$-modules, $ev_A(\text{hom}, \otimes)(N', N'', B) : \text{Hom}_A(N', N'') \otimes_A B \to \text{Hom}_A(N', N'' \otimes_A B)$ is the evaluation classical map.

Let $\phi : (S, O_1) \to (S, O_2)$ a morphism of presheaves of ring on $S \in \text{Cat}$.

• Let $M \in \text{PSh}_{O_1}(S)$. We say that $M$ admits an $O_2$ module structure if there exits a structure of $O_2$ module on $M \in \text{PSh}(S)$ which is compatible with $\phi$ together with the $O_1$ module structure on $M$.

• For $N_1 \in C_{O_1}(S)$ and $N_2 \in C_{O_2}(S)$,

$$I(O_1/O_2)(N_1, N_2) : \text{Hom}_{O_1}(N_1, N_2) \cong \text{Hom}_{O_2}(N_1 \otimes_{O_1} B, N_2)$$

is the adjunction between the restriction of scalars and the extension of scalars.

• For $N', N'' \in C_{O_1}(S)$,

$$ev_{O_1}(\text{hom}, \otimes)(N', N'', O_2) : \text{Hom}_{O_1}(N', N'') \otimes_{O_1} O_2 \to \text{Hom}_{O_1}(N', N'' \otimes_{O_1} O_2).$$

is the classical evaluation map.

Let $(S, O_S) \in \text{RCat}$.

• For $F_1, F_2, G_1, G_2 \in C(S)$, we denote by

$$T(\otimes, \text{Hom})(F_1, F_2, G_1, G_2) : \text{Hom}(F_1, G_1) \otimes \text{Hom}(F_2, G_2) \to \text{Hom}(F_1 \otimes F_2, G_1 \otimes G_2)$$

the canonical map.

• For $G_3 \in C(S)$ and $G_1, G_2 \in C_{O_S}(S)$, we denote by

$$ev(\text{hom}, \otimes)(G_3, G_1, G_2) : \text{Hom}(G_3, G_1) \otimes_{O_S} G_2 \to \text{Hom}(G_3, G_1 \otimes_{O_S} G_2)$$

$\phi \otimes s \mapsto (s' \mapsto \phi(s')) \otimes s$.

• Let $S \in \text{Cat}$ a small category. Let $(H_X : C(S/X) \to C(S/X))_{X \in S}$ a familly of functors which is functorial in $X$. We have by definition, for $F_1, F_2 \in C(S)$, the canonical transformation map

$$T(H, \text{hom})(F_1, F_2) : H(\text{Hom}^\bullet(F_1, F_2)) \to \text{Hom}^\bullet(H(F_1), H(F_2)), \quad \phi \in \text{Hom}(F_1[X], F_2[X]) \mapsto H^F_{1\times X} \cdot F_{2\times X}(\phi) \in \text{Hom}(H(F_1[X]), H(F_2[X])).$$

in $C(S)$.

Let $T, S \in \text{Cat}$ small categories and $f : T \to S$ a morphism of presite.

• For $F_1, F_2 \in C(T)$ we have by definition $f_*(F_1 \otimes F_2) = f_* F_1 \otimes f_* F_2$. For $G_1, G_2 \in C(S)$, we have a canonical isomorphism $f^* G_1 \otimes f^* G_2 \cong f^*(G_1 \otimes G_2)$ since the tensor product is a right exact functor, and a canonical map $f^! G_1 \otimes f^! G_2 \to f^!(G_1 \otimes G_2)$.

• We have for $F \in C(S)$ and $G \in C(T)$ the adjonction isomorphim,

$$I(f^*, f_*)(F, G) : f_* \text{Hom}^\bullet(f^* F, G) \cong \text{Hom}^\bullet(F, f_* G).$$

• Let $O_S \in \text{PSh}(S, \text{Ring})$ by a presheaf of ring so that $(S, O_S), (T, f^* O_S) \in \text{RCat}$. We have for $F \in C_{O_S}(S)$ and $G \in C_{f^* O_S}(T)$ the adjonction isomorphim,

$$I(f^*, f_*)(F, G) : f_* \text{Hom}_{f^* O_S}(f^* F, G) \cong \text{Hom}^\bullet_{O_S}(F, f_* G),$$

and
the map \( \text{ad}(f^*, f_*)(F) : F \to f_* f^* F \) in \( C(S) \) is \( O_S \) linear, that is is a map in \( C_{O_S}(S) \),
- the map \( \text{ad}(f^*, f_*)(G) : f^* f_* G \to G \) in \( C(T) \) is \( f^* O_S \) linear, that is is a map in \( C_{f^* O_S}(T) \).

- For \( F_1, F_2 \in C(T) \), we have the canonical map

\[
T_s(f, \text{hom})(F_1, F_2) := T(f, \text{hom}) : f_* \text{Hom}^\bullet(F_1, F_2) \to \text{Hom}^\bullet(f_1, F_1, f_2, F_2),
\]

for \( X \in S, \phi \in \text{Hom}(F_1|_{f^*(X)}, F_2|_{f^*(X)}) \mapsto f_* f_1|_{f^*(X)}, f_2|_{f^*(X)})(\phi) \in \text{Hom}(f_* F_1, f_* F_2|_{f^*(X)}) \) given by evaluation.

- For \( G_1, G_2 \in C(S) \), we have the following canonical transformation in \( C(T) \)

\[
T(f, \text{hom})(G_1, G_2) := T(f^*, \text{hom})(G_1, G_2) : \]

\[
f^* f_* \text{Hom}^\bullet(G_1, G_2) \xrightarrow{f^* \text{Hom}(G_1, f^* G_2)} f^* f_* \text{Hom}^\bullet(G_1, f_* f^* G_2) \xrightarrow{f^* f_* \text{Hom}^\bullet(f^* G_1, f^* G_2)} \text{Hom}^\bullet(f^* G_1, f^* G_2),
\]

- Let \( O_S \in \text{PSh}(S, \text{Ring}) \) by a presheaf of ring so that \( (S, O_S), (T, f^* O_S) \in \text{RCat} \). For \( G_1, G_2 \in C_{O_S}(S) \), we have the following canonical transformation in \( C_{f^* O_S}(T) \)

\[
T(f, \text{hom})(G_1, G_2) := T(f^*, \text{hom})(G_1, G_2) : \]

\[
f^* f_* \text{Hom}^\bullet_{O_S}(G_1, G_2) \xrightarrow{f^* \text{Hom}_{O_S}(G_1, f^* G_2)} f^* f_* \text{Hom}^\bullet_{O_S}(G_1, f_* f^* G_2) \xrightarrow{f^* f_* \text{Hom}^\bullet_{O_S}(f^* G_1, f^* G_2)} \text{Hom}^\bullet_{f^* O_S}(f^* G_1, f^* G_2),
\]

- Let \( O_S \in \text{PSh}(S, \text{Ring}) \) by a presheaf of ring so that \( (S, O_S), (T, f^* O_S) \in \text{RCat} \). For \( M \in C_{O_S}(S) \) and \( N \in C_{f^* O_S}(T) \), we denote by

\[
T(f, \otimes)(M, N) : M \otimes_{O_S} f_* N \xrightarrow{\text{ad}(f^*, f_*)(M \otimes_{O_S} f_* N)} f_* f^* (M \otimes_{O_S} f_* N) = f_* (f^* M \otimes_{O_S} f^* f_* N) \xrightarrow{\text{ad}(f^*, f_*)(N)} f_* (f^* M \otimes_{f^* O_S} N)
\]

the canonical transformation map.

Let \( f : (T, O_T) \to (S, O_S) \) a morphism with \( (S, O_S), (T, O_T) \in \text{RCat} \). We have the adjunction

\[
(f^\text{mod}, f_*) : C_{O_T}(S) \Rightarrow C_{O_T}(T)
\]

with \( f^\text{mod} G := f^* G \otimes_{f^* O_S} O_T \). If \( f^* : C(S) \to C(T) \) preserve monomorphisms, it induces the adjunction

\[
(f^\text{mod}, f_*) : C_{O_T}(S) \Rightarrow C_{f^\text{mod}}(T)
\]

with \( f^\text{mod}(G, F) := f^*(G, F) \otimes_{f^* O_S} O_T \).

For a commutative diagram in \( \text{RCat} \):

\[
D = (T', O'_2) \xrightarrow{g_2} (S', O'_1), \quad \begin{array}{c}
\downarrow f_2 \\
(T, O_2) \xrightarrow{g_1} (S, O_1)
\end{array}
\]

we denote by, for \( F \in C_{O_1'}(S') \),

\[
T^\text{mod}(D)(F) : g_1^\text{mod} f_1_* F \xrightarrow{g_2^\text{mod} f_1_* \text{ad}(g_2^\text{mod}, g_2^\text{mod}) (F)} g_1^\text{mod} f_1_* g_2^\text{mod} g_2^\text{mod} F = g_1^\text{mod} f_1_* f^* g_2^\text{mod} F \xrightarrow{\text{ad}(g_1^\text{mod}, g_2^\text{mod}) (f^* g_2^\text{mod})} f_2^* g_2^\text{mod} F
\]

\[
21
\]
are left Quillen functor for the projective model structure. In particular,

\[ T^\text{mod}(D)(G, F) : g_1^\text{mod} f_1^*(G, F) \xrightarrow{g_1^\text{mod} f_1^* + \text{ad}(g_2^\text{mod} g_2^*(G, F))} g_1^\text{mod} f_1^* g_2^*(G, F) = g_1^\text{mod} f_1^* g_2^*(G, F) \xrightarrow{\text{ad}(g_1^\text{mod} g_1^*(f_2^* g_2^*(G, F))} f_2^* g_2^*(G, F) \]

the canonical transformation map in \( CO_\Omega(T) \) given by the adjonction maps.

Let \( f : (T, O_T) \to (S, O_S) \) a morphism with \((S, O_S), (T, O_T) \in RCat\).

- We have, for \( M, N \in CO_\Omega(S) \) the canonical transformation map in \( CO_\Omega(T) \)

\[
T^\text{mod}(f, \text{hom})(M, N) : f^\text{hom} \text{Hom}_\Omega(M, N) \xrightarrow{T(f, \text{hom})(M, N) \otimes f^* O_2} \text{Hom}_{f^* O_1}(f^* M, f^* N) \otimes f^* O_2
\]

the canonical transformation map.

We now give some properties of the tensor product functor and \( \text{hom} \) functor given above

**Proposition 5.** Let \((S, O_S) \in RCat\). Then, the functors

- \((-) \otimes (-) : C(S)^2 \to C(S)\), \(C(S) \times CO_\Omega(S) \to CO_\Omega(S)\)

- \((-) \otimes O_S (-) : CO_\Omega(S) \times CO_\Omega(S) \to C(S)\) and in case \(O_S\) is commutative \((-) \otimes O_S (-) : CO_\Omega(S)^2 \to CO_\Omega(S)\)

are left Quillen functor for the projective model structure. In particular,

- for \( L \in C(S)\) is such that \( L^n \in PSh(S)\) are projective for all \( n \in \mathbb{Z}\), and \( \phi : F \to G\) is a quasi-isomorphism with \( F, G \in C(S)\), then \( \phi \otimes I : F \otimes L \to G \otimes L\) is a quasi-isomorphism,

- for \( L \in CO_\Omega(S)\) is such that \( L^n \in PSh_{O_S}(S)\) are projective for all \( n \in \mathbb{Z}\), and \( \phi : F \to G\) is a quasi-isomorphism with \( F, G \in CO_\Omega(S)\), then \( \phi \otimes I : F \otimes O_S L \to G \otimes O_S L\) is a quasi-isomorphism.

**Proof.** Standard.

**Proposition 6.** Let \((S, O_S) \in RCat\). Then, the functors

- \( \text{Hom}(-, \cdot) : C(S) \times CO_\Omega(S) \to CO_\Omega(S)\), \(C(S) \times CO_\Omega(S) \to CO_\Omega(S)\),

- \( \text{Hom}_{O_S}(\cdot, \cdot) : CO_\Omega(S) \times CO_\Omega(S) \to C(S)\) and in the case \(O_S\) is commutative \( \text{Hom}_{O_S}(\cdot, \cdot) : CO_\Omega(S) \times CO_\Omega(S) \to CO_\Omega(S)\),

are on the left hand side left Quillen functor for the projective model structure. In particular,

- for \( L \in C(S)\) is such that \( L^n \in PSh(S)\) are projective for all \( n \in \mathbb{Z}\), and \( \phi : F \to G\) is a quasi-isomorphism with \( F, G \in C(S)\), then \( \text{Hom}(L, \phi) : \text{Hom}^*(L, F) \to \text{Hom}^*(L, G)\) is a quasi-isomorphism,

- for \( L \in CO_\Omega(S)\) is such that \( L^n \in PSh_{O_S}(S)\) are projective for all \( n \in \mathbb{Z}\), and \( \phi : F \to G\) is a quasi-isomorphism with \( F, G \in CO_\Omega(S)\), then \( \text{Hom}_{O_S}(L, \phi) : \text{Hom}_{O_S}^*(L, F) \to \text{Hom}_{O_S}^*(L, G)\) is a quasi-isomorphism.
Proof. Standard.

Let $\mathcal{S} \in \text{Cat}$ a site endowed with topology $\tau$. Denote by $a_{\tau} : \text{PSh}(\mathcal{S}) \to \text{Sh}(\mathcal{S})$ the sheafification functor. A morphism $\phi : F^\bullet \to G^\bullet$ with $F^\bullet, G^\bullet \in C(\mathcal{S})$ is said to be a $\tau$ local equivalence if

$$a_{\tau} H^n(\phi) : a_{\tau} H^n(F^\bullet) \to a_{\tau} H^n(G^\bullet)$$

is an isomorphism for all $n \in \mathbb{Z}$, where $a_{\tau}$ is the sheafification functor. Recall that $C_{fK}(\mathcal{S}) \subset (C(\mathcal{S}), F) = C(\text{PSh}(\mathcal{S}), F)$ denotes the category of filtered complexes of abelian presheaves on $\mathcal{S}$ whose filtration is biregular.

- A morphism $\phi : (F^\bullet, F) \to (G^\bullet, F)$ with $(F^\bullet, F), (G^\bullet, F) \in C_{fK}(\mathcal{S})$ is said to be a filtered $\tau$ local equivalence or an 1-filtered $\tau$ local equivalence if

$$a_{\tau} H^n(\phi) : a_{\tau} H^n(\text{Gr}_F^p F^\bullet) \sim a_{\tau} H^n(\text{Gr}_F^p G^\bullet)$$

is an isomorphism for all $n, p \in \mathbb{Z}$.

- Let $r \in \mathbb{N}$. More generally, a morphism $\phi : (F^\bullet, F) \to (G^\bullet, F)$ with $(F^\bullet, F), (G^\bullet, F) \in C_{fK}(\mathcal{S})$ is said to be an $r$-filtered $\tau$ local equivalence if for all $p, q \in \mathbb{Z}$,

$$a_{\tau} E_{r}^{p,q}(\phi) : a_{\tau} E_{r}^{p,q}(F^\bullet, F) \sim a_{\tau} E_{r}^{p,q}(G^\bullet, F)$$

is an isomorphism. Note that if $\phi$ is an $r$-filtered $\tau$ local equivalence, that it is an $s$-filtered $\tau$ local equivalence for all $s \geq r$.

- A morphism $\phi : (F^\bullet, F) \to (G^\bullet, F)$ with $(F^\bullet, F), (G^\bullet, F) \in C_{fK}(\mathcal{S})$ is said to be a $\infty$-filtered $\tau$ local equivalence if there exists $r \in \mathbb{N}$ such that $\phi$ is an $r$-filtered $\tau$ local equivalence. If $\phi : (F^\bullet, F) \to (G^\bullet, F)$ with $(F^\bullet, F), (G^\bullet, F) \in C_{fK}(\mathcal{S})$ is an $\infty$-filtered $\tau$ local equivalence then, for all $n \in \mathbb{Z}$,

$$a_{\tau} H^n(\phi) : a_{\tau} H^n(F^\bullet, F) \to a_{\tau} H^n(G^\bullet, F)$$

is an isomorphism of filtered sheaves on $\mathcal{S}$. Recall the converse is NOT true (see section 2.1).

Let $(\mathcal{O}, \mathcal{O})$ a ringed topos where $\mathcal{S} \in \text{Cat}$ is a site endowed with topology $\tau$. Let $r \in \mathbb{N}$. A morphism $\phi : (F^\bullet, F) \to (G^\bullet, F)$ with $(F^\bullet, F), (G^\bullet, F) \in C_{O_{fK}}(\mathcal{S})$ is said to be an $r$-filtered $\tau$ local equivalence if $\phi$ is one, where $\phi : C_{O_{fK}}(\mathcal{S}) \to C_{fK}(\mathcal{S})$ is the forgetful functor, that is if

$$a_{\tau} E_{r}^{p,q}(\phi) : a_{\tau} E_{r}^{p,q}(F^\bullet, F) \to a_{\tau} E_{r}^{p,q}(G^\bullet, F)$$

is an isomorphism for all $p, q \in \mathbb{Z}$.

Let $\mathcal{S} \in \text{Cat}$ a site which admits fiber product, endowed with topology $\tau$. A complex of presheaves $F^\bullet \in C(\mathcal{S})$ is said to be $\tau$ fibrant if it satisfy descent for covers in $\mathcal{S}$, i.e. if for all $X \in \mathcal{S}$ and all $\tau$ covers $(c_i : U_i \to X)_{i \in I}$ of $X$, denoting $U_J := (U_{i_0} \times_S U_{i_1} \times_S \cdots U_{i_n})_{i_n \in J}$ and for $I \subset J$, $p_{IJ} : U_J \to U_I$ is the projection,

$$F^\bullet(c_i) : F^\bullet(X) \to \text{Tot}(\oplus_{\text{card} I = \bullet} F^\bullet(U_I))$$

is a quasi-isomorphism of complexes of abelian groups.

- A complex of filtered presheaves $(F^\bullet, F) \in C_{fK}(\mathcal{S})$ is said to be filtered $\tau$ fibrant if $1$-filtered $\tau$ fibrant if it satisfy descent for covers in $\mathcal{S}$, i.e. if for all $X \in \mathcal{S}$ and all $\tau$ covers $(c_i : U_i \to X)_{i \in I}$ of $X$,

$$(F^\bullet, F)(c_i) : (F^\bullet, F)(X) \to \text{Tot}(\oplus_{\text{card} I = \bullet} (F^\bullet, F)(U_I))$$

is a filtered quasi-isomorphism of filtered complexes of abelian groups.
Let $r \in \mathbb{N}$. More generally, a complex of filtered presheaves $(F^\bullet, F) \in C_{fil}(\mathcal{S})$ is said to be $r$-filtered $\tau$ fibrant if it satisfy descent for covers in $\mathcal{S}$, i.e. if for all $X \in \mathcal{S}$ and all $\tau$ covers $(c_i : U_i \to X)_{i \in I}$ of $X$,

$$E^p_q(F^\bullet, F)(c_i) : E^p_q(F^\bullet, F)(X) \to E^p_q(Tot(\oplus_{\text{card}I = r}(F^\bullet, F)(U_I)))$$

is an isomorphism for all $p, q \in \mathbb{Z}$. Note that if $(F^\bullet, F)$ is $r$-filtered $\tau$ fibrant, then it is $s$-filtered $\tau$ fibrant for all $s \geq r$.

A complex of filtered presheaves $(F^\bullet, F) \in C_{fil}(\mathcal{S})$ is said to be $\infty$-filtered $\tau$ fibrant if there exist $r \in \mathbb{N}$ such that $(F^\bullet, F)$ is $r$-filtered $\tau$ fibrant. If a complex of filtered presheaves $(F^\bullet, F) \in C_{fil}(\mathcal{S})$ is $\infty$-filtered $\tau$ fibrant, then for all $X \in \mathcal{S}$ and all $\tau$ covers $(c_i : U_i \to X)_{i \in I}$ of $X$,

$$H^n(F^\bullet, F)(c_i) : H^n(F^\bullet, F)(X) \to H^n\text{Tot}(\oplus_{\text{card}I = r}(F^\bullet, F)(U_I))$$

is a filtered isomorphism for all $n \in \mathbb{Z}$.

### 2.3.2 Canonical flasque resolution of a presheaf on a site or a presheaf of module on a ringed topos

Let $\mathcal{S} \in \text{Cat}$ a site with topology $\tau$. Denote $a_\tau : \text{PSh}(\mathcal{S}) \to \text{Shv}(\mathcal{S})$ the sheafification functor. There is for $F \in C(\mathcal{S})$ an explicit $\tau$ fibrant replacement:

- $k : F^\bullet \to E^\bullet_\tau(F^\bullet) := \text{Tot}(E^\bullet_1(F^\bullet))$, if $F^\bullet \in C^+(\mathcal{S})$,
- $k : F^\bullet \to E^\bullet_\tau(F^\bullet) := \text{holim}\text{Tot}(E^\bullet_2(F^\bullet \otimes_{\mathbb{Z}}))$, if $F^\bullet \in C(\mathcal{S})$ is not bounded below.

The bicomplex $E^\bullet(F^\bullet) := E^\bullet_\tau(F^\bullet)$ together with the map $k : F^\bullet \to E^\bullet(F^\bullet)$ is given inductively by

- considering $p_{S} : S^\delta \to S$ the morphism of site from the discrete category $S^\tau$ whose objects are the points of the topos $\mathcal{S}$ and we take

$$k_0 := \text{ad}(p_{S}, p_{S^\tau})(F^\bullet) \to E^0(F^\bullet) := p_{S^\tau}p_{S}F^\bullet := \bigoplus_{s \in S^\tau, s \in X} F^\bullet(X),$$

then $a_\tau k_0 : a_\tau F^\bullet \to E^0(F^\bullet)$ is injective and $E^0(F^\bullet)$ is $\tau$ fibrant,

- denote $Q^0(F^\bullet) := a_\tau \text{coker}(k_0 : F^\bullet \to E^0(F^\bullet))$ and take the composite

$$E^0(F^\bullet) \to Q^0(F^\bullet) \to E^1(F^\bullet) := E^0(Q^0(F^\bullet)).$$

Note that $k : F^\bullet \to E^\bullet(F^\bullet)$ is a $\tau$ local equivalence and that $a_\tau k : a_\tau F^\bullet \to E^\bullet(F^\bullet)$ is injective by construction.

Since $E^0$ is functorial, $E$ is functorial: for $m : F^\bullet \to G^\bullet$ a morphism, with $F^\bullet, G^\bullet \in C(\mathcal{S})$, we have a canonical morphism $E(m) : E(F) \to E(G)$ such that $E(m) \circ k = k' \circ m$, with $k : F \to E(F)$ and $k' : G \to E(G)$. Note that $E^0$, hence $E$ preserve monomorphisms. This gives, for $(F^\bullet, F) \in C_{fil}(\mathcal{S})$, a filtered $\tau$ local equivalence $k : (F^\bullet, F) \to E^\bullet(F^\bullet, F)$ with $E^\bullet(F^\bullet, F)$ filtered $\tau$ fibrant.

Moreover, we have a canonical morphism $E(F) \otimes E(G) \to E(F \otimes G)$.

There is, for $g : T \to S$ a morphism of presite with $T, S \in \text{Cat}$ two site, and $F^\bullet \in C(\mathcal{S})$, a canonical transformation

$$T(g, E)(F^\bullet) : g^*E(F^\bullet) \to E(g^*F^\bullet) \quad (17)$$

given inductively by

- $T(g, E^0)(F) := T(g, p_{S})(p_{S^\tau}F) : g^*E^0(F) = g^*p_{S^\tau}p_{S}F \to pr_{T}g^*p_{S}F = pr_{T}p_{T}g^*F = E^0(g^*F)$,
- $T(g, Q^0)(F) := T(g, E^0)(F) : g^*Q^0(F) = \text{coker}(g^*F \to g^*E^0(F)) \to Q^0(g^*F) = \text{coker}(g^*F \to E^0(g^*F))$. 

24
\[ T(g, Q^1)(F) : g^* E^1(F) = g^* E^0(Q^0(F)) \xrightarrow{T(g, E^1)(Q^0(F))} E^0(g^* Q^0(F)) \xrightarrow{E^0(T(g, Q^1)(F))} E^0(Q^0(g^* F)) = E^1(g^* F). \]

Let \((S, O_S) \in \text{RCat}) with topology \(\tau\). Then, for \(F^\bullet \in C_{O_S}(S)\), \(E_\tau(F^\bullet)\) is naturally a complex of \(O_S\) modules such that \(k : F^\bullet \to E_\tau(F^\bullet)\) is \(O_S\) linear, that is is a morphism in \(C_{O_S}(S)\).

We will use the following :

**Proposition 7.** Let \(S \in \text{Cat}\) an small category endowed with a topology \(\tau\). Let \(\phi : G^1 \to G^2\) a morphism with \(G^1_0, G^2_0 \in C(S)\). It is a morphism of filtered complex \(\phi : (G^1_0, F_b) \to (G^2_0, F_b)\), where we recall that \(F_b\) is the trivial filtration. If \(\phi : G^1_0 \to G^2_0\) is an homotopy equivalence, then \(E(\phi) : E^\bullet(G^1_0, F_b) \to E^\bullet(G^2_0, F_b)\) is a 2-filtered quasi-isomorphism that is for all \(p, q \in \mathbb{Z}\)

\[ E_2^{p,q}(E(\phi)) : E_2^{p,q}(E^\bullet(G^1_0, F_b)) \xrightarrow{\sim} E_2^{p,q}(E^\bullet(G^2_0, F_b)) \]

is an isomorphism

**Proof.** Let \(X \in S\).Consider the cohomological functors

\[ T_X^n : K(S) \to \text{Ab}, G^\bullet \mapsto H^n E^\bullet(G^\bullet)(X) =: \mathbb{H}^n(X, G^\bullet) \]

and denote, for \(G^\bullet \in C(S)\) by \(E_2^{p,q}(T_X(G^\bullet))\) the associated spectral sequence. The result then follows (see [30]) from the following commutative diagram of complexes for each \(r \in \mathbb{N}\)

\[
\begin{array}{ccc}
E^r_{\cdot, \cdot}(E^\bullet(G^1_0, F_b)) & \xrightarrow{E^r_{\cdot, \cdot}(E(\phi))} & E^r_{\cdot, \cdot}(E^\bullet(G^2_0, F_b)) \\
\downarrow & & \downarrow \\
E^r_{\cdot, \cdot}(T_X(G^1_0)) & \xrightarrow{E^r_{\cdot, \cdot}(T_X(\phi))} & E^r_{\cdot, \cdot}(T_X(G^2_0))
\end{array}
\]

\[ \square \]

### 2.3.3 Canonical projective resolution of a presheaf of module on a ringed topos

Let \((S, O_S) \in \text{RCat}) . We recall that we denote by, for \(U \in S\), \(Z(U) \in \text{PSh}(S)\) the presheaf represented by \(U:\) for \(V \in S\) \(Z(U)(V) = Z \text{Hom}(V, U)\), and for \(h : V_1 \to V_2\) a morphism in \(S\), and \(h_1 : V_1 \to U\) \(Z(U)(h) : h_1 \to h \circ h_1\), and \(s\) is the morphism of presheaf given by \(s(V_1)(h_1) = F(h_1)(s) \in F(V_1)\). There is for \(F \in C_{O_S}(S)\) a complex of \(O_S\) module an explicit projective replacement :

- \(q : L^q_0(F^\bullet) := \text{Tot}(L^q_0(F^\bullet)) \hookrightarrow F^\bullet\), if \(F^\bullet \in \text{C}^{-}(S)\),
- \(q : L^q_0(F^\bullet) := \text{holim}(L^q_0(F^\bullet)^{\leq n})\) if \(F^\bullet \in \text{C}(S)\) is not bounded above.

For \(O_S = Z_S\), we denote \(L^q_{O_S}(F^\bullet) = : L(F^\bullet)\). The bicomplex \(L^q_0(F^\bullet)\) together with the map \(q : L^q_0(F^\bullet) \to F^\bullet\) is given inductively by

- considering the pairs \(\{U \in S, s \in F(U)\}\), where \(U\) is an object of \(S\) and \(s\) a section of \(F\) over \(U\) we take

\[ q_0 : L^q_0(F) := \bigoplus_{(U \in S, s \in F(U))} Z(U) \otimes O_S \xrightarrow{q_0} F, \]

then \(q_0\) is surjective and \(L^q_0(F)\) is projective, this construction is functorial : for \(m : F \to G\) a morphism in \(\text{PSh}(S)\) the following diagram commutes

\[
\begin{array}{ccc}
\bigoplus_{(U \in S, s \in F(U))} Z(U) \otimes O_S & \xrightarrow{q_0} & F \\
\downarrow{(L_0(m))_{((U, s) \in F(U))}} & & \downarrow{m} \\
\bigoplus_{(U \in S, s' \in G(U))} Z(U) \otimes O_S & \xrightarrow{q_0} & G
\end{array}
\]

where \((L_0(m))_{((U, s) \in F(U))} = I_{Z(U)}\) and \((L_0(m))_{((U, s) \in F(U))}((U, s')) = 0\) if \(s' \neq m(U)(s)\),
• denote $K^0_O(F) := \ker(q_0 : L^0_O(F) \to F))$ and take the composite

$$q_1 : L^0_O(F^\bullet) := L^0_O(K^0_O(F^\bullet)) \xrightarrow{q_0(K^0_O(F))} K^0_O(F^\bullet) \to L^0_O(F^\bullet).$$

Note that $q = q(F) : L(F^\bullet) \to F^\bullet$ is a surjective quasi-isomorphism by construction. Since $L^0_O$ is functorial, $L_O$ is functorial: for $m : F^\bullet \to G^\bullet$ a morphism, with $F^\bullet, G^\bullet \in \mathcal{C}(S)$, we have a canonical morphism $L_O(m) : L_O(F) \to L_O(G)$ such that $q' \circ L_O(m) = m \circ q'$, with $q : L_O(F) \to F$ and $q' : L_O(G) \to G$. Note that $L^0_O$ and hence $L_O$ preserve monomorphisms. In particular, it gives for $(F^\bullet, F) \in CO_S(S)$, a filtered quasi-isomorphism $q : L_O(F^\bullet, F) \to (F^\bullet, F)$. Moreover, we have a canonical morphism $L_O(F) \otimes L_O(G) \to L_O(F \otimes G)$.

Let $g : T \to S$ a morphism of presite with $T, S \in \mathcal{C}at$ two sites.

• Let $F^\bullet \in \mathcal{C}(S)$. Since $g^*L(F^\bullet)$ is projective and $q(g^*F) : L(g^*F^\bullet) \to g^*F^\bullet$ is a surjective quasi-isomorphism, there is a canonical transformation

$$T(g, L)(F^\bullet) : g^*L(F^\bullet) \to L(g^*F^\bullet)$$

unique up to homotopy such that $q(g^*F) \circ T(g, L)(F^\bullet) = g^*q(F)$.

• Let $F^\bullet \in \mathcal{C}(S)$. Since $L(g^*F^\bullet)$ is projective and $g^*q(F) : g^*L(F^\bullet) \to g^*F^\bullet$ is a surjective quasi-isomorphism, there is a canonical transformation

$$T(g, L)(F^\bullet) : L(g^*F^\bullet) \to g^*L(F^\bullet)$$

unique up to homotopy such that $g^*q(F) \circ T(g, L)(F^\bullet) = q(g^*F)$.

• Let $F^\bullet \in \mathcal{C}(T)$. Since $L(g_*F^\bullet)$ is projective and $g_*q(F) : g_*L(F^\bullet) \to g_*F^\bullet$ is a surjective quasi-isomorphism, there is a canonical transformation

$$T_*(g, L)(F^\bullet) : L(g_*F^\bullet) \to g_*L(F^\bullet)$$

unique up to homotopy such that $g_*q(F) \circ T_*(g, L)(F^\bullet) = q(g_*F)$.

Let $g : (T, O_T) \to (S, O_S)$ a morphism with $(T, O_T), (S, O_S) \in \mathcal{R}Cat$. Let $F^\bullet \in CO_S(S)$. Since $g^{*\text{mod}}L_O(F^\bullet)$ is projective and $q(g^{*\text{mod}}F) : L_O(g^{*\text{mod}}F^\bullet) \to g^{*\text{mod}}F^\bullet$ is a surjective quasi-isomorphism, there is a canonical transformation

$$T(g, L)(F^\bullet) : g^{*\text{mod}}L_O(F^\bullet) \to L_O(g^{*\text{mod}}F^\bullet)$$

unique up to homotopy such that $q(g^{*\text{mod}}F) \circ T(g, L)(F^\bullet) = g^{*\text{mod}}q(F)$.

Let $p : (S_{12}, O_{S_{12}}) \to (S_1, O_{S_1})$ a morphism with $(S_{12}, O_{S_{12}}), (S_1, O_{S_1}) \in \mathcal{R}Cat$, such that the structural morphism $p^*O_{S_1} \to O_{S_{12}}$ is flat. Let $F^\bullet \in CO_S(S)$. Since $L_O(p^{*\text{mod}}F^\bullet)$ is projective and $p^{*\text{mod}}q(F) : p^{*\text{mod}}L_O(F^\bullet) \to p^{*\text{mod}}F^\bullet$ is a surjective quasi-isomorphism, there is also in this case a canonical transformation

$$T(p, L)(F^\bullet) : L_O(p^{*\text{mod}}F^\bullet) \to p^{*\text{mod}}L_O(F^\bullet)$$

unique up to homotopy such that $p^{*\text{mod}}q(F) \circ T(p, L)(F^\bullet) = q(p^{*\text{mod}}F)$.

2.3.4 The De Rham complex of a ringed topos and functorialities

Let $A \in \mathcal{c}Ring$ a commutative ring. For $M \in \mathcal{M}od(A)$, we denote by

$$\text{Der}_A(A, M) \subset \text{Hom}(A, M) = \text{Hom}_{\mathcal{A}b}(A, M)$$
the abelian subgroup of derivation. Denote by $I_A = \ker(s_A : A \otimes A \to A) \subset A \otimes A$ the diagonal ideal with $s_A(a_1, a_2) = a_1 - a_2$. Let $\Omega_A := I_A/I_A^2 \in \text{Mod}(A)$ together with its derivation map $d = d_A : A \to \Omega_A$.

Then, for $M \in \text{Mod}(A)$ the canonical map

$$w(M) : \text{Hom}_A(\Omega_A, M) \xrightarrow{\sim} \text{Der}_A(A, M), \psi \mapsto \phi \circ d$$

is an isomorphism, that is $\Omega_A$ is the universal derivation. In particular, its dual $T_A := \mathbb{D}^A(\Omega_A) = D^A(I_A/I_A^2)$ is isomorphic to the derivations group: $w(A) : T_A \xrightarrow{\sim} \text{Der}_A(A, A)$. Also note that $\text{Der}_A(A, A) \subset \text{Hom}(A, A)$ is a Lie subalgebra. If $\phi : A \to B$ is a morphism of commutative ring, we have a canonical morphism of abelian group $\Omega_B(A, B) : \Omega_A \to \Omega_B$.

Let $(S, O_S) \in \text{RCat}$, with $O_S \in \text{PSh}(S, \mathcal{E}\text{Ring})$ commutative. For $G \in \text{PSh}_{O_S}(S)$, we denote by

$$\text{Der}_{O_S}(O_S, G) \subset \text{Hom}(O_S, G) = \text{Hom}_{\text{Ab}}(O_S, G)$$

the abelian subsheaf of derivation. Denote by $I_S = \ker(s_S : O_S \otimes O_S \to O_S) \subset \text{PSh}_{O_S \times O_S}(S)$ the diagonal ideal with $s_S(X) = s_{O_S}(X)$ for $X \in S$. Then $\Omega_{O_S} := I_S/I_S^2 \subset \text{PSh}_{O_S}(S)$ together with its derivation map $d : O_S \to \Omega_{O_S}$ is the universal derivation $O_S$-module: the canonical map

$$w(G) : \text{Hom}_{O_S}(\Omega_{O_S}, G) \xrightarrow{\sim} \text{Der}_{O_S}(O_S, G), \phi \mapsto \phi \circ d$$

is an isomorphism. In particular, its dual $T_{O_S} := \mathbb{D}^O_{O_S}(\Omega_{O_S}) = \mathbb{D}^O_S(I_S/I_S^2)$ is isomorphic to the presheaf of derivations: $w(O_S) : T_{O_S} \xrightarrow{\sim} \text{Der}_{O_S}(O_S, O_S)$ and $\text{Der}_{O_S}(O_S, O_S) \subset \text{Hom}(O_S, O_S)$ is a Lie subalgebra. The universal derivation $d = d_{O_S} : O_S \to O_{O_S}$ induces the De Rham complex

$$\text{DR}(O_S) : \Omega_S^* := \wedge^* O_{O_S} \subset C(S)$$

A morphism $\phi : O_S' \to O_S$ with $O_S, O_S' \text{PSh}(S, \mathcal{E}\text{Ring})$ induces by the universal property canonical morphisms

$$\Omega_{O_S'/O_S} : \Omega_{O_S'} \to \Omega_{O_S}, \; \mathbb{D}^O_{O_S'}(\Omega_{O_S'}) : T_{O_S'} \to T_{O_S}$$

in $\text{PSh}_{O_S}(S)$.

- In the particular cases where $S = (S, O_S) \in \text{Var}(\mathbb{C})$ or $S = (S, O_S) \in \text{AnSp}(\mathbb{C})$, we denote as usual $\Omega_S := \Omega_{O_S/\mathbb{C}_S}, T_S := T_{O_S/\mathbb{C}_S}$ and $\text{DR}(S) := \text{DR}(O_S/\mathbb{C}_S) : \Omega_S^* \subset C(S)$.

- In the particular cases where $S = (S, O_S) \in \text{Diff}(\mathbb{R})$ is a differential manifold, we denote as usual $A_S := \Omega_{O_S/\mathbb{R}_S}, T_S := T_{O_S/\mathbb{R}_S}$ and $\text{DR}(S) := \text{DR}(O_S/\mathbb{R}_S) : A_S^* \subset C(S)$.

For $f : (X, O_X) \to (S, O_S)$ with $(X, O_X), (S, O_S) \in \text{RCat}$ such that $O_X$ and $O_S$ are commutative, we denote by

$$\Omega_{O_X/ f^*O_S} := \text{coker}(\Omega_{O_X/ f^*O_S} : \Omega_{f^*O_S} \to \Omega_{O_X}) \in \text{PSh}_{f^*O_S}(X)$$

the relative cotangent sheaf. The surjection $q = q_{O_X/ f} : \Omega_{O_X} \to \Omega_{O_X/ f^*O_S}$ gives the derivation $w(\Omega_{O_X/ f^*O_S})(q) = d_{O_X/ f} : O_X \to \Omega_{O_X/ f^*O_S}$. It induces the surjections $q^p := \wedge^p q : \Omega_{O_X}^p \to \Omega_{O_X/ f^*O_S}^p$. We then have the relative De Rham complex

$$\text{DR}(O_X/ f^*O_S) : \Omega_{O_X/ f^*O_S}^* := \wedge^* \Omega_{O_X/ f^*O_S} \in C_{f^*O_S}(X)$$

whose differentials are given by

$$d(q^p(\omega)) := q^{p+1}(d(\omega))$$

Note that $\Omega_{O_X/ f^*O_S}^* \in C_{f^*O_S}(S)$ is a complex of $f^*O_S$ modules, but is NOT a complex of $O_X$ module since the differential is a derivation hence NOT $O_X$ linear. On the other hand, the canonical map in $\text{PSh}_{f^*O_S}(S)$

$$T(f, \text{hom})(O_S, O_S) : f^*\text{Hom}(O_S, O_S) \to \text{Hom}(f^*O_S, f^*O_S)$$

induces morphisms

$$T(f, \text{hom})(O_S, O_S) : f^*T_{O_S} \to T_{f^*O_S} \text{ and } \mathbb{D}^O_{f^*O_S} T(f, \text{hom})(O_S, O_S) : \Omega_{f^*O_S} \to f^*\Omega_{O_S}.$$
In the particular case where $O_S \text{PSh}(S, \text{cRing})$ is a sheaf, $\Omega_{O_S}, T_{O_S} \in \text{PSh}_{O_S}(S)$ are sheaves. Hence, 

\[ T(f, \text{hom})(O_S, O_S) : a_* = f^* T_{O_S} \sim T_{a_* f^* O_S} \text{ and } \square_{f, O_S} T(f, \text{hom})(O_S, O_S) : \Omega_{a_* f^* O_S} \sim (a_* f^* O_S) \]

are isomorphisms, where $a_* : \text{PSh}(S) \rightarrow \text{Shv}(S)$ is the sheafification functor. We will note again in this case by abuse (as usual) $f^* O_S := a_* f^* O_S$, $f^* \Omega_{O_S} := a_* f^* \Omega_{O_S}$ and $f^* T_{O_S} := a_* f^* T_{O_S}$, so that 

\[ \Omega_{f^* O_S} = f^* \Omega_{O_S} \text{ and } f^* T_{O_S} = T_{f^* O_S} \]

In the particular cases where $S = (S, O_S), X = (X, O_X) \in \text{Var}(\mathbb{C})$ or $S = (S, O_S), X = (X, O_X) \in \text{AnSp}(\mathbb{C})$, we denote as usual $\Omega_X/S := \Omega_{O_X / f^* O_S}, q_X/S := q_{O_X/S} : O_X \rightarrow \Omega_X/S$ and $\text{DR}(X/S) := \text{DR}(O_X / f^* O_S) : \Omega_{X/S} \in C_{f^* O_S}(S)$.

**Definition 1.** For a commutative diagram in $\text{RCat}$

\[ D = (X, O_X) \rightarrow (S, O_S), \]

whose structural presheaves are commutative sheaves, the map in $C_{g^* O_X f^!}(X')$

\[ \Omega_{O_X/S} : (g^* O_X, F_b) = (\Omega_{g^* O_X}, F_b) \rightarrow (\Omega_{O_X/S}^\bullet F_b) \]

pass to quotient to give the map in $C_{g^* O_X f^!}(X')$

\[ \Omega_{(O_X/g^* O_X)/(O_T/g^* O_S)} : (\Omega_{O_X/S}^\bullet F_b) \rightarrow (\Omega_{O_T/S}^\bullet F_b) \]

It is in particular given for $X'^o \in X'$, $g^*(X') \leftarrow X'^o$ and $\omega \in \Gamma(X'^o, \Omega_{O_X/S}^\bullet F_b)$,

\[ \Omega_{(O_X/g^* O_X)/(O_T/g^* O_S)}(X'^o)(\omega) := q_{O_X/f^!}\Omega_{O_X/S}^\bullet F_b(\omega) \in \Gamma(X'^o, \Omega_{O_T/S}^\bullet F_b) \]

where $\omega \in \Gamma(X'^o, \Omega_{O_X/S}^\bullet F_b)$ such that $q_{O_X/f^!}(\omega) = \omega$. We then have the following canonical transformation map in $C_{O_T f^!}(T)$

\[ T^{O}_f : g^* \text{smod}L_{O_T} f^* E(\Omega_{O_X/S}^\bullet F_b) \rightarrow f^* \text{smod}L_{O_T} E(\Omega_{O_X/S}^\bullet F_b) \rightarrow T(f^! E(\Omega_{O_X/S}^\bullet F_b), F_b) \otimes g^* O_S O_T \]

with $m(n \otimes s) = s.n.$

### 2.4 Presheaves on diagrams of sites or on diagrams of ringed topos

Let $I, I' \in \text{Cat}$ and $(f_*, s) : \mathcal{T}_* \rightarrow \mathcal{S}_*$ a morphism of diagrams of presites with $\mathcal{T}_* \in \text{Fun}(I, \text{Cat}), \mathcal{S}_* \in \text{Fun}(I', \text{Cat})$. Recall it is by definition given by a functor $s : I \rightarrow I'$ and morphism of functor $P(f_*) :$
$S_{s(*)} := S_* \circ s \to T_*$. and that we denote for short, $S_{s(*)} := S_* \circ s \in \text{Fun}(\mathcal{I}, \text{Cat})$. Recall that, for $r_{IJ} : I \to J$ a morphism, with $I, J \in \mathcal{I}$, $D_{fIJ}$ is the commutative diagram in $\text{Cat}$

$$D_{fIJ} := S_{s(I)} \xrightarrow{r_{IJ}} S_{s(J)}.$$ 

The adjonction

$$(f_*, s)^* \circ (f_*, s)_* = (\text{id}, \text{id}) : \text{C}(S_{s(*)}) \Rightarrow \text{C}(T_*),$$

$G = (G_I, u_{IJ}) \mapsto (f_*, s)^* (G) := (f_I^*(G_I), T(D_{fIJ})(G_I) \circ f_I^* u_{IJ})$

$G = (G_I, u_{IJ}) \mapsto (f_*, s)_* (G) := (f_I*(G_I), f_I^* u_{IJ})$

gives an adjonction

$$(f_*, s)^* \circ (f_*, s)_* : \text{C}(2)_{f(*)} (S_{s(*)}) \Rightarrow \text{C}(2)_{f(*)} (T_*),$$

$(G, F) = ((G_I, F), u_{IJ}) \mapsto (f_*, s)^* (G, F) := (f_I^*(G_I, F), T(D_{fIJ})(G_I, F) \circ f_I^* u_{IJ})$

$(G, F) = ((G_I, F), u_{IJ}) \mapsto (f_*, s)_* (G, F) := (f_I*(G_I, F), f_I^* u_{IJ})$. 

For a commutative diagram of diagrams of presite :

$$D = T_* \xrightarrow{r_{S_{s(*)}}} S_{s(*)},$$

with $\mathcal{I}, \mathcal{I}', \mathcal{J}, \mathcal{J}' \in \text{Cat}$ and $T_* \in \text{Fun}(\mathcal{I}, \text{Cat}), T_*' \in \text{Fun}(\mathcal{I}', \text{Cat}), s_* \in \text{Fun}(\mathcal{J}, \text{Cat}), s_*' \in \text{Fun}(\mathcal{J}', \text{Cat})$, and $s = s_1 \circ s_2' = s_2 \circ s_1' : \mathcal{I}' \to J$, we denote by, for $F = (F_I, u_{IJ}) \in \text{C}(s_{s_1(*)})$, 

$$T(D)(F) := g_1^* f_1 \cdot F \xrightarrow{g_1^* f_1 \cdot ad(g_1^* g_2)(F)} g_1^* f_1 \cdot g_2 \cdot g_2^* F = g_1^* g_1, f_2 \cdot g_2^* F \xrightarrow{\text{ad}(g_1^* g_1, f_2, g_2^* F)} f_2 g_2^* F$$

the canonical transformation map in $\text{C}(T_{s_1(*)})$, and for $(G, F) = ((G_I, F), u_{IJ}) \in \text{C}(s_{s_2(*)})$, 

$$T(D)(G, F) := g_1^* f_1 \cdot (G, F) \xrightarrow{g_1^* f_1 \cdot ad(g_1^* g_2)(G, F)} g_1^* f_1 \cdot g_2 \cdot g_2^* (G, F) = g_1^* g_1, f_2 \cdot g_2^* (G, F) \xrightarrow{\text{ad}(g_1^* g_1, f_2, g_2^* (G, F))} f_2 g_2^* (G, F)$$

the canonical transformation map in $\text{C}(f_1 T_{s_2(*)})$ given by the adjonction maps.

Let $S_* \in \text{Fun}(\mathcal{I}, \text{RCat})$ a diagram of ringed topos with $\mathcal{I} \in \text{Cat}$. We have the tensor product bifunctor

$$(\cdot) \otimes (\cdot) : \text{PSh}(S_*) \Rightarrow \text{PSh}(S_*),$$

$$((F_I, u_{IJ}, (G_I, u_{IJ})) \mapsto (F_I, u_{IJ}) \otimes (G_I, v_{IJ}) := (F_I \otimes G_I, u_{IJ} \otimes v_{IJ})$$

We get the bifunctors

$$(\cdot) \otimes (\cdot) : C_{f_1 T_2}(S_*) \Rightarrow C_{f_1 T_2}(S_*),$$

$$((F_I, u_{IJ}, (G_I, u_{IJ})) \mapsto (F_I, u_{IJ}) \otimes (G_I, v_{IJ}) := (F_I \otimes G_I, u_{IJ} \otimes v_{IJ})$$

We have the tensor product bifunctor

$$(\cdot) \otimes O_S (\cdot) : \text{PSh}_S(S_*) \Rightarrow \text{PSh}(S_*),$$

$$((F_I, u_{IJ}, (G_I, u_{IJ})) \mapsto (F_I, u_{IJ}) \otimes O_S (G_I, v_{IJ}) := (F_I \otimes O_S G_I, u_{IJ} \otimes v_{IJ})$$

which gives,
• in all case it gives the bifunctor $(-) \otimes_{O_S} (-) : C_{O_S} \otimes C_{O_S} \rightarrow C_{O_S}$.

• in the case $O_S$ is commutative, it gives the bifunctor $(-) \otimes_{O_S} (-) : C_{O_S} \rightarrow C_{O_S}$.

Let $((f, s) : (\mathcal{I}_a, \mathcal{O}_a) \rightarrow (\mathcal{S}_a, \mathcal{O}_a))$ a morphism with $(\mathcal{S}_a, \mathcal{O}_a) \in \text{Fun} (\mathcal{I}, \text{RCat})$ and $\mathcal{I}, \mathcal{I}^\prime \in \text{Cat}$, which is by definition given by a functor $s : \mathcal{I} \rightarrow \mathcal{I}^\prime$ and morphism of ringed topos $r : (\mathcal{I}_a, \mathcal{O}_a) \rightarrow (\mathcal{S}_a, \mathcal{O}_a)$. As before, we denote for short, $(\mathcal{S}_a, \mathcal{O}_a) := (\mathcal{S}_a, \mathcal{O}_a) \circ s \in \text{Fun} (\mathcal{I}, \text{RCat})$.

Denote as before, for $r_{I J} : I \rightarrow J$ a morphism with $I, J \in \mathcal{I}$, $D_{I J}$ the commutative diagram in RCat

$$D_{I J} := \begin{array}{c}
\mathcal{T}_I \\
\mathcal{T}_J \\
\text{Fun}(\mathcal{T}_I, \mathcal{T}_J)
\end{array}$$

We have then the adjonction

$$((f, s)_{\star} : C_{O_S} (\mathcal{S}_a) \rightarrow C_{O_S} (\mathcal{I}_a), (G_I, u_{I J}) \rightarrow (f, s)_{\star} (G_I, u_{I J}) := (f_{I J} (G_I) \circ u_{I J})).$$

which induces the adjonction

$$((f, s)_{\star} : C_{O_S} (\mathcal{S}_a) \rightarrow C_{O_S} (\mathcal{I}_a), (G_I, F) \circ u_{I J} \rightarrow (f, s)_{\star} (G_I, F) \circ u_{I J} := (f_{I J} (G_I) \circ F \circ u_{I J})).$$

For a commutative diagram of ringed topos, :

$$D = \begin{array}{c}
(\mathcal{T}_a, \mathcal{O}_a) \\
(\mathcal{T}_a, \mathcal{O}_a)
\end{array}$$

the canonical transformation map in $C_{O_S} (\mathcal{T}_a)$, and for $G = (G_I, F, u_{I J}) \in C_{O_S} (\mathcal{S}_a)$, $u_{I J}$ the canonical transformation map in $C_{O_S} (\mathcal{S}_a)$ given by the adjonction maps.

Let $((\mathcal{S}_a, \mathcal{O}_a)) \in \text{Fun} (\mathcal{I}, \text{RCat})$ a diagram of ringed topos with $\mathcal{I} \in \text{Cat}$ and, for $I \in \mathcal{I}$, $\mathcal{S}_I$ is endowed with topology $\tau_I$ and for $r : I \rightarrow J$ a morphism with $I, J \in \mathcal{I}$, $r_{I J} : \mathcal{S}_I \rightarrow \mathcal{S}_J$ is continuous. Let $r \in \mathbb{N}$.

• A morphism $\phi = (\phi_I) : (\mathcal{F}_I, u_{I J}) \rightarrow (\mathcal{G}_I, F, u_{I J})$ with $((\mathcal{F}_I, F), u_{I J}) \in C_{O_S} (\mathcal{S}_a)$ is said to be an $r$-filtered $\tau$ local equivalence if the $\phi_I$ are $r$-filtered $\tau$ local equivalences for all $I \in \mathcal{I}$.

• $((\mathcal{G}_I, F, u_{I J}) \in C_{O_S} (\mathcal{S}_a)$ is said to be $r$-filtered $\tau$ fibrant if the $(\mathcal{G}_I, F) \in C_{O_S} (\mathcal{S}_a)$ are $r$-filtered $\tau$ fibrant for all $I \in \mathcal{I}$.
2.5 Presheaves on topological spaces and presheaves of modules on a ringed spaces

In this subsection, we will consider the particular case of presheaves on topological spaces.

Let \( f : T \to S \) a continuous map with \( S, T \in \text{Top} \). We denote as usual the adjunction

\[
(f^*, f_*) := (P(f)^*, P(f)_*) : \text{PSh}(S) \rightleftarrows \text{PSh}(T)
\]

induced by the morphism of site given by the pullback functor

\[
P(f) : \text{Ouv}(S) \to \text{Ouv}(T), (S^n \subset S) \mapsto P(f)(S^n) := S^n \times_S T \to f^{-1}(S^n) \subset T
\]

Since the colimits involved in the definition of \( f^* = P(f)^* \) are filtered, \( f^* \) also preserve monomorphism. Hence, we get an adjunction

\[
(f^*, f_*) : \text{PSh}_{fil}(S) \rightleftarrows \text{PSh}_{fil}(T), f^*(G, F) := (f^*G, f^*F)
\]

Let \( f : (T, O_T) \to (S, O_S) \) a morphism with \( (S, O_S), (T, O_T) \in \text{Top} \). We have then the adjunction

\[
(f^{*\text{mod}}, f_*) := (P(f)^{*\text{mod}}, P(f)_*) : \text{PSh}_{O_S,fil}(S) \rightleftarrows \text{PSh}_{O_T,fil}(T), f^{*\text{mod}}(G, F) := f^*(G, F) \otimes_{f^*O_S} O_T
\]

Recall \( \text{CW} \subset \text{Top} \) is the full subcategory whose objects consists of \( CW \) complexes. Denote, for \( n \in \mathbb{N}, \mathbb{I}^n := [0,1]^n, \mathbb{S}^n := \mathbb{I}^n/\partial \mathbb{I}^n \in \text{CW} \) and \( \Delta^n \subset \mathbb{I}^n \) the \( n \) dimensional simplex. We get \( I^*, \Delta^* \in \text{Fun}(\Delta, \text{CW}) \)

Denote for \( S \in \text{Top}, \Sigma_1S := S \times \mathbb{I}^1/((\{0\} \times S) \cup (\{1\} \times S)) \in \text{Top} \).

- Let \( f : T \to S \) a morphism with \( T, S \in \text{Top} \). We have the mapping cylinder \( \text{Cyl}(f) := (T \times I^1) \sqcup_f S \in \text{Top} \) and the mapping cone \( \text{Cone}(f) := (T \times I^1) \sqcup_f S \in \text{Top} \). We have then the quotient map \( q_f : \text{Cyl}(f) \to \text{Cone}(f) \) and a canonical retraction \( r_f : \text{Cone}(f) \to \Sigma^1 T \).

- Recall two morphisms \( f, g : T \to S \) with \( T, S \in \text{Top} \) are homotopic if there exist \( H : T \times I^1 \to S \) continuous such that \( H \circ (I \times i_0) = f \) and \( H \circ (I \times i_1) = g \). Then \( K(\text{Top}) := \text{Ho}_{I^1}(\text{Top}) \) is a triangulated category with distinguish triangle

\[
T \overset{f}{\to} \text{Cyl}(f) \overset{q_f}{\to} \text{Cone}(f) \overset{r_f}{\to} \Sigma^1 T.
\]

- For \( X \in \text{Top} \), denote for \( n \in \mathbb{N}, \pi_n(X) : \text{Hom}_{K(\text{Top})}(S^n, X) \) the homotopy groups. For \( f : T \to S \) a morphism with \( T, S \in \text{Top} \), we have for \( n \in \mathbb{N} \) the morphisms of abelian groups

\[
f_* : \pi_n(T) \to \pi_n(S), h \mapsto f \circ h
\]

Recall two morphisms \( f, g : T \to S \) with \( T, S \in \text{Top} \) are weakly homotopic if \( f_* = g_* : \pi_n(T) \to \pi_n(S) \) for all \( n \in \mathbb{N} \).

- For \( X \in \text{Top} \), denote by \( C^*_\text{sing}(X) := \mathbb{Z} \text{Hom}(\Delta^*, X) \in C^- (\mathbb{Z}) \) the complex of singular chains and by \( C^*_{\text{sing}}(X) := \mathbb{D}^2 C^*_\text{sing}(X) := \mathbb{D} \mathbb{Z} \text{Hom}(\Delta^*, X) \in C^- (\mathbb{Z}) \) the complex of singular cochains. For \( f : T \to S \) a morphism with \( T, S \in \text{Top} \), we have

\[
- \text{the morphism of complexes of abelian groups}
\]

\[
f_* : C^*_\text{sing}(T) \to C^*_\text{sing}(S), \sigma \mapsto f \circ \sigma,
\]

\[
- \text{the morphism of complexes of abelian groups}
\]

\[
f^* := \mathbb{D}^2 f_* : C^*_\text{sing}(T) \to C^*_\text{sing}(S), \alpha \mapsto f^* \alpha : (\sigma \mapsto f^* \alpha(\sigma) := \alpha(f \circ \sigma))
\]
Theorem 7.  
(i) If two morphisms \( f, g : T \to S \) with \( T, S \in \text{Top} \) are weakly homotopic, then
\[
H^n(f_s) = H^n(g_s) : H_n(\pi(T, Z)) := H^n(C_{\pi_s}^\ast(T)) \to H_n(\pi(S, Z)) := H^n(C_{\pi_s}^\ast(S)).
\]
(ii) For \( S \in \text{Top} \) there exists \( CW(S) \in CW \) together with a morphism \( L_S : CW(S) \to S \) which is a weakly homotopic equivalence, that is \( L_{S*} : \pi_n(CW(S)) \to \pi_n(S) \) are isomorphisms of abelian groups for all \( n \in \mathbb{N} \).

(ii)' For \( f : T \to S \) a morphism, with \( T, S \in \text{Top} \), and \( L_S : CW(S) \to S \), \( L_S : CW(T) \to T \) weakly homotopy equivalence with \( CW(S), CW(T) \in CW \) there exist a morphism \( L(f) : CW(T) \to CW(S) \) unique up to homotopy such that the following diagram in \( \text{Top} \) commutes

\[
\begin{array}{ccc}
CW(S) & \xrightarrow{L_S} & S \\
\downarrow{L(f)} & & \downarrow{f} \\
CW(T) & \xrightarrow{L_T} & T
\end{array}
\]

In particular, for \( S \in \text{Top} \), \( CW(S) \) is unique up to homotopy.

Proof. See [13].

We have Kunnneth formula for singular cohomology:

Proposition 8. Let \( X_1, X_2 \in \text{Top} \). Denote by \( p_1 : X_1 \times X_2 \to X_1 \) and \( p_2 : X_1 \times X_2 \to X_2 \) the projections. Then
\[
p_1^\ast \otimes p_2^\ast : C_{\ast_{\text{sing}}}^\ast(X_1) \otimes C_{\ast_{\text{sing}}}^\ast(X_2) \to C_{\ast_{\text{sing}}}^\ast(X_1 \times X_2)
\]
is a quasi-isomorphism.

Proof. Standard (see [13] for example): follows from the fact that for all \( p \in \mathbb{N} \), \( H^n(C_{\ast_{\text{sing}}}^\ast(\Delta^p)) = 0 \) for all \( n \in \mathbb{Z} \).

Remark 2. By definition, \( X \in \text{Top} \) is locally contractile if an only if the inclusion map \( c_X : Z_X \to C_{\ast_{\text{sing}}}^\ast \) is an equivalence top local. In this case it induce, by taking injective resolutions, for \( n \in \mathbb{Z} \) isomorphisms
\[
H^n(c_X : H^n(X, Z_X)) \cong H^n(X, C_{\ast_{\text{sing}}}^\ast) = H^n(C_{\ast_{\text{sing}}}^\ast(X)) =: H^n_{\text{sing}}(X, Z).
\]

We will use the following easy propositions:

Proposition 9.  
(i) Let \( (S, O_S) \in \text{RTop} \). Then, if \( K^\ast \in C_{O_S}^\ast(S) \) is a bounded above complex such that \( K_n^\ast \in \text{PSH}_{O_S}(S) \) are locally free for all \( n \in \mathbb{Z} \), and \( \phi : F^\ast \to G^\ast \) is a top local equivalence with \( F, G \in C_{O_S}(S) \), then \( \phi \otimes I : F^\ast \otimes_{O_S} L^\ast \to G^\ast \otimes_{O_S} L^\ast \) is an equivalence top local.
(ii) Let \( f : (T, O_T) \to (S, O_S) \) a morphism with \( (T, O_T), (S, O_S) \in \text{RTop} \). Then, if \( K \in C^\bullet_{O_S}(S) \) is a bounded complex such that \( K^n \in PSh_{O_S}(S) \) are locally free for all \( n \in \mathbb{Z} \), and \( N \in C_{O_T}(T) \)

\[
k \circ T^{\text{mod}}(f, \otimes)(M, E(N)) : K \otimes_{O_S} f_* E(N) \to f_*((f^{* \otimes K}) \otimes_{O_T} E(N)) \to f_* E((f^{* \otimes K}) \otimes_{O_T} E(N))
\]

is an equivalence top local.

\[\begin{proof}
\end{proof}\]

Proposition 10. Let \( i : (Z, O_Z) \hookrightarrow (S, O_S) \) a closed embedding of ringed spaces, with \( Z, S \in \text{Top} \). Then for \( M \in C_{O_S}(S) \) and \( M \in C_{O_T}(Z) \),

\[
T(i, \otimes)(M, N) : M \otimes_{O_S} i_* N \to i_*(i^* M \otimes_{O_S} N)
\]
is an equivalence top local.

\[\begin{proof}
\end{proof}\]

We note the following:

Proposition 11. Let \( (S, O_S) \in \text{Sch} \) such that \( O_{S,s} \) are reduced local rings for all \( s \in S \). For \( s \in S \) consider \( q : L_{O_S,s}(k(s)) \to k(s) \) the canonical projective resolution of the \( O_{S,s} \) module \( k(s) := O_{S,s}/m_s \) (the residual field) of \( s \in S \). For \( s \in S \) denote by \( i_s : \{s\} \to S \) the embedding. Let \( \phi : F \to G \) a morphism with \( F, G \in C_{O_S,c}(S) \) i.e. such that \( a_{\text{zar}} H^n F, a_{\text{zar}} H^n G \in \text{Coh}(S) \). If

\[
i_s^* \phi \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s)) : i_s^* F \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s)) \to i_s^* G \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s))
\]
is a quasi-isomorphism for all \( s \in S \), then \( \phi : F \to G \) is an equivalence top local.

\[\begin{proof}
\end{proof}\]

Let \( s \in S \). Since tensorizing with \( L_{i_s^* O_S}(k(s)) \) is an exact functor, we have canonical isomorphism \( \alpha(F), \alpha(G) \) fitting in a commutative diagram

\[
\begin{array}{ccc}
H^n(i_s^* F \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s))) & \overset{H^n(i_s^* \phi \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s)))}{\longrightarrow} & H^n(i_s^* G \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s))) \\
\downarrow{\alpha(F)} & & \downarrow{\alpha(G)} \\
i_s^* (H^n F) \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s)) & \xrightarrow{i_s^* (H^n \phi) \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s))} & i_s^* (H^n G) \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s))
\end{array}
\]

Let \( n \in \mathbb{Z} \). By hypothesis

\[
H^n(i_s^* \phi \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s))) : H^n(i_s^* F \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s))) \cong H^n(i_s^* G \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s)))
\]
is an isomorphism. Hence, the diagram (25) implies that

\[
i_s^* (H^n \phi) \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s)) : i_s^* (H^n F) \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s)) \cong i_s^* (H^n G) \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s))
\]
is an isomorphism. We conclude on the one hand that \( i_s^* H^n \phi : i_s^* H^n F \to i_s^* H^n G \) is surjective by Nakayama lemma since \( i_s^* H^n F, i_s^* H^n G \) are \( O_{S,s} \) modules of finite type as \( F, G \in C_{O_S,c}(S) \) has coherent cohomology sheaves, and on the other hand that the rows of the following commutative diagram are isomorphism

\[
\begin{array}{ccc}
H^0(i_s^* (H^n F) \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s))) & \overset{H^0(i_s^* (H^n \phi) \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s)))}{\longrightarrow} & H^0(i_s^* (H^n G) \otimes_{i_s^* O_S} L_{i_s^* O_S}(k(s))) \\
\downarrow{=} & & \downarrow{=} \\
i_s^* (H^n F) \otimes_{i_s^* O_S} k(s) & \xrightarrow{i_s^* (H^n \phi) \otimes_{i_s^* O_S} k(s)} & i_s^* (H^n G) \otimes_{i_s^* O_S} k(s)
\end{array}
\]

Since

\[
i_s^* (H^n \phi) \otimes_{i_s^* O_S} k(s) : i_s^* (H^n F) \otimes_{i_s^* O_S} k(s) \cong i_s^* (H^n F) \otimes_{i_s^* O_S} k(s)
\]
is an isomorphism for all \( s \in S, O_{S,s} = : i_s^* O_S \) are reduced, and \( a_{\text{zar}} H^n F, a_{\text{zar}} H^n G \) are coherent, \( i_s^* H^n \phi : i_s^* H^n F \to i_s^* H^n G \) are injective.

\[\begin{proof}
\end{proof}\]
Let $i : Z \hookrightarrow S$ a closed embedding, with $S, Z \in \text{Top}$. Denote by $j : S \setminus Z \hookrightarrow S$ the open embedding of the complementary subset. We have the adjunction

$$(i_*, i^!): (i_*, i^!): C(Z) \to C(S), \text{ with in this case } i^! F := \ker(F \to j_* j^* F).$$

It induces the adjunction $(i_*, i^!): C_{(2)fil}(Z) \to C_{(2)fil}(S)$ (we recall that $i^! := i^\perp$ preserve monomorphisms).

Let $i : Z \to S$ a closed embedding, with $S, Z \in \text{Top}$. Denote by $j : S \setminus Z \hookrightarrow S$ the open embedding of the complementary subset. We have the support section functors:

- We have the functor

$$\Gamma_Z : C(S) \to C(S), \quad F \mapsto \Gamma_Z(F) := \text{Cone}(\text{ad}(j^*, j_*)(F) : F \to j_* j^* F)[-1],$$

together with the canonical map $\gamma_Z(F) : \Gamma_Z F \to F$. We have the factorization

$$\text{ad}(i_*, i^!)(F) : i_* i^! F \xrightarrow{\text{ad}(i_*, i^!)(F)\gamma} \Gamma_Z F \xrightarrow{\gamma_Z(F)} F,$$

and $\text{ad}(i_*, i^!)(F)\gamma : i_* i^! F \to \Gamma_Z F$ is an homotopy equivalence. Since $\Gamma_Z$ preserve monomorphisms, it induce the functor

$$\Gamma_Z : C_{fil}(S) \to C_{fil}(S), \quad (G, F) \mapsto \Gamma_Z(G, F) := (\Gamma_Z G, \Gamma_Z F),$$

together with the canonical map $\gamma_Z((G, F) : \Gamma_Z(G, F) \to (G, F)$.

- We have also the functor

$$\Gamma^\gamma_Z : C(S) \to C(S), \quad F \mapsto \Gamma^\gamma_Z(F) := \text{Cone}(\text{ad}(j_!, j^!)(F) : j_! j^* F \to F),$$

together with the canonical map $\gamma^\gamma_Z(F) : \Gamma^\gamma_Z F \to F$. We have the factorization

$$\text{ad}(i^*, i_!)(F) : F \xrightarrow{\gamma^\gamma_Z(F)} \Gamma^\gamma_Z F \xrightarrow{\text{ad}(i^*, i_!)(F)\gamma} i_* i^! F,$$

and $\text{ad}(i^*, i_!)(F)\gamma : \Gamma^\gamma_Z F \to i_* i^! F$ is an homotopy equivalence. Since $\Gamma^\gamma_Z$ preserve monomorphisms, it induce the functor

$$\Gamma_Z : C_{fil}(S) \to C_{fil}(S), \quad (G, F) \mapsto \Gamma^\gamma_Z(G, F) := (\Gamma^\gamma_Z G, \Gamma^\gamma_Z F),$$

together with the canonical map $\gamma^\gamma_Z((G, F) : \Gamma^\gamma_Z(G, F) \to \Gamma^\gamma_Z(G, F)$.

**Definition-Proposition 1.** (i) Let $g : S' \to S$ a morphism and $i : Z \hookrightarrow S$ a closed embedding with $S', S, Z \in \text{Top}$. Then, for $(G, F) \in C_{fil}(S)$, there is a canonical map in $C_{fil}(S')$

$$T(g, \gamma)(G, F) : g^* \Gamma_Z(G, F) \to \Gamma_{Z \times S'}(g^*(G, F)$$

unique up to homotopy such that $\gamma_{Z \times S'}(g^*(G, F)) \circ T(g, \gamma)(G, F) = g^* \gamma_Z(G, F)$.

(ii) Let $i_1 : Z_1 \hookrightarrow S$, $i_2 : Z_2 \hookrightarrow Z_1$ be closed embeddings with $S, Z_1, Z_2 \in \text{Top}$. Then, for $(G, F) \in C_{fil}(S)$,

- there is a canonical map $T(Z_2/Z_1, \gamma)(G, F) : \Gamma_{Z_2}(G, F) \to \Gamma_{Z_1}(G, F)$ in $C_{fil}(S)$ unique up to homotopy such that $\gamma_{Z_1}(G, F) \circ T(Z_2/Z_1, \gamma)(G, F) = \gamma_{Z_2}(G, F)$ together with a distinguish triangle in $K_{fil}(S) := K(\text{PSh}_{fil}(S))$

$$\begin{align*}
\Gamma_{Z_2}(G, F) & \xrightarrow{T(Z_2/Z_1, \gamma)(G, F)} \Gamma_{Z_1}(G, F) \\
& \xrightarrow{\text{ad}(j[Z_2/Z_1](G, F))} \Gamma_{Z_1}(G, F) \to \Gamma_{Z_2}(G, F)[1]
\end{align*}$$

34
(iii) Consider a morphism \( g : (S', Z') \to (S, Z) \) with \( (S', Z'), (S, Z) \in \text{Top}^2 \). We denote, for \( G \in C(S) \), the composite

\[
T(D, \gamma^\vee)(G) : g^* \Gamma_Z^\vee G \to \Gamma_Z^\vee g^* G
\]

and we have then the factorization \( \gamma^\vee_Z : (g^* G) \to \Gamma_Z^\vee g^* G \).

Proof. (i): We have the cartesian square

\[
\begin{array}{ccc}
S \setminus Z & \xrightarrow{j} & S \\
\downarrow{g^*} & & \downarrow{g} \\
S' \setminus Z \times S & \xrightarrow{\gamma^*} & S'
\end{array}
\]

and the map is given by

\[
(I, T(g,j)(j^* G)) : \text{Cone}(g^* G \to g^* j^* j^* G) \to \text{Cone}(g^* G \to j_1^* j_2^* G = j_1^* G).
\]

(ii): Follows from the fact that \( j_1^* \Gamma_Z G = 0 \) and \( j_1^* \Gamma_Y G = 0 \), with \( j_1 : S' \setminus Z_1 \to S \) the closed embedding. (iii): Obvious.

Let \( (S, O_S) \in \text{RTop} \). Let \( Z \subset S \) a closed subset. Denote by \( j : S \setminus Z \to S \) the open complementary embedding.

- For \( G \in C_{O_S}(S), \Gamma_Z G := \text{Cone}(\text{ad}(j^*, j_*)(G) : F \to j_* j^* G)[-1] \) has a (unique) structure of \( O_S \) module such that \( \gamma_Z(G) : \Gamma_Z G \to G \) is a map in \( C_{O_S}(S) \). This gives the functor

\[
\Gamma_Z : C_{O_S}(S) \to C_{i-filt}(S), \quad (G, F) \mapsto \Gamma_Z(G, F) := (\Gamma_Z G, \Gamma_Z F),
\]

together with the canonical map \( \gamma_Z((G, F) : \Gamma_Z(G, F) \to (G, F) \). Let \( Z_2 \subset Z \) a closed subset. Then, for \( G \in C_{O_S}(S), T(Z_2 / Z, \gamma)(G) : \Gamma_{Z_2} G \to \Gamma_Z G \) is a map in \( C_{O_S}(S) \) (i.e. is \( O_S \) linear).

- For \( G \in C_{O_S}(S), \Gamma_Z^\vee := \text{Cone}(\text{ad}(j^*, j_*)^\vee(G) : j_! j^* G \to G) \) has a unique structure of \( O_S \) module, such that \( \gamma^\vee_Z(G) : G \to \Gamma_Z^\vee G \) is a map in \( C_{O_S}(S) \). This gives the functor

\[
\Gamma^\vee_Z : C_{i-filt}(S) \to C_{i-filt}(S), \quad (G, F) \mapsto \Gamma^\vee_Z(G, F) := (\Gamma^\vee_Z G, \Gamma^\vee_Z F),
\]

together with the canonical map \( \gamma^\vee_Z((G, F) : (G, F) \to \Gamma^\vee_Z(G, F) \). Let \( Z_2 \subset Z \) a closed subset. Then, for \( G \in C_{O_S}(S), T(Z_2 / Z, \gamma^\vee)(G) : \Gamma^\vee_{Z_2} G \to \Gamma^\vee_Z G \) is a map in \( C_{O_S}(S) \) (i.e. is \( O_S \) linear).

- For \( G \in C_{O_S}(S) \), we will use

\[
\Gamma^\vee_{Z, h} G := D_S^O L O \Gamma_Z E(D_S^O G)
\]

and we have the canonical map \( \gamma^\vee_{Z, h}(G) : M \to \Gamma^\vee_{Z, h} G \) of \( O_S \) module. The factorization

\[
\text{ad}(j^*, j^*)(L_M) \to j_! j^* L_O G \xrightarrow{(k \circ D^O I(j^*, j^*) (D^O j^* L_O G) \circ \text{ad}(j^*, j^* L_O G))} D_S^O L O j^* E(D_S^O L_O G) \to D_S^O L O E(D_S^O L_O G)
\]

and we have the canonical map \( \gamma^\vee_{Z, h}(G) : M \to \Gamma^\vee_{Z, h} G \) of \( O_S \) module.
gives the factorization $\gamma^\vee h(L_O G) : L_O G \xrightarrow{\gamma^\vee Z(L_O G)} \Gamma^\vee_Z L_O G \xrightarrow{(\kappa \circ \Omega^O I(j, j^*) (\Omega^O j^* L_O G) \circ (j^* L_O G))} \Gamma^\vee_Z L_O G$. We get the functor

$$\Gamma^\vee_Z : C_{O_Sfil}(S) \to C_{O_Sfil}(S), (G, F) \mapsto \Gamma^\vee_Z (G, F) : = \mathbb{D}_Z^O L_O \Gamma_Z E(\mathbb{D}_S^O (G, F)),$$

together with the factorization

$$\gamma^\vee (L_O (G, F)) : L_O (G, F) \xrightarrow{\gamma^\vee Z (L_O (G, F))} \Gamma^\vee_Z L_O (G, F) \xrightarrow{(\kappa \circ \Omega^O I(j, j^*) (\Omega^O j^* L_O (G, F)) \circ (j^* L_O (G, F)))} \Gamma^\vee_Z L_O (G, F),$$

- Consider $I \subset O_S$ a right ideal of $O_S$ such that $I_Z \subset I$, where $I_Z \subset O_S$ is the left and right ideal consisting of section which vanish on $Z$.

  - For $G \in \text{PSh}_{O_S}(S)$, we consider, $S^o \subset S$ being an open subset,

$$\mathcal{I}G(S^o) = \{ f, m, m \in G(S^o), f \in \mathcal{I}(S^o) \} \subset G(S^o)$$

since $\mathcal{I}$ is a right ideal, and we denote by $b_I(G) : \mathcal{I}G \to G$ the injective morphism of $O_S$ modules and by $c_Z(G) : G \to G/\mathcal{I}G$ the quotient map. The adjonction map $\text{ad}(j_!, j^*)(G) : j_! j^* G \to G$ factors trough $b_I(G)$:

$$\text{ad}(j_!, j^*)(G) : j_! j^* G \xrightarrow{b_I(G)} \mathcal{I}G \xrightarrow{b_I(G)} G$$

We have then the support section functor,

$$\Gamma^\vee \mathbb{I}_{O_S} : C_{O_S}(S) \to C_{O_S}(S), G \mapsto \Gamma^\vee \mathbb{I}_{O_S} G := \text{Cone}(b_I(G) : I_G \to G)$$

together with the canonical map $\gamma^\vee \mathbb{I}_{O_S}(G) : G \to \Gamma^\vee \mathbb{I}_{O_S} G$ which factors through

$$\gamma^\vee \mathbb{I}_{O_S}(G) : G \xrightarrow{\gamma^\vee (G)} \Gamma^\vee_Z G \xrightarrow{b_{I/S}(G)} \Gamma^\vee_Z \mathbb{I}_S^O G.$$

By the exact sequence $0 \to \mathcal{I}G \xrightarrow{b_I(G)} G \xrightarrow{e_I(G)} G/\mathcal{I}G \to 0$, we have an homotopy equivalence $e_I(G) : \Gamma^\vee \mathbb{I}_{O_S} G \to G/\mathcal{I}G$.

- For $G \in \text{PSh}_{O_S}(S)$, we consider

$$b'_I(G) : G \to G \otimes_{O_S} \mathbb{D}_S^O (I) := G \otimes_{O_S} \mathcal{H}om(I, O_S)$$

The adjonction map $\text{ad}(j^*, j_!)(G) : G \to j^* j_! G$ factors trough $b'_I(G)$:

$$\text{ad}(j^*, j_!)(G) : G \xrightarrow{b'_I(G)} G \otimes_{O_S} \mathbb{D}_S^O (I) \xrightarrow{b'_I/S(G)} j^* j_! G$$

We have then the support section functor,

$$\Gamma^\mathbb{I}_{O_S} : C_{O_S}(S) \to C_{O_S}(S), G \mapsto \Gamma^\mathbb{I}_{O_S} G := \text{Cone}(b'_I(G) : G \to G \otimes_{O_S} \mathbb{D}_S^O (I))[-1]$$

together with the canonical map $\gamma^\mathbb{I}_{O_S}(G) : \Gamma^\mathbb{I}_{O_S} G \to G$ which factors through

$$\gamma^\mathbb{I}_{O_S}(G) : \Gamma^\mathbb{I}_{O_S} G \xrightarrow{b'_{I/S}(G)} \Gamma^\mathbb{I}_{O_S} G \xrightarrow{\gamma_{I}(G)} G.$$
– By definition, we have for a canonical isomorphism
\[ I(D, \gamma^O) : D_S^O \Gamma^V, O^I G \cong \Gamma^O Z D_S^O G \]
which gives the transformation map in \( C_{O_S}(S) \)
\[ T(D, \gamma^O)(G) : \Gamma^V, O^I D_S^O G \xrightarrow{d} D_S^O \Gamma^V, O^I D_S^O G \xrightarrow{d^{-1}(D, \gamma^O)(D)^O G)} \]
\[ D_S^O \Gamma^V, O^I D_S^O G \xrightarrow{d'} D_S^O \Gamma^O Z D_S^O G \]

**Definition-Proposition 2.** 
(i) Let \( g : (S', O_{S'}) \rightarrow (S, O_S) \) a morphism and \( i : Z \hookrightarrow S \) a closed embedding with \( (S', O_{S'}, (S, O_S)) \in \text{RTop} \). Then, for \( (G, F) \in C_{O_S}(S) \), there is a canonical map in \( C_{O_S}(S') \)
\[ T_{\text{mod}}^\gamma(g)(G, F) : g^{\text{mod}} \Gamma_Z(G, F) \rightarrow \Gamma_{Z \times S'} g^{\text{mod}}(G, F) \]
unique up to homotopy, such that \( \gamma_{Z \times S'}(g^{\text{mod}} G) \circ T_{\text{mod}}(g, \gamma)(G) = g^{\text{mod}} \gamma_Z G \).
(ii) Let \( i_1 : (Z_1, O_{Z_1}) \hookrightarrow (S, O_S) \), \( i_2 : (Z_2, O_{Z_2}) \hookrightarrow (Z_1, O_{Z_1}) \) be closed embeddings with \( S, Z_1, Z_2 \in \text{Top} \). Then, for \( (G, F) \in C_{O_S}(S) \), there is a canonical map in \( C_{O_S}(S') \)
\[ T(Z_2/Z_1, \gamma^V, O)(G, F) : \Gamma_{Z_1}^O(G, F) \rightarrow \Gamma_{Z_2}^O(G, F) \]
unique up to homotopy such that \( \gamma_{Z_2}^O(G, F) = T(Z_2/Z_1, \gamma^V, O)(G, F) \circ \gamma_{Z_1}^O(G, F) \).
(iii) Consider a morphism \( g : ((S', O_{S'}), Z') \rightarrow ((S, O_S), Z) \) with \( ((S', O_{S'}), Z') \rightarrow ((S, O_S), Z) \in \text{RTop}^2 \).
We denote, for \( M \in C_{O_S}(S) \) the composite
\[ T_{\text{mod}}(D, g^V, O)(G) : g^{\text{mod}} \Gamma_{Z}^O G \cong \Gamma_{Z \times S'} g^{\text{mod}} G \xrightarrow{T(Z'/Z \times S', \gamma^V, O)(G)} \Gamma_{Z'} \gamma^O \]
and we have then the factorization
\[ \gamma_{Z'}^O(g^{\text{mod}} M) : g^{\text{mod}} G \xrightarrow{g^{\text{mod}} \gamma_{Z'}^O(G)} \gamma_{Z'}^O G \xrightarrow{T_{\text{mod}}(D, \gamma^V, O)(G)} \Gamma_{Z'} \gamma^O g^{\text{mod}} G \]

**Proof.** (i): We have the cartesian square
\[
\begin{array}{ccc}
S \setminus Z & \xrightarrow{j} & S \\
g \downarrow & & \downarrow g \\
S' \setminus Z' S' & \xrightarrow{j'} & S'
\end{array}
\]
and the map is given by
\[ (I, T_{\text{mod}}(g, j)(j^* G)) : \text{Cone}(g^{\text{mod}} G \rightarrow g^{\text{mod}} j_! j^* G) \rightarrow \text{Cone}(g^{\text{mod}} G \rightarrow j'_! j'_* g^{\text{mod}} G = j'_* g^{j^* \text{mod}} j^* G). \]
(ii): Obvious.
(iii): Obvious.

**Definition-Proposition 3.** Consider a commutative diagram in \( \text{RTop} \)
\[ D_0 = f : (X, O_X) \xrightarrow{i} (Y, O_Y) \xrightarrow{p} (S, O_S) \]
\[ f' : (X', O_{X'}) \xrightarrow{i'} (Y', O_{Y'}) \xrightarrow{p'} (T, O_T) \]
with \( i, i' \) being closed embeddings. Denote by \( D \) the right square of \( D_0 \). The closed embedding \( i' : X' \hookrightarrow Y' \) factors through \( i' : X' \xrightarrow{i'_0} X \times_Y Y' \xrightarrow{i'_1} Y' \) where \( i'_1, i'_0 \) are closed embeddings.
(i) We have the canonical map,
\[ E(\Omega_{(O_{\nu}^V/\gamma^*O_Y)})/(O_{\nu}^V/\gamma^*S)) \circ T(g'',E)(-): \]
\[ g'' \Gamma X E(\Omega^*_X/\gamma^*S, F_b) \to \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b), \]
unique up to homotopy such that the following diagram in \( C_{(g''/\gamma^*S)} \) commutes
\[ \xymatrix{ g'' \Gamma X E(\Omega^*_X/\gamma^*S, F_b) \ar[r]^{E(\Omega_{(O_{\nu}^V/\gamma^*Y)})/(O_{\nu}^V/\gamma^*S)) \circ T(g'',E)(-)} \ar[d]_{\gamma X(-)} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[d]_{\gamma X_{XY'}(-)} \\
g'' E(\Omega^*_X/\gamma^*S, F_b) \ar[r]^{E(\Omega_{(O_{\nu}^V/\gamma^*Y)})/(O_{\nu}^V/\gamma^*S)) \circ T(g'',E)(-)} & E(\Omega^*_X/\gamma^*S, F_b) }

(ii) There is a canonical map,
\[ T^O(\omega) \gamma : g''^\text{mod} LOP_s \Gamma X E(\Omega^*_X/\gamma^*S, F_b) \to \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b), \]
unique up to homotopy such that the following diagram in \( C_{(g''/\gamma^*S)} \) commutes
\[ \xymatrix{ g''^\text{mod} LOP_s \Gamma X E(\Omega^*_X/\gamma^*S, F_b) \ar[r]^{T^O(\omega) \gamma} \ar[d]_{\gamma X(-)} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[d]_{\gamma X_{XY'}(-)} \\
g''^\text{mod} LOP_s E(\Omega^*_X/\gamma^*S, F_b) \ar[r]^{T^O(\omega)} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) }

(iii) We have the canonical map in \( C_{f^*O_T(Y')} \)
\[ T(X'/X \times Y', \gamma)(E(\Omega^*_S/\gamma^*S, F_b)) : \Gamma X' E(\Omega^*_X/\gamma^*S, F_b) \to \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b), \]
unique up to homotopy such that \( \gamma X_{XY'}(-) \circ T(X'/X \times Y', \gamma)(-) = \gamma X'(-) \).

Proof. Immediate from definition. We take for the map of point (ii) the composite
\[ \xymatrix{ T^O(\omega) \gamma : g''^\text{mod} LOP_s \Gamma X E(\Omega^*_X/\gamma^*S, F_b) \ar[r]^{T^O(\omega) \gamma} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[r]_{\circ g'' O_T} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[r]_{\circ g'' O_T} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[r]_{\circ g'' O_T} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[r]_{\circ g'' O_T} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[r]_{\circ g'' O_T} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[r]_{\circ g'' O_T} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[r]_{\circ g'' O_T} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[r]_{\circ g'' O_T} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[r]_{\circ g'' O_T} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) \ar[r]_{\circ g'' O_T} & \Gamma X_{XY'} E(\Omega^*_X/\gamma^*S, F_b) }
\]
with \( m(n \otimes s) = s.n \). □

Definition 2. (i) Let \( S \in \text{Top} \). For \( Z \subseteq S \) a closed subset, we denote by \( C_Z(S) \subset C(S) \) the full subcategory consisting of complexes of presheaves \( F \in C(S) \) such that \( a_{top}H^n(j^*F) = 0 \) for all \( n \in \mathbb{Z} \), where \( j : S \setminus Z \to S \) is the complementary open embedding and \( a_{top} \) is the sheafification functor.

(i)' More generally, let \( (S, O_S) \in \text{RTop} \). For \( Z \subseteq S \) a closed subset, we denote by
\[ C_{O_Z, Z}(S) \subset C_{O_Z}(S) \ , \ QCoh_Z(S) \subset QCoh(S) \]
the full subcategories consisting of complexes of presheaves \( G \in C_{O_Z}(S) \) such that \( a_{top}H^n(j^*F) = 0 \) for all \( n \in \mathbb{Z} \), resp. quasi-coherent sheaves \( G \in QCoh(S) \) such that \( j^*F = 0 \).
(ii) Let \( S \in \text{Top} \). For \( Z \subset S \) a closed subset, we denote by \( C_{\text{fil},Z}(S) \subset C_{\text{fil}}(S) \) the full subcategory consisting of filtered complexes of presheaves \((G, F) \in C_{\text{fil}}(S)\) such that there exist \( r \in \mathbb{N} \) such that \( a_{\text{top}}j^*E_{p,q}^r(G, F) = 0 \) for all \( p, q \in \mathbb{Z} \), where \( j : S \setminus Z \hookrightarrow S \) is the complementary open embedding and \( a_{\text{top}} \) is the sheafification functor. Note that this definition say that this \( r \) does NOT depend on \( p \) and \( q \).

(ii') More generally, let \( (S, O_S) \in \text{RTop} \). For \( Z \subset S \) a closed subset, we denote by

\[
C_{O_S, \text{fil},Z}(S) \subset C_{O_S, \text{fil}}(S), \mathbb{Q}\text{Coh}_{\text{fil},Z}(S) \subset \mathbb{Q}\text{Coh}(S)
\]

the full subcategories consisting of filtered complexes of presheaves \((G, F) \in C_{O_S, \text{fil}}(S)\) such that there exist \( r \in \mathbb{N} \) such that \( a_{\text{top}}j^*E_{p,q}^r(G, F) = 0 \) for all \( p, q \in \mathbb{Z} \), resp. filtered quasi-coherent sheaves \((G, F) \in \mathbb{Q}\text{Coh}(S)\) such that there exist \( r \in \mathbb{N} \) such that \( j^*E_{p,q}^rF = 0 \) for all \( p, q \in \mathbb{Z} \). Note that this definition say that this \( r \) does NOT depend on \( p \) and \( q \).

Let \((S, O_S) \in \text{RTop} \) and \( Z \subset S \) a closed subset.

- For \((G, F) \in C_{\text{fil}}(S)\), we have \( \Gamma_Z(G, F), \Gamma_Z^\lor(G, F) \in C_{\text{fil},Z}(S) \).
- For \((G, F) \in C_{O_S, \text{fil}}(S)\), we have \( \Gamma_Z(G, F), \Gamma_Z^\lor(G, F), \Gamma_Z^{\lor,h}(G, F), \Gamma_Z^{\lor,O}(G, F) \in C_{O_S, \text{fil},Z}(S) \).

**Proposition 12.** Let \( S \in \text{Top} \) and \( Z \subset S \) a closed subspace. Denote by \( i : Z \hookrightarrow S \) the closed embedding.

(i) The functor \( i^* : \text{Shv}Z(S) \to \text{Shv}(Z) \) is an equivalence of category whose inverse is \( i_* : \text{Shv}(Z) \to \text{Shv}Z(S) \). More precisely \( \text{ad}(i_*, i^*) : \text{Shv}(S) \to \text{Shv}(Z) \) is an isomorphism if \( H \in \text{Shv}(S) \) and \( \text{ad}(i_*, i^*)^{-1}(G) : \text{Shv}(Z) \to \text{Shv}(S) \) is an isomorphism if \( G \in \text{Shv}(Z) \).

(ii) : The functor \( i^* : \text{Shv}_{\text{fil},Z}(S) \to \text{Shv}_{\text{fil}}(Z) \) is an equivalence of category whose inverse is \( i_* : \text{Shv}_{\text{fil}}(Z) \to \text{Shv}_{\text{fil},Z}(S) \). More precisely \( \text{ad}(i_*, i^*) : \text{Shv}_{\text{fil}}(S) \to \text{Shv}_{\text{fil},Z}(S) \) is an isomorphism if \( (H, F) \in \text{Shv}(S) \) and \( \text{ad}(i_*, i^*)^{-1}(G) : \text{Shv}_{\text{fil},Z}(S) \to \text{Shv}_{\text{fil}}(S) \) is an isomorphism if \( (G, F) \in \text{Shv}_{\text{fil}}(S) \).

(iii) : The functor \( i^* : D_{\tau,\text{fil},Z}(S) \to D_{\tau,\text{fil}}(Z) \) is an equivalence of category whose inverse is \( i_* : D_{\tau,\text{fil}}(Z) \to D_{\tau,\text{fil},Z}(S) \). More precisely \( \text{ad}(i_*, i^*) : D_{\tau,\text{fil}}(S) \to D_{\tau,\text{fil},Z}(S) \) is an equivalence top local if \( (H, F) \in \text{C}_{\text{fil}}(Z) \) and \( \text{ad}(i_*, i^*)^{-1}(G) : D_{\tau,\text{fil},Z}(S) \to D_{\tau,\text{fil}}(S) \) is an equivalence top local if \( (G, F) \in \text{C}_{\text{fil},Z}(S) \).

**Proof.** (i):Standard.

(ii): Follows from (i).

(iii): Follows from (ii). \( \square \)

Let \( S \in \text{Top} \) and \( Z \subset S \) a closed subspace. By proposition 12, if \( G \in C(S) \), \( \text{ad}(i_*, i^*)(\Gamma_Z G) : \Gamma_Z G \to i_*i^*\Gamma_Z G \) is an equivalence top local since \( \Gamma_Z G \in C(Z) \).

Let \((S, O_S) \in \text{RTop} \). Let \( D = \cup_i D_i \subset X \) a normal crossing divisor, denote by \( j : S \setminus D \hookrightarrow S \) the open embedding, and consider \( \mathbb{L}_D \subset O_S \) the ideal of vanishing function on \( D \) which is invertible. We set, for \( M \in C_{O_S}(S) \),

\[
M(*D) := \lim_n \text{Hom}_{O_S}(\mathbb{L}_D^n, M),
\]

and we denote by \( a_D(F) : F \to F(*D) \) the surjective morphism of presheaves. The adjunction map \( \text{ad}(j^*, j_*)(F) : F \to j_*j^*F \) factors trough \( a_D(F) : F \to F(*D) \)

\[
\xymatrix{ ad(j^*, j_*)(F) : F & a_D(F) \ar[r] & F(*D) \ar[r]^{a_{S/D}(F)} & j_*j^*F.}
\]

**Remark 3.** Let \( j : U \hookrightarrow X \) an open embedding, with \((X, O_X) \in \text{RTop} \). Then if \( F \in \text{Coh}_{O_X}(U) \) is a coherent sheaf of \( O_U \) module, \( j_*F \) is quasi-coherent but NOT coherent in general. In particular for \( F \in C_{O_Y}(U) \) whose cohomology sheaves \( a_{\text{top}}H^nF \) are coherent for all \( n \in \mathbb{Z} \), the cohomology sheaves \( R^nj_*F := a_nH^n j_*E(F) \) of \( Rj_*F = j_*E(F) \) are quasi-coherent but NOT coherent.
• Let \( j : U \rightarrow X \) an open embedding, with \( X \in \text{Sch} \). Then if \( F \in \text{Coh}(U) \) is a coherent sheaf of \( O_U \) module, \( j_*F \) is quasi-coherent but NOT coherent. However, there exist an \( O_X \) submodule \( \tilde{F} \subset j_*F \) such that \( j^*\tilde{F} = F \) and \( \tilde{F} \in \text{Coh}(X) \).

The following propositions are true for schemes but NOT for arbitrary ringed spaces like analytic spaces :

**Proposition 13.**

(i) Let \( X = (X,O_X) \in \text{Sch} \) a noetherien scheme and \( D \subset X \) a closed subset. Denote by \( j : U = X\setminus D \hookrightarrow X \) an open embedding. Then for \( F \in \mathcal{QCoh}_{O_U}(U) \) a quasi coherent sheaf, \( j_*F \in \mathcal{QCoh}_{O_X}(X) \) is quasi-coherent and is the direct limit of its coherent subsheaves.

(ii) Let \( X = (X,O_X) \) a noetherien scheme and \( D = \bigcup D_i \subset X \) a normal crossing divisor. Denote by \( j : U = X\setminus D \hookrightarrow X \) an open embedding. Then for \( F \in \mathcal{QCoh}_{O_U}(U) \) a quasi coherent sheaf, the canonical map \( a_{X/D}(F) : F(*D) \xrightarrow{\sim} j_*F \) is an isomorphism.

Proof. Standard.

**Proposition 14.** Let \( S = (S,O_S) \in \text{Sch} \) and \( Z \subset S \) a closed subscheme. Denote by \( i : Z \hookrightarrow S \) the closed embedding.

(i) For \( G \in \mathcal{QCoh}_Z(S) \), \( i^*G \) has a canonical structure of \( O_Z \) module. Moreover, the functor \( i^* : \mathcal{QCoh}_Z(S) \rightarrow \mathcal{QCoh}(Z) \) is an equivalence of category whose inverse is \( i_* : \mathcal{QCoh}(Z) \rightarrow \mathcal{QCoh}_Z(S) \).

(ii) The functor \( i^* : \mathcal{QCoh}_{fil,Z}(S) \rightarrow \mathcal{QCoh}_{fil}(Z) \) is an equivalence of category whose inverse is \( i_* : \mathcal{QCoh}_{fil}(Z) \rightarrow \mathcal{QCoh}_{fil,Z}(S) \).

(iii) The functor \( i^* : \mathcal{D}_{O_{Z,fil,qc}}(S) \rightarrow \mathcal{D}_{O_{Z,fil,qc}}(Z) \) is an equivalence of category whose inverse is \( i_* : \mathcal{D}_{O_{Z,fil,qc}}(Z) \rightarrow \mathcal{D}_{O_{Z,fil,qc}}(S) \).

(ii): Follows from (i).

(iii): Follows from (ii) since \( i^* \) and \( i_* \) are exact functors.

**Definition 3.** Let \( (S,O_S) \in \text{RTop} \) a locally ringed space with \( O_S \) commutative. Consider an \( \kappa_S \in C_{O_S}(S) \). Let \( \mathcal{I} \subset O_S \) an ideal subsheaf and \( Z = V(\mathcal{I}) \subset S \) the associated closed subset. For \( G \in \text{PSh}_{O_S}(S) \), we denote by \( \hat{G}_Z := \hat{G}_1 := \lim \mathcal{I}/\mathcal{I}^k \mathcal{G} \) the completion with respect to the ideal \( \mathcal{I} \) and by \( c_Z^\infty(G) : G \rightarrow \hat{G}_Z \) the quotient map. Then, the canonical map

\[
d_{\kappa_S,Z}(G) : G \xrightarrow{d(G)} D_S^O 2G \xrightarrow{T^{mod}(\mathcal{O}_S,\kappa_S,G,O_S)} \mathcal{H}om_{O_S}(D_S^O G \otimes O_S \kappa_S, \kappa_S) \xrightarrow{T^{mod}(\Gamma_Z E,\mathcal{H}om)(\imath,\imath)} \mathcal{H}om_{O_S}(\Gamma_Z E(D_S^O G \otimes O_S \kappa_S), \Gamma_Z E(\kappa_S))
\]

factors through

\[
d_{\kappa_S,Z}(G) : G \xrightarrow{c_Z^\infty(G)} \hat{G}_Z \xrightarrow{d_{\kappa_S,Z}(G)} \mathcal{H}om_{O_S}(\Gamma_Z E(D_S^O \hat{G}_Z \otimes O_S \kappa_S), \Gamma_Z E(\kappa_S))
\]

Clearly if \( G \in C_{O_S}(S) \) then \( d_{\kappa_S,Z}(G) \) is a map in \( C_{O_S}(S) \). On the other hand, we have a commutative diagram

\[
\begin{array}{ccc}
\Omega^p_{O_S} & \xrightarrow{d_{\kappa_S,Z}(\Omega^p_{O_S})} & \mathcal{H}om_{O_S}(\Gamma_Z E(D_S^O \Omega^p_{O_S} \otimes O_S \kappa_S), \Gamma_Z E(\kappa_S)) \\
\downarrow d & & \downarrow d^{\ast_{\kappa_S}} \\
\Omega^{p+1}_{O_S} & \xrightarrow{d_{\kappa_S,Z}(\Omega^{p+1}_{O_S})} & \mathcal{H}om_{O_S}(\Gamma_Z E(D_S^O \Omega^{p+1}_{O_S} \otimes O_S \kappa_S), \Gamma_Z E(\kappa_S))
\end{array}
\]

so that \( d_{\kappa_S,Z}(\Omega^p_{O_S}) \in C(S) \).
The following theorem is from [13]

**Theorem 8.** Let $S \in \text{Var}(\mathbb{C})$. Let $Z = V(\mathcal{I}) \subset S$ a closed subset. Denote by $K_S \in \text{PSh}_O(S)$ the canonical bundle. Then, for $G \in \text{C}_{O_S,c}(S)$,

$$d_{K_G,Z}(G) : \hat{G}_Z \to \mathcal{H}om_O(S, (\Gamma_Z E(\mathbb{D}^G S \otimes O_S K_S), \Gamma_Z E(K_S)))$$

is an equivalence Zariski local.

Let $f : (X,O_X) \to (S,O_S)$ a morphism with $(S,O_S) \in \text{RTop}$. In the particular case where $O_S$ is a commutative sheaf of ring, $T_{O_S} \in \text{PSh}_{O_S}(S)$ and $\Omega_{O_S} = \mathbb{D}_{O_S} T_{O_S} \in \text{PSh}_{O_S}(S)$ are sheaves and the morphism in $\text{PSh}(X)$

$$T(f, \text{hom})(O_S,O_S) : f^* \mathcal{H}om(O_S,O_S) \to \mathcal{H}om(f^*O_S,f^*O_S)$$

induces isomorphisms $T(f, \text{hom})(O_S,O_S) : f^*T_{O_S} \cong T_{f^*O_S}$ and $\mathbb{D}_{f^*O_S} T(f, \text{hom})(O_S,O_S) : \Omega_{f^*O_S} \to f^*\Omega_{O_S}$ where for $F \in \text{Shv}(S)$, we denote again (as usual) by abuse $f^*F := a_S f^* F \in \text{Shv}(S)$, $a_S : \text{PSh}(S) \to \text{Shv}(S)$ being the sheafification functor.

**Definition 4.**

(i) Let $(X,O_X) \in \text{RTop}$. A foliation $(X,O_X)/\mathcal{F}$ on $(X,O_X)$ is an $O_X$ module $\Omega_{O_X}/\mathcal{F} \in \text{PSh}_{O_X}(X)$ together with a derivation map $d := d_F : O_X \to \Omega_{O_X}/\mathcal{F}$ such that

- the associated map $q := q^F := \omega_X(d) : O_X \to \Omega_{O_X}/\mathcal{F}$ is surjective
- satisfy the integrability condition $d(\ker q) \subset \ker q$ which implies that the map $d : \Omega_{O_X}^p \to \Omega_{O_X}^{p+1}$ induce factors trough

\[
\begin{array}{ccc}
\Omega_{O_X}^p & \xrightarrow{d} & \Omega_{O_X}^{p+1} \\
\downarrow{q^p := \wedge^p q} & & \downarrow{q^{p+1} := \wedge^{p+1} q} \\
\Omega_{O_X}/\mathcal{F} & \xrightarrow{d} & \Omega_{O_X}^{p+1}/\mathcal{F}
\end{array}
\]

and $d : \Omega_{O_X}/\mathcal{F} \to \Omega_{O_X}^{p+1}/\mathcal{F}$ is neccessary unique by the surjectivity of $q^p : \Omega_{O_X}^p \to \Omega_{O_X}^p/\mathcal{F}$.

In the particular case where $\Omega_{O_X}/\mathcal{F} \in \text{PSh}_{O_X}(X)$ is a locally free sheaf of $O_X$ module, $\mathbb{D}_{O_X} q : T_{O_X/\mathcal{F}} := \mathbb{D}_{O_X} \Omega_{O_X}/\mathcal{F} \to T_{O_X}$ is injective and the second condition is then equivalent to the fact that the sub $O_X$ module $T_{O_X/\mathcal{F}} \subset T_{O_X}$ is a Lie subalgebra, that is $T_{O_X/\mathcal{F}} \subset T_{O_X/\mathcal{F}} \subset T_{O_X/\mathcal{F}}$.

(ii) A piece of leaf a foliation $(X,O_X)/\mathcal{F}$ with $(X,O_X) \in \text{RTop}$ such that $O_X$ is a commutative sheaf of ring is an injective morphism of ringed spaces $l : (Z,O_Z) \hookrightarrow (X,O_X)$ such that $\Omega_{l^*O_X/O_Z} := \Omega_{\mathcal{F}O_X} \to \Omega_{O_Z}$ factors trough an isomorphism

$$\Omega_{l^*O_X/O_Z} : \Omega_{l^*O_X} \xrightarrow{\mathbb{D}_{l^*O_X} T(l,\text{hom})(O_X,O_X)} i^*\Omega_{O_X} \xrightarrow{i^*q} i^*\Omega_{O_X}/\mathcal{F} \to \Omega_{O_Z}.$$

(iii) If $f : (X,O_X) \to (S,O_S)$ is a morphism with $(X,O_X),(S,O_S) \in \text{RTop}$, we have the foliation $(X,O_X)/(S,O_S) := ((X,O_X),f)$ on $(X,O_X)$ given by the surjection

$$q : \Omega_{O_X} \to \Omega_{O_X}/f^*O_S := \text{coker}(\Omega_{O_X}/f^*O_S : \Omega_{f^*O_S} \to \Omega_{O_X}).$$

The fibers $i_{X_s} : (X_s,O_X) \hookrightarrow (X,O_X)$ for each $s \in S$ are the leaves of the foliation.

(iv) We have the category FolRTop

- whose objects are foliated ringed spaces $(X,O_X)/\mathcal{F}$ with $O_X$ a commutative sheaf of ring and
whose morphisms \( f: (X, O_X)/F \to (S, O_S)/G \) are morphisms of ringed spaces \( f: (X, O_X) \to (S, O_S) \) such that \( \Omega_{O_X/F \circ O_S} : \Omega_{f \circ O_S} \to \Omega_{O_X} \) factors through

\[
\begin{array}{ccc}
\Omega_{O_X} & \xrightarrow{\Omega_{O_X/f \circ O_S}} & \Omega_{O_X/\ast} \\
\downarrow{f^*} & & \downarrow{q^*} \\
\Omega_{O_S/G} & \xrightarrow{\Omega_{O_S/f \circ O_S}} & \Omega_{O_X/F}
\end{array}
\]

This category admits inverse limits with \( (X, O_X)/F \times (Y, O_Y)/G = (X \times Y, p_X^* O_X \oplus p_Y^* O_Y)/p_X^* F \oplus p_Y^* G \) and

\[
(X, O_X)/F \times_{(S, O_S)/H} (Y, O_Y)/G = (X \times_S Y, \delta_S^* (p_X^* O_X \oplus p_Y^* O_Y))/p_X^* F \oplus p_Y^* G
\]

with \( \delta_S: X \times S Y \to X \times Y \) the embedding given by the diagonal \( \delta_S: S \to S \times S \).

Let \( S \in \text{Top} \). Let \( S = \bigcup_{i=1}^{l} S_i \) an open cover and denote by \( S_I = \cap_{i \in I} S_i \). Let \( i_i : S_i \to \tilde{S}_i \) closed embeddings, with \( \tilde{S}_i \in \text{Top} \). For \( I \subset \{1, \cdots, l\} \), denote by \( \tilde{S}_I = \Pi_{i \in I} \tilde{S}_i \). We then have closed embeddings \( i_I : S_I \to \tilde{S}_I \) and, for \( J \subset I \), the following commutative diagram

\[
D_{IJ} = \begin{array}{ccc}
S_I & \xrightarrow{i_I} & \tilde{S}_I \\
\downarrow{j_{IJ}} & & \downarrow{p_{IJ}} \\
S_J & \xrightarrow{i_J} & \tilde{S}_J
\end{array}
\]

where \( j_{IJ} : S_J \to S_I \) is the open embedding so that \( j_I \circ j_{IJ} = j_J \). and \( p_{IJ} : \tilde{S}_J \to \tilde{S}_I \) the projection. This gives the diagram of topological spaces \( (\tilde{S}_I) \in \text{Fun}(\mathbb{P}(\mathbb{N}), \text{Top}) \) which gives the diagram \( (\tilde{S}_I) \in (\text{Ouv}(\tilde{S}_I)) \in \text{Fun}(\mathbb{P}(\mathbb{N}), \text{Cat}) \). Denote \( m : \tilde{S}_I \setminus (\tilde{S}_I \setminus S_J) \to \tilde{S}_I \) the open embedding.

**Definition 5.** Let \( S \in \text{Top} \). Let \( S = \bigcup_{i=1}^{l} S_i \) an open cover and denote by \( S_I = \cap_{i \in I} S_i \). Let \( i_i : S_i \to \tilde{S}_i \) closed embeddings, with \( \tilde{S}_i \in \text{Top} \). We denote by \( C_{\text{fid}}(S/\tilde{S}_I) \subset C_{\text{fid}}(\tilde{S}_I) \) the full subcategory

- whose objects are \( (G, F) = ((G_I, F_I)_{I \subset \{1, \cdots, l\}}, u_{IJ}) \), with \( (G_I, F_I) \in C_{\text{fid}}(\tilde{S}_I) \), and \( u_{IJ} : m^*(G_I, F_I) \to m^* p_{IJ}(G_I, F_I) \) are \( \infty \)-filtered top local equivalences satisfying for \( I \subset J \subset K \), \( p_{IJ} \circ u_{IK} \circ u_{IJ} = u_{IK} \) in \( C_{\text{fid}}(\tilde{S}_I) \),

- the morphisms \( m : ((G_I, F_I), u_{IJ}) \to ((H_I, F_I), v_{IJ}) \) being (see section 2.1) a family of morphism of complexes,

\[
m = (m_I : (G_I, F_I) \to (H_I, F_I))_{I \subset \{1, \cdots, l\}}
\]

such that \( v_{IJ} \circ m_I = p_{IJ} m_J \circ u_{IJ} \) in \( C_{\text{fid}}(\tilde{S}_I) \).

A morphism \( m : ((G_I, F_I), u_{IJ}) \to ((H_I, F_I), v_{IJ}) \) is said to be an \( r \)-filtered top local equivalence if all the \( m_I \) are \( r \)-filtered top local equivalences.

Denote \( L = \{1, \cdots, l\} \) and for \( I \subset L \), \( p_{0(I)} : S \times \tilde{S}_I \to S \), \( p_{I(0)} : S \times \tilde{S}_I \to S_I \) the projections. By definition, we have functors

- \( T((S/\tilde{S}_I)) : C_{\text{fid}}(S) \to C_{\text{fid}}(S/\tilde{S}_I) \), \( (G, F) \to (i_{I*} j_I^* (G, F), I) \)

- \( T((\tilde{S}_I)/S) : C_{\text{fid}}(S/\tilde{S}_I) \to C_{\text{fid}}(S) \), \( (G_I, F_I, u_{IJ}) \to \text{holim}_{I \subset L} p_{0(I)} \Gamma_{\tilde{S}_I} p_{I(0)} (G_I, F_I) \).

Note that the functors \( T(S/\tilde{S}_I) \) are embedding, since

\[
\text{ad}(i_{I*}, i_{I*})(j_I^* F) : i_{I*} j_I^* F \to j_I F
\]
are top local equivalence.

Let \( f : X \to S \) a morphism, with \( X, S \in \text{Top} \). Let \( S = \bigcup_{i=1}^d S_i \) and \( X = \bigcup_{i=1}^d X_i \) be open covers and \( i_i : S_i \hookrightarrow \tilde{S}_i, i'_i : X_i \to \tilde{X}_i \) be closed embeddings, such that, for each \( i \in [1, d] \), \( f_i := f_{X_i} : X_i \to S_i \) lift to a morphism \( \tilde{f}_i : \tilde{X}_i \to \tilde{S}_i \). Then, \( f_I = f_{X_I} : X_I = \cap_{i \in I} X_i \to S_I = \cap_{i \in I} S_i \) lift to the morphism

\[
\tilde{f}_I = \Pi_{i \in I} \tilde{f}_i : \tilde{X}_I = \Pi_{i \in I} \tilde{X}_i \to \tilde{S}_I = \Pi_{i \in I} \tilde{S}_i
\]

Denote by \( p_{IJ} : \tilde{S}_I \to \tilde{S}_I \) and \( p'_{IJ} : \tilde{X}_I \to \tilde{X}_I \) the projections. Consider for \( J \subset I \) the following commutative diagrams

\[
\begin{array}{c}
\begin{array}{ccc}
D_{IJ} &=& S_I \xrightarrow{i_i} S_I, \quad D'_{IJ} = X_I \xrightarrow{i'_i} X_I, \quad D_J = S_I \xrightarrow{i_i} S_I \\
& \downarrow {j_{ij}} & \downarrow {j'_{ij}} & \downarrow {j_{ij}} \\
& S_J = \tilde{S}_J & X_J = \tilde{X}_J & X_I \xrightarrow{i'_i} X_I \\
\end{array}
\end{array}
\]

We have then following commutative diagram

\[
\begin{array}{ccc}
\begin{array}{ccc}
X_I & \xrightarrow{n'_j} & \tilde{X}_I \\
\downarrow {j'_{ij}} & \downarrow {j'_{ij}} & \downarrow {j'_{ij}} \\
& X_I \times X_I \times \tilde{X}_J \xrightarrow{i'_j} & \tilde{X}_J \times \tilde{X}_J
\end{array}
\end{array}
\]

whose square are cartesian. We then have the pullback functor

\[
f^* : C_{(2)fil}(S/\tilde{S}_I) \to C_{(2)fil}(X/(\tilde{X}_I)),
\]

\[
((G, F), u_{IJ}) \mapsto f^*((G, F), u_{IJ}) := (\Gamma_{X_I} \tilde{f}_I^*(G, F), \tilde{f}_I^* u_{IJ})
\]

with

\[
\tilde{f}_{I,J}^* : \Gamma_{X_I} \tilde{f}_I^*(G, F) \xrightarrow{\text{adj}(p_{IJ}, p'_{IJ}, j'_{IJ})} \Gamma_{X_J} \tilde{f}_J^*(G, F) \xrightarrow{T_{X_I}((p_{IJ}, p'_{IJ}, j'_{IJ})^{-1})} \Gamma_{X_J} \tilde{f}_J^*(G, F)
\]

Let \((G, F) \in C_{fil}(S)\). Since, \( j'_I j'_J f^*(G, F) = 0 \), the morphism \( T(D_{IJ})(j'_I j'_J) : \tilde{f}_I^* i_{I,J} j'_I j'_J f^*(G, F) \) factors trough

\[
T(D_{IJ})(j'_I j'_J) : \tilde{f}_I^* i_{I,J} j'_I j'_J f^*(G, F)
\]

We have then, for \((G, F) \in C_{fil}(S)\), the canonical transformation map

\[
f^* T(S/\tilde{S}_I)(G, F) 
\]

\[
\begin{array}{ccc}
\Gamma_{X_I} \tilde{f}_I^* i_{I,J} j'_I j'_J f^*(G, F) & \xrightarrow{T:X_I(/\tilde{X}_I)(f^*(G, F))} & T(X/(\tilde{X}_I)(f^*(G, F))
\end{array}
\]

\[
\begin{array}{ccc}
\Gamma_{X_I} \tilde{f}_I^* i_{I,J} j'_I j'_J f^*(G, F) & \xrightarrow{T:D_{IJ}(j'_I j'_J) f^*(G, F))} & T:((i_{I,J} j'_I j'_J f^*(G, F)), I)
\end{array}
\]

**Proposition 15.** Let \( S \in \text{Top} \). Let \( S = \bigcup_{i=1}^d S_i \) an open cover and denote by \( S_I = \cap_{i \in I} S_i \). Let \( i_i : S_i \hookrightarrow \tilde{S}_i \) closed embeddings, with \( \tilde{S}_i \in \text{Top} \). Denote by \( D_{(2)fil,\infty}((S/\tilde{S}_I)) = \text{Ho}_{top,\infty}(C_{(2)fil}((S/\tilde{S}_I))) \) the localization of \( C_{(2)fil}((S/\tilde{S}_I)) \) with respect to top local equivalences. The functor \( T(S/\tilde{S}_I) \) induces an equivalence of category

\[
T(S/\tilde{S}_I) : D_{(2)fil,\infty}(S) \xrightarrow{\sim} D_{(2)fil,\infty}((S/\tilde{S}_I))
\]

with inverse \( T((\tilde{S}_I)/S) \)
Proof. Follows from the fact that for \((G, F) \in C_{fil}(S)\),
\[
\text{ho lim}_{f \in L} p_{0(0)}, \Gamma_{S,i}^{\mathbb{V}} p_{0(0)}(i \ast j_1^*(G, F)) \rightarrow p_{0(0)}(i \ast j_1^*(G, F))
\]
is an equivalence top local. \(\Box\)

For \(f : T \rightarrow S\) a morphism with \(T, S \in \text{Top} \) locally compact (in particular Hausdorff), e.g. \(T, S \in \text{CW}\), there is also a functor \(f_! : C(T) \rightarrow C(S)\) given by the section which have compact support over \(f\), and, for \(K_1, K_2 \in C(T)\), we have a canonical map
\[
T_t(f, \text{hom}) : f_! \text{Hom}(K_1, K_2) \rightarrow \text{Hom}(f_! K_1, f_! K_2)
\]
The main result on presheaves on locally compact spaces is the following:

**Theorem 9.** Let \(f : T \rightarrow S\) a morphism with \(T, S \in \text{Top} \) locally compact.

(i) The derived functor \(Rf_! : D(T) \rightarrow D(S)\) has a right adjoint \(f^!\) (Verdier duality) and, for \(K_1, K_2 \in D(T)\) and \(K_3, K_4 \in D(S)\), we have canonical isomorphisms
\[
\begin{align*}
- Rf_! R\text{Hom}^*(f_! K_1, K_3) & \xrightarrow{\sim} R\text{Hom}^*(K_1, f^! K_3) \\
- f^! R\text{Hom}^*(K_3, K_4) & \xrightarrow{\sim} R\text{Hom}^*(f^* K_3, f^! K_4)
\end{align*}
\]

(ii) Denote, for \(K \in D(S)\), \(D(K) = R\text{Hom}^*(K, \mathbb{A}_S^2) \in D(S)\) the Verdier dual of \(K\). Then, if \(K \in D_c(S)\), the evaluation map \(\text{ev}^c(S)(K) : K \rightarrow D(D(K))\) is an isomorphism.

(iii) Assume we have a factorization \(f : T \xrightarrow{l} Y \xrightarrow{p} S\) of \(f\) with \(l\) a closed embedding and \(p\) a smooth morphism of relative dimension \(d\). Then \(f^! K = \tilde{\iota}_p^* K[d]\)

Proof. (i): Standard, the proof is formal (see [29]).

(ii): See [29].

(iii): The fact that \(p^! K = \tilde{\iota}_p^* K[d]\) follows by Poincare duality for topological manifold. \(\Box\)

We have by theorem 9 a pair of adjoint functor
\[
(Rf_!, f^!) : D(T) \rightleftarrows D(S)
\]
- with \(f_! = f_*\) if \(f\) is proper,
- with \(f^! = f^*[d]\) if \(f\) is smooth of relative dimension \(d\).

### 2.6 Presheaves on the big Zariski site or on the big etale site

For \(S \in \text{Var}(\mathbb{C})\), we denote by \(\rho_\Sigma : \text{Var}(\mathbb{C})^\text{sm} / S \hookrightarrow \text{Var}(\mathbb{C}) / S\) be the full subcategory consisting of the objects \(U/S = (U, h) \in \text{Var}(\mathbb{C}) / S\) such that the morphism \(h : U \rightarrow S\) is smooth. That is, \(\text{Var}(\mathbb{C})^\text{sm} / S\) is the category

- whose objects are smooth morphisms \(U/S = (U, h), h : U \rightarrow S\) with \(U \in \text{Var}(\mathbb{C})\),
- whose morphisms \(g : U/S = (U, h_1) \rightarrow V/S = (V, h_2)\) is a morphism \(g : U \rightarrow V\) of complex algebraic varieties such that \(h_2 \circ g = h_1\).

We denote again \(\rho_\Sigma : \text{Var}(\mathbb{C}) / S \rightarrow \text{Var}(\mathbb{C})^\text{sm} / S\) the associated morphism of site. We will consider
\[
r^*(S) : \text{Var}(\mathbb{C}) \xrightarrow{r(S)} \text{Var}(\mathbb{C}) / S \xrightarrow{\rho_\Sigma} \text{Var}(\mathbb{C})^\text{sm} / S
\]
the composite morphism of site. For \( S \in \text{Var}(C) \), we denote by \( Z_S := \mathbb{Z}(S/S) \in \text{PSh}(\text{Var}(C)^{sm}/S) \) the constant presheaf. By Yoneda lemma, we have for \( F \in C(\text{Var}(C)^{sm}/S) \), \( \text{Hom}(Z_S, F) = F \). For \( f : T \to S \) a morphism, with \( T, S \in \text{Var}(C) \), we have the following commutative diagram of sites

\[
\begin{array}{ccc}
\text{Var}(C)/T & \xrightarrow{\rho_T} & \text{Var}(C)^{sm}/T \\
\uparrow P(f) & & \uparrow P(f) \\
\text{Var}(C)/S & \xrightarrow{\rho_S} & \text{Var}(C)^{sm}/S
\end{array}
\]  

(23)

We denote, for \( S \in \text{Var}(C) \), the obvious morphism of sites

\[
\tilde{e}(S) : \text{Var}(C)/S \xrightarrow{\rho_S} \text{Var}(C)^{sm}/S \xrightarrow{e(S)} \text{Ouv}(S)
\]

where \( \text{Ouv}(S) \) is the set of the Zariski open subsets of \( S \), given by the inclusion functors \( \tilde{e}(S) : \text{Ouv}(S) \hookrightarrow \text{Var}(C)^{sm}/S \hookrightarrow \text{Var}(C)/S \). By definition, for \( f : T \to S \) a morphism with \( S, T \in \text{Var}(C) \), the commutative diagram of sites (23) extend a commutative diagram of sites:

\[
\begin{array}{ccc}
\text{Var}(C)/T & \xrightarrow{\rho_T} & \text{Var}(C)^{sm}/T \\
\uparrow P(f) & & \uparrow P(f) \\
\text{Var}(C)/S & \xrightarrow{\rho_S} & \text{Var}(C)^{sm}/S
\end{array}
\]  

(24)

\[
\tilde{e}(T) : \text{Var}(C)/T \xrightarrow{\rho_T} \text{Var}(C)^{sm}/T \xrightarrow{e(T)} \text{Ouv}(T)
\]

\[
\tilde{e}(S) : \text{Var}(C)/S \xrightarrow{\rho_S} \text{Var}(C)^{sm}/S \xrightarrow{e(S)} \text{Ouv}(S)
\]

- As usual, we denote by

\[
(f^*, f_s) := (P(f)^*, P(f)_s) : C(\text{Var}(C)^{sm}/S) \to C(\text{Var}(C)^{sm}/T)
\]

the adjunction induced by \( P(f) : \text{Var}(C)^{sm}/T \to \text{Var}(C)^{sm}/S \). Since the colimits involved in the definition of \( f^* = P(f)^* \) are filtered, \( f^* \) also preserve monomorphism. Hence, we get an adjunction

\[
(f^*, f_s) : C_{fil}(\text{Var}(C)^{sm}/S) \leftrightarrows C_{fil}(\text{Var}(C)^{sm}/T), f^*(G, F) := (f^*G, f^*F)
\]

- As usual, we denote by

\[
(f^*, f_s) := (P(f)^*, P(f)_s) : C(\text{Var}(C)/S) \to C(\text{Var}(C)/T)
\]

the adjunction induced by \( P(f) : \text{Var}(C)/T \to \text{Var}(C)/S \). Since the colimits involved in the definition of \( f^* = P(f)^* \) are filtered, \( f^* \) also preserve monomorphism. Hence, we get an adjunction

\[
(f^*, f_s) : C_{fil}(\text{Var}(C)/S) \leftrightarrows C_{fil}(\text{Var}(C)/T), f^*(G, F) := (f^*G, f^*F)
\]

- For \( h : U \to S \) a smooth morphism with \( U, S \in \text{Var}(C) \), the pullback functor \( P(h) : \text{Var}(C)^{sm}/S \to \text{Var}(C)^{sm}/U \) admits a left adjoint \( C(h)(X \to U) = (X \to U \to S) \). Hence, \( h^* : C(\text{Var}(C)^{sm}/S) \to C(\text{Var}(C)^{sm}/U) \) admits a left adjoint

\[
h_* : C(\text{Var}(C)^{sm}/U) \to C(\text{Var}(C)^{sm}/S), F \mapsto \lim_{(V, h_0) \to (V', h_0)} F(V', h_0)
\]

Note that we have for \( V/U = (V, h') \) with \( h' : V \to U \) a smooth morphism we have \( h_0(\mathbb{Z}(V/U)) = \mathbb{Z}(V'/S) \) with \( V'/S = (V', h \circ h') \). Hence, since projective presheaves are the direct summands of the representable presheaves, \( h_* \) sends projective presheaves to projective presheaves. For \( F^* \in C(\text{Var}(C)^{sm}/S) \) and \( G^* \in C(\text{Var}(C)^{sm}/U) \), we have the adjunction maps

\[
\text{ad}(h_2, h^*)(G^*) : G^* \to h^* h_2 G^*, \quad \text{ad}(h_2, h^*)(F^*) : h_2 h^* F^* \to F^*.
\]

For a smooth morphism \( h : U \to S \), with \( U, S \in \text{Var}(C) \), we have the adjunction isomorphism, for \( F \in C(\text{Var}(C)^{sm}/U) \) and \( G \in C(\text{Var}(C)^{sm}/S) \),

\[
I(h_2, h^*)(F, G) : \text{Hom}^*(h_2 F, G) \cong h_* \text{Hom}^*(F, h^* G).
\]

(25)
• For a morphism $f : T \to S$ any morphism with $T, S \in \text{Var}(C)$, the pullback functor $P(f) : \text{Var}(C)/T \to \text{Var}(C)/S$ admits a left adjoint $C(f)(X \to T) = (X \to T \to S)$. Hence, $f^* : \text{C}(\text{Var}(C)/S) \to \text{C}(\text{Var}(C)/T)$ admits a left adjoint

$$f_2 : \text{C}(\text{Var}(C)/T) \to \text{C}(\text{Var}(C)/S), \quad F \mapsto ((V, h_0) \mapsto \lim_{(V', f \circ h') \to (V, h_0)} F(V', h'))$$

Note that we have, for $(V/T) = (V, h), f_2Z(V/T) = Z(V/S)$ with $V/S = (V, f \circ h)$. Hence, since projective presheaves are the direct summands of the representable presheaves, $h_2$ sends projective presheaves to projective presheaves. For $F^* \in \text{C}(\text{Var}(C)/S)$ and $G^* \in \text{C}(\text{Var}(C)/T)$, we have the adjunction maps

$$\text{ad}(f_2, f^*)(G^*) : G^* \to f^*f_2G^*, \quad \text{ad}(f_2, f^*)(F^*) : f_2f^*F^* \to F^*.$$ For a morphism $f : T \to S$, with $T, S \in \text{Var}(C)$, we have the adjunction isomorphism, for $F \in \text{C}(\text{Var}(C)/T)$ and $G \in \text{C}(\text{Var}(C)/S),$

$$I(f_2, f^*)(F, G) : \text{Hom}^*(f_2F, G) \xrightarrow{\sim} f_*\text{Hom}^*(F, f^*G). \quad (26)$$

• For a commutative diagram in $\text{Var}(C)$ :

$$D = V \xrightarrow{g_2} U \xrightarrow{h_1} T \xrightarrow{g_1} S$$

where $h_1$ and $h_2$ are smooth, we denote by, for $F^* \in \text{C}(\text{Var}(C)^{\text{sm}}/U),$

$$T^*(D)(F^*) : h_{21}g_2^*F^* \to g_1^*h_1F^*$$

the canonical map in $\text{C}(\text{Var}(C)^{\text{sm}}/T)$ given by adjunction. If $D$ is cartesian with $h_1 = h, g_1 = g, f_2 = h' : U_T \to T, g' : U_T \to U,$

$$T^*(D)(F^*) =: T^*(g, h)(F^*) : h'_2g'_2F^* \xrightarrow{\sim} g_1^*h_1F^*$$

is an isomorphism and for $G^* \in \text{C}(\text{Var}(C)^{\text{sm}}/T)$

$$T(D)(G^*) =: T(g, h)(G^*) : g^*h_4G^* \xrightarrow{\sim} h'_4g'_4G^*$$

is an isomorphism.

• For a commutative diagram in $\text{Var}(C)$ :

$$D = V \xrightarrow{g_2} X \xrightarrow{f_1} S$$

we denote by, for $F^* \in \text{C}(\text{Var}(C)/X),$

$$T^*(D)(F^*) : f_{21}g_2^*F^* \to g_1^*f_1F^*$$

the canonical map in $\text{C}(\text{Var}(C)/T)$ given by adjunction. If $D$ is cartesian with $h_1 = h, g_1 = g, f_2 = h' : X_T \to T, g' : X_T \to X,$

$$T^*(D)(F^*) =: T^*(g, f)(F^*) : f'_2g'_2F^* \xrightarrow{\sim} g_1^*f_1F^*$$

is an isomorphism and for $G^* \in \text{C}(\text{Var}(C)/T)$

$$T(D)(G^*) =: T(g, h)(G^*) : f^*g_4G^* \xrightarrow{\sim} g'_1f'_1G^*$$

is an isomorphism.

46
For $f : T \to S$ a morphism with $S, T \in \text{Var}(\mathbb{C})$,

- we get for $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$ from the a commutative diagram of sites (24) the following canonical transformation
  
  $$T(e,f)(F^\bullet) : f^*e(S)_*F^\bullet \to e(T)_*f^*F^\bullet,$$

  which is NOT a quasi-isomorphism in general. However, for $h : U \to S$ a smooth morphism with $S,U \in \text{Var}(\mathbb{C})$, $T(e,h)(F^\bullet) : h^*e(S)_*F^\bullet \simto e(T)_*h^*F^\bullet$ is an isomorphism.

- we get for $F \in C(\text{Var}(\mathbb{C})/S)$ from the a commutative diagram of sites (24) the following canonical transformation
  
  $$T(e,f)(F^\bullet) : f^*e(S)_*F^\bullet \to e(T)_*f^*F^\bullet,$$

  which is NOT a quasi-isomorphism in general. However, for $h : U \to S$ a smooth morphism with $S,U \in \text{Var}(\mathbb{C})$, $T(e,h)(F^\bullet) : h^*e(S)_*F^\bullet \simto e(T)_*h^*F^\bullet$ is an isomorphism.

Let $S \in \text{Var}(\mathbb{C})$,

- We have for $F, G \in C(\text{Var}(\mathbb{C})^{sm}/S)$,
  
  - $e(S)_*(F \otimes G) = (e(S)_*F) \otimes (e(S)_*G)$ by definition
  - the canonical forgetful map
  
  $$T(S, \text{hom})(F,G) : e(S)_*\mathcal{H}om^\bullet(F,G) \to \mathcal{H}om^\bullet(e(S)_*F,e(S)_*G).$$

  which is NOT a quasi-isomorphism in general.

  By definition, we have for $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$, $e(S)_*E_{zar}(F) = E_{zar}(e(S)_*F)$.

- We have for $F, G \in C(\text{Var}(\mathbb{C})/S)$,
  
  - $e(S)_*(F \otimes G) = (e(S)_*F) \otimes (e(S)_*G)$ by definition
  - the canonical forgetful map
  
  $$T(S, \text{hom})(F,G) : e(S)_*\mathcal{H}om^\bullet(F,G) \to \mathcal{H}om^\bullet(e(S)_*F,e(S)_*G).$$

  which is NOT a quasi-isomorphism in general.

  By definition, we have for $F \in C(\text{Var}(\mathbb{C})/S)$, $e(S)_*E_{zar}(F) = E_{zar}(e(S)_*F)$.

Let $S \in \text{Var}(\mathbb{C})$,

- We have the dual functor
  
  $\mathbb{D}_S : C(\text{Var}(\mathbb{C})^{sm}/S) \to C(\text{Var}(\mathbb{C})^{sm}/S), \ F \mapsto \mathbb{D}_S(F) := \mathcal{H}om(F,E_{et}(\mathbb{Z}_S))$

  It induces the functor
  
  $L\mathbb{D}_S : C(\text{Var}(\mathbb{C})^{sm}/S) \to C(\text{Var}(\mathbb{C})^{sm}/S), \ F \mapsto L\mathbb{D}_S(F) := \mathbb{D}_S(LF) := \mathcal{H}om(LF,E_{et}(\mathbb{Z}_S))$

- We have the dual functor
  
  $\mathbb{D}_S : C(\text{Var}(\mathbb{C})/S) \to C(\text{Var}(\mathbb{C})/S), \ F \mapsto \mathbb{D}_S(F) := \mathcal{H}om(F,E_{et}(\mathbb{Z}_S))$

  It induces the functor
  
  $L\mathbb{D}_S : C(\text{Var}(\mathbb{C})/S) \to C(\text{Var}(\mathbb{C})/S), \ F \mapsto L\mathbb{D}_S(F) := \mathbb{D}_S(LF) := \mathcal{H}om(LF,E_{et}(\mathbb{Z}_S))$
The adjunctions
\[(\tilde{e}(S)^*, \tilde{e}(S)_*) : C(\text{Var}(\mathbb{C})/S) \leftrightarrows C(S), \ (e(S)^*, e(S)_*) : C(\text{Var}(\mathbb{C})^{sm}/S) \leftrightarrows C(S)\]
induce adjunctions
\[(\tilde{e}(S)^*, \tilde{e}(S)_*) : C_{fil}(\text{Var}(\mathbb{C})/S) \leftrightarrows C_{fil}(S), \ (e(S)^*, e(S)_*) : C_{fil}(\text{Var}(\mathbb{C})^{sm}/S) \leftrightarrows C_{fil}(S)\]
given by \(e(S)_*(G, F) := (e(S)_*G, e(S)_*F)\), since \(e(S)_*\) and \(e(S)^*\) preserve monomorphisms. Note that

- for \(F \in \text{PSh}(\text{Var}(\mathbb{C})^{sm}/S)\), \(e(S)_*F\) is simply the restriction of \(F\) to the small Zariski site of \(X\),
- for \(F \in \text{PSh}(\text{Var}(\mathbb{C})/S)\), \(\tilde{e}(S)_*F = e(S)_*\rho_{S*}F\) is simply the restriction of \(F\) to the small Zariski site of \(X\), \(\rho_{S*}F\) being the restriction of \(F\) to \(\text{Var}(\mathbb{C})^{sm}/S\).

Together with the internal hom functor, we get the bifunctor,
\[e(S)_* \text{Hom}(\cdot, \cdot) : C_{fil}(\text{Var}(\mathbb{C})^{sm}/S) \times C_{fil}(\text{Var}(\mathbb{C})^{sm}/S) \to C_{fil}(S), \quad ((F, W), (G, F)) \mapsto e(S)_* \text{Hom}((F^*, W), (G^*, F)).\]

For \(i : Z \hookrightarrow S\) a closed embedding, with \(Z, S \in \text{Var}(\mathbb{C})\), we denote by
\[i_*^\dagger := (P(i)_*, P(i)^\dagger) : C(\text{Var}(\mathbb{C})^{sm}/Z) \leftrightarrows C(\text{Var}(\mathbb{C})^{sm}/S)\]
the adjonction induced by the morphism of site \(P(i) : \text{Var}(\mathbb{C})^{sm}/Z \to \text{Var}(\mathbb{C})^{sm}/S\) For \(i : Z \hookrightarrow S\) a closed embedding, \(Z, S \in \text{Var}(\mathbb{C})\), we denote
\[Z_{Z, S} := \text{Cone}(\text{ad}(i^*, i_*)(Z_S) : Z_S \to i_*Z_Z)\]
We have the support section functors of a closed embedding \(i : Z \hookrightarrow S\) for presheaves on the big Zariski site.

**Definition 6.** Let \(i : Z \hookrightarrow S\) be a closed embedding with \(S, Z \in \text{Var}(\mathbb{C})\) and \(j : S\backslash Z \hookrightarrow S\) be the open complementary subset.

(i) We define the functor
\[\Gamma_Z : C(\text{Var}(\mathbb{C})^{sm}/S) \to C(\text{Var}(\mathbb{C})^{sm}/S), \ G^* \mapsto \Gamma_Z G^* := \text{Cone}(\text{ad}(j_*, j_*)(G^*) : G^* \to j_*j^*G^*)[-1],\]
so that there is then a canonical map \(\gamma_Z(G^*) : \Gamma_Z G^* \to G^*\).

(ii) We have the dual functor of (i):
\[\Gamma_Z^\vee : C(\text{Var}(\mathbb{C})^{sm}/S) \to C(\text{Var}(\mathbb{C})^{sm}/S), \ F \mapsto \Gamma_Z^\vee(F^*) := \text{Cone}(\text{ad}(j_!, j^*)(G^*) : j_!j^*G^* \to G^*),\]
together with the canonical map \(\gamma_Z^\vee(G) : F \to \Gamma_Z^\vee(G)\).

(iii) For \(F, G \in C(\text{Var}(\mathbb{C})^{sm}/S)\), we denote by
\[I(\gamma, \text{hom})(F, G) := (I, I(j_!, j^*)(F, G)^{-1}) : \Gamma_Z \text{Hom}(F, G) \xrightarrow{\sim} \text{Hom}(\Gamma_Z^\vee F, G)\]
the canonical isomorphism given by adjonction.

Let \(i : Z \hookrightarrow S\) be a closed embedding with \(S, Z \in \text{Var}(\mathbb{C})\) and \(j : S\backslash Z \hookrightarrow S\) be the open complementary.
• For $G \in C(\text{Var}(\mathbb{C})^{sm}/S)$, the adjunction map $\text{ad}(i_*, i^!(G)) : i_* i^! G \to G$ factor through $\gamma_Z(G)$:

$$\text{ad}(i_*, i^!(G)) : i_* i^! G \xrightarrow{\text{ad}(i_*, i^!(G))} \Gamma_Z(G) \xrightarrow{\gamma_Z(G)} G.$$ 

However, note that when dealing with the big sites $P(i) : \text{Var}(\mathbb{C})^{sm}/Z \to \text{Var}(\mathbb{C})^{sm}/S$, if $G \in C(\text{Var}(\mathbb{C})^{sm}/S)$ is not $\mathbb{A}^1_k$ local and Zariski fibrant, 

$$\text{ad}(i_*, i^!(G))\gamma : i_* i^! G \to \Gamma_Z(G)$$

is NOT and homotopy equivalence, and $\Gamma_Z G \in C(\text{Var}(\mathbb{C})^{sm}/S)$ is NOT in general in the image of the functor $i_* : C(\text{Var}(\mathbb{C})^{sm}/Z) \to C(\text{Var}(\mathbb{C})^{sm}/S)$.

• For $G \in C(\text{Var}(\mathbb{C})^{sm}/S)$, the adjunction map $\text{ad}(i^*, i_*)(G) : G \to i_* i^* G$ factor through $\gamma_Z^\vee(G)$:

$$\text{ad}(i^*, i_*)(G) : G \xrightarrow{\gamma_Z^\vee(G)} \Gamma_Z^\vee G \xrightarrow{\text{ad}(i^*, i_*)(G)\gamma} i_* i^* G,$$

and as in (i), $\text{ad}(i^*, i_*)(G)\gamma : \Gamma_Z^\vee(G) \to i_* i^* G$ is NOT an homotopy equivalence but

Let $i : Z \hookrightarrow S$ be a closed embedding with $S, Z \in \text{Var}(\mathbb{C})$.

• Since $\Gamma_Z : C(\text{Var}(\mathbb{C})^{sm}/S) \to C(\text{Var}(\mathbb{C})^{sm}/S)$ preserve monomorphism, it induces a functor

$$\Gamma_Z : C_{fil}(\text{Var}(\mathbb{C})^{sm}/S) \to C_{fil}(\text{Var}(\mathbb{C})^{sm}/S), \ (G, F) \mapsto \Gamma_Z(G, F) := (\Gamma_Z G, \Gamma_Z F)$$

• Since $\Gamma_Z^\vee : C(\text{Var}(\mathbb{C})^{sm}/S) \to C(\text{Var}(\mathbb{C})^{sm}/S)$ preserve monomorphism, it induces a functor

$$\Gamma_Z^\vee : C_{fil}(\text{Var}(\mathbb{C})^{sm}/S) \to C_{fil}(\text{Var}(\mathbb{C})^{sm}/S), \ (G, F) \mapsto \Gamma_Z^\vee(G, F) := (\Gamma_Z^\vee G, \Gamma_Z^\vee F)$$

Definition-Proposition 4. (i) Let $g : S' \to S$ a morphism and $i : Z \hookrightarrow S$ a closed embedding with $S', S, Z \in \text{Var}(\mathbb{C})$. Then, for $(G, F) \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S')$, there exist a map in $C_{fil}(\text{Var}(\mathbb{C})^{sm}/S')$

$$T(g, \gamma)(G, F) : g^* \Gamma_Z(G, F) \to \Gamma_{Z \times_S S'} g^*(G, F)$$

unique up to homotopy such that $\gamma_{Z \times_S S'}(g^*(G, F)) \circ T(g, \gamma)(G, F) = g^* \gamma_Z(G, F)$.

(ii) Let $i_1 : Z_1 \hookrightarrow S, i_2 : Z_2 \hookrightarrow Z_1$ be closed embeddings with $S, Z_1, Z_2 \in \text{Var}(\mathbb{C})$. Then, for $(G, F) \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)$,

- there exist a canonical map $T(Z_2/Z_1, \gamma)(G, F) : \Gamma_{Z_1}(G, F) \to \Gamma_{Z_1}(G, F)$ in $C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)$ unique up to homotopy such that $\gamma_{Z_1}(G, F) \circ T(Z_2/Z_1, \gamma)(G, F) = \gamma_{Z_2}(G, F)$, together with a distinguish triangle

$$\Gamma_{Z_2}(G, F) \xrightarrow{T(Z_2/Z_1, \gamma)(G, F)} \Gamma_{Z_1}(G, F) \xrightarrow{\text{ad}(j_{2!}, j_2^*)(\Gamma_{Z_1}(G, F))} \Gamma_{Z_1 \setminus Z_2}(G, F) \to \Gamma_{Z_2}(G, F)[1]$$

in $K_{fil}(\text{Var}(\mathbb{C})^{sm}/S) := K(\text{PSh}_{fil}(\text{Var}(\mathbb{C})^{sm}/S))$,

- there exist a map $T(Z_2/Z_1, \gamma^\vee)(G, F) : \Gamma_{Z_1}(G, F) \to \Gamma_{Z_2}(G, F)$ in $C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)$ unique up to homotopy such that $\gamma_{Z_1}^\vee(G, F) = T(Z_2/Z_1, \gamma^\vee)(G, F) \circ \gamma_{Z_1}^\vee(G, F)$, together with a distinguish triangle

$$\Gamma_{Z_1 \setminus Z_2}(G, F) \xrightarrow{\text{ad}(j_{2!}, j_2^*)(\Gamma_{Z_1}^\vee(G, F))} \Gamma_{Z_1}^\vee(G, F) \xrightarrow{T(Z_2/Z_1, \gamma^\vee)(G, F)} \Gamma_{Z_2}^\vee(G, F) \to \Gamma_{Z_1 \setminus Z_2}(G, F)[1]$$

in $K_{fil}(\text{Var}(\mathbb{C})^{sm}/S)$.
(iii) Consider a morphism \( g : (S', Z') \to (S, Z) \) with \((S', Z'), (S, Z) \in \text{Var}^2(\mathbb{C})\) We denote, for \( G \in C(\text{Var}(\mathbb{C})^{sm}/S) \) the composite
\[
T(D, \gamma)(G) : g^*\Gamma^r_C G \rightarrow \Gamma^r_{Z \times S' S'} g^* G \xrightarrow{T(Z'/Z \times S' S', \gamma)(G)} \Gamma^r_{Z'} g^* G
\]
and we have then the factorization \( \gamma_{Z'}(g^* G) : g^* G \xrightarrow{g^* \gamma_{Z'}(G)} g^* \Gamma^r_{Z} g^* G \xrightarrow{T(D, \gamma)(G)} \Gamma^r_{Z'} g^* G. \)

Proof. (i): We have the cartesian square
\[
\begin{array}{c}
S' \times S \\
g \downarrow \\
S \\
\end{array}
\]
and the map is given by
\[(I, T(g, j)(j^* G)) : \text{Cone}(g^* G \rightarrow g^* j_* j^* G) \rightarrow \text{Cone}(g^* G \rightarrow j'_* j^* G = j'_* j^* G).\]

(ii): Follows from the fact that \( j_1^* \Gamma_{Z} G = 0 \) and \( j_1^* \Gamma_{Z'} G = 0 \), with \( j_1 : S' \setminus Z_1 \hookrightarrow S \) the closed embedding.

(iii): Obvious. \( \square \)

The following easy proposition concern the restriction from the big Zariski site to the small site Zariski site:

**Proposition 16.** For \( f : T \rightarrow S \) a morphism and \( i : Z \hookrightarrow S \) a closed embedding, with \( Z, S, T \in \text{Var}(\mathbb{C}) \), we have
\[
\begin{align*}
(i) & \ e(S)_* f_* = f_* e(T)_* \text{ and } e(S)^* f_* = f_* e(T)^* \\
(ii) & \ e(S)_* \Gamma_Z = \Gamma_Z e(S)_*.
\end{align*}
\]

Proof. (i): The first equality \( e(S)_* f_* = f_* e(T)_* \) is given by the diagram \([23]\). The second equality is immediate from definition after a direct computation.

(ii) For \( G^* \in C(\text{Var}(\mathbb{C})^{sm}/S) \), we have the canonical equality
\[
e(S)_* \Gamma_Z(G^*) = e(S)_* \text{Cone}(G \rightarrow j_* j^* G^*)[-1] = \text{Cone}(e(S)_* G^* \rightarrow e(S)_* j_! j^* G^*)[-1] = \Gamma_Z e(S)_* G^*
\]
by (i) and since \( j : S \setminus Z \hookrightarrow S \) is a smooth morphism. \( \square \)

**Definition 7.** For \( S \in \text{Var}(\mathbb{C}) \), we denote by
\[
C_{O_S}(\text{Var}(\mathbb{C})^{sm}/S) := C_{e(S)^* O_S}(\text{Var}(\mathbb{C})^{sm}/S)
\]
the category of complexes of presheaves on \( \text{Var}(\mathbb{C})^{sm}/S \) endowed with a structure of \( e(S)^* O_S \) module, and by
\[
C_{O_S, fil}(\text{Var}(\mathbb{C})^{sm}/S) := C_{e(S)^* O_S, fil}(\text{Var}(\mathbb{C})^{sm}/S)
\]
the category of filtered complexes of presheaves on \( \text{Var}(\mathbb{C})^{sm}/S \) endowed with a structure of \( e(S)^* O_S \) module.

Let \( S \in \text{Var}(\mathbb{C}) \). Let \( Z \subset S \) a closed subset. Denote by \( j : S \setminus Z \hookrightarrow S \) the open complementary embedding,
• For $G \in C_{O_s}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$, $\Gamma_Z G := \text{Cone}(\text{ad}(j^*, j_*)(G) : F \to j_* j^* G)[-1]$ has a (unique) structure of $e(S)^*O_S$ module such that $\gamma_Z(G) : \Gamma_Z G \to G$ is a map in $C_{O_S}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$. This gives the functor

$$\Gamma_Z : C_{O_S}fil(\text{Var}(\mathbb{C})^{\text{sm}}/S) \to C_{filO_S}(\text{Var}(\mathbb{C})^{\text{sm}}/S), \ (G, F) \mapsto \Gamma_Z(G, F) := (\Gamma_Z G, \Gamma_Z F),$$

together with the canonical map $\gamma_Z((G, F) : \Gamma_Z(G, F) \to (G, F)$. Let $Z_2 \subset Z$ a closed subset. Then, for $G \in C_{O_S}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$, $T(Z_2/Z, \gamma)(G) : \Gamma_{Z_2}G \to \Gamma_Z G$ is a map in $C_{O_S}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$ (i.e. is $e(S)^*O_S$ linear).

• For $G \in C_{O_S}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$, $\Gamma_Z^\vee G := \text{Cone}(\text{ad}(j_2, j^*)(G) : j_2 j^* G \to G)$ has a unique structure of $e(S)^*O_S$ module such that $\gamma_Z^\vee(G) : G \to \Gamma_Z^\vee G$ is a map in $C_{O_S}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$. This gives the the functor

$$\Gamma_Z^\vee : C_{O_S}fil(S) \to C_{filO_S}(S), \ (G, F) \mapsto \Gamma_Z^\vee(G, F) := (\Gamma_{Z_2}^\vee G, \Gamma_{Z_2}^\vee F),$$

together with the canonical map $\gamma_Z^\vee((G, F) : (G, F) \to (G, F)$, Let $Z_2 \subset Z$ a closed subset. Then, for $G \in C_{O_S}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$, $T(Z_2/Z, \gamma^\vee)(G) : \Gamma_{Z_2}^\vee G \to \Gamma_Z^\vee G$ is a map in $C_{O_S}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$ (i.e. is $e(S)^*O_S$ linear).

**Definition 8.** Let $S \in \text{Var}(\mathbb{C})$. Let $Z \subset S$ a closed subset.

(i) We denote by

$$C_Z(\text{Var}(\mathbb{C})^{\text{sm}}/S) \subset C(\text{Var}(\mathbb{C})^{\text{sm}}/S)$$

the full subcategory consisting of complexes of presheaves $F^\bullet \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S)$ such that $a_{et}H^n(j^* F^\bullet) = 0$ for all $n \in \mathbb{Z}$, where $j : S \setminus Z \hookrightarrow S$ is the complementary open embedding and $a_{et}$ is the sheafification functor.

(i)' We denote by

$$C_{O_S,Z}(\text{Var}(\mathbb{C})^{\text{sm}}/S) \subset C_{O_S}(\text{Var}(\mathbb{C})^{\text{sm}}/S),$$

the full subcategory consisting of complexes of presheaves $F^\bullet \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S)$ such that $a_{et}H^n(j^* F^\bullet) = 0$ for all $n \in \mathbb{Z}$, where $j : S \setminus Z \hookrightarrow S$ is the complementary open embedding and $a_{et}$ is the sheafification functor.

(ii) We denote by

$$C_{fil,Z}(\text{Var}(\mathbb{C})^{\text{sm}}/S) \subset C_{fil}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$$

the full subcategory consisting of filtered complexes of presheaves $(F^\bullet, F) \in C_{fil}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$ such that there exist $r \in \mathbb{N}$ such that $a_{et} j^* E_{p,q}^r(F^\bullet, F) = 0$ for all $p, q \in \mathbb{Z}$, where $j : S \setminus Z \hookrightarrow S$ is the complementary open embedding and $a_{et}$ is the sheafification functor. Note that by definition this $r$ does NOT depend on $p$ and $q$.

(ii)' We denote by

$$C_{O_S,fil,Z}(\text{Var}(\mathbb{C})^{\text{sm}}/S) \subset C_{O_S,fil}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$$

the full subcategory consisting of filtered complexes of presheaves $(F^\bullet, F) \in C_{O_S,fil}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$ such that there exist $r \in \mathbb{N}$ such that $a_{et} j^* E_{p,q}^r(F^\bullet, F) = 0$ for all $p, q \in \mathbb{Z}$, where $j : S \setminus Z \hookrightarrow S$ is the complementary open embedding and $a_{et}$ is the sheafification functor. Note that by definition this $r$ does NOT depend on $p$ and $q$.

Let $S \in \text{Var}(\mathbb{C})$ and $Z \subset S$ a closed subset.

• For $(G, F) \in C_{fil}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$, we have $\Gamma_Z(G, F), \Gamma_{Z_2}^\vee(G, F) \in C_{fil,Z}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$.

• For $(G, F) \in C_{O_S,fil}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$, we have $\Gamma_Z(G, F), \Gamma_{Z_2}^\vee(G, F) \in C_{O_S,fil,Z}(\text{Var}(\mathbb{C})^{\text{sm}}/S)$.
Let $S \in \text{Var}(\mathbb{C})$. Let $S = \bigcup_{i=1}^{l} S_i$ an open affine cover and denote by $S_I = \cap_{i \in I} S_i$. Let $i_i : S_i \rightarrow \tilde{S}_i$, closed embeddings, with $\tilde{S}_i \in \text{Var}(\mathbb{C})$. For $I \subset [1, \ldots, l]$, denote by $\tilde{S}_I = \Pi_{i \in I} \tilde{S}_i$. We then have closed embeddings $i_I : S_I \hookrightarrow \tilde{S}_I$ and for $J \subset I$ the following commutative diagram

$$
D_{IJ} = S_I \xrightarrow{i_I} \tilde{S}_I \\
\downarrow j_{JI} \quad \downarrow p_{IJ} \\
S_J \xrightarrow{i_J} \tilde{S}_J
$$

where $p_{IJ} : \tilde{S}_J \rightarrow \tilde{S}_I$ is the projection and $j_{JI} : S_J \hookrightarrow S_I$ is the open embedding so that $j_I \circ j_{JI} = j_J$. This gives the diagram of algebraic varieties $(\tilde{S}_I) \in \text{Fun}(\mathcal{P}(\mathbb{N}), \text{Var}(\mathbb{C}))$ which the diagram of sites $\text{Var}(\mathbb{C})^{sm}/(\tilde{S}_I) \in \text{Fun}(\mathcal{P}(\mathbb{N}), \text{Cat})$. Denote by $m : \tilde{S}_I \setminus (\tilde{S}_J \setminus S_I) \hookrightarrow \tilde{S}_I$ the open embedding.

**Definition 9.** Let $S \in \text{Var}(\mathbb{C})$. Let $S = \bigcup_{i=1}^{l} S_i$ an open cover and denote by $S_I = \cap_{i \in I} S_i$. Let $i_i : S_i \rightarrow \tilde{S}_i$, closed embeddings, with $\tilde{S}_i \in \text{Var}(\mathbb{C})$. We will denote by $C_{fid}(\text{Var}(\mathbb{C})^{sm}/(S/(\tilde{S}_I))) \subset C_{fid}(\text{Var}(\mathbb{C})^{sm}/(\tilde{S}_I))$ the full subcategory

- whose objects $(G, F) = ((G_I, F)_{I \subset [1, \ldots, l]}, u_{IJ})$, with $(G_I, F) \in C_{fid}(S_I)(\text{Var}(\mathbb{C})^{sm}/\tilde{S}_I)$, and $u_{IJ} : m^\ast(G_I, F) \rightarrow m^\ast p_{IJ} \ast (G_J, F)$ for $I \subset J$, are infinite filtered Zariski local equivalence, satisfying for $I \subset J \subset K$, $p_{IJ} \circ p_{JI} = p_{IK}$ in $C_{fid}(\text{Var}(\mathbb{C})^{sm}/\tilde{S}_I)$,

- the morphisms $m = ((G, F), u_{IJ}) \rightarrow ((H, F), v_{IJ})$ being (see section 2.1) a family of morphisms of complexes,

$$
m = (m_I : (G_I, F) \rightarrow (H_I, F))_{I \subset [1, \ldots, l]}
$$

such that $v_{IJ} \circ m_I = p_{IJ} \ast m_J \circ u_{IJ}$ in $C_{fid}(\text{Var}(\mathbb{C})^{sm}/\tilde{S}_I)$.

A morphism $m = ((G, F), u_{IJ}) \rightarrow ((H, F), v_{IJ})$ is said to an $r$-filtered Zariski, resp. etale local, equivalence, if all the $m_I$ are $r$-filtered Zariski, resp. etale, local equivalences.

Denote $L = [1, \ldots, l]$ and for $I \subset L$, $p_{0(I)} : S \times \tilde{S}_I \rightarrow S$, $p_{I(I)} : S \times \tilde{S}_I \rightarrow S_I$ the projections. By definition, we have functors

- $T(S/(\tilde{S}_I)) : C_{fid}(\text{Var}(\mathbb{C})^{sm}/S) \rightarrow C_{fid}(\text{Var}(\mathbb{C})^{sm}/(S/(\tilde{S}_I))), (G, F) \rightarrow (i_I, j^\ast_I(G, F), T(D_{IJ})(j^\ast_I(G, F)))$,

- $T((\tilde{S}_I)/S) : C_{fid}(\text{Var}(\mathbb{C})^{sm}/(S/(\tilde{S}_I))) \rightarrow C_{fid}(\text{Var}(\mathbb{C})^{sm}/S), ((G_I, F), u_{IJ}) \rightarrow \text{ho lim}_{I \subset L} p_{0(I)} \ast \Gamma_{S_I}^{I} p_{I(I)}^{\ast}(G_I, F)$.

Note that the functors $T(S/(\tilde{S}_I))$ are NOT embedding, since

$$
\text{ad}(i_I^\ast, i_{I(I)}^\ast)(j_I^\ast F) : i_I^\ast i_{I(I)}^\ast F \rightarrow j_I^\ast F
$$

are Zariski local equivalence but NOT isomorphism since we are dealing with the morphism of big sites $P(i_I) : \text{Var}(\mathbb{C})^{sm}/S \rightarrow \text{Var}(\mathbb{C})^{sm}/S_I$. However, by theorem 13 these functors induce full embeddings

$$
T(S/(\tilde{S}_I)) : D_{fid}(\text{Var}(\mathbb{C})^{sm}/S) \rightarrow D_{fid}(\text{Var}(\mathbb{C})^{sm}/(S/(\tilde{S}_I)))
$$

since for $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$,

$$
\text{ho lim}_{I \subset L} p_{0(I)} \ast \Gamma_{S_I}^{I} p_{I(I)}^{\ast}(i_I^\ast j_I^\ast F) \rightarrow p_{0(I)} \ast \Gamma_{S_I}^{I} j_I^\ast F
$$

is an equivalence Zariski local.

Let $f : X \rightarrow S$ a morphism, with $X, S \in \text{Var}(\mathbb{C})$. Let $S = \bigcup_{i=1}^{l} S_i$ and $X = \bigcup_{i=1}^{l} X_i$ be affine open covers and $i_i : S_i \rightarrow \tilde{S}_i, i_i' : X_i \rightarrow \tilde{X}_i$ be closed embeddings. Let $f_i : \tilde{X}_i \rightarrow \tilde{S}_i$ be a lift of the morphism $f_i = f_{|X_i} : X_i \rightarrow S_i$. Then, $f_I = f_{|X_I} : X_I = \cap_{i \in I} X_i \rightarrow S_I = \cap_{i \in I} \tilde{S}_i$, lift to the morphism

$$
\tilde{f}_I = \Pi_{i \in I} \tilde{f}_i : \tilde{X}_I = \Pi_{i \in I} \tilde{X}_i \rightarrow \tilde{S}_I = \Pi_{i \in I} \tilde{S}_i
$$
Denote by $p_{IJ} : \tilde{S}_J \to \tilde{S}_I$ and $p'_{IJ} : \tilde{X}_J \to \tilde{X}_I$ the projections. Consider for $J \subset I$ the following commutative diagrams

$$D_{IJ} = \begin{array}{ccc}
S_I & \xrightarrow{i_i} & \tilde{S}_I \\
\downarrow S_J & & \downarrow \tilde{S}_J \\
X_J & \xrightarrow{\tilde{p}_{IJ}} & \tilde{X}_J \\
\downarrow i_j & & \downarrow \tilde{X}_I \\
S_I & \xrightarrow{i_i} & \tilde{S}_I
\end{array}$$

$D'_{IJ} = \begin{array}{ccc}
X_I & \xrightarrow{i'_i} & \tilde{X}_I \\
\downarrow S_J & & \downarrow \tilde{S}_J \\
X_J & \xrightarrow{p'_{IJ}} & \tilde{X}_J \\
\downarrow i'_j & & \downarrow \tilde{X}_I \\
X_I & \xrightarrow{i'_i} & \tilde{X}_I
\end{array}$

We have then following commutative diagram

$$\begin{array}{ccc}
X_I & \xrightarrow{n'_j} & \tilde{X}_I \\
\downarrow S_J & & \downarrow \tilde{S}_J \\
X_J & \xrightarrow{p'_{IJ}} & \tilde{X}_J \\
\downarrow i'_j & & \downarrow \tilde{X}_I \\
X_I \times X_J & \xrightarrow{n'_j \times I} & \tilde{X}_I \times \tilde{X}_J
\end{array}$$

whose square are cartesian. We then have the pullback functor

$$f^* : C_{(2)fil}(\text{Var}(\mathbb{C})^{sm}/S/(\tilde{S}_I)) \to C_{(2)fil}(\text{Var}(\mathbb{C})^{sm}/X/(\tilde{X}_I)),
((G, F), u_{IJ}) \to f^*((G, F), u_{IJ}) := (\Gamma_{\tilde{X}_I} \tilde{j}_I^*(G, F), \tilde{f}_I^*u_{IJ})$$

with

$$\tilde{f}_I^*u_{IJ} : \Gamma_{\tilde{X}_I} \tilde{j}_I^*(G, F) \xrightarrow{\text{add}(\tilde{\phi}_{IJ}, \tilde{\psi}_{IJ}, \alpha_\gamma)} p_{IJ}^* \Gamma_{\tilde{X}_I} \tilde{j}_I^*(G, F) \xrightarrow{T_{\tilde{I}J}(p_{IJ}, \tilde{\psi}_{IJ}, \alpha_\gamma)} p_{IJ}^* \Gamma_{\tilde{X}_I} \tilde{j}_I^*(G, F) \xrightarrow{T_{\tilde{I}J}(p_{IJ}, \tilde{\psi}_{IJ}, \alpha_\gamma)^{-1}} p_{IJ}^* \Gamma_{\tilde{X}_I} \tilde{j}_I^*(G, F)$$

Let $(G, F) \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)$. Since, $j_I^* i_{IJ}^* j_I^* f^*(G, F) = 0$, the morphism $T(D_{IJ})(j_I^*(G, F)) : \tilde{j}_I^* i_{IJ}^* j_I^* f^*(G, F)$ factors trough

$$T(D_{IJ})(j_I^*(G, F)) : \tilde{j}_I^* i_{IJ}^* j_I^* f^*(G, F) \xrightarrow{\text{add}(\tilde{\phi}_{IJ}, \tilde{\psi}_{IJ}, \alpha_\gamma)} \Gamma_{\tilde{X}_I} \tilde{j}_I^* i_{IJ}^* j_I^* f^*(G, F) \xrightarrow{T_{\tilde{I}J}(j_I^*(G, F))} \tilde{i}_{IJ}^* \tilde{j}_I^* f^*(G, F)$$

We have then, for $(G, F) \in C_{fil}(S)$, the canonical transformation map

$$f^* T(S/(\tilde{S}_I))(G, F) \xrightarrow{T(f, T(1/I))(G, F)} T(X/(\tilde{X}_I))(f^*(G, F))$$

$$\text{Def 10.} \ (i) \text{ Let } f : X \to S \text{ a morphism with } X, S \in \text{Var}(\mathbb{C}). \text{ Assume that there exist a factorization } f : X \xrightarrow{i} Y \times S \xrightarrow{p} S, \text{ with } Y \in \text{SmVar}(\mathbb{C}), i : X \hookrightarrow Y \text{ is a closed embedding and } p \text{ the projection. We then consider}

$$Q(X/S) := p_t \Gamma_X^\vee f_* Z_{Y \times S} \in C(\text{Var}(\mathbb{C})^{sm}/S).$$

By definition $Q(X/S)$ is projective.
(ii) Let \( f : X \to S \) and \( g : T \to S \) two morphism with \( X, S, T \in \Var(\mathbb{C}) \). Assume that there exist a factorization \( f : X \to Y \times S \to S \), with \( Y \in \Sm\Var(\mathbb{C}), i : X \to Y \) is a closed embedding and \( p \) the projection. We then have the following commutative diagram whose squares are cartesian

\[
\begin{array}{ccc}
f : X & \xrightarrow{i} & Y \times S \\
g' & \downarrow & \downarrow g \\
f' : XT & \xrightarrow{i'} & Y \times T
\end{array}
\]

We then have the canonical isomorphism in \( C(\Var(\mathbb{C})^{sm}/T) \)

\[
T(f, g, Q) : g^*Q(X/S) \xrightarrow{T_1(g,p)(\cdot)^{-1}} p'^*\Gamma_X^g\Gamma_Y^{\tau g}Z_{Y \times S} \xrightarrow{p'^*\Gamma_X^g\Gamma_Y^{\tau g}(\cdot)^{-1}} \Gamma_X^{g \tau}\Gamma_Y^{\tau g}Z_{Y \times T} =: Q(\tau T/T).
\]

(iii) Let \( f : X \to S \) a morphism with \( X, S \in \Var(\mathbb{C}) \). Assume that there exist a factorization \( f : X \to Y \times S \to S \), with \( Y \in \Sm\Var(\mathbb{C}), i : X \to Y \) is a closed embedding and \( p \) the projection. We then consider

\[
Q^h(X/S) := p_1\Gamma_X E_{et}(Z_{Y \times S}) \in C(\Var(\mathbb{C})^{sm}/S).
\]

(iv) Let \( f : X \to S \) and \( g : T \to S \) two morphism with \( X, S, T \in \Var(\mathbb{C}) \). Assume that there exist a factorization \( f : X \to Y \times S \to S \), with \( Y \in \Sm\Var(\mathbb{C}), i : X \to Y \) is a closed embedding and \( p \) the projection. We then have the following commutative diagram whose squares are cartesian

\[
\begin{array}{ccc}
f : X & \xrightarrow{i} & Y \times S \\
g' & \downarrow & \downarrow g \\
f' : XT & \xrightarrow{i'} & Y \times T
\end{array}
\]

We then have the canonical morphism in \( C(\Var(\mathbb{C})^{sm}/T) \)

\[
T(f, g, Q^h) : g^*Q^h(X/S) \xrightarrow{T_1(g,p)(\cdot)^{-1}} p'^*\Gamma_X^g\Gamma_Y^{\tau g}E_{et}(Z_{Y \times S}) \xrightarrow{p'^*\Gamma_X^g\Gamma_Y^{\tau g}(\cdot)^{-1}} \Gamma_X^{g \tau}\Gamma_Y^{\tau g}E_{et}(Z_{Y \times T}) =: Q^h(\tau T/T).
\]

We now give the definition of the \( \mathbb{A}^1 \) local property :

**Definition 11.** Let \( S \in \Var(\mathbb{C}) \). Denote for short \( \Var(\mathbb{C})^{(sm)}/S \) either the category \( \Var(\mathbb{C})/S \) or the category \( \Var(\mathbb{C})^{sm}/S \).

(i) A complex \( F \in C(\Var(\mathbb{C})^{(sm)}/S) \) is said to be \( \mathbb{A}^1 \) invariant if for all \( U/S \in \Var(\mathbb{C})^{(sm)}/S \),

\[
F(p_U) : F(U/S) \to F(U \times \mathbb{A}^1/S)
\]

is a quasi-isomorphism, where \( p_U : U \times \mathbb{A}^1 \to U \) is the projection.

(ii) Let \( \tau \) a topology on \( \Var(\mathbb{C}) \). A complex \( F \in C(\Var(\mathbb{C})^{(sm)}/S) \) is said to be \( \mathbb{A}^1 \) local for the topology \( \tau \), if for a (hence every) \( \tau \) local equivalence \( k : F \to G \) with \( k \) injective and \( G \in \Var(\mathbb{C})^{(sm)}/S \) \( \tau \) fibrant, e.g. \( k : F \to E_{et}(F), G \) is \( \mathbb{A}^1 \) invariant for all \( n \in \mathbb{Z} \).

(iii) A morphism \( m : F \to G \) with \( F, G \in C(\Var(\mathbb{C})^{(sm)}/S) \) is said to an \( (\mathbb{A}^1, \text{et}) \) local equivalence if for all \( H \in C(\Var(\mathbb{C})^{(sm)}/S) \) which is \( \mathbb{A}^1 \) local for the etale topology

\[
\text{Hom}(L(m), E_{et}(H)) : \text{Hom}(L(G), E_{et}(H)) \to \text{Hom}(L(F), E_{et}(H))
\]
is a quasi-isomorphism. Equivalently, \( m : F \to G \) with \( F,G \in C(\var(C)^{(sm)}/S) \) is an \((\mathbb{A}^1, et)\) local equivalence if and only if there exists \( X_1/S, \ldots, X_r/S \in \var(C)^{(sm)}/S \) such that we have in \( \Ho_{et}(C(\var(C)^{(sm)}/S)) \)

\[
\text{Cone}(m) \xrightarrow{\sim} \text{Cone}(\text{Cone}(\mathbb{Z}(X_1 \times \mathbb{A}^1/S) \to \mathbb{Z}(X_1/S)) \to \cdots \to \text{Cone}(\mathbb{Z}(X_r \times \mathbb{A}^1/S) \to \mathbb{Z}(X_r/S)))
\]

**Definition-Proposition 5.** Let \( S \in \var(C) \).

(i) With the weak equivalence the \((\mathbb{A}^1, et)\) local equivalence and the fibration the epimorphism with \( \mathbb{A}^1_S \) local and etale fibrant kernels gives a model structure on \( C(\var(C)^{(sm)}/S) : \) the left bousfield localization of the projective model structure of \( C(\var(C)^{(sm)}/S) \). We call it the projective \((\mathbb{A}^1, et)\) model structure.

(ii) With the weak equivalence the \((\mathbb{A}^1, et)\) local equivalence and the fibration the epimorphism with \( \mathbb{A}^1_S \) local and etale fibrant kernels gives a model structure on \( C(\var(C)/S) : \) the left bousfield localization of the projective model structure of \( C(\var(C)/S) \). We call it the projective \((\mathbb{A}^1, et)\) model structure.

Proof. See [10].

We will consider for the construction of the filtered De Rham realization functor the filtered case :

**Definition 12.** Let \( S \in \var(C) \). Denote for short \( \var(C)^{(sm)}/S \) either the category \( \var(C)/S \) or the category \( \var(C)^{(sm)}/S \).

(i) Let \( r \in \mathbb{N} \). A filtered complex \( (G, F) \in C_{fil}(\var(C)^{(sm)}/S) \) is said to be an \( r \)-filtered \( \mathbb{A}^1 \) invariant if for all \( U/S \in \var(C)^{(sm)}/S \), and all \( p,q \in \mathbb{Z} \),

\[
E_{p,q}^r(G, F)(U/S) \overset{\sim}{\rightarrow} E_{p,q}^r(G, F)(U \times \mathbb{A}^1/S)
\]

is an isomorphism of abelian groups, where \( p_U : U \times \mathbb{A}^1 \to U \) is the projection. Note that this definition say that this \( r \) does NOT depend on \( p \) and \( q \).

(ii) A filtered complex \( (G, F) \in C_{fil}(\var(C)^{(sm)}/S) \) is said to be \( \infty \)-filtered \( \mathbb{A}^1 \) invariant if for all \( U/S \in \var(C)^{(sm)}/S \), there exist \( r \in \mathbb{N} \) such that for all \( p,q \in \mathbb{Z} \),

\[
E_{p,q}^r(G, F)(U/S) \overset{\sim}{\rightarrow} E_{p,q}^r(G, F)(U \times \mathbb{A}^1/S)
\]

is an isomorphism of abelian groups, where \( p_U : U \times \mathbb{A}^1 \to U \) is the projection (note that this definition say that this \( r \) does NOT depend on \( p \) and \( q \) but may depends on \( U/S \)). This implies that for all \( U/S \in \var(C)^{(sm)}/S \),

\[
H^n(G, F)(U/S) \overset{\sim}{\rightarrow} H^n(G, F)(U \times \mathbb{A}^1/S)
\]

is a filtered isomorphism of filtered abelian groups for all \( n \in \mathbb{Z} \).

(iii) Let \( \tau \) a topology on \( \var(C)^{(sm)} \). A filtered complex \( (G, F) \in C_{fil}(\var(C)^{(sm)}/S) \) is said to be \( \infty \)-filtered \( \mathbb{A}^1 \) local for the topology \( \tau \) if for a (hence every) \( \infty \)-filtered \( \tau \) local equivalence \( k : (G, F) \to (H, F) \) with \( k \) injective and \( (H, F) \in C_{fil}(\var(C)^{(sm)}/S) \) \( \infty \)-filtered \( \tau \) fibrant, e.g. \( k : (G, F) \to E_\tau(G, F), (H, F) \) is \( \infty \)-filtered \( \mathbb{A}^1 \) invariant.

**Lemma 1.** Let \( S \in \var(C) \).

(i) Let \( (G, F) \in C_{fil}(\var(C)^{(sm)}/S) \) Then, if \( m : F_1 \to F_2 \) with \( F_1, F_2 \in C(\var(C)^{(sm)}/S) \) is an etale local equivalence,

\[
\text{Hom}(m, E_{et}(G, F)) : \text{Hom}^\bullet(F_2, E_{et}(G, F)) \to \text{Hom}^\bullet(F_1, E_{et}(G, F))
\]

is a filtered quasi-isomorphism.
(ii) Let \((G, F) \in C_{fd}(\text{Var}(\mathbb{C})^{sm}/S)\) be \(\infty\)-filtered \(\mathbb{A}^1\) local for the etale topology. Then, if \(m : F_1 \to F_2\) with \(F_1, F_2 \in C(\text{Var}(\mathbb{C})^{sm}/S)\) is an \((\mathbb{A}^1, \text{et})\) local equivalence,

\[
\text{Hom}(m, E_{\text{et}}(G, F)) : \text{Hom}^*(F_2, E_{\text{et}}(G, F)) \to \text{Hom}^*(F_1, E_{\text{et}}(G, F))
\]

is an \(\infty\)-filtered quasi-isomorphism.

Proof. (i): Follows from the fact that \(E_{\text{et}}(G, F)\) is \((1-)\)-filtered etale fibrant.

(ii) By definition of an \((\mathbb{A}^1, \text{et})\) local equivalence, we have there exists \(X_1/S, \ldots, X_r/S \in \text{Var}(\mathbb{C})^{sm}/S\) such that we have in \(\text{Ho}_{\text{et}}(C(\text{Var}(\mathbb{C})^{sm}/S))\)

\[
\text{Cone}(m) \cong \text{Cone}(\text{Cone}(\mathbb{Z}(X_1 \times \mathbb{A}^1/S) \to \mathbb{Z}(X_1/S)) \to \cdots \to \text{Cone}(\mathbb{Z}(X_r \times \mathbb{A}^1/S) \to \mathbb{Z}(X_r/S)))
\]

This gives in \(D_{\text{fd},1}(\mathbb{Z}) := \text{Ho}_{\text{fd},1}(\mathbb{Z})\),

\[
\text{Cone}(\text{Hom}(m, E_{\text{et}}(G, F))) \cong \text{Cone}(\text{Cone}(E_{\text{et}}(G, F)(X_1/S) \to E_{\text{et}}(G, F)(X_1 \times \mathbb{A}^1/S))) \to \cdots \to \text{Cone}(E_{\text{et}}(G, F)(X_r/S) \to E_{\text{et}}(G, F)(X_r \times \mathbb{A}^1/S)))
\]

Since \((G, F) \in C_{fd}(\text{Var}(\mathbb{C})^{sm}/S)\) is \(\infty\)-filtered \(\mathbb{A}^1\) local for the etale topology, there exist \(s_i \in \mathbb{Z}\) such that for all \(p, q \in \mathbb{Z}\),

\[
E^{p,q}_{s} \text{Cone}(E_{\text{et}}(G, F)(X_i/S) \to E_{\text{et}}(G, F)(X_i \times \mathbb{A}^1/S)) = 0
\]

Hence for \(s := \max((s_i)_{1 \leq i \leq r})\), \(E^{p,q}_{s} \text{Cone}(\text{Hom}(m, E_{\text{et}}(G, F))) = 0\). \(\square\)

Denote \(\square^* \subset \mathbb{P}^*

- Let \(S \in \text{Var}(\mathbb{C})\). For \(U/S = (U, h) \in \text{Var}(\mathbb{C})^{sm}/S\), we consider

\[\square^* \times U/S = (\mathbb{A}^* \times U, h \circ p) \in \text{Fun}(\Delta, \text{Var}(\mathbb{C})^{sm}/S)\].

For \(F \in C^{-}(\text{Var}(\mathbb{C})^{sm}/S)\), it gives the complex

\[C_* F \in C^{-}(\text{Var}(\mathbb{C})^{sm}/S), U/S = (U, h) \mapsto C_* F(U/S) := \text{Tot} F(\square^* \times U/S)\]

together with the canonical map \(c_F := (0, I_F) : C_* F \to F\). For \(F \in C(\text{Var}(\mathbb{C})^{sm}/S)\), we get

\[C_* F := \text{holim}_n C_* F^{\leq n} \in C(\text{Var}(\mathbb{C})^{sm}/S)\],

together with the canonical map \(c_F := (0, I_F) : C_* F \to F\). For \(m : F \to G\) a morphism, with \(F, G \in C(\text{Var}(\mathbb{C})^{sm}/S)\), we get by functoriality the morphism \(C_* m : C_* F \to C_* G\).

- Let \(S \in \text{Var}(\mathbb{C})\). For \(U/S = (U, h) \in \text{Var}(\mathbb{C})/S\), we consider

\[\square^* \times U/S = (\mathbb{A}^* \times U, h \circ p) \in \text{Fun}(\Delta, \text{Var}(\mathbb{C})/S)\].

For \(F \in C^{-}(\text{Var}(\mathbb{C})/S)\), it gives the complex

\[C_* F \in C^{-}(\text{Var}(\mathbb{C})/S), U/S = (U, h) \mapsto C_* F(U/S) := \text{Tot} F(\square^* \times U/S)\]

together with the canonical map \(c_F := (0, I_F) : C_* F \to F\). For \(F \in C(\text{Var}(\mathbb{C})/S)\), we get

\[C_* F := \text{holim}_n C_* F^{\leq n} \in C(\text{Var}(\mathbb{C})/S)\],

together with the canonical map \(c_F := (0, I_F) : C_* F \to F\). For \(m : F \to G\) a morphism, with \(F, G \in C(\text{Var}(\mathbb{C})/S)\), we get by functoriality the morphism \(C_* m : C_* F \to C_* G\).
Proposition 17. Let $S \in \text{Var}(\mathbb{C})$. Then for $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$, $C_*F$ is $\mathbb{A}^1$ local for the etale topology and $c_{FP} : C_*F \rightarrow F$ is an equivalence $(\mathbb{A}^1, \text{et})$ local.

Proposition 18. Let $g : T \rightarrow S$ a morphism with $T, S \in \text{Var}(\mathbb{C})$.

(i) The adjonction $(g^*, g_* : C(\text{Var}(\mathbb{C})^{sm}/S) \rightleftharpoons C(\text{Var}(\mathbb{C})^{sm}/T))$ is a Quillen adjonction for the $(\mathbb{A}^1, \text{et})$ projective model structure (see definition-proposition [5]).

(ii) Let $h : U \rightarrow S$ a smooth morphism with $U, S \in \text{Var}(\mathbb{C})$.

The adjonction $(h^*, h_* : C(\text{Var}(\mathbb{C})^{sm}/U) \rightleftharpoons C(\text{Var}(\mathbb{C})^{sm}/S))$ is a Quillen adjonction for the $(\mathbb{A}^1, \text{et})$ projective model structure.

Proposition 19. Let $S \in \text{Var}(\mathbb{C})$.

(i) The adjonction $(\rho_S^*, \rho_S_* : C(\text{Var}(\mathbb{C})^{sm}/S) \rightleftharpoons C(\text{Var}(\mathbb{C})/S))$ is a Quillen adjonction for the $(\mathbb{A}^1, \text{et})$ projective model structure.

(ii) The functor $\rho_S^* : C(\text{Var}(\mathbb{C})/S) \rightarrow C(\text{Var}(\mathbb{C})^{sm}/S)$ sends quasi-isomorphism to quasi-isomorphism, sends equivalence Zariski local to equivalence Zariski local, and equivalence etale local to equivalence etale local, sends $(\mathbb{A}^1, \text{et})$ local equivalence to $(\mathbb{A}^1, \text{et})$ local equivalence.

For $S \in \text{Var}(\mathbb{C})$, let $\text{Cor}(\text{Var}(\mathbb{C})^{sm}/S)$ be the category

- whose objects are smooth morphisms $U/S = (U, h)$, $h : U \rightarrow S$ with $U \in \text{Var}(\mathbb{C})$,
- whose morphisms $\alpha : U/S = (U, h_1) \rightarrow V/S = (V, h_2)$ is finite correspondence that is $\alpha \in \bigoplus_i \mathbb{Z}/i(U_i \times_S V)$, where $U = \bigsqcup_i U_i$, with $U_i$ connected, and $\mathbb{Z}/i(U_i \times_S V)$ is the abelian group of cycle finite and surjective over $U_i$.

We denote by $\text{Tr}(S) : \text{Cor}(\text{Var}(\mathbb{C})^{sm}/S) \rightarrow \text{Cor}(\text{Var}(\mathbb{C})^{sm}/S)$ the morphism of site given by the inclusion functor $\text{Tr}(S) : \text{Var}(\mathbb{C})^{sm}/S \rightarrow \text{Cor}(\text{Var}(\mathbb{C})^{sm}/S)$ It induces an adjonction

\[(\text{Tr}(S)^* \text{Tr}(S)_*) : C(\text{Var}(\mathbb{C})^{sm}/S) \rightleftharpoons C(\text{Cor}(\text{Var}(\mathbb{C})^{sm}/S))\]

A complex of preheaves $G \in C(\text{Var}(\mathbb{C})^{sm}/S)$ is said to admit transfers if it is in the image of the embedding

\[\text{Tr}(S)_* : C(\text{Cor}(\mathbb{C})^{sm}/S) \hookrightarrow C(\text{Var}(\mathbb{C})^{sm}/S),\]

that is $G = \text{Tr}(S)_* \text{Tr}(S)^* G$.

We will use to define the algebraic De Rahm realization functor the following
Theorem 10. Let \( \phi : F^* \to G^* \) an etale local equivalence with \( F^*, G^* \in C(\text{Var}(\mathbb{C})^{sm}/S) \). If \( F^* \) and \( G^* \) are \( \mathcal{A}^1 \) local and admit transferts then \( \phi : F^* \to G^* \) is a Zariski local equivalence. Hence if \( F \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is \( \mathcal{A}^1 \) local and admits transfert

\[
k : E_{zar}(F) \to E_{et}(E_{zar}(F)) = E_{et}(F)
\]

is a Zariski local equivalence.

Proof. See [10]. \( \square \)

2.7 Presheaves on the big Zariski site or the big etale site of pairs

We recall the definition given in subsection 5.1: For \( S \in \text{Var}(\mathbb{C}) \), \( \text{Var}(\mathbb{C})^{2}/S := \text{Var}(\mathbb{C})^{2}/(S,S) \) is by definition (see subsection 2.1) the category whose set of objects is

\[
(\text{Var}(\mathbb{C})^{2}/S)^0 := \{((X,Z), h) : X \to S, Z \subset X \text{ closed} \} \subset \text{Var}(\mathbb{C})/S \times \text{Top}
\]

and whose set of morphisms between \( (X_1, Z_1)/S = ((X_1, Z_1), h_1), (X_2, Z_2)/S = ((X_2, Z_2), h_2) \in \text{Var}(\mathbb{C})^{2}/S \) is the subset

\[
\text{Hom}_{\text{Var}(\mathbb{C})^{2}/S}((X_1, Z_1)/S, (X_2, Z_2)/S) := \{(f : X_2 \to X_2), \text{ s.t. } h_1 \circ f = h_2 \text{ and } Z_1 \subset f^{-1}(Z_2)\} \subset \text{Hom}_{\text{Var}(\mathbb{C})}(X_1, X_2)
\]

The category \( \text{Var}(\mathbb{C})^{2} \) admits fiber products : \( (X_1, Z_1) \times (S, Z) (X_2, Z_2) = (X_1 \times_Z X_2, Z_1 \times_Z Z_2) \). In particular, for \( f : T \to S \) a morphism with \( S,T \in \text{Var}(\mathbb{C}) \), we have the pullback functor

\[
P(f) : \text{Var}(\mathbb{C})^{2}/S \to \text{Var}(\mathbb{C})^{2}/T, P(f)((X,Z)/S) := (X_T, Z_T)/T, P(f)(g) := (g \times_S f)
\]

and we note again \( P(f) : \text{Var}(\mathbb{C})^{2}/T \to \text{Var}(\mathbb{C})^{2}/S \) the corresponding morphism of sites.

We will consider in the construction of the filtered De Rham realization functor the full subcategory \( \text{Var}(\mathbb{C})^{2,sm}/S \subset \text{Var}(\mathbb{C})^{2}/S \) such that the first factor is a smooth morphism: We will also consider, in order to obtain a complex of D modules in the construction of the filtered De Rham realization functor, the restriction to the full subcategory \( \text{Var}(\mathbb{C})^{2,pr}/S \subset \text{Var}(\mathbb{C})^{2}/S \) such that the first factor is a projection :

**Definition 13.**

(i) Let \( S \in \text{Var}(\mathbb{C}) \). We denote by

\[
\rho_S : \text{Var}(\mathbb{C})^{2,sm}/S \hookrightarrow \text{Var}(\mathbb{C})^{2}/S
\]

the full subcategory consisting of the objects \( (U,Z)/S = ((U,Z), h) \in \text{Var}(\mathbb{C})^{2}/S \) such that the morphism \( h : U \to S \) is smooth. That is, \( \text{Var}(\mathbb{C})^{2,sm}/S \) is the category

- whose objects are \( (U,Z)/S = ((U,Z), h) \), with \( U \in \text{Var}(\mathbb{C}) \), \( Z \subset U \) a closed subset, and \( h : U \to S \) a smooth morphism,

- whose morphisms \( g : (U,Z)/S = ((U,Z), h_1) \to (U',Z')/S = ((U',Z'), h_2) \) is a morphism \( g : U \to U' \) of complex algebraic varieties such that \( Z \subset g^{-1}(Z') \) and \( h_2 \circ g = h_1 \).

We denote again \( \rho_S : \text{Var}(\mathbb{C})^{2}/S \to \text{Var}(\mathbb{C})^{2,sm}/S \) the associated morphism of site. We have

\[
r^*(S) : \text{Var}(\mathbb{C})^{2} \xrightarrow{r(S) := r(S,S)} \text{Var}(\mathbb{C})^{2}/S \xrightarrow{\rho_S} \text{Var}(\mathbb{C})^{2,sm}/S
\]

the composite morphism of site.

(ii) Let \( S \in \text{Var}(\mathbb{C}) \). We will consider the full subcategory

\[
\mu_S : \text{Var}(\mathbb{C})^{2,pr}/S \hookrightarrow \text{Var}(\mathbb{C})^{2}/S
\]

whose subset of object consist of those whose morphism is a projection to \( S \):

\[
(\text{Var}(\mathbb{C})^{2,pr}/S)^0 := \{((Y \times S, X), p), Y \in \text{Var}(\mathbb{C}), p : Y \times S \to S \text{ the projection}\} \subset (\text{Var}(\mathbb{C})^{2}/S)^0.
\]
(iii) We will consider the full subcategory
\[ \mu_S : (\text{Var}(\mathbb{C})^{2,\text{smpr}} / S) \hookrightarrow \text{Var}(\mathbb{C})^{2,\text{sm}} / S \]
whose subset of object consist of those whose morphism is a smooth projection to S:
\[(\text{Var}(\mathbb{C})^{2,\text{smpr}} / S)^0 := \{(Y \times S, X), p, Y \in \text{SmVar}(\mathbb{C}), p : Y \times S \rightarrow S \text{ the projection} \} \subset (\text{Var}(\mathbb{C})^{2}/S)^0 \]
For \( f : T \rightarrow S \) a morphism with \( T, S \in \text{Var}(\mathbb{C}) \), we have by definition, the following commutative diagram of sites

\[
\begin{array}{ccc}
\text{Var}(\mathbb{C})^{2}/T & \xrightarrow{\mu_T} & \text{Var}(\mathbb{C})^{2,\text{pr}} / T \\
\downarrow P(f) & & \downarrow P(f) \\
\text{Var}(\mathbb{C})^{2,\text{sm}} / S & \xrightarrow{\eta_f} & \text{Var}(\mathbb{C})^{2,\text{smpr}} / T \\
\downarrow P(f) & & \downarrow P(f) \\
\text{Var}(\mathbb{C})^{2,\text{sm}} / S & \xrightarrow{\mu_S} & \text{Var}(\mathbb{C})^{2,\text{smpr}} / S
\end{array}
\]
Recall we have (see subsection 2.1), for \( S \in \text{Var}(\mathbb{C}) \), the graph functor
\[ \text{Gr}_S^{12} : \text{Var}(\mathbb{C}) / S \rightarrow \text{Var}(\mathbb{C})^{2,\text{pr}} / S, \quad X / S \mapsto \text{Gr}_S^{12}(X / S) := (X \times S, X) / S, \]
\[(g : X / S \rightarrow X' / S) \mapsto \text{Gr}_S^{12}(g) := (g \times I_S : (X \times S, X) \rightarrow (X' \times S, X')) \]
For \( f : T \rightarrow S \) a morphism with \( T, S \in \text{Var}(\mathbb{C}) \), we have by definition, the following commutative diagram of sites

\[
\begin{array}{ccc}
\text{Var}(\mathbb{C})^{2,\text{pr}} / T & \xrightarrow{\text{Gr}_f^{12}} & \text{Var}(\mathbb{C}) / T \\
\downarrow P(f) & & \downarrow P(f) \\
\text{Var}(\mathbb{C})^{2,\text{smpr}} / S & \xrightarrow{\text{Gr}_f^{12}} & \text{Var}(\mathbb{C})^{2,\text{sm}} / S \\
\downarrow P(f) & & \downarrow P(f) \\
\text{Var}(\mathbb{C})^{2,\text{sm}} / S & \xrightarrow{\mu_S} & \text{Var}(\mathbb{C})^{2,\text{smpr}} / S
\end{array}
\]
where we recall that \( P(f)((X, Z) / S) := ((X_T, Z_T) / T) \), since smooth morphisms are preserved by base change.

- As usual, we denote by \( (f^*, f_*) := (P(f))^*, P(f)_* : C(\text{Var}(\mathbb{C})^{2,(\text{sm})} / S) \rightarrow C(\text{Var}(\mathbb{C})^{2,(\text{sm})} / T) \)
  the adjunction induced by \( P(f) : \text{Var}(\mathbb{C})^{2,(\text{sm})} / T \rightarrow \text{Var}(\mathbb{C})^{2,(\text{sm})} / S \). Since the colimits involved in the definition of \( f^* = P(f)^* \) are filtered, \( f^* \) also preserve monomorphism. Hence, we get an adjunction
  \[ (f^*, f_* : C_{\text{fil}}(\text{Var}(\mathbb{C})^{2,(\text{sm})} / S) \dashv C_{\text{fil}}(\text{Var}(\mathbb{C})^{2,(\text{sm})} / T), f^*(G, F) := (f^* G, f^* F) \]
  For \( S \in \text{Var}(\mathbb{C}) \), we denote by \( Z_S := Z((S, S) / (S, S)) \in \text{PSh}(\text{Var}(\mathbb{C})^{2,(\text{sm})} / S) \) the constant presheaf. By Yoneda lemma, we have for \( F \in C(\text{Var}(\mathbb{C})^{2,(\text{sm})} / S) \), \( \text{Hom}(Z_S, F) = F \).
As usual, we denote by

\[(f^*, f_*) := (P(f))^*, P(f)_*): C(\text{Var}(C)^{2,(sm)pr}/S) \to C(\text{Var}(C)^{2,(sm)pr}/T)\]

the adjunction induced by \(P(f): \text{Var}(C)^{2,(sm)pr}/T \to \text{Var}(C)^{2,(sm)pr}/S\). Since the colimits involved in the definition of \(f^* = P(f)^*\) are filtered, \(f^*\) also preserve monomorphism. Hence, we get an adjunction

\[(f^*, f_*): C_{fil}(\text{Var}(C)^{2,(sm)pr}/S) \rightleftharpoons C_{fil}(\text{Var}(C)^{2,(sm)pr}/T), \quad f^*(G, F) := (f^*G, f^*F)\]

For \(S \in \text{Var}(C)\), we denote by \(Z_S := Z((S, S)/(S, S)) \in \text{PSh}(\text{Var}(C)^{2,sm}/S)\) the constant presheaf.

By Yoneda lemma, we have for \(F \in C(\text{Var}(C)^{2,sm}/S)\), \(\text{Hom}(Z_S, F) = F\).

- For \(h : U \to S\) a smooth morphism with \(U, S \in \text{Var}(C)\), \(P(h) : \text{Var}(C)^{2,sm}/S \to \text{Var}(C)^{2,sm}/U\) admits a left adjoint

\[C(h) : \text{Var}(C)^{2,sm}/U \to \text{Var}(C)^{2,sm}/S, \quad C(h)((U', Z'), h') = ((U', Z'), h \circ h').\]

Hence \(h^* : C(\text{Var}(C)^{2,sm}/S) \to C(\text{Var}(C)^{2,sm}/U)\) admits a left adjoint

\[h^*_F : C(\text{Var}(C)^{2,sm}/U) \to C(\text{Var}(C)^{2,sm}/S), \quad F \mapsto (h^*_F : ((U, Z), h_0) \mapsto \lim_{((U', Z'), h \circ h') \to ((U, Z), h_0)} F((U', Z')/U))\]

- For \(h : X \to S\) a morphism with \(X, S \in \text{Var}(C)\), \(P(h) : \text{Var}(C)^{2}/S \to \text{Var}(C)^{2}/X\) admits a left adjoint

\[C(h) : \text{Var}(C)^{2}/X \to \text{Var}(C)^{2}/S, \quad C(h)((X', Z'), h') = ((X', Z'), h \circ h').\]

Hence \(h^* : C(\text{Var}(C)^{2}/S) \to C(\text{Var}(C)^{2}/X)\) admits a left adjoint

\[h^*_F : C(\text{Var}(C)^{2}/X) \to C(\text{Var}(C)^{2}/S), \quad F \mapsto (h^*_F : ((X, Z), h_0) \mapsto \lim_{((X', Z'), h \circ h') \to ((X, Z), h_0)} F((X', Z')/X))\]

- For \(p : Y \times S \to S\) a projection with \(Y, S \in \text{Var}(C)\) with \(Y\) smooth, \(P(p) : \text{Var}(C)^{2,smpr}/S \to \text{Var}(C)^{2,smpr}/Y \times S\) admits a left adjoint

\[C(p) : \text{Var}(C)^{2,smpr}/Y \times S \to \text{Var}(C)^{2,smpr}/S, \quad C(p)((Y' \times S, Z'), p') = ((Y' \times S, Z'), p \circ p').\]

Hence \(p^* : C(\text{Var}(C)^{2,smpr}/S) \to C(\text{Var}(C)^{2,smpr}/Y \times S)\) admits a left adjoint

\[p^*_F : C(\text{Var}(C)^{2,smpr}/Y \times S) \to C(\text{Var}(C)^{2,smpr}/S), \quad F \mapsto (p^*_F : ((Y_0 \times S, Z), p_0) \mapsto \lim_{((Y' \times Y \times S, Z'), p \circ p') \to ((Y_0 \times S, Z), p_0)} F((Y' \times Y \times S, Z')/(Y \times S)))\]

- For \(p : Y \times S \to S\) a projection with \(Y, S \in \text{Var}(C)\), \(P(p) : \text{Var}(C)^{2,pr}/S \to \text{Var}(C)^{2,pr}/Y \times S\) admits a left adjoint

\[C(p) : \text{Var}(C)^{2,pr}/Y \times S \to \text{Var}(C)^{2,pr}/S, \quad C(p)((Y' \times S, Z'), p') = ((Y' \times S, Z'), p \circ p').\]

Hence \(p^* : C(\text{Var}(C)^{2,pr}/S) \to C(\text{Var}(C)^{2,pr}/Y \times S)\) admits a left adjoint

\[p^*_F : C(\text{Var}(C)^{2,pr}/Y \times S) \to C(\text{Var}(C)^{2,pr}/S), \quad F \mapsto (p^*_F : ((Y_0 \times S, Z), p_0) \mapsto \lim_{((Y' \times Y \times S, Z'), p \circ p') \to ((Y_0 \times S, Z), p_0)} F((Y' \times Y \times S, Z')/(Y \times S)))\]
We have the support section functors of a closed embedding \( i : Z \hookrightarrow S \) for presheaves on the big Zariski site of pairs.

**Definition 14.** Let \( i : Z \hookrightarrow S \) be a closed embedding with \( S, Z \in \text{Var}(\mathbb{C}) \) and \( j : S \setminus Z \hookrightarrow S \) be the open complementary subset.

(i) We define the functor
\[
\Gamma_Z : \text{C}(\text{Var}(\mathbb{C})^{2,\text{sm}}/S) \to \text{C}(\text{Var}(\mathbb{C})^{2,\text{sm}}/S), \quad G^* \mapsto \Gamma_Z G^* := \text{Cone}(\text{ad}(j^*, j_*)(G^*) : G^* \to j_* j^* G^*)[-1],
\]
so that there is then a canonical map \( \gamma_Z(G^*) : \Gamma_Z G^* \to G^* \).

(ii) We have the dual functor of (i):
\[
\Gamma_Z^\vee : \text{C}(\text{Var}(\mathbb{C})^{2,\text{sm}}/S) \to \text{C}(\text{Var}(\mathbb{C})^{2,\text{sm}}/S), \quad F \mapsto \Gamma_Z^\vee(F^*) := \text{Cone}(\text{ad}(j_!, j^*)(G^*) : j_! j^* G^* \to G^*),
\]
together with the canonical map \( \gamma_Z^\vee(G) : F \to \Gamma_Z^\vee(G) \).

(iii) For \( F, G \in \text{C}(\text{Var}(\mathbb{C})^{2,\text{sm}}/S) \), we denote by
\[
\Gamma^\vee(\gamma, \text{hom})(F, G) := (I, I(j_!, j^*)(F, G)^{-1}) : \Gamma_Z \text{Hom}(F, G) \xrightarrow{\sim} \text{Hom}(\Gamma_Z^\vee F, G)
\]
the canonical isomorphism given by adjunction.

Note that we have similarly for \( i : Z \hookrightarrow S, i' : Z' \hookrightarrow Z \) closed embeddings, \( g : T \to S \) a morphism with \( T, S, Z \in \text{Var}(\mathbb{C}) \) and \( F \in \text{C}(\text{Var}(\mathbb{C})^{2,\text{sm}}/S) \), the canonical maps in \( \text{C}(\text{Var}(\mathbb{C})^{2,\text{sm}}/S) \)
\[
- T(g, \gamma)(F) : g^* \Gamma_Z F \xrightarrow{\sim} \Gamma_{Z \times_S T} g^* F, \quad T(g, \gamma^\vee)(F) : \Gamma_{Z \times_S T}^\vee g^* F \xrightarrow{\sim} g^* \Gamma_Z F
\]
but we will not use them in this article.

We now define the Zariski and the etale topology on \( \text{Var}(\mathbb{C})^2/S \).

**Definition 15.** Let \( S \in \text{Var}(\mathbb{C}) \).

(i) Denote by \( \tau \) a topology on \( \text{Var}(\mathbb{C}) \), e.g. the Zariski or the etale topology. The \( \tau \) covers in \( \text{Var}(\mathbb{C})^2/S \) of \( X, Z/S \) are the families of morphisms
\[
\{(c_i : (U_i, Z \times_X U_i)/S \to (X, Z)/S)_{i \in I}, \text{ with } (c_i : U_i \to X)_{i \in I} \text{ a cover of } X \text{ in } \text{Var}(\mathbb{C}) \}
\]

(ii) Denote by \( \tau \) the Zariski or the etale topology on \( \text{Var}(\mathbb{C}) \). The \( \tau \) covers in \( \text{Var}(\mathbb{C})^{2,\text{sm}}/S \) of \( U, Z/S \) are the families of morphisms
\[
\{(c_i : (U_i, Z \times_U U_i)/S \to (U, Z)/S)_{i \in I}, \text{ with } (c_i : U_i \to U)_{i \in I} \text{ a cover of } U \text{ in } \text{Var}(\mathbb{C}) \}
\]

(iii) Denote by \( \tau \) the Zariski or the etale topology on \( \text{Var}(\mathbb{C}) \). The \( \tau \) covers in \( \text{Var}(\mathbb{C})^{2,\text{sm}pr}/S \) of \( Y \times S, Z/S \) are the families of morphisms
\[
\{(c_i \times I_S : (U_i \times S, Z \times_Y S U_i \times S)/S \to (Y \times S, Z)/S)_{i \in I}, \text{ with } (c_i : U_i \to Y)_{i \in I} \text{ a cover of } Y \text{ in } \text{Var}(\mathbb{C}) \}
\]

Let \( S \in \text{Var}(\mathbb{C}) \). Denote by \( \tau \) the Zariski or the etale topology on \( \text{Var}(\mathbb{C}) \). In particular, denoting \( a_\tau : \text{PSh}(\text{Var}(\mathbb{C})^{2,\text{sm}}/S) \to \text{Shv}(\text{Var}(\mathbb{C})^{2,\text{sm}}/S) \) and \( a_\tau : \text{PSh}(\text{Var}(\mathbb{C})^{2,\text{sm}pr}/S) \to \text{Shv}(\text{Var}(\mathbb{C})^{2,\text{sm}pr}/S) \) the sheafification functors,

| a morphism \( \phi : F \to G \), with \( F, G \in \text{C}(\text{Var}(\mathbb{C})^{2,\text{sm}}/S) \), is a \( \tau \) local equivalence if \( a_\tau H^n \phi : a_\tau H^n F \to a_\tau H^n G \) is an isomorphism, a morphism \( \phi : F \to G \), with \( F, G \in \text{C}(\text{Var}(\mathbb{C})^{2,\text{sm}pr}/S) \), is a \( \tau \) local equivalence if \( a_\tau H^n \phi : a_\tau H^n F \to a_\tau H^n G \) is an isomorphism,
\[
\tau(\tau) \ni (ii) \text{ Let } \tau \text{ a morphism } \phi : (G_1, F) \to (G_2, F), \text{ with } (G_1, F), (G_2, F) \in C_{f_{\mu}}(\text{Var}(\mathbb{C})^{2,(sm)/S}), \text{ is an } r\text{-filtered } \tau \text{ local equivalence if for all } p, q \in \mathbb{Z}, \alpha_\tau E_p^q \phi : \alpha_\tau E_p^q(G_1, F) \to \alpha_\tau E_p^q(G_2, F) \text{ is an isomorphism of abelian groups for all } p, q \in \mathbb{Z}, \alpha_\tau E_p^q \phi : \alpha_\tau E_p^q(G_1, F) \to \alpha_\tau E_p^q(G_2, F) \text{ is an isomorphism of sheaves on } \text{Var}(\mathbb{C})^{2,(sm)/S}.
\]

\[
F^\bullet \in C(\text{Var}(\mathbb{C})^{2,(sm)/S}) \text{ is } \tau \text{ fibrant if for all } (U, Z)/S \in \text{Var}(\mathbb{C})^{2,(sm)/S} \text{ and all } \tau \text{ covers } (c_i : (U, Z)/S) \ni (U, Z)/S ,
\]

\[
F^\bullet(c_i) : F^\bullet((U, Z)/S) \to \text{Tot}(\oplus_{\text{card}I = \bullet} F^\bullet((U, Z)/S))
\]

is a quasi-isomorphism of complexes of abelian groups, \( F^\bullet \in C(\text{Var}(\mathbb{C})^{2,(sm)_{pr}/S}) \) is \( \tau \) fibrant if for all \((Y \times S, Z)/S \in \text{Var}(\mathbb{C})^{2,(sm)_{pr}/S} \) and all \( \tau \) covers \((c_i \times I_S : (U_i \times S, Z \times U \times S) \ni (Y \times S, Z)/S ,
\]

\[
F^\bullet(c_i \times I_S) : F^\bullet((Y \times S, Z)/S) \to \text{Tot}(\oplus_{\text{card}I = \bullet} F^\bullet((U_i \times S, Z \times S)/U_i))
\]

is a quasi-isomorphism of complexes of abelian groups,

\[
(F^\bullet, F) \in C_{f_{\mu}}(\text{Var}(\mathbb{C})^{2,(sm)/S}) \text{ is } \tau \text{ fibrant if for all } (U, Z)/S \in \text{Var}(\mathbb{C})^{2,(sm)/S} \text{ and all } \tau \text{ covers } (c_i : (U, Z)/S) \ni (U, Z)/S ,
\]

\[
E_p^q(F^\bullet, F)(c_i) : E_p^q(F^\bullet, F)((U, Z)/S) \to E_p^q(\text{Tot}(\oplus_{\text{card}I = \bullet} F^\bullet((U, Z)/S))
\]

is an isomorphism of complexes of abelian groups for all \( p, q \in \mathbb{Z} \), \((F^\bullet, F) \in C_{f_{\mu}}(\text{Var}(\mathbb{C})^{2,(sm)_{pr}/S}) \) is \( \tau \) fibrant if for all \((Y \times S, Z)/S \in \text{Var}(\mathbb{C})^{2,(sm)_{pr}/S} \) and all \( \tau \) covers \((c_i \times I_S : (U_i \times S, Z \times U \times S) \ni (Y \times S, Z)/S ,
\]

\[
E_p^q(F^\bullet, F)(c_i \times I_S) : E_p^q(F^\bullet, F)((Y \times S, Z)/S) \to E_p^q(\text{Tot}(\oplus_{\text{card}I = \bullet} F^\bullet((U_i \times S, Z \times S)/U_i))
\]

is an isomorphism of abelian groups for all \( p, q \in \mathbb{Z} \).

Will now define the \( \mathbb{A}^1 \) local property on \( \text{Var}(\mathbb{C})^{2}/S \).

**Definition 16.** Let \( S \in \text{Var}(\mathbb{C}) \). Denote for short \( \text{Var}(\mathbb{C})^{2,(sm)/S} \) either the category \( \text{Var}(\mathbb{C})^{2}/S \) or the category \( \text{Var}(\mathbb{C})^{2,(sm)/S} \). Denote for short \( \text{Var}(\mathbb{C})^{2,(sm)_{pr}/S} \) either the category \( \text{Var}(\mathbb{C})^{2,pr}/S \) or the category \( \text{Var}(\mathbb{C})^{2,(sm)_{pr}/S} \).

(i) A complex \( F \in C(\text{Var}(\mathbb{C})^{2,(sm)/S}) \), is said to be \( \mathbb{A}^1 \) invariant if for all \((X, Z)/S \in \text{Var}(\mathbb{C})^{2,(sm)/S} \)

\[
F(p_X) : F((X, Z)/S) \to F((X \times \mathbb{A}^1, (Z \times \mathbb{A}^1))/S)
\]

is a quasi-isomorphism, where \( p_X : (X \times \mathbb{A}^1, (Z \times \mathbb{A}^1)) \to (X, Z) \) is the projection.

(i)' A complex \( G \in C(\text{Var}(\mathbb{C})^{2,(sm)_{pr}/S}) \), is said to be \( \mathbb{A}^1 \) invariant if for all \((Y \times S, Z)/S \in \text{Var}(\mathbb{C})^{2,(sm)_{pr}/S} \)

\[
G(p_{Y \times S}) : G((Y \times S, Z)/S) \to G((Y \times \mathbb{A}^1 \times S, (Z \times \mathbb{A}^1))/S)
\]

is a quasi-isomorphism of abelian group for all \( p, q \in \mathbb{Z} \).

(ii) Let \( \tau \) a topology on \( \text{Var}(\mathbb{C}) \). A complex \( F \in C(\text{Var}(\mathbb{C})^{2,(sm)/S}) \) is said to be \( \mathbb{A}^1 \) local for the \( \tau \) topology induced on \( \text{Var}(\mathbb{C})^{2}/S \), if for an (hence every) \( \tau \) local equivalence \( k : F \to G \) with \( k \) injective and \( G \in (\text{Var}(\mathbb{C})^{2,(sm)/S}) \) \( \tau \) fibrant, e.g. \( k : F \to E_{\tau}(F) \), \( G \) is \( \mathbb{A}^1 \) invariant.

(ii)' Let \( \tau \) a topology on \( \text{Var}(\mathbb{C}) \). A complex \( F \in C(\text{Var}(\mathbb{C})^{2,(sm)_{pr}/S}) \) is said to be \( \mathbb{A}^1 \) local for the \( \tau \) topology induced on \( \text{Var}(\mathbb{C})^{2,pr}/S \), if for an (hence every) \( \tau \) local equivalence \( k : F \to G \) with \( k \) injective and \( G \in (\text{Var}(\mathbb{C})^{2,(sm)_{pr}/S}) \) \( \tau \) fibrant, e.g. \( k : F \to E_{\tau}(F) \), \( G \) is \( \mathbb{A}^1 \) invariant.
(iii) A morphism \( m : F \to G \) with \( F, G \in \text{C}(\text{Var}(\mathbb{C})^2, (\text{sm})/S) \) is said to be an \( (\mathbb{A}^1, \text{et}) \) local equivalence if for all \( H \in \text{C}(\text{Var}(\mathbb{C})^2, (\text{sm})/S) \) which is \( \mathbb{A}^1 \) local for the etale topology

\[
\text{Hom}(L(m), E_{\text{et}}(H)) : \text{Hom}(L(G), E_{\text{et}}(H)) \to \text{Hom}(L(F), E_{\text{et}}(H))
\]

is a quasi-isomorphism.

(iii)' A morphism \( m : F \to G \) with \( F, G \in \text{C}(\text{Var}(\mathbb{C})^2, (\text{sm})_{pr}/S) \) is said to be an \( (\mathbb{A}^1, \text{et}) \) local equivalence if for all \( H \in \text{C}(\text{Var}(\mathbb{C})^2, (\text{sm})_{pr}/S) \) which is \( \mathbb{A}^1 \) local for the etale topology

\[
\text{Hom}(L(m), E_{\text{et}}(H)) : \text{Hom}(L(G), E_{\text{et}}(H)) \to \text{Hom}(L(F), E_{\text{et}}(H))
\]

is a quasi-isomorphism.

Equivalently, \( m : F \to G \) with \( F, G \in \text{C}(\text{Var}(\mathbb{C})^2, (\text{sm})/S) \) is an \( (\mathbb{A}^1, \text{et}) \) local equivalence if and only if there exists \( (X_1, Z_1)/S, \ldots, (X_r, Z_r)/S \in \text{Var}(\mathbb{C})^{2, \text{sm}}/S \) such that we have in \( \text{Ho}_{\text{et}}(\text{C}(\text{Var}(\mathbb{C})^2, \text{sm})/S) \)

\[
\text{Cone}(m) \xrightarrow{\sim} \text{Cone}(\text{Cone}(Z((X_1 \times \mathbb{A}^1, Z_1 \times \mathbb{A}^1)/S) \to Z((X_1, Z_1)/S))
\to \cdots \to \text{Cone}(Z((X_1 \times \mathbb{A}^1, Z_1 \times \mathbb{A}^1)/S) \to Z((X_1, Z_1)/S)))
\]

**Definition-Proposition 6.** Let \( S \in \text{Var}(\mathbb{C}) \).

(i) With the weak equivalence the \( (\mathbb{A}^1, \text{et}) \) local equivalence and the fibration the epimorphism with \( \mathbb{A}^1 \) local and etale fibrant kernels gives a model structure on \( \text{C}(\text{Var}(\mathbb{C})^2, (\text{sm})/S) \) : the left bousfield localization of the projective model structure of \( \text{C}(\text{Var}(\mathbb{C})^2, (\text{sm})/S) \). We call it the projective \( (\mathbb{A}^1, \text{et}) \) model structure.

(ii) With the weak equivalence the \( (\mathbb{A}^1, \text{et}) \) local equivalence and the fibration the epimorphism with \( \mathbb{A}^1 \) local and etale fibrant kernels gives a model structure on \( \text{C}(\text{Var}(\mathbb{C})^2, (\text{sm})_{pr}/S) \) : the left bousfield localization of the projective model structure of \( \text{C}(\text{Var}(\mathbb{C})^2, (\text{sm})_{pr}/S) \). We call it the projective \( (\mathbb{A}^1, \text{et}) \) model structure.

**Proof.** Similar to the proof of proposition 5.

In the filtered case, we consider:

**Definition 17.** Let \( S \in \text{Var}(\mathbb{C}) \). Denote for short \( \text{Var}(\mathbb{C})^{2, \text{sm}}/S \) either the category \( \text{Var}(\mathbb{C})^2/S \) or the category \( \text{Var}(\mathbb{C})^{2, \text{sm}}/S \). Denote for short \( \text{Var}(\mathbb{C})^{2, \text{sm}}_{pr}/S \) either the category \( \text{Var}(\mathbb{C})^{2, \text{pr}}/S \) or the category \( \text{Var}(\mathbb{C})^{2, \text{sm}}_{pr}/S \).

(i) Let \( r \in \mathbb{N} \). A filtered complex \( (G, F) \in \text{C}_{\text{fil}}(\text{Var}(\mathbb{C})^2, (\text{sm})/S) \), is said to be \( r \)-filtered \( \mathbb{A}^1 \) invariant if for all \( (X, Z)/S \in \text{Var}(\mathbb{C})^{2, \text{sm}}/S \)

\[
E_p^0(G, F)(p_X) : (G, F)((X, Z)/S) \to E_p^0(G, F)((X \times \mathbb{A}^1, (Z \times \mathbb{A}^1))/S)
\]

is an isomorphism of abelian groups for all \( p, q \in \mathbb{Z} \), where \( p_X : (X \times \mathbb{A}^1, (Z \times \mathbb{A}^1)) \to (X, Z) \) is the projection. Note that this definition say that this \( r \) does NOT depend on \( p \) and \( q \).

(i)' Let \( r \in \mathbb{N} \). A filtered complex \( (G, F) \in \text{C}_{\text{fil}}(\text{Var}(\mathbb{C})^2, (\text{sm})_{pr}/S) \), is said to be \( r \)-filtered \( \mathbb{A}^1 \) invariant if for all \( (Y \times X, Z)/S \in \text{Var}(\mathbb{C})^{2, \text{sm}}_{pr}/S \)

\[
E_p^0(G, F)(p_{Y \times S}) : E_p^0(G, F)((Y \times X, Z)/S) \to E_p^0(G, F)((Y \times \mathbb{A}^1 \times X, (Z \times \mathbb{A}^1))/S)
\]

is an isomorphism of abelian group for all \( p, q \in \mathbb{Z} \). Note that this definition say that this \( r \) does NOT depend on \( p \) and \( q \).
(ii) A filtered complex \((G, F) \in C_{fil}(\text{Var}(\mathbb{C})^{2,(sm)}/S)\), is said to be \(\aleph^1\) invariant if for all \((X, Z)/S \in \text{Var}(\mathbb{C})^{2,(sm)}/S\) there exist \(r \in \mathbb{N}\) such that

\[
E^p_q(G, F)(p_X) : E^p_q(G, F)((X, Z)/S) \to E^p_q(G, F)((X \times \mathbb{A}^1, (Z \times \mathbb{A}^1))/S)
\]

is an isomorphism of abelian groups for all \(p, q \in \mathbb{Z}\), where \(p_X : (X \times \mathbb{A}^1, (Z \times \mathbb{A}^1)) \to (X, Z)\) is the projection (note that this definition say that this \(r\) does NOT depend on \(p\) and \(q\) but may depends on \((X, Z)/S\)). This implies that, for all \((X, Z)/S \in \text{Var}(\mathbb{C})^{2,(sm)}/S\),

\[
H^n(G, F)(p_X) : H^n(G, F)((X, Z)/S) \to H^n(G, F)((X \times \mathbb{A}^1, (Z \times \mathbb{A}^1))/S)
\]

is a filtered isomorphism of filtered abelian groups for all \(n \in \mathbb{Z}\).

(ii') Similarly, a filtered complex \((G, F) \in C_{fil}(\text{Var}(\mathbb{C})^{2,(sm)pr}/S)\), is said to be \(\aleph^1\) invariant if for all \((Y \times S, Z)/S \in \text{Var}(\mathbb{C})^{2,(sm)pr}/S\) there exist \(r \in \mathbb{N}\) such that

\[
E^p_q(G, F)(p_{Y \times S}) : E^p_q(G, F)((Y \times S, Z)/S) \to E^p_q(G, F)((Y \times \mathbb{A}^1 \times S, (Z \times \mathbb{A}^1))/S)
\]

is an isomorphism of abelian groups for all \(p, q \in \mathbb{Z}\) (note that this definition say that this \(r\) does NOT depend on \(p\) and \(q\) but may depends on \((Y \times \mathbb{A}^1, Z)/S\)). This implies that, for all \((Y \times S, Z)/S \in \text{Var}(\mathbb{C})^{2,(sm)pr}/S\),

\[
H^n(G, F)(p_{Y \times S}) : H^n(G, F)((Y \times S, Z)/S) \to H^n(G, F)((Y \times \mathbb{A}^1 \times S, (Z \times \mathbb{A}^1))/S)
\]

is an isomorphism of filtered abelian groups for all \(n \in \mathbb{Z}\).

(iii) Let \(\tau\) a topology on \(\text{Var}(\mathbb{C})\). A filtered complex \((G, F) \in C_{fil}(\text{Var}(\mathbb{C})^{2,(sm)}/S)\), is said to be \(\aleph^1\) local for the \(\tau\) topology induced on \(\text{Var}(\mathbb{C})^{2}/S\), if for an (hence every) \(\aleph^1\) filtered \(\tau\) local equivalence \(k : (G, F) \to (H, F)\) with \(k\) injective and \((H, F) \in C_{fil}(\text{Var}(\mathbb{C})^{2,(sm)}/S)\), \(\aleph^1\)-filtered \(\tau\) fibrant, e.g. \(k : (G, F) \to E_\tau(G, F), (H, F)\) is \(\aleph^1\) invariant.

(iii') Similarly, a filtered complex \((G, F) \in C_{fil}(\text{Var}(\mathbb{C})^{2,(sm)pr}/S)\), is said to be \(\aleph^1\) local for the \(\tau\) topology induced on \(\text{Var}(\mathbb{C})^{2}/S\), if for an (hence every) \(\aleph^1\) filtered \(\tau\) local equivalence \(k : (G, F) \to (H, F)\) with \(k\) injective and \((H, F) \in C_{fil}(\text{Var}(\mathbb{C})^{2,(sm)pr}/S)\), \(\aleph^1\)-filtered \(\tau\) fibrant, e.g. \(k : (G, F) \to E_\tau(G, F), (H, F)\) is \(\aleph^1\) invariant.

Lemma 2. Let \(S \in \text{Var}(\mathbb{C})\).

(i) Let \((G, F) \in C_{fil}(\text{Var}(\mathbb{C})^{2,smpr}/S)\) Then, if \(m : F_1 \to F_2\) with \(F_1, F_2 \in C(\text{Var}(\mathbb{C})^{2,smpr}/S)\) is an etale local equivalence,

\[
\text{Hom}(m, E_{et}(G, F)) : \text{Hom}^\bullet(F_2, E_{et}(G, F)) \to \text{Hom}^\bullet(F_1, E_{et}(G, F))
\]

is a filtered quasi-isomorphism.

(ii) Let \((G, F) \in C_{fil}(\text{Var}(\mathbb{C})^{2,smpr}/S)\) be \(\aleph^1\) local for the etale topology. Then, if \(m : F_1 \to F_2\) with \(F_1, F_2 \in C(\text{Var}(\mathbb{C})^{2,smpr}/S)\) is an \((\aleph^1, et)\) local equivalence,

\[
\text{Hom}(m, E_{et}(G, F)) : \text{Hom}^\bullet(F_2, E_{et}(G, F)) \to \text{Hom}^\bullet(F_1, E_{et}(G, F))
\]

is an \(\aleph^1\) quasi-isomorphism.

Proof. (i): Follows from the fact that \(E_{et}(G, F)\) is \((1-)\)-filtered etale fibrant.

(ii): By definition of an \((\aleph^1, et)\) local equivalence, we have there exists \((X_1, Z_1)/S, \ldots, (X_r, Z_r)/S \in \text{Var}(\mathbb{C})^{2,smpr}/S\) such that we have in \(\text{Ho}_{et}(C(\text{Var}(\mathbb{C})^{2,smpr}/S))\)

\[
\text{Cone}(m) \xrightarrow{\sim} \text{Cone}(\text{Cone}(\mathbb{Z}((X_1 \times \mathbb{A}^1, Z_1 \times \mathbb{A}^1)/S) \to \mathbb{Z}((X_1, Z_1)/S))
\]

\[
\to \cdots \to \text{Cone}(\mathbb{Z}((X_r \times \mathbb{A}^1, Z_r \times \mathbb{A}^1)/S) \to \mathbb{Z}((X_r, Z_r)/S)))
\]

64
This gives in $D_{fri,1}(Z) := \text{Ho}_{fri,1}(Z)$,

$$\text{Cone}(\text{Hom}(m, E_{ct}(G, F))) \cong \text{Cone}(\text{Cone}(E_{ct}(G, F)((X_1, Z_1)/S) \to E_{ct}(G, F)((X_1 \times \mathbb{A}^1, Z_1 \times \mathbb{A}^1)/S))$$

$$\to \cdots \to \text{Cone}(E_{ct}(G, F)((X_r, Z_r)/S) \to E_{ct}(G, F)((X_r \times \mathbb{A}^1, Z_r \times \mathbb{A}^1)/S))$$

Since $(G, F) \in C_{fri}(\text{Var}(\mathbb{C})^{2, smpr}/S)$ is $\infty$-filtered $\mathbb{A}^1$ local for the etale topology, there exist $s_i \in \mathbb{Z}$ such that for all $p, q \in \mathbb{Z}$,

$$E_{p,q}^s \text{Cone}(E_{ct}(G, F)((X_i, Z_i)/S) \to E_{ct}(G, F)((X_i \times \mathbb{A}^1, Z_i \times \mathbb{A}^1)/S) = 0$$

Hence for $s := \max((s_i)_{1 \leq i \leq r})$, $E_{p,q}^s \text{Cone}(\text{Hom}(m, E_{ct}(G, F))) = 0$. \hfill \Box

We have, similarly to the case of single varieties the following:

**Proposition 20.** Let $g : T \to S$ a morphism with $T, S \in \text{Var}(\mathbb{C})$.

(i) The adjunction $(g^*, g_*) : C(\text{Var}(\mathbb{C})^{2,(sm)}/S) \rightleftarrows C(\text{Var}(\mathbb{C})^{2,(sm)}/T)$ is a Quillen adjunction for the projective $(\mathbb{A}^1, \text{et})$ model structure (see definition-proposition 6).

(i)' The functor $g^* : C(\text{Var}(\mathbb{C})^{2,(sm)}/S) \to C(\text{Var}(\mathbb{C})^{2,(sm)}/T)$ sends quasi-isomorphism to quasi-isomorphism, sends equivalence Zariski local to equivalence Zariski local, and equivalence etale local to equivalence etale local, sends $(\mathbb{A}^1, \text{et})$ local equivalence to $(\mathbb{A}^1, \text{et})$ local equivalence.

(ii) The adjunction $(g^*, g_*) : C(\text{Var}(\mathbb{C})^{2,(sm)pr}/S) \rightleftarrows C(\text{Var}(\mathbb{C})^{2,(sm)pr}/T)$ is a Quillen adjunction for the projective $(\mathbb{A}^1, \text{et})$ model structure (see definition-proposition 6).

(ii)' The functor $g^* : C(\text{Var}(\mathbb{C})^{2,(sm)pr}/S) \to C(\text{Var}(\mathbb{C})^{2,(sm)pr}/T)$ sends quasi-isomorphism to quasi-isomorphism, sends equivalence Zariski local to equivalence Zariski local, and equivalence etale local to equivalence etale local, sends $(\mathbb{A}^1, \text{et})$ local equivalence to $(\mathbb{A}^1, \text{et})$ local equivalence.

**Proof.** (i): Follows immediately from definition. (i)': Since the functor $g^*$ preserve epimorphism and also monomorphism (the colimits involved being filetered), $g^*$ sends quasi-isomorphism to quasi-isomorphism. Hence it preserve Zariski and etale local equivalence. The fact that it preserve $(\mathbb{A}^1, \text{et})$ local equivalence then follows similarly to the single case by the fact that $g_*$ preserve by definition $\mathbb{A}^1$ equivariant presheaves. (ii) and (ii)': Similar to (i) and (i)'. \hfill \Box

**Proposition 21.** Let $S \in \text{Var}(\mathbb{C})$.

(i) The adjunction $(\rho_+^S, \rho_+^S) : C(\text{Var}(\mathbb{C})^{2, sm}/S) \rightleftarrows C(\text{Var}(\mathbb{C})^2/S)$ is a Quillen adjunction for the $(\mathbb{A}^1, \text{et})$ projective model structure.

(i)' The functor $\rho_+ : C(\text{Var}(\mathbb{C})^2/S) \to C(\text{Var}(\mathbb{C})^{2, sm}/S)$ sends quasi-isomorphism to quasi-isomorphism, sends equivalence Zariski local to equivalence Zariski local, and equivalence etale local to equivalence etale local, sends $(\mathbb{A}^1, \text{et})$ local equivalence to $(\mathbb{A}^1, \text{et})$ local equivalence.

(ii) The adjunction $(\rho_+^S, \rho_+^S) : C(\text{Var}(\mathbb{C})^{2, smpr}/S) \rightleftarrows C(\text{Var}(\mathbb{C})^{2, pr}/S)$ is a Quillen adjunction for the $(\mathbb{A}^1, \text{et})$ projective model structure.

(ii)' The functor $\rho_+ : C(\text{Var}(\mathbb{C})^{2, pr}/S) \to C(\text{Var}(\mathbb{C})^{2, smpr}/S)$ sends quasi-isomorphism to quasi-isomorphism, sends equivalence Zariski local to equivalence Zariski local, and equivalence etale local to equivalence etale local, sends $(\mathbb{A}^1, \text{et})$ local equivalence to $(\mathbb{A}^1, \text{et})$ local equivalence.

**Proof.** Similar to the proof of proposition 19. \hfill \Box

We also have

**Proposition 22.** Let $S \in \text{Var}(\mathbb{C})$. 

(i) The adjunction \((\text{Gr}^2_S, \text{Gr}^{12}_S) : C(\text{Var}(\mathbb{C})/S) \Rightarrow C(\text{Var}(\mathbb{C})^{2,pr}/S)\) is a Quillen adjunction for the \((\mathbb{A}^1, \text{et})\) projective model structure.

(ii) The adjunction \((\text{Gr}^2_S, \text{Gr}^{12}_S) : C(\text{Var}(\mathbb{C})^{sm}/S) \Rightarrow C(\text{Var}(\mathbb{C})^{2,smpr}/S)\) is a Quillen adjunction for the \((\mathbb{A}^1, \text{et})\) projective model structure.

Proof. Immediate from definition. \(\square\)

We have the following canonical functor:

**Definition 18.** (i) For \(S \in \text{Var}(\mathbb{C})\), we have the functor

\[
(-)^{\Gamma} : C(\text{Var}(\mathbb{C})^{sm}/S) \to C(\text{Var}(\mathbb{C})^{2,sm}/S),
\]

\[
F \mapsto F^{\Gamma} : (((U, Z)/S) = ((U, Z), h) \mapsto F^{\Gamma}((U, Z)/S) := (\Gamma^*_Z h^* LF)(U/U),
\]

\[
(g : ((U', Z'), h') \to ((U, Z), h)) \mapsto (F^{\Gamma}(g) : (\Gamma^*_Z h^* LF)(U/U) \xrightarrow{i_{(\Gamma^*_Z h^* LF)(U/U)}} (g^*(\Gamma^*_Z h^* LF))(U'/U'))
\]

where \(i_{(\Gamma^*_Z h^* LF)(U/U)}\) is the canonical arrow of the inductive limit. Similarly, we have, for \(S \in \text{Var}(\mathbb{C})\), the functor

\[
(-)^{\Gamma} : C(\text{Var}(\mathbb{C})/S) \to C(\text{Var}(\mathbb{C})^{2}/S),
\]

\[
F \mapsto F^{\Gamma} : (((X, Z)/S) = ((X, Z), h) \mapsto F^{\Gamma}((X, Z)/S) := (\Gamma^*_Z h^* F)(X/X),
\]

\[
(g : ((X', Z'), h') \to ((X, Z), h)) \mapsto (F^{\Gamma}(g) : (\Gamma^*_Z h^* LF)(X/X) \to (\Gamma^*_Z h^* LF)(X'/X'))
\]

Note that for \(S \in \text{Var}(\mathbb{C})\), \(I(S/S) : \text{Z}(S/S)/S) \to \text{Z}(S/S)^{\Gamma}\) given by

\[
I(S/S)((U, Z), h) : \text{Z}(S/S)/S)((U, Z), h)) \xrightarrow{\gamma^*_Z(Z(U/U))} \text{Z}(S/S)^{\Gamma}((U, Z), h) := (\Gamma^*_Z \text{Z}(U/U))(U/U)
\]

is an isomorphism.

(ii) Let \(f : T \to S\) a morphism with \(T, S \in \text{Var}(\mathbb{C})\). For \(F \in C(\text{Var}(\mathbb{C})^{sm}/S)\), we have the canonical morphism in \(C(\text{Var}(\mathbb{C})^{2,sm}/T)\)

\[
T(f, \Gamma)(F) := T^*(f, \Gamma)(F) : f^*(F^{\Gamma}) \to (f^* F)^{\Gamma},
\]

\[
T(f, \Gamma)((U', Z')/T = ((U', Z'), h')) := \lim_{(U', Z'), h' \to ((U, Z), h)} (\Gamma^*_Z h^* LF)(U/U),
\]

\[
f^*(F^{\Gamma})((U', Z'), h') := (f^* F)^{\Gamma} ((U', Z'), h')
\]

where \(f_U : U_T : U \times_S T \to U\) and \(h_T : U_T : U \times_S T \to T\) are the base change maps, the equality following from the fact that \(h \circ f_U \circ l = f \circ h_T \circ l = f \circ h'.\) For \(F \in C(\text{Var}(\mathbb{C})/S)\), we have similarly the canonical morphism in \(C(\text{Var}(\mathbb{C})^{2}/T)\)

\[
T(f, \Gamma)(F) : f^*(F^{\Gamma}) \to (f^* F)^{\Gamma}.
\]
(iii) Let \( h : U \to S \) a smooth morphism with \( U, S \in \text{Var}(\mathbb{C}) \). We have, for \( F \in C(\text{Var}(\mathbb{C})^{sm}/U) \), the canonical morphism in \( C(\text{Var}(\mathbb{C})^{2,sm}/S) \)

\[
T_{\xi}(h, \Gamma)(F)((U', Z'), h') : h_{\xi}(F^\Gamma)((U', Z'), h') := \lim_{\rightarrow (U', U)} (\Gamma_{Z'}^h, l^*LF((U'/U') \to (\Gamma_{Z'}^h, h^*h_{\xi}LF((U'/U') = (h_{\xi}LF)^\Gamma((U', Z')/h')
\]

(iv) Let \( i : Z_0 \hookrightarrow S \) a closed embedding with \( Z_0, S \in \text{Var}(\mathbb{C}) \). We have the canonical morphism in \( C(\text{Var}(\mathbb{C})^{2,sm}/S) \)

\[
T_\ast(i, \Gamma)((Z(Z_0/Z_0)) : i_\ast((Z(Z_0/Z_0))^\Gamma \to (i_\ast Z(Z/Z))^\Gamma,
T_\ast(i, \Gamma)((Z(Z_0/Z_0))/((U, Z), h) : i_\ast((Z(Z_0/Z_0))^\Gamma((U, Z), h) := (\Gamma_{Z}^h, Z/Z_0/Z_0)((U \times S Z_0) \to (\Gamma_{Z}^h, Z/Z_0/Z_0)((U \times S Z_0) = (i_\ast Z(Z/Z))^\Gamma((U, Z), h)
\]

**Definition 19.** Let \( S \in \text{Var}(\mathbb{C}) \). We have for \( F \in C(\text{Var}(\mathbb{C})^{sm}/S) \) the canonical map \( C(\text{Var}(\mathbb{C})^{sm}/S) \)

\[
\text{Gr}(F) : \text{Gr}^\text{et}_{S, U} h_{\ast} F \to F,
\]

\[
\text{Gr}(F)(U/S) : \Gamma_{Z}^h, p^\ast F(U \times S/U \times S) \to h_{\ast} F(U/U) = F(U/S)
\]

where \( h : U \to S \) is a smooth morphism with \( U \in \text{Var}(\mathbb{C}) \) and \( h : U \xrightarrow{l} U \times S \xrightarrow{p} S \) is the graph factorization with \( l \) the graph embedding and \( p \) the projection.

**Proposition 23.** Let \( S \in \text{Var}(\mathbb{C}) \).

(i) Then,

- if \( m : F \to G \) with \( F, G \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is a quasi-isomorphism, \( m^\Gamma : F^\Gamma \to G^\Gamma \) is a quasi-isomorphism in \( C(\text{Var}(\mathbb{C})^{2,sm}/S) \),
- if \( m : F \to G \) with \( F, G \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is a Zariski local equivalence, \( m^\Gamma : F^\Gamma \to G^\Gamma \) is an etale local equivalence in \( C(\text{Var}(\mathbb{C})^{2,sm}/S) \), if \( m : F \to G \) with \( F, G \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is an etale local equivalence, \( m^\Gamma : F^\Gamma \to G^\Gamma \) is an etale local equivalence in \( C(\text{Var}(\mathbb{C})^{2,sm}/S) \),
- if \( m : F \to G \) with \( F, G \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is an \((\mathbb{A}^1, \text{et})\) local equivalence, \( m^\Gamma : F^\Gamma \to G^\Gamma \) is an \((\mathbb{A}^1, \text{et})\) local equivalence in \( C(\text{Var}(\mathbb{C})^{2,sm}/S) \).

(ii) Then,

- if \( m : F \to G \) with \( F, G \in C(\text{Var}(\mathbb{C})/S) \) is a quasi-isomorphism, \( m^\Gamma : F^\Gamma \to G^\Gamma \) is a quasi-isomorphism in \( C(\text{Var}(\mathbb{C})^{2}/S) \),
- if \( m : F \to G \) with \( F, G \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is a Zariski local equivalence, \( m^\Gamma : F^\Gamma \to G^\Gamma \) is a Zariski local equivalence in \( C(\text{Var}(\mathbb{C})^{2,sm}/S) \), if \( m : F \to G \) with \( F, G \in C(\text{Var}(\mathbb{C})/S) \) is an etale local equivalence, \( m^\Gamma : F^\Gamma \to G^\Gamma \) is an etale local equivalence in \( C(\text{Var}(\mathbb{C})^{2}/S) \),
- if \( m : F \to G \) with \( F, G \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is an \((\mathbb{A}^1, \text{et})\) local equivalence, \( m^\Gamma : F^\Gamma \to G^\Gamma \) is an \((\mathbb{A}^1, \text{et})\) local equivalence in \( C(\text{Var}(\mathbb{C})^{2,sm}/S) \).

**Proof.** (i): Follows immediately from the fact that for \( ((U, Z), h) \in \text{Var}(\mathbb{C})^{2,sm}/S \),

- if \( m : F \to G \) with \( F, G \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is a quasi-isomorphism, \( \Gamma_{Z}^h, h_{\ast} LF(m) : \Gamma_{Z}^h, h_{\ast} LF \to \Gamma_{Z}^h, h_{\ast} LG \) is a quasi-isomorphism
- if \( m : F \to G \) with \( F, G \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is a Zariski or etale local equivalence, \( \Gamma_{Z}^h, h_{\ast} LF(m) : \Gamma_{Z}^h, h_{\ast} LG \) is a Zariski, resp. etale, local equivalence,
- if \( m : F \to G \) with \( F, G \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is an \((\mathbb{A}^1, \text{et})\) local equivalence, \( \Gamma_{Z}^h, h_{\ast} LF(m) : \Gamma_{Z}^h, h_{\ast} LG \) is an \((\mathbb{A}^1, \text{et})\) local equivalence.

(ii): Similar to (i).
2.8 Presheaves on the big analytical site

For \( S \in \text{AnSp}(\mathbb{C}) \), we denote by \( \rho_S : \text{AnSp}(\mathbb{C})^\text{sm}/S \to \text{AnSp}(\mathbb{C})/S \) be the full subcategory consisting of the objects \( U/S = (U, h) \in \text{AnSp}(\mathbb{C})/S \) such that the morphism \( h : U \to S \) is smooth. That is, \( \text{AnSp}(\mathbb{C})^\text{sm}/S \) is the category

- whose objects are smooth morphisms \( U/S = (U, h) \), \( h : U \to S \) with \( U \in \text{AnSp}(\mathbb{C}) \),
- whose morphisms \( g : U/S = (U, h_1) \to V/S = (V, h_2) \) is a morphism \( g : U \to V \) of complex algebraic varieties such that \( h_2 \circ g = h_1 \).

We denote again \( \rho_S : \text{AnSp}(\mathbb{C})/S \to \text{AnSp}(\mathbb{C})^\text{sm}/S \) the associated morphism of site. We will consider

\[
\rho^* (S) : \text{AnSp}(\mathbb{C}) -\longrightarrow \text{AnSp}(\mathbb{C})/S \xrightarrow{\rho_S} \text{AnSp}(\mathbb{C})^\text{sm}/S
\]

the composite morphism of site. For \( S \in \text{AnSp}(\mathbb{C}) \), we denote by \( Z_S := Z(S/S) \in \text{PSh}(\text{AnSp}(\mathbb{C})^\text{sm}/S) \) the constant presheaf By Yoneda lemma, we have for \( F \in C(\text{AnSp}(\mathbb{C})^\text{sm}/S) \), \( \text{Hom}(Z_S, F) = F \). For \( f : T \to S \) a morphism, with \( T, S \in \text{AnSp}(\mathbb{C}) \), we have the following commutative diagram of sites

\[
\begin{array}{ccc}
\text{AnSp}(\mathbb{C})/T & \xrightarrow{\rho_T} & \text{AnSp}(\mathbb{C})^\text{sm}/T \\
\downarrow{P(f)} & & \downarrow{P(f)} \\
\text{AnSp}(\mathbb{C})/S & \xrightarrow{\rho_S} & \text{AnSp}(\mathbb{C})^\text{sm}/S
\end{array}
\]  

(31)

We denote, for \( S \in \text{AnSp}(\mathbb{C}) \), the obvious morphism of sites

\[
\tilde{e}(S) : \text{AnSp}(\mathbb{C})/S \xrightarrow{\rho_S} \text{AnSp}(\mathbb{C})^\text{sm}/S \xrightarrow{e(S)} \text{Ouv}(S)
\]

where \( \text{Ouv}(S) \) is the set of the open subsets of \( S \), given by the inclusion functors \( \tilde{e}(S) : \text{Ouv}(S) \to \text{AnSp}(\mathbb{C})^\text{sm}/S \to \text{AnSp}(\mathbb{C})/S \). By definition, for \( f : T \to S \) a morphism with \( S, T \in \text{AnSp}(\mathbb{C}) \), the commutative diagram of sites \((31)\) extend a commutative diagram of sites :

\[
\begin{array}{ccc}
\text{AnSp}(\mathbb{C})/T & \xrightarrow{\rho_T} & \text{AnSp}(\mathbb{C})^\text{sm}/T \\
\downarrow{P(f)} & & \downarrow{P(f)} \\
\text{AnSp}(\mathbb{C})/S & \xrightarrow{\rho_S} & \text{AnSp}(\mathbb{C})^\text{sm}/S
\end{array}
\]  

(32)

\( \tilde{e}(S) : \text{AnSp}(\mathbb{C})/S \xrightarrow{\rho_S} \text{AnSp}(\mathbb{C})^\text{sm}/S \xrightarrow{e(S)} \text{Ouv}(S) \)

- As usual, we denote by

\[
(f^*, f_*) := (P(f)^*, P(f)_*) : C(\text{AnSp}(\mathbb{C})^\text{sm}/S) \to C(\text{AnSp}(\mathbb{C})^\text{sm}/T)
\]

the adjonction induced by \( P(f) : \text{AnSp}(\mathbb{C})^\text{sm}/T \to \text{AnSp}(\mathbb{C})^\text{sm}/S \). Since the colimits involved in the definition of \( f^* = P(f)^* \) are filtered, \( f^* \) also preserve monomorphism. Hence, we get an adjonction

\[
(f^*, f_*) : C_{fil}(\text{AnSp}(\mathbb{C})^\text{sm}/S) \Rightarrow C_{fil}(\text{AnSp}(\mathbb{C})^\text{sm}/T), \ f^*(G, F) := (f^*G, f^*F)
\]

- As usual, we denote by

\[
(f^*, f_*) := (P(f)^*, P(f)_*) : C(\text{AnSp}(\mathbb{C})/S) \to C(\text{AnSp}(\mathbb{C})/T)
\]

the adjonction induced by \( P(f) : \text{AnSp}(\mathbb{C})/T \to \text{AnSp}(\mathbb{C})/S \). Since the colimits involved in the definition of \( f^* = P(f)^* \) are filtered, \( f^* \) also preserve monomorphism. Hence, we get an adjonction

\[
(f^*, f_*) : C_{fil}(\text{AnSp}(\mathbb{C})/S) \Rightarrow C_{fil}(\text{AnSp}(\mathbb{C})/T), \ f^*(G, F) := (f^*G, f^*F)
\]
• For \( h : U \to S \) a smooth morphism with \( U, S \in \text{AnSp}(\mathbb{C}) \), the pullback functor \( P(h) : \text{AnSp}(\mathbb{C})^{sm}/S \to \text{AnSp}(\mathbb{C})^{sm}/U \) admits a left adjoint \( C(h)(X \to U) = (X \to U \to S) \). Hence, \( h^* : C(\text{AnSp}(\mathbb{C})^{sm}/S) \to C(\text{AnSp}(\mathbb{C})^{sm}/U) \) admits a left adjoint

\[
h_t : C(\text{AnSp}(\mathbb{C})^{sm}/U) \to C(\text{AnSp}(\mathbb{C})^{sm}/S), \quad F \mapsto \lim_{(V,h_0) \to (V',h')} F(V',h')
\]

Note that for \( h' : V' \to V \) a smooth morphism, \( V', V \in \text{AnSp}(\mathbb{C}) \), we have \( h_t(Z(V'/V)) = Z(V'/S) \) with \( V'/S = (V', h \circ h') \). Hence, since projective presheaves are the direct summands of the representable presheaves, \( h_t \) sends projective presheaves to projective presheaves. For \( F^* \in C(\text{AnSp}(\mathbb{C})^{sm}/S) \) and \( G^* \in C(\text{AnSp}(\mathbb{C})^{sm}/U) \), we have the adjunction maps

\[
\text{ad}(h_t,h^*)(G^*) : G^* \to h^* h_t G^*, \quad \text{ad}(h_t,h^*)(F^*) : h_t h^* F^* \to F^*.
\]

For a smooth morphism \( h : U \to S \), with \( U, S \in \text{AnSp}(\mathbb{C}) \), we have the adjunction isomorphism, for \( F \in C(\text{AnSp}(\mathbb{C})^{sm}/U) \) and \( G \in C(\text{AnSp}(\mathbb{C})^{sm}/S) \),

\[
I(h_t,h^*)(F,G) : \text{Hom}^*(h_t F,G) \xrightarrow{\sim} h_* \text{Hom}^*(F,h^* G). \tag{33}
\]

• For \( f : T \to S \) any morphism with \( T, S \in \text{AnSp}(\mathbb{C}) \), the pullback functor \( P(f) : \text{AnSp}(\mathbb{C})/T \to \text{AnSp}(\mathbb{C})/S \) admits a left adjoint \( C(f)(X \to T) = (X \to T \to S) \). Hence, \( f^* : C(\text{AnSp}(\mathbb{C})/S) \to C(\text{AnSp}(\mathbb{C})/T) \) admits a left adjoint

\[
f_t : C(\text{AnSp}(\mathbb{C})/T) \to C(\text{AnSp}(\mathbb{C})/S), \quad F \mapsto \lim_{(V,h_0) \to (V',h')} F(V',h')
\]

Note that we have for \( h' : V' \to V \) a morphism, \( V', V \in \text{AnSp}(\mathbb{C}) \), \( h_t(Z(V'/V)) = Z(V'/S) \) with \( V'/S = (V', h \circ h') \). Hence, since projective presheaves are the direct summands of the representable presheaves, \( h_t \) sends projective presheaves to projective presheaves. For \( F^* \in C(\text{AnSp}(\mathbb{C})/S) \) and \( G^* \in C(\text{AnSp}(\mathbb{C})/T) \), we have the adjunction maps

\[
\text{ad}(f_t,f^*)(G^*) : G^* \to f^* f_t G^*, \quad \text{ad}(f_t,f^*)(F^*) : f_t f^* F^* \to F^*.
\]

For a morphism \( f : T \to S \), with \( T, S \in \text{AnSp}(\mathbb{C}) \), we have the adjunction isomorphism, for \( F \in C(\text{AnSp}(\mathbb{C})/T) \) and \( G \in C(\text{AnSp}(\mathbb{C})/S) \),

\[
I(f_t,f^*)(F,G) : \text{Hom}^*(f_t F,G) \xrightarrow{\sim} f_* \text{Hom}^*(F,f^* G). \tag{34}
\]

• For a commutative diagram in \( \text{AnSp}(\mathbb{C}) \):

\[
\begin{array}{ccc}
D & \xrightarrow{g_2} & U \\
\downarrow h_2 & & \downarrow h_1 \\
T & \xrightarrow{g_1} & S
\end{array}
\]

where \( h_1 \) and \( h_2 \) are smooth, we denote by, for \( F^* \in C(\text{AnSp}(\mathbb{C})^{sm}/U) \),

\[
T^*_g(D)(F^*) : h_2 g_2^* F^* \to g_1^* h_1 g^* F^*
\]

the canonical map in \( C(\text{AnSp}(\mathbb{C})^{sm}/T) \) given by adjunction. If \( D \) is cartesian with \( h_1 = h, g_1 = g \)

\[
f_2 = h' : U_T \to T, g_1 : U_T \to U,
\]

\[
T^*_g(D)(F^*) =: T_g(h,F) : h'_2 g'_1 F^* \xrightarrow{\sim} g^* h_2 F^*
\]

is an isomorphism and for \( G^* \in C(\text{AnSp}(\mathbb{C})^{sm}/T) \)

\[
T(D)(G^*) =: T(g,h)(G^*) : g^* h_2 G^* \xrightarrow{\sim} h'_2 g'_1 G^*
\]

is an isomorphism.
• For a commutative diagram in $\mathsf{AnSp}(\mathbb{C})$:

\[
D = V \xrightarrow{g_2} X,
\]

\[
\begin{array}{c}
\downarrow f_2 \\
T \xrightarrow{g_1} S \\
\end{array}
\]

we denote by, for $F^\bullet \in C(\mathsf{AnSp}(\mathbb{C})/X)$,

\[
T^*_1(D)(F^\bullet) : f_2 g_2^* F^\bullet \to g_1^* f_1 F^\bullet
\]

the canonical map in $C(\mathsf{AnSp}(\mathbb{C})/T)$ given by adjunction. If $D$ is cartesian with $h_1 = h$, $g_1 = g$ $f_2 = h' : X_T \to T$, $g' : X_T \to X$,

\[
T^*_1(D)(F^\bullet) =: T_2(g, f)(F^\bullet) : f_2^* g^* F^\bullet \simto g^* f_2 F^\bullet
\]

is an isomorphism and for $G^\bullet \in C(\mathsf{AnSp}(\mathbb{C})/T)$

\[
T_2(D)(G^\bullet) =: T_2(g, h)(G^\bullet) : f^* g_* G^\bullet \simto g'_* f^* G^\bullet
\]

is an isomorphism.

For $f : T \to S$ a morphism with $S, T \in \mathsf{VarAnSp}(\mathbb{C})$, we get for $F \in C(\mathsf{AnSp}(\mathbb{C})^\mathsf{sm}/S)$ from the commutative diagram of sites \ref{comm-diagram} the following canonical transformation

\[
T(e, f)(F^\bullet) : f^* e(S)_* F^\bullet \to e(T)_* f^* F^\bullet,
\]

which is NOT a quasi-isomorphism in general. However, for $h : U \to S$ a smooth morphism with $S, U \in \mathsf{AnSp}(\mathbb{C})$, $T(e, h)(F^\bullet) : h^* e(S)_* F^\bullet \to e(T)_* h^* F^\bullet$ is an isomorphism.

Let $S \in \mathsf{AnSp}(\mathbb{C})$.

• We have for $F, G \in C(\mathsf{AnSp}(\mathbb{C})^\mathsf{sm}/S)$,

- $e(S)_*(F \otimes G) = (e(S)_* F) \otimes (e(S)_* G)$ by definition
- the canonical forgetful map

\[
T(S, \mathcal{H}om)(F, G) : e(S)_* \mathcal{H}om^\bullet(F, G) \to \mathcal{H}om^\bullet(e(S)_* F, e(S)_* G).
\]

which is NOT a quasi-isomorphism in general.

By definition, we have for $F \in C(\mathsf{AnSp}(\mathbb{C})^\mathsf{sm}/S)$, $e(S)_* E_{usu}(F) = E_{usu}(e(S)_* F)$.

• We have for $F, G \in C(\mathsf{AnSp}(\mathbb{C})/S)$,

- $e(S)_*(F \otimes G) = (e(S)_* F) \otimes (e(S)_* G)$ by definition
- the canonical forgetful map

\[
T(S, \mathcal{H}om)(F, G) : e(S)_* \mathcal{H}om^\bullet(F, G) \to \mathcal{H}om^\bullet(e(S)_* F, e(S)_* G).
\]

which is NOT a quasi-isomorphism in general.
By definition, we have for \( F \in C(\text{AnSp}(\mathbb{C})/S) \), \( e(S), E_{usu}(F) = E_{usu}(e(S), F) \).

Let \( S \in \text{AnSp}(\mathbb{C}) \). We have the support section functor of a closed subset \( Z \subset S \) for presheaves on the big analytical site.

**Definition 20.** Let \( S \in \text{AnSp}(\mathbb{C}) \). Let \( Z \subset S \) a closed subset. Denote by \( j : S \setminus Z \hookrightarrow S \) be the open complementary subset.

(i) We define the functor 
\[
\Gamma_Z : C(\text{AnSp}(\mathbb{C})^{sm}/S) \to C(\text{AnSp}(\mathbb{C})^{sm}/S), \ G^* \mapsto \Gamma_Z G^* := \text{Cone}(\text{ad}(j^*, j_*)(G^*) : G^* \to j_* j^* G^*)[-1],
\]
so that there is then a canonical map \( \gamma_Z(G^*) : \Gamma_Z G^* \to G^* \).

(ii) We have the dual functor of (i): 
\[
\Gamma_Z^\vee : C(\text{AnSp}(\mathbb{C})^{sm}/S) \to C(\text{AnSp}(\mathbb{C})^{sm}/S), \ F \mapsto \Gamma_Z^\vee(F^*) := \text{Cone}(\text{ad}(j^*, j_*)(G^*) : j^* j_* G^* \to G^*),
\]

together with the canonical map \( \gamma_Z^\vee(G) : F \to \Gamma_Z^\vee(G) \).

(iii) For \( F, G \in C(\text{AnSp}(\mathbb{C})^{sm}/S) \), we denote by 
\[
I(\gamma, \text{hom})(F, G) := (I, I(j_*, j_*)(F, G)) : \Gamma_Z \text{Hom}(F, G) \cong \text{Hom}(\Gamma_Z^\vee F, G)
\]
the canonical isomorphism given by adjunction.

Let \( S \in \text{AnSp}(\mathbb{C}) \) and \( Z \subset S \) a closed subset.

- Since \( \Gamma_Z : C(\text{AnSp}(\mathbb{C})^{sm}/S) \to C(\text{AnSp}(\mathbb{C})^{sm}/S) \) preserve monomorphism, it induces a functor 
\[
\Gamma_Z : C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S) \to C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S), \ (G, F) \mapsto \Gamma_Z G, F := (\Gamma_Z G, \Gamma_Z F)
\]
- Since \( \Gamma_Z^\vee : C(\text{AnSp}(\mathbb{C})^{sm}/S) \to C(\text{AnSp}(\mathbb{C})^{sm}/S) \) preserve monomorphism, it induces a functor 
\[
\Gamma_Z^\vee : C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S) \to C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S), \ (G, F) \mapsto \Gamma_Z^\vee G, F := (\Gamma_Z^\vee G, \Gamma_Z^\vee F)
\]

**Definition-Proposition 7.** (i) Let \( g : S' \to S \) a morphism and \( i : Z \hookrightarrow S \) a closed embedding with \( S', S, Z \in \text{AnSp}(\mathbb{C}) \). Then, for \( (G, F) \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S') \), there exist a map in \( C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S') \)
\[
T(g, \gamma)(G, F) : g^* \Gamma_Z(G, F) \to \Gamma_{Z', S'}(g^*(G, F))
\]
unique up to homotopy, such that \( \gamma_{Z', S'}(g^*(G, F)) \circ T(g, \gamma)(G, F) = g^* \gamma_Z(G, F) \).

(ii) Let \( i_1 : Z_1 \to S, i_2 : Z_2 \to Z_1 \) be closed embeddings with \( S, Z_1, Z_2 \in \text{AnSp}(\mathbb{C}) \). Then, for \( (G, F) \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S) \),
- there exist a canonical map \( T(Z_2/Z_1, \gamma)(G, F) : \Gamma_{Z_2}(G, F) \to \Gamma_{Z_1}(G, F) \) in \( C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S) \)
unique up to homotopy such that \( \gamma_{Z_2}(G, F) \circ T(Z_2/Z_1, \gamma)(G, F) = \gamma_{Z_1}(G, F) \), together with a distinguish triangle
\[
\Gamma_{Z_2}(G, F) \xrightarrow{T(Z_2/Z_1, \gamma)(G, F)} \Gamma_{Z_1}(G, F) \xrightarrow{\text{ad}(j_2, j_1)(\Gamma_{Z_1}(G, F))} \Gamma_{Z_1\setminus Z_2}(G, F) \to \Gamma_{Z_2}(G, F)[1]
\]
in \( K_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S) \),
- there exist a map \( T(Z_2/Z_1, \gamma')(G, F) : \Gamma_{Z_1}^\vee(G, F) \to \Gamma_{Z_2}^\vee(G, F) \) in \( C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S) \)
unique up to homotopy such that \( \gamma_{Z_2}^\vee(G, F) = T(Z_2/Z_1, \gamma')(G, F) \circ \gamma_{Z_1}^\vee(G, F) \), together with a distinguish triangle
\[
\Gamma_{Z_1\setminus Z_2}^\vee(G, F) \xrightarrow{\text{ad}(j_2, j_1)(\Gamma_{Z_1}^\vee(G, F))} \Gamma_{Z_1}^\vee(G, F) \xrightarrow{T(Z_2/Z_1, \gamma')(G, F)} \Gamma_{Z_2}^\vee(G, F) \to \Gamma_{Z_1\setminus Z_2}^\vee(G, F)[1]
\]
in \( K_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S) \).
(iii) Consider a morphism \( g: (S', Z) \rightarrow (S, Z) \) with \((S', Z) \rightarrow (S, Z) \in \text{AnSp}(\mathbb{C})\). We denote, for \( G \in C(\text{AnSp}(\mathbb{C})^{sm}/S) \) the composite

\[
T(D, \gamma^\vee)(G) : g^* \Gamma^{\vee}_Z G \xrightarrow{\gamma^\vee} \Gamma^{\vee}_{Z \times S'} g^* G \xrightarrow{T((Z'/Z \times S', \gamma^\vee))(G)} \Gamma^{\vee}_{Z'} g^* G
\]

and we have then the factorization \( \gamma^\vee_{Z'}(g^* G) : g^* G \xrightarrow{g^* \gamma^\vee_{Z'}(G)} g^* \Gamma^{\vee}_{Z'} G \xrightarrow{T(D, \gamma^\vee)(G)} \Gamma^{\vee}_{Z'} g^* G \).

**Proof.** Similar to definition-proposition \([1]\) or definition-proposition \([4]\). \qed

**Definition 21.** For \( S \in \text{AnSp}(\mathbb{C}) \), we denote by

\[
C_{O_S}(\text{AnSp}(\mathbb{C})^{sm}/S) := C_{e(S)^* O_S}(\text{AnSp}(\mathbb{C})^{sm}/S)
\]

the category of complexes of presheaves on \( \text{AnSp}(\mathbb{C})^{sm}/S \) endowed with a structure of \( e(S)^* O_S \) module, and by

\[
C_{O_S,fil}(\text{AnSp}(\mathbb{C})^{sm}/S) := C_{e(S)^* O_S,fil}(\text{AnSp}(\mathbb{C})^{sm}/S)
\]

the category of filtered complexes of presheaves on \( \text{Var}(\mathbb{C})^{sm}/S \) endowed with a structure of \( e(S)^* O_S \) module.

Let \( S \in \text{AnSp}(\mathbb{C}) \). Let \( Z \subset S \) a closed subset. Denote by \( j : S \setminus Z \rightarrow S \) the open complementary embedding.

- For \( G \in C_{O_S}(\text{AnSp}(\mathbb{C})^{sm}/S) \), \( \Gamma_Z G := \text{Cone}(\text{ad}(j^*, j_*)(G) : F \rightarrow j_* j^* G)[-1] \) has a (unique) structure of \( e(S)^* O_S \) module such that \( \gamma_Z(G) : \Gamma_Z G \rightarrow G \) is a map in \( C_{O_S}(\text{AnSp}(\mathbb{C})^{sm}/S) \). This gives the functor

\[
\Gamma_Z : C_{O_S,fil}(\text{AnSp}(\mathbb{C})^{sm}/S) \rightarrow C_{fil O_S}(\text{AnSp}(\mathbb{C})^{sm}/S), \quad (G, F) \mapsto \Gamma_Z(G, F) := (\Gamma_Z G, \Gamma_Z F),
\]

together with the canonical map \( \gamma_Z((G, F) : \Gamma_Z(G, F) \rightarrow (G, F) \). Let \( Z_2 \subset Z \) a closed subset. Then, for \( G \in C_{O_S}(\text{AnSp}(\mathbb{C})^{sm}/S) \), \( T(Z_2/Z, \gamma)(G) : \Gamma_{Z_2} G \rightarrow \Gamma_Z G \) is a map in \( C_{O_S}(\text{AnSp}(\mathbb{C})^{sm}/S) \) (i.e. is \( e(S)^* O_S \) linear).

- For \( G \in C_{O_S}(\text{Var}(\mathbb{C})^{sm}/S) \), \( \Gamma^\vee_Z G := \text{Cone}(\text{ad}(j^*_2, j^*_Z)(G) : j^*_2 j^*_Z G \rightarrow G) \) has a unique structure of \( e(S)^* O_S \) module, such that \( \gamma^\vee_Z(G) : G \rightarrow \Gamma^\vee_Z G \) is a map in \( C_{O_S}(\text{AnSp}(\mathbb{C})^{sm}/S) \). This gives the the functor

\[
\Gamma^\vee_Z : C_{O_S,fil}(S) \rightarrow C_{fil O_S}(S), \quad (G, F) \mapsto \Gamma^\vee_Z(G, F) := (\Gamma^\vee_Z G, \Gamma^\vee_Z F),
\]

together with the canonical map \( \gamma^\vee_Z((G, F) : (G, F) \rightarrow \Gamma^\vee_Z(G, F) \). Let \( Z_2 \subset Z \) a closed subset. Then, for \( G \in C_{O_S}(\text{AnSp}(\mathbb{C})^{sm}/S) \), \( T(Z_2/Z, \gamma^\vee)(G) : \Gamma^\vee_{Z_2} G \rightarrow \Gamma^\vee_Z G \) is a map in \( C_{O_S}(\text{AnSp}(\mathbb{C})^{sm}/S) \) (i.e. is \( e(S)^* O_S \) linear).

**Definition 22.** Let \( S \in \text{AnSp}(\mathbb{C}) \). Let \( Z \subset S \) a closed subset.

(i) We denote by

\[
C_Z(\text{AnSp}(\mathbb{C})^{sm}/S) \subset C(\text{AnSp}(\mathbb{C})^{sm}/S),
\]

the full subcategory consisting of complexes of presheaves \( F^* \in C(\text{AnSp}(\mathbb{C})^{sm}/S) \) such that \( a_{asu} H^n(j^* F^*) = 0 \) for all \( n \in \mathbb{Z} \), where \( j : S \setminus Z \rightarrow S \) is the complementary open embedding and \( a_{asu} \) is the sheafification functor.

(i)’ We denote by

\[
C_{O_S, Z}(\text{AnSp}(\mathbb{C})^{sm}/S) \subset C_{O_S}(\text{AnSp}(\mathbb{C})^{sm}/S),
\]

the full subcategory consisting of complexes of presheaves \( F^* \in C(\text{AnSp}(\mathbb{C})^{sm}/S) \) such that \( a_{asu} H^n(j^* F^*) = 0 \) for all \( n \in \mathbb{Z} \), where \( j : S \setminus Z \rightarrow S \) is the complementary open embedding and \( a_{asu} \) is the sheafification functor.
(ii) We denote by 
\[ C_{fil,Z}(\text{AnSp}(\mathbb{C})^{sm}/S) \subset C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S) \]
the full subcategory consisting of filtered complexes of presheaves \((F^•, F) \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S)\) such that there exist \(r \in \mathbb{N}\) such that \(a_{usu}E^{p,q}_{r}(F^•, F) = 0\) for all \(p, q \in \mathbb{Z}\), where \(j : S \setminus Z \to S\) is the complementary open embedding and \(a_{usu}\) is the sheafification functor. Note that by definition this \(r\) does NOT depend on \(p\) and \(q\).

(ii)' We denote by 
\[ C_{O_{fil,Z}}(\text{AnSp}(\mathbb{C})^{sm}/S) \subset C_{O_{fil}}(\text{AnSp}(\mathbb{C})^{sm}/S) \]
the full subcategory consisting of filtered complexes of presheaves \((F^•, F) \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S)\) such that there exist \(r \in \mathbb{N}\) such that \(a_{usu}E^{p,q}_{r}(F^•, F) = 0\) for all \(p, q \in \mathbb{Z}\), where \(j : S \setminus Z \to S\) is the complementary open embedding and \(a_{usu}\) is the sheafification functor. Note that by definition this \(r\) does NOT depend on \(p\) and \(q\).

Let \(S \in \text{AnSp}(\mathbb{C})\) and \(Z \subset S\) a closed subset.

- For \((G, F) \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S)\), we have \(\Gamma_Z(G, F), \Gamma_Z^\mathbb{Z}(G, F) \in C_{fil,Z}(\text{AnSp}(\mathbb{C})^{sm}/S)\).
- For \((G, F) \in C_{O_{fil}}(\text{AnSp}(\mathbb{C})^{sm}/S)\), we have \(\Gamma_Z(G, F), \Gamma_Z^\mathbb{Z}(G, F) \in C_{O_{fil,Z}}(\text{AnSp}(\mathbb{C})^{sm}/S)\).

Let \(S \in \text{AnSp}(\mathbb{C})\). Let \(S = \bigcup_{i \in I} S_i\) an open cover and denote by \(S_I = \cap_{i \in I} S_i\). Let \(i_i : S_I \to \tilde{S}_I\) closed embeddings, with \(\tilde{S}_I \in \text{AnSp}(\mathbb{C})\). For \(I \subset [1, \ldots, l]\), denote by \(\tilde{S}_I = \bigcap_{i \in I} \tilde{S}_i\). We then have closed embeddings \(i_I : S_I \to S_I\), and for \(J \subset I\) the following commutative diagram

\[
D_{IJ} = \begin{array}{ccc}
S_I & \xrightarrow{i_I} & \tilde{S}_I \\
\downarrow{j_{IJ}} & & \downarrow{p_{IJ}} \\
S_J & \xrightarrow{i_J} & \tilde{S}_J
\end{array}
\]

where \(p_{IJ} : \tilde{S}_J \to \tilde{S}_I\) is the projection and \(j_{IJ} : S_I \to S_I\) is the open embedding so that \(j_I \circ j_{IJ} = j_J\). This gives the diagram of analytic spaces \((\tilde{S}_I) \in \text{Fun}(\mathcal{P}(\mathbb{N}), \text{AnSp}(\mathbb{C}))\) which gives the diagram of sites \(\text{AnSp}(\mathbb{C})^{sm}/(\tilde{S}_I) \in \text{Fun}(\mathcal{P}(\mathbb{N}), \text{Cat})\). Denote by \(m : \tilde{S}_I \setminus (S_I \setminus S_J) \to \tilde{S}_J\) the open embedding.

**Definition 23.** Let \(S \in \text{AnSp}(\mathbb{C})\). Let \(S = \bigcup_{i \in I} S_i\) an open cover and denote by \(S_I = \cap_{i \in I} S_i\). Let \(i_i : S_i \to \tilde{S}_I\) closed embeddings, with \(\tilde{S}_I \in \text{AnSp}(\mathbb{C})\). We denote by the full subcategory \(C_{fil}((\text{AnSp}(\mathbb{C})^{sm}/(S/(\tilde{S}_I))) \subset C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/(\tilde{S}_I)))\) the full subcategory

- whose objects \((G, F) = ((G_I, F)_{I \subset [1, \ldots, l]}, u_{IJ})\), with \((G_I, F) \in C_{fil,Z}(\text{AnSp}(\mathbb{C})^{sm}/\tilde{S}_I)\), and \(u_{IJ} : m^*(G_I, F) \to m^*p_{IJ,*}(G_J, F)\) for \(I \subset J\), are \(\infty\)-filtered usu local equivalence, satisfying for \(I \subset J \subset K\), \(p_{IJ} \circ u_{IK} = u_{IK} \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/\tilde{S}_I)\),

- the morphisms \(m : ((G, F), u_{IJ}) \to ((H, F), v_{IJ})\) being (see section 2.1) a family of morphisms of complexes,

\[
m = (m_I : (G_I, F) \to (H_I, F))_{I \subset [1, \ldots, l]} \]

such that \(v_{IJ} \circ m_I = p_{IJ} \circ m_J \circ u_{IJ}\) in \(C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/\tilde{S}_I)\).

A morphism \(m : ((G, F), u_{IJ}) \to ((H, F), v_{IJ})\) is said to an \(r\)-filtered usu local equivalence, if all the \(m_I\) are \(r\)-filtered usu local equivalences.

Denote \(L = [1, \ldots, l]\) and for \(I \subset L\), \(p_{0(I)} : S \times \tilde{S}_I \to S\), \(p_{I(0)} : S \times \tilde{S}_I \to S_I\) the projections. By definition, we have functors

- \(T(S/(\tilde{S}_I)) : C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S) \to C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/(S/(\tilde{S}_I))), (G, F) \mapsto (i_{I*}j_{I*}F, T(D_{IJ})(j_I^*(G, F)))\),

73
\( T((\tilde{S}_I)/S) : C_{fil}(\text{AnSp}(\mathbb{C})_{\text{sm}}/(S/((\tilde{S}_I)))) \to C_{fil}(\text{AnSp}(\mathbb{C})_{\text{sm}}/S), ((G_I, F), u_{IJ}) \mapsto \text{ho lim}_{I \subseteq L} p_{0(I)*}\Gamma_{\tilde{S}_I}p_{I(I)}^* (G_I, F). \)

Note that the functors \( T(S/(\tilde{S}_I)) \) are NOT embedding, since
\[
\text{ad}(i_I^*, i_{IJ}*)(j_I^*)^* F : i_I^* i_{IJ}^* j_I^* F \to j_I^* F
\]
is an equivalence but NOT isomorphism since we are dealing with the morphism of big sites \( P(i_I) : \text{AnSp}(\mathbb{C})_{\text{sm}}/S_I \to \text{AnSp}(\mathbb{C})_{\text{sm}}/\tilde{S}_I. \) However, these functors induce full embeddings

\[ T(S/(\tilde{S}_I)) : D_{fil}(\text{AnSp}(\mathbb{C})_{\text{sm}}/S) \to D_{fil}(\text{AnSp}(\mathbb{C})_{\text{sm}}/(S/((\tilde{S}_I)))) \]

since for \( F \in C(\text{AnSp}(\mathbb{C})_{\text{sm}}/S), \)
\[
\text{ho lim}_{I \subseteq L} p_{0(I)*}\Gamma_{\tilde{S}_I}p_{I(I)}^* (i_I^* j_I^* F) \to p_{0(I)*}\Gamma_{\tilde{S}_I} j_I^* F
\]
is an equivalence.

Let \( f : X \to S \) a morphism, with \( X, S \in \text{AnSp}(\mathbb{C}). \) Let \( S = \sqcup_{i=1}^d S_i \) and \( X = \sqcup_{i=1}^d X_i \) be affine open covers and \( i_i : S_i \to \tilde{S}_i, i_i^* : X_i \to \tilde{X}_i \) be closed embeddings. Let \( f_i : \tilde{X}_i \to \tilde{S}_i \) be a lift of the morphism \( f_i = f_{|X_i} : X_i \to S_i. \) Then, \( f_I = f_{|X_I} : X_I = \cap_{i \in I} X_i \to \tilde{S}_I = \cap_{i \in I} \tilde{S}_i \) lift to the morphism

\[ f_I = \Pi_{i \in I} f_i : \tilde{X}_I = \Pi_{i \in I} \tilde{X}_i \to \tilde{S}_I = \Pi_{i \in I} \tilde{S}_i. \]

Denote by \( p_{IJ} : \tilde{S}_J \to \tilde{S}_I \) and \( p_{IJI}^* : \tilde{X}_J \to \tilde{X}_I \) the projections. Consider for \( J \subset I \) the following commutative diagrams

\[
D_{IJ} = \begin{array}{ccc}
S_I & \xrightarrow{i_I} & \tilde{S}_I \\
\downarrow{j_{IJ}} & & \downarrow{p_{IJ}} \\
S_J & \xrightarrow{i_J} & \tilde{S}_J
\end{array}, \\
D_{IJ}' = \begin{array}{ccc}
X_I & \xrightarrow{i_I'} & \tilde{X}_I \\
\downarrow{j_{IJ}} & & \downarrow{p_{IJ}'} \\
X_J & \xrightarrow{i_J'} & \tilde{X}_J
\end{array}
\]

We have then following commutative diagram

\[
\begin{array}{ccc}
X_J & \xrightarrow{n_J'} & \tilde{X}_J \\
\downarrow{j_{IJ}} & & \downarrow{p_{IJ}'} \\
\tilde{X}_J & \xrightarrow{n_J} & \tilde{X}_J \\
\end{array}
\]

whose square are cartesian. We then have the pullback functor

\[
f^* : C_{fil}(\text{AnSp}(\mathbb{C})_{\text{sm}}/S/((\tilde{S}_I))) \to C_{fil}(\text{AnSp}(\mathbb{C})_{\text{sm}}/X/((\tilde{X}_I))),
((G_I, F), u_{IJ}) \mapsto f^*((G_I, F), u_{IJ}) := (\Gamma_{\tilde{X}_I}^* f_I^*(G_I, F), f_{IJ}^* u_{IJ})
\]

with

\[
f_{IJ}^* u_{IJ} : \Gamma_{\tilde{X}_I}^* f_I^*(G_I, F) \xrightarrow{\text{ad}(p_{IJ}^*, p_{IJI}^*)((-))} p_{IJ}^* p_{IJI}^* \Gamma_{\tilde{X}_I}^* \tilde{f}_I^*(G_I, F) \xrightarrow{T_I(p_{IJ}, n_J)((-)^{-1})} p_{IJ}^* \Gamma_{\tilde{X}_I}^* i_{IJ}^* f_{IJ}^*(G_I, F)
\]

Let \( (G, F) \in C_{fil}(\text{AnSp}(\mathbb{C})_{\text{sm}}/S). \) Since, \( j_{IJ}^* i_{IJ}^* f^*(G, F) = 0, \) the morphism \( T(D_{IJ})(j_I^*(G, F)) : f_I^* i_I^* j_I^* f^*(G, F) \to i_J^* j_J^* f^*(G, F) \) factors through

\[
T(D_{IJ})(j_I^*(G, F)) : f_I^* i_I^* j_I^* f^*(G, F) \xrightarrow{\gamma_{j_I}^* (-)} \Gamma_{\tilde{X}_I}^* f_I^* i_I^* j_I^* f^*(G, F) \xrightarrow{T^*(D_{IJ})(j_I^*(G, F))} i_J^* j_J^* f^*(G, F)
\]
We have then, for \((G, F) \in C_{fil}(S)\), the canonical transformation map

\[
f^*T(S/\tilde{S})(G, F) \xrightarrow{T(f,T(0/1))(G,F)} T(X/(\tilde{X}))(f^* (G, F))
\]

\[
(\Gamma_X, j_{1*} f_{1*} j_I^* (G, F), f_I^* I) \xrightarrow{T^u(D_{jI})(j_{I}^* (G,F))} (i_{I*} j_I^* f^* (G, F), I)
\]

We have similarly to the algebraic case, we have:

**Definition 24.**

(i) Let \(f : X \to S\) a morphism with \(X, S \in AnSp(C)\). Assume that there exist a factorization \(f : X \to Y \times S \xrightarrow{p} S\), with \(Y \in AnSm(C)\), \(i : X \hookrightarrow Y\) is a closed embedding and \(p\) the projection. We then consider

\[
Q(X/S) := p_{1}^{\vee} \Gamma_{X} Z_{Y \times S} := \text{Cone}(\mathbb{Z}((Y \times S)/X) \to \mathbb{Z}(Y \times S/S)) \in C(AnSp(C)^{\text{sm}}/S).
\]

By definition \(Q(X/S)\) is projective since it is a complex of two representative pre sheaves.

(ii) Let \(f : X \to S\) and \(g : T \to S\) two morphism with \(X, S, T \in AnSp(C)\). Assume that there exist a factorization \(f : X \to Y \times S \xrightarrow{p} S\), with \(Y \in AnSm(C)\), \(i : X \hookrightarrow Y\) is a closed embedding and \(p\) the projection. We then have the following commutative diagram whose squares are cartesian

\[
f : X \xrightarrow{i} Y \times S \xrightarrow{p} S
\]

\[
g' \quad g'' := (1 \times g) \quad g
\]

\[
f' : X_T \xrightarrow{i'} Y \times T \xrightarrow{p'} T
\]

We then have the canonical isomorphism in \(C(AnSp(C)^{\text{sm}}/T)\)

\[
T(f, g, Q) := T_{i}(g, p)(-1) \circ T_{i}(g'', j)(-1) : g^{*} Q(X/S) := g' p_{1}^{\vee} \Gamma_{X} Z_{Y \times S} \cong p_{1}^{\vee} \Gamma_{X_{T}} Z_{Y \times T} := Q(X_T/T)
\]

with \(j : Y \times S \setminus X \hookrightarrow Y \times S\) the closed embedding.

We now define the \(D^{1}\) localization property:

**Definition 25.** Let \(S \in \text{Var}(C)\).

(i) A complex \(F \in C(AnSp(C)^{\text{sm}}/S)\) is said to be \(D^{1}\) invariant if for all \(U/S \in AnSp(C)^{\text{sm}}/S\,

\[
F(p_{U}) : F(U/S) \to F(U \times D^{1}/S)
\]

is a quasi-isomorphism, where \(p_{U} : U \times D^{1} \to U\) is the projection.

(ii) A complex \(F \in C(AnSp(C)^{\text{sm}}/S)\) is said to be \(D^{1}\) local for the usual topology, if for a (hence every) usu local equivalence \(k : F \to G\) with \(k\) injective and \(G \in C(AnSp(C)^{\text{sm}}/S)\) usu fibrant, e.g. \(k : F \to E_{r}(F)\), \(G\) is \(D^{1}\) invariant for all \(n \in \mathbb{Z}\).

(iii) A morphism \(m : F \to G\) with \(F, G \in C(AnSp(C)^{\text{sm}}/S)\) is said to an \((D^{1}, \text{usu})\) local equivalence if for all \(H \in C(AnSp(C)^{\text{sm}}/S)\) which is \(D^{1}\) local for the etale topology

\[
\text{Hom}(L(m), E_{usu}(H)) : \text{Hom}(L(G), E_{usu}(H)) \to \text{Hom}(L(F), E_{usu}(H))
\]

is a quasi-isomorphism. Equivalently, \(m : F \to G\) with \(F, G \in C(AnSp(C)^{\text{sm}}/S)\) is an \((D^{1}, \text{et})\) local equivalence if and only if there exists \(X_1, S_1, ... , X_r, S \in AnSp(C)^{\text{sm}}/S\) such that we have in \(\text{Ho}_{et}(C(\text{Var}(C)^{\text{sm}}/S))\)

\[
\text{Cone}(m) \xrightarrow{\sim} \text{Cone}(\text{Cone}(\mathbb{Z}(X_1 \times D^{1}/S) \to \mathbb{Z}(X_1/S)) \to \cdots \to \text{Cone}(\mathbb{Z}(X_r \times D^{1}/S) \to \mathbb{Z}(X_r/S)))
\]

75
Definition-Proposition 8. Let $S \in \text{AnSp}(\mathbb{C})$

(i) With the weak equivalence the $(\mathbb{D}^1, \text{usu})$ local equivalence and the fibration the epimorphism with $\mathbb{D}^1_S$ local and usu fibrant kernels gives a model structure on $C(\text{AnSp}(\mathbb{C})^\text{sm}/S)$ : the left bousfield localization of the projective model structure of $C(\text{AnSp}(\mathbb{C})^\text{sm}/S)$. We call it the $(\mathbb{D}^1, \text{usu})$ projective model structure.

(ii) With the weak equivalence the $(\mathbb{D}^1, \text{usu})$ local equivalence and the fibration the epimorphism with $\mathbb{D}^1_S$ local and usu fibrant kernels gives a model structure on $C(\text{AnSp}(\mathbb{C})/S)$ : the left bousfield localization of the projective model structure of $C(\text{AnSp}(\mathbb{C})/S)$. We call it the $(\mathbb{D}^1, \text{usu})$ projective model structure.

Proof. Similar to the proof of definition-proposition [5] □

We will consider for the construction of the filtered De Rham realization functor the filtered case :

Definition 26. Let $S \in \text{AnSp}(\mathbb{C})$.

(i) Let $r \in \mathbb{N}$. A filtered complex $(G, F) \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S)$ is said to be $r$-filtered $\mathbb{D}^1$ invariant if for all $U/S \in \text{AnSp}(\mathbb{C})/S$ and all $p, q \in \mathbb{Z}$,

$$E^r_{p,q}G(p_U) : E^r_{p,q}(G, F)(U/S) \xrightarrow{\sim} E^r_{p,q}(G, F)(U \times \mathbb{D}^1/S)$$

is an isomorphism of abelian group, where $p_U : U \times \mathbb{D}^1 \to U$ is the projection. Note that by definition this $r$ does NOT depend on $p$ and $q$.

(ii) A filtered complex $(G, F) \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S)$ is said to be $\infty$-filtered $\mathbb{D}^1$ invariant if for all $U/S \in \text{AnSp}(\mathbb{C})^{sm}/S$, there exist $r \in \mathbb{N}$ such that for all $p, q \in \mathbb{Z}$,

$$E^r_{p,q}G(p_U) : E^r_{p,q}(G, F)(U/S) \xrightarrow{\sim} E^r_{p,q}(G, F)(U \times \mathbb{D}^1/S)$$

is an isomorphism of abelian group, where $p_U : U \times \mathbb{D}^1 \to U$ is the projection (note that by definition this $r$ does NOT depend on $p$ and $q$ but may depends on $U/S$). This implies that, for all $U/S \in \text{AnSp}(\mathbb{C})^{sm}/S$,

$$H^nG(p_U) : H^n(G, F)(U/S) \xrightarrow{\sim} H^n(G, F)(U \times \mathbb{D}^1/S)$$

is a filtered isomorphism of filtered abelian groups for all $n \in \mathbb{Z}$.

(iii) A filtered complex $(G, F) \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S)$ is said to be $\infty$-filtered $\mathbb{D}^1$ local for the usual topology if for a (hence every) $\infty$-filtered usu local equivalence $k : (G, F) \to (H, F)$ with $k$ injective and $(H, F) \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S)$ $\infty$-filtered usu fibrant, e.g. $k : (G, F) \to E_{usu}(G, F)$, $(H, F)$ is $\infty$-filtered $\mathbb{D}^1$ invariant.

Lemma 3. Let $S \in \text{Var}(\mathbb{C})$.

(i) Let $(G, F) \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S)$ Then, if $m : F_1 \to F_2$ with $F_1, F_2 \in C(\text{AnSp}(\mathbb{C})^{sm}/S)$ is an usu local equivalence,

$$\text{Hom}(m, E_{usu}(G, F)) : \text{Hom}^*(F_2, E_{usu}(G, F)) \to \text{Hom}^*(F_1, E_{usu}(G, F))$$

is a filtered quasi-isomorphism.

(ii) Let $(G, F) \in C_{fil}(\text{AnSp}(\mathbb{C})^{sm}/S)$ be $\infty$-filtered $\mathbb{D}^1$ local for the usual topology. Then, if $m : F_1 \to F_2$ with $F_1, F_2 \in C(\text{AnSp}(\mathbb{C})^{sm}/S)$ is an $(\mathbb{D}^1, \text{et})$ local equivalence,

$$\text{Hom}(m, E_{usu}(G, F)) : \text{Hom}^*(F_2, E_{usu}(G, F)) \to \text{Hom}^*(F_1, E_{usu}(G, F))$$

is an $\infty$-filtered quasi-isomorphism.
Proof. Similar to lemma \[1\]

**Proposition 24.** Let \( g : T \to S \) a morphism with \( T, S \in \text{AnSp}(\mathbb{C}) \).

(i) The adjunction \( (g^*, g_*) : C(\text{AnSp}(\mathbb{C})^\text{sm}/S) \rightleftarrows C(\text{AnSp}(\mathbb{C})^\text{sm}/T) \) is a Quillen adjunction for the \((\mathbb{D}^1, \text{et})\) projective model structure.

(ii)’ Let \( h : U \to S \) a smooth morphism with \( U, S \in \text{AnSp}(\mathbb{C}) \). The adjunction \( (h_2, h^*) : C(\text{AnSp}(\mathbb{C})^\text{sm}/U) \rightleftarrows C(\text{AnSp}(\mathbb{C})^\text{sm}/S) \) is a Quillen adjunction for the \((\mathbb{D}^1, \text{et})\) projective model structure.

(iii)” The functor \( g^* : C(\text{AnSp}(\mathbb{C})^\text{sm}/S) \to C(\text{AnSp}(\mathbb{C})^\text{sm}/T) \) sends quasi-isomorphism to quasi-isomorphism, sends equivalence usu local to equivalence usu local, sends \((\mathbb{D}^1, \text{et})\) local equivalence.

Proof. Similar to the proof of proposition \[18\]

**Proposition 25.** Let \( S \in \text{AnSp}(\mathbb{C}) \).

(i) The adjunction \( (\rho_S^*, \rho_S^* ) : C(\text{AnSp}(\mathbb{C})^\text{sm}/S) \rightleftarrows C(\text{AnSp}(\mathbb{C})/S) \) is a Quillen adjunction for the \((\mathbb{D}^1, \text{et})\) projective model structure.

(ii)’ The functor \( g_S : C(\text{AnSp}(\mathbb{C})/S) \to C(\text{AnSp}(\mathbb{C})^\text{sm}/S) \) sends quasi-isomorphism to quasi-isomorphism, sends equivalence usu local to equivalence usu local, sends \((\mathbb{D}^1, \text{usu})\) local equivalence to \((\mathbb{D}^1, \text{usu})\) local equivalence.

Proof. Similar to the proof of proposition \[19\]

### 2.9 Presheaves on the big analytical site of pairs

We recall the definition given in subsection 5.1: For \( S \in \text{AnSp}(\mathbb{C}) \), \( \text{AnSp}(\mathbb{C})^2/S := \text{AnSp}(\mathbb{C})^2/(S, S) \) is by definition (see subsection 2.1) the category whose set of objects is

\[(\text{AnSp}(\mathbb{C})^2/S)^0 := \{(X, Z, h), h : X \to S, Z \subset X \text{ closed} \} \subset \text{AnSp}(\mathbb{C})/S \times \text{Top}\]

and whose set of morphisms between \((X_1, Z_1)/S = ((X_1, Z_1), h_1), (X_1, Z_1)/S = ((X_2, Z_2), h_2) \in \text{AnSp}(\mathbb{C})^2/S\) is the subset

\[\text{Hom}_{\text{AnSp}(\mathbb{C})^2/S}((X_1, Z_1)/S, (X_2, Z_2)/S) := \{(f : X_2 \to X_2), \text{ s.t. } h_1 \circ f = h_2 \text{ and } Z_1 \subset f^{-1}(Z_2) \} \subset \text{Hom}_{\text{AnSp}(\mathbb{C})}(X_1, X_2)\]

The category \( \text{AnSp}(\mathbb{C})^2 \) admits fiber products : \((X_1, Z_1) \times_{(S, Z)} (X_2, Z_2) = (X_1 \times_S X_2, Z_1 \times_Z Z_2) \). In particular, for \( f : T \to S \) a morphism with \( S, T \in \text{AnSp}(\mathbb{C}) \), we have the pullback functor

\[P(f) : \text{AnSp}(\mathbb{C})^2/S \to \text{AnSp}(\mathbb{C})^2/T, P(f)((X, Z, S)) := (X_T, Z_T)/T, P(f)(g) := (g \times_S f)\]

and we note again \( P(f) : \text{AnSp}(\mathbb{C})^2/T \to \text{AnSp}(\mathbb{C})^2/S \) the corresponding morphism of sites.

We will consider in the construction of the filtered De Rham realization functor the full subcategory \( \text{AnSp}(\mathbb{C})^2^\text{sm}/S \subset \text{AnSp}(\mathbb{C})^2/S \) such that the first factor is a smooth morphism: We will also consider, in order to obtain a complex of D modules in the construction of the filtered De Rham realization functor, the restriction to the full subcategory \( \text{AnSp}(\mathbb{C})^2^\text{pr}/S \subset \text{AnSp}(\mathbb{C})^2/S \) such that the first factor is a projection:
Definition 27.  (i) Let $S \in \text{AnSp}(\mathbb{C})$. We denote by

$$\rho_S : \text{AnSp}(\mathbb{C})^{2,sm}/S \hookrightarrow \text{AnSp}(\mathbb{C})^2/S$$

the full subcategory consisting of the objects $(U, Z)/S = ((U, Z), h) \in \text{AnSp}(\mathbb{C})^2/S$ such that the morphism $h : U \to S$ is smooth. That is, $\text{AnSp}(\mathbb{C})^{2,sm}/S$ is the category

- whose objects are $(U, Z)/S = ((U, Z), h)$, with $U \in \text{AnSp}(\mathbb{C})$, $Z \subset U$ a closed subset, and $h : U \to S$ a smooth morphism,

- whose morphisms $g : (U, Z)/S = ((U, Z), h_1) \to (U', Z')/S = ((U', Z'), h_2)$ is a morphism $g : U \to U'$ of complex algebraic varieties such that $Z \subset g^{-1}(Z')$ and $h_2 \circ g = h_1$.

We denote again $\rho_S : \text{AnSp}(\mathbb{C})^2/S \to \text{AnSp}(\mathbb{C})^{2,sm}/S$ the associated morphism of site. We have

$$r^*(S) : \text{AnSp}(\mathbb{C})^2 / \rho_S \to \text{AnSp}(\mathbb{C})^{2,sm}/S$$

the composite morphism of site.

(ii) Let $S \in \text{AnSp}(\mathbb{C})$. We will consider the full subcategory

$$\mu_S : \text{AnSp}(\mathbb{C})^{2,pr}/S \hookrightarrow \text{AnSp}(\mathbb{C})^2/S$$

whose subset of object consist of those whose morphism is a projection to $S$:

$$(\text{AnSp}(\mathbb{C})^{2,pr}/S)^0 := \{(Y \times S, X), Y \in \text{AnSp}(\mathbb{C}), p : Y \times S \to S \text{ the projection}\} \subset (\text{AnSp}(\mathbb{C})^2/S)^0.$$

(iii) We will consider the full subcategory

$$\mu_S : (\text{AnSp}(\mathbb{C})^{2,smpr}/S) \hookrightarrow \text{AnSp}(\mathbb{C})^{2,sm}/S$$

whose subset of object consist of those whose morphism is a smooth projection to $S$:

$$(\text{AnSp}(\mathbb{C})^{2,smpr}/S)^0 := \{(Y \times S, X), Y \in \text{SmVar}(\mathbb{C}), p : Y \times S \to S \text{ the projection}\} \subset (\text{AnSp}(\mathbb{C})^2/S)^0.$$

For $f : T \to S$ a morphism with $T, S \in \text{AnSp}(\mathbb{C})$, we have by definition, the following commutative diagram of sites

\begin{equation}
\begin{array}{ccc}
\text{AnSp}(\mathbb{C})^2/T & \xrightarrow{\rho_T} & \text{AnSp}(\mathbb{C})^{2,pr}/T \\
\downarrow P(f) & & \downarrow P(f) \\
\text{AnSp}(\mathbb{C})^{2,sm}/T & \xrightarrow{\rho_T} & \text{AnSp}(\mathbb{C})^{2,smpr}/T \\
\downarrow P(f)^S & & \downarrow P(f)^S \\
\text{AnSp}(\mathbb{C})^{2,sm}/S & \xrightarrow{\rho_S} & \text{AnSp}(\mathbb{C})^{2,smpr}/S
\end{array}
\end{equation}

Recall we have (see subsection 2.1), for $S \in \text{Var}(\mathbb{C})$, the graph functor

$$\text{Gr}^{12}_S : \text{AnSp}(\mathbb{C})/S \to \text{AnSp}(\mathbb{C})^{2,pr}/S, X/S \mapsto \text{Gr}^{12}_S(X/S) := (X \times S, X)/S,$$

$$(g : X/S \to X'/S) \mapsto \text{Gr}^{12}_S(g) := (g \times I_S : (X \times S, X) \to (X' \times S, X')).$$
For \( f : T \rightarrow S \) a morphism with \( T, S \in \text{AnSp}(\mathbb{C}) \), we have by definition, the following commutative diagram of sites

\[
\begin{array}{ccc}
\text{AnSp}(\mathbb{C})^{2,\text{pr}}/T & \xrightarrow{Gr^T} & \text{AnSp}(\mathbb{C})/T \\
\downarrow P(f) & & \downarrow \rho_T \\
\text{AnSp}(\mathbb{C})^{2,\text{sm}}/S & \xrightarrow{Gr^S} & \text{AnSp}(\mathbb{C})^{sm}/T \\
\downarrow P_S & & \downarrow \rho_S \\
\text{AnSp}(\mathbb{C})^{2,\text{sm}}/S & \xrightarrow{Gr^S} & \text{AnSp}(\mathbb{C})^{sm}/S \\
\end{array}
\]

(36)

where we recall that \( P(f)((X, Z)/S) := ((X_T, Z_T)/T) \), since smooth morphisms are preserved by base change.

As usual, we denote by

\[
(f^*, f_*): = (P(f)^*, P(f)_*) : C(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/S) \rightarrow C(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/T)
\]

the adjunction induced by \( P(f) : \text{AnSp}(\mathbb{C})^{2,\text{sm}}/T \rightarrow \text{AnSp}(\mathbb{C})^{2,\text{sm}}/S \). Since the colimits involved in the definition of \( f^* = P(f)^* \) are filtered, \( f^* \) also preserve monomorphism. Hence, we get an adjunction

\[
(f^*, f_*): C_{fd}(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/S) \rightleftharpoons C_{fd}(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/T), \ f^*(G, F) := (f^*G, f^*F)
\]

For \( S \in \text{AnSp}(\mathbb{C}) \), we denote by \( Z_S := Z((S, S)/(S, S)) \in \text{PSh}(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/S) \) the constant presheaf. By Yoneda lemma, we have for \( F \in C(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/S) \), \( \text{Hom}(Z_S, F) = F \).

For \( h : U \rightarrow S \) a smooth morphism with \( U, S \in \text{AnSp}(\mathbb{C}) \), \( P(h) : \text{AnSp}(\mathbb{C})^{2,\text{sm}}/S \rightarrow \text{AnSp}(\mathbb{C})^{2,\text{sm}}/U \) admits a left adjoint

\[
C(h) : \text{AnSp}(\mathbb{C})^{2,\text{sm}}/U \rightarrow \text{AnSp}(\mathbb{C})^{2,\text{sm}}/S, C(h)((U', Z'), h') = ((U', Z'), h \circ h').
\]

Hence \( h^* : C(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/S) \rightarrow C(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/U) \) admits a left adjoint

\[
h^*_2 : C(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/U) \rightarrow C(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/S), \ F \mapsto (h_U F : ((U, Z), h_0) \mapsto \lim_{((U', Z'), h_0 \circ h')} F((U', Z')/U))
\]

For \( F^* \in C(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/S) \) and \( G^* \in C(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/U) \), we have the adjunction maps

\[
\text{ad}(h^*_2, h^*)(G^*) : G^* \rightarrow h^*_2 h^* G^*, \ \text{ad}(h^*_2, h^*)(F^*) : h^*_2 h^* F^* \rightarrow F^*.
\]

For a smooth morphism \( h : U \rightarrow S \), with \( U, S \in \text{AnSp}(\mathbb{C}) \), we have the adjunction isomorphism, for \( F \in C(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/U) \) and \( G \in C(\text{AnSp}(\mathbb{C})^{2,\text{sm}}/S) \),

\[
I(h^*_2, h^*)(F, G) : \text{Hom}^*(h^*_2 F, G) \xrightarrow{\sim} h^*_2 \text{Hom}^*(F, h^* G).
\]

(37)

For a commutative diagram in \( \text{AnSp}(\mathbb{C}) \ :

\[
\begin{array}{ccc}
D = V \xrightarrow{g_2} U \\
\downarrow h_2 & & \downarrow h_1 \\
T \xrightarrow{g_1} S
\end{array}
\]

79
where $h_1$ and $h_2$ are smooth, we denote by, for $F^\bullet \in C(\text{AnSp}(\mathbb{C})^{2,sm}/U)$, $$\tau T^2(D)(F^\bullet) : h_2 g F^\bullet \rightarrow g^*_h h_1 F^\bullet$$ the canonical map given by adjonction. If $D$ is cartesian with $h_1 = h$, $g_1 = g = f_2 = h' : U_T \rightarrow T$, $g' : U_T \rightarrow U$, $$\tau T^2(g,h)(F) : h' g^* F^\bullet \rightarrow g^* h F^\bullet$$ is an isomorphism.

We have the support section functors of a closed embedding $i : Z \rightarrow S$ for presheaves on the big analytical site of pairs.  

**Definition 28.** Let $i : Z \rightarrow S$ be a closed embedding with $S, Z \in \text{AnSp}(\mathbb{C})$ and $j : S \setminus Z \rightarrow S$ be the open complementary subset.

(i) Define the functor $$\Gamma_Z : C(\text{AnSp}(\mathbb{C})^{2,sm}/S) \rightarrow C(\text{AnSp}(\mathbb{C})^{2,sm}/S), \ G^\bullet \mapsto \Gamma_Z G^\bullet := \text{Cone}(\text{ad}(j^*, j_*)(G^\bullet) : G^\bullet \rightarrow j_* j^* G^\bullet)[-1],$$ so that there is then a canonical map $\gamma_Z(G^\bullet) : \Gamma_Z G^\bullet \rightarrow G^\bullet$.

(ii) We have the dual functor of (i) : $$\Gamma^\vee_Z : C(\text{AnSp}(\mathbb{C})^{2,sm}/S) \rightarrow C(\text{AnSp}(\mathbb{C})^{2,sm}/S), \ F \mapsto \Gamma^\vee_Z(F^\bullet) := \text{Cone}(\text{ad}(j_!, j^*)(G^\bullet) : j_! j^* G^\bullet \rightarrow G^\bullet),$$ together with the canonical map $\gamma^\vee_Z(G) : F \rightarrow \Gamma^\vee_Z(G)$.

(iii) For $F,G \in C(\text{AnSp}(\mathbb{C})^{2,sm}/S)$, we denote by $$I(\gamma, \text{hom})(F,G) := (I, I(j_!, j^*)(F,G))^{-1} : \Gamma_Z \text{Hom}(F,G) \rightarrow \text{Hom}(\Gamma^\vee_Z F,G)$$ the canonical isomorphism given by adjonction.

Note that we have similarly for $i : Z \rightarrow S$, $i' : Z' \rightarrow Z$ closed embeddings, $g : T \rightarrow S$ a morphism with $T, S, Z \in \text{AnSp}(\mathbb{C})$ and $F \in C(\text{AnSp}(\mathbb{C})^{2,sm}/S)$, the canonical maps in $C(\text{AnSp}(\mathbb{C})^{2,sm}/S)$

- $T(g, \gamma)(F) : g^* \Gamma_Z F \rightarrow \Gamma_{Z \times_S T} g^* F$, $T(g, \gamma)(F) : \Gamma^\vee_{Z \times_S T} g^* F \rightarrow g^* \Gamma_Z F$
- $T(Z'/Z, \gamma)(F) : \Gamma_Z F \rightarrow \Gamma_Z F$, $T(Z'/Z, \gamma)(F) : \Gamma^\vee_Z F \rightarrow \Gamma^\vee_Z F$

but we will not use them in this article.

We now define the usual topology on $\text{AnSp}(\mathbb{C})^{2}/S$.

**Definition 29.** Let $S \in \text{AnSp}(\mathbb{C})$.

(i) Denote by $\tau$ a topology on $\text{AnSp}(\mathbb{C})$, e.g. the usual topology. The $\tau$ covers in $\text{AnSp}(\mathbb{C})^{2}/S$ of $(X, Z)/S$ are the families of morphisms

$$\{(c_i : (U_i, Z \times_X U_i)/S \rightarrow (X, Z)/S)_{i \in I}, \text{ with } (c_i : U_i \rightarrow X)_{i \in I} \ \text{cover of } X \text{ in } \text{AnSp}(\mathbb{C})\}$$

(ii) Denote by $\tau$ the usual or the etale topology on $\text{AnSp}(\mathbb{C})$. The $\tau$ covers in $\text{AnSp}(\mathbb{C})^{2,sm}/S$ of $(U, Z)/S$ are the families of morphisms

$$\{(c_i : (U_i, Z \times_U U_i)/S \rightarrow (U, Z)/S)_{i \in I}, \text{ with } (c_i : U_i \rightarrow U)_{i \in I} \ \text{cover of } X \text{ in } \text{AnSp}(\mathbb{C})\}$$

(iii) Denote by $\tau$ the usual or the etale topology on $\text{AnSp}(\mathbb{C})$. The $\tau$ covers in $\text{AnSp}(\mathbb{C})^{2,(sm)pr}/S$ of $(Y \times_S Z)/S$ are the families of morphisms

$$\{(c_i \times_S : (U_i \times_S Z \times_{Y \times_S} U_i \times_S)/S \rightarrow (Y \times_S Z)/S)_{i \in I}, \text{ with } (c_i : U_i \rightarrow Y)_{i \in I} \ \text{cover of } Y \text{ in } \text{AnSp}(\mathbb{C})\}$$
Let $S \in \text{AnSp}(\mathbb{C})$. Denote by $\tau$ the usual topology on $\text{AnSp}(\mathbb{C})$. In particular, denoting $a_{\tau} : \text{PSh}(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})}/S \to \text{Shv}(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})}/S$ and $a_{\tau} : \text{PSh}(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})^{pr}}/S \to \text{Shv}(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})^{pr}}/S$ the sheafification functors,

- a morphism $\phi : F \to G$, with $F, G \in C(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})}/S$, is a $\tau$ local equivalence if $a_{\tau}H^n\phi : a_{\tau}H^nF \to a_{\tau}H^nG$ is an isomorphism, a morphism $\phi : F \to G$, with $F, G \in C(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})^{pr}}/S$, is a $\tau$ local equivalence if $a_{\tau}H^n\phi : a_{\tau}H^nF \to a_{\tau}H^nG$ is an isomorphism,

- a morphism $\phi : (G_1, F) \to (G_2, F)$, with $(G_1, F), (G_2, F) \in C_{fil}(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})}/S$, is an $r$-filtered $\tau$ local equivalence if for all $p, q \in \mathbb{Z}$, $a_{\tau}E^p_{r,q}\phi : a_{\tau}E^p_{r,q}(G_1, F) \to a_{\tau}E^p_{r,q}(G_2, F)$ is an isomorphism of sheaves on $\text{AnSp}(\mathbb{C})^{2,(\text{sm})}/S$, a morphism $\phi : (G_1, F) \to (G_2, F)$, with $(G_1, F), (G_2, F) \in C_{fil}(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})^{pr}}/S$, is an $r$-filtered $\tau$ local equivalence if for all $p, q \in \mathbb{Z}$ $a_{\tau}E^p_{r,q}\phi : a_{\tau}E^p_{r,q}(G_1, F) \to a_{\tau}E^p_{r,q}(G_2, F)$ is an isomorphism of sheaves on $\text{AnSp}(\mathbb{C})^{2,(\text{sm})^{pr}}/S$,

$F^\bullet \in C(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})}/S$ is $\tau$ fibrant if for all $(U, Z)/S \in \text{AnSp}(\mathbb{C})^{2,sm}/S$ and all $\tau$ covers $(c_i : (U_i, Z \times_U U_i)/S \to (U, Z)/S)_{i \in I}$ of $(U, Z)/S$,

$$F^\bullet(c_i : F^\bullet((U_i, Z)/S) \to \text{Tot}(\oplus_{\text{card} I = \bullet}F^\bullet((U_i \times Z \times_U U_i)/S))$$

is a quasi-isomorphism of complexes of abelian groups, $F^\bullet \in C(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})^{pr}}/S$ is $\tau$ fibrant if for all $(Y \times S, Z)/S \in \text{AnSp}(\mathbb{C})^{2,sm^{pr}}/S$ and all $\tau$ covers $(c_i : (U_i \times S \times Y \times U_i \times S)/S \to (Y \times S, Z)/S)_{i \in I}$ of $(Y \times S, Z)/S$,

$$F^\bullet(c_i \times I_S) : F^\bullet((Y \times S, Z)/S) \to \text{Tot}(\oplus_{\text{card} I = \bullet}F^\bullet((U_i \times S, Z \times_U U_i)/S))$$

is a quasi-isomorphism of complexes of abelian groups,

$(F^\bullet, F) \in C_{fil}(\text{AnSp}(\mathbb{C}))^{2,sm}/S$ is $r$-filtered $\tau$ fibrant if for all $(U, Z)/S \in \text{AnSp}(\mathbb{C})^{2,(\text{sm})}/S$ and all $\tau$ covers $(c_i : (U_i, Z \times_U U_i)/S \to (U, Z)/S)_{i \in I}$ of $(U, Z)/S$,

$$E^r_{r,q}(F^\bullet, F)(c_i) : E^p_{r,q}(F^\bullet, F)((U_i, Z)/S) \to E^p_{r,q}(\text{Tot}(\oplus_{\text{card} I = \bullet}(F^\bullet, F)((U_i \times Z \times_U U_i)/S)))$$

is an isomorphism of abelian groups for all $p, q \in \mathbb{Z}$, $(F^\bullet, F) \in C_{fil}(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})^{pr}}/S$ is $r$-filtered $\tau$ fibrant if for all $(Y \times S, Z)/S \in \text{AnSp}(\mathbb{C})^{2,(\text{sm})^{pr}}/S$ and all $\tau$ covers $(c_i \times I_S : (U_i \times S \times Y \times S U_i \times S)/S \to (Y \times S, Z)/S)_{i \in I}$ of $(Y \times S, Z)/S$,

$$E^r_{r,q}(F^\bullet, F)(c_i \times I_S) : E^p_{r,q}(F^\bullet, F)((Y \times S, Z)/S) \to E^p_{r,q}(\text{Tot}(\oplus_{\text{card} I = \bullet}(F^\bullet, F)((U_i \times S, Z \times Y U_i)/S)))$$

is an isomorphism of abelian groups for all $p, q \in \mathbb{Z}$.

Will now define the $\mathbb{D}^1$ local property on $\text{AnSp}(\mathbb{C})^{2}/S$.

**Definition 30.** Let $S \in \text{AnSp}(\mathbb{C})$.

1. **(i) A complex $F \in C(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})}/S$, is said to be $\mathbb{D}^1$ invariant if for all $(X, Z)/S \in \text{AnSp}(\mathbb{C})^{2,(\text{sm})}/S$**

$$F(p_X) : F((X, Z)/S) \to F((X \times \mathbb{D}^1, (Z \times \mathbb{D}^1))/S)$$

**is a quasi-isomorphism, where $p_X : (X \times \mathbb{D}^1, (Z \times \mathbb{D}^1)) \to (X, Z)$ is the projection.**

1. **(i)’ Similarly, a complex $F \in C(\text{AnSp}(\mathbb{C}))^{2,(\text{sm})^{pr}}/S$ is said to be $\mathbb{D}^1$ invariant if for all $(Y \times S, Z)/S \in \text{AnSp}(\mathbb{C})^{2,(\text{sm})^{pr}}/S$**

$$F(p_{Y \times S}) : F((Y \times S, Z)/S) \to F((Y \times S \times \mathbb{D}^1, (Z \times \mathbb{D}^1))/S)$$

**is a quasi-isomorphism.**
(ii) A complex \( F \in C(\text{AnSp}(\mathbb{C})^{2,(sm)}/S) \) is said to be \( \mathbb{D}^1 \) local for the \( \tau \) topology if \( F \) is \( \mathbb{D}^1 \) local for the \( \mathbb{D}^1 \) topology induced on \( \text{AnSp}(\mathbb{C})^{2,(sm)}/S \).

Similarly, a complex \( F \in C(\text{AnSp}(\mathbb{C})^{2,(sm)pr}/S) \) is said to be \( \mathbb{D}^1 \) local for the \( \tau \) topology if \( F \) is \( \mathbb{D}^1 \) local for the \( \mathbb{D}^1 \) topology induced on \( \text{AnSp}(\mathbb{C})^{2,(sm)pr}/S \).

(iii) A morphism \( m : F \rightarrow G \) with \( F,G \in C(\text{AnSp}(\mathbb{C})^{2,(sm)}/S) \) is said to be \( \mathbb{D}^1 \) local for the \( \mathbb{D}^1 \) topology if \( m \) is \( \mathbb{D}^1 \) local for the usual topology.

Equivalently, \( m : F \rightarrow G \) is \( \mathbb{D}^1 \) local if \( m \) is \( \mathbb{D}^1 \) local for the usual topology.

**Definition-Proposition 9.** Let \( S \in \text{AnSp}(\mathbb{C}) \).

(i) With the weak equivalence the \( (\mathbb{D}^1, \text{et}) \) equivalence and the fibration the epimorphism with \( \mathbb{D}^1 \) local and \( \text{etale} \) fibrant kernels gives a model structure on \( C(\text{AnSp}(\mathbb{C})^{2,(sm)}/S) \) : the left bousfield localization of the projective model structure of \( C(\text{AnSp}(\mathbb{C})^{2,(sm)}/S) \). We call it the projective \( (\mathbb{D}^1, \text{et}) \) model structure.

(ii) With the weak equivalence the \( (\mathbb{D}^1, \text{et}) \) equivalence and the fibration the epimorphism with \( \mathbb{D}^1 \) local and \( \text{etale} \) fibrant kernels gives a model structure on \( C(\text{AnSp}(\mathbb{C})^{2,(sm)pr}/S) \) : the left bousfield localization of the projective model structure of \( C(\text{AnSp}(\mathbb{C})^{2,(sm)pr}/S) \). We call it the projective \( (\mathbb{D}^1, \text{et}) \) model structure.

**Proof.** Similar to the proof of proposition 5.

In the filtered case, we consider :

**Definition 31.** Let \( S \in \text{AnSp}(\mathbb{C}) \).

(i) Let \( r \in \mathbb{N} \). A filtered complex \( (G,F) \in C_{\text{fil}}(\text{AnSp}(\mathbb{C})^{2,(sm)}/S) \), is said to be \( r \)-filtered \( \mathbb{D}^1 \) invariant if for all \( (X,Z)/S \in \text{AnSp}(\mathbb{C})^{2,(sm)}/S \)

\[
\text{E}_p^r(G,F)(p_X) : (G,F)((X,Z)/S) \rightarrow \text{E}_p^r(G,F)((X \times \mathbb{D}^1, (Z \times \mathbb{D}^1))/S)
\]

is an isomorphism of abelian groups for all \( p,q \in \mathbb{Z} \), where \( p_X : (X \times \mathbb{D}^1, (Z \times \mathbb{D}^1)) \rightarrow (X, Z) \) is the projection. Note that by definition this \( r \) does NOT depend on \( p \) and \( q \).

(i') Let \( r \in \mathbb{N} \). A filtered complex \( (G,F) \in C_{\text{fil}}(\text{AnSp}(\mathbb{C})^{2,(sm)pr}/S) \), is said to be \( r \)-filtered \( \mathbb{D}^1 \) invariant if for all \( (Y \times S, Z)/S \in \text{AnSp}(\mathbb{C})^{2,(sm)pr}/S \)

\[
\text{E}_p^r(G,F)(p_{Y \times S}) : \text{E}_p^r(G,F)((Y \times S, Z)/S) \rightarrow \text{E}_p^r(G,F)((Y \times \mathbb{D}^1 \times S, (Z \times \mathbb{D}^1))/S)
\]

is an isomorphism of abelian group for all \( p,q \in \mathbb{Z} \). Note that by definition this \( r \) does NOT depend on \( p \) and \( q \).
(ii) A filtered complex $(G, F) \in C_{fd}(\text{AnSp}(\mathbb{C})^{2, sm}/S)$, is said to be $\infty$-filtered $\mathbb{D}^1$ invariant if for all $(X, Z)/S \in \text{AnSp}(\mathbb{C})^{2, (sm)}/S$ there exist $r \in \mathbb{N}$ such that

$$E^p_q(G, F)(p_X) : E^p_q(G, F)((X, Z)/S) \rightarrow E^p_q(G, F)((X \times \mathbb{D}^1, (Z \times \mathbb{D}^1))/S)$$

is an isomorphism of abelian groups for all $p, q \in \mathbb{Z}$, where $p_X : (X \times \mathbb{D}^1, (Z \times \mathbb{D}^1)) \rightarrow (X, Z)$ is the projection (note that by definition this $r$ does NOT depend on $p$ and $q$ but may depends on $(X, Z)/S$). This implies that, for all $(X, Z)/S \in \text{AnSp}(\mathbb{C})^{2, (sm)}/S$,

$$H^n(G, F)(p_X) : H^n(G, F)((X, Z)/S) \rightarrow H^n(G, F)((X \times \mathbb{D}^1, (Z \times \mathbb{D}^1))/S)$$

is a filtered isomorphism of filtered abelian groups for all $n \in \mathbb{Z}$.

(ii)' Similarly, a filtered complex $(G, F) \in C_{fd}(\text{AnSp}(\mathbb{C})^{2, (sm)pr}/S)$, is said to be $\infty$-filtered $\mathbb{D}^1$ invariant if for all $(Y \times S, Z)/S \in \text{AnSp}(\mathbb{C})^{2, (sm)pr}/S$ there exist $r \in \mathbb{N}$ such that

$$E^p_q(G, F)(p_{Y \times S}) : E^p_q(G, F)((Y \times S, Z)/S) \rightarrow E^p_q(G, F)((Y \times \mathbb{A}^1 \times S, (Z \times \mathbb{A}^1))/S)$$

is an isomorphism of abelian group for all $p, q \in \mathbb{Z}$ (note that by definition this $r$ does NOT depend on $p$ and $q$ by may depend on $(Y \times S, Z)/S$). This implies that, for all $(X, Z)/S \in \text{AnSp}(\mathbb{C})^{2, (sm)pr}/S$,

$$H^n(G, F)(p_{Y \times S}) : H^n(G, F)((Y \times S, Z)/S) \rightarrow H^n(G, F)((Y \times S \times \mathbb{D}^1, (Z \times \mathbb{D}^1))/S)$$

is a filtered isomorphism of filtered abelian groups for all $n \in \mathbb{Z}$.

(iii) A filtered complex $(G, F) \in C_{fd}(\text{AnSp}(\mathbb{C})^{2, (sm)}/S)$, is said to be $\infty$-filtered $\mathbb{D}^1$ local for the $\tau$ topology induced on $\text{AnSp}(\mathbb{C})^{2, (sm)}/S$, if for an (hence every) $\infty$-filtered $\tau$ local equivalence $k : (G, F) \rightarrow (H, F)$ with $k$ injective and $(H, F) \in C_{fd}(\text{AnSp}(\mathbb{C})^{2, (sm)}/S)$, $\infty$-filtered $\tau$ fibrant, e.g. $k : (G, F) \rightarrow E_\tau(G, F)$, $(H, F)$ is $\infty$-filtered $\mathbb{D}^1$ invariant.

(iii)' Similarly, a filtered complex $(G, F) \in C_{fd}(\text{AnSp}(\mathbb{C})^{2, (sm)pr}/S)$, is said to be $\infty$-filtered $\mathbb{D}^1$ local for the $\tau$ topology induced on $\text{AnSp}(\mathbb{C})^{2, (sm)pr}/S$, if for an (hence every) $\infty$-filtered $\tau$ local equivalence $k : (G, F) \rightarrow (H, F)$ with $k$ injective and $(H, F) \in C_{fd}(\text{AnSp}(\mathbb{C})^{2, (sm)pr}/S)$, $\infty$-filtered $\tau$ fibrant, e.g. $k : (G, F) \rightarrow E_\tau(G, F)$, $(H, F)$ is $\infty$-filtered $\mathbb{D}^1$ invariant.

Lemma 4. Let $S \in \text{Var}(\mathbb{C})$.

(i) Let $(G, F) \in C_{fd}(\text{AnSp}(\mathbb{C})^{2, smpr}/S)$ Then, if $m : F_1 \rightarrow F_2$ with $F_1, F_2 \in C(\text{AnSp}(\mathbb{C})^{2, smpr}/S)$ is an usu local equivalence,

$$\text{Hom}(m, E_{usu}(G, F)) : \text{Hom}^*(F_2, E_{usu}(G, F)) \rightarrow \text{Hom}^*(F_1, E_{usu}(G, F))$$

is a filtered quasi-isomorphism.

(ii) Let $(G, F) \in C_{fd}(\text{AnSp}(\mathbb{C})^{2, smpr}/S)$ be $\infty$-filtered $\mathbb{D}^1$ local for the etale topology. Then, if $m : F_1 \rightarrow F_2$ with $F_1, F_2 \in C(\text{AnSp}(\mathbb{C})^{2, smpr}/S)$ is an ($\mathbb{D}^1$, usu) local equivalence,

$$\text{Hom}(m, E_{usu}(G, F)) : \text{Hom}^*(F_2, E_{usu}(G, F)) \rightarrow \text{Hom}^*(F_1, E_{usu}(G, F))$$

is an $\infty$-filtered quasi-isomorphism.

Proof. Similar to lemma 2: follows from lemma 3.

We have, similarly to the case of single varieties the following:

**Proposition 26.** Let $g : T \rightarrow S$ a morphism with $T, S \in \text{AnSp}(\mathbb{C})$.

(i) The adjunction $(g^*, g_*) : C(\text{AnSp}(\mathbb{C})^{2, (sm)}/S) \rightleftarrows C(\text{AnSp}(\mathbb{C})^{2, (sm)}/T)$ is a Quillen adjunction for the ($\mathbb{D}^1$, usu) model structure.
(i) The functor $g^*: C(\text{AnSp}(\mathbb{C}))^{2,sm}/S \to C(\text{AnSp}(\mathbb{C}))^{2,sm}/T$ sends quasi-isomorphism to quasi-isomorphism and equivalence usu local to equivalence usu local, sends $(\mathbb{D},usu)$ local equivalence to $(\mathbb{D},usu)$ local equivalence.

(ii) The adjunction $(g^*,g_*): C(\text{AnSp}(\mathbb{C}))^{2,sm}/S \rightleftarrows C(\text{AnSp}(\mathbb{C}))^{2,sm}/T)$ is a Quillen adjunction for the $(\mathbb{D},usu)$ model structure.

(iii) The functor $g^*: C(\text{AnSp}(\mathbb{C}))^{2,sm}/S \to C(\text{AnSp}(\mathbb{C}))^{2,sm}/T$ sends quasi-isomorphism to quasi-isomorphism and equivalence usu local to equivalence usu local, sends $(\mathbb{D},usu)$ local equivalence to $(\mathbb{D},usu)$ local equivalence.

Proof. Similar to the proof of proposition 20.

Proposition 27. Let $S \in \text{Var}(\mathbb{C})$.

(i) The adjunction $(\rho_S^*, \rho_S_*): C(\text{AnSp}(\mathbb{C}))^{2,sm}/S \rightleftarrows C(\text{AnSp}(\mathbb{C}))^{2}/S)$ is a Quillen adjunction for the $(A^1,et)$ projective model structure.

(ii) The adjunction $(\rho_S^*, \rho_S_*): C(\text{AnSp}(\mathbb{C}))^{2,sm}/S \rightleftarrows C(\text{AnSp}(\mathbb{C}))^{2}/S)$ is a Quillen adjunction for the $(\mathbb{A},et)$ projective model structure.

(iii) The adjunction $(\rho_S^*, \rho_S_*): C(\text{AnSp}(\mathbb{C}))^{2,sm}/S \rightleftarrows C(\text{AnSp}(\mathbb{C}))^{2}/S)$ sends quasi-isomorphism to quasi-isomorphism, sends equivalence usu local to equivalence usu local, sends $(\mathbb{D},usu)$ local equivalence to $(\mathbb{D},usu)$ local equivalence.

Proof. Similar to the proof of proposition 19.

We also have

Proposition 28. Let $S \in \text{AnSp}(\mathbb{C})$.

(i) The adjunction $(\text{Gr}_S^{12}, \text{Gr}_S^{12}): C(\text{AnSp}(\mathbb{C}))/S \rightleftarrows C(\text{AnSp}(\mathbb{C}))^{2,pr}/S)$ is a Quillen adjunction for the $(\mathbb{D},usu)$ projective model structure.

(ii) The adjunction $(\text{Gr}_S^{12}, \text{Gr}_S^{12}): C(\text{AnSp}(\mathbb{C}))/S \rightleftarrows C(\text{AnSp}(\mathbb{C}))^{2,sm}/S)$ is a Quillen adjunction for the $(\mathbb{D},usu)$ projective model structure.

Proof. Immediate from definition.

We have the following canonical functor:

Definition 32. (i) For $S \in \text{AnSp}(\mathbb{C})$, we have the functor

$$(-)^T: C(\text{AnSp}(\mathbb{C})^{sm}/S \to C(\text{AnSp}(\mathbb{C}))^{2,sm}/S),$$

$$F \mapsto F^T: (((U,Z)/S) = ((U,Z),h) \mapsto F^T((U,Z)/S) := (\Gamma_Z h^*LF)(U/U),$$

$$(g : ((U',Z'),h') \mapsto ((U,Z),h)) \mapsto (F^T(g) : (\Gamma_Z h^*LF)(U/U) \xrightarrow{\gamma_*(h^*LF)(U'/U')} (g^*(\Gamma_Z h^*LF))(U'/U')$$

$$\xrightarrow{\gamma_*(h^*LF)(U'/U')} (\Gamma_{Z\times_U U'} h^*LF)(U'/U') \xrightarrow{\gamma_*(h^*LF)(U'/U')} (\Gamma_{Z\times_U U'} g^*(h^*LF))(U'/U'))
where \( i_{(\Gamma_Z^*\mathbf{L}F)(U/U)} \) is the canonical arrow of the inductive limit. Similarly, we have, for \( S \in \text{AnSp}(\mathbb{C}) \), the functor
\[
(-)^T : C(\text{AnSp}(\mathbb{C})/S) \to C(\text{AnSp}(\mathbb{C})^2/S),
\]
\[
F \mapsto F^T : (\{(X, Z)/S\} = ((X, Z), h) \mapsto F^T((X, Z)/S) := (\Gamma_Z^*h^*F)(X/X),
\]
\[
(g : ((X', Z'), h') \to ((X, Z), h)) \to (F^T(g) : (\Gamma_Z^*h^*LF)(X/X) \to (\Gamma_Z^*h^*LF)(X'/X')).
\]

Note that for \( S \in \text{AnSp}(\mathbb{C}) \), \( I(S/S) : \mathbb{Z}((S, S)/S) \to \mathbb{Z}(S/S)^T \) given by
\[
I(S/S)((U, Z), h) : \mathbb{Z}((S, S)/S) \to (U, Z), h := (\Gamma_Z^*\mathbb{Z}(U/U))(U/U)
\]
is an isomorphism.

(ii) Let \( f : T \to S \) a morphism with \( T, S \in \text{AnSp}(\mathbb{C}) \). For \( F \in C(\text{AnSp}(\mathbb{C})^{sm}/S) \), we have the canonical morphism in \( C(\text{AnSp}(\mathbb{C})^{2, sm}/T) \)
\[
T(f, \Gamma)(F) := T^*(f, \Gamma)(F) : f^*(F^T) \to (f^*F)^T,\]
\[
T(f, \Gamma)(F)((U', Z'), h') = \lim_{(U', Z'), h') \to (U, Z), h) \quad (\Gamma_Z^*h^*LF(U'/U')) \to (\Gamma_Z^*h^*LF(U'/U')) = (f^*F)^T((U', Z'), h')
\]
where \( f_U : U_T : U \times_S T \to U \) and \( h_T : U_T := U \times_S T \to T \) are the base change maps, the equality following from the fact that \( h \circ f_U \circ l = f \circ h_T \circ l = f \circ h' \). For \( F \in C(\text{AnSp}(\mathbb{C})/S) \), we have similarly the canonical morphism in \( C(\text{AnSp}(\mathbb{C})^2/T) \)
\[
T(f, \Gamma)(F) : f^*(F^T) \to (f^*F)^T.
\]

(iii) Let \( h : U \to S \) a smooth morphism with \( U, S \in \text{AnSp}(\mathbb{C}) \). We have, for \( F \in C(\text{AnSp}(\mathbb{C})^{sm}/U) \), the canonical morphism in \( C(\text{AnSp}(\mathbb{C})^{2, sm}/S) \)
\[
T^h_2(h, \Gamma)(F)((U', Z'), h') = h_U^T(F^T)((U', Z'), h') := \lim_{(U', Z'), h') \to (U, Z), h) \quad (\Gamma_Z^*h^*LF(U'/U')) \to (\Gamma_Z^*h^*LF(U'/U')) = (h_U^T(F)^T((U', Z'), h')
\]
\[
T^h_2(h, \Gamma)(F)((U, Z), h) : h_U^T(F^T)((U, Z), h) = (\Gamma_Z^*h^*LF(U'/U')) \to (\Gamma_Z^*h^*LF(U'/U')) = (h_U^T(F)^T((U', Z'), h')
\]
\[
T^h_2(h, \Gamma)(Z(Z_0/Z_0))((U, Z), h) = i_*((\mathbb{Z}(Z_0/Z_0))^T = (i_*\mathbb{Z}(Z/Z)^T)
\]
\[
T^h_2(h, \Gamma)(Z(Z_0/Z_0))((U, Z, h) : i_*((\mathbb{Z}(Z_0/Z_0))^T((U, Z, h) = (\Gamma_Z^*Z(Z_0/Z_0))^T((U, Z, h) := (i_*\mathbb{Z}(Z/Z)^T)((U, Z, h)
\]

Definition 33. Let \( S \in \text{AnSp}(\mathbb{C}) \). We have for \( F \in C(\text{AnSp}(\mathbb{C})^{sm}/S) \) the canonical map in \( C(\text{AnSp}(\mathbb{C})^{sm}/S) \)
\[
\text{Gr}(F) : \text{Gr}_S^2 \mu_S^*F^T \to F,
\]
\[
\text{Gr}(F)(U/S) : \Gamma_{U/S}^*F(U \times_S U / U) \to h^*F(U/U) = F(U/S)
\]
where \( h : U \to S \) is a smooth morphism with \( U \in \text{AnSp}(\mathbb{C}) \) and \( h : U \to U \times_S S \) is the graph factorization with \( l \) the graph embedding and \( p \) the projection.
Proposition 29. Let $S \in \text{AnSp}(\mathbb{C})$.

(i) Then,

- if $m : F \rightarrow G$ with $F,G \in C(\text{AnSp}(\mathbb{C})^{sm}/S)$ is a quasi-isomorphism, $m^\Gamma : F^\Gamma \rightarrow G^\Gamma$ is a quasi-isomorphism in $C(\text{AnSp}(\mathbb{C})^{2,sm}/S)$,
- if $m : F \rightarrow G$ with $F,G \in C(\text{AnSp}(\mathbb{C})^{sm}/S)$ is an usu local equivalence, $m^\Gamma : F^\Gamma \rightarrow G^\Gamma$ is an usu local equivalence in $C(\text{AnSp}(\mathbb{C})^{2,sm}/S)$,
- if $m : F \rightarrow G$ with $F,G \in C(\text{AnSp}(\mathbb{C})^{sm}/S)$ is an $(\mathcal{D}^1, usu)$ local equivalence, $m^\Gamma : F^\Gamma \rightarrow G^\Gamma$ is an $(\mathcal{D}^1, usu)$ local equivalence in $C(\text{AnSp}(\mathbb{C})^{2,sm}/S)$.

(ii) Then,

- if $m : F \rightarrow G$ with $F,G \in C(\text{AnSp}(\mathbb{C})/S)$ is a quasi-isomorphism, $m^\Gamma : F^\Gamma \rightarrow G^\Gamma$ is a quasi-isomorphism in $C(\text{AnSp}(\mathbb{C})^{2}/S)$,
- if $m : F \rightarrow G$ with $F,G \in C(\text{AnSp}(\mathbb{C})^{sm}/S)$ is an usu local equivalence, $m^\Gamma : F^\Gamma \rightarrow G^\Gamma$ is an usu local equivalence in $C(\text{AnSp}(\mathbb{C})^{2,sm}/S)$,
- if $m : F \rightarrow G$ with $F,G \in C(\text{AnSp}(\mathbb{C})^{sm}/S)$ is an $(\mathcal{D}^1, usu)$ local equivalence, $m^\Gamma : F^\Gamma \rightarrow G^\Gamma$ is an $(\mathcal{D}^1, usu)$ local equivalence in $C(\text{AnSp}(\mathbb{C})^{2}/S)$.

Proof. Similar to the proof of proposition 23.

\[ \square \]

2.10 The analytical functor for presheaves on the big Zariski or etale site and on the big Zariski or etale site of pairs

We have for $f : T \rightarrow S$ a morphism with $T,S \in \text{Var}(\mathbb{C})$ the following commutative diagram of sites

\[ \text{Dia}(S) := \frac{\text{AnSp}(\mathbb{C})/T^an}{\text{Var}(\mathbb{C})/T} \quad \frac{\text{P}(f)}{\text{AnSp}(\mathbb{C})^{sm}/T^an} \quad \frac{\text{P}(f)}{\text{Var}(\mathbb{C})^{sm}/T} \]

\[ \text{AnSp}(\mathbb{C})/S^an \quad \frac{\text{AnSp}(\mathbb{C})^{sm}/S^an}{\text{Var}(\mathbb{C})^{sm}/S} \quad \frac{\text{P}(f)}{\text{AnSp}(\mathbb{C})^{sm}/S^an} \quad \frac{\text{P}(f)}{\text{Var}(\mathbb{C})^{sm}/S} \]

and

\[ \text{Dia}^{12}(S) := \frac{\text{AnSp}(\mathbb{C})^{2}/T^an}{\text{Var}(\mathbb{C})^{2}/T} \quad \frac{\text{P}(f)}{\text{AnSp}(\mathbb{C})^{2,sm}/T^an} \quad \frac{\text{P}(f)}{\text{Var}(\mathbb{C})^{2,sm}/T} \]

\[ \text{AnSp}(\mathbb{C})^{2}/S^an \quad \frac{\text{AnSp}(\mathbb{C})^{2,sm}/S^an}{\text{Var}(\mathbb{C})^{2,sm}/S} \quad \frac{\text{P}(f)}{\text{AnSp}(\mathbb{C})^{2,sm}/S^an} \quad \frac{\text{P}(f)}{\text{Var}(\mathbb{C})^{2,sm}/S} \]
For $S \in \text{Var}(C)$ we have the following commutative diagrams of sites

\[
\begin{array}{ccc}
\text{AnSp}(C)^2/S & \xrightarrow{\mu_S} & \text{AnSp}(C)^{2,pr}/S \\
\text{AnS} & \downarrow{\rho_S} & \downarrow{\rho_S} \\
\text{Var}(C)^2/S & \xrightarrow{\mu_S} & \text{Var}(C)^{2,smpr}/S
\end{array}
\]

\[
\begin{array}{ccc}
\text{AnSp}(C)^{2,sm}/S & \xrightarrow{\rho_S} & \text{AnSp}(C)^{2,smpr}/S \\
\text{AnS} & \downarrow{\rho_S} & \downarrow{\rho_S} \\
\text{Var}(C)^{2,sm}/S & \xrightarrow{\mu_S} & \text{Var}(C)^{2,smpr}/S
\end{array}
\]

and

\[
\begin{array}{ccc}
\text{AnSp}(C)^{2,pr}/S & \xrightarrow{\text{Gr}^{12}_S} & \text{AnSp}(C)/S \\
\text{AnS} & \downarrow{\rho_S} & \downarrow{\rho_S} \\
\text{Var}(C)^{2,pr}/S & \xrightarrow{\text{Gr}^{12}_S} & \text{Var}(C)/S
\end{array}
\]

\[
\begin{array}{ccc}
\text{AnSp}(C)^{2,smpr}/S & \xrightarrow{\text{Gr}^{12}_S} & \text{AnSp}(C)^{sm}/S \\
\text{AnS} & \downarrow{\rho_S} & \downarrow{\rho_S} \\
\text{Var}(C)^{2,sm}/S & \xrightarrow{\text{Gr}^{12}_S} & \text{Var}(C)^{sm}/S
\end{array}
\]

For $f : T \to S$ a morphism in $\text{Var}(C)$ the diagram $\text{Dia}(S)$ and $\text{Dia}(T)$ commutes with the pullback functors: we have $e(S) \circ P(f) = P(f) \circ e(T)$.

For $S \in \text{Var}(C)$, the analytical functor is

\[(-)^{an} : C_{O_S}(S) \to C_{O_{S^{an}}}, G \mapsto G^{an} := an^{sm}_{O_S} G := an^{mod}_{O_S} G \otimes_{an_{O_S} O_{S^{an}}} O_{S^{an}}\]

Let $S \in \text{Var}(C)$.

- As $an_{O_S} : \text{PSh}(S) \to \text{PSh}(S^{an})$ preserve monomorphisms (the colimits involved being filtered colimits), we define, for $(G, F) \in C_{f!}(S)$, $an_{O_S}^*(G, F) := (an_{O_S}^* G, an_{O_S}^* F) \in C_{f!}(S^{an})$.

- As $(-)^{an} := an^{mod}_{O_S} : \text{PSh}_{O_S}(S) \to \text{PSh}(S^{an})$ preserve monomorphisms ($an_{O_S}^*$ preserve monomorphisms and $- \otimes_{O_S} O_{S^{an}}$ preserve monomorphism since $O_{S^{an}}$ is a flat $O_S$ module), we define, for $(G, F) \in C_{f!}(S)$, $(G, F)^{an} := (G^{an}, an_{O_S}^* F \otimes_{O_S} O_{S^{an}}) \in C_{f!}(S^{an})$.

Let $f : T \to S$ a morphism with $T, S \in \text{Var}(C)$. Then,

- the commutative diagrams of sites $D(\text{An}, f) := (\text{AnS}, f, \text{AnT}, f = f^{an})$ gives, for $G \in C(\text{Var}(C)^{sm}/T)$, the canonical map in $C(\text{AnSp}(C)^{sm}/T)$

\[
T(\text{An}, f)(G) : \text{AnS}^* f_* G \xrightarrow{\text{ad}(\text{AnS}^*, \text{AnT})} \text{AnS}^* f_* \text{AnT}_* \text{AnT}^* G = \text{AnS}^* \text{AnS}_* f_* \text{AnT}_* \text{AnT}^* G
\]

- the commutative diagrams of sites $D(an, f) := (an_S, f an_T, f)$ gives, for $G \in C(T)$, the canonical map in $C(T^{an})$

\[
T(an, f)(G) : an_S^* f_* G \xrightarrow{\text{ad}(an_T^*, \text{AnT})} an_S^* f_* an_T^* an_T G = an_S^* an_T^* an_T G
\]
and for \( G \in C_{O_T}(T) \), the canonical map in \( C_{O_{S^n}}(T^{an}) \)

\[
T^{an}(an, \gamma)(G) : (\ellam_G) \mapsto \ellam_{\gamma}(\ellam_G) \circ \ellam_{\gamma}(\ellam_G) = : \ellam_{\gamma}(\ellam_G).
\]

**Definition-Proposition 10.** Consider a closed embedding \( i : Z \hookrightarrow S \) with \( S, Z \in \text{Var}(\mathbb{C}) \). Then, for \( G^\bullet \in C(\text{Var}(\mathbb{C})^{sm}/S) \), there exist a map in \( C(\text{AnSp}(\mathbb{C})^{sm}/S) \)

\[
T(\text{An}(\gamma))(G) : \text{An}_S^* \Gamma_Z G \rightarrow \Gamma_Z \text{An}_S^* G
\]

unique up to homotopy, such that \( \gamma_Z(\text{An}_S^* G) \circ T(\text{An}(\gamma))(G) = \text{An}_S^* \gamma_Z G \).

**Proof.** Denote by \( j : S\backslash Z \rightarrow S \) the open complementary embedding. The map is given by \((I, T(\text{An}(j))(j^*G)) : \text{Cone}(\text{An}_S^* G \rightarrow \text{An}_S^* j^* G) \rightarrow (\text{An}_S^* G \rightarrow j^* \text{An}_S^* G) \). \( \Box \)

**Definition 34.** Let \( f : X \rightarrow S \) a morphism with \( X, S \in \text{Var}(\mathbb{C}) \). Assume that there exist a factorization \( f : X \rightarrow Y \times S \rightarrow S \), with \( Y \in \text{SmVar}(\mathbb{C}) \), \( i : X \hookrightarrow Y \) is a closed embedding and \( p \) the projection. We then have the canonical isomorphism in \( C(\text{AnSp}(\mathbb{C})^{sm}/S^{an}) \)

\[
T(f, g, Q) := T_0(\text{An}, p)(-1) \circ T_1(\text{An}, j)(-1) :
\]

\[
\text{An}_S^* Q(X/S) := \text{An}_S^* \pi_1^* \Gamma_Y^X \mathbb{Z}_{Y \times S}[d_Y] \rightarrow \pi_1^* \Gamma_X \mathbb{Z}_{X \times S}[d_Y] = : Q(X^{an}/S^{an})
\]

with \( j : Y \times S \backslash X \rightarrow Y \times S \) the closed embedding.

**Definition-Proposition 11.** Consider a closed embedding \( i : Z \hookrightarrow S \) with \( S \in \text{Var}(\mathbb{C}) \). Then, for \( G \in C_{O_S}(S) \), there is a canonical map in \( C_{O_{S^n}}(S^{an}) \)

\[
T^{an}(an, \gamma)(G) : (\Gamma_Z G)^{an} \rightarrow \Gamma_{Z^{an}} G^{an}
\]

unique up to homotopy, such that \( \gamma_{Z^{an}}(G^{an}) \circ T^{an}(an, \gamma)(G) = g^* \gamma_Z G \).

**Proof.** It is a particular case of definition-proposition 2(i).

We recall the first GAGA theorem for coherent sheaf on the projective spaces :

**Theorem 11.** For \( X \in \text{Var}(\mathbb{C}) \) and \( F \in C_{O_X}(X) \) denote by

\[
a(F) : \text{ad}(\text{an}_X^{an}, \text{an}(\gamma)_{an})(E(F)) : E(F) \rightarrow \text{an}_X(E(F))^{an} = \text{an}_X E(F^{an}),
\]

the canonical morphism.

(i) Let \( X \in \text{PVar}(\mathbb{C}) \) a proper complex algebraic variety. For \( F \in \text{Coh}_{O_X}(X) \) a coherent sheaf, the morphism

\[
H^n(\Gamma(X, a(F))) : H^n(X, F) = H^n(\Gamma(X, E(F))) \rightarrow H^n(X, F^{an}) = H^n(\Gamma(X, E(F^{an}))
\]

is an isomorphism for all \( n \in \mathbb{Z} \).

(ii) Let \( f : X \rightarrow S \) a proper morphism with \( X, S \in \text{Var}(\mathbb{C}) \). For \( F \in \text{Coh}_{O_X}(X) \) a coherent sheaf, the morphism

\[
H^n f_* a(F) : R^n f_* F = H^n f_* (E(F)) \rightarrow R^n f_* E^{an} = H^n f_* E(F^{an})
\]

is an isomorphism for all \( n \in \mathbb{Z} \).

**Proof.** See [25]. (i) reduces to the case where \( X \) is projective and (ii) to the case where \( f \) is projective. Hence, the theorem reduce to the case of a coherent sheaf \( F \in \text{Coh}_{O_{\mathbb{P}^N}}(\mathbb{P}^N) \) on \( \mathbb{P}^N \). \( \Box \)
2.11 The De Rham complexes of algebraic varieties and analytical spaces

For $X \in \text{Var}(\mathbb{C})$, we denote by $\iota_X : \mathbb{C}_X \to \Omega^*_X =: DR(X)$ the canonical inclusion map. More generally, for $f : X \to S$ a morphism with $X, S \in \text{Var}(\mathbb{C})$, we denote by $\iota_{X/S} : f^*O_S \to \Omega^*_{X/S} =: DR(X/S)$ the canonical inclusion map.

For $X \in \text{AnSp}(\mathbb{C})$, we denote by $\iota_X : \mathbb{C}_X \to \Omega^*_X =: DR(X)$ the canonical inclusion map. More generally, for $f : X \to S$ a morphism with $X, S \in \text{AnSp}(\mathbb{C})$, we denote by $\iota_{X/S} : f^*O_S \to \Omega^*_{X/S} =: DR(X/S)$ the canonical inclusion map.

Let $f : X \to S$ a morphism with $X, S \in \text{Var}(\mathbb{C})$. Then, the commutative diagram of site $(an, f) := (f, \text{AnSp}, f = f^{an}, \text{an}, (X))$ gives the transformation map in $C_{\text{O}^{an}}(S^{an})$ (definition [1])

$$
\begin{align*}
T_\omega^O(an, f) : (f_*E(\Omega^*_{X/S}, F_b))^{an} & := \text{an}_S^\text{mod} f_*E(\Omega^*_{X/S}, F_b) \\
& \xrightarrow{T(\text{an}(X), E((-) \circ \text{an}(f)(E(\Omega^*_{X/S})))}
(f(E(\text{an}(X)^*\text{E}(\Omega^*_{X/S}, F_b))) \otimes_{\text{an}_S} O_{S^{an}} \circ E(\text{an}(X)^*\text{E}(\Omega^{an}_{X/S}))) \rightarrow f_*E(\Omega^{an}_{X/S}, F_b)
\end{align*}
$$

We will give is this paper a relative version for all smooth morphisms of the following theorem of Grothendieck

**Theorem 12.** Let $U \in \text{SmVar}(\mathbb{C})$. Denote by $a_U : U \to \{pt\}$ the terminal map. Then the map

$$
T_\omega^O(a_U, an) : \Gamma(U, E(\Omega^*_U)) \to \Gamma(U^{an}, E(\Omega^*_U))
$$

is a quasi-isomorphism of complexes.

**Proof.** Take a compactification $(X, D)$ of $U$, with $X \in \text{PSmVar}(\mathbb{C})$ and $D = X \setminus U$ a normal crossing divisor. The proof then use proposition [13] the first GAGA theorem (theorem [11] (i)) for the coherent cohomology sheaves $\mathcal{O}_U(nD)$ on $X$, and the fact (which is specific of the De Rham complex) that $\Omega^{an}_{U^{an}}(\ast D^{an}) \rightarrow j_*E(\mathcal{O}_{U^{an}})$ is a quasi-isomorphism.

We recall Poincare lemma for smooth morphisms of complex analytic spaces and in particular complex analytic manifold:

**Proposition 30.** (i) For $h : U \to S$ a smooth morphism with $U, S \in \text{AnSp}(\mathbb{C})$, the inclusion map $\iota_{X/S} : h^*O_S \to \Omega^*_{U/S} =: DR(U/S)$ is a quasi-isomorphism.

(ii) For $X \in \text{AnSm}(\mathbb{C})$, the inclusion map $\iota_X : \mathbb{C}_X \to \Omega^*_X$ is a quasi-isomorphism.

**Proof.** Standard. (ii) is a particular case of (i) (the absolute case $S = \{pt\}$).

**Remark 4.** We do NOT have poincare lemma in general if $h : U \to S$ is not a smooth morphism. Already in the absolute case, we can find $X \in \text{Var}(\mathbb{C})$ singular such that the inclusion map $\iota_X : \mathbb{C}_{X^{an}} \to \Omega^*_{X^{an}}$ is not a quasi-isomorphism. Indeed, we can find example of $X \in \text{PVar}(\mathbb{C})$ projective singular where

$$
H^p(c_X) : H^p(X^{an}, \mathbb{C}_{X^{an}}) \rightarrow H^p(\mathbb{C}_{X^{an}})
$$

$X^{an}$ being locally contractible since $X^{an} \in \text{CW}$, have not the same dimension then the De Rham cohomology

$$
H^p(T_\omega^O(an, a_X)) : H^p(X, E(\Omega^*_X)) \rightarrow H^p(X^{an}, E(\Omega^*_{X^{an}}))
$$

$X$ being projective, that is are not isomorphic as vector spaces. Hence, in particular, the canonical map

$$
H^p(\iota_X) : H^p(X^{an}, \mathbb{C}_{X^{an}}) \rightarrow H^p(X^{an}, E(\Omega^*_{X^{an}}))
$$

is not an isomorphism.
Consider a commutative diagram

\[
D_0 = \begin{array}{ccc}
X & \overset{i}{\rightarrow} & Y \\
\downarrow{g'} & & \downarrow{p} \\
X' & \overset{i'}{\rightarrow} & Y'
\end{array}
\]

with \(X, X', Y, Y', S, T \in \text{Var}(\mathbb{C})\) or \(X, X', Y, Y', S, T \in \text{AnSp}(\mathbb{C})\), \(i, i'\) being closed embeddings. Denote by \(D\) the right square of \(D_0\). The closed embedding \(i' : X' \rightarrow Y'\) factors through \(i' : X' \overset{i'}{\rightarrow} X \times_Y Y' \overset{i''}{\rightarrow} Y'\) where \(i'_1, i''_0\) are closed embeddings. Then, definition-proposition 3 say that

- there is a canonical map,
  \[
  E(\Omega_{(Y'/Y)}/(T/S)) \circ T(g'', E)(- \circ T(g'', \gamma)(-) : g''^* \Gamma_X E(\Omega^\bullet_{Y'/S}, F_b) \rightarrow \Gamma_{X \times_Y Y'} E(\Omega^\bullet_{Y'/T}, F_b)
  \]
  unique up to homotopy such that the following diagram in \(C_{g''^*O_{Tfil}(Y')} = C_{g'^*O_{Tfil}(Y')}\) commutes

- there is a canonical map,
  \[
  T'_\omega(D) : g'^{\text{mod}} L\text{Op}_\ast \Gamma_X E(\Omega^\bullet_{Y'/S}, F_b) \rightarrow p'_\ast \Gamma_{X \times_Y Y'} E(\Omega^\bullet_{Y'/T}, F_b)
  \]
  unique up to homotopy such that the following diagram in \(C_{Tfil(T)}\) commutes

(iii) there is a map in \(C_{g'^*O_{Tfil}(Y')}\)

\[
T(X'/X \times_Y Y', \gamma)(E(\Omega^\bullet_{Y'/T}, F_b)) : \Gamma_{X'} E(\Omega^\bullet_{Y'/T}, F_b) \rightarrow \Gamma_{X \times_Y Y'} E(\Omega^\bullet_{Y'/T}, F_b)
\]

unique up to homotopy such that \(\gamma_{X \times_Y Y'}(-) \circ T(X'/X \times_Y Y', \gamma)(-) = \gamma_{X'}(-)\).

Let \(h : Y \rightarrow S\) a morphism and \(i : X \hookrightarrow Y\) a closed embedding with \(S, Y, X \in \text{Var}(\mathbb{C})\). Then, definition-proposition 3 say that

- there is a canonical map
  \[
  E(\Omega_{(Yan/Y)}/(S\text{an}/S)) \circ T(an, \gamma)(-) : an(Y)^\ast \Gamma_X E(\Omega^\bullet_{Y/S}, F_b) \rightarrow \Gamma_{Xan} E(\Omega^\bullet_{Y/S}, F_b)
  \]
  unique up to homotopy such that the following diagram in \(C_{g'^*O_{Tfil}(Y')an}\) commutes

\[
\begin{array}{ccc}
\text{an}(Y)^\ast \Gamma_X E(\Omega^\bullet_{Y/S}, F_b) & \overset{E(\Omega_{Yan/Y}/(S\text{an}/S)) \circ T(an, \gamma)(-)}{\longrightarrow} & \Gamma_{Xan} E(\Omega^\bullet_{Y/S}, F_b) \\
\downarrow{\gamma_X(-)} & & \downarrow{\gamma_{Xan}(-)} \\
\text{an}(Y)^\ast E(\Omega^\bullet_{Y/S}, F_b) & \overset{E(\Omega_{Yan/Y}/(S\text{an}/S))}{\longrightarrow} & E(\Omega^\bullet_{Y/S}, F_b)
\end{array}
\]
there is a canonical map

$$T^\omega_{\gamma^\gamma}(an, h): (h_* \Gamma X E(\Omega^\bullet_{Y/S}, F_b))^{an} \rightarrow h_* \Gamma X^{an} E(\Omega^\bullet_{Y/S}, F_b)$$

unique up to homotopy such that the following diagram in $C(Y)$ commutes

$$
\begin{array}{c}
\gamma_X(-) \\
\downarrow \\
T^\omega_{\gamma^\gamma}(an, h)
\end{array}
\begin{array}{c}
\gamma_X^{an}(-) \\
\downarrow \\
T^\omega_{\gamma^\gamma}(an, h)
\end{array}
\begin{array}{c}
(h_* \Gamma X E(\Omega^\bullet_{Y/S}, F_b))^{an} \\
\rightarrow \\
(h_* E(\Omega^\bullet_{Y/S}, F_b))^{an}
\end{array}
\begin{array}{c}
h_* \Gamma X^{an} E(\Omega^\bullet_{Y/S}, F_b) \\
\rightarrow \\
h_* E(\Omega^\bullet_{Y/S}, F_b)
\end{array}
$$

2.12 Resolution of a representable presheaf on $\text{Var}(\mathbb{C})/S$ by Corti-Hanamura presheaves and the functorialities of these resolutions

**Definition 35.** Let $X_0 \in \text{Var}(\mathbb{C})$ and $Z \subset X_0$ a closed subset. A desingularization of $(X_0, Z)$ is a pair of complex varieties $(X, D) \in \text{Var}^2(\mathbb{C})$, together with a morphism of pair of varieties $\epsilon: (X, D) \rightarrow (X_0, Z)$ such that

- $X \in \text{SmVar}(\mathbb{C})$ and $D := \epsilon^{-1}(Z) \subset X$ is a normal crossing divisor
- $\epsilon: X \rightarrow X_0$ is a proper modification with discriminant $Z$, that is $\epsilon: X \rightarrow X_0$ is proper and $\epsilon: X \setminus D \xrightarrow{\sim} X \setminus Z$ is an isomorphism.

We have the following well known resolution of singularities of complex algebraic varieties and their functorialities:

**Theorem 13.** (i) Let $X_0 \in \text{Var}(\mathbb{C})$ and $Z \subset X_0$ a closed subset. There exists a desingularization of $(X_0, Z)$, that is a pair of complex varieties $(X, D) \in \text{Var}^2(\mathbb{C})$, together with a morphism of pair of varieties $\epsilon: (X, D) \rightarrow (X_0, Z)$ such that

- $X \in \text{SmVar}(\mathbb{C})$ and $D := \epsilon^{-1}(Z) \subset X$ is a normal crossing divisor
- $\epsilon: X \rightarrow X_0$ is a proper modification with discriminant $Z$, that is $\epsilon: X \rightarrow X_0$ is proper and $\epsilon: X \setminus D \xrightarrow{\sim} X \setminus Z$ is an isomorphism.

(ii) Let $X_0 \in \text{PVar}(\mathbb{C})$ and $Z \subset X_0$ a closed subset. There exists a desingularization of $(X_0, Z)$, that is a pair of complex varieties $(X, D) \in \text{PVar}^2(\mathbb{C})$, together with a morphism of pair of varieties $\epsilon: (X, D) \rightarrow (X_0, Z)$ such that

- $X \in \text{PSmVar}(\mathbb{C})$ and $D := \epsilon^{-1}(Z) \subset X$ is a normal crossing divisor
- $\epsilon: X \rightarrow X_0$ is a proper modification with discriminant $Z$, that is $\epsilon: X \rightarrow X_0$ is proper and $\epsilon: X \setminus D \xrightarrow{\sim} X \setminus Z$ is an isomorphism.

We use this theorem to construct a resolution of a morphism by Corti-Hanamura morphisms, we will need these resolution in the definition of the filtered De Rham realization functor:

**Definition-Proposition 12.** (i) Let $h: V \rightarrow S$ a morphism, with $V, S \in \text{Var}(\mathbb{C})$. Let $\bar{S} \in \text{PVar}(\mathbb{C})$ be a compactification of $S$.

- There exist a compactification $X_0 \in \text{PVar}(\mathbb{C})$ of $V$ such that $h: V \rightarrow S$ extend to a morphism $f_0 = \bar{h}_0: X_0 \rightarrow \bar{S}$. Denote by $Z = X_0 \setminus V$. We denote by $j: V \hookrightarrow X_0$ the open embedding and by $i_0: Z \hookrightarrow X_0$ the complementary closed embedding.
Take, using theorem 13(ii), a desingularization $\epsilon : (X, D) \to (X_0, Z)$ of the pair $(X_0, Z)$, with $X \in \text{PSmVar}(\mathbb{C})$ and $D = \cup_{i \in I} D_i \subset X$ a normal crossing divisor. We denote by $i_\bullet : D_\bullet \hookrightarrow X = X_{\epsilon(\bullet)}$ the morphism of simplicial varieties given by the closed embeddings $i_{\epsilon} : D_{\epsilon} \hookrightarrow X$. Then the morphisms $f := h_0 \circ \epsilon : X \to S$ and $f_{D_\bullet} := f \circ i_\bullet : D_\bullet \to S$ are projective since $X$ and $D_\bullet$ are projective varieties.

(ii) Let $g : V'/S \to V/S$ a morphism, with $V'/S = (V', h')$, $V/S = (V, h) \in \text{Var}(\mathbb{C})/S$.

Take (see (i)) a compactification $X_0 \in \text{PVar}(\mathbb{C})$ of $V$ such that $h : V \to S$ extend to a morphism $f_0 = h_0 : X_0 \to \bar{S}$. Denote by $Y = X_0 \backslash V$. Then, there exist a compactification $X_0' \in \text{PVar}(\mathbb{C})$ of $V'$ such that $h' : V' \to S$ extend to a morphism $f_0' = h_0' : X_0' \to \bar{S}$, $g : V' \to V$ extend to a morphism $g_0 : X_0' \to X_0$ and $f \circ g_0 = f'$ that is $g_0$ is gives a morphism $g_0 : X_0'/S \to X_0/S$. Denote by $Z' = X_0' \backslash V'$. We then have the following commutative diagram:

$$
\begin{array}{cccc}
V & \xrightarrow{j} & X_0 & \xrightarrow{i} & Z \\
g \downarrow & & \downarrow g_0 & & \downarrow g' \\
V' & \xrightarrow{j'} & X_0' & \xrightarrow{i'} & Z' & \xrightarrow{i'^{-1}_{g_0}} & 0 \\
\end{array}
$$

Take using theorem 13 a desingularization $\epsilon : (X, D) \to (X_0, Z)$ of $(X_0, Z)$. Then there exist a desingularization $\epsilon' : (X', D') \to (X_0', Z')$ of $(X_0', Z')$ and a morphism $\bar{g} : X' \to X$ such that the following diagram commutes:

$$
\begin{array}{ccc}
X_0' & \xrightarrow{\bar{g}_0} & X_0 \\
\downarrow \epsilon' & & \downarrow \epsilon \\
X' & \xrightarrow{\bar{g}} & X \\
\end{array}
$$

We then have the following commutative diagram in $\text{Fun}(\Delta, \text{Var}(\mathbb{C}))$:

$$
\begin{array}{cccc}
V & \xrightarrow{j} & X = X_{\epsilon(\bullet)} & \xrightarrow{i_\bullet} & D_{X_{\epsilon(\bullet)}} \\
g \downarrow & & \downarrow \epsilon & & \downarrow \epsilon' \\
V' & \xrightarrow{j'} & X' = X'_{\epsilon(\bullet)} & \xrightarrow{i'_\bullet} & D'_{X'_{\epsilon(\bullet)}} & \xrightarrow{\epsilon'^{-1}_{g_0}} & 0 \\
\end{array}
$$

where $i_\bullet : D_\bullet \hookrightarrow X_{\epsilon(\bullet)}$ the morphism of simplicial varieties given by the closed embeddings $i_n : D_n \hookrightarrow X_n$, and $i'_\bullet : D'_n \hookrightarrow X'_n$ the morphism of simplicial varieties given by the closed embeddings $i'_n : D'_n \hookrightarrow X'_n$.

Proof. (i): Let $X_0 \in \text{PVar}(\mathbb{C})$ be a compactification of $V$. Let $l_0 : X_0 = \overline{\Gamma_n} \hookrightarrow X_0 \times S$ be the closure of the graph of $h$ and $f_0 := p_S \circ l_0 : X_0 \hookrightarrow X_0 \times S \to S$, $\epsilon_{X_0} := p_{X_0} \circ l_0 : X_0 \hookrightarrow X_0 \times S \to X_0$ be the restriction to $X_0$ of the projections. Then, $X \in \text{PSmVar}(\mathbb{C})$, $\epsilon_{X_0} : X_0 \to X_0$ is a proper modification which does not affect the open subset $V \subset X_0$, and $f_0 = h_0 : X_0 \to \bar{S}$ is a compactification of $h$.

(ii): There is two things to prove:

- Let $f_0 : X_0 \to S$ a compactification of $h : V \to S$ and $f_{00} : X_{00} \to S$ a compactification of $h' : V' \to S$ (see (i)). Let $l_0 : X_0 = \overline{\Gamma_n} \subset X_0 \times S$ be the closure of the graph of $g$, $f_{0} := (f_{00}, f_0) \circ l_0 : X_0' \hookrightarrow X_0' \times S \to S$ and $g_0 := p_{X_0} \circ l_0 : X_0' \to X_0' \times S \to X_0' \to X_0$, $\epsilon_{X_{00}} := p_{X_{00}} \circ i : X_0' \hookrightarrow X_0' \times S \to X_0$ be the restriction to $X$ of the projections. Then $\epsilon_{X_{00}} : X_0' \to X_0$ is a proper modification which does not affect the open subset $V' \subset X_0'$, $f_0 : X_0' \to S$ is an other compactification of $h' : V' \to S$ and $\bar{g}_0 : X_0' \to X_0$ is a compactification of $g$.
• Take, using theorem 13, a desingularization \( \epsilon : (X, D) \to (X_0, Z) \) of the pair \((X_0, Z)\). Take then, using theorem 13, a desingularization \( \epsilon' : (X', D') \to (X \times_{X_0} X_0', X \times_{X_0} Z') \) of the pair \((X \times_{X_0} X_0', X \times_{X_0} Z')\). We consider then following commutative diagram whose square is cartesian:

\[
\begin{array}{ccc}
X'_0 & \xrightarrow{\bar{g}_0} & X_0 \\
\downarrow{\epsilon'} & & \downarrow{\epsilon} \\
X \times_{X_0} X'_0 & \xrightarrow{\bar{g}} & X
\end{array}
\]

and \( \epsilon' := \epsilon'_0 \circ \epsilon'_1 : (X', D') \to (X'_0, Z') \) is a desingularization of the pair \((X \times_{X_0} X'_0, X \times_{X_0} Z')\).

Let \( S \in \text{Var}(\mathbb{C}) \). Recall we have the dual functor

\[
\mathbb{D}_S : C(\text{Var}(\mathbb{C})/S) \to C(\text{Var}(\mathbb{C})/S), \quad F \mapsto \mathbb{D}_S(F) := \mathcal{H}om(F, E_{et}(\mathbb{Z}_S))
\]

which induces the functor

\[
L\mathbb{D}_S : C(\text{Var}(\mathbb{C})/S) \to C(\text{Var}(\mathbb{C})/S), \quad F \mapsto L\mathbb{D}_S(F) := \mathbb{D}_S(LF) := \mathcal{H}om(LF, E_{et}(\mathbb{Z}_S)).
\]

We will use the following resolutions of representable presheaves by Corti-Hanamura presheaves and their the functorialities.

**Definition 36.**

(i) Let \( h : U \to S \) a morphism, with \( U, S \in \text{Var}(\mathbb{C}) \). Take, see definition-proposition 12(ii), a compactification \( h : U \to S \) of \( h : U \to S \) and denote by \( Z = X_0 \backslash U \). Take, using theorem 12(ii), a desingularization \( \epsilon : (X, D) \to (X_0, Z) \) of the pair \((X_0, Z)\), with \( X \in \text{PSmVar}(\mathbb{C}) \) and \( D = \bigcup_{i=1}^n D_i \subset X \) a normal crossing divisor. We denote by \( i_\bullet : D_\bullet \hookrightarrow X = X_{et(\bullet)} \) the morphism of simplicial varieties given by the closed embeddings \( i_1 : D_i = \bigcap_{i \in I} D_i \hookrightarrow X \) We denote by \( j_\bullet : U \hookrightarrow X \) the open embedding. We then consider the following map in \( C(\text{Var}(\mathbb{C})/S) \)

\[
\begin{align*}
\rho_{(X,D)/S}(\mathbb{Z}(U/S)) : R_{(X,D)/S}(\mathbb{Z}(U/S)) & \approx \text{Cone}(\text{ad}(i_\bullet^*, i^*_\bullet)(Z(X/X))) : f_! E_{et}(i_\bullet^* Z(D_\bullet/D_\bullet), u_{1,1}) \to f_! E_{et}(\mathbb{Z}(X/X))) \\
& \approx (0, \text{ad}(j^*, j_\bullet)(E_{et}(\mathbb{Z}(X/X)))) h_! E_{et}(\mathbb{Z}(U/U)) = \mathbb{D}_S(\mathbb{Z}(U/S))
\end{align*}
\]

Note that \( \rho_{(X,D)/S} \) is NOT an equivalence \((\mathbb{A}^1, \text{et})\) local by proposition 12 since \( \rho_{S,i_\bullet^* Z(D_\bullet/D_\bullet)} = 0 \), whereas \( \rho_{S, \text{ad}(j^*, j_\bullet)(E_{et}(\mathbb{Z}(X/X)))} \) is not an equivalence \((\mathbb{A}^1, \text{et})\) local.

(ii) Let \( g : U'/S \to U/S \) a morphism, with \( U'/S = (U', h'), U/S = (U, h) \in \text{Var}(\mathbb{C})/S \) Take, see definition-proposition 12(ii), a compactification \( f_0 = h : X_0 \to S \) of \( h : U \to S \) and a compactification \( f'_0 = h' : X'_0 \to S \) of \( h' : U' \to S \) such that \( g : U'/S \to U/S \) extend to a morphism \( \bar{g}_0 : X'_0/S \to X_0/S \). Denote \( Z = X_0 \backslash U \) and \( Z' = X'_0 \backslash U' \). Take, see definition-proposition 12(ii), a desingularization \( \epsilon : (X, D) \to (X_0, Z) \) of \((X_0, Z)\), a desingularization \( \epsilon' : (X', D') \to (X'_0, Z') \) of \((X'_0, Z')\) and a morphism \( \bar{g} : X' \to X \) such that the following diagram commutes.

\[
\begin{array}{ccc}
X'_0 & \xrightarrow{\bar{g}_0} & X_0 \\
\downarrow{\epsilon'} & & \downarrow{\epsilon} \\
X' & \xrightarrow{\bar{g}} & X
\end{array}
\]
We then have, see definition-proposition \[\PageIndex{12}\(\text{ii}\)], the following commutative diagram in \(\Fun(\Delta, \Var(\mathbb{C}))\)

\[
\begin{array}{ccc}
U = U_c(\bullet) & \xrightarrow{j} & X = X_c(\bullet) & \xleftarrow{i^*} & D_{s_0}(\bullet) \\
g \downarrow & & g \downarrow & & g \downarrow \\
U' = U'_c(\bullet) & \xrightarrow{j'} & X' = X'_c(\bullet) & \xleftarrow{i'^*} & D'_s : i'_g \\
\end{array}
\tag{41}
\]

We then consider the following map in \(\Var(\mathbb{C})/S\)

\[
\begin{align*}
\R^G S^H_g : & \R_{(X,D)/S}(\mathbb{Z}/U/S)) \\
\xrightarrow{=} & \Cone(\text{ad}(i_{\bullet}, i_{\bullet}^*)(\mathbb{Z}/X/X)) : f_*E_{et}(i_{\bullet}^*(\mathbb{Z}/D_{\bullet}/D_{\bullet}), u_{1,j})) \rightarrow f_*E_{et}(\mathbb{Z}/X/X)) \\
& \xrightarrow{\text{ad}(g^*, g^*)((-1))} \Cone(\mathbb{Z}/X/X/) : f_*E_{et}(i_{\bullet}^*(\mathbb{Z}/D_{\bullet}/D_{\bullet}), u_{1,j})) \rightarrow f_*E_{et}(\mathbb{Z}/X/X)) \\
& \xrightarrow{\text{ad}(i_{\bullet}^*, i_{\bullet}^*)} \Cone(\mathbb{Z}/X/X/) : f_*E_{et}(i_{\bullet}^*(\mathbb{Z}/D_{\bullet}/D_{\bullet}), u_{1,j})) \rightarrow f_*E_{et}(\mathbb{Z}/X/X)) \\
& \xrightarrow{=} \R_{(X',D')/S}(\mathbb{Z}/U'/S))
\end{align*}
\]

Then by the diagram (41) and adjunction, the following diagram in \(\Var(\mathbb{C})/S\) obviously commutes

\[
\begin{array}{ccc}
R_{(X,D)/S}(\mathbb{Z}/U/S)) & \xrightarrow{r_{(X,D)/S}(\mathbb{Z}/U/S))} & D_SZ(U/S) = h_*E_{et}(\mathbb{Z}/U/U)) \\
\R^G S^H_u(g) \downarrow & & \downarrow \gamma(g, E_{et}(\mathbb{Z}/U/U)) \\
R_{(X',D')/S}(\mathbb{Z}/U'/S)) & \xrightarrow{r_{(X',D')/S}(\mathbb{Z}/U'/S))} & D_SZ(U'/S) = h_*E_{et}(\mathbb{Z}/U'/U'))
\end{array}
\]

(iii) Let \(F \in \Var(\mathbb{C})^m/S\). We get from (i) and (ii) morphisms in \(\Var(\mathbb{C})/S\)

\[
R^G S^H(LF) : R_{(X',D')/S}(\rho^S S^H(I)) \rightarrow D_SZ^H(LF)
\]

- Let \(g : T \rightarrow S\) a morphism with \(T, S \in \Var(\mathbb{C})\). Let \(h : U \rightarrow S\) a morphism with \(U \in \Var(\mathbb{C})\). Consider the cartesian square

\[
\begin{array}{ccc}
U_T & \xrightarrow{h'} & T \\
\downarrow g & & \downarrow g \\
U & \xrightarrow{h} & S
\end{array}
\]

Take, see definition-proposition \[\PageIndex{12}\(\text{ii}\)], a compactification \(f_0 = \bar{h} : X_0 \rightarrow S\) of \(h : U \rightarrow S\) and a compactification \(f'_0 = g \circ h' : X'_0 \rightarrow S\) of \(g \circ h' : U' \rightarrow S\) such that \(g' : U_T/S \rightarrow U/S\) extend to a morphism \(\bar{g}_0 : X'_0/S \rightarrow X_0/S\). Denote \(Z = X_0 \setminus U\) and \(Z' = X'_0 \setminus U_T\). Take, see definition-proposition \[\PageIndex{12}\(\text{ii}\)], a desingularization \(\epsilon : (X, D) \rightarrow (X_0, Z)\) of \((X_0, Z)\), a desingularization \(\epsilon'_0 : (X', D') \rightarrow (X'_0, Z')\) of \((X'_0, Z')\) and a morphism \(\hat{g}' : X' \rightarrow X\) such that the following diagram commutes

\[
\begin{array}{ccc}
X'_0 & \xrightarrow{\hat{g}_0} & X_0 \\
\downarrow \epsilon & & \downarrow \epsilon \\
X' & \xrightarrow{\hat{g}} & X
\end{array}
\]

94
We then have, see definition-proposition 12(ii), the following commutative diagram in Fun(Δ, Var(C))

\[
\begin{array}{ccc}
U = U_c(\bullet) & \xrightarrow{j} & X = X_c(\bullet) & \xrightarrow{i} & D_s(\bullet) \\
\downarrow{g'} & & \downarrow{\bar{g}} & & \\
U_T = U_{T,c}(\bullet) & \xrightarrow{j'} & X' = X'_{c}(\bullet) & \xleftarrow{i'} & D' \xleftarrow{g^{-1}(D_s(\bullet)) : i'_{g}} \\
\end{array}
\]

We then consider the following map in C(Var(\mathbb{C})/T), see definition\,\,\,36(ii)

\[
T(g, R^{CH})(\mathbb{C}(U/S)) : g^* R(X,D)/S(\mathbb{C}(U/S))
\]

\[
\xrightarrow{g^* R^H_{s}(g')} g^* R(X^{'},D')/S(\mathbb{C}(U_T/S)) = g^* g_* R(X^{'},D')/T(\mathbb{C}(U_T/T))
\]

\[
\xrightarrow{\text{add}(g^*,g_*)(R(X^{'},D')/T(\mathbb{C}(U_T/T)))} R(X^{'},D')/T(\mathbb{C}(U_T/T))
\]

It gives for \( F \in C(\text{Var}(\mathbb{C}))^{sm}/S \) the map in C(Var(\mathbb{C})/T)

\[
T(g, R^{CH})(LF) : g^* R(X^{'},D')/S(\rho^*_{S} LF) \rightarrow R(X^{'},D')/T(\rho^*_{T} g^* LF)
\]

- Let \( S_1, S_2 \in \text{Var}(\mathbb{C}) \) and \( p : S_1 \times S_2 \rightarrow S_1 \) the projection. Let \( h : U \rightarrow S_1 \) a morphism with \( U \in \text{Var}(\mathbb{C})\). Consider the cartesian square

\[
U \times S_2 \xrightarrow{h \times I} S_1 \times S_2 \xrightarrow{p} S_1
\]

Take, see definition-proposition 12(i), a compactification \( f = \bar{h} : X_0 \rightarrow S_1 \) of \( h : U \rightarrow S_1 \). Then \( f \times I : S_0 \times S_2 \rightarrow S_1 \times S_2 \) is a compactification of \( h \times I : U \times S_2 \rightarrow S_1 \times S_2 \) and \( p' : U \times S_2 \rightarrow U \) extend to \( p'_0 := pX_0 : X_0 \times S_2 \rightarrow X_0 \). Denote \( Z = X_0 \setminus U \). Take see theorem 13(i), a desingularization \( c : (X, D) \rightarrow (X_0, Z) \) of the pair \( (X_0, Z) \). We then have the following commutative diagram in Fun(Δ, Var(\mathbb{C})) whose squares are cartesian

\[
U = U_c(\bullet) \xrightarrow{j} X \xleftarrow{i} D \xrightarrow{i'} D' \\
\downarrow{\bar{g}} \quad \quad \downarrow{\bar{\rho}^{'}} \\
U \times S_2 = (U \times S_2)_{c}(\bullet) \xrightarrow{j \times I} X \times S_2 \xleftarrow{i'} D \times S_2
\]

Then the map in C(Var(\mathbb{C})/S_1 \times S_2)

\[
T(p, R^{CH})(\mathbb{C}(U/S_1)) : p^* R(X,D)/S_1(\mathbb{C}(U/S_1)) \xrightarrow{\sim} R(X\times S_2,D_\bullet \times S_2)/S_1 \times S_2(\mathbb{C}(U \times S_2/S_1 \times S_2))
\]

is an isomorphism. It gives for \( F \in C(\text{Var}(\mathbb{C}))^{sm}/S_1 \) the isomorphisms in C(Var(\mathbb{C})/S_1 \times S_2)

\[
T(p, R^{CH})(LF) : p^* R(X^{'},D')/S_1(\rho^*_{S_1} LF) \xrightarrow{\sim} R(X^{'},D')/S_1 \times S_2(\rho^*_{S_1 \times S_2} p^* LF)
\]

is an isomorphism

- Let \( h_1 : U_1 \rightarrow S \), \( h_2 : U_2 \rightarrow S \) two morphisms with \( U_1, U_2, S \in \text{Var}(\mathbb{C}) \). Denote by \( p_1 : U_1 \times S \rightarrow U_1 \) and \( p_2 : U_1 \times S \rightarrow U_2 \) the projections. Take, see definition-proposition 12(i), a compactification \( f_{10} = \bar{h}_1 : X_{10} \rightarrow S \) of \( h_1 : U_1 \rightarrow S \) and a compactification \( f_{20} = h_2 : X_{20} \rightarrow S \) of \( h_2 : U_2 \rightarrow S \). Then,
- $f_{10} \times f_{20} : X_{10} \times S X_{20} \to S$ is a compactification of $h_1 \times h_2 : U_1 \times S U_2 \to S$.
- $\bar{p}_{10} := p_{X_{10}} : X_{10} \times S X_{20} \to X_{10}$ is a compactification of $p_1 : U_1 \times S U_2 \to U_1$.
- $\bar{p}_{20} := p_{X_{20}} : X_{10} \times S X_{20} \to X_{20}$ is a compactification of $p_2 : U_1 \times S U_2 \to U_2$.

Denote $Z_1 = X_{10} \setminus U_1$ and $Z_2 = X_{20} \setminus U_2$. Take, see theorem [T3(i)], a desingularization $\epsilon_1 : (X_1, D) \to (X_{10}, Z_1)$ of the pair $(X_{10}, Z_1)$, and a desingularization $\epsilon_2 : (X_2, E) \to (X_{20}, Z_2)$ of the pair $(X_{20}, Z_2)$. Take then a desingularization

$$\epsilon_{12} : ((X_1 \times S X_2)^N, F) \to (X_1 \times S X_2, (D \times S X_2) \cup (X_1 \times S E))$$

of the pair $(X_1 \times S X_2, (D \times S X_2) \cup (X_1 \times S E))$. We have then the following commutative diagram

\[
\begin{array}{ccc}
(X_1 \times S X_2)^N & \xrightarrow{f_1} & S \\
\downarrow \bar{p}_1 & & \downarrow f_2 \\
X_1 \times S X_2 & \xrightarrow{\epsilon_{12}} & X_2 \\
\end{array}
\]

2.13 The derived categories of filtered complexes of presheaves on a site or of filtered complexes of presheaves of modules on a ringed topos

**Definition 37.** Let $\mathcal{S} \in \text{Cat}$ a site endowed with topology $\tau$. We denote by $D(\mathcal{S}) := \text{Ho}_{\text{Top}} C(\mathcal{S})$ the localization of the category of complexes of presheaves on $\mathcal{S}$ with respect to top local equivalence and by $D(\tau) : C(\mathcal{S}) \to D(\mathcal{S})$ the localization functor. We denote for $r = 1, \ldots, \infty$, resp. $r = (1, \ldots, \infty)^2$,

$$D_{fil,r}(\mathcal{S}) := \text{Ho}_{\text{F}^r} C_{fil}(\mathcal{S}), \quad D_{2fil,r}(\mathcal{S}) := \text{Ho}_{\text{F}^r} C_{2fil}(\mathcal{S}),$$

the localizations of the category of filtered complexes of presheaves on $\mathcal{S}$ whose filtration is biregular with respect to $r$-$\tau$ local equivalence. By definition, we have sequences of functors

$$C_{fil}(\mathcal{S}) \to K_{fil}(\mathcal{S}) \to D_{fil}(\mathcal{S}) \to D_{fil,2}(\mathcal{S}) \to \cdots \to D_{fil,\infty}(\mathcal{S}).$$

where we recall $K_{fil}(\mathcal{S}) := K(PSh_{fil}(\mathcal{S}))$. 

96
Definition 38. Let $(S, O_S) \in R\text{Cat}$ where $S \in \text{Cat}$ is a site endowed with topology $\tau$. We denote by $D_O(S) := \text{Ho}_{\text{Top}} C_O(S)$ the localization of the category of complexes of presheaves on $S$ with respect to top local equivalence and by $D(\tau) : C_O(S) \rightarrow D_O(S)$ the localization functor. We denote for $r = 1, \ldots, \infty$, resp. $r = (1, \ldots, \infty)^2$, 

$$D_{O\text{fil},r}(S) := \text{Ho}_{F \tau} C_{O\text{fil}}(S), \quad D_{O\text{fil},2}(S) := \text{Ho}_{F \tau} C_{O\text{fil}}(S),$$

the localizations of the category of filtered complexes of presheaves on $S$ whose filtration is biregular with respect to $r, \tau$ local equivalence. By definition, we have sequences of functors

$$C_{O\text{fil}}(S) \rightarrow K_{O\text{fil}}(S) \rightarrow D_{O\text{fil}}(S) \rightarrow D_{O\text{fil},2}(S) \rightarrow \cdots \rightarrow D_{O\text{fil},\infty}(S),$$

where we recall $K_{O\text{fil}}(S) := K(P\text{Sh}_{O\text{fil}}(S)).$

Let $f : T \rightarrow S$ a morphism of presite, with $S, T \in \text{Cat}$ endowed with a topology $\tau$. If $f$ is a morphism of site, the adjunctions

$$(f^*, f_*): C(S) \rightleftarrows C(T), \quad (f^*, f_*): C(f_2\text{fil})(S) \rightleftarrows C(f_2\text{fil})(T).$$

are Quillen adjunctions. They induces respectively in the derived categories, for $r = (1, \ldots, \infty)$, resp. $r = (1, \ldots, \infty)^2$ (note that $f^*$ derive trivially)

$$(f^*, Rf_*): D(S) \rightleftarrows D(T), \quad (f^*, Rf_*): D_{f\text{il},r}(S) \rightleftarrows D_{f\text{il},r}(T).$$

For $F^* \in C(S)$, we have the adjunction maps

$$\text{ad}(f^*, f_*)(F^*) : F^* \rightarrow f_* f^* F^*, \quad \text{ad}(f^*, f_*)(F^*) : f^* f_* F^* \rightarrow F^*,$$

induces in the derived categories, for $(M, F) \in D_{f\text{il}}(S)$ and $(N, F) \in D_{f\text{il}}(T)$, the adjunction maps

$$\text{ad}(f^*, Rf_*)(M) : (M, F) \rightarrow Rf_* f^*(M, F), \quad \text{ad}(f^*, Rf_*)(N, F) : f^* Rf_*(N, F) \rightarrow (N, F).$$

For a commutative diagram of sites:

$$
\begin{array}{ccc}
D & \xrightarrow{g_2} & X \\
\downarrow f_2 & & \downarrow f_2 \\
\mathcal{T} & \xrightarrow{g_1} & S
\end{array}
$$

with $\mathcal{Y}, \mathcal{T}, S, X \in \text{Cat}$ with topology $\tau_{\mathcal{Y}}, \tau_{\mathcal{T}}, \tau_S, \tau_X$, the maps, for $F \in C(X)$,

$$T(D)(F) : g_1^* f_1_* F \rightarrow f_2^* g_2^* F$$

induce in the derived category the maps in $D_{f\text{il},r}(T)$, given by, for $(G, F) \in D_{f\text{il},r}(X)$ with $(G, F) = D(\tau_X, r)((G, F))$,

$$
\begin{array}{cc}
g_1^* Rf_1_*(M, F) & \xrightarrow{T(D)(M,F)} Rf_2^* g_2^* (M, F) \\
\downarrow & \downarrow \\
g_1^* f_1_*(E(G,F)) & \xrightarrow{k \circ T(D)(E(G,F))} f_2^* E(g_2^*(E(G,F)))
\end{array}
$$

Let $S \in \text{Cat}$ a site with topology $\tau$. The tensor product of complexes of abelian groups and the internal hom of presheaves on $S$

$$((\cdot \otimes \cdot), \text{Hom}^*(\cdot, \cdot)) : C(S)^2 \rightarrow C(S),$$

97
is a Quillen adjunction which induces in the derived category

\[(\cdot \otimes^{L} \cdot, R\text{Hom}^{\bullet}(\cdot, \cdot)) : D_{fil,r}(S)^{2} \to D_{fil,r}(S), \quad R\text{Hom}^{\bullet}(M, W), (N, W) = \text{Hom}^{\bullet}((Q, W), E(G, F)),\]

where, \(Q\) is projectively cofibrant such that \(M = D(\tau)(Q^{\bullet})\) and \(G\) such that \(N = D(\tau)(G)\).

Let \(i : Z \hookrightarrow S\) a closed embedding, with \(S, Z \in \text{Top}\). Denote by \(j : S \setminus Z \hookrightarrow S\) the open embedding of the complementary subset. The adjunction

\[(i_{*}, i^{\dagger}) := (i_{*}, i^{\dagger}) : C(Z) \to C(S), \text{ with in this case } i^{\dagger}F := \ker(F \to j_{*}j^{*}F)\]

is a Quillen adjunction. Since \(i^{\dagger}\) preserve monomorphisms, we have also Quillen adjunctions

\[(i_{*}, i^{\dagger}) : C_{(2)}(Z) \to C_{(2)}(S), \text{ with } i^{\dagger}(G, F) = (i^{\dagger}G, F),\]

which induces in the derived category \((i_{*} \text{ derive trivially})\)

\[(i_{*}, R^{\dagger}i) : D_{(2)}(Z) \to D_{(2)}(S), \text{ with } R^{\dagger}i(G, F) = i^{\dagger}E(G, F).\]

### 3 Triangulated category of motives

#### 3.1 Definition and the six functor formalism

The category of motives is obtained by inverting the \((\mathbb{A}_{S}^{1}, \text{et})\) equivalence. Hence the \(\mathbb{A}_{S}^{1}\) local complexes of presheaves plays a key role.

**Definition 39.** The derived category of motives of complex algebraic varieties over \(S\) is the category

\[DA(S) := \text{Ho}_{\mathbb{A}_{S}^{1}, \text{et}}(C(\text{Var}(\mathbb{C})^{sm}/S)),\]

which is the localization of the category of complexes of presheaves on \(\text{Var}(\mathbb{C})^{sm}/S\) with respect to \((\mathbb{A}_{S}^{1}, \text{et})\) local equivalence and we denote by

\[D(\mathbb{A}_{S}^{1}, \text{et}) := D(\mathbb{A}_{S}^{1}) \circ D(\text{et}) : C(\text{Var}(\mathbb{C})^{sm}/S) \to DA(S)\]

the localization functor. We have \(DA^{-}(S) := D(\mathbb{A}_{S}^{1}, \text{et})(\text{PSh}(\text{Var}(\mathbb{C})^{sm}/S, C^{-}(\mathbb{Z}))) \subset DA(S)\) the full subcategory consisting of bounded above complexes.

**Definition 40.** The stable derived category of motives of complex algebraic varieties over \(S\) is the category

\[DA_{st}(S) := \text{Ho}_{\mathbb{A}_{S}^{1}, \text{et}}(C_{\Sigma}(\text{Var}(\mathbb{C})^{sm}/S)),\]

which is the localization of the category of \(\mathbb{G}_{mS}\)-spectra \((\Sigma F^{\bullet} = F^{\bullet} \otimes \mathbb{G}_{mS})\) of complexes of presheaves on \(\text{Var}(\mathbb{C})^{sm}/S\) with respect to \((\mathbb{A}_{S}^{1}, \text{et})\) local equivalence. The functor

\[\Sigma^{\infty} : C(\text{Var}(\mathbb{C})^{sm}/S) \leftrightarrow C_{\Sigma}(\text{Var}(\mathbb{C})^{sm}/S)\]

induces the functor \(\Sigma^{\infty} : DA(S) \to DA_{st}(S)\).

We have all the six functor formalism by [10]. We give a list of the operation we will use:

- For \(f : T \to S\) a morphism with \(S, T \in \text{Var}(\mathbb{C})\), the adjunction

  \[(f^{*}, f_{*}) : C(\text{Var}(\mathbb{C})^{sm}/S) \rightleftarrows C(\text{Var}(\mathbb{C})^{sm}/T)\]

  is a Quillen adjunction which induces in the derived categories \((f^{*} \text{ derives trivially}), (f^{*}, Rf_{*}) : DA(S) \rightleftarrows DA(T)\).
• For \( h : V \to S \) a smooth morphism with \( V,S \in \text{Var}(\mathbb{C}) \), the adjunction
\[
(h_\sharp, h^*) : C(\text{Var}(\mathbb{C})^{sm}/V) \leftrightarrows C(\text{Var}(\mathbb{C})^{sm}/S)
\]
is a Quillen adjunction which induces in the derived categories (\( h^* \) derive trivially) \((Lh_\sharp, h^*) =: \text{DA}(V) \leftrightarrows \text{DA}(S)\).

• For \( i : Z \hookrightarrow S \) a closed embedding, with \( Z,S \in \text{Var}(\mathbb{C}) \),
\[
(i_\sharp, i^!) := (i_\sharp, i^!) : C(\text{Var}(\mathbb{C})^{sm}/Z) \leftrightarrows C(\text{Var}(\mathbb{C})^{sm}/S)
\]
is a Quillen adjunction, which induces in the derived categories (\( i_\sharp \) derive trivially) \((i_\sharp, R i^!) : \text{DA}(Z) \leftrightarrows \text{DA}(S)\). The fact that \( i_\sharp \) derive trivially (i.e. send \((\mathbb{A}^1, \text{et})\) local equivalence to \((\mathbb{A}^1, \text{et})\) local equivalence is proved in [4].

• For \( S \in \text{Var}(\mathbb{C}) \), the adjunction given by the tensor product of complexes of abelian groups and the internal hom of presheaves
\[
((\cdot \otimes -), \text{Hom}^\ast (-, \cdot)) : C(\text{Var}(\mathbb{C})^{sm}/S)^2 \to C(\text{Var}(\mathbb{C})^{sm}/S),
\]
is a Quillen adjunction, which induces in the derived category
\[
((\cdot \otimes^L -), R \text{Hom}^\ast (-, \cdot)) : \text{DA}(S)^2 \to \text{DA}(S),
\]
- Let \( M,N \in \text{DA}(S) \), \( Q^\ast \) projectively cofibrant such that \( M = D(\mathbb{A}^1, \text{et})(Q^\ast) \), and \( G^\ast \) be \( \mathbb{A}^1 \) local for the etale topology such that \( N = D(\mathbb{A}^1, \text{et})(G^\ast) \). Then,
\[
R \text{Hom}^\ast(M,N) = \text{Hom}^\ast(Q^\ast, E(G^\ast)) \in \text{DA}(S).
\]
This is well defined since if \( s : Q_1 \to Q_2 \) is an etale local equivalence,
\[
\text{Hom}(s, E(G)) : \text{Hom}(Q_1, E(G)) \to \text{Hom}(Q_2, E(G))
\]
is an etale local equivalence for \( 1 \leq i \leq l \).

• For a commutative diagram in \( \text{Var}(\mathbb{C}) \):
\[
\begin{array}{ccc}
Y & \xrightarrow{g_2} & X \\
\downarrow f_2 & & \downarrow f_1 \\
T & \xrightarrow{g_1} & S
\end{array}
\]
and \( F \in C(\text{Var}(\mathbb{C})^{sm}/X) \), the transformation map \( T(D)(F) : g_1^* f_1_* F \to f_2_* g_2^* F \) induces in the derived category, for \( M \in \text{DA}(X) \), \( M = D(\mathbb{A}^1, \text{et})(F) \) with \( F \mathbb{A}^1 \) local for the etale topology,
\[
g_1^* R f_1_* M \xrightarrow{T(D)(M)} R f_2_* g_2^* M
\]
If \( D \) is cartesian with \( f_1 = f, g_1 = g, f_2 = f' : X_T \to T, g' : X_T \to X \), we denote
- \( T(D)(F) := T(f,g)(F) : g^* f_* F \to f'_* g'^* F \),
- \( T(D)(M) := T(f,g)(M) : g^* R f_* M \to R f'_* g'^* M \).
We get from the first point 2 functors:
• The 2-functor \( C(\text{Var}(\mathbb{C})^{\text{sm}}/\cdot) : \text{Var}(\mathbb{C}) \to \text{AbCat} \), given by
  \[ S \mapsto C(\text{Var}(\mathbb{C})^{\text{sm}}/S), \quad (f : T \to S) \mapsto (f^* : C(\text{Var}(\mathbb{C})^{\text{sm}}/S) \to C(\text{Var}(\mathbb{C})^{\text{sm}}/T)). \]

• The 2-functor \( \text{DA}(\cdot) : \text{Var}(\mathbb{C}) \to \text{TriCat} \), given by
  \[ S \mapsto \text{DA}(S), \quad (f : T \to S) \mapsto (f^* : \text{DA}(S) \to \text{DA}(T)). \]

The main theorem is the following:

**Theorem 14.** [4][10] The 2-functor \( \text{DA}(\cdot) : \text{Var}(\mathbb{C}) \to \text{TriCat} \), given by
  \[ S \mapsto \text{DA}(S), \quad (f : T \to S) \mapsto (f^* : \text{DA}(S) \to \text{DA}(T)) \]

is a 2-homotopic functor ([4])

From theorem [14] we get in particular

• For \( f : T \to S \) a morphism with \( T, S \in \text{Var}(\mathbb{C}) \), there by theorem [14] is also a pair of adjoint functor
  \[ (f_!, f^!) : \text{DA}(S) \rightleftarrows \text{DA}(T) \]
  – with \( f_! = Rf_* \) if \( f \) is proper,
  – with \( f^! = f^*[d] \) if \( f \) is smooth of relative dimension \( d \).

For \( h : U \to S \) a smooth morphism with \( U, S \in \text{Var}(\mathbb{C}) \) irreducible, have, for \( M \in \text{DA}(U) \), an isomorphism
  \[ Lh_*M \to h^!_!M[d], \quad (44) \]
  in \( \text{DA}(S) \).

• For \( i : Z \hookrightarrow X \) a closed embedding with \( Z, X \in \text{Var}(\mathbb{C}) \), denote by \( j : S\backslash Z \to S \) the open complementary subset. Then :
  – the functor \( (i^!, j^*) : \text{DA}(S) \to \text{DA}(Z) \times \text{DA}(S\backslash Z) \) is conservative,
  – on the other hand, it is easy to see that, for \( F \in C(\text{Var}(\mathbb{C})^{\text{sm}}/Z) \), the adjonction map
    \[ \text{ad}(i^!, j_*)(F) : i^!j_*F \to F \]
    is an equivalence Zariski local, hence for \( M \in \text{DA}(S) \), the induced map in the derived category
    \[ \text{ad}(i^!, j_*)(M) : i^!j_*M \sim M \]
    is an isomorphism.

• For \( f : X \to S \) a proper map, \( g : T \to S \) a morphism, with \( T, X, S \in \text{Var}(\mathbb{C}) \), and \( M \in \text{DA}(X) \),
  \[ T(f, g)(M) : g^*Rf_*M \to Rf'_*g^*M \]
  is an isomorphism in \( \text{DA}(T) \) if \( f \) is proper.

**Definition 41.** The derived category of extended motives of complex algebraic varieties over \( S \) is the category
  \[ \text{DA}(S) := \text{Ho}_{\mathbb{A}^1_S, \text{et}}(C(\text{Var}(\mathbb{C})/S)), \]
which is the localization of the category of complexes of presheaves on \( \text{Var}(\mathbb{C})/S \) with respect to \( (\mathbb{A}^1_S, \text{et}) \) local equivalence and we denote by
  \[ D(\mathbb{A}^1_S, \text{et}) := D(\mathbb{A}^1_S) \circ D(\text{et}) : C(\text{Var}(\mathbb{C})/S) \to \text{DA}(S) \]
the localization functor. We have \( \text{DA}^{-}(S) := D(\mathbb{A}^1_S, \text{et})(\text{PSh}(\text{Var}(\mathbb{C})/S, C^{-}(\mathbb{Z}))) \subset \text{DA}(S) \) the full subcategory consisting of bounded above complexes.
Remark 5. Let \( i : Z \hookrightarrow S \) a closed embedding, with \( Z, S \in \text{Var}(\mathbb{C}) \).

(i) By theorem \([14]\) for \( X/S = (X, h) \in \text{Var}(\mathbb{C})^{sm}/S \),

\[
(0, \text{ad}(i^*, i_*(Z(X/S)))) : \Gamma_Z^n(X/S) \rightarrow i_*Z(X/Z)
\]

is an equivalence \((\mathbb{A}^1, \text{et}) \) local.

(ii) For \( X/S = (X, f) \in \text{Var}(\mathbb{C})/S \),

\[
(0, \text{ad}(i^*, i_*(Z(X/S)))) : \Gamma_Z^n(X/S) \rightarrow i_*Z(X/Z)
\]

is NOT an equivalence \((\mathbb{A}^1, \text{et}) \) local in general, since for example if \( f(X) = Z \subset S \), \( \rho_S, Z(X/S) = 0 \) but \( D(\mathbb{A}^1, \text{et})(\rho_S, i_*Z(X/Z)) = \rho_S, i_*Z(X/Z) \neq 0 \in \text{DA}(S) \), hence it is NOT an equivalence \((\mathbb{A}^1, \text{et}) \) local in this case by proposition \([14]\). In particular \( \text{DA}(S) \) does NOT satisfy the localization property.

(ii') For \( X/Z = (X, f) \in \text{Var}(\mathbb{C})/Z \), the inclusion

\[
T(i_2, i_*): i_2Z(X/Z) \hookrightarrow i_*Z(X/Z)
\]

is NOT an equivalence \((\mathbb{A}^1, \text{et}) \) local by proposition \([14]\) since \( \rho_S, i_2Z(X/Z) = 0 \) but \( D(\mathbb{A}^1, \text{et})(\rho_S, i_*Z(X/Z) = i_*\rho_S, Z(X/Z) \neq 0 \in \text{DA}(S) \).

Definition 42. (i) Let \( f : X \rightarrow S \) a smooth proper morphism with \( X, S \in \text{Var}(\mathbb{C}) \) of relative dimension \( d = d_X - d_S \) and \( X \) smooth. Then, we have the equivalence \((\mathbb{A}^1, \text{et}) \) local in \( C(\text{Var}(\mathbb{C})^{sm}/S) \)

\[
T_0(f_2, f_*)(Z(X/X)) := [\Delta_X] : f_2Z(X/X) = Z(X/S) \rightarrow f_*E_{et}(Z(X/X))(d)[2d]
\]

given by the class of the diagonal \( [\Delta_X] \in \text{Hom}(f_2Z(X/X), f_*E_{et}(Z(X/X))(d)[2d]) \) which induces the isomorphism

\[
D(\mathbb{A}^1, \text{et})([\Delta_X]) \in \text{CH}^d(X \times_S X) \cong \text{Hom}_{\text{DA}(S)}(f_2Z(X/X), f_*E_{et}(Z(X/X))(d)[2d]).
\]

It gives the the map in \( C(\text{Var}(\mathbb{C})^{sm}/S) \)

\[
T(f_2, f_*)(Z(X/X)) := [\Delta_X] : f_2Z(X/X) = Z(X/S) \rightarrow Lf_*E_{et}(Z(X/X))(d)[2d]
\]

unique up to homotopy such that \( T_0(f_2, f_*)(Z(X/X)) = q \circ T(f_2, f_*)(Z(X/X)) \). In particular \( T(f_2, f_*)(Z(X/X)) \) is an equivalence \((\mathbb{A}^1, \text{et}) \) local.

(ii) Let \( f : X \rightarrow S \) a proper surjective morphism with \( X, S \in \text{Var}(\mathbb{C}) \) of relative dimension \( d = d_X - d_S \) and \( X \) smooth. Then, we have the equivalence \((\mathbb{A}^1, \text{et}) \) local in \( C(\text{Var}(\mathbb{C})/S) \)

\[
T_0(f_2, f_*)(Z(X/X)) := [\Delta_X] : f_2Z(X/X) = Z(X/S) \rightarrow f_*E_{et}(Z(X/X))(d)[2d]
\]

given by the class of the diagonal \( [\Delta_X] \in \text{Hom}(f_2Z(X/X), f_*E_{et}(Z(X/X))(d)[2d]) \) which induces the isomorphism

\[
D(\mathbb{A}^1, \text{et})([\Delta_X]) \in \text{CH}^d(X \times_S X) = \text{Hom}_{\text{DA}(S)}(f_2Z(X/X), f_*E_{et}(Z(X/X))(d)[2d]).
\]

Note that if \( f : X \rightarrow S \) is not surjective, \( d < 0 \) and

\[
\text{Hom}_{\text{DA}(S)}(f_2Z(X/X), f_*E_{et}(Z(X/X))(d)[2d]) = \text{CH}^d(X \times_S X) = 0.
\]

It gives the the map in \( C(\text{Var}(\mathbb{C})/S) \)

\[
T(f_2, f_*)(Z(X/X)) := [\Delta_X] : f_2Z(X/X) = Z(X/S) \rightarrow Lf_*E_{et}(Z(X/X))(d)[2d]
\]

unique up to homotopy such that \( T_0(f_2, f_*)(Z(X/X)) = q \circ T(f_2, f_*)(Z(X/X)) \). In particular \( T(f_2, f_*)(Z(X/X)) \) is an equivalence \((\mathbb{A}^1, \text{et}) \) local.
(ii) Let \( f : X \to S \) a proper surjective morphism with \( X, S \in \text{Var}(\mathbb{C}) \) of relative dimension \( d = d_X - d_S \) and \( X \) smooth. Then, we have, for \( i : Z \hookrightarrow X \) a closed embedding with \( Z \) smooth, the equivalence \((\mathbb{A}^1, \text{et})\) local in \( C(\text{Var}(\mathbb{C})/S)\)

\[
T_0(f_!, f_*)(Z(Z/X)) := [\Delta_Z] : f_!Z(Z/X) = Z(Z/S) \to f_*E_{\text{et}}(Z(Z/X))(d)[2d]
\]
given by the class of the diagonal

\[
[\Delta_Z] \in \text{Hom}(f_!Z(Z/X), f_*E_{\text{et}}(Z(Z/X))(d)[2d]) \xrightarrow{\text{Hom}(-, E_{\text{et}}(Z(i))(d)[2d])} \text{Hom}(Z(Z \times_S X/X), E_{\text{et}}(Z(Z/X))(d)[2d]) \xrightarrow{\text{Hom}(-, E_{\text{et}}(Z(i))(d)[2d])} \text{Hom}(Z(Z \times_S X/X), E_{\text{et}}(Z(Z/X))(d)[2d])
\]

which induces the isomorphism

\[
D(\mathbb{A}^1, \text{et})([\Delta_Z]) \in \text{Hom}_{DA(S)}(f_!Z(Z/X), f_*E_{\text{et}}(Z(Z/X))(d)[2d]) \xrightarrow{\text{Hom}(-, E_{\text{et}}(Z(i))(d)[2d])} \text{Hom}_{DA(S)}(Z(Z \times_S X/X), E_{\text{et}}(Z(Z/X))(d)[2d]) = \text{CH}_{d_Z}(Z \times_S Z)
\]

with \( Z(i) : Z(Z/X) \hookrightarrow Z(X/X) \) the monomorphism, note that \( \text{codim}(\Delta_Z, Z \times_S X) = d \) since \( f' : Z \times_S X \to Z \) is proper surjective of relative dimension \( d \) and that we have the following commutative diagram of abelian groups

Also note that \( Z(Z/X) \) is trivially \( \mathbb{A}^1 \) invariant since \( Z(Z/X)(S/S) = Z(Z/X)(\mathbb{A}^1 \times S/S) = 0 \). It gives the map in \( C(\text{Var}(\mathbb{C})/S)\)

\[
T(f_!, f_*)(Z(Z/X)) := [\Delta_Z] : f_!Z(Z/X) = Z(Z/S) \to Lf_*E_{\text{et}}(Z(Z/X))(d)[2d]
\]

unique up to homotopy such that \( T_0(f_!, f_*)(Z(Z/X)) = q \circ T(f_!, f_*)(Z(Z/X)) \). In particular \( T(f_!, f_*)(Z(Z/X)) \) is an equivalence \((\mathbb{A}^1, \text{et})\) local.

### 3.2 Constructible motives and resolution of a motive by Corti-Hanamura motives

We now give the definition of the motives of morphisms \( f : X \to S \) which are constructible motives and the definition of the category of Corti-Hanamura motives.

**Definition 43.** Let \( S \in \text{Var}(\mathbb{C})\),

- the homological motive functor is \( M(/S) : \text{Var}(\mathbb{C})/S \to DA(S) \), \( (f : X \to S) \mapsto M(X/S) := f_!f^!M(S/S) \),
- the cohomological motive functor is \( M^\vee(/S) : \text{Var}(\mathbb{C})/S \to DA(S) \), \( (f : X \to S) \mapsto M(X/S)^\vee := Rf_*M(X/X) = f_*E(Z_X) \),
Theorem 15. Let $S$ be a morphism with $X, S \in \text{Var}(\mathbb{C})$. Assume that there exist a factorization $f : X \xrightarrow{\sim} Y \times S \xrightarrow{p} S$, with $Y \in \text{SmVar}(\mathbb{C})$, $i : X \to Y$ is a closed embedding and $p$ the projection. Then,

$$Q(X/S) := p_*\Gamma_X^w \mathbb{Z}_{Y \times S} \in C(\text{Var}(\mathbb{C})_{\text{sm}}/S)$$

(see definition [17] is projective, admits transfer, and satisfy $D(\mathbb{A}^1_{\text{et}})(Q(X/S)) = M(X/S)$.

Definition 44. (i) Let $S \in \text{Var}(\mathbb{C})$. We define the full subcategory $\text{DA}_c(S) \subset \text{DA}(S)$ whose objects are constructible motives to be the thick triangulated category generated by the motives of the form $M(X/S)$, with $f : X \to S$ a morphism, $X \in \text{Var}(\mathbb{C})$.

(ii) Let $X, S \in \text{Var}(\mathbb{C})$. If $f : X \to S$ is proper (but not necessarily smooth) and $X$ is smooth, $M(X/S)$ is said to be a Corti-Hanamura motive and we have by above in this case $M(X/S) = M_c(X/S)[c] = M(X/S)^\vee[c]$, with $c = \text{codim}(X, X \times S)$ whenever $f : X \to X \times S \to S$. We denote by

$$\text{CH}(S) = (M(X/S))_{(X/S = (X, f), f \text{pr}, X \text{sm})} \subset \text{DM}(S)$$

the full subcategory which is the pseudo-abelian completion of the full subcategory whose objects are Corti-Hanamura motives.

(iii) We denote by

$$\text{CH}^0(S) \subset \text{CH}(S)$$

the full subcategory which is the pseudo-abelian completion of the full subcategory whose objects are Corti-Hanamura motives $M(X/S)$ such that the morphism $f : X \to S$ is projective.

For bounded above motives, we have

Theorem 15. Let $S \in \text{Var}(\mathbb{C})$.

(i) There exists a unique weight structure $\omega$ on $\text{DA}^{-}(S)$ such that $\text{DA}^{-}(S)^{\omega = 0} = \text{CH}(S)$

(ii) There exists a well defined functor

$$W(S) : \text{DA}^{-}(S) \to K^-(\text{CH}(S)), W(S)(M) = [M^{\bullet}]$$

where $M^{\bullet} \in C^{-}(\text{CH}(S))$ is a bounded above weight complex, such that if $m \in \mathbb{Z}$ is the highest weight, we have a generalized distinguish triangle for all $i \leq m$

$$T_i : M^{(i)}[i] \to M^{(i+1)}[(i+1)] \to \cdots \to M^{(m)}[m] \to M^{w \geq i}$$

Moreover the maps $w(M)^{(\geq i)} : M^{\geq i} \to M$ induce an isomorphism $w(M) : \text{holim}_i M^{\geq i} \cong M$ in $\text{DA}^{-}(S)$.

(iii) Denote by Chow$(S)$ the category of Chow motives, which is the pseudo-abelian completion of the category

- whose set of objects consist of the $X/S = (X, f) \in \text{Var}(\mathbb{C})/S$ such that $f$ is proper and $X$ is smooth,

- whose set of morphisms between $X_1/S$ and $X_2/S$ is $\text{CH}^{\text{pr}}(X_1 \times S X_2)$, and the composition law is given in $[17]$.
We have then a canonical functor $CH_S : \text{Chow}(S) \rightarrow \text{DA}(S)$, with $CH_S(X/S) := M(X/S) := Rf_*\mathbb{Z}(X/X)$, which is a full embedding whose image is the category $\mathcal{CH}(S)$.

Proof. (i): The category $\text{DA}(S)$ is clearly weakly generated by $\mathcal{CH}(S)$. Moreover $\mathcal{CH}(S) \subset \text{DA}(S)$ is negative. Hence, the result follows from [10] theorem 4.3.2 III.

(ii): Follows from (i) by standard fact of weight structure on triangulated categories. See [6] theorem 3.2.2 and theorem 4.3.2 V for example.

(iii): See [12].}

Theorem 16. Let $S \in \text{Var}(\mathbb{C})$.

(i) There exists a unique weight structure $\omega$ on $\text{DA}^{-}(S)$ such that $\text{DA}^{-}(S)^{\omega=0} = \mathcal{CH}^0(S)$

(ii) There exist a well defined functor

$$W(S) : \text{DA}^{-}(S) \rightarrow K^{-}(\mathcal{CH}^0(S)),$$

where $M^{\bullet} \in C^{-}(\mathcal{CH}^0(S))$ is a bounded above weight complex, such that if $m \in \mathbb{Z}$ is the highest weight, we have a generalized distinguish triangle for all $i \leq m$

$$T_i : M^{(i)}[i] \rightarrow M^{(i+1)}[i+1] \rightarrow \cdots \rightarrow M^{(m)}[m] \rightarrow M^{\omega \geq i}$$

Moreover the maps $w(M)^{(\omega \geq i)} : M^{\omega \geq i} \rightarrow M$ induce an isomorphism $w(M) : \text{holim}_i M^{\omega \geq i} \rightarrow M$ in $\text{DA}^{-}(S)$.

Proof. Similar to the proof of theorem [16].

Corollary 1. Let $S \in \text{Var}(\mathbb{C})$. Let $M \in \text{DA}(S)$. Then there exist $(F, W) \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)$ such that $D(\mathbb{A}^1, et)(F) = M$ and $D(\mathbb{A}^1, et)(\text{Gr}_p W) \in \mathcal{CH}^0(S)$.

Proof. By theorem [16] there exist, by induction, for $i \in \mathbb{Z}$, a distinguish triangle in $\text{DA}(S)$

$$T_i : M^{(i)}[i] \rightarrow M^{(i+1)}[i+1] \rightarrow \cdots \rightarrow M^{(m)}[m] \rightarrow M^{\omega \geq i}$$

with $M^{(i)}[j] \in \mathcal{CH}^0(S)$ and $w(M) : \text{holim}_i M^{\omega \geq i} \rightarrow M$ in $\text{DA}^{-}(S)$. For $i \in \mathbb{Z}$, take $(F_j)_{j \geq i}, F_{w \geq i} \in C(\text{Var}(\mathbb{C})^{sm}/S)$ such that $D(\mathbb{A}^1, et)(F_j) = M^{(j)}[j], D(\mathbb{A}^1, et)(F_{w \geq i}) = M^{\omega \geq i}$ and such that we have in $C(\text{Var}(\mathbb{C})^{sm}/S)$,

$$F_{w \geq i} = \text{Cone}(F_i \rightarrow \cdots \rightarrow F_{i+1} \rightarrow \cdots \rightarrow F_m)$$

where $m_j : F_j \rightarrow F_{j+1}$ are morphisms in $C(\text{Var}(\mathbb{C})^{sm}/S)$ such that $D(\mathbb{A}^1, et)(m_j) = m_j$. Now set $F = \text{holim}_i F_{w \geq i} \in C(\text{Var}(\mathbb{C})^{sm}/S)$ and $W_i F := F_{w \geq i} \rightarrow F$, so that $(F, W) \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)$ satisfy $D(\mathbb{A}^1, et)(\text{Gr}_p W) = M^{(p)}[p] \in \mathcal{CH}^0(S)$.

3.3 The restriction of relative motives to their Zariski sites

Let $S \in \text{Var}(\mathbb{C})$. The adjunction

$$(e(S)^*, e(S)_*) : C(\text{Var}(\mathbb{C})^{sm}/S) \leftrightarrows C(S)$$

is a Quillen adjunction and induces in the derived category

- $(e(S)^*, e(S)_*) : \text{Ho}_{zar}(\text{Var}(\mathbb{C})^{sm}/S) \leftrightarrows D(T) := \text{Ho}_{zar} C(S)$, since $e(S)_*$ sends Zariski local equivalence on the big site $\text{Var}(\mathbb{C})^{sm}/S$ to Zariski local equivalence in the small Zariski site of $S$,

- $(e(S)^*, \text{Re}(S)_*) : \text{DA}(S) \leftrightarrows D(T) := \text{Ho}_{zar} C(S)$.

We will use in the definition of the De Rahm realization functor on $\text{DA}(S)$ the following proposition concerning the restriction of the derived internal hom functor to the Zariski site :
**Proposition 31.** Let $M, N \in DA(S)$ and $m : M \to N$ be a morphism. Let $F^\bullet, G^\bullet \in PSh(Var(C)^{sm}/S, C(Z))$ such that $M = D(\mathbb{A}^1_S, et)(F^\bullet)$ and $N = D(\mathbb{A}^1_S, et)(G^\bullet)$. If we take $G^\bullet (\mathbb{A}^1_S, et)$ fibrant and admitting transfert, and $F^\bullet$ cofibrant for the projective model structure, we have

\[
Re(S)_*R\text{Hom}^\bullet(M, N) = e(S)_*\text{Hom}^\bullet(F^\bullet, G^\bullet)
\]

in $D(S)$.

**Proof.** Since $F^\bullet$ is projectively cofibrant and $G^\bullet$ is (projectively) $(\mathbb{A}^1_S, et)$ fibrant, we have $R\text{Hom}^\bullet(M, N) = \text{Hom}^\bullet(F^\bullet, G^\bullet)$. Then, $\text{Hom}^\bullet(F^\bullet, G^\bullet)$ is $\mathbb{A}^1_S$ local and admits transfert. On the other hand, we have

\[
\mathcal{L}_{\mathbb{A}^1_S}D_{\text{et}}(\text{Cor Var}(C)^{sm}/S) = \mathcal{L}_{\mathbb{A}^1_S}D_{\text{zar}}(\text{Cor Var}(C)^{sm}/S) \subset D(\text{Var}(C)^{sm}/S)
\]

by theorem [10] (ii). This gives the equality of the proposition. \hfill \Box

We will also have :

**Proposition 32.** For $f : T \to S$ a morphism and $i : Z \hookrightarrow S$ a closed embedding, with $Z, S, T \in Var(C)$, we have

(i) $Re(S)_*Rf_* = Rf_*Re(T)_*$ and $e(S)^*Rf_* = Rf_*e(T)^*$

(ii) $Re(S)_*RG_Z = RG_ZRe(S)_*$.

**Proof.** (i):Follows from proposition [10] (i) and the fact that $f_*$ preserve $(\mathbb{A}^1, et)$ fibrant complex of presheaves.

(ii):Follows from proposition [10] (ii) and the fact that $\Gamma_Z$ preserve $(\mathbb{A}^1, et)$ fibrant complex of presheaves. \hfill \Box

### 3.4 Motives of complex analytic spaces

The category of motives is obtained by inverting the $(\mathbb{D}^1_S, usu)$ local equivalence. Hence the $\mathbb{D}^1_S$ local complexes of presheaves plays a key role.

**Definition 45.** The derived category of motives of complex algebraic varieties over $S$ is the category

\[
\text{AnDA}(S) := \text{Ho}_{\mathbb{D}^1_S, usu}(C(\text{AnSp}(C)^{sm}/S)),
\]

which is the localization of the category of complexes of presheaves on $\text{AnSp}(C)^{sm}/S$ with respect to $(\mathbb{D}^1_S, usu)$ local equivalence and we denote by

\[
D(\mathbb{D}^1_S, usu) := D(\mathbb{A}^1_S) \circ D(\text{et}) : C(\text{AnSp}(C)^{sm}/S) \to \text{AnDA}(S)
\]

the localization functor. We have $DA^-(S) := D(\mathbb{D}^1_S, usu)(PSh(\text{AnSp}(C)^{sm}/S, C^{-}(Z))) \subset DA(S)$ the full subcategory consisting of bounded above complexes.

**Theorem 17.** Let $S \in \text{AnSp}(C)$. The adjunction $(e(S)^*, e(S)_*) : C(\text{AnSp}(C)^{sm}/S) \to C(S)$ induces an equivalence of categories

\[
(e(S)^*, Re(S)_*) : \text{AnDM}(S) \xrightarrow{\sim} D(S).
\]

In particular, for $F \in C(\text{AnSp}(C)^{sm}/S)$, the adjunction map $\text{ad}(e(S)^*, e(S)_*)(F) : e(S)^*e(S)_*F \to F$ is an equivalence $(\mathbb{D}^1, usu)$ local.

**Proof.** See [1]. \hfill \Box

We deduce from this theorem the following :
Proposition 33. Let $S \in \text{AnSp}(\mathbb{C})$. Let $F, G \in C(\text{AnSp}(\mathbb{C})^{sm}/S)$. If $G$ is $\mathbb{D}^1$ local, then the canonical map

$$T(e, \text{hom})(F, G) : e(S)_*\mathcal{H}om(F, G) \to \mathcal{H}om(e(S)_*F, e(S)_*G)$$

is an equivalence usul local.

Proof. The map $T(e, \text{hom})(F, G)$ is the composite

$$T(e, \text{hom})(F, G) : e(S)_*\mathcal{H}om(F, G) \xrightarrow{\mathcal{H}om(ad(e(S)^*, e(S))_*(F), G)} e(S)_*\mathcal{H}om(e(S)^*e(S)_*F, G)$$

where the last map is the adjonction isomorphism. The first map is an isomorphism by theorem $17$ since $G$ is $\mathbb{D}^1$ local. \qed

4 The category of filtered D modules on commutative ringed topos, on commutative ringed spaces, complex algebraic varieties complex analytic spaces and the functorialities

4.1 The category of filtered D modules on commutative ringed topos, on commutative ringed spaces, and the functorialities

4.1.1 Definitions et functorialities

Let $(\mathcal{S}, O_S) \in \text{RCat}$ with $O_S$ commutative. Recall that $\Omega_{O_S} := \mathbb{D}_S^0(\mathcal{I}_S/\mathcal{I}_S^2) \in \text{PSh}_{O_S}(S)$ is the universal derivation $O_S$-module together with its derivation map $d : O_S \to \Omega_{O_S}$, where $\mathcal{I}_S = \ker(s_S : O_S \otimes O_S \to O_S) \in \text{PSh}_{O_S \times O_S}(S)$ the diagonal ideal.

In the particular case of a ringed space $(S, O_S) \in \text{RTop}$, $s_S : O_S \otimes O_S = \Delta_S^*(p_1^*O_S \otimes p_2^*O_S) \to O_S$ is the structural morphism of diagonal embedding $\Delta_S : (S, O_S) \hookrightarrow (S \times S, p_1^*O_S \otimes p_2^*O_S)$, $p_1 : S \times S \to S$ and $p_2 : S \times S \to S$ being the projections. More generally, for $k \in \mathbb{N}$, $k \geq 1$ we have the sheaf of $k$-jets $J^k(O_S) := \Delta_S^k\mathcal{I}_S/\mathcal{I}_S^{k+1}$ with in particular $J^1(O_S) = T_S$. We have, for $s \in \mathcal{S}$, $J^k(O_S)_s = m_s/m^k$ where $m_s \subset O_{S,s}$ is the maximal ideal if $O_{S,s}$ is a local ring.

Definition 46. (i) Let $(\mathcal{S}, O_S) \in \text{RCat}$ with $O_S$ a commutative sheaf of ring and $\mathcal{S}$ is endowed with a topology $\tau$. We denote by

$$D(O_S) = \langle O_S, \text{Der}_{O_S}(O_S, O_S) \rangle \subset a_\tau \mathcal{H}om(O_S, O_S)$$

the subsheaf of ring generated by $O_S$ and the subsheaf of derivations $\text{Der}_{O_S}(O_S, O_S) : = \mathbb{D}_S^0\Omega_{O_S}$, $a_\tau : \text{PSh}(\mathcal{S}) \to \text{Shv}(\mathcal{S})$ being the sheafification functor.

(ii) Let $f : \mathcal{X} \to \mathcal{S}$ be a morphism of site, with $\mathcal{X}, \mathcal{S} \in \text{Cat}$ endowed with topology $\tau$, resp. $\tau'$, and $O_S \in \text{PSh}(\mathcal{S}, e\text{Ring})$ a commutative sheaf of ring. We will note in this case by abuse $f^*O_S := a_\tau f^*O_S$ and $f^*D(O_S) := a_\tau f^*D(O_S)$, $a_\tau : \text{PSh}(\mathcal{X}) \to \text{Shv}(\mathcal{X})$ being the sheafification functor.

Let $f : \mathcal{X} \to \mathcal{S}$ a morphism of site, with $\mathcal{X}, \mathcal{S} \in \text{Cat}$ endowed with topology $\tau$, resp. $\tau'$, and $O_S \in \text{PSh}(\mathcal{S}, e\text{Ring})$ a commutative sheaf of ring. Consider the ringed space $(\mathcal{X}, f^*O_S) := (\mathcal{X}, a_\tau f^*O_S) \in \text{RCat}$, $a_\tau : \text{PSh}(\mathcal{X}) \to \text{Shv}(\mathcal{X})$ being the sheafification functor. Then, the map in $\text{PSh}(\mathcal{X})$

$$T(f, \text{hom})(O_S, O_S) : f^*\mathcal{H}om(O_S, O_S) \to \mathcal{H}om(f^*O_S, f^*O_S)$$

induces a canonical morphism of sheaf of rings

$$T(f, \text{hom})(O_S, O_S) : a_\tau f^*D(O_S) =: f^*D(O_S) \to D(a_\tau f^*O_S) =: D(f^*O_S).$$

In the special case of ringed spaces, we have then:
**Proposition 34.** Let \( f : X \to S \) is a continuous map, with \( X, S \in \text{Top} \) and \( O_S \in \mathbf{PSh}(\mathbf{S}, \mathbf{cRing}) \) a commutative sheaf of ring. Consider the ringed space \( (X, f^*O_S) := (X, a_r f^*O_S) \in \mathbf{RTop} \), \( a_r : \mathbf{PSh}(X) \to \mathbf{Shv}(X) \) being the sheafification functor. Then, the map in \( \mathbf{PSh}(X) \)

\[
T(f, \text{hom})(O_S, O_S) : f^*\text{Hom}(O_S, O_S) \to \text{Hom}(f^*O_S, f^*O_S)
\]

induces a canonical isomorphism of sheaf of rings

\[
T(f, \text{hom})(O_S, O_S) : f^*D(O_S) := a_r f^* D(O_S) \simto D(a_r f^*O_S) =: D(f^*O_S).
\]

**Proof.** For all \( x \in X \),

\[
T(f, \text{hom})(O_S, O_S)_x : (f^*D(O_S))_x \simto D(O_{S,f(x)}) \simto (D(f^*O_S))_x.
\]

Hence, since \( a_r f^* D(O_S) \) and \( D(a_r f^*O_S) \) are sheaves,

\[
T(f, \text{hom})(O_S, O_S) : f^*D(O_S) := a_r f^* D(O_S) \simto D(a_r f^*O_S) =: D(f^*O_S).
\]

is an isomorphism \( \square \)

We will consider presheaves of \( D(O_S) \) modules on a ringed topos \((S, O_S)\):

**Definition 47.** Let \((S, O_S) \in \mathbf{RCat}\) with \( O_S \) a commutative sheaf of ring.

(i) We will consider \( \mathbf{PSh}_{\text{fil}}(O_S) \) the category of presheaves of \((\)left\) \( D(O_S) \) modules on \( S \) and \( C_{D(O_S)}(S) := \mathbf{C}(\mathbf{PSh}_{\text{fil}}(O_S)) \) its category of complexes. We will consider \( \mathbf{PSh}_{\text{ord}, p}(S) \) the category of presheaves of right \( D(O_S) \) modules on \( S \) and \( C_{D(O_S), \text{ord}, p}(S) := \mathbf{C}(\mathbf{PSh}_{\text{ord}, p}(S)) \) its category of complexes. We denote again by abuse

\[
\mathbf{PSh}_{\text{fil}}(O_S) := (\mathbf{PSh}_{\text{fil}}(O_S), F) := (\mathbf{PSh}_{D(O_S), F_{\text{ord}, p}}(S), F)
\]

the category of filtered \( (D(O_S), F_{\text{ord}}) \)-module, with, for \(-p \leq 0\), \( F_{\text{ord}, -p}D(O_S) = \{ P \in D(O_S), \text{ord}(P) \leq p \}\) and \( F_{\text{ord}, p}D(O_S) = 0 \) for \( p > 0 \),

- whose objects are \((M, F) \in \mathbf{PSh}_{O_S}(S), F)\) together with a map of filtered presheaves of \( O_S \) modules \( m_d : (M, F) \otimes_{O_S} D(O_S), F_{\text{ord}} \to (M, F)\), i.e. a map in \( \mathbf{PSh}_{O_S}(S), F\),

- whose morphism \( \phi : (M_1, F) \to (M_2, F) \) as usual the morphisms of presheaves \( \phi : M_1 \to M_2 \) which are morphism of filtered presheaves \((i.e. \phi(F^pM_1) \subset F^p M_2)\) and which are \( D(O_S) \) linear (in particular \( O_S \) linear).

Note that this a \( \text{NOT the category of filtered } D(O_S) \) modules in the usual sense, that is the \((M, F) \in \mathbf{PSh}_{O_S}(S), F)\) together with a map \( m_d : (M, F) \otimes_{O_S} D(O_S) \to (M, F)\) in \( \mathbf{PSh}_{O_S}(S), F\), since \( F_{\text{ord}} \) \( \text{NOT the trivial filtration. More precisely the } O_S \) submodules \( F^p M \subset M \) are \( \text{NOT } D(O_S) \) submodules but satisfy Griffitz transversality. We denote by

\[
\mathbf{PSh}_{D(O_S), 0}(S) \subset \mathbf{PSh}_{D(O_S), 1}(S), \mathbf{PSh}_{D(O_S), 0}(S) \subset \mathbf{PSh}_{D(O_S), 1}(S), \mathbf{PSh}_{D(O_S), 2}(S) := (\mathbf{PSh}_{D(O_S), F_{\text{ord}, p}}(S), F, W)
\]

the full subcategory consisting of filtered \( D(O_S) \) module in the usual sense, resp. the full subcategory such that \( W \) is a filtration by \( D(O_S) \) submodules.

(ii) We denote again by

\[
C_{D(O_S), \text{fil}}(S) \subset \mathbf{C}(\mathbf{PSh}_{D(O_S), F}) , C_{D(O_S), 2\text{fil}}(S) \subset \mathbf{C}(\mathbf{PSh}_{D(O_S), F})
\]

the full subcategory of complexes such that the filtration(s) is (are) regular. We will consider also

\[
C_{D(O_S), 0\text{fil}}(S) \subset C_{D(O_S), \text{fil}}(S) , C_{D(O_S), 1\text{fil}}(S) \subset C_{D(O_S), \text{fil}}(S)
\]

the full subcategory consisting of complexes of filtered \( D(O_S) \) modules in the usual sense \( \text{(i.e. by } D(O_S) \text{ submodule)}\), respectively the full subcategory consisting of complexes of bifilterd \( D(O_S) \) modules such that \( W^p M \subset M \) are \( D(O_S) \) submodules i.e. the filtration \( W \) is a filtration in the usual sense, but NOT \( F \) wich satisfy only Griffitz transversality.
Proposition 35. Let \((S, O_S) \in \text{RCat}\) with a \(O_S\) commutative sheaf of ring.

(i) Let \(M \in \text{PSh}_{O_S}(S)\). Then, there is a one to one correspondence between
- the \(D(O_S)\) module structure on \(M\) compatible with the \(O_S\) module structure, that is the maps \(m_d : D(O_S) \otimes_{O_S} M \to M\) in \(\text{PSh}_{O_S}(S)\) and
- the integrable connections on \(M\), that is the maps \(\nabla : M \to \Omega_{O_S} \otimes_{O_S} M\) satisfying \(\nabla \circ \nabla = 0\) with \(\nabla : \Omega_{O_S} \otimes_{O_S} M \to \Omega^2_{O_S} \otimes_{O_S} M\) given by \(\nabla(\omega \otimes m) = (d\omega) \otimes m + \omega \wedge \nabla(m)\).

(ii) Let \((M, F) \in \text{PSh}_{O_S, fil}(S)\). Then, there is a one to one correspondence between
- the \(D(O_S)\) module structure on \((M, F)\) compatible with the \(O_S\) module structure, that is the maps \(m_d : (D(O_S), F^{ord}) \otimes_{O_S} (M, F) \to (M, F)\) in \(\text{PSh}_{O_S, fil}(S)\) and
- the integrable connections on \(M\), that is the maps \(\nabla : (M, F) \to \Omega_{O_S} \otimes_{O_S} (M, F)\) satisfying \(\nabla \circ \nabla = 0\) and Griffith transversality (i.e. \(\nabla(F^p M) \subset \Omega_{O_S} \otimes_{O_S} F^{p-1}M\)).

Proof. Standard.

The following proposition tells that the \(O\)-tensor product of \(D\) modules has a canonical structure of \(D\) module.

Definition-Proposition 13. (i) Let \(f : (X, O_X) \to (S, O_S)\) a morphism with \((X, O_X), (S, O_S) \in \text{RCat}\) with commutative structural sheaf of ring. For \(N \in \text{PSh}_{O_X, D(f^*O_S)}(X)\) and \(M \in \text{PSh}_{O_X, D(f^*O_S)}(X)\), \(N \otimes_{O_X} M\) has the canonical \(D(f^*O_S)\) module structure given by, for \(X^o \in X\),

\[\gamma \in \Gamma(X^o, D(f^*O_S)), m \in \Gamma(X^o, M), n \in \Gamma(X^o, N), \quad \gamma.(n \otimes m) = (\gamma.n) \otimes m + n \otimes (\gamma.m).\]

This gives the functor

\[\text{PSh}_{O_X, D(f^*O_S)}(X) \times \text{PSh}_{O_X, D(f^*O_S)}(X) \to \text{PSh}_{O_X, D(f^*O_S)}(X), ((M, F), (N, F)) \mapsto (M, F) \otimes_{O_X} (N, F), F^p(M, F) \otimes_{O_X} (N, F) := \text{Im}(\oplus_{q \in \mathbb{Z}} F^q M \otimes_{O_X} F^{p-q} N \to M \otimes_{O_X} N)\]

(ii) Let \(f : (X, O_X) \to (S, O_S)\) a morphism with \((X, O_X), (S, O_S) \in \text{RCat}\) with commutative structural sheaf of ring. For \(N \in \text{C}_{D(O_X), D(f^*O_S)}(X)\) and \(M \in \text{C}_{D(O_X), D(f^*O_S)}(X)\), \(N \otimes_{D(O_X)} M\) has the canonical \(f^*D(O_S)\) module structure given by, for \(X^o \in X\),

\[\gamma \in \Gamma(X^o, D(f^*O_S)), m \in \Gamma(X^o, M), n \in \Gamma(X^o, N), \quad \gamma.(n \otimes m) = (\gamma.n) \otimes m.\]

This gives the functor

\[\text{C}_{D(O_X), D(f^*O_S)}(X) \times \text{C}_{D(O_X), D(f^*O_S)}(X) \to \text{C}_{D(O_X), D(f^*O_S)}(X), ((M, F), (N, F)) \mapsto (M, F) \otimes_{D(O_X)} (N, F), F^p(M, F) \otimes_{D(O_X)} (N, F) := \text{Im}(\oplus_{q \in \mathbb{Z}} F^q M \otimes_{D(O_X)} F^{p-q} N \to M \otimes_{D(O_X)} N)\]

Note that, by definition, we have for \((M, F) \in \text{PSh}_{D(O_S)}(S)\), the canonical isomorphism

\[(M, F) \otimes_{D(O_S)} (D(O_S), F^{ord}) \cong (M, F), m \otimes P \mapsto Pm, m \mapsto (m \otimes 1)\]

Proof. Immediate from definition.

We now look at the functorialites for morphisms of ringed spaces, using proposition 35. First note that for \(f : (X, O_X) \to (S, O_S)\) a morphism, with \((X, O_X), (S, O_S) \in \text{RTop}\) with structural presheaves commutative sheaves of rings, there is NO canonical morphism between \(D(f^*O_S) = f^*D(O_S)\) (see Proposition 34) and \(D(O_X)\).

We have the pullback functor for (left) \(D\)-modules:
Definition-Proposition 14. (i) Let \( f : (X, O_X) \to (S, O_S) \) a morphism with \( (X, O_X), (S, O_S) \in \text{RTop} \) with structural presheaves commutative sheaves of rings. Recall that \( f^* D(O_S) = D(f^* O_S) \) in this case. Then for \((M, F) \in \text{PSh}_{D(O_S)}(S)\),

\[
 f^{*\text{mod}}(M, F) := (O_X, F_0) \otimes_{f^* O_S} f^*(M, F) \in \text{PSh}_{O_X} f_{\text{il}}(X)
\]

has a canonical structure of filtered \( D(O_X) \) module given by

for \( \gamma \in \Gamma(X^o, T_{O_X}) \), \( n \otimes m \in \Gamma(X^o, O_X \otimes_{f^* O_S} f^* M) \), \( \gamma.(n \otimes m) := (\gamma.n) \otimes m + n \otimes df(\gamma)(m) \)

with \( df := D_S^g \Omega_{O_X/f^* O_S} : T_{O_X} \to T_{f^* O_S} = f^* T_{O_S} \) and \( f^*(M, F) \in \text{PSh}_{f^* D(O_S)} f_{\text{il}}(X) = \text{PSh}_{D(f^* O_S)} f_{\text{il}}(X) \).

(ii) More generally, let \( f : (X, O_X) \to (S, O_S) \) a morphism with \( (X, O_X), (S, O_S) \in \text{RCat} \) with structural presheaves commutative sheaves of rings. Assume that the canonical morphism \( T(f, \text{hom})(O_S, O_S) : f^* D(O_S) \to D(f^* O_S) \) is an isomorphism of sheaves. Then for \((M, F) \in \text{PSh}_{D(O_S)}(S)\),

\[
 f^{*\text{mod}}(M, F) := (O_X, F_0) \otimes_{f^* O_S} f^*(M, F) \in \text{PSh}_{O_X} f_{\text{il}}(X)
\]

has a canonical structure of filtered \( D(O_X) \) module given by

for \( \gamma \in \Gamma(X^o, T_{O_X}) \), \( n \otimes m \in \Gamma(X^o, O_X \otimes_{f^* O_S} f^* M) \), \( \gamma.(n \otimes m) := (\gamma.n) \otimes m + n \otimes df(\gamma)(m) \)

with \( df := D_S^g \Omega_{O_X/f^* O_S} : T_{O_X} \to T_{f^* O_S} = f^* T_{O_S} \) and \( f^*(M, F) \in \text{PSh}_{f^* D(O_S)} f_{\text{il}}(X) = \text{PSh}_{D(f^* O_S)} f_{\text{il}}(X) \).

Proof. Standard. \( \Box \)

Remark 6. • Let \( f : (X, O_X) \to (S, O_S) \) a morphism with \( (X, O_X), (S, O_S) \in \text{RTop} \) with structural presheaves commutative sheaves of rings. Recall that \( f^* D(O_S) = D(f^* O_S) \). Then by definition \( f^{*\text{mod}}(O_X, F_0) = (O_X, F_0) \).

• More generally, let \( f : (X, O_X) \to (S, O_S) \) a morphism with \( (X, O_X), (S, O_S) \in \text{RCat} \) with structural presheaves commutative sheaves of rings. Assume that the canonical morphism \( T(f, \text{hom})(O_S, O_S) : f^* D(O_S) \to D(f^* O_S) \) is an isomorphism of sheaves. Then by definition \( f^{*\text{mod}}(O_X, F_0) = (O_X, F_0) \).

For the definition of a push-forward functor for a right \( D \) module we use the transfert module

\[
 f : (X, O_X) \to (S, O_S)\) be a morphism with \( (X, O_X), (S, O_S) \in \text{RTop} \) with structural presheaves commutative sheaves of rings. Then, the transfer module is

\[
 (D(O_X \to f^* O_S), F_{\text{ord}}) := f^{*\text{mod}}(D(O_S), F_{\text{ord}}) := f^*(D(O_S), F_{\text{ord}}) \otimes_{f^* O_S} (O_X, F_0)
\]

which is a left \( D(O_X) \) module and a left and right \( f^* D(O_S) = D(f^* O_S) \) module.

Lemma 5. Let \( f_1 : (X, O_X) \to (Y, O_Y), f_2 : (Y, O_Y) \to (S, O_S) \) be two morphism with \( (X, O_X), (Y, O_Y), (S, O_S) \in \text{RTop} \). We have in \( C_{D(O_X) \cap f^* f_{\text{il}}(X)} \)

\[
 (D_{O_X \to f_2 f_1^* O_S}, F_{\text{ord}}) = f_1^*(D_{O_Y \to f_1^* O_S}, F_{\text{ord}}) \otimes_{f_1^* D(O_Y), f_{\text{ord}}} (D_{O_X \to f_1^* O_Y}, F_{\text{ord}})
\]

Proof. Follows immediately from definition. \( \Box \)

For right \( D \) module, we have the direct image functor:

Definition 48. Let \( f : (X, O_X) \to (S, O_S) \) a morphism with \( (X, O_X), (S, O_S) \in \text{RTop} \) with structural presheaves commutative sheaves of rings. Then for \((M, F) \in C_{D(O_X)} f_{\text{il}}(X)\), we define

\[
 f^{00}_{*\text{mod}}(M, F) = f_*(D_{O_X \to f^* O_S}, F_{\text{ord}} \otimes_{D(O_X)} (M, F)) \in C_{D(O_S)} f_{\text{il}}(S)
\]

For a closed embedding of topological spaces, there is the \( V \)-filtration on the structural sheaf, it will play an important role in this article
Definition 49. (i) Let \((S,O_S)\) ∈ 𝑅𝑇𝐨𝐩 a locally ringed space. Let \(Z = V(I_Z) \subset S\) a Zariski closed subset. We set, for \(S^o \subset S\) an open subset, \(p \in \mathbb{Z}\),

- \(V_{Z,p}O_S(S^o) := O_S(S^o)\) if \(p > 0\),
- \(V_{Z,-q}O_S(S^o) := \mathcal{I}_Z^q(S^o) \subset O_S(S^o)\) for \(p = -q \leq 0\).

We immediately check that, by definition, this filtration satisfy Griffitz transversality, that is \((O_S, V_Z) \in \text{PSh}_{D(O_S)_{fil}}(S)\). For a morphism \(g : ((T, O_T), Z') \rightarrow ((S, O_S), Z)\) with \(((T, O_T), Z), ((S, O_S), Z) \in \text{RTop}^2\) locally ringed spaces, where \(Z\) and \(Z'\) are Zariski closed subsets, the structural morphism \(a_g : g^*O_S \rightarrow O_T\) is given by

\[
a_g : g^*(O_S, V_Z) \rightarrow (O_T, V_{Z'}), \quad h \mapsto a_g(h)
\]

(ii) Let \((S, O_S) \in \text{RTop}\). Let \(i : Z \hookrightarrow S\) a closed embedding. The \(V_Z\)-filtration on \(O_S\) (see (i)) gives the filtration, given by for \(p \in \mathbb{Z}\),

\[
V_{Z,p} \text{Hom}(O_S, O_S) := \left\{ P \in \text{Hom}(O_S, O_S), \text{ s.t. } P\mathcal{T}_Z^k \subset \mathcal{T}_Z^{k-p} \right\}
\]

on \(\text{Hom}(O_S, O_S)\), which induces the filtration \(V_{Z,p}D_S := D_S \cap V_{Z,p} \text{Hom}(O_S, O_S)\) on \(D_S \subset \text{Hom}(O_S, O_S)\). We get \((D_S, V_Z) \in \text{PSh}_{fil}(S, \text{Ring})\) and we call it the \(V_Z\)-filtration on \(D_S\).

(iii) Let \((S, O_S) \in \text{RTop}\) a locally ringed space. Let \(i : Z = V(I_Z) \hookrightarrow S\) a Zariski closed embedding and \(O_Z := i^*O_S/I_Z\). We say that \((M, F) \in \text{PSh}_{D(O_S)_{fil}}(S)\) is specializable on \(Z\) if it admits an (increasing) filtration (called a \(V_Z\)-filtration) \((M, F, V) \in \text{PSh}_{D(O_S)_{fil}}(S)\) compatible with \((D_S, V_Z)\), that is \(V_{Z,p}D_S, Vq M \subset V_{p+q}M\).

(iii)' Under certain hypothesis, a \(V_Z\)-filtration on \((M, F)\) if it exist is unique in this case we denote \((M, F, V) \in \text{PSh}_{D(O_S)_{fil}}(S)\). If \(m : (M_1, F) \rightarrow (M_2, F)\) is a morphism, with \((M_1, F), (M_2, F) \in \text{PSh}_{D(O_S)_{fil}}(S)\) admiring a unique \(V_Z\) filtration, we have \(m(V_{Z,p}F, M_1) \subset V_{Z,p}F, M_2\), that is we get a morphism \(m : (M_1, F, V_Z) \rightarrow (M_2, F, V_Z)\). See proposition \(\text{X}9\) for the particular case of smooth complex algebraic varieties we will be mainly interested with.

(iv) Let \((S, O_S) \in \text{RTop}\) a locally ringed space. Let \(i : Z = V(I_Z) \hookrightarrow S\) a Zariski closed embedding and \(O_Z := i^*O_S/I_Z\). For \((M, F) \in \text{PSh}_{D(O_S)_{fil}}(S)\) is specializable on \(Z\), consider for a \(V_Z\) filtration \((M, F, V) \in \text{PSh}_{D(O_S)_{fil}}(S)\), the quotient map in \(\text{PSh}_{O_S_{fil}}(S)\)

\[
q_{\text{v}_0} : (M, F) \rightarrow (M, F)/V_{<0}(M, F) =: \text{Gr}_{V_{<0}}(M, F).
\]

Since by definition \(I_ZV_{<0}(M, F) \subset V_{<0}(M, F)\), \(q_{\text{v}_0}\) factors trough in \(\text{PSh}_{I^*O_S_{fil}}(Z)\)

\[
i^*q_{\text{v}_0} : i^*(M, F) \rightarrow i^*\text{Gr}_{V_{<0}}(M, F)
\]

where

\[
- q_Z : (M, F) = (M, F) \otimes_{O_S} O_S \rightarrow (M, F) \otimes_{O_S} i_*O_Z\text{ is the quotient map, which is given by for } S^o \subset S \text{ an open subset and } m \in \Gamma(S^o, M), q_Z(m) := m \otimes 1,
\]

\[
- \text{sp}_{V}(M, F) : i^*\text{mod}(M, F) \rightarrow i^*\text{Gr}_{V_{<0}}(M, F)\text{ is given by for } S^o \subset S \text{ an open subset, } m \in \Gamma(S^o, M) \text{ and } h \in \Gamma(S^o, i_*O_Z),
\]

\[
\text{sp}_{V}(M, F)(m \otimes h) := h q_{\text{v}_0}(m) = q_{\text{v}_0}(hm),
\]

where \(\hat{h} \in \Gamma(S^o, O_S)\) is lift of \(h\), and of course \(\text{sp}_{V}(M, F) : i^*\text{mod}(M, F) \rightarrow i^*\text{Gr}_{V_{<0}}(M, F)\) is unique in \(\text{PSh}_{I^*O_S_{fil}}(Z)\) such that \(i^*q_{\text{v}_0} = \text{sp}_{V}(M, F) \circ i^*q_Z\) since \(q_Z\) is surjective.
The quotient $i^* \mathrm{Gr}_{V,0}(M,F)$ has a structure of $D_Z$ module since for $S^0 \subset S$ an open subset and $\partial_z \in \Gamma(Z \cap S^0, T_Z) \subset \Gamma(S^0, T_Z)$, we have $\partial_z \in \Gamma(S, V_{Z,S,O})$ since for $f = \sum_{i=1}^r t_i h_i \in \Gamma(S^0, I_Z)$, where $(t_i) = I_Z(S^0)$ are generators of the ideal $I_Z(S^0) \subset O_S(S^0)$ and $h_i \in \Gamma(S^0, O_S)$, we have

$$
\partial_z(\sum_{i=1}^r t_i h_i) = \sum_{i=1}^r (\partial_z(t_i) h_i + t_i \partial_z(h_i)) = \sum_{i=1}^r t_i (\partial_z(h_i)) \in \Gamma(S, I_Z)
$$

as $\partial_z(t_i) = 0$ (only the vector field of $T_{O_S}$ which are transversal to $T_{O_Z} \subset T_{O_S}$ increase the grading). Then, obviously, by definition,

$$
sp_{V}(M,F) : i^* \mathrm{mod}(M,F) \to i^*(M,F)/V_{<0}(M,F) =: i^* \mathrm{Gr}_{V,0}(M,F)
$$

is $D(O_Z)$ linear, i.e. is a map in $\mathrm{PSh}_{D(O_Z),fil}(Z)$ and we call it the specialization map.

**Definition-Proposition 15.** Let $(S, O_S) \in \mathrm{RTop}$ a locally ringed space. Consider a commutative diagram

$$
\begin{align*}
Z_1 &= V(I_1) \xrightarrow{i_1} (S, O_S) \\
Z &= V(I) \xrightarrow{i_2} Z_2 = V(I_2)
\end{align*}
$$

where the maps are Zariski closed embeddings and which is cartesian (i.e. $I = (I_1, I_2)$, in particular $Z = Z_1 \cap Z_2$).

(i) Let $(M, F) \in \mathrm{PSh}_{D(O_Z),fil}(S)$ admitting a unique $V_Z$-filtration, a unique $V_{Z_1}$-filtration and a unique $V_{Z_2}$-filtration (see definition $[49]$). Let $p, q \in \mathbb{Z}$. Then

- $\mathrm{Gr}_{V_{Z_1},p}(M,F)$ is a $D(O_{Z_1})$ admitting a unique $V_{Z_1}$-filtration,
- $\mathrm{Gr}_{V_{Z_2},q}(M,F)$ is a $D(O_{Z_2})$ admitting a unique $V_{Z_2}$-filtration,

and the quotient map in $\mathrm{PSh}_{O_Z,fil}(S)$

$$
q_{V_{Z_1},p} : \mathrm{Gr}_{V_{Z_1},q}(M,F) \rightarrow \mathrm{Gr}_{V_{Z_2},q}(M,F)
$$

factors trough

$$
q_{V_{Z_1}} : \mathrm{Gr}_{V_{Z_1},q}(M,F) \xrightarrow{q_{V_{Z_2},p}} \mathrm{Gr}_{V_{Z_2},p}(M,F) \xrightarrow{G_{Z_1,Z_2}^{p,q}(M,F)} \mathrm{Gr}_{V_{Z_2},q}(M,F)
$$

and $G_{Z_1,Z_2}^{p,q}(M,F)$ is an isomorphism in $\mathrm{PSh}_{D(O_Z),fil}(S)$.

(ii) If $m : (M_1, F) \rightarrow (M_2, F)$ is a morphism with $(M_1, F), (M_2, F) \in \mathrm{PSh}_{D(O_S),fil}(S)$ admitting a unique $V_Z$-filtration, a unique $V_{Z_1}$-filtration and a unique $V_{Z_2}$-filtration (see definition $[49]$). Then for all $p, q \in \mathbb{Z}$ the following diagram commutes

$$
\begin{align*}
\mathrm{Gr}_{V_{Z_1},p} \mathrm{Gr}_{V_{Z_2},q}(M_1, F) &\xrightarrow{G_{Z_1,Z_2}^{p,q}(M,F)} \mathrm{Gr}_{V_{Z_2},q}(M_1, F) \\
\mathrm{Gr}_{V_{Z_1},p} \mathrm{Gr}_{V_{Z_2},q}(M_2, F) &\xrightarrow{G_{Z_1,Z_2}^{p,q}(M_2,F)} \mathrm{Gr}_{V_{Z_2},q}(M_2, F)
\end{align*}
$$

Let $(S, O_S) \in \mathrm{RTop}$ a locally ringed space. Consider a commutative diagram

$$
\begin{align*}
Z_1' &= V(I_1') \xrightarrow{i_1} Z_1 = V(I_1) \xrightarrow{i_1} (S, O_S) \\
Z' &= V(I') \xrightarrow{i_2} Z = V(I) \xrightarrow{i_2} Z_2 = V(I_2)
\end{align*}
$$

111
where the maps are Zariski closed embeddings and whose squares are cartesian (i.e. \( I = (I_1, I_2) \) and \( I' = (I'_1, I'_2) \), in particular \( Z = Z_1 \cap Z_2 \) and \( Z' = Z'_1 \cap Z \). Let \((M, F) \in \text{PSh}_{D(O_S)}(S)\) admitting a unique \( V_Z \)-filtration, a unique \( V_{Z_1} \)-filtration a unique \( V_{Z_2} \)-filtration, and a unique \( V_{Z_2} \)-filtration (see definition \[49\]). Then for all \( p, q \in \mathbb{Z}, \text{Gr}_{V_{Z'_1}, p} \text{Gr}_{V_{Z'_2}, p}(M, F) = \text{Gr}_{V_{Z'_1}, p}(M, F) \) and

\[
G^{p,q}_{Z'_1, Z'_2}(G^{p,q}_{Z_1, Z_2}(M, F)) = G^{p,q}_{Z'_1, Z'_2}(M, F)
\]

Proof. Obvious.

We will also consider the following categories

**Definition 50.** Let \((X, O_X) \in \text{RCat}\). We denote by \(C_{O_X \text{fil}, D(O_X)}(X)\) the category

- whose objects \((M, F) \in C_{O_X \text{fil}, D(O_X)}(X)\) are filtered complexes of presheaves of \(O_X\) modules \((M, F) \in C_{O_X \text{fil}}(X)\) whose cohomology presheaves \(H^n(M, F) \in \text{PSh}_{O_X \text{fil}}(X)\) are endowed with a structure of filtered \(D(O_X)\) modules for all \(n \in \mathbb{Z}\).

- whose set of morphisms \(\text{Hom}_{C_{O_X \text{fil}, D(O_X)}(X)}((M, F), (N, F)) \subseteq \text{Hom}_{C_{O_X \text{fil}}(X)}((M, F), (N, F))\) between \((M, F), (N, F) \in C_{O_X \text{fil}, D(O_X)}(X)\) are the morphisms of filtered complexes of \(O_X\) modules \(m: (M, F) \to (N, F)\) such that \(H^n m: H^n(M, F) \to H^n(N, F)\) is \(D(O_X)\) linear, i.e. is a morphism of (filtered) \(D(O_X)\) modules, for all \(n \in \mathbb{Z}\).

### 4.1.2 The De Rham complex of a (left) filtered D-module and the Spencer complex of a right filtered D-module

Using proposition \[55\] we define the filtered De Rham complex of a complex of filtered (left) D-modules:

**Definition 51.**

1. Let \((S, O_S) \in \text{RCat} with O_S\) commutative. Let \((M, F) \in C_{D(O_S) \text{fil}}(S)\). By proposition \[55\], we have the complex

\[
\text{DR}(O_S)(M, F) := (\Omega^*_{O_S}, F_b) \otimes_{O_S} (M, F) \in C_{\text{fil}}(S)
\]

where differentials are \(d(\omega \otimes m) = (d\omega) \otimes m + \omega \wedge (\nabla m)\).

2. More generally, let \(f: (X, O_X) \to (S, O_S)\) with \((X, O_X), (S, O_S) \in \text{RCat}\). The quotient map \(q: \Omega_{O_X} \to \Omega_{O_X / f^*O_S}\) induce, for \(G \in \text{PSh}_{O_X}(X)\) the quotient map

\[
q^p(G) := \wedge^p q \otimes I\Omega^p_{O_X} \otimes_{O_X} G \to \Omega^p_{O_X / f^*O_S} \otimes_{O_X} G.
\]

Let \((M, F) \in C_{D(O_S) \text{fil}}(X)\). By proposition \[55\] we have the relative De Rham complex

\[
\text{DR}(O_X / f^*O_S)(M, F) := (\Omega^*_{X/S}, F_b) \otimes_{O_X} (M, F) \in C_{f^*O_S \text{fil}}(X)
\]

where differentials are \(d(q^p(M)(\omega \otimes m)) = q^{p+1}(M)((d\omega) \otimes m) + q^{p+1}(M)(\omega \otimes (\nabla m))\).

3. Let \((X, O_X) / F \in \text{FolRTop}\), that is \((X, O_X) \in \text{RTop}\) endowed with a foliation with quotient map \(q: \Omega_{O_X} \to \Omega_{O_X / F}\). Let \((M, F) \in C_{D(O_X) \text{fil}}(X)\). By proposition \[55\] we have the foliated De Rham complex

\[
\text{DR}(O_X / F)(M, F) := (\Omega^*_{X/F}, F_b) \otimes_{O_X} (M, F) \in C_{\text{fil}}(X)
\]

where differentials are \(d(q(M)(\omega \otimes m)) = q(M)((d\omega) \otimes m) + q(M)(\omega \otimes (\nabla m))\).

By definition,

- with the notation of (ii) if \(\phi: (M_1, F) \to (M_2, F)\) is a morphism in \(C_{D(O_X) \text{fil}}(X)\),

\[
\text{DR}(O_X / f^*O_S)(\phi) := (I \otimes \phi) : (\Omega^*_{X/S}, F) \otimes_{O_X} (M_1, F) \to (\Omega^*_{X/S}, F) \otimes_{O_X} (M_2, F)
\]

is a morphism in \(C_{f^*O_S \text{fil}}(X)\).
• with the notation of (ii) \( DR(O_X)(O_X) = DR(O_X) \) and more generally in the relative case \( DR(O_X/f^*O_S)(O_X) = DR(O_X/f^*O_S) \), and with the notation of (iii) \( DR(O_X/F)(O_X) = DR(O_X/F) \).

Dually, we have the filtered Spencer complex of a complex of filtered right \( D \)-module:

**Definition 52.**

(i) Let \( (S,O_S) \in \text{RCat} \) with \( O_S \) commutative. Let \( (M,F) \in C_{D(O_S)^{op}fil}(S) \). By proposition 52, we have the complex

\[
SP(O_S)(M,F) := (T_{O_S}^\bullet, F_b) \otimes_{O_S} (M,F) \in C_{fil}(S)
\]

whose differentials are, for \( X \in S \), and \( \partial_1 \wedge \cdots \wedge \partial_r \otimes m \in \Gamma(X, T_{O_S}^{\otimes r-1} \otimes_{O_S} M) \),

\[
d(\partial_1 \wedge \cdots \wedge \partial_r \otimes m) : (\omega \in \Gamma(X, \Omega_{O_S}^{\otimes r-1})) \rightarrow \sum_i \omega(\partial_1 \wedge \cdots \wedge \partial_i \cdots \wedge \partial_r) m - \sum_{i<j} \omega([\partial_i, \partial_j]) m.
\]

(ii) More generally, let \( f : (X,O_X) \rightarrow (S,O_S) \) with \( (X,O_X),(S,O_S) \in \text{RCat} \). The quotient map \( q : \Omega_{O_X} \rightarrow \Omega_{O_X/f^*O_S} \) induce, for \( G \in \text{PSh}_O(X) \) the injective map

\[
q^\vee \circ p(G) := \wedge q^\vee \otimes I : T_{O_X/f^*O_S}^0 \otimes_{O_X} G \rightarrow T_{O_X}^0 \otimes_{O_X} G.
\]

Let \( (M,F) \in C_{D(O_X)^{op}fil}(X) \). By proposition 52, we have the relative Spencer complex

\[
SP(O_X/f^*O_S)(M,F) := (T_{X/S}^\bullet, F_b) \otimes_{O_X} (M,F) \in C_{f^*O_Sfil}(X)
\]

whose differentials are the one of \( SP(O_X)(M,F) \) given in (i) by the embedding \( q^\vee : SP(O_X/f^*O_S)(M,F) \hookrightarrow SP(O_X)(M,F) \).

(iii) Let \( (X_O,F) \in \text{FolRTop} \), that is \( (X,O_X) \in \text{RTop} \) endowed with a foliation with quotient map \( q : \Omega_{O_X} \rightarrow \Omega_{O_X/F} \). Let \( (M,F) \in C_{D(O_X)^{op}fil}(X) \). By proposition 52, we have the foliated Spencer complex

\[
SP(O_X/F)(M,F) := (T_{X/S}^\bullet, F_b) \otimes_{O_X} (M,F) \in C_{fil}(X)
\]

whose differentials are of \( SP(O_X/F)(M,F) \) given in (i) by the embedding \( q^\vee : SP(O_X/F)(M,F) \hookrightarrow SP(O_X)(M,F) \).

By definition, with the notation of (ii) if \( \phi : (M_1,F) \rightarrow (M_2,F) \) is a morphism in \( C_{D(O_X)^{op}fil}(X) \),

\[
SP(O_X/f^*O_S)(\phi) := (I \otimes \phi) : (T_{X/S}^\bullet, F_b) \otimes_{O_X} (M_1,F) \rightarrow (T_{X/S}^\bullet, F_b) \otimes_{O_X} (M_2,F)
\]

is a morphism in \( C_{f^*O_Sfil}(X) \).

**Proposition 36.**

(i) Let \( f : (X,O_X) \rightarrow (S,O_S) \) a morphism with \( (S,O_S),(X,O_X) \in \text{RTop} \). Assume that the canonical map \( T(f,\text{hom})(O_X,O_X) : f^*D(O_X) \rightarrow D(f^*O_X) \) is an isomorphism of sheaves. For \( (M,F) \in C_{D(O_X)^{op}f^{*'}D(O_S)^{f^{*'}fil}(X)} \) and \( (M',F),(N,F) \in C_{D(O_X)^{fil}(X)} \), we have canonical isomorphisms in \( C_{f^{*'}O_Sfil}(X) \):

\[
(M',F) \otimes_{O_X} (N,F) \otimes_{D(O_X)} (M,F) = (M',F) \otimes_{D(O_X)} ((M,F) \otimes_{O_X} (N,F))
\]

\[
= ((M',F) \otimes_{O_X} (M,F)) \otimes_{D(O_X)} (N,F)
\]

(ii) Let \( f : (X,O_X) \rightarrow (S,O_S) \) a morphism with \( (S,O_S),(X,O_X) \in \text{RTop} \). For \( (M,F) \in C_{D(O_X)^{fil}(X)} \), we have a canonical isomorphisms of filtered \( f^*O_S \) modules, i.e. isomorphisms in \( C_{f^*O_Sfil}(X) \),

\[
(\Omega_{O_X/f^*O_S}^*, F_b) \otimes_{O_X} (M,F) = ((\Omega_{O_X/f^*O_S}^*, F_b) \otimes_{O_X} D(O_X)) \otimes_{D(O_X)} (M,F)
\]

**Proof.** These are standard fact of algebra.
Definition-Proposition 16. \textit{Consider a commutative diagram in RCat} \[ D = (\mathcal{X}, O_X) \xymatrix{ \ar[r]^-{f} & (\mathcal{S}, O_S) \ar[d]^-{g} \ar@{^{(}->}[r]_-{g'} & (T, O_T) \ar[d]^-{g} \ar@{^{(}->}[r]_-{g'} & (\mathcal{X}', O_{X'}) \ar[r]^-{f'} & (\mathcal{T}', O_{T'}) } \] with commutative structural sheaf of rings. Assume that the canonical map \( T(g', \text{hom})(O_X, O_X) : g^* D(O_X) \to D(g^* O_X) \) is an isomorphism of sheaves.

(i) For \((M, F) \in \text{PSh}_{g^* O_X}(\mathbb{N} \times \mathcal{X}), \) the graded map in \( \text{PSh}_{g^* O_X}(\mathbb{N} \times \mathcal{X}), F) \)
\[ \Omega_{(O_{X'}, g'^* O_X)/(O_T, g^* O_S)}(M, F) := m' \circ (\Omega_{(O_{X'}, g'^* O_X)/(O_T, g^* O_S)} \otimes I) : g'^*(((\Omega_{O_X/f^* O_S}, F_b) \otimes O_X (M, F)) \to (\Omega_{O_{X'}/f'^* O_T}, F_b) \otimes O_{X'}, g'^* \text{mod}(M, F) \]
given in degree \( p \in \mathbb{N} \) by, for \( X^o \in \mathcal{X}' \) and \( X^o \in \mathcal{X} \) such that \( g^* (X^o) \to X^o, \)
\[ \Omega^p_{(O_{X'}, g'^* O_X)/(O_T, g^* O_S)}(M)(X^o) := m' \circ (\Omega^p_{(O_{X'}, g'^* O_X)/(O_T, g^* O_S)} \otimes I)(X^o) : \]
\( \omega \otimes m \in \Gamma(X^o, \Omega^p_{O_X} \otimes O_X M) \to \Omega^p_{O_{X'}/g'^* O_X}(\omega) \otimes (m \otimes 1) \)
is a map of complexes, that is a map in \( C_{(f^g)^* O_S} \text{fil}(\mathcal{X}'). \)

(ii) For \((M, F) \in C_{D(O_X) \text{fil}}(\mathcal{X}), \) we get from (i) by functoriality, the map in \( C_{D(O_X) \text{fil}}(\mathcal{X}') \)
\[ \Omega_{(O_{X'}, g'^* O_X)/(O_T, g^* O_S)}(M, F) := m' \circ (\Omega_{(O_{X'}, g'^* O_X)/(O_T, g^* O_S)} \otimes I) : g'^*(((\Omega_{O_X/f^* O_S}, F_b) \otimes O_X (M, F)) \to (\Omega_{O_{X'}/f'^* O_T}, F_b) \otimes O_{X'}, g'^* \text{mod}(M, F) \]

(iii) For \((M, F) \in C_{D(O_X) \text{fil}}(\mathcal{X}), \) we get from (ii) the canonical transformation map in \( C_{O_T \text{fil}(T)} \)
\[ T^q(D)(M, F) : g'^* \text{mod}(f_* E((\Omega^p_{O_X} \otimes O_X (M, F))) \to T_{g'^* E}(-)(-)^q T(D)(E(\Omega^p_{O_X} \otimes O_X M)(M, F))) \]
\[ (f'_* E((\Omega^p_{O_X} \otimes O_X (M, F))) \otimes g^* O_T \to f'_* E((\Omega^p_{O_X' \otimes O_T}, F_b) \otimes O_{X'}, g'^* \text{mod}(M, F)) \]
with \( m(n \otimes s) = s.n. \)

Proof. (i): We check that the map in \( \text{PSh}_{g^* O_X}(\mathbb{N} \times \mathcal{X}), F) \)
\[ \Omega_{(O_{X'}, g'^* O_X)/(O_T, g^* O_S)}(M, F) := m' \circ (\Omega_{(O_{X'}, g'^* O_X)/(O_T, g^* O_S)} \otimes I) : g'^*(((\Omega_{O_X/f^* O_S}, F_b) \otimes O_X (M, F)) \to (\Omega_{O_{X'}/f'^* O_T}, F_b) \otimes O_{X'}, g'^* \text{mod}(M, F) \]
is a map in \( C_{(f^g)^* O_S} \text{fil}(\mathcal{X}'). \) But we have, for \( X^o \in \mathcal{X}' \) the following equality in \( \Gamma(X^o, \Omega^p_{O_X} \otimes O_X, g'^* \text{mod} M) \)
\[ d(\Omega^p_{(O_{X'/} g'^* O_X)/(O_T, g^* O_S)}(M)(\omega \otimes m)) := d(\Omega^p_{O_{X'/} g'^* O_X}(\omega) \otimes (m \otimes 1)) \]
\[ = d(\Omega^p_{O_{X'/} g'^* O_X}(\omega) \otimes (m \otimes 1)) + \Omega^p_{O_{X'/} g'^* O_X}(\omega) \otimes \nabla (m \otimes 1) \]
\[ = \Omega^p_{O_{X'/} g'^* O_X}(d\omega) \otimes (m \otimes 1) + \Omega^p_{O_{X'/} g'^* O_X}(\omega) \otimes \nabla (m \otimes 1) \]
\[ = \Omega^p_{O_{X'/} g'^* O_X}(d\omega) \otimes (m \otimes 1) + \Omega^p_{O_{X'/} g'^* O_X}(\omega) \otimes \nabla (m \otimes 1) \]
\[ = \Omega^p_{(O_{X'/} g'^* O_X)/(O_T, g^* O_S)}(M)(d\omega) + m \otimes \nabla (m) \]
\[ = \Omega^p_{(O_{X'/} g'^* O_X)/(O_T, g^* O_S)}(M)(d\omega) + m \otimes \nabla (m) \]

114
since for $\varphi \in T_{O_X}(X')$,

$$\nabla_{\varphi}(m \otimes 1) = \nabla_{d\varphi(\varphi)}(m) \otimes 1 + m \otimes \nabla_{\varphi} 1 = \nabla_{d\varphi(\varphi)}(m) \otimes 1 :$$

see in definition-proposition [14] the definition of the $D(O_{X'})$ module structure on the $O_{X'}$ module $g'^* M := g'^* M \otimes g'^* O_{X'}$.

(ii) and (iii): There is nothing to prove.  

**Remark 7.** Consider a commutative diagram in $\text{RCat}$

$$D = (\mathcal{X}, O_{\mathcal{X}}) \xrightarrow{f} (\mathcal{S}, O_{\mathcal{S}}).$$

Assume that the canonical map $T(g'^* \text{hom})(O_{\mathcal{X}}, O_{\mathcal{X}}) : g'^* D(O_{\mathcal{X}}) \to D(g'^* O_{\mathcal{X}})$ is an isomorphism of sheaves. Under the canonical isomorphism $(-) \otimes 1 : (\mathcal{O}_{\mathcal{X}/f^* O_{\mathcal{S}}}, F_b) \xrightarrow{\sim} (\mathcal{O}_{\mathcal{X}/f^* O_{\mathcal{S}}}, F_b) \otimes O_{\mathcal{X}}(O_X, F_b)$, we have (see definition-proposition [14] and definition [1])

- $\Omega_{(O_{\mathcal{X}'}/g'^* O_{\mathcal{X}})/\text{R}(g'^* O_{\mathcal{S}})}(O_{\mathcal{X}}) = \Omega_{(O_{\mathcal{X}'}/g'^* O_{\mathcal{X}})/\text{R}(g'^* O_{\mathcal{S}})} : g'^* \mathcal{O}_{\mathcal{X}/f^* O_{\mathcal{S}}} \to \mathcal{O}_{\mathcal{X}'}/f'^* O_{\mathcal{T}}$
- $\mathcal{T}_\omega^*(D)(O_{\mathcal{X}}) = \mathcal{T}_\omega^*(D) : g'^* \text{mod} L_O(f, E(\mathcal{O}_{\mathcal{X}/f^* O_{\mathcal{S}}}, F_b)) \to f'^* E(\mathcal{O}_{\mathcal{X}'}/f'^* O_{\mathcal{T}}, F_b)$.

**Definition 53.** Consider a commutative diagram in $\text{RCat}$

$$D = (\mathcal{X}, O_{\mathcal{X}}) \xrightarrow{f} (\mathcal{S}, O_{\mathcal{S}}).$$

with commutative structural sheaf of rings. Assume that the canonical map $T(g'^* \text{hom})(O_{\mathcal{X}}, O_{\mathcal{X}}) : g'^* D(O_{\mathcal{X}}) \to D(g'^* O_{\mathcal{X}})$ is an isomorphism of sheaves. For $(N, F) \in C_{D(O_{\mathcal{X}'}, g'^* D(O_{\mathcal{X}}))}(\mathcal{X})$, we have by definition-proposition [14] the map in $C_{f^*, O_{\mathcal{S}}}(\mathcal{X})$

$$T_\omega^*(g'^* \otimes)(N, F) : \mathcal{O}_{\mathcal{X}/f^* O_{\mathcal{S}}} \otimes O_{\mathcal{X}} g'_*(N, F) \xrightarrow{\text{ad}(g'^* \otimes g'_*(N, F))}$$

$$g'_*(g'^* \mathcal{O}_{\mathcal{X}/f^* O_{\mathcal{S}}} \otimes g'_* O_{\mathcal{X}'}) \xrightarrow{\text{ad}(g'^* \otimes g'_*(N, F))} g'_*(\mathcal{O}_{\mathcal{X}'}/f'^* O_{\mathcal{T}} \otimes O_{\mathcal{X}'}(N, F))$$

with $m(n \otimes s) = s \cdot n$ and $g'_* N \in C_d(O_{\mathcal{X}'})$, the structure of $D(O_{\mathcal{X}})$ module being given by the canonical morphism $\text{ad}(g'^* \otimes g'_*(D(O_{\mathcal{X}})) : D(O_{\mathcal{X}}) \to g'_* g'^* D(O_{\mathcal{X}})$ applied to $g'_* N \in C_{g'_* g'^* D(O_{\mathcal{X}})}(\mathcal{X}').

We finish this subsection by a proposition for ringed spaces similar to proposition [11]

**Proposition 37.** Let $f : (\mathcal{X}, O_{\mathcal{X}}) \to (\mathcal{S}, O_{\mathcal{S}})$ a morphism with $(\mathcal{X}, O_{\mathcal{X}}), (\mathcal{S}, O_{\mathcal{S}}) \in \text{RTop}$ with commutative sheaves of rings. Assume that $\Omega_{\mathcal{X}/f^* O_{\mathcal{S}}} \in \text{PSh}_{O_{\mathcal{X}}}(\mathcal{X})$ is a locally free $O_{\mathcal{X}}$ module of finite rank.

(i) If $\phi : (M, F) \to (N, F)$ is an $r$-filtered top local equivalence with $(M, F), (N, F) \in C_{D(O_{\mathcal{X}})}(\mathcal{X})$, then

$$DR(O_{\mathcal{X}/f^* O_{\mathcal{S}}})(\phi) : (\mathcal{O}_{\mathcal{X}/f^* O_{\mathcal{S}}}, F_b) \otimes O_{\mathcal{X}}(M, F) \to (\mathcal{O}_{\mathcal{X}/f^* O_{\mathcal{S}}}, F_b) \otimes O_{\mathcal{T}}(N, F)$$

is an $r$-filtered top local equivalence.
(ii) Consider a commutative diagram in RTOP

\[ D = (X, O_X) \xrightarrow{f} (S, O_S), \]

\[ g' \quad g \]

\[ (X', O_{X'}) \xrightarrow{f'} (T, O_T) \]

with commutative structural sheaf of rings. For \((N, F) \in C_{D(D_O_S)}(X')\), the map in \(C_{D(O_S)}(X')\)

\[ k \circ T^O_D(g', \otimes)(E(N, F)) : (\Omega^*_O_{X'/f, O_{X'}}) \otimes_{O_X} E(N, F) \rightarrow g'_*E((\Omega^*_O_{X'/f, O_{X'}}), O_{X'}) \otimes_{O_X} E(N, F) \]

is a filtered top local equivalence (see definition [55]).

Proof: (i):Follows from proposition [8] (i) since \(\Omega^*_O_{X'/f, O_{X'}} \in C^b(X')\) is then a bounded complex with \(\Omega^*_O_{X'/f, O_{X'}} \in \text{PSh}_O(X')\) a locally free \(O_X\) module of finite rank.

(ii):Follows from proposition [8] (ii) since \(\Omega^*_O_{X'/f, O_{X'}} \in C^b(X')\) is then a bounded complex with \(\Omega^*_O_{X'/f, O_{X'}} \in \text{PSh}_O(X')\) a locally free \(O_X\) module of finite rank. \(\square\)

4.1.3 The support section functor for \(D\) module on ringed spaces

Let \((S, O_S) \in \text{RTOP}\) with \(O_S\) commutative. Let \(Z \subset S\) a closed subset. Denote by \(j : S \setminus Z \hookrightarrow S\) the open complementary embedding,

- For \(G \in C_{D(O_S)}(S)\), \(\Gamma_Z G := \text{Cone}(\text{ad}(j^*, j_*)(G) : F \rightarrow j_*j^*G)[-1]\) has a (unique) structure of \(D(O_S)\) module such that \(\Gamma_Z G : \Gamma_Z G \rightarrow G\) is a map in \(C_{D(O_S)}(S)\). This gives the functor

\[ \Gamma_Z : C_{D(O_S)}(S) \rightarrow C_{D(O_S)}(S), \quad (G, F) \mapsto \Gamma_Z(G, F) \]

together with the canonical map \(\Gamma_Z(G, F) : \Gamma_Z(G, F) \rightarrow (G, F)\). Let \(Z_2 \subset Z\) a closed subset, then for \(G \in C_{D(O_S)}(S)\), \((T(Z_2/Z, \gamma)(G) : \Gamma_Z G \rightarrow \Gamma_Z G)\) is a map in \(C_{D(O_S)}(S)\).

- For \(G \in C_{O_S}(S)\), \(\Gamma^\gamma_Z G := \text{Cone}(\text{ad}(j, j^*)G : j_*j^*G \rightarrow G)\) has a unique structure of \(D(O_S)\) module, such that \(\Gamma^\gamma_Z(G) : G \rightarrow \Gamma^\gamma_Z G\) is a map in \(C_{D(O_S)}(S)\). This gives the functor

\[ \Gamma^\gamma_Z : C_{D(O_S)}(S) \rightarrow C_{D(O_S)}(S), \quad (G, F) \mapsto \Gamma^\gamma_Z(G, F), \]

together with the canonical map \(\Gamma^\gamma_Z(G, F) : (G, F) \rightarrow \Gamma^\gamma_Z(G, F)\). Let \(Z_2 \subset Z\) a closed subset, then for \(G \in C_{D(O_S)}(S)\), \((T(Z_2/Z, \gamma^*)(G) : \Gamma^\gamma_Z G \rightarrow \Gamma^\gamma_Z G)\) is a map in \(C_{D(O_S)}(S)\).

- For \(G \in C_{D(O_S)}(S)\),

\[
\Gamma^\nu,h_Z G : = D^O_S L_O \Gamma_Z E(D^O_S G)
\]

\[
: = \text{Cone}(D^O_S L_O \text{ad}(j, j^*)(E(D^O_S G)) : D^O_S L_O j_* j^* E(D^O_S G) \rightarrow D^O_S L_O E(D^O_S G))
\]

has also canonical \(D(O_S)\)-module structure, and \(\Gamma^\nu,h_Z(G) : G \rightarrow \Gamma^\nu,h_Z G\) is a map in \(C_{D(O_S)}\). This gives the functor

\[ \Gamma^\nu,h_Z : C_{D(O_S)}(S) \rightarrow C_{D(O_S)}(S), \quad (G, F) \mapsto \Gamma^\nu,h_Z(G, F), \]

together with the canonical map \(\Gamma^\nu,h_Z(G, F) : (G, F) \rightarrow \Gamma^\nu,h_Z(G, F)\).

- Consider \(I_Z \subset O_S\) the ideal of vanishing function on \(Z\) and \(I_Z \subset D_S\) the right ideal of \(D_S\) generated by \(I_Z\). We have then \(I^O_Z \subset I_Z\), where \(I^O_Z \subset D_S\) is the left and right ideal consisting of sections which vanish on \(Z\). For \(G \in \text{PSh}_{D(O_S)}(S)\), we consider, \(S^o \subset S\) being an open subset,

\[ I_Z G(S^o) = \{ f, m \in G(S^o), f \in I_Z(S^o) \} \supset G(S^o) \]

116
the $D(O_S)$-submodule generated by the functions which vanish on $Z$ ($I_Z$ is a right $D(O_S)$ ideal). This gives the functor,
\[ \Gamma^\vee_O \mid_{D(O_S)^{fil}(S)} : C_D(O_S)^{fil}(S) \to C_D(O_S)^{fil}(S), \]
\[ (G, F) \mapsto \Gamma^\vee_O(G, F) := \text{Cone}(b_{2Z}(G, F) : I_Z(G, F) \to (G, F)), b_{2Z}(-) := b_{I_Z}(-) \]
together with the canonical map $\gamma^\vee_O(G, F) : (G, F) \to \Gamma^\vee_O(G, F)$, which factors through
\[ \gamma^\vee_O(G) : G \xrightarrow{\gamma^\vee_O(G)} \Gamma^\vee_O(G, F), \]
with $b_{S/Z}(-) = b^1_{S/Z}$ and we have an homotopy equivalence $c_Z(G) = c_{I_Z}(G) : \Gamma^\vee_O(G) \to G/I_ZG$.

**Lemma 6.** Let $(Y, O_Y) \in \text{RTop}$ and $i : X \to Y$ a closed embedding.

(i) For $(M, F) \in C_D(O_Y)^{fil}(Y)$ and $(N, F) \in \text{PSh}_{D(O_Y)^{op}}(Y)$ such that $a_rN$ is a locally free $D(O_Y)$ module of finite rank, the canonical map
\[ T(\gamma, \otimes)(E(M, F), (N, F)) := (I, T(j, \otimes)(E(M, F), (N, F))) : (\Gamma_X(E(M, F)) \otimes_{D(O_Y)} (N, F) \to \Gamma_X(E((M, F) \otimes_{D(O_Y)} (N, F))) \]
is an equivalence top local.

(ii) For $(M, F) \in C_D(O_Y)^{op}(Y)$ and $(N, F) \in \text{PSh}_{D(O_Y)^{op}}(Y)$ such that $a_rN$ is a locally free $O_Y$ module of finite rank, the canonical map
\[ T(\gamma, \otimes)(E(M, F), (N, F)) := (I, T(j, \otimes)(E(M, F), (N, F))) : (\Gamma_X(E(M, F)) \otimes_{O_Y} (N, F) \to \Gamma_X(E((M, F) \otimes_{O_Y} (N, F))) \]
is a filtered top local equivalence.

**Proof.** Follows from proposition[3]. Also note that $T(j, \otimes)(-,-) = T^{mod}(j, \otimes)(-,-)$. \qed

We now look at the pullback map and the transformation map of De Rham complexes together with the support section functor. The followin is a generalization of definition-proposition[3]:

**Definition-Proposition 17.** Consider a commutative diagram in $\text{RTop}$
\[ D_0 = \begin{array}{c}
X \\
\xrightarrow{i} Y \\
\xrightarrow{g} Z \\
\xrightarrow{g'} T \end{array} \]
\[ f : (X, O_X) \xrightarrow{i} (Y, O_Y) \xrightarrow{p} (S, O_S) \]
with $i$, $i'$ being closed embeddings. Denote by $D$ the right square of $D$. We have a factorization $i' : X' \xrightarrow{i'_0} X \times YY' \xrightarrow{\delta} Y'$, where $i'_0, i'_1$ are closed embedding.

(i) For $(M, F) \in C_D(O_Y)^{fil}(Y)$, the canonical map,
\[ g'' \Gamma_X E((\Omega^\bullet_{O_Y/p''O_S}, F_b) \otimes_{O_Y} (M, F)) \to \Gamma_X \text{PSh}_{D(O_Y)^{op}}(Y) E((\Omega^\bullet_{O_Y/p''O_T}, F_b) \otimes_{O_Y} g'' \otimes_{D(O_Y)} (M, F)) \]
unique up to homotopy such that the following diagram in $C_{g'' \otimes D(O_Y)^{fil}}(Y') = C_{g'' \otimes D(O_Y)^{fil}}(Y')$ commutes
\[ g'' \Gamma_X E((\Omega^\bullet_{O_Y/p''O_S}, F_b) \otimes_{O_Y} (M, F)) \xrightarrow{E((\Omega^\bullet_{O_Y/p''O_T}, F_b) \otimes_{O_Y} g'' \otimes_{D(O_Y)} (M, F))) \]
with $\gamma_X(-)\cdot \gamma_X(\delta(-))$. \hfill \Box
(ii) For $M \in C_D(Y)$, there is a canonical map

$$T^O_\omega(D)(M,F)^γ : g^{*\text{mod}}Lp_\omega \Gamma_X E((\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} (M,F)) \rightarrow \Gamma_X E((\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} g^{*\text{mod}}(M,F))$$

unique up to homotopy such that the following diagram in $C_{O_Tfil}(T)$ commutes

$$\begin{array}{ccc}
g^{*\text{mod}}Lp_\omega \Gamma_X E((\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} (M,F)) & \xrightarrow{T^O_\omega(D)(M,F)^γ} & \Gamma_X E((\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} g^{*\text{mod}}(M,F)) \\
\gamma_X(\cdot) & \downarrow & \gamma_X(\cdot) \\
g^{*\text{mod}}Lp_\omega \Gamma_X E((\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} (M,F)) & \xrightarrow{T^O_\omega(D)(M,F)^γ} & \Gamma_X E((\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} g^{*\text{mod}}(M,F))
\end{array}$$

(iii) For $N \in C_D(Y \times T)$, the canonical map in $C_{N^*\text{Fil}}(Y')$

$$T(X' \times Y', γ)(-) : \Gamma_X E((\Omega^*_{O_Y/T}, F_b) \otimes_{O_Y} (N,F)) \rightarrow \Gamma_X E((\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} (N,F))$$

is unique up to homotopy such that $\gamma_X X' Y'(-) \circ T(X' / X \times Y', γ)(-) = \gamma_X X'(-)$.

(iv) For $M = O_Y$, we have $T^O_\omega(D)(O_{Y \times S})^γ = T^O_\omega(D)^γ$ and $T^O_\omega(X \times Y / Y')(O_Y)^γ = T^O_\omega(X \times Y Y'/Y')^γ$ (see definition-proposition 5).

Proof. Immediate from definition. We take for the map of point (ii) the composite

$$p^*p_\omega \Gamma_X E((\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} (M,F)) \xrightarrow{T^O_\omega(D)(M,F)^γ} \Gamma_X E((\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} g^{*\text{mod}}(M,F))$$

with $m(n \otimes s) = s.n.$

Let $p : (Y, O_Y) \rightarrow (S, O_S)$ be a morphism with $(Y, O_Y), (S, O_S) \in \text{RTop}$. Let $i : X \hookrightarrow Y$ a closed embedding. Denote by $j : Y \setminus X \hookrightarrow Y$ the complementary open embedding. Consider, for $(M,F) \in C_{D(O_Y)}fil(Y)$ (see definition 53):

$$k \circ T^O_\omega(j, γ)(E(M,F)) : (\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} j_*j^*E(M,F) \xrightarrow{DR(O_Y/p^*O_S)(\text{adj}(j^*, j_*)(-))} j_*j^*(\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} j_*j^*E(M,F)$$

$$\xrightarrow{k \circ DR(O_Y/p^*O_S)(\text{adj}(j^*, j_*)(j^*E(M,F)))} j_*E(j^*(\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} E(M,F))$$

**Definition 54.** Let $p : (Y, O_Y) \rightarrow (S, O_S)$ a morphism with $(Y, O_Y), (S, O_S) \in \text{RTop}$. Let $i : X \hookrightarrow Y$ a closed embedding. Denote by $j : Y \setminus X \hookrightarrow Y$ the complementary open embedding. We consider, for $(M,F) \in C_{D(O_Y)}fil(Y)$ the canonical map in $C_{p^*O_Sfil(Y)}$

$$T^O_\omega(γ, γ)(M,F) : (\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} Γ_X E(M,F) \rightarrow Γ_X E((\Omega^*_{O_Y/p^*O_S}, F_b) \otimes_{O_Y} E(M,F)).$$
Proof. By proposition 37, it is possible to assume that all the presheaves are sheaves and take the sheafification functor after the internal hom functors and tensor products of presheaves of modules on $S \in \text{Var}(\mathbb{C})$ or $S \in \text{AnSp}(\mathbb{C})$, and after the pullback functor $f^\star$ for a morphism $f : X \to S$. Let $\tau_{\text{hol}}(\mathcal{O}_S)$ be the category of holonomic sheaves on $S$. We consider the full subcategories whose objects are coherent, resp. holonomic, sheaves of left $D_S$ modules, and by $\text{Sh}_{\text{hol}}(S) \subset \text{Sh}(S)$ the full subcategories whose objects are coherent, resp. holonomic, sheaves of left $D_S$ modules.

For convenience, we will work with and state the results for presheaves of D-modules. In this section, it is possible to assume that all the presheaves are sheaves and take the sheafification functor after the pullback functor $f^\star$ for a morphism $f : X \to S$, $X, S \in \text{Var}(\mathbb{C})$ or $X, S \in \text{AnSp}(\mathbb{C})$, and after the internal hom functors and tensor products of presheaves of modules on $S \in \text{Var}(\mathbb{C})$ or $S \in \text{AnSp}(\mathbb{C})$. For $S = (S, O_S) \in \text{SmVar}(\mathbb{C})$, resp. $S = (S, O_S) \in \text{AnSm}(\mathbb{C})$, we denote by

- $D_S := D(O_S) \subset \mathcal{H}om_{\mathcal{C}_S}(O_S, O_S)$ the subsheaf consisting of differential operators. By a $D_S$ module, we mean a left $D_S$ module.

- we denote by
  - $\text{PSh}_D(S)$ the abelian category of Zariski (resp. usu) presheaves on $S$ with a structure of left $D_S$ module, and by $\text{Hol}_D(S) \subset \text{Sh}_D(S) \subset \text{PSh}_D(S)$ the full subcategories whose objects are coherent, resp. holonomic, sheaves of left $D_S$ modules.
  - $\text{PSh}_{D-\text{proj}}(S)$ the abelian category of Zariski (resp. usu) presheaves on $S$ with a structure of right $D_S$ module, and by $\text{Hol}_{D-\text{proj}}(S) \subset \text{Sh}_{D-\text{proj}}(S) \subset \text{PSh}_{D-\text{proj}}(S)$ the full subcategories whose objects are coherent, resp. holonomic, sheaves of right $D_S$ modules.

- we denote by
  - $C_D(S) = C(\text{PSh}_D(S))$ the category of complexes of Zariski presheaves on $S$ with a structure of $D_S$ module,
    
    $C_{D,h}(S) \subset C_{D,c}(S) \subset C_D(S)$

    the full subcategories consisting of complexes of presheaves $M$ such that $a_\tau H^n(M)$ are coherent (resp. holonomic) sheaves of $D_S$ modules, $a_\tau$ being the sheafification functor for the Zariski, resp. usual, topology,
- \(C_{D^{op}}(S) = C(\text{PSh}_{D^{op}}(S))\) the category of complexes of Zariski presheaves on \(S\) with a structure of right \(D_S\) module,

\[
C_{D^{op}, h}(S) \subset C_{D^{op}, c}(S) \subset C_{D^{op}}(S)
\]

the full subcategories consisting of complexes of presheaves \(M\) such that \(a_\tau H^n(M)\) are coherent (resp. holonomic) sheaves of right \(D_S\) modules,

- in the filtered case we have

\[
C_{D(2)fil}(S) \subset C(\text{PSh}_D(S), F, W) := C(\text{PSh}_{D(\mathcal{O}_S)}(S), F, W)\]

the category of (bi)filtered complexes of algebraic (resp. analytic) \(D_S\) modules such that the filtration is biregular (see definition 47),

\[
C_{D(2)fil, h}(S) \subset C_{D(2)fil, c}(S) \subset C_{D(2)fil}(S),
\]

the full subcategories consisting of filtered complexes of presheaves \((M, F, W)\) such that \(a_\tau H^n(M)\) are coherent (resp. holonomic) sheaves of \(D_S\) modules,

\[
C_{D^{op}(2)fil}(S) \subset C_{D^{op}fil}(S) the full subcategory such that the filter is a filtration by \(D_S\) submodule (which is stronger then Griffith transversality), \(C_{D^{op}(1,0)fil}(S) \subset C_{D^{op}2fil}(S)\) the full subcategory such that \(W\) is a filter by \(D_S\) submodules (see definition 47),

\[
C_{D^{op}(1,0)fil, h}(S) \subset C_{D^{op}(1,0)fil, c}(S) \subset C_{D^{op}(2)fil}(S),
\]

the full subcategory consisting of filtered complexes of presheaves \((M, F, W)\) such that \(a_\tau H^n(M)\) are coherent modules of \(D_S\) submodules such that \(W^p M \subset M\) are \(D_S\) submodules but satisfy by definition \(\text{ad} : F^p D_S \otimes F^p M \subset F^{p+r} M\),

\[
C_{D^{op}(2)fil}(S) \subset C(\text{PSh}_{D^{op}}(S), F, W) := C(\text{PSh}_{D^{op}(\mathcal{O}_S)}(S), F, W)\]

the category of (bi)filtered complexes of algebraic (resp. analytic) right \(D_S\) modules such that the filtration is biregular, as in the left case we consider the subcategories

\[
C_{D^{op}(2)fil, h}(S) \subset C_{D^{op}(2)fil, c}(S) \subset C_{D^{op}(2)fil}(S),
\]

the full subcategories consisting of filtered complexes of presheaves \((M, F)\) such that \(a_\tau H^n(M)\) are coherent (resp. holonomic) sheaves of right \(D_S\) modules.

For \(S = (S, \mathcal{O}_S) \in \text{AnSm}(\mathbb{C})\), we have the natural extension \(D_S \subset D^S = \text{Hom}_{\mathcal{C}_S}(\mathcal{O}_S, \mathcal{O}_S)\) where \(D^S \subset \text{Hom}_{\mathcal{C}_S}(\mathcal{O}_S, \mathcal{O}_S)\) is the subsheaf of differential operators of possibly infinite order (see 18) for the definition of the action of a differential operator of infinite order on \(\mathcal{O}_S\). Similarly, we have

- \(C_{D^{\approx}(2)fil}(S) \subset C(\text{PSh}_{D^{\approx}}(S), F, W) := C(\text{PSh}_{D^{\approx}(\mathcal{O}_S)}(S), F, W)\)

the category of (bi)filtered complexes of \(D^S\) modules such that the filtration is biregular,

\[
C_{D^{\approx}(2)fil, h}(S) \subset C_{D^{\approx}(2)fil, c}(S) \subset C_{D^{\approx}(2)fil}(S),
\]

the full subcategories consisting of filtered complexes of presheaves \((M, F)\) such that \(a_\tau H^n(M)\) are coherent (resp. holonomic) sheaves of \(D^S\) modules.

- \(C_{D^{\approx}0fil}(S) \subset C_{D^{\approx}fil}(S)\) the full subcategory such that the filter is a filtration by \(D^S\) submodule, \(C_{D(1,0)fil}(S) \subset C_{D^{\approx}2fil}(S)\) the full subcategory such that \(W\) is a filter by \(D^S\) submodules,

\[
C_{D^{\approx}(1,0)fil, h}(S) = C_{D^{\approx}2fil, h}(S) \cap C_{D^{\approx}(1,0)fil}(S) \subset C_{D^{\approx}2fil, h}(S),
\]

the full subcategory consisting of filtered complexes of presheaves \((M, F, W)\) such that \(a_\tau H^n(M)\) are holonomic sheaves of \(D^S\) modules and such that \(W^p M \subset M\) are \(D_S\) submodules
\[ C_{D^\infty,\text{op}(2)\text{fil}(S)} \subset C(\text{PSh}_{D^\infty,\text{op}}(S), F, W) := C(\text{PSh}_{D^\infty,\text{op}}(S), F, W) \text{ the category of (bi)filtered complexes of right } D^\infty_S \text{ modules such that the filtration is biregular}, \]
\[ C_{D^\infty,\text{op}(2)\text{fil},h}(S) \subset C_{D^\infty,\text{op}(2)\text{fil},c}(S) \subset C_{D^\infty,\text{op}(2)\text{fil}(S)}, \]
the full subcategories consisting of filtered complexes of presheaves \((M, F)\) such that \(a_\tau H^n(M)\) are coherent (resp. holonomic) sheaves of \(D_S\) modules.

For \(f : X \to S\) a morphism with \(X, S \in \text{SmVar}(\mathbb{C})\) or with \((X, S) \in \text{AnSm}(\mathbb{C})\),

- we denote by
  - \(\text{PSh}_{f^\ast, D}(X)\) the abelian category of Zariski (resp. usu) presheaves on \(S\) with a structure of left \(f^\ast D_S\) module, and \(C_{f^\ast, D}(X) = C(\text{PSh}_{f^\ast, D}(X))\),
  - \(\text{PSh}_{D^\infty, f^\ast, D}(X)\) the abelian category of Zariski (resp. usu) presheaves on \(X\) with a structure of left \(f^\ast D_S\) module and left \(D_X\) module, and \(C_{D^\infty, f^\ast, D}(X) = C(\text{PSh}_{D^\infty, f^\ast, D}(X))\),
  - \(\text{PSh}_{D^\infty, f^\ast, D}(X)\) the abelian category of Zariski (resp. usu) presheaves on \(X\) with a structure of left \(f^\ast D_S\) module and right \(D_X\) module and \(C_{D^\infty, f^\ast, D}(X) = C(\text{PSh}_{D^\infty, f^\ast, D}(X))\),

- we denote by
  - \(C_{f^\ast, D\text{fil}}(X) \subset C(\text{PSh}_{f^\ast, D}(X), F) := C(\text{PSh}_{f^\ast, D}(X), F)\) the category of filtered complexes of algebraic (resp. analytic) \((f^\ast D_S, D_X)\) modules such that the filtration is biregular,
  - \(C_{D^\infty, f^\ast, D\text{fil}}(X) \subset C(\text{PSh}_{D^\infty, f^\ast, D}(X), F)\) the category of filtered complexes of algebraic (resp. analytic) \((f^\ast D_S, D_X)\) modules such that the filtration is biregular,
  - \(C_{D^\infty, f^\ast, D\text{fil}}(X) \subset C(\text{PSh}_{D^\infty, f^\ast, D}(X), F)\) the category of filtered complexes of algebraic (resp. analytic) \((f^\ast D_S, D_X)\) modules such that the filtration is biregular.

For \(f : X \to S\) a morphism with \(X, S \in \text{AnSm}(\mathbb{C})\), we denote by

- \(C_{f^\ast, D^\infty, \text{fil}}(X) \subset C(\text{PSh}_{f^\ast, D^\infty}(X), F) := C(\text{PSh}_{f^\ast, D^\infty}(X), F)\) the category of filtered complexes of \(f^\ast D^\infty_S\) modules such that the filtration is biregular,
- \(C_{D^\infty, f^\ast, D^\infty, \text{fil}}(X) \subset C(\text{PSh}_{D^\infty, f^\ast, D^\infty}(X), F)\) the category of filtered complexes of \((f^\ast D^\infty_S, D^\infty_X)\) modules such that the filtration is biregular,
- \(C_{D^\infty, f^\ast, D^\infty, \text{fil}}(X) \subset C(\text{PSh}_{D^\infty, f^\ast, D^\infty}(X), F)\) the category of filtered complexes of \((f^\ast D^\infty_S, D^\infty_X, \text{op})\) modules such that the filtration is biregular.

For \(S \in \text{AnSm}(\mathbb{C})\), we denote by
\[ J_S : C_{D(2)\text{fil}}(S) \to C_{D^\infty(2)\text{fil}}(S), \quad (M, F) \mapsto J_S(M, F) := (M, F) \otimes_{D_S} (D^\infty_S, F^{ord}) \]
the natural functor. For \((M, F) \in C_{D^\infty\text{fil}}(S)\), we will consider the map
\[ J_S(M, F) : J_S(M, F) := (M, F) \otimes_{D_S} (D^\infty_S, F^{ord}) \to (M, F), m \otimes P \to PM \]
Of course \(J_S(C_{D(1,0)\text{fil}}(S)) \subset C_{D^\infty(1,0)\text{fil}}(S)\). More generally, for \(f : X \to S\) a morphism with \(X, S \in \text{AnSm}(\mathbb{C})\), we denote by
\[ J_{X/S} : C_{f^\ast, D(2)\text{fil}}(X) \to C_{f^\ast, D^\infty(2)\text{fil}}(X), \quad (M, F) \mapsto J_{X/S}(M, F) := (M, F) \otimes_{f^\ast(D_S, F)} f^\ast(D^\infty_S, F) \]
the natural functor, together with, for \((M, F) \in C_{f^\ast, D^\infty\text{fil}}(X)\), the map \(J_S(M, F) : J_S(M, F) \to (M, F)\).

**Definition 55.** Let \(S \in \text{SmVar}(\mathbb{C})\), resp. \(S \in \text{AnSm}(\mathbb{C})\). Let \(Z \subset S\) a closed subset and denote by \(j : S \setminus Z \to S\) the open embedding.
(i) We denote by

- $\text{PSh}_{\mathcal{D},Z}(S) \subset \text{PSh}_{\mathcal{D}}(S)$, the full subcategory consisting of presheaves $M \in \text{PSh}_{\mathcal{D}}(S)$, such that $j^* M = 0$,
- $\mathcal{C}_{\mathcal{D},Z}(S) \subset \mathcal{C}_{\mathcal{D}}(S)$, the full subcategory consisting of complexes presheaves $M \in \mathcal{C}_{\mathcal{D}}(S)$ such that $a_r j^* H^n M = 0$ for all $n \in \mathbb{Z}$,
- $\mathcal{C}_{\mathcal{D},Z,h}(S) := \mathcal{C}_{\mathcal{D},Z}(S) \cap \mathcal{C}_{\mathcal{D},h}(S) \subset \mathcal{C}_{\mathcal{D}}(S)$ the full subcategory consisting of $M \in \mathcal{C}_{\mathcal{D}}(S)$ such that $a_r H^n(M)$ are holonomic and $a_r j^* H^n M = 0$ for all $n \in \mathbb{Z}$,
- $\mathcal{C}_{\mathcal{D},Z,e}(S) := \mathcal{C}_{\mathcal{D},Z}(S) \cap \mathcal{C}_{\mathcal{D},e}(S) \subset \mathcal{C}_{\mathcal{D}}(S)$ the full subcategory consisting of $M \in \mathcal{C}_{\mathcal{D}}(S)$ such that $a_r H^n(M)$ are coherent and $a_r j^* H^n M = 0$ for all $n \in \mathbb{Z}$.

(ii) We denote by

- $\mathcal{C}_{\mathcal{D}(2),fil,Z}(S) \subset \mathcal{C}_{\mathcal{D}(2),fil}(S)$, the full subcategory consisting of $(M, F) \in \mathcal{C}_{\mathcal{D}(2),fil}(S)$ such that there exists $r \in \mathbb{N}$ such that $a_r j^* E_{p,q}^r(M, F) = 0$ for all $p, q \in \mathbb{Z}$, note that by definition this $r$ does NOT depend on $p$ and $q$,
- $\mathcal{C}_{\mathcal{D}(2),fil,Z,h}(S) := \mathcal{C}_{\mathcal{D}(2),fil,Z}(S) \cap \mathcal{C}_{\mathcal{D}(2),fil,h}(S) \subset \mathcal{C}_{\mathcal{D}(2),fil}(S)$ the full subcategory consisting of $(M, F)$ such that $a_r H^n(M)$ are holonomic for all $n \in \mathbb{Z}$ and such that there exists $r \in \mathbb{N}$ such that $a_r j^* E_{p,q}^r(M, F) = 0$ for all $p, q \in \mathbb{Z}$,
- $\mathcal{C}_{\mathcal{D}(2),fil,Z,e}(S) := \mathcal{C}_{\mathcal{D}(2),fil,Z}(S) \cap \mathcal{C}_{\mathcal{D}(2),fil,e}(S) \subset \mathcal{C}_{\mathcal{D}(2),fil}(S)$ the full subcategory consisting of $(M, F)$ such that $a_r H^n(M)$ are coherent for all $n \in \mathbb{Z}$ and such that there exists $r \in \mathbb{N}$ such that $a_r j^* E_{p,q}^r(M, F) = 0$ for all $p, q \in \mathbb{Z}$.

(iii) We have then the full subcategories

- $\mathcal{C}_{\mathcal{D}(1,0),fil,Z}(S) = \mathcal{C}_{\mathcal{D}(1,0),fil}(S) \cap \mathcal{C}_{\mathcal{D}(2),fil,Z}(S) \subset \mathcal{C}_{\mathcal{D}(2),fil}(S)$,
- $\mathcal{C}_{\mathcal{D}(1,0),fil,Z,h}(S) = \mathcal{C}_{\mathcal{D}(1,0),fil}(S) \cap \mathcal{C}_{\mathcal{D}(2),fil,Z,h}(S) \subset \mathcal{C}_{\mathcal{D}(2),fil}(S)$.

Similarly :

Definition 56. Let $S \in \text{AnSm}(\mathbb{C})$. Let $Z \subset S$ a closed subset and denote by $j : S \setminus Z \hookrightarrow S$ the open embedding.

(i) We denote by

- $\mathcal{C}_{\mathcal{D}(2),fil,Z}(S) \subset \mathcal{C}_{\mathcal{D}(2),fil}(S)$, the full subcategory consisting of $(M, F) \in \mathcal{C}_{\mathcal{D}(2),fil}(S)$ such that $j^* M$ is acyclic
- $\mathcal{C}_{\mathcal{D}(2),fil,Z,h}(S) := \mathcal{C}_{\mathcal{D}(2),fil,Z}(S) \cap \mathcal{C}_{\mathcal{D}(2),fil,h}(S) \subset \mathcal{C}_{\mathcal{D}(2),fil}(S)$ the full subcategory consisting of $(M, F)$ such that $a_r H^n(M)$ are holonomic and $a_r j^* E_{p,q}^r(M, F)$.

(ii) We have then the full subcategories

- $\mathcal{C}_{\mathcal{D}(1,0),fil,Z}(S) = \mathcal{C}_{\mathcal{D}(1,0),fil}(S) \cap \mathcal{C}_{\mathcal{D}(2),fil,Z}(S) \subset \mathcal{C}_{\mathcal{D}(2),fil}(S)$,
- $\mathcal{C}_{\mathcal{D}(1,0),fil,Z,h}(S) := \mathcal{C}_{\mathcal{D}(1,0),fil}(S) \cap \mathcal{C}_{\mathcal{D}(2),fil,Z,h}(S) \subset \mathcal{C}_{\mathcal{D}(2),fil}(S)$.

Definition 57. (i) Let $f : X \to S$ a morphism with $X, S \in \text{SmVar}(\mathbb{C})$, or with $X, S \in \text{AnSm}(\mathbb{C})$, we have, for $r = 1, \ldots, \infty$, resp. $r = (1, \ldots, \infty)^2$, the categories

$\mathcal{D}_{\mathcal{D},f^{\prime},\mathcal{D}(2),fil,r}(S) := \text{Ho}_{F^{r,\top}} \mathcal{C}_{\mathcal{D},f^{\prime},\mathcal{D}(2),fil}(S)$, $\mathcal{D}_{\mathcal{D}^{\circ},f^{\prime},\mathcal{D}(2),fil,r}(S) := \text{Ho}_{F^{r,\top}} \mathcal{C}_{\mathcal{D}^{\circ},f^{\prime},\mathcal{D}(2),fil}(S)$,

the localizations with respect to $r$-filtered Zariski, resp. usu, local equivalence.
(ii) Let $S \in \text{SmVar}(\mathbb{C})$, or $S \in \text{AnSm}(\mathbb{C})$. We denote by

$$D_{\mathcal{D}(2)\text{fil},\infty,h}(S) \subset D_{\mathcal{D}(2)\text{fil},\infty}(S), \ D_{\mathcal{D}(1,0)\text{fil},\infty,h}(S) \subset D_{\mathcal{D}2\text{fil},\infty}(S)$$

the full subcategories consisting of the image of $C_{\mathcal{D}(2)\text{fil},h}(S)$, resp. $C_{\mathcal{D}(1,0)\text{fil},h}(S)$, by the localization functor

$$D(\text{top}) : C_{\mathcal{D}(2)\text{fil},h}(S) \to D_{\mathcal{D}(2)\text{fil},\infty}(S)$$

that is consisting of $(M, F) \in C_{\mathcal{D}\text{fil}}(S)$ such that $a_*H^n(M)$ are holonomic, for all $n \in \mathbb{Z}$, resp. consisting of $(M, F, W) \in C_{\mathcal{D}2\text{fil}}(S)$ such that $a_*H^n(M)$ are holonomic and $W^nM^n \subset M^n$ are $D_S$ submodules for all $n \in \mathbb{Z}$.

(iii) Let $S \in \text{AnSm}(\mathbb{C})$. We denote by

$$- D_{\mathcal{D}(2)\text{fil},\infty,h}(S) \subset D_{\mathcal{D}(2)\text{fil},\infty,h}(S), \ D_{\mathcal{D}(1,0)\text{fil},\infty,h}(S) \subset D_{\mathcal{D}2\text{fil},\infty,h}(S)$$

the full subcategories consisting of $(M, F) \in C_{\mathcal{D}\text{fil}}(S)$ such that $a_*H^n(M)$ are regular holonomic for all $n \in \mathbb{Z}$.

$$- D_{\mathcal{D}(1,0)\text{fil},\infty,h}(S) = D_{\mathcal{D}2\text{fil},\infty,h}(S) \cap D_{\mathcal{D}(1,0)\text{fil},\infty,h}(S) \subset D_{\mathcal{D}2\text{fil},\infty,h}(S),$$

the full subcategory consisting of $(M, F, W) \in C_{\mathcal{D}2\text{fil}}(S)$ such that $a_*H^n(M)$ are regular holonomic and $W^nM^n \subset M$ are $D_S$ submodules for all $n \in \mathbb{Z}$.

Similarly,

**Definition 58.** (i) Let $f : X \to S$ a morphism with $X, S \in \text{AnSm}(\mathbb{C})$, we have, for $r = 1, \ldots, \infty$, resp. $r = (1, \ldots, \infty)^2$, the categories

$$D_{\mathcal{D}^\infty,f\cdot\mathcal{D}^\infty(2)\text{fil},r}(S) := \text{Ho}_{\mathcal{F}r\text{top}} C_{\mathcal{D}^\infty,f\cdot\mathcal{D}^\infty(2)\text{fil}}(S), \ D_{\mathcal{D}^\infty,op,f\cdot\mathcal{D}^\infty(2)\text{fil},r}(S) := \text{Ho}_{\mathcal{F}r\text{top}} C_{\mathcal{D}^\infty,op,f\cdot\mathcal{D}^\infty(2)\text{fil}}(S),$$

the localizations with respect to $r$-filtered usu local equivalence.

(ii) Let $S \in \text{AnSm}(\mathbb{C})$. We denote by

$$D_{\mathcal{D}^\infty(2)\text{fil},\infty,h}(S) \subset D_{\mathcal{D}^\infty(2)\text{fil},\infty}(S), \ D_{\mathcal{D}^\infty(1,0)\text{fil},\infty,h}(S) \subset D_{\mathcal{D}^\infty(2)\text{fil},\infty}(S)$$

the full subcategories consisting of the image of $C_{\mathcal{D}^\infty(2)\text{fil},h}(S)$, resp. $C_{\mathcal{D}^\infty(1,0)\text{fil},h}(S)$, by the localization functor

$$D(\text{top}) : C_{\mathcal{D}^\infty(2)\text{fil}}(S) \to D_{\mathcal{D}^\infty(2)\text{fil},\infty}(S).$$

We begin this subsection by recalling the following well known facts

**Proposition 39.** Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$.

(i) The sheaf of differential operators $D_S$ is a locally free sheaf of $O_S$ module. Hence, a coherent $D_S$ module $M \in \text{Coh}_S$ is a quasi-coherent sheaf of $O_S$ modules.

(ii) A coherent sheaf $M \in \text{Coh}_O(S)$ of $O_S$ module admits a $D_S$ module structure if and only if it is locally free (of finite rank by coherency) and admits an integrable connexion. In particular if $i : Z \to S$ is a closed embedding for the Zariski topology, then $i_*O_Z$ does NOT admit a $D_S$ module structure since it is a coherent but not locally free $O_S$ module.

**Proof.** Standard.

In order to prove a version of the first GAGA theorem for coherent D modules, we will need to following. We start by a definition (cf. [16] definition 1.4.2):

**Definition 59.** An $X \in \text{SmVar}(\mathbb{C})$ is said to be $D$-affine if the following two condition hold:

(i) The global section functor $\Gamma(X, \cdot) : \text{QCoh}_{\mathcal{D}}(X) \to \text{Mod}(\Gamma(X, D_X))$ is exact.

(ii) If $\Gamma(X, M) = 0$ for $M \in \text{QCoh}_{\mathcal{D}}(X)$, then $M = 0$. 

123
Proposition 40. If $X \in \text{SmVar}(\mathbb{C})$ is $D$-affine, then :

(i) Any $M \in \mathcal{QCoh}_D(X)$ is generated by its global sections.

(ii) The functor $\Gamma(X, \cdot) : \mathcal{QCoh}_D(X) \to \text{Mod}(\Gamma(X, D_X))$ is an equivalence of category whose inverse is $L \in \text{Mod}(\Gamma(X, D_X)) \mapsto D_X \otimes_{\Gamma(X, D_X)} L \in \mathcal{QCoh}_D(X)$.

(iii) We have $\Gamma(X, \cdot)(\mathcal{Coh}(X)) = \text{Mod}(\Gamma(X, D_X))_f$, that is the global sections of a coherent $D_X$ module is a finite module over the differential operators on $X$.

Proof. See [16].

The following proposition is from Kashiwara.

Proposition 41. Let $S \in \text{AnSm}(\mathbb{C})$.

(i) For $K \in C_c(S)$ a complex of presheaves with constructible cohomology sheaves, we have $\mathcal{H}\text{om}(L(K), E(O_S)) \in C_{D^{\infty}_S}(S)$.

(ii) The functor $J_S : C_{D(2)fil}(S) \to C_{D^{\infty}(2)fil}(S)$ satisfy $J_S(C_{D(2)fil,h}(S)) \subset C_{D^{\infty}(2)fil,h}(S)$, derive trivially, and induce an equivalence of category:

$$J_S : D_{D(2)fil,\infty, rh}(S) \to D_{D^{\infty}(2)fil,\infty, h}(S).$$

whose inverse satisfy, for $(M, F) \in \mathcal{H}\text{om}_{D^{\infty}(2)fil}(S)$ a (filtered) holonomic $D_S^\infty$ module, that $J_S^{-1}(M, F) = (M_{\text{reg}}, F) \subset (M, F)$ is the $D_S$ sub-module of $M$ which is the regular part.

(iii) We have $J_S(C_{D(1,0)fil, rh}(S)) \subset C_{D^{\infty}(1,0)fil,h}(S)$ and $J_S(D_{D(1,0)fil,\infty, rh}(S)) = D_{D^{\infty}(1,0)fil,\infty, h}(S)$.

Proof. Follows from [18].

Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$, and let $i : Z \hookrightarrow S$ a closed embedding and denote by $j : S \setminus Z \hookrightarrow S$ the open complementary. For $M \in \mathcal{PSh}_D(S)$, we denote $\mathcal{I}_Z M \subset M$ the (left) $D_S$ submodule given by, for $S^o \subset S$ an open subset, $\mathcal{I}_Z M(S^o) \subset M(S^o)$ is the (left) $D_S(S^o)$ submodule generated by the elements of the form $fm$. We denote by $b_Z(M) : \mathcal{I}_Z M \to M$ the inclusion map and $c_Z(M) : M \to M/\mathcal{I}_Z M$ the quotient map of (left) $D_S$ modules. For $M \in \mathcal{PSh}_D(S)$, we denote $M\mathcal{I}_Z \subset M$ the right $D_S$ submodule given by, for $S^o \subset S$ an open subset, $\mathcal{I}_Z M(S^o) \subset M(S^o)$ is the right $D_S(S^o)$ submodule generated by the elements of the form $mf$. We denote by $b_Z(M) : \mathcal{I}_Z M \to M$ the inclusion map and $c_Z(M) : M \to M/\mathcal{I}_Z M$ the quotient map of right $D_S$ modules.

4.2.1 Functorialities

Let $f : X \to S$ be a morphism with $X, S \in \text{SmVar}(\mathbb{C})$, or let $f : X \to S$ be a morphism with $X, S \in \text{AnSm}(\mathbb{C})$. Then, we recall from section 4.1, the transfers modules

- $(D_{X \to S}, F^{\text{ord}}) := f^{\text{mod}}(D_S, F^{\text{ord}}) := f^*(D_S, F^{\text{ord}}) \otimes_{f^*O_S} (O_X, F_b)$ which is a left $D_X$ module and a left and right $f^*D_S$ module

- $(D_{X \to S}, F^{\text{ord}}) := (K_X, F_b) \otimes_{O_X} f^*(D_X, F^{\text{ord}}) \otimes_{f^*O_S} f^*(K_S, F_b)$ which is a right $D_X$ module and a left and right $f^*D_S$ module.

Let $f : X \to S$ be a morphism with $X, S \in \text{AnSm}(\mathbb{C})$. Then, the transfers modules of infinite order are
Lemma 7. Let \( f_1 : X \to Y \), \( f_2 : Y \to S \) be two morphism with \( X,S,Y \in \text{SmVar}(\mathbb{C}) \), or let \( f_1 : X \to Y \), \( f_2 : Y \to S \) be two morphism with \( X,S,Y \in \text{AnSm}(\mathbb{C}) \).

(i) We have \( (D_{X \to S}, F^{\text{ord}}) := f^*(D_{Y \to S}, F^{\text{ord}}) \otimes f^* \mathcal{O}_S (O_X, F_b) \) which is a left \( D_X^\infty \) module and a left and right \( f^*D_S^\infty \) module.

(ii) We have \( (D_{X \to S}, F^{\text{ord}}) := (K_X, F_b) \otimes O_X (D_{X \to S}, F^{\text{ord}}) \otimes f^* \mathcal{O}_S f^*(K_S, F_b) \) which is a right \( D_X^\infty \) module and a left and right \( f^*D_S^\infty \) module.

We have the following:

Proof. Follows immediately from definition. The first assertions of (i) and (ii) are particular cases of lemma \( \Box \) See [10] for example.

In the analytical case we also have

Lemma 8. Let \( f_1 : X \to Y \), \( f_2 : Y \to S \) be two morphism with \( X,S,Y \in \text{AnSm}(\mathbb{C}) \).

(i) We have \( (D_{X \to S}^\infty, F^{\text{ord}}) := f_1^*(D_{Y \to S}^\infty, F^{\text{ord}}) \otimes f_1^* \mathcal{D}_Y (D_{X \to Y}^\infty, F^{\text{ord}}) \) in \( C_{D_{\infty}.(f_2 \circ f_1)^* \mathcal{D}_Y}(X) \) and

\[
(D_{X \to S}^\infty, F^{\text{ord}}) = f_1^*(D_{Y \to S}^\infty, F^{\text{ord}}) \otimes f_1^* \mathcal{D}_Y (D_{X \to Y}^\infty, F^{\text{ord}}) = f_1^*(D_{Y \to S}^\infty, F^{\text{ord}}) \otimes f_1^* \mathcal{D}_Y (D_{X \to Y}^\infty, F^{\text{ord}}).
\]

in \( D_{D_{\infty}.(f_2 \circ f_1)^* \mathcal{D}_Y}(X) \).

(ii) We have \( (D_{X \to S}^\infty, F^{\text{ord}}) := f_1^*(D_{Y \to S}^\infty, F^{\text{ord}}) \otimes f_1^* \mathcal{D}_Y (D_{X \to Y}^\infty, F^{\text{ord}}) \) in \( C_{D_{\infty,\mathcal{D}_Y}}(f_2 \circ f_1)^* \mathcal{D}_Y(X) \) and

\[
(D_{X \to S}^\infty, F^{\text{ord}}) = f_1^*(D_{Y \to S}^\infty, F^{\text{ord}}) \otimes f_1^* \mathcal{D}_Y (D_{X \to Y}^\infty, F^{\text{ord}}) = f_1^*(D_{Y \to S}^\infty, F^{\text{ord}}) \otimes f_1^* \mathcal{D}_Y (D_{X \to Y}^\infty, F^{\text{ord}}).
\]

in \( D_{D_{\infty,\mathcal{D}_Y}}(f_2 \circ f_1)^* \mathcal{D}_Y(X) \).

Proof. Similar to the proof of lemma \( \Box \)

For closed embeddings, we have:

Proposition 42. (i) Let \( i : Z \hookrightarrow S \) be a closed embedding with \( Z,S \in \text{SmVar}(\mathbb{C}) \). Then, \( D_{Z \to S} = i^* D_S / D_S \mathcal{I}_Z \) and it is a locally free (left) \( D_Z \) module. Similarly, \( D_{Z \to S} = i^* D_S / D_S \mathcal{I}_Z \) and it is a locally free right \( D_Z \) module.

(ii) Let \( i : Z \hookrightarrow S \) be a closed embedding with \( Z,S \in \text{AnSm}(\mathbb{C}) \). Then, \( D_{Z \to S} = i^* D_S / D_S \mathcal{I}_Z \) and it is a locally free (left) \( D_Z \) module. Similarly, \( D_{Z \to S} = i^* D_S / D_S \mathcal{I}_Z \) and it is a locally free right \( D_Z \) module.

(iii) Let \( i : Z \hookrightarrow S \) be a closed embedding with \( Z,S \in \text{AnSm}(\mathbb{C}) \). Then, \( D_{Z \to S} = i^* D_S / D_S \mathcal{I}_Z \) and it is a locally free (left) \( D_Z \) module. Similarly, \( D_{Z \to S} = i^* D_S / D_S \mathcal{I}_Z \) and it is a locally free right \( D_Z \) module.
Proof. (i): See [10].
(ii): See [25].
(iii): Similar to (ii).

We now enumerate some functorialities we will use, all of them are particular case of the functoriality given in subsection 2.3 for any ringed spaces:

- Let $f: X \to S$ be a morphism with $X, S \in \text{Var}(\mathbb{C})$, or let $f: X \to S$ be a morphism with $X, S \in \text{AnSp}(\mathbb{C})$. Then, the inverse image functor
\[ f^\text{mod} : \text{PSh}_{O_S}(S) \to \text{PSh}_{O_X}(X) \quad M \mapsto f^\text{mod} M := O_X \otimes_{f^* O_S} f^* M \]
is a Quillen adjoinction which induces in the derived category the functor
\[ Lf^\text{mod} : D_{O_S}(S) \to D_{O_X}(X) \quad M \mapsto Lf^\text{mod} M := O_X \otimes_{f^* O_S} f^* M = O_X \otimes_{f^* O_S} f^* L_O M, \]
The adjonction $(f^\text{mod}, f_*) : \text{PSh}_{O_S}(S) \rightleftarrows \text{PSh}_{O_X}(X)$ is a Quillen adjoinction, the adjoinction map are the maps
- for $M \in C_{O_S}(S)$, ad$(f^\text{mod}, f_*) : M \xrightarrow{ad(f^* , f_*)(M)} f_* f^* M \xrightarrow{L_m} f_* f^* (f^* M \otimes_{f^* O_S} O_X) = f_* (f^* M \otimes_{f^* O_S} O_X)$ where $m f(m) = m \otimes 1$,
- for $M \in C_{O_X}(X)$, ad$(f^\text{mod}, f_*) : f^* M = f^* f_* M \otimes_{f^* O_S} O_X \xrightarrow{ad(f^* , f_*)}(M \otimes_{f^* O_S} O_X) \xrightarrow{\beta} M$, where $n(m \otimes h) = h m$ is the multiplication map.

- Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$.
  - For $M \in C_D(S)$, we have the canonical projective resolution $q : L_D(M) \to M$ of complexes of $D_S$ modules.
  - For $M \in C_D(S)$, there exist a unique strucure of $D_S$ module on the flasque presheaves $E(M)$ such that $E(M) \in C_D(S)$ (i.e. a complex of $D_S$ modules) and that the map $k : M \to E(M)$ is a morphism of complexes of $D_S$ modules.

Let $S \in \text{AnSm}(\mathbb{C})$.

- For $M \in C_{D^\sim}(S)$, we have the canonical projective resolution $q : L_{D^\sim}(M) \to M$ of complexes of $D_S^\sim$ modules.
- For $M \in C_{D^\sim}(S)$, there exist a unique strucure of $D_S^\sim$ module on the flasque presheaves $E(M)$ such that $E(M) \in C_{D^\sim}(S)$ (i.e. is a complex of $D_S^\sim$ modules) and that the map $k : M \to E(M)$ is a morphism of complexes of $D_S^\sim$ modules.

- Let $S \in \text{SmVar}(\mathbb{C})$ or let $S \in \text{AnSm}(\mathbb{C})$. For $M \in C_{D(D^\sim)}(S)$, $N \in C(S)$, we will consider the induced D module structure (right $D_S$ module in the case one is a left $D_S$ module and the other one is a right one) on the presheaf $M \otimes N := M \otimes_{Z_S} N$ (see section 2). We get the bifunctor
\[ C(S) \times C_D(S) \to C_D(S), (M, N) \mapsto M \otimes N \]
For $S \in \text{AnSm}(\mathbb{C})$, we also have the bifunctor $C(S) \times C_{D^\sim}(S) \to C_{D^\sim}(S), (M, N) \mapsto M \otimes N$.

- Let $S \in \text{SmVar}(\mathbb{C})$ or let $S \in \text{AnSm}(\mathbb{C})$. For $M, N \in C_{D(D^\sim)}(S)$, $M \otimes_{O_S} N$ (see section 2), has a canonical structure of $D_S$ modules (right $D_S$ module in the case one is a left $D_S$ module and the other one is a right one) given by (in the left case) for $S^o \subset S$ an open subset,
\[ m \otimes n \in \Gamma(S^o, M \otimes_{O_S} N), \gamma \in \Gamma(S^o, D_S), \gamma m \otimes n := (\gamma m) \otimes n - m \otimes \gamma n \]
This gives the bifunctor
\[ C_{\mathcal{D}(\text{op})}^2(S) \to C_{\mathcal{D}(\text{op})}(S), (M, N) \mapsto M \otimes_{O_S} N \]

More generally, let \( f : X \to S \) a morphism with \( X, S \in \text{Var}(\mathbb{C}) \) or with \( X, S \in \text{AnSp}(\mathbb{C}) \). Assume \( S \) smooth. For \( M, N \in C_{\mathcal{D}(\text{op})}(X) \), \( M \otimes_{f^*O_S} N \) (see section 2), has a canonical structure of \( f^*D_S \) modules (right \( f^*D_S \) module in the case one is a left \( f^*D_S \) module and the other one is a right one) given by (in the left case) for \( X^o \subset X \) an open subset,

\[ m \otimes n \in \Gamma(X^o, M \otimes_{f^*O_S} N), \gamma \in \Gamma(X^o, f^*D_S), \gamma.(m \otimes n) := (\gamma.m) \otimes n - m \otimes \gamma.n \]

This gives the bifunctor
\[ C_{f^*\mathcal{D}(\text{op})}(X)^2 \to C_{f^*\mathcal{D}(\text{op})}(X), (M, N) \mapsto M \otimes_{f^*O_S} N \]

For \( f : X \to S \) a morphism with \( X, S \in \text{AnSp}(\mathbb{C}) \) and \( S \) smooth, we also have the bifunctor \( C_{f^*\mathcal{D}(\text{op})}(X)^2 \to C_{f^*\mathcal{D}(\text{op})}(X), (M, N) \mapsto M \otimes_{f^*O_S} N \).

- Let \( S \in \text{SmVar}(\mathbb{C}) \) or let \( S \in \text{AnSm}(\mathbb{C}) \). For \( M \in C_{\mathcal{D}(\text{op})}(S) \) and \( N \in C_{\mathcal{D}}(S) \), we have \( M \otimes_{D_S} N \in C(S) \) (see section 2). This gives the bifunctor

\[ C_{\mathcal{D}(\text{op})}(S) \times C_{\mathcal{D}}(S) \to C(S), (M, N) \mapsto M \otimes_{D_S} N \]

For \( S \in \text{AnSm}(\mathbb{C}) \), we also have the bifunctor \( C_{\mathcal{D}(\text{op})}(S) \times C_{\mathcal{D}(\text{op})}(S) \to C(S), (M, N) \mapsto M \otimes_{D_S} N \).

- Let \( S \in \text{SmVar}(\mathbb{C}) \) or let \( S \in \text{AnSm}(\mathbb{C}) \). The internal hom bifunctor

\[ \mathcal{H}om(\cdot, \cdot) := \mathcal{H}om_{\mathcal{Z}_S}(\cdot, \cdot) : C(S)^2 \to C(S) \]

induces a bifunctor
\[ \mathcal{H}om(\cdot, \cdot) := \mathcal{H}om_{\mathcal{Z}_S}(\cdot, \cdot) : C(S) \times C_{\mathcal{D}}(S) \to C_{\mathcal{D}}(S) \]

such that, for \( F \in C(S) \) and \( G \in C_{\mathcal{D}}(S) \), the \( D_S \) structure on \( \mathcal{H}om^\bullet(F, G) \) is given by

\[ \gamma \in \Gamma(S^o, D_S) \mapsto (\phi \in \mathcal{H}om^p(F_{|S^o}, G_{|S^o}) \mapsto (\gamma \cdot \phi : \alpha \in F^p(S^o) \mapsto \gamma \cdot \phi^p(S^o)(\alpha)) \]

where \( \phi^p(S^o)(\alpha) \in \Gamma(S^o, G) \). For \( S \in \text{AnSm}(\mathbb{C}) \), it also induce the bifunctor

\[ \mathcal{H}om(\cdot, \cdot) := \mathcal{H}om_{\mathcal{Z}_S}(\cdot, \cdot) : C(S) \times C_{\mathcal{D}(\text{op})}(S) \to C_{\mathcal{D}(\text{op})}(S) \]

- Let \( S \in \text{SmVar}(\mathbb{C}) \) or let \( S \in \text{AnSm}(\mathbb{C}) \). For \( M, N \in C_{\mathcal{D}}(S) \), \( \mathcal{H}om_{O_S}(M, N) \), has a canonical structure of \( D_S \) modules given by for \( S^o \subset S \) an open subset and \( \phi \in \Gamma(S^o, \mathcal{H}om(M, O_S)) \), \( \gamma \in \Gamma(S^o, D_S) \), \( (\gamma, \phi)(m) := (\gamma(\phi(m))) - \phi(\gamma.m) \). This gives the bifunctor

\[ \mathcal{H}om_{O_S}^\bullet(-, -) : C_{\mathcal{D}}(S)^2 \to C_{\mathcal{D}}(S)^{op}, (M, N) \mapsto \mathcal{H}om_{O_S}^\bullet(M, N) \]

In particular, for \( M \in C_{\mathcal{D}}(S) \), we get the dual

\[ \mathcal{D}_S^2(M) := \mathcal{H}om_{O_S}^\bullet(M, O_S) \in C_{\mathcal{D}}(S) \]

with respect to \( O_S \), together with the canonical map \( d(M) : M \to \mathcal{D}_S^2(M) \). Let \( f : X \to S \) a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \) or with \( X, S \in \text{AnSm}(\mathbb{C}) \). We have, for \( M \in C_{\mathcal{D}}(S) \), the canonical transformation map

\[ T(f, D^o)(M) : f^*\mathcal{D}_S(M, O_S) = (f^*\mathcal{H}om_{O_S}(M, O_S)) \otimes f^*O_S O_X \]

\[ T_{\mathcal{D}}(f, \mathcal{H}om(M, O_S))_{\mathcal{Z}_S} \mathcal{H}om_{O_X}(f^*M \otimes f^*O_S O_X, O_X) := \mathcal{D}_X(f^*\mathcal{D})(M). \]

127
• Let $S \in \text{SmVar}(\mathbb{C})$ or let $S \in \text{AnSm}(\mathbb{C})$. We have the bifunctors

$$\text{Hom}^*_D(-, -) : C_D(S)^2 \to C(S), \quad (M, N) \mapsto \text{Hom}^*_D(M, N)$$

and if $N$ is a bimodule (i.e. has a right $D_S$ module structure whose opposite coincide with the left one), $\text{Hom}_{D_S}(M, N) \in C_{D_{op}}(S)$ given by for $S^o \subset S$ an open subset and $\phi \in \Gamma(S^o, \text{Hom}(M, N))$, $\gamma \in \Gamma(S^o, D_S)$, $(\phi, \gamma)(m) := (\phi(m)). \gamma$

$$\text{Hom}_{D_S}(M, N) \in C(D(S))$$

For $M \in C_D(S)$, we get in particular the dual with respect $D_S$,

$$D_S M := \text{Hom}_{D_S}(M, D_S) \in C_D(S) ; \quad D_S^K M := \text{Hom}_{D_S}(M, D_S) \otimes_{D_S} D_S^O w(K_S)[d_S] \in C_D(S)$$

and we have canonical map $d : M \to D_S^2 M$. This functor induces in the derived category, for $M \in D_D(S)$,

$$L D_S M := R \text{Hom}_{D_S}(L D_M, D_S) \otimes_{D_S} D_S^O w(K_S)[d_S] = D_S^K L D_M \in D_D(S)$$

where $D_S^O w(S) : D_S^O w(K_S) \to D_S^O K_S = K_S^1$ is the dual of the Koczul resolution of the canonical bundle (prop 62), and the canonical map $d : M \to L D_S^2 M$. For $S \in \text{AnSm}(\mathbb{C})$, we also have the bifunctors

$$\text{Hom}^*_D(-, -) : C_D(S)^2 \to C(S), \quad (M, N) \mapsto \text{Hom}^*_D(M, N)$$

and if $N$ is a bimodule,

$$\text{Hom}_{D_S}(M, N) \in C_{D_{op}}(S)$$

For $M \in C_D(S)$, we get in particular the dual with respect $D_S^\infty$,

$$D_S^\infty M := \text{Hom}_{D_S^\infty}(M, D_S^\infty) \in C_{D_{op}}(S) ; \quad D_S^{\infty, K} M := \text{Hom}_{D_S^\infty}(M, D_S^\infty) \otimes_{D_S^\infty} D_S^O w(K_S)[d_S] \in C_{D_{op}}(S)$$

and we have canonical maps $d : M \to D_S^{\infty, 2} M ; d : M \to D_S^{\infty, K, 2} M$. This functor induces in the derived category, for $M \in D_{D_{op}}(S)$,

$$L D_S^\infty M := R \text{Hom}_{D_S^\infty}(L D_M, D_S^\infty) \otimes_{D_S^\infty} D_S^O w(K_S)[d_S] = D_S^{\infty, K} L D_{\infty} M \in D_{D_{op}}(S)$$

and the canonical map $d : M \to L D_S^{\infty, 2} M$.

• Let $f : X \to S$ a morphism with $X, S \in \text{SmVar}(\mathbb{C})$ or with $X, S \in \text{AnSm}(\mathbb{C})$. For $N \in C_{D_{f_{op}}}(X)$ and $M \in C_D(X)$, $N \otimes_{D_X} M$ has the canonical $f^* D_S$ module structure given by, for $X^o \subset X$ an open subset,

$$\gamma \in \Gamma(X^o, f^* D_S), m \in \Gamma(X^o, M), n \in \Gamma(X^o, N), \gamma \cdot (n \otimes m) = (\gamma \cdot n) \otimes m.$$
• Let \( f : X \to S \) be a morphism with \( X,S \in \text{SmVar}(\mathbb{C}) \), or let \( f : X \to S \) be a morphism with \( X,S \in \text{AnSm}(\mathbb{C}) \). Then, for \( M \in C_D(S) \), \( O_X \otimes_{f^* O_S} f^* M \) has a canonical \( D_X \) module structure given by given by, for \( X^o \subset X \) an open subset,
\[
m \otimes n \in \Gamma(X^o, O_X \otimes_{f^* O_S} f^* M), \gamma \in \Gamma(X^o, D_X), \quad \gamma.(m \otimes n) := (\gamma.m) \otimes n - m \otimes df(\gamma).n.
\]
This gives the inverse image functor
\[
f^{\text{mod}} : \text{PSh}_D(S) \to \text{PSh}_D(X), \quad M \mapsto f^{\text{mod}}M := O_X \otimes_{f^* O_S} f^* M = D_{X \to S} \otimes_{f^* D_S} f^* M
\]
which induces in the derived category the functor
\[
L f^{\text{mod}} : D_D(S) \to D_D(X), \quad M \mapsto L f^{\text{mod}}M := O_X \otimes_{f^* O_S} f^* M = O_X \otimes_{f^* O_S} f^* L_D M,
\]
We will also consider the shifted inverse image functor
\[
L f^{\text{mod}}[-] := L f^{\text{mod}}[d_S - d_X] : D_D(S) \to D_D(X).
\]
• Let \( f : X \to S \) be a morphism with \( X,S \in \text{AnSm}(\mathbb{C}) \). Then, for \( M \in C_D(S) \), \( O_X \otimes_{f^* O_S} f^* M \) has a canonical \( D_X^{\infty} \) module structure induced by the finite order case. This gives the inverse image functor
\[
f^{\text{mod}} : \text{PSh}_D(S) \to \text{PSh}_D(X), \quad M \mapsto f^{\text{mod}}M := O_X \otimes_{f^* O_S} f^* M = D_{X \to S} \otimes_{f^* D_S} f^* M
\]
which induces in the derived category the functor
\[
L f^{\text{mod}} : D_D(S) \to D_D(X), \quad M \mapsto L f^{\text{mod}}M := O_X \otimes_{f^* O_S} f^* M = O_X \otimes_{f^* O_S} f^* L_D M,
\]
We will also consider the shifted inverse image functor
\[
L f^{\text{mod}}[-] := L f^{\text{mod}}[d_S - d_X] : D_D(S) \to D_D(X).
\]
• Let \( f : X \to S \) be a morphism with \( X,S \in \text{SmVar}(\mathbb{C}) \), or let \( f : X \to S \) be a morphism with \( X,S \in \text{AnSm}(\mathbb{C}) \). For \( M \in C_D(X) \), \( D_X \otimes_{D_X} M \) has the canonical \( f^* D_S \) module structure given above. Then, the direct image functor
\[
f_{\text{mod}}^0 : \text{PSh}_D(X) \to \text{PSh}_D(S), \quad M \mapsto f_{\text{mod}}M := f_*(D_X \otimes_{D_X} M)
\]
induces in the derived category the functor
\[
\int_f = R f_{\text{mod}} : D_D(X) \to D_D(S), \quad M \mapsto \int_f M = R f_*(D_X \otimes_{D_X} M).
\]
• Let \( f : X \to S \) be a morphism with \( X,S \in \text{AnSm}(\mathbb{C}) \). For \( M \in C_D(X) \), \( D_X \otimes_{D_X} M \) has the canonical \( f^* D_S \) module structure given above. Then, the direct image functor
\[
f_{\text{mod}}^{00} : \text{PSh}_D(X) \to \text{PSh}_D(S), \quad M \mapsto f_{\text{mod}}M := f_*(D_X^{\infty} \otimes_{D_X} M)
\]
induces in the derived category the functor
\[
\int_f = R f_{\text{mod}} : D_D(X) \to D_D(S), \quad M \mapsto \int_f M = R f_*(D_X^{\infty} \otimes_{D_X} M).
\]
• Let \( f : X \to S \) be a morphism with \( X,S \in \text{AnSm}(\mathbb{C}) \). The direct image functor with compact support
\[
f_{\text{lim}}^{00} : \text{PSh}_D(X) \to \text{PSh}_D(S), \quad M \mapsto f_{\text{lim}}M := f_!(D_S \otimes_{D_X} M)
\]
induces in the derived category the functor
\[
\int_{f^!} = R f_{\text{lim}} : D_D(X) \to D_D(S), \quad M \mapsto \int_{f^!} M = R f_!(D_S \otimes_{D_X} M).
\]
• Let $f : X \to S$ be a morphism with $X, S \in \text{AnSm}(\mathbb{C})$. The direct image functor with compact support
$$
f^{0\text{mod}} : \text{PSh}_{\mathbb{D}^\times}(X) \to \text{PSh}_{\mathbb{D}^\times}(S), \quad M \mapsto f_{\text{mod}}^* M := f_!(D^\infty_{X \to S} \otimes D^\infty_{S \to X} M)
$$
duces in the derived category the canonical transformation map given by the adjunction maps
$$
\int_f = Rf_{\text{mod}} : D_{\mathbb{D}^\times}(X) \to D_{\mathbb{D}^\times}(S), \quad M \mapsto \int_f M = Rf_!(D^\infty_{X \to S} \otimes L^f_{D^\infty_{S \to X}} M).
$$

• Let $S \in \text{SmVar}(\mathbb{C})$. The analytical functor of a $D_S$ modules has a canonical structure of $D_{S^{an}}$ module:
$$( - )^{an} : C_\mathbb{D}(S) \to C_\mathbb{D}(S^{an}), \quad M \mapsto M^{an} := an^{\text{mod}}_{S^{an}} M := M \otimes_{an^{\text{an}}_S} O_{S^{an}}$$
which induces in the derived category
$$
( - )^{an} : D_\mathbb{D}(S) \to D_\mathbb{D}(S^{an}), \quad M \mapsto M^{an} := an^{\text{mod}}_{S^{an}} M
$$
since $an^{\text{mod}}_{S^{an}}$ derive trivially.

The functorialities given above induce:

• Let $f : X \to S$ be a morphism with $X, S \in \text{Var}(\mathbb{C})$, or let $f : X \to S$ be a morphism with $X, S \in \text{AnSp}(\mathbb{C})$. The adjonction map induces
  
  
  \[
  \text{ad}(Lf^{\text{mod}}, Rf_*)(M, F) : (M, F) \xrightarrow{\text{load}(f^*, f_*)(M, F)} f_*E(f^*(M, F)) = Rf_*f^*(M, F)
  \]
  \[
  \xrightarrow{f_*m} Rf_*(f^*(M, F)) \otimes_{f^*O_S} O_X = Rf_*f^*(M, F),
  \]
  
  where $m(m) = m \otimes 1$,

  • for $(M, F) \in C_{O_S f\mathbb{D}}(S)$, the map in $D_{O_S f\mathbb{D}}(S)$

  \[
  \text{ad}(Lf^{\text{mod}}, Rf_*)(M, F) : (M, F) \xrightarrow{\text{load}(f^*, f_*)(M, F)} f_*E(f^*(M, F)) = Rf_*f^*(M, F)
  \]
  \[
  \xrightarrow{f_*m} Rf_*(f^*(M, F)) \otimes_{f^*O_S} O_X = Rf_*f^*(M, F),
  \]
  
  where $n(m \otimes h) = h.m$ is the multiplication map.

• For a commutative diagram in $\text{Var}(\mathbb{C})$ or in $\text{AnSp}(\mathbb{C})$:

\[
D = \begin{array}{c}
Y \xrightarrow{g_2} X \\
\downarrow f_2 \\
T \xrightarrow{g_1} S
\end{array}
\]

we have, for $(M, F) \in C_{O_X f\mathbb{D}}(X)$, the canonical map in $D_{O_X f\mathbb{D}}(T)$

\[
T^{\text{mod}}(D)(M, F) : Lg_1^{\text{mod}} f_1^*(M, F) \xrightarrow{\text{ad}(Lf_2^{\text{mod}}, Rf_2)(Lg_1^{\text{mod}} f_1^*E(M, F))}
\]

\[
Rf_2^*Lg_2^{\text{mod}}Lg_1^{\text{mod}} Rf_1^*(M, F) = Rf_2^*Lg_2^{\text{mod}} Lf_1^{\text{mod}} Rf_1^*(M, F)
\]

\[
\xrightarrow{\text{ad}(Lf_2^{\text{mod}}, Rf_2)(M, F)} Rf_2^*Lg_2^{\text{mod}}(M, F)
\]

the canonical transformation map given by the adjonction maps.
• Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$. For $(M, F) \in C_{\text{fil}}(S)$ and $(N, F) \in C_{\text{fil}}(S)$, recall that (see section 2)

$$F^p((M, F) \otimes (N, F)) := \text{Im}(\oplus_q F^q M \otimes F^{p-q} N \to M \otimes N)$$

This gives the functor

$$(\cdot, \cdot) : C_{\text{fil}}(S) \times C_{\text{Dfil}}(S) \to C_{\text{Dfil}}(S), ((M, F), (N, F)) \mapsto (M, F) \otimes (N, F).$$

It induces in the derived categories by taking r-projective resolutions the bifunctors, for $r = 1, \ldots, \infty$,

$$(\cdot, \cdot) : D_{\text{Dfil}, r}(S) \times D_{\text{fil}, r}(S) \to D_{\text{Dfil}, r}(S), ((M, F), (N, F)) \mapsto (M, F) \otimes^L (N, F) = L_D(M, F) \otimes (N, F).$$

For $S \in \text{AnSm}(\mathbb{C})$, it gives the bifunctor

$$(\cdot, \cdot) : C_{\text{fil}}(S) \times C_{D^\infty \text{fil}}(S) \to C_{D^\infty \text{fil}}(S), ((M, F), (N, F)) \mapsto (M, F) \otimes (N, F),$$

and its derived functor.

• Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$ and $O_S \in \text{PSh}(\text{S, cRing})$ a sheaf of commutative ring. For $(M, F) \in C_{O_S \text{fil}}(S)$ and $(N, F) \in C_{O_S \text{fil}}(S)$, recall that (see section 2)

$$F^p((M, F) \otimes_{O_S} (N, F)) := \text{Im}(\oplus_q F^q M \otimes_{O_S} F^{p-q} N \to M \otimes_{O_S} N)$$

It induces in the derived categories by taking r-projective resolutions the bifunctors, for $r = 1, \ldots, \infty$,

$$(\cdot, \cdot) : D_{\text{Dfil}, r}(S)^2 \to D_{\text{Dfil}, r}(S), ((M, F), (N, F)) \mapsto (M, F) \otimes^L_{O_S} (N, F).$$

More generally, let $f : X \to S$ a morphism with $X, S \in \text{Var}(\mathbb{C})$ or with $X, S \in \text{AnSp}(\mathbb{C})$. Assume $S$ smooth. We have the bifunctors

$$(\cdot, \cdot) : D_{f^* \text{Dfil}, r}(X)^2 \to D_{f^* \text{Dfil}, r}(X), ((M, F), (N, F)) \mapsto (M, F) \otimes^L_{f^* O_S} (N, F) = (M, F) \otimes_{f^* O_S} L_{f^* D}(N, F).$$

• Let $S \in \text{SmVar}(\mathbb{C})$ or let $S \in \text{AnSm}(\mathbb{C})$. The hom functor induces the bifunctor

$${\text{Hom}}(-, -) : C_{\text{fil}}(S) \times C_{\text{fil}}(S) \to C_{\text{Dfil}(1, 0)}(S), ((M, W), (N, F)) \mapsto {\text{Hom}}((M, W), (N, F)).$$

For $S \in \text{AnSm}(\mathbb{C})$, the hom functor also induces the bifunctor

$${\text{Hom}}(-, -) : C_{D^\infty \text{fil}}(S) \times C_{\text{fil}}(S) \to C_{D^\infty (1, 0)}(S), ((M, W), (N, F)) \mapsto {\text{Hom}}((M, W), (N, F)).$$

Note that the filtration given by $W$ satisfy that the $W^p$ are $D_S$ submodule which is stronger than Griffitz transversality.

• Let $S \in \text{SmVar}(\mathbb{C})$ or let $S \in \text{AnSm}(\mathbb{C})$. The hom functor induces the bifunctor

$${\text{Hom}}_{O_S}(-, -) : C_{\text{fil}}(S)^2 \to C_{D_{2fil}}(S), ((M, W), (N, F)) \mapsto {\text{Hom}}_{O_S}((M, W), (N, F)).$$

• Let $S \in \text{SmVar}(\mathbb{C})$ or let $S \in \text{AnSm}(\mathbb{C})$. The hom functor induces the bifunctors

- $${\text{Hom}}_{D_S}(-, -) : C_{\text{fil}}(S)^2 \to C_{2fil}(S), ((M, W), (N, F)) \mapsto {\text{Hom}}_{D_S}((M, W), (N, F)),$$
- $${\text{Hom}}_{D_S}(-, -) : C_{D^\infty \text{fil}}(S)^2 \to C_{2fil}(S), ((M, W), (N, F)) \mapsto {\text{Hom}}_{D_S}((M, W), (N, F)).$$
We get the filtered dual
\[ D_S^K(\cdot) : C_{D(2)fri}(S) \to C_{D(2)fri}(S)^{op}, \ (M, F) \mapsto D_S^K(M, F) := \mathcal{H}om_{D_S}(\mathcal{O}, D_S) \otimes_{O_S} D_S^0 w(K_S)[d_S] \]
together with the canonical map \( d(M, F) : (M, F) \to D_S^{2K}(M, F) \). Of course \( D_S^K(\cdot)(C_{D(1,0)fri}(S)) \subseteq C_{D(1,0)fri}(S) \). It induces in the derived categories \( D_{D_{fri},r}(S) \), for \( r = 1, \ldots, \infty \), the functors
\[ L D_S(\cdot) : D_{D(2)fri,r}(S) \to D_{D(2)fri,r}(S)^{op}, \ (M, F) \mapsto L D_S(M, F) := D_S^K L_D(M, F). \]
together with the canonical map \( d(M, F) : L_D(M, F) \to D_S^{2K} L_D(M, F) \).

- Let \( S \in \text{AnSm}(\mathbb{C}) \). The hom functor also induces the bifunctors
  \[ \text{Hom}_{D_S}(-, -) : C_{D(\infty)fri}(S)^2 \to C_{2fri}(S), \ ((M, W), (N, F)) \mapsto \mathcal{H}om_{D_S}((M, W)(N, F)), \]
  \[ \text{Hom}_{D_S}(N, M) : C_{D(\infty)^{op}fri}(S)^2 \to C_{2fri}(S), \ ((M, W), (N, F)) \mapsto \mathcal{H}om_{D_S}((M, W)(N, F)). \]

We get the filtered dual
\[ D_S^{\infty,K}(\cdot) : C_{D(2)fri}(S) \to C_{D(2)fri}(S)^{op}, \ (M, F) \mapsto D_S^{\infty,K}(M, F) := \mathcal{H}om_{D_S}(\mathcal{O}, D_S^0) \otimes_{O_S} D_S^0 w(K_S)[d_S] \]
together with the canonical map \( d(M, F) : (M, F) \to D_S^{\infty,2}(M, F) \). Of course \( D_S^{\infty,K}(\cdot)(C_{D(1,0)fri}(S)) \subseteq C_{D(1,0)fri}(S) \). It induces in the derived categories \( D_{D_{fri},r}(S) \), for \( r = 1, \ldots, \infty \), the functors
\[ L D_S^\infty(\cdot) : D_{D(2)fri,r}(S) \to D_{D(2)fri,r}(S)^{op}, \ (M, F) \mapsto L D_S^\infty(M, F) := D_S^{\infty,K} L_D(M, F). \]
together with the canonical map \( d(M, F) : (M, F) \to L D_S^{\infty,2}(M, F) \).

- Let \( f : X \to S \) be a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \), or let \( f : X \to S \) be a morphism with \( X, S \in \text{AnSm}(\mathbb{C}) \). Then, the inverse image functor
\[ f^{mod} : C_{D(2)fri}(S) \to C_{D(2)fri}(X), \ (M, F) \mapsto f^{mod}(M, F) := (O_X, F_b) \otimes_{f^{*}O_S} f^{*}(M, F) = (D_{X \to S}, F_{\text{ord}}) \otimes_{f^{*}O_S} f^{*}(M, F), \]
induces in the derived categories the functors, for \( r = 1, \ldots, \infty \) (resp. \( r \in (1, \ldots, \infty)^2 \)),
\[ L f^{mod} : D_{D(2)fri,r}(S) \to D_{D(2)fri,r}(X)(M, F) \mapsto L f^{mod}(M) := (O_X, F_b) \otimes_{f^{*}O_S} f^{*}(M, F) = (O_X, F_b) \otimes_{f^{*}O_S} f^{*}L_D(M, F). \]
Of course \( f^{mod}(C_{D(1,0)fri}(S)) \subseteq C_{D(1,0)fri}(X) \). Note that
- If the \( M \) is a complex of locally free \( O_S \) modules, then \( L f^{mod}(M, F) = f^{mod}(M, F) \) in \( D_{D(2)fri,r}(S) \).
- If the \( \text{Gr}_{\mathfrak{p}} M \) are complexes of locally free \( O_S \) modules, then \( L f^{mod}(M, F) = f^{mod}(M, F) \) in \( D_{D(2)fri}(S) \).

We will consider also the shifted inverse image functors
\[ L f^{mod}[\cdot] := L f^{mod}[d_S - d_X] : D_{D(2)fri,r}(S) \to D_{D(2)fri,r}(X). \]

- Let \( f : X \to S \) be a morphism with \( X, S \in \text{AnSm}(\mathbb{C}) \). Then, the inverse image functor
\[ f^{mod} : C_{D(\infty)fri}(S) \to C_{D(\infty)fri}(X), \ (M, F) \mapsto f^{mod}(M, F) := (O_X, F_b) \otimes_{f^{*}O_S} f^{*}(M, F), \]
induces in the derived categories the functors, for \( r = 1, \ldots, \infty \) (resp. \( r \in (1, \ldots, \infty)^2 \)),

\[
Lf^{\text{mod}} : D_{D^\infty (2;fil,r)}(S) \to D_{D^\infty (2;fil,r)}(X),
\]

\[
(M, F) \mapsto Lf^{\text{mod}} M := (O_X, F_0) \otimes_{D^b\text{-}O_S} f^* (M, F) = (O_X, F_0) \otimes f^* L_{D^\infty}(M, F).
\]

Of course \( f^{\text{mod}}(C_{D^\infty (1;fil)}(S)) \subset C_{D^\infty (1;fil)}(X) \). Note that We will consider also the shifted inverse image functors

\[
Lf^{\text{mod}[-]} := Lf^{\text{mod}}[d_S - d_X] : D_{D^\infty (2;fil,r)}(S) \to D_{D^\infty (2;fil,r)}(X).
\]

- Let \( f : X \to S \) be a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \), or let \( f : X \to S \) be a morphism with \( X, S \in \text{AnSm}(\mathbb{C}) \). Then, the direct image functor

\[
f_{*\text{mod}}^{\text{0}} : (\text{PSh}_{D}(X), F) \to (\text{PSh}_{D}(S), F), \quad (M, F) \mapsto f_{*\text{mod}}(M, F) := f_*((D_{S^\infty -X}, F^{\text{ord}}) \otimes D_X (M, F))
\]

induces in the derived categories by taking r-injective resolutions the functors, for \( r = 1, \ldots, \infty \),

\[
\int_f = Rf_{*\text{mod}} : D_{D(2;fil,r)}(X) \to D_{D(2;fil,r)}(S), \quad (M, F) \mapsto \int_f (M, F) = Rf_*((D_{S^\infty -X}, F^{\text{ord}}) \otimes D_X (M, F)).
\]

Let \( f_1 : X \to Y \) and \( f_2 : Y \to S \) two morphisms with \( X, Y, S \in \text{SmVar}(\mathbb{C}) \) or with \( X, Y, S \in \text{AnSm}(\mathbb{C}) \). We have, for \( (M, F) \in C_{D(2;fil)}(X) \), the canonical transformation map in \( D_{D(2;fil,r)}(S) \)

\[
T\left( \int_{f_2} \circ \int_{f_1} \int_{f_2 \circ f_1} \right) (M, F) :
\]

\[
\int_{f_2} \int_{f_1} (M, F) := Rf_2_*((D_{Y^\infty -S}, F^{\text{ord}}) \otimes D_Y (M, F))
\]

\[
\int_{f_2} \int_{f_1} (M, F) := Rf_2_*((D_{Y^\infty -S}, F^{\text{ord}}) \otimes D_Y (M, F))
\]

\[
\xrightarrow{T(f_1, \Box \langle -,- \rangle)} Rf_2_* Rf_1_* (f_1^* (D_{Y^\infty -S}, F^{\text{ord}}) \otimes D_Y (M, F))
\]

\[
\xrightarrow{\sim} Rf_2_* Rf_1_* (f_1^* (D_{Y^\infty -S}, F^{\text{ord}}) \otimes D_Y (M, F))
\]

\[
\int_{f_2 \circ f_1} (M, F) := \int_{f_2 \circ f_1} (M, F)
\]

- Let \( f : X \to S \) be a morphism with \( X, S \in \text{AnSm}(\mathbb{C}) \). Then, the direct image functor

\[
f_{*\text{mod}}^{\text{0}} : (\text{PSh}_{D}(X), F) \to (\text{PSh}_{D}(S), F), \quad (M, F) \mapsto f_{*\text{mod}}(M, F) := f_*((D_{S^\infty -X}, F^{\text{ord}}) \otimes D_X (M, F))
\]

induces in the derived categories by taking r-injective resolutions the functors, for \( r = 1, \ldots, \infty \),

\[
\int_f = Rf_{*\text{mod}} : D_{D^\infty (2;fil,r)}(X) \to D_{D^\infty (2;fil,r)}(S), \quad (M, F) \mapsto \int_f (M, F) = Rf_*((D_{S^\infty -X}, F^{\text{ord}}) \otimes D_X (M, F)).
\]

We have, similarly, for \( (M, F) \in C_{D^\infty (2;fil)}(X) \), the canonical transformation map in \( D_{D^\infty (2;fil,r)}(S) \)

\[
T\left( \int_{f_2} \circ \int_{f_1} \int_{f_2 \circ f_1} \right) (M, F) : \int_{f_2} \int_{f_1} (M, F) \to \int_{f_2 \circ f_1} (M, F)
\]

- Let \( f : X \to S \) be a morphism with \( X, S \in \text{AnSm}(\mathbb{C}) \). Then, the direct image functor with compact support

\[
f_{*\text{mod}}^{\text{0}} : (\text{PSh}_{D}(X), F) \to (\text{PSh}_{D}(S), F), \quad (M, F) \mapsto f_{*\text{mod}}(M, F) := f_*((D_{S^\infty -X}, F^{\text{ord}}) \otimes D_X (M, F))
\]

induces in the derived categories by taking r-injective resolutions the functors, for \( r = 1, \ldots, \infty \),

\[
\int_f = Rf_{*\text{mod}} : D_{D^\infty (2;fil,r)}(X) \to D_{D^\infty (2;fil,r)}(S), \quad (M, F) \mapsto \int_f (M, F) = Rf_*((D_{S^\infty -X}, F^{\text{ord}}) \otimes D_X (M, F)).
\]
We have, similarly, for \((M, F) \in C_{D_{fil}}(X)\), the canonical transformation map in \(D_{D(2)fil,r}(S)\)

\[
T\left(\int_{f_{2}!} \circ \int_{f_{1}!} \, \left(\int_{f_{2} \circ f_{1}} \right) (M, F) : \int_{f_{2}!} \int_{f_{1}!} (M, F) \to \int_{(f_{2} \circ f_{1})!} (M, F) \right)
\]

Let \(f : X \to S\) be a morphism with \(X, S \in \text{SmVar}(\mathbb{C})\). Then, the direct image functor with compact support

\[
f_{1}^{an} : (\text{PSh}_{\Delta}(X), F) \to (\text{PSh}_{\Delta}(S), F), \quad (M, F) \mapsto f_{1}^{an}(M, F) := f_{1}((D_{S+\Delta}^{\infty}, F^{ord}) \otimes_{D_{X}^{\infty}} D_{S}^{\infty}(M, F))
\]

induces in the derived categories by taking r-injective resolutions the functors, for \(r = 1, \ldots, \infty\),

\[
\int_{f_{1}!} = Rf_{1}^{an} : D_{D_{fil}}(X) \to D_{D_{fil}}(S), (M, F) \mapsto \int_{f_{1}} (M, F) = Rf_{1}((D_{S+\Delta}^{\infty}, F^{ord}) \otimes_{D_{X}^{\infty}} L_{D_{S}^{\infty}}(M, F)).
\]

We have, similarly, for \((M, F) \in C_{D_{fil}}(X)\), the canonical transformation map in \(D_{D(2)fil,r}(S)\)

\[
T\left(\int_{f_{2}!} \circ \int_{f_{1}!} \, \left(\int_{f_{2} \circ f_{1}} \right) (M, F) : \int_{f_{2}!} \int_{f_{1}!} (M, F) \to \int_{(f_{2} \circ f_{1})!} (M, F) \right)
\]

Let \(S \in \text{SmVar}(\mathbb{C})\). The analytical functor for filtered \(D_{S}\)-modules is

\[
(\cdot)^{an} : C_{D(2)fil}(S) \to C_{D(2)fil}(S^{an}), \quad (M, F) \mapsto (M, F)^{an} := an_{S}^{*}(M, F) \otimes_{an_{S}} O_{S}(O_{S}^{an}, F_{b}).
\]

It induces in the derived categories the functors, for \(r = 1, \ldots, \infty\),

\[
(\cdot)^{an} : D_{D(2)fil}(S) \to D_{D(2)fil}(S^{an}), \quad (M, F) \mapsto (M, F)^{an} := an_{S}^{*}(M, F) \otimes_{an_{S}} L_{an_{S}} O_{S}(O_{S}^{an}, F_{b}).
\]

Let \(f : X \to S\) be a morphism with \(X, S \in \text{SmVar}(\mathbb{C})\), or let \(f : X \to S\) be a morphism with \(X, S \in \text{SmVar}(\mathbb{C})\). Then the functor

\[
f^{an} : C_{D_{fil}}(X) \to C_{D_{fil}}(S^{an}), \quad (M, F) \mapsto f^{an}(M, F) := \text{an}_{S}^{*} L_{D} f^{an} L_{D} \text{an}_{S}^{*} D_{S}(M, F)
\]

induces in the derived categories the exceptional inverse image functors, for \(r \in (1, \ldots, \infty)^{2}\),

\[
Lf^{an} : D_{D(2)fil,r}(S) \to D_{D(2)fil,r}(X), \quad (M, F) \mapsto Lf^{an}(M, F) := \text{D}_{X}^{\infty} L_{D} f^{an} L_{D} \text{D}_{S}^{\infty}(M, F) := f^{an} L_{D}(M, F).
\]

Of course \(f^{an}(C_{D(1,0)fil}(S)) \subset C_{D(1,0)fil}(X)\). We will also consider the shifted exceptional inverse image functors

\[
Lf^{an}[\cdot] := Lf^{an} d_{S} - d_{X} : D_{D(2)fil,r}(S) \to D_{D(2)fil,r}(X).
\]

Let \(f : X \to S\) be a morphism with \(X, S \in \text{AnSm}(\mathbb{C})\). Then the functor

\[
f^{an} : C_{D^{\infty}(2)fil}(S) \to C_{D^{\infty}(2)fil}(X), \quad (M, F) \mapsto f^{an}(M, F) := \text{D}_{X}^{\infty} L_{D} f^{an} L_{D} \text{D}_{S}^{\infty}(M, F)
\]

induces in the derived categories the exceptional inverse image functors, for \(r = 1, \ldots, \infty\) (resp. \(r \in (1, \ldots, \infty)^{2}\)),

\[
Lf^{an} : D_{D^{\infty}(2)fil,r}(S) \to D_{D^{\infty}(2)fil,r}(X), \quad (M, F) \mapsto Lf^{an}(M, F) := \text{D}_{X}^{\infty} L_{D} f^{an} L_{D} \text{D}_{S}^{\infty}(M, F) := f^{an} L_{D}(M, F).
\]

Of course \(f^{an}(C_{D^{\infty}(1,0)fil}(S)) \subset C_{D^{\infty}(1,0)fil}(X)\). We will also consider the shifted exceptional inverse image functors

\[
Lf^{an}[\cdot] := Lf^{an} d_{S} - d_{X} : D_{D^{\infty}(2)fil,r}(S) \to D_{D^{\infty}(2)fil,r}(X).
\]
• Let $S_1, S_2 \in \text{SmVar}(\mathbb{C})$ or $S_1, S_2 \in \text{AnSm}(\mathbb{C})$. Consider $p : S_1 \times S_2 \to S_1$ the projection. Since $p$ is a projection, we have a canonical embedding $p^*D_{S_1} \to D_{S_1 \times S_2}$. For $(M, F) \in C_{D_{(2)}}(S_1 \times S_2)$, $(M, F)$ has a canonical $p^*D_{S_1}$ module structure. Moreover, with this structure, for $(M_1, F) \in C_{D_{(2)}}(S_1)$

$$\text{ad}(p^{*\text{mod}}, p)(M_1, F) : (M_1, F) \to p_*p^{*\text{mod}}(M_1, F)$$

is a map of complexes of $D_{S_1}$ modules, and for $(M_{12}, F) \in C_{D_{(2)}}(S_1 \times S_2)$

$$\text{ad}(p^{*\text{mod}}, p)(M_{12}, F) : p^{*\text{mod}}p_*(M_{12}, F) \to (M_{12}, F)$$

is a map of complexes of $D_{S_1 \times S_2}$ modules. Indeed, for the first adjunction map, we note that $p^{*\text{mod}}(M_1, F)$ has a structure of $p^*D_{S_1}$ module, hence $p_*p^{*\text{mod}}(M_1, F)$ has a structure of $p_*p^*D_{S_1}$ module, hence a structure of $D_{S_1}$ module using the adjunction map $\text{ad}(p^*, p_*)(D_{S_1}) : D_{S_1} \to p_*p^*D_{S_1}$. For the second adjunction map, we note that $(M_{12}, F)$ has a structure of $p^*D_{S_1}$ module, hence $p_*(M_{12}, F)$ has a structure of $p_*p^*D_{S_1}$, hence a structure of $D_{S_1}$ module using the adjunction map $\text{ad}(p^*, p_*)(D_{S_1}) : D_{S_1} \to p_*p^*D_{S_1}$.

• Let $S_1, S_2 \in \text{AnSm}(\mathbb{C})$. Consider $p : S_1 \times S_2 \to S_1$ the projection. Since $p$ is a projection, we have a canonical embedding $p^*D_{S_1} \to D_{S_1 \times S_2}$. For $(M, F) \in C_{D_{(2)}}(S_1 \times S_2)$, $(M, F)$ has a canonical $p^*D_{S_1}$ module structure. Moreover, with this structure, for $(M_1, F) \in C_{D_{(2)}}(S_1)$

$$\text{ad}(p^{*\text{mod}}, p)(M_1, F) : (M_1, F) \to p_*p^{*\text{mod}}(M_1, F)$$

is a map of complexes of $D_{S_1}^\infty$ modules, and for $(M_{12}, F) \in C_{D_{(2)}}(S_1 \times S_2)$

$$\text{ad}(p^{*\text{mod}}, p)(M_{12}, F) : p^{*\text{mod}}p_*(M_{12}, F) \to (M_{12}, F)$$

is a map of complexes of $D_{S_1 \times S_2}^\infty$ modules, similarly to the finite order case.

We following proposition concern the commutativity of the inverse image functors and the commutativity of the direct image functors.

**Proposition 43.** (i) Let $f_1 : X \to Y$ and $f_2 : Y \to S$ two morphism with $X, Y, S \in \text{SmVar}(\mathbb{C})$.

- Let $(M, F) \in C_{D_{(2)}}(S)$. Then $(f_2 \circ f_1)^{*\text{mod}}(M, F) = f_1^{*\text{mod}}f_2^{*\text{mod}}(M, F)$.
- Let $(M, F) \in D_{(2)}(S)$. Then $L(f_2 \circ f_1)^{*\text{mod}}(M, F) = Lf_2^{*\text{mod}}(Lf_2^{*\text{mod}}(M, F))$.

(ii) Let $f_1 : X \to Y$ and $f_2 : Y \to S$ two morphism with $X, Y, S \in \text{SmVar}(\mathbb{C})$. Let $M \in D_{\mathcal{D}}(X)$. Then,

$$T(\int_{f_2 \circ f_1} \int_{f_2 \circ f_1}) (M) : \int_{f_2 \circ f_1} \int_{f_2 \circ f_1} (M) \xrightarrow{\sim} \int_{f_2 \circ f_1} (M)$$

is an isomorphism in $D_{\mathcal{D}}(S)$ (i.e. if we forget filtration).

(iii) Let $i_0 : Z_2 \hookrightarrow Z_1$ and $i_1 : Z_1 \hookrightarrow S$ two closed embedding, with $Z_2, Z_1, S \in \text{SmVar}(\mathbb{C})$. Let $(M, F) \in C_{D_{(2)}}(Z_2)$. Then, $(i_1 \circ i_0)^{*\text{mod}}(M, F) = i_1^{*\text{mod}}(i_0^{*\text{mod}}(M, F))$ in $C_{D_{(2)}}(S)$.

**Proof.** (i): Obvious : we have

- $f_1^{*\text{mod}}f_2^{*\text{mod}}(M, F) = f_1^*(f_2^*(M, F) \otimes f_2^*O_S O_Y) \otimes f_1^*O_Y O_X = f_1^*f_2^*(M, F) \otimes f_1^*f_2^*O_S f_1^*O_Y O_X = (f_2 \circ f_1)^{*\text{mod}}(M, F)$
- $Lf_1^{*\text{mod}}Lf_2^{*\text{mod}}(M, F) = f_1^*(f_2^*(M, F) \otimes f_2^*O_S O_Y) \otimes f_1^*O_Y O_X = f_1^*f_2^*(M, F) \otimes f_1^*f_2^*O_S f_1^*O_Y \otimes f_1^*O_Y O_X = L(f_2 \circ f_1)^{*\text{mod}}(M, F)$

135
Proof. Follows immediately from the non filtered case since we look at the complex in the derived category. A module is still holonomic. See [16] for the non filtered case.

Proposition 44. the isomorphic cohomology sheaves may be different.

(ii) Let \( D \) be a quasi-coherent \( D \) module, which follows from the fact that \( f_1 \) is not isomorphic to \( f_2 \).

Remark 8. Let \( f_1 : X \to Y \) and \( f_2 : Y \to S \) two morphism with \( X,Y,S \in \text{SmVar}(\mathbb{C}) \). Then, for \( (M,F) \in D_{D(2)fil,\infty}(X) \), \( \int f_2 \int f_1 (M,F) \) is NOT isomorphic to \( \int f_2 \int f_1 (M,F) \) in general, the filtrations on the isomorphic cohomology sheaves may be different.

Proposition 44. Let \( f : X \to S \) a morphism with \( X,S \in \text{SmVar}(\mathbb{C}) \). Then,

(i) For \( (M,F) \in C_{D(2)fil,h}(S) \), we have \( Lf^{*\text{mod}}(M,F) \in D_{D(2)fil,\infty,h}(X) \).

(ii) For \( (M,F) \in C_{D(2)fil,h}(X) \), we have \( \int f(M,F) \in D_{D(2)fil,\infty,h}(S) \).

Proof. Follows immediately from the non filtered case since we look at the complex in the derived category with respect to \( \infty \)-Zariski local equivalence. It says that the pullback and the pushforward of an holonomic \( D \) module is still holonomic. See [16] for the non filtered case.

The following easy proposition says that the analytical functor commutes we the pullback of \( D \) modules and the tensor product. Again it is well known in the non filtered case. Note that for \( S \in \text{SmVar}(\mathbb{C}) \), \( D_S^{an} = D_{S^{an}} \).

Proposition 45. (i) Let \( f : T \to S \) a morphism with \( T,S \in \text{SmVar}(\mathbb{C}) \).

- Let \( (M,F) \in C_{D(2)fil,r}(S) \). Then \( (f^{*\text{mod}}(M,F))^{an} = f^{*\text{mod}}(M,F)^{an} \).
- Let \( (M,F) \in D_{Dfil,r}(S) \), for \( r = 1, \ldots \infty \). Then, \( (Lf^{*\text{mod}}(M,F))^{an} = Lf^{*\text{mod}}(M,F)^{an} \).

(ii) Let \( S \in \text{SmVar}(\mathbb{C}) \)

- Let \( (M,F) \in C_{Dfil}(S) \). Then, \( ((M,F) \otimes O_S(N,F))^{an} = (M,F)^{an} \otimes O_{S^{an}}(N,F)^{an} \).
- Let \( (M,F) \in D_{Dfil,r}(S) \), for \( r = 1, \ldots \infty \). Then, \( ((M,F) \otimes _O^L(N,F))^{an} = (M,F)^{an} \otimes _O^{L^{an}}(N,F)^{an} \).
Proof. (i): For \((M, F) \in C_{D,fil}(S)\), we have, since \(f^* \text{an}^*_X = \text{an}^*_X f^{an*}\),

\[
(f^{\text{an}mod}(M, F))^\text{an} = \text{an}(X)^*(f^*(M, F) \otimes_{f^* O_S} O_X) \otimes_{\text{an}(X)^* O_X} O_X^{\text{an}n},
\]

\[
= f^{an*} \text{an}^*_X(M, F) \otimes_{f^{an*} O_{X^{an}}} O_{X^{an}} =: f^{an*mod}(M^{an}, F).
\]

For \((M, F) \in D_{D,fil,r}(S)\), we take \((M, F) \in C_{D,fil}(S)\) an r-projective \(f^* O_S\) module such that \(D_{top,r}(M, F) = (M, F)\) so that

\[
(Lf^{\text{an}mod}(M, F))^\text{an} = (f^{\text{an}mod}(M, F))^\text{an} = f^{an*mod}(M^{an}, F) = Lf^{an*mod}(M^{an}, F).
\]

(ii): For \((M, F), (N, F) \in C_{D,fil}(S)\), we have

\[
((M, F) \otimes_{O_S} (N, F))^\text{an} : = \text{an}^*_Z((M, F) \otimes_{O_S} (N, F)) \otimes_{\text{an}^*_Z O_S} O_{S^{an}}
\]

\[
= \text{an}^*_Z(M, F) \otimes_{\text{an}^*_Z O_S} \text{an}^*_S(N, F) \otimes_{\text{an}^*_S O_S} O_{S^{an}}
\]

\[
= \text{an}^*_Z(M, F) \otimes_{\text{an}^*_Z O_S} O_{S^{an}} \otimes_{O_{S^{an}}} \text{an}^*_S(N, F) \otimes_{\text{an}^*_S O_S} O_{S^{an}}
\]

\[
=: (M^{an}, F) \otimes_{O_{S^{an}}} (N^{an}, F).
\]

It implies the isomorphism in the derived category by taking an r-projective resolution of \((M, F)\) (e.g \((L\mathcal{D}(M, F) = L\mathcal{D}(M, F))\). \(\square\)

**Proposition 46.** (i) Let \(f_1 : X \to Y\) and \(f_2 : Y \to S\) two morphism with \(X, Y, S \in \text{AnSm}(\mathbb{C})\).

- Let \((M, F) \in C_{D(2),fil}(S)\) or let \((M, F) \in C_{D(\infty),fil}(S)\). Then \((f_2 \circ f_1)^{\text{an}mod}(M, F) = f_1^{\text{an}mod} f_2^{\text{an}mod}(M, F).

- Let \((M, F) \in D_{D(2),fil,r}(S)\) or let \((M, F) \in D_{D(\infty),fil,r}(S)\). Then \(L(f_2 \circ f_1)^{\text{an}mod}(M, F) = Lf_1^{\text{an}mod}(L f_2^{\text{an}mod}(M, F))\).

(ii) Let \(f_1 : X \to Y\) and \(f_2 : Y \to S\) two morphisms with \(X, Y, S \in \text{AnSm}(\mathbb{C})\). Let \(M \in D_{D}(X)\). If \(f_1\) is proper, we have \(\int_{f_2 \circ f_1} M = \int_{f_2}(\int_{f_1} M)\).

(iii) Let \(f_1 : X \to Y\) and \(f_2 : Y \to S\) two morphisms with \(X, Y, S \in \text{AnSm}(\mathbb{C})\). Let \(M \in D_{D(\infty)}(X)\). If \(f_1\) is proper, we have \(\int_{f_2 \circ f_1} M = \int_{f_2}(\int_{f_1} M)\).

(iii)’ Let \(f_1 : X \to Y\) and \(f_2 : Y \to S\) two morphisms with \(X, Y, S \in \text{AnSm}(\mathbb{C})\). Let \(M, F \in D_{D}(X)\). We have \(\int_{(f_2 \circ f_1)!} M = \int_{f_2}(\int_{f_1} M)\).

(iv) Let \(i_0 : Z_2 \hookrightarrow Z_1\) and \(i_1 : Z_1 \hookrightarrow S\) two closed embedding, with \(Z_2, Z_1, S \in \text{AnSm}(\mathbb{C})\). Let \((M, F) \in C_{D(2),fil}(Z_2)\). Then, \((i_1 \circ i_0)^{\text{an}mod}(M, F) = i_1^{\text{an}mod}(i_0^{\text{an}mod}(M, F))\) in \(C_{D(2),fil}(S)\).

(iv)’ Let \(i_0 : Z_2 \hookrightarrow Z_1\) and \(i_1 : Z_1 \hookrightarrow S\) two closed embedding, with \(Z_2, Z_1, S \in \text{AnSm}(\mathbb{C})\). Let \((M, F) \in C_{D(\infty),fil}(Z_2)\). Then, \((i_1 \circ i_0)^{\text{an}mod}(M, F) = i_1^{\text{an}mod}(i_0^{\text{an}mod}(M, F))\) in \(C_{D(\infty),fil}(S)\).

\(\square\)
is an isomorphism if $f_1$ is proper (in this case $f_{1!} = f_{1*}$).

(iii): Similar to the proof of proposition 43(ii): we use lemma 7 and the fact that for $N \in C_{f_1^*D}(X)$ and $N' \in C_D(Y)$, the canonical morphism

$$T(f_1^! \otimes)(N', N) : N' \otimes^L_{D_{V'}} Rf_{1!!}N \to Rf_{1!!}(f_1^*N' \otimes^L_{f_1^*D_{V'}} N)$$

is an isomorphism.

(iii)': Similar to the proof of proposition 43(ii): we use lemma 8 and the fact that for $N \in C_{f_1^*D^\infty}(X)$ and $N' \in C_D^\infty(Y)$, the canonical morphism

$$T(f_1^! \otimes)(N', N) : N' \otimes^L_{D_{V'}} Rf_{1!!}N \to Rf_{1!!}(f_1^*N' \otimes^L_{f_1^*D_{V'}} N)$$

is an isomorphism.

(iv): Similar to the proof of proposition 43(iii): we have

$$i_{2*mod}(M, F) = i_{2*}((M, F) \otimes_{D_{E_1}} D_{E_2}) \odot^\text{ord} \to$$

using lemma 7 and proposition 10.

(iv)': Similar to the proof of (iv): we have

$$i_{2*mod}(M, F) = i_{2*}((M, F) \otimes_{D_{E_1}} D_{E_2}) \odot^\text{ord} \to$$

using lemma 8 and proposition 10.

**Proposition 47.** (i) Let $f : X \to S$ a morphism with $X, S \in \text{AnSm}(\mathbb{C})$. For $(M, F) \in C_{D(2)fil,h}(S)$, we have $Lf^*\text{mod}(M, F) \in D_{D(2)fil,\infty,h}(X)$. For $(M, F) \in C_{D(2)fil,h}(S)$, we have $Lf^*\text{mod}(M, F) \in D_{D(2)fil,\infty,h}(X)$.

(ii) Let $f : X \to S$ a proper morphism with $X, S \in \text{AnSm}(\mathbb{C})$. Then, for $(M, F) \in C_{D(2)fil,h}(X)$, we have $\int f(M, F) \in D_{D(2)fil,\infty,h}(S)$.

(iii) Let $f : X \to S$ a morphism with $X, S \in \text{AnSm}(\mathbb{C})$. Then, for $(M, F) \in C_{D(2)fil,h}(X)$, we have $\int f(M, F) \in D_{D(2)fil,\infty,h}(S)$.

**Proof.** (i) and (ii): Follows immediately from the non filtered case since we look at the complex in the derived category with respect to $\infty$-usu local equivalence. It says that the pullback and the proper pushforward of an holonomic D module is still holonomic. See [10] for the non filtered case.

(iii): In the case the morphism is proper, it follows from the finite order case (ii). In the case of an open embedding, it follows from proposition 44(i): we have for $j : S^\infty \to S$ an open embedding,

$$j_* E(O_{S^\infty}) = j_* \text{Hom}(\mathbb{Z}_{S^\infty}, E(O_{S^\infty})) = \text{Hom}(j_! \mathbb{Z}_{S^\infty}, E(O_S)) \in C_{D(2)^\infty,h}(S).$$

and on the other hand

$$T(j, \otimes)(-, -) = T^\text{mod}(j, \otimes)(-, -) : \int j(M, F) = j_* E(M, F) = j_* E(j^! O_{S} \otimes_{O_{S^\infty}} (M, F))$$

is an isomorphism by proposition 9.

For $X, Y \in \text{SmVar}(\mathbb{C})$ or $X, Y \in \text{AnSm}(\mathbb{C})$, we denote by

138
\begin{itemize}
\item $C_{O_X}(X) \times C_{O_Y}(Y) \to C_{O_X \times Y}(X \times Y), (M, N) \mapsto M \cdot N := O_{X \times Y} \otimes_{p_X^*O_X \otimes p_Y^*O_Y} p_X^*M \otimes p_Y^*N,$
\item $C_{D}(X) \times C_{D}(Y) \to C_{D}(X \times Y), (M, N) \mapsto M \cdot N := O_{X \times Y} \otimes_{p_X^*O_X \otimes p_Y^*O_Y} p_X^*M \otimes p_Y^*N$
\end{itemize}

the natural functors which induces functors in the filtered cases and the derived categories, $p_X : X \times Y \to X$ and $p_Y : X \times Y \to Y$ the projections.

We have then the following easy proposition:

**Proposition 48.** For $X \in \text{SmVar}(\mathbb{C})$ or $X \in \text{AnSm}(\mathbb{C})$, we have for $(M, F), (N, F) \in C_{O_X,fil}(X)$ or \((M, F), (N, F) \in C_{D,fil}(X)\),

$$(M, F) \otimes_{O_X} (N, F) = \Delta_{\mathcal{X}}^{*\text{mod}}(M, F) \cdot (N, F)$$

**Proof.** Standard. \qed

**Definition 60.** Let $f : X \to S$ a morphism with $X, S \in \text{AnSm}(\mathbb{C})$. We have the canonical map in $C_{f,fil}(X)$ modules :

$$T(f, \infty) : (D_{X\to S}, F_{\text{ord}}) \otimes_{D_X} (D_{X}^\infty, F_{\text{ord}}) \to (D_{X\to S}^\infty, F_{\text{ord}}), \quad (h_X \otimes P_S) \otimes P_X \mapsto (P_X \cdot h_X \otimes P_S + h_X \cdot df(P_X)) P_S$$

where $h_X \in \Gamma(X^o, O_X), P_S \in \Gamma(X^o, f^*D_S)$ and $P_X \in \Gamma(X^o, D_X^\infty)$. This gives, for $(M, F) \in C_{D(2)fil}(S)$, the following transformation map in $C_{D(2)fil}(X)$

$$T(f, \infty)((M, F)) : J_X(f^{*\text{mod}}(M, F)) := f^*(M, F) \otimes_{f^*D_S} (D_{X\to S}, F_{\text{ord}}) \otimes_{D_X} (D_{X}^\infty, F_{\text{ord}}) \xrightarrow{f \otimes T(f, \infty)} f^*(M, F) \otimes_{f^*D_S} f^*D_{X}^\infty \otimes_{f^*D_S} (D_{X\to S}^\infty, F_{\text{ord}}) =: f^{*\text{mod}} J_S(M, F)$$

where we recall that $J_S(M, F) = (M, F) \otimes_{D_S} (D_S^\infty, F_{\text{ord}})$.

We now look at some properties of the dual functor for $D$ modules : For complex of $D$ module with coherent cohomology we have the following:

**Proposition 49.** (i) Let $S \in \text{SmVar}(\mathbb{C})$. For $M \in C_{D,c}(S)$, the canonical map $d(M) : M \to D_S^2LDM$ is an equivalence Zariski local.

(ii) Let $S \in \text{AnSm}(\mathbb{C})$. For $M \in C_{D}(S)$, the canonical map $d(M) : M \to D_S^2LD(M)$ is an equivalence usu local.

(iii) Let $S \in \text{AnSm}(\mathbb{C})$. For $(M, F) \in C_{D}(S)$, the canonical map $d(M) : M \to D_S^2LD\infty(M)$ is an equivalence usu local.

**Proof.** Standard :follows from the definition of coherent sheaves. See [16] for example. \qed

Let $S_1, S_2 \in \text{SmVar}(\mathbb{C})$ or $S_1, S_2 \in \text{AnSm}(\mathbb{C})$ and $p : S_1 := S_1 \times S_2 \to S_1$ the projection. In this case we have a canonical embedding $D_{S_1} \hookrightarrow p_*D_{S_12}$. This gives, for $(M, F) \in C_{Dfil}(S_1 \times S_2)$, the following transformation map in $C_{Dfil}(S_1)$

$$T_*(p, D)(M, F) : p_*D_{S_1}^K(M, F) := p_*\text{Hom}_{D_{S_12}}((M, F), D_{S_12}) \otimes_{O_{S_12}} D_{S_12}^Ow(K_{S_12})[d_{S_12}]$$

We have the canonical map

$$p(D) : p^{*\text{mod}}D_{S_1} = p^*D_{S_1} \otimes_{p^*O_{S_1}} O_{S_12} \to D_{S_12}, \quad \gamma \otimes f \mapsto f.\gamma$$
induced by the embedding $p^*D_{S_1} \hookrightarrow D_{S_12}$. This gives, for $(M, F) \in C_{Djul}(S_1)$, the following transformation map in $C_{Djul}(S_1 \times S_2)$

$$T(p, D)(M, F) : p^*\text{Hom}_{D_{S_1}}((M, F), D_{S_1}) \otimes p^*\text{Hom}_{D_{S_12}}(M, F)[d_{S_1}] \rightarrow \text{Hom}_{p^*D_{S_1}}(p^*(M, F), p^*D_{S_12}) \otimes p^*\text{Hom}_{D_{S_12}}(M, F)[d_{S_1}]$$

where $K^{-1}(S_1/S_{12})$ is given by the wedge product with a generator of $\wedge^{d_{S_2}} T_{S_{12}/S_1} \rightarrow K^{-1}_{S_2}$. We also have the embedding $p^*D_{S_1} \rightarrow D_{S_12}$. This gives in the same way, for $(M, F) \in C_{Djul}(S_1 \times S_2)$, the following transformation map in $C_{Djul}(S_1)$

$$T_s(p, D^{\infty})(M, F) : p_*D_{S_12}^{\infty}K(M, F) \rightarrow D_{S_1}^{\infty}p_*(M, F).$$

The map

$$p(D^{\infty}) : p^*\text{Hom}_{D_{S_1}}(M, F) \otimes p^*\text{Hom}_{D_{S_12}}(M, F)[d_{S_1}] \rightarrow D^{\infty}_{S_12}, \quad \gamma \otimes f \mapsto f \cdot \gamma$$

induced by the embedding $p^*D_{S_1}^{\infty} \hookrightarrow D_{S_12}^{\infty}$, gives in the same way, for $(M, F) \in C_{D^{\infty}jul}(S_1)$, the transformation map in $C_{D^{\infty}jul}(S_1 \times S_2)$

$$T(p, D^{\infty})(M, F) : p^*\text{Hom}_{D_{S_1}}^{\infty}(M, F) \otimes p^*\text{Hom}_{D_{S_12}}^{\infty}(M, F)[d_{S_1}] \rightarrow \text{Hom}_{p^*D_{S_1}}^{\infty}(M, F) \otimes p^*\text{Hom}_{D_{S_12}}^{\infty}(M, F)[d_{S_1}]$$

and in the same way then $T(p, D)(M, F)$.}

**Proposition 50.** (i) Let $g : T \rightarrow S$ a morphism with $T, S \in \text{SmVar}(\mathbb{C})$. We have, for $M \in D_T(S)$ canonical maps

$$T'(g, D)(M) : L\mathbb{D}_S Lg^{-1}M \rightarrow Lg^{-1}M$$

Moreover, in the case where $g$ is non characteristic with respect to $M$ (e.g if $g$ is smooth), these maps are isomorphism.

(ii) Let $S_1, S_2 \in \text{SmVar}(\mathbb{C})$, $p : S_1 \times S_2 \rightarrow S_1$ the projection. For $M \in D_T(S_1)$, we have $T(p, D)(L_D(M)) = T'(p, D)(M)$ in $D_{Djul}(S_1 \times S_2)$ (c.f.(i)).

**Proof.** (i):See [16] for the first map. The second one follows from the first by proposition [49] (i) and (iii). (ii):See the proof of (i) in [14].

We have the followings:

**Proposition 51.** Let $f_1 : X \rightarrow Y$ and $f_2 : Y \rightarrow S$ two morphism with $X, Y, S \in \text{SmVar}(\mathbb{C})$. Let $M \in C_{D, b}(S)$. Then, we have $L(f_2 \circ f_1)^*M = Lf_1^*M = Lf_1^*M$ in $D_{D, b}(X)$.

**Proof.** Follows from proposition [43] (i), proposition [44] and proposition [49].

**Proposition 52.** Let $f_1 : X \rightarrow Y$ and $f_2 : Y \rightarrow S$ two morphism with $X, Y, S \in \text{AnSm}(\mathbb{C})$. 

140
(i) Let $(M) \in C_{D,\theta}(S)$. Then, we have $L(f_2 \circ f_1) \otimes_{\text{mod}}(M) = Lf_1 \otimes_{\text{mod}} (Lf_2 \otimes_{\text{mod}} (M))$ in $D_{D,\theta}(X)$.

(ii) Let $M \in C_{D^=,\theta}(S)$. Then, we have $L(f_2 \circ f_1) \otimes_{\text{mod}} M = Lf_1 \otimes_{\text{mod}} (Lf_2 \otimes_{\text{mod}} M)$ in $D_{D^=,\theta}(X)$.

Proof. Follows from proposition 46 (i), proposition 47, and proposition 49.

In the analytic case, we have the following transformation map which we will use in subsection 5.3:

**Definition 61.** Let $S \in \text{AnSm}(\mathbb{C})$. We have for $(M, F) \in C_{D,fil}(S)$ the canonical transformation map in $C_{D^=,fil}(S)$:

$$T(D, \infty)(M, F) : J_S(\mathbb{D}^K_S(M, F)) := \text{Hom}_{D_S}((M, F), D_S) \otimes_{D_S} (D_S^\infty, F_{\text{ord}}) \otimes_{\text{Os}} \mathbb{D}^O_S w(K_S)[d_S]$$

$$\text{ev}_{D_S}(\text{hom}, \otimes)(-,-,-) \otimes I$$

$$\text{Hom}_{D_S}(L_D(M, F), D_S^\infty) \otimes_{\text{Os}} \mathbb{D}^O_S w(K_S)[d_S] \xrightarrow{(L(D_S^\infty/D_S)((M, F), D_S^\infty))} \text{Hom}_{D_S^\infty}((M, F) \otimes_{D_S} (D_S^\infty, F_{\text{ord}}), D_S^\infty) \otimes_{\text{Os}} \mathbb{D}^O_S w(K_S)[d_S] =: \mathbb{D}^K_S J_S(M, F).$$

which is an isomorphism.

### 4.2.2 The (relative) De Rahm of a (filtered) complex of a D-module and the filtered De Rahm direct image

Recall that for $f : X \to S$ a morphism with $X, S \in \text{Var}(\mathbb{C})$ or with $X, S \in \text{AnSp}(\mathbb{C})$,

$$DR(X/S) := \Omega^\bullet_{X/S} \in C_{f*O_S}(X)$$

denotes (see section 2) the relative De Rahm complex of the morphism of ringed spaces $f : (X, O_X) \to (S, O_S)$, with $\Omega^p_{X/S} := \land^p \Omega_{X/S} \in PSh_{O_X}(X)$ and $\Omega_X := \text{coker}(f^* O_S \to O_X) \in PSh_{O_X}(X)$. Recall that $\Omega^\bullet_{X/S} \in C_{f*O_S}(S)$ is a complex of $f^* O_S$ modules, but is NOT a complex of $O_X$ module since the differential is a derivation hence NOT $O_X$ linear. Recall that (see section 4.1), for $(M, F) \in C_{D(O_X),fil}(X)$, we have the relative (filtered) De Rahm complex of $(M, F)$

$$DR(X/S)(M, F) := (\Omega^\bullet_{X/S}, F_0) \otimes_{O_X} (M, F) \in C_{f*O_S,fil}(X),$$

and that if $\phi : (M_1, F) \to (M_2, F)$ a morphism with $(M_1, F), (M_2, F) \in C_{D(O_X),fil}(X)$,

$$\phi : DR(X/S)(M_1, F) := (\Omega^\bullet_{X/S}, F) \otimes_{O_X} (M_1, F) \to DR(X/S)(M_2, F) := (\Omega^\bullet_{X/S}, F) \otimes_{O_X} (M_2, F)$$

is by definition a morphism of complexes, that is a morphism in $C_{f*O_S,fil}(X)$. For $(N, F) \in C_{D(O_X),fil}(X)$, we have the relative (filtered) Spencer complex of $(N, F)$

$$SP(X/S)(N, F) := (T^\bullet_{X/S}, F_0) \otimes_{O_X} (N, F) \in C_{f*O_S,fil}(X),$$

and that if $\phi : (N_1, F) \to (N_2, F)$ a morphism with $(N_1, F), (N_2, F) \in C_{D(O_X),fil}(X)$,

$$\phi : SP(X/S)(N_1, F) := (T^\bullet_{X/S}, F) \otimes_{O_X} (N_1, F) \to SP(X/S)(N_2, F) := (T^\bullet_{X/S}, F) \otimes_{O_X} (N_2, F)$$

is by definition a morphism of complexes, that is a morphism in $C_{f*O_S,fil}(X)$.

**Proposition 53.** Let $f : X \to S$ a smooth morphism with $X, S \in \text{Var}(\mathbb{C})$ or with $X, S \in \text{AnSp}(\mathbb{C})$, denote $d = d_X - d_S$. The inner product gives, for $(M, F) \in C_{D(O_X),fil}(X)$, an isomorphism in $C_{f*O_S,fil}(X)$ and termwise $O_X$ linear

$$T(DR, SP)(M, F) : T^\bullet_{X/S} \otimes_{O_X} (M, F) \otimes_{O_X} K_{X/S} \xrightarrow{\wr} \Omega^d_{X/S} \otimes_{O_X} (M, F), \partial \otimes m \otimes \kappa \mapsto \iota(\partial) \kappa \otimes m$$

Proof. Standard.
For a commutative diagram in $\text{Var}(\mathbb{C})$ or in $\text{AnSp}(\mathbb{C})$:

\[
\begin{array}{ccc}
D = & X & f \\
& g' & \downarrow g \\
& X' & \rightarrow T
\end{array}
\]

we have (see section 2) the relative differential map of $g'$ given by the pullback of differential forms:

\[
\Omega(X'/X)\otimes M,F : g'^*\Omega_{X/S} \rightarrow \Omega_{X'/T},
\]

given by $X'^{\circ} \subset X'$, $X^{\circ} \supset g'(X'^{\circ})$ (i.e. $g'^{-1}(X'^{\circ}) \supset X^{\circ}$),

$\omega \in \Gamma(X^{\circ}, \Omega^p_{X/S}) \mapsto \Omega(X'/X)\otimes M,F(X^{\circ})(\omega) := [g'^*\omega] \in \Gamma(X'^{\circ}, \Omega^p_{X'/T})$.

Moreover, by definition-proposition 16 (section 4.1), for $(M, F) \in C_D(O_X)_{fil}(X)$ the map

\[
\Omega(X'/X)\otimes (M, F) : g'^*\Omega_{X/S} \otimes O_X \rightarrow \Omega_{X'/T} \otimes O_{X'}, \ g'^*\mod(M, F)
\]

given in degree $(p, i)$ by, for $X'^{\circ} \subset X'$ an open subset and $X^{\circ} \subset X$ an open subset such that $g'^{-1}(X'^{\circ}) \supset X^{\circ}$ (i.e. $X^{\circ} \supset g'(X'^{\circ})$, $\omega \in \Gamma(X^{\circ}, \Omega^p_{X/S})$ and $m \in \Gamma(X^{\circ}, M')$,

\[
\Omega(X'/X)\otimes (M, F)(\omega \otimes m) = g'^*\omega \otimes (m \otimes 1)
\]
is a map of complexes, that is a map in $C_{f^*O_S}fil(X')$. This give, for $(M, F) \in C_D(O_X)_{fil}(X)$, the following transformation map in $C_{O_{fil}(T)}$

\[
T^O_\omega(D)(M, F) = g'^*\mod L_O(f_*E(\Omega_{X/S}^\bullet \otimes O_X (M, F))) T(g_*L_O)(-) \\
(g^*f_*E(\Omega_{X/S}^\bullet \otimes O_X (M, F))) \otimes g^*O_T T(g', E)(- \otimes T(D)(E(\Omega_{X/S}^\bullet \otimes O_X M))) \\
(f'_E(g'^*(\Omega_{X/S}^\bullet \otimes O_X (M, F)))) \otimes g^*O_T mO_E(\Omega_{X'/X}^\bullet \otimes O_X \otimes O_X, \ g'^*\mod(M, F)),
\]

with $m'(m) = m \otimes 1$. Under the canonical isomorphism $\Omega^p_{X/S} \cong \Omega^p_{X/S} \otimes O_X O_X$ given by $\omega \mapsto \omega \otimes 1$, we have (see remark 16)

\[
T^O_\omega(D)(O_X) = T^O_\omega(D) = g'^*\mod L_O(f_*E(\Omega_{X/S}^\bullet )) f'_{E}(\Omega_{X'/T}^\bullet )
\]

Let $f : X \rightarrow S$ a morphism with $X, S \in \text{Var}(\mathbb{C})$. Again by definition-proposition 16 (section 4.1), for $(M, F) \in C_D(O_X)_{fil}(X)$ the map

\[
\Omega(X^{an}/X)/(S^{an}/S)(M, F) : an^*_X(\Omega_{X/S}^\bullet \otimes O_X (M, F)) \rightarrow \Omega_{X^{an}/S^{an}} \otimes O_{X^{an}} M^{an}
\]
given in degree $(p, i)$ by, for $X^{\circ} \subset X$ and $X^{\circ} \supset X^{oo}$ an open subsets of $X$ for the usual, Zariski topology, $\omega \in \Gamma(X^{\circ}, \Omega^p_{X/S})$ and $m \in \Gamma(X^{\circ}, M')$,

\[
\Omega(X^{an}/X)/(S^{an}/S)(M, F)(\omega \otimes m) = \omega \otimes (m \otimes 1)
\]
is a map of complexes, that is a map in $C_{f^*O_S}fil(X^{an})$. This gives, for $(M, F) \in C_D(O_X)_{fil}(X)$, we have the following transformation map in $C_{O_{fil}(S^{an})}$

\[
T^O_\omega(an, f)(M, F) = (f_*E(\Omega_{X/S}^\bullet \otimes O_X (M, F)))^{an} := an^*_X f_*E(\Omega_{X/S}^\bullet \otimes O_X (M, F)) \otimes an^*_S O_{S^{an}} T(an(X), E)(-) \otimes T(an, f)(E(\Omega_{X/S}^\bullet \otimes O_X M)) \\
\otimes an^*_S O_{S^{an}} mO_E(\Omega_{X^{an}/X}^\bullet \otimes (S^{an}/S)(M, F)) f_*E(\Omega_{X/S}^\bullet \otimes O_X (M, F))
\]
with \(m(n \otimes s) = s.n\). Under the canonical isomorphism \(\Omega^\bullet_{X/S} \cong \Omega^\bullet_{X/S} \otimes_{O_X} O_X\) given by \(\omega \mapsto \omega \otimes 1\), we have (see remark [7])

\[
T^0_\omega(an, f)(O_X) = T^0_\omega(an, f) : (f_*, E(\Omega^\bullet_{X/S}))^n \rightarrow f_*E(\Omega^\bullet_{X/S} \otimes_{O_X} O_X)
\]

Let \(f : X \rightarrow S\) a morphism with \(X, S \in \Var(\mathbb{C})\) or with \(X, S \in \AnSp(\mathbb{C})\). In the case where \(X\) is smooth, for \((M, F) = (M^\bullet, F) \in C_{\DF il}(X)\), the differential of the relative De Rham complex of \((M, F)\)

\[
DR(X/S)(M, F) := (\Omega^\bullet_{X/S}, F) \otimes_{O_X} (M, F) = \text{Tot}((\Omega^\bullet_{X/S}, F) \otimes_{O_X} (M^\bullet, F)) \in C_{f*O_{S\fil}}(X)
\]

are given by

- \(d_{p,p+1} : \Omega^p_{X/S} \otimes_{O_X} M^i \rightarrow \Omega^{p+1}_{X/S} \otimes_{O_X} M^i\), with for \(X^o \subset X\) an open affine subset with \((x_1, \ldots, x_n)\) local coordinate (since \(X\) is smooth, \(T_X\) is locally free), \(m \in \Gamma(X^o, M^i)\) and \(\omega \in \Gamma(X^o, \Omega^p_{X/S})\),

\[
d_{p,p+1}(\omega \otimes m) := (d\omega) \otimes m + \sum_{i=1}^n (dx_i \wedge \omega) \otimes (\partial_i m)
\]

- \(d_{i,i+1} : \Omega^p_{X/S} \otimes_{O_X} M^i \rightarrow \Omega^p_{X/S} \otimes_{O_X} M^{i+1}\), with for \(X^o \subset X\) an open subset, \(m \in \Gamma(X^o, M^i)\) and \(\omega \in \Gamma(X^o, \Omega^p_{X/S})\), \(d_{i,i+1}(\omega \otimes m) := (\omega \otimes dm)\).

For \(D_X\) only, the differential of its De Rham complex \((\Omega^\bullet_{X/S}, F) \otimes_{O_X} D_X\) are right linear, so that

\[
(\Omega^\bullet_{X/S}, F_b) \otimes_{O_X} (D_X, F^{ord}) \in C_{D_{f*}f*O_{S\fil}}(X)
\]

In the particular case of a projection \(p : Y \times S \rightarrow S\) with \(Y, S \in \SmVar(\mathbb{C})\) or with \(Y, S \in \AnSm(\mathbb{C})\) we have :

**Proposition 54.** Let \(Y, S \in \SmVar(\mathbb{C})\) or \(Y, S \in \AnSm(\mathbb{C})\). Let \(p : Y \times S \rightarrow S\) the projection. For \((M, F) \in C_{\DF il}(Y \times S)\),

\[
DR(Y \times S/S)(M, F) := (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} (M, F) \in C_{p*O_{S\fil}}(Y \times S)
\]

is a naturally a complex of filtered \(p^*D_X\) modules, that is

\[
DR(Y \times S/S)(M, F) := (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} (M, F) \in C_{p^*D_{f*il}}(Y \times S),
\]

where the \(p^*D_X\) module structure on \(\Omega^p_{Y \times S/S} \otimes_{O_{Y \times S}} M^n\) is given by for \((Y \times S)^o \subset Y \times S\) an open subset,

\[
(\gamma \in \Gamma((Y \times S)^o, T_{Y \times S}), \omega \otimes m \in \Gamma((Y \times S)^o, \Omega^p_{Y \times S/S} \otimes_{O_{Y \times S}} M^n)) \mapsto \gamma.(\omega \otimes m) := (\omega \otimes (\gamma, m)).
\]

Moreover, if \(\phi : (M_1, F) \rightarrow (M_2, F)\) a morphism with \((M_1, F), (M_2, F) \in C_{\DF il}(Y \times S)\),

\[
DR(Y \times S/S)(\phi) := (I \otimes \phi) : (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} (M_1, F) \rightarrow (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} (M_2, F)
\]

is a morphism in \(C_{p^*D_{f*il}}(Y \times S)\).

**Proof.** Standard. \(\square\)

In the analytic case, we also have

**Proposition 55.** Let \(Y, S \in \AnSm(\mathbb{C})\). Let \(p : Y \times S \rightarrow S\) the projection. For \((M, F) \in C_{D_{\infty f*il}}(Y \times S)\),

\[
DR(Y \times S/S)(M, F) := (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} (M, F) \in C_{p*O_{S\fil}}(Y \times S)
\]
is naturally a complex of filtered $p^*D_S^\infty$ modules, that is

$$DR(Y \times S/S)(M, F) := (\Omega^\bullet_{X/S/S}, F_b) \otimes_{O_{Y \times S}} (M, F) \in C_{p^*D^\infty}(Y \times S),$$

where the $p^*D_S^\infty$ module structure on $\Omega^p_{Y \times S/S} \otimes_{O_{Y \times S}} M^\bullet$ is given by for $(Y \times S)^o \subset Y \times S$ an open subset,

$$(\gamma \in \Gamma((Y \times S)^o, T_{Y \times S}), \dot{\omega} \otimes m \in \Gamma((Y \times S)^o, \Omega^p_{Y \times S/S} \otimes_{O_{Y \times S}} M^\bullet)) \mapsto \gamma.(\dot{\omega} \otimes m) := (\dot{\omega} \otimes (\gamma.m)).$$

Moreover, if $\phi : (M_1, F) \to (M_2, F)$ a morphism with $(M_1, F), (M_2, F) \in C_{D^\infty}(Y \times S),$

$$DR(Y \times S/S)(\phi) := (I \otimes \phi) : (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} (M_1, F) \to (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} (M_2, F)$$

is a morphism in $C_{p^*D^\infty}(Y \times S).$

Proof. Standard : follows from the finite order case (proposition 54). \hfill \square

We state on the one hand the commutativity of the tensor product with respect to $D_S$ and with respect to $O_S$, for $S \in SmVar(\mathbb{C})$ or $S \in AnSm(\mathbb{C})$ in the filtered case, and on the other hand the commutativity between the tensor product with respect to $D_S$ by $D_S$ and the De Rahm complex :

**Proposition 56.** (i) Let $f : X \to S$ a morphism with $X, S \in SmVar(\mathbb{C})$ or with $X, S \in AnSm(\mathbb{C})$. For $(M^\bullet, F) \in C_{D_{(O_S)}f}(X)$ and $(M, F), (N, F) \in C_{D_{f}}(X).$ we have canonical isomorphisms of filtered $f^*D_S^\infty$ modules, i.e. isomorphisms in $C_{f^*D}(X)$,

$$(M^\bullet, F) \otimes_{O_X} (N, F) \otimes_{D_X} (M, F) = (M^\bullet, F) \otimes_{D_X} ((M, F) \otimes_{O_X} (N, F))$$

$$= (((M^\bullet, F) \otimes_{O_X} (M, F)) \otimes_{D_X} (N, F))$$

(ii) Let $f : X \to S$ a morphism with $X, S \in Var(\mathbb{C})$ or with $X, S \in AnSp(\mathbb{C})$. For $(M, F) \in C_{D_{(O_S)}f}(X)$, we have a canonical isomorphisms of filtered $f^*O_S^\infty$ modules, i.e. isomorphisms in $C_{f^*O_S}(X)$,

$$(\Omega^\bullet_{X/S}, F_b) \otimes_{O_X} (M, F) = ((\Omega^\bullet_{X/S}, F_b) \otimes_{O_X} (D(O_X), F_b)) \otimes_{D(O_X)} (M, F)$$

(iii) Let $p : Y \times S \to S$ a projection with $Y, S \in SmVar(\mathbb{C})$ or with $X, S \in AnSm(\mathbb{C})$. For $(M, F) \in C_{D_{f}}(Y \times S)$, the isomorphisms of filtered $p^*O_S^\infty$ modules of (ii)

$$(\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} (M, F) = ((\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} (D_{Y \times S}, F_b)) \otimes_{D_{Y \times S}} (M, F)$$

are isomorphisms of filtered $p^*D_S^\infty$ modules, that is isomorphism in $C_{p^*D^\infty}(Y \times S)$.

Proof: (i) and (ii) are particular case of proposition 30 \hfill (iii): follows immediately by definition of the $p^*D_S$ module structure. \hfill \square

We now look at the functorialities of the relative De Rham complex of a smooth morphisms of smooth complex algebraic varieties :

**Proposition 57.** Consider a commutative diagram in $SmVar(\mathbb{C})$ or in $AnSm(\mathbb{C})$ :

$$D = \begin{array}{ccc}
Y \times S & \rightarrow^p & S \\
\downarrow & & \downarrow \\
Y' \times T & \rightarrow^{p'} & T
\end{array}$$

with $p$ and $p'$ the projections. For $(M, F) \in C_{D_{f}}(Y \times S)$ the map in $C_{g'' \circ p^*O_S f}(Y' \times T)$

$$\Omega(p'^*Y \times T/Y \times S)/(T/S)(M, F) : g''((\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} (M, F)) \mapsto (\Omega^\bullet_{Y' \times T/T}, F_b) \otimes_{O_{Y' \times T}} g''_{mod}(M, F)$$

\hfill 144
given in definition-proposition 58 is a map in $C_{g'' p_\ast Dfil}(Y' \times T)$. Hence, for $(M, F) \in C_{Dfil}(Y \times S)$, the map in $C_{Dfil}(T)$ (with $L_D$ instead of $L_O$)

$T^O_\omega(D)(M) : g^{smod} L_D(p_\ast E((\Omega^\bullet_{Y/S/S}, F_b) \otimes_{O_{Y/S}} (M, F))) \rightarrow p'_\ast E((\Omega^\bullet_{Y'/T/T}, F_b) \otimes_{O_{Y'/T}} g''^{smod}(M, F))$,

is a map in $C_{Dfil}(T)$.

Proof. Follows immediately by definition.

In the analytic case, we also have

**Proposition 58.** Consider a commutative diagram in $\text{AnSm}(\mathbb{C})$:

$$
\begin{array}{ccc}
D & \xrightarrow{p} & S \\
g' = (g_b \times g) & \downarrow & g \\
Y' \times T & \xrightarrow{p'} & T
\end{array}
$$

with $p$ and $p'$ the projections. For $(M, F) \in C_{D=fil}(Y \times S)$ the map in $C_{g'' p_\ast O_{Sfil}}(Y' \times T)$

$\Omega_{(Y' \times T/Y \times S)/(T/S)}(M, F) : g'^\ast((\Omega^\bullet_{Y/S/S}, F_b) \otimes_{O_{Y/S}} (M, F)) \rightarrow (\Omega^\bullet_{Y'/T/T}, F_b) \otimes_{O_{Y'/T}} g''^{smod}(M, F)$

is a map in $C_{g'' p_\ast D=fil}(Y' \times T)$. Hence, for $(M, F) \in C_{D=fil}(Y \times S)$, the map in $C_{O_{Tfil}}(T)$ (with $L_D$ instead of $L_O$)

$T^O_\omega(D)(M) : g^{smod} L_D(p_\ast E((\Omega^\bullet_{Y/S/S}, F_b) \otimes_{O_{Y/S}} (M, F))) \rightarrow p'_\ast E((\Omega^\bullet_{Y'/T/T}, F_b) \otimes_{O_{Y'/T}} g''^{smod}(M, F))$,

is a map in $C_{D=fil}(T)$.

Proof. Follows immediately by definition.

Similarly, we have

**Proposition 59.** Let $p : Y \times S \rightarrow S$ a projection with $Y, S \in \text{SmVar}(\mathbb{C})$. For $(M, F) \in C_{Dfil}(Y \times S)$ the map in $C_{p^\ast O_{San}}(Y^{an} \times S^{an})$

$\Omega_{(Y^{an} \times S^{an}/Y \times S)/(S^{an}/S)}(M, F) : an(Y \times S)^\ast((\Omega^\bullet_{Y/S/S}, F_b) \otimes_{O_{Y/S}} (M, F)) \rightarrow (\Omega^\bullet_{Y^{an}/S^{an}/S^{an}}, F_b) \otimes_{O_{Y^{an}/S^{an}}} (M^{an}, F)$

is a map in $C_{p^\ast O_{fil}}(Y^{an} \times S^{an})$. For $(M, F) \in C_{Dfil}(Y \times S)$, the map in $C_{O_{San}fil}(S^{an})$

$T^O_{\omega}(an, h)(M, F) : (p_\ast E((\Omega^\bullet_{Y/S/S}, F_b) \otimes_{O_{Y/S}} (M, F)))^{an} \rightarrow p'_\ast E((\Omega^\bullet_{Y^{an}/S/S}, F_b) \otimes_{O_{Y^{an}/S}} (M, F))^{an}$

is a map in $C_{Dfil}(S^{an})$.

Proof. Similar to the proof of proposition 57.

**Proposition 60.** Let $p : Y \times S \rightarrow S$ a projection with $Y, S \in \text{SmVar}(\mathbb{C})$ or with $Y, S \in \text{AnSm}(\mathbb{C})$.

(i) If $\phi : (M, F) \rightarrow (N, F)$ is an $r$-filtered Zariski, resp. usu, local equivalence with $(M_1, F), (M_2, F) \in C_{Dfil}(Y \times S)$, then

$DR(Y \times S/S)(\phi) : (\Omega^\bullet_{Y/S/S}, F_b) \otimes_{O_{Y/S}} (M, F) \rightarrow \Omega^\bullet_{Y^{an}/S^{an}/S^{an}} \otimes_{O_{Y^{an}/S^{an}}} (N, F)$

is an $r$-filtered equivalence Zariski, resp. usu, local in $C_{p^\ast Dfil}(Y \times S)$.  

145
(ii) Consider a commutative diagram in $\text{SmVar}(\mathbb{C})$ or in $\text{AnSm}(\mathbb{C})$

\[
\begin{array}{ccc}
D & \to & S \\
p \downarrow & & \downarrow \\
Y \times S & \to & S
\end{array}
\]

with $p$ the projection. For $(N, F) \in C_{D, l, \pi} \text{fil}(V)$, the map in $C_{p^*O_S}(Y \times S)$ (see definition 53)

\[
k \circ T^O_{\omega}(l, \otimes)(E(N, F)) : (\Omega^*_Y \otimes_{O_Y} F_b) \otimes_{O_Y \times S} l_* E(N, F) \to l_* ((\Omega^*_Y \otimes_{O_Y} F_b) \otimes_{O_Y} E(N, F))
\]

is a filtered equivalence Zariski, resp. usu, local in $C_{p^*D_{\pi} \text{fil}(Y \times S)}$.

Proof. (i): Follows from proposition 54 that it is a morphism of $p^*D_S$ module. The fact that it is an equivalence Zariski, resp usu, local is a particular case of proposition 57(i).

(ii): Follows from proposition 54 and the first part of proposition 57 that it is a morphism of $h^*D_S$ module. The fact that it is an equivalence Zariski, resp usu, local is a particular case of proposition 57(ii). □

In the analytical case, we also have

**Proposition 61.** Let $p : Y \times S \to S$ a projection with $Y, S \in \text{SmVar}(\mathbb{C})$ or with $Y, S \in \text{AnSm}(\mathbb{C})$.

(i) If $\phi : (M, F) \to (N, F)$ is an $r$-filtered usu local equivalence with $(M_1, F), (M_2, F) \in C_{D, l, \pi} \text{fil}(Y \times S)$, then

\[
\text{DR}(Y \times S/S)(\phi) : (\Omega^*_Y \otimes_{O_Y} F_b) \otimes_{O_Y \times S} (M, F) \to (\Omega^*_Y \otimes_{O_Y} F_b) \otimes_{O_Y \times S} (N, F)
\]

is an $r$-filtered equivalence usu local in $C_{p^*D_{\pi} \text{fil}(Y \times S)}$.

(ii) Consider a commutative diagram in $\text{AnSm}(\mathbb{C})$

\[
\begin{array}{ccc}
D & \to & S \\
p \downarrow & & \downarrow \\
Y \times S & \to & S
\end{array}
\]

with $p$ the projection. For $(N, F) \in C_{D, l, \pi} \text{fil}(V)$, the map in $C_{p^*O_S}(Y \times S)$ (see definition 53)

\[
k \circ T^O_{\omega}(l, \otimes)(E(N, F)) : (\Omega^*_Y \otimes_{O_Y} F_b) \otimes_{O_Y \times S} l_* E(N, F) \to l_* ((\Omega^*_Y \otimes_{O_Y} F_b) \otimes_{O_Y} E(N, F))
\]

is a filtered equivalence usu local in $C_{p^*D_{\pi} \text{fil}(Y \times S)}$.

Proof. Follows from the finite order case: proposition 60. □

Dually of the De Rahm complex of a $D_S$ module $M$, we have the Spencer complex of $M$. In the particular case of $D_S$, we have the following:

**Proposition 62.** Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$.

- We have the filtered resolutions of $K_S$ by the following complex of locally free right $D_S$ modules: $\omega(S) : \omega(K_S) := (\Omega^*_S \otimes_{O_S} F_b)[d_S] \otimes_{O_S} (D_S, F_b) \to (K_S, F_b)$ and $\omega(S) : \omega(K_S, F^{ord}) := (\Omega^*_S \otimes_{O_S} F_b)[d_S] \otimes_{O_S} (D_S, F^{ord}) \to (K_S, F^{ord})$.

- Dually, we have the filtered resolution of $O_S$ by the following complex of locally free (left) $D_S$ modules: $\omega^\vee(S) : \omega(O_S) := (\wedge^* T_S \otimes_{O_S} F_b)[d_S] \otimes_{O_S} (D_S, F_b) \to (O_S, F_b)$ and $\omega^\vee(S) : \omega(O_S, F^{ord}) := (\wedge^* T_S \otimes_{O_S} F_b)[d_S] \otimes_{O_S} (D_S, F^{ord}) \to (O_S, F^{ord})$.

146
Let $S_1, S_2 \in \text{SmVar}(\mathbb{C})$ or $S_1, S_2 \in \text{AnSm}(\mathbb{C})$. Consider the projection $p = p_1 : S_1 \times S_2 \to S_1$.

- We have the filtered resolution of $D_{S_1 \times S_2 \to S_1}$ by the following complexes of (left) $(p^*D_{S_1}$ and right $D_{S_1 \times S_2})$ modules:
  \[
  \omega(S_1 \times S_2/S_1) : (\Omega_{S_1 \times S_2/S_1}^\bullet[d_{S_2}], F_b) \otimes_{O_{S_1 \times S_2}} (D_{S_1 \times S_2}, F^{\text{ord}}) \to (D_{S_1 \times S_2 \to S_1}, F^{\text{ord}}).
  \]

- Dually, we have the filtered resolution of $D_{S_1 \times S_2 \to S_1}$ by the following complexes of (left) $(p^*D_{S_1}, D_{S_1 \times S_2})$ modules:
  \[
  \omega^\vee(S_1 \times S_2/S_1) : (\wedge \bullet T_{S_1 \times S_2/S_1}[d_{S_2}], F_b) \otimes_{O_{S_1 \times S_2}} (D_{S_1 \times S_2}, F^{\text{ord}}) \to (D_{S_1 \times S_2 \to S_1}, F^{\text{ord}}),
  \]

Proof. See [10].

In the analytical case, we also have

**Proposition 63.** Let $S \in \text{AnSm}(\mathbb{C})$.

- We have the filtered resolutions of $K_S$ by the following complex of locally free right $D_S$ modules:
  \[
  \omega(S) : \omega(K_S) := (\Omega_{S}^\bullet[F_b][d_S] \otimes_{O_S} (D_S^\infty, F^{\text{ord}}) \to (K_S, F_b).
  \]

- Dually, we have the filtered resolution of $O_S$ by the following complex of locally free (left) $D_S$ modules:
  \[
  \omega^\vee(S) : \omega(O_S) := (\wedge \bullet T_S[F_b][d_S] \otimes_{O_S} (D_S^\infty, F^{\text{ord}}) \to (O_S, F_b).
  \]

Let $S_1, S_2 \in \text{AnSm}(\mathbb{C})$. Consider the projection $p = p_1 : S_1 \times S_2 \to S_1$.

- We have the filtered resolution of $D_{S_1 \times S_2 \to S_1}^\infty$ by the following complexes of (left) $(p^*D_{S_1}^\infty$ and right $D_{S_1 \times S_2})$ modules:
  \[
  \omega(S_1 \times S_2/S_1) : (\Omega_{S_1 \times S_2/S_1}^\bullet[d_{S_2}], F_b) \otimes_{O_{S_1 \times S_2}} (D_{S_1 \times S_2}^\infty, F^{\text{ord}}) \to (D_{S_1 \times S_2 \to S_1}^\infty, F^{\text{ord}}).
  \]

- Dually, we have the filtered resolution of $D_{S_1 \times S_2 \to S_1}^\infty$ by the following complexes of (left) $(p^*D_{S_1}^\infty, D_{S_1 \times S_2}^\infty)$ modules:
  \[
  \omega^\vee(S_1 \times S_2/S_1) : (\wedge \bullet T_{S_1 \times S_2/S_1}[d_{S_2}], F_b) \otimes_{O_{S_1 \times S_2}} (D_{S_1 \times S_2}^\infty, F^{\text{ord}}) \to (D_{S_1 \times S_2 \to S_1}^\infty, F^{\text{ord}}),
  \]

Proof. Similar to the finite order case: the first map on the right is a surjection and the kernel are obtained by tensoring $D_{S_1}^\infty$ with the kernel of the kozcul resolution of $K_S$ (note that $D_{S_1}^\infty$ is a locally free hence flat $O_S$ module).

Motivated by these resolutions, we make the following definition

**Definition 62.**

(i) Let $i : Z \hookrightarrow S$ be a closed embedding, with $Z, S \in \text{SmVar}(\mathbb{C})$ or with $Z, S \in \text{AnSm}(\mathbb{C})$. Then, for $(M, F) \in C_{D_{fil}}(Z)$, we set
\[
  i_{*\text{mod}}(M, F) := i_{*\text{mod}}^0(M, F) := i_*(M, F) \otimes_{D_Z} (D_{Z \to S}, F^{\text{ord}}) \in C_{D_{fil}}(S)
\]

(ii) Let $S_1, S_2 \in \text{SmVar}(\mathbb{C})$ or $S_1, S_2 \in \text{AnSm}(\mathbb{C})$ and $p : S_1 \times S_2 \to S_1$ be the projection. Then, for $(M, F) \in C_{D_{fil}}(S_1 \times S_2)$, we set
\[
  \begin{align*}
  p^0_{*\text{mod}}(M, F) & := p_*^0(\text{DR}(S_1 \times S_2/S_1)(M, F)) := p_*^0((\Omega_{S_1 \times S_2/S_1}^\bullet, F_b) \otimes_{O_{S_1 \times S_2}} (M, F))[d_{S_2}] \in C_{D_{fil}}(S_1), \\
  p^1_{*\text{mod}}(M, F) & := p_*^1(\text{DR}(S_1 \times S_2/S_1)(M, F)) := p_*^1((\Omega_{S_1 \times S_2/S_1}^\bullet, F_b) \otimes_{O_{S_1 \times S_2}} (M, F))[d_{S_2}] \in C_{D_{fil}}(S_1).
  \end{align*}
\]

147
(iii) Let $f : X \to S$ be a morphism, with $X, S \in \text{SmVar}(\mathbb{C})$ or $X, S \in \text{AnSm}(\mathbb{C})$. Consider the factorization $f : X \xrightarrow{i} X \times S \xrightarrow{p_S} S$, where $i$ is the graph embedding and $p_S : X \times S \to S$ is the projection. Then, for $(M, F) \in C_{\text{Dfil}}(X)$ we set

$$f^\text{FR}_{\text{mod}}(M, F) := p_{\text{SmVar}^\text{d} \text{mod}^\text{d} \text{mod}}(M, F) \in C_{\text{Dfil}}(S),$$

$$- f^\text{FR}_{\text{mod}}(M, F) := f^\text{FR}_{\text{mod}}(M, F) := p_{\text{SmVar}^\text{d} \text{mod}^\text{d} \text{mod}}(M, F) \in D_{\text{Dfil}, \infty}(S).$$

By proposition 63 below, we have $\int_f^{\text{FR}} M = \int_f M \in D_{\text{Dfil}}(X)$.

(iii) Let $f : X \to S$ be a morphism, with $X, S \in \text{SmVar}(\mathbb{C})$ or $X, S \in \text{AnSm}(\mathbb{C})$. Consider the factorization $f : X \xrightarrow{i} X \times S \xrightarrow{p_S} S$, where $i$ is the graph embedding and $p_S : X \times S \to S$ is the projection. Then, for $(M, F) \in C_{\text{Dfil}}(X)$ we set

$$f^\text{FR}_{\text{mod}}(M, F) := \mathbb{D}^\text{K}_S L_D f^\text{FR}_{\text{mod}} L^\text{K}_S L_D(M, F) := \mathbb{D}^\text{K}_S L_D p_{\text{SmVar}^\text{d} \text{mod}^\text{d} \text{mod}} L^\text{K}_S L_D(M, F) \in C_{\text{Dfil}}(S),$$

$$- f^\text{FR}_{\text{mod}}(M, F) := f^\text{FR}_{\text{mod}}(M, F) := \mathbb{D}^\text{K}_S L_D p_{\text{SmVar}^\text{d} \text{mod}^\text{d} \text{mod}} L^\text{K}_S L_D(M, F) \in D_{\text{Dfil}, \infty}(S).$$

In the analytical case we also consider:

**Definition 63.**

(i) Let $i : Z \hookrightarrow S$ be a closed embedding with $Z, S \in \text{AnSm}(\mathbb{C})$. Then, for $(M, F) \in C_{\text{Dfil}^\text{ord}}(Z)$, we set

$$i^\text{mod}(M, F) := i^\text{mod}_i(M, F) := i_*(M, F) \otimes_{D^\text{K}_Z} (D^\text{ord}_Z, F^\text{ord}) \in C_{\text{Dfil}^\text{ord}}(S).$$

(ii) Let $S_1, S_2 \in \text{AnSm}(\mathbb{C})$ and $p : S_1 \times S_2 \to S_1$ be the projection. For $(M, F) \in C_{\text{Dfil}^\text{ord}}(S_1 \times S_2)$, we consider

$$p^\text{mod}_0(M, F) := p_*(DR(S_1 \times S_2/S_1)(M, F)) := p_*(\Omega^\bullet_{S_1 \times S_2/S_1} F_b \otimes_{O_{S_1 \times S_2}} (M, F))[d_{S_2}] \in C_{\text{Dfil}^\text{ord}}(S_1),$$

$$- p^\text{mod}(M, F) := p_*(DR(S_1 \times S_2/S_1)(M, F)) := p_*(\Omega^\bullet_{S_1 \times S_2/S_1} F_b \otimes_{O_{S_1 \times S_2}} (M, F))[d_{S_2}] \in C_{\text{Dfil}^\text{ord}}(S_1).$$

(iii) Let $S_1, S_2 \in \text{AnSm}(\mathbb{C})$ and $p : S_1 \times S_2 \to S_1$ be the projection. For $(M, F) \in C_{\text{Dfil}^\text{ord}}(S_1 \times S_2)$ or $(M, F) \in C_{\text{Dfil}^\text{ord}}(S_1 \times S_2)$, we set

$$p^\text{mod}_0(M, F) := p_*(DR(S_1 \times S_2/S_1)(M, F)) := p_*(\Omega^\bullet_{S_1 \times S_2/S_1} F_b \otimes_{O_{S_1 \times S_2}} (M, F))[d_{S_2}] \in C_{\text{Dfil}^\text{ord}}(S_1),$$

$$- p^\text{mod}(M, F) := p_*(DR(S_1 \times S_2/S_1)(M, F)) := p_*(\Omega^\bullet_{S_1 \times S_2/S_1} F_b \otimes_{O_{S_1 \times S_2}} (M, F))[d_{S_2}] \in C_{\text{Dfil}^\text{ord}}(S_1).$$

(iv) Let $f : X \to S$ be a morphism, with $X, S \in \text{AnSm}(\mathbb{C})$. Consider the factorization $f : X \xrightarrow{i} X \times S \xrightarrow{p_S} S$, where $i$ is the graph embedding and $p_S : X \times S \to S$ is the projection. Then, for $(M, F) \in C_{\text{Dfil}^\text{ord}}(X)$ we set

$$f^\text{FR}_{\text{mod}}(M, F) := p_{\text{SmVar}^\text{d} \text{mod}^\text{d} \text{mod}}(M, F) \in C_{\text{Dfil}^\text{ord}}(S),$$

$$- f^\text{FR}_{\text{mod}}(M, F) := f^\text{FR}_{\text{mod}}(M, F) := p_{\text{SmVar}^\text{d} \text{mod}^\text{d} \text{mod}}(M, F) \in D_{\text{Dfil}^\text{ord}, \infty}(S),$$

$$- f^\text{FR}_{\text{mod}}(M, F) := p^\text{mod}^\text{d} \text{mod}(M, F) \in C_{\text{Dfil}^\text{ord}}(S),$$

$$- f^\text{FR}_{\text{mod}}(M, F) := f^\text{FR}_{\text{mod}}(M, F) := p^\text{mod}^\text{d} \text{mod}(M, F) \in D_{\text{Dfil}^\text{ord}, \infty}(S).$$

By proposition 65 below, we have $\int_f^{\text{FR}} M = \int_f M \in D_{\text{Dfil}}(X)$ and $\int_f^{\text{FR}} M = \int_f M \in D_{\text{Dfil}}(X)$.  

148
(v) Let \( f : X \to S \) be a morphism, with \( X, S \in \text{AnSm}(\mathbb{C}) \). Consider the factorization \( f : X \xrightarrow{i} X \times S \xrightarrow{p_S} S \), where \( i \) is the graph embedding and \( p_S : X \times S \to S \) is the projection. Then, for \((M, F) \in C_{D_{fil}}(X)\) we set
\[
- f_{i\times mod}^{FDR}(M, F) := p_S i_{\times mod}(M, F) \in C_{D_{fil}}(S),
- f_f^{FDR}(M, F) := f_{i\times mod}^{FDR}(M, F) := p_S i_{\times mod}(M, F) \in D_{D_{fil}, \infty}(S).
\]

By proposition 65 below, we have \( \int f^{FDR} M = \int f_{i} M \in D_D(X) \).

**Proposition 64.**

(i) Let \( i : Z \hookrightarrow S \) a closed embedding with \( S, Z \in \text{SmVar}(\mathbb{C}) \) or with \( S, Z \in \text{AnSm}(\mathbb{C}) \). Then for \((M, F) \in C_{D_{fil}}(Z)\), we have
\[
\int i (M, F) := Ri_*((M, F) \otimes_{D_S} (D_{Z \leftarrow S}, \text{F}^{\text{ord}})) = i_*((M, F) \otimes_{D_S} (D_{Z \leftarrow S}, \text{F}^{\text{ord}})) = i_{\times mod}(M, F).
\]

(ii) Let \( S_1, S_2 \in \text{SmVar}(\mathbb{C}) \) or \( S_1, S_2 \in \text{AnSm}(\mathbb{C}) \) and \( p : S_{12} := S_1 \times S_2 \to S_1 \) be the projection. Then, for \((M, F) \in C_{D_{fil}}(S_{1 \times S_2})\) we have
\[
\int p (M, F) := Rp_*(((M, F) \otimes_{D_{S_{1 \times S_2}}} (D_{S_{1 \times S_2} \leftarrow S_1}, \text{F}^{\text{ord}}))) = p_*E((\Omega^*_{S_{1 \times S_2} / S_1}, F_b) \otimes_{O_{S_{1 \times S_2}}} (D_{S_{1 \times S_2}}, \text{F}^{\text{ord}}) \otimes_{D_{S_{1 \times S_2}}} (M, F)[d_{S_2}] = p_{\times mod}(M, F).
\]

where the second equality follows from Griffiths transversality (the canonical isomorphism map respect by definition the filtration).

(iii) Let \( f : X \to S \) be a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \) or with \( X, S \in \text{AnSm}(\mathbb{C}) \). Then for \( M \in C_D(X) \), we have \( \int f^{FDR} M = \int f_{i} M \).

**Proof.** (i): Follows from the fact that \( D_{Z \leftarrow S} \) is a locally free \( D_Z \) module and that \( i_* \) is an exact functor.

(ii): Since \( \Omega^*_{S_{12} / S_1} [d_{S_2}], F_b \otimes_{O_{S_{12}}} D_{S_{12}} \) is a complex of locally free \( D_{S_{1 \times S_2}} \) modules, we have in \( D_{fil}(S_1 \times S_2) \), using proposition 62
\[
(D_{S_{1 \times S_2} \leftarrow S_1}, \text{F}^{\text{ord}}) \otimes_{D_{S_{1 \times S_2}}} (M, F) = (\Omega^*_{S_{12} / S_1} [d_{S_2}], F_b) \otimes_{O_{S_{12}}} (D_{S_{12}}, \text{F}^{\text{ord}}) \otimes_{D_{S_{12}}} (M, F).
\]

(iii): Follows from (i) and (ii) by proposition 63 (ii) in the algebraic case and by proposition 60 (ii) in the analytic case since a closed embedding is proper.

\[\square\]

In the analytical case, we also have:

**Proposition 65.**

(i) Let \( i : Z \hookrightarrow S \) a closed embedding with \( S, Z \in \text{AnSm}(\mathbb{C}) \). Then for \((M, F) \in C_{D^{\infty}_{fil}}(Z)\), we have \( \int i (M, F) = i_{\times mod}(M, F) \).

(ii) Let \( S_1, S_2 \in \text{AnSm}(\mathbb{C}) \) and \( p : S_{12} := S_1 \times S_2 \to S_1 \) be the projection. Then, for \((M, F) \in C_{D^{\infty}_{fil}}(S_{1 \times S_2})\) we have
\[
\int p (M, F) := Rp_*(((M, F) \otimes_{D_{S_{1 \times S_2}}} (D_{S_{1 \times S_2} \leftarrow S_1}, \text{F}^{\text{ord}}))) = p_*E((\Omega^*_{S_{1 \times S_2} / S_1}, F_b) \otimes_{O_{S_{1 \times S_2}}} (D_{S_{1 \times S_2}}, \text{F}^{\text{ord}}) \otimes_{D_{S_{1 \times S_2}}} (M, F)[d_{S_2}] =: p_{\times mod}(M, F).
\]
(ii') Let $S_1, S_2 \in \text{AnSm}(\mathbb{C})$ and $p : S_{12} := S_1 \times S_2 \to S_1$ be the projection. Then, for $(M, F) \in C_{D^{fil}}(S_1 \times S_2)$ or $(M, F) \in C_{D^{fil}}(S_1 \times S_2)$, we have

$$\int (M, F) : = \text{R}p!(\int (M, F) \otimes^L_{D_{S_1 \times S_2}} (D_{S_{1 \times S_2} \leftarrow S_1}, F^{ord})$$

$$= p_!E((\Omega_{S_1 \times S_2/S}^* F_b) \otimes_{O_{S_1 \times S_2}} (D_{S_{1 \times S_2}}(M, F))[d_S])$$

$$= p_!E((\Omega_{S_1 \times S_2/S}^* F_b) \otimes_{O_{S_1 \times S_2}} (M, F)[d_S])$$

(iii) Let $f : X \to S$ be a morphism with $X, S \in \text{AnSm}(\mathbb{C})$. For $M \in C_{D^{\infty}}(X)$, we have $\int^F f M = \int f M$ and $\int^F f M = \int f M$. For $M \in C_{D}(X)$, we have $\int^F f M = \int f M$.

**Proof.** (i):Follows from the fact that $D_X^{\infty}$ is a locally free $D_X^{\infty}$ module and that $i_*$ is an exact functor. (ii): Similar to the proof of proposition 63 (ii); follows from proposition 63. (ii)': Similar to the proof of proposition 63 (ii); follows from proposition 63. (iii): The first assertion follows from (i), (ii) and (ii)' by proposition 66. The second one follows from proposition 63 (i) and (ii)' by proposition 66.

**Proposition 66.** Let $f_1 : X \to Y$ and $f_2 : Y \to S$ two morphism with $X, Y, S \in \text{SmVar}(\mathbb{C})$.

(i) Let $(M, F) \in C_{D^{(2)}}(Y)$. Then $\int^F f_2 f_1 (M, F) = \int^F f_2 \int^F f_1 (M, F) \in C_{D^{(2)}}(Y, S)$.

(ii) Let $(M, F) \in C_{D^{(2)}}(Y, S)$. Then $\int^F f_2 f_1 (M, F) = \int^F f_2 \int^F f_1 (M, F) \in C_{D^{(2)}}(Y, S)$.

**Proof.** See 64.

**Proposition 67.** Let $f_1 : X \to Y$ and $f_2 : Y \to S$ two morphism with $X, Y, S \in \text{AnSm}(\mathbb{C})$.

(i) Let $(M, F) \in C_{D^{\infty}}(Y)$. Then $\int^F f_2 f_1 (M, F) = \int^F f_2 \int^F f_1 (M, F)$.

(ii) Let $(M, F) \in C_{D^{\infty}}(Y, S)$. Then $\int^F f_2 f_1 (M, F) = \int^F f_2 \int^F f_1 (M, F)$.

**Proof.** Similar to proposition 66.

**Definition 64.** (i) Let $f : X \to S$ be a morphism, with $X, S \in \text{SmVar}(\mathbb{C})$ or $X, S \in \text{AnSm}(\mathbb{C})$. Consider the graph factorization $f : X \xrightarrow{l} X \times S \xrightarrow{p} S$, with $l$ the graph embedding and $p$ the projection. We have the transformation map given by, for $(M, F) \in C_{D^{fil}}(X)$,

$$\int f (M, F) = \int f \int f (M, F)$$

(ii) Let $j : S^o \to S$ an open embedding with $S \in \text{Var}(\mathbb{C})$. Consider the graph factorization $j : S^o \xrightarrow{l} S^o \times S \xrightarrow{p} S$, with $l$ the graph embedding and $p$ the projection. We have, for $(M, F) \in C_{D^{fil}}(S^o)$, the canonical map in $C_{D^{fil}}(S^o)$,

$$T(\int^F j_*(M, F)) : = p_!E((\bullet_{S^o \times S/S}^* F_b) \otimes_{O_{S^o \times S}} l_{*mod}(M, F)) \xrightarrow{k_{\omega}(S^o \times S/S)}$$

$$p_!E((D_{S^o \times S \leftarrow S}, F^{ord}) \otimes_{D_{S^o \times S}} l_*(D_{S^o \times S \leftarrow S} \otimes_{D_{S^o \times S}} E(M, F))) \xrightarrow{T(l, \otimes) (-)} j_*(M, F)$$

We have, for $(M, F) \in C_{D^{fil}}(S)$, the canonical map in $C_{D^{fil}}(S)$,

$$\text{ad}(j^*, j_{*mod})(M, F) : = \text{ad}(p_{*mod}^*, p_*(M, F))$$

$$\int^F j_*(M, F) : = p_!E((\bullet_{S^o \times S/S}^* F_b) \otimes_{O_{S^o \times S}} p_{*mod}(M, F))$$
4.2.3 The support section functors for D modules and the graph inverse image

Let \( S \in \text{SmVar}(\mathbb{C}) \) or \( S \in \text{AnSm}(\mathbb{C}) \). Let \( i : Z \to S \) a closed embedding and denote \( j : S \setminus Z \to S \) the complementary open embedding. More generally, let \( h : Y \to S \) a morphism with \( Y, S \in \text{Var}(\mathbb{C}) \) or \( Y, S \in \text{AnSp}(\mathbb{C}) \), \( S \) smooth, and let \( i : X \to Y \) a closed embedding and denote by \( j : Y \setminus X \to Y \) the open complementary. We then get from section 2 the following functors:

- We get the functor
  \[
  \Gamma_Z : C_{D(2)fil}(S) \to C_{D(2)fil}(S),
  \]
  \[(M, F) \mapsto \Gamma_Z(M, F) := \text{Cone}(\text{ad}(j^*, j_*)((M, F)) : (M, F) \to j_*j^*(M, F))[-1],
  \]
  together we the canonical map \( \gamma_Z(M, F) : \Gamma_Z(M, F) \to (M, F) \), and more generally the functor
  \[
  \Gamma_X : C_{h^*D(2)fil}(Y) \to C_{h^*D(2)fil}(Y),
  \]
  \[(M, F) \mapsto \Gamma_X(M, F) := \text{Cone}(\text{ad}(j^*, j_*)((M, F)) : (M, F) \to j_*j^*(M, F))[-1],
  \]
  together we the canonical map \( \gamma_X(M, F) : \Gamma_X(M, F) \to (M, F) \).

- We get the functor
  \[
  \Gamma^\vee_Z : C_{D(2)fil}(S) \to C_{D(2)fil}(S),
  \]
  \[(M, F) \mapsto \Gamma^\vee_Z(M, F) := \text{Cone}(\text{ad}(j^*, j^*)((M, F)) : (M, F) \to j^*j^*(M, F)),
  \]
  together we the canonical map \( \gamma^\vee_Z(M, F) : \Gamma^\vee_Z(M, F) \to (M, F) \), and more generally the functor
  \[
  \Gamma^\vee_X : C_{h^*D(2)fil}(Y) \to C_{h^*D(2)fil}(Y),
  \]
  \[(M, F) \mapsto \Gamma^\vee_X(M, F) := \text{Cone}(\text{ad}(j^*, j^*)((M, F)) : (M, F) \to j^*j^*(M, F)),
  \]
  together we the canonical map \( \gamma^\vee_X(M, F) : \Gamma^\vee_X(M, F) \to (M, F) \).

- We get the functor
  \[
  \Gamma^\vee,h_Z : C_{D(2)fil}(S) \to C_{D(2)fil}(S),
  \]
  \[(M, F) \mapsto \Gamma^\vee,h_Z(M, F) := \mathbb{D}^K_S L_D \Gamma_Z \mathbb{E}(\mathbb{D}^K_S (M, F)),
  \]
  together with the factorization
  \[
  \gamma^\vee,h_Z(L_D(M, F)) : L_D(M, F) \xrightarrow{\gamma^\vee(L_D(M, F))} \Gamma^\vee_Z L_D(M, F) \xrightarrow{\text{col}^K I((j, j_*)((-)) \text{od}(-))} \Gamma^\vee,h_Z L_D(M, F),
  \]
  and more generally the functor
  \[
  \Gamma^\vee,h_X : C_{h^*D(2)fil}(Y) \to C_{h^*D(2)fil}(Y),
  \]
  \[(M, F) \mapsto \Gamma^\vee,h_X(M, F) := \mathbb{D}^h_{Y} L_{h^*D} \Gamma_X \mathbb{E}(\mathbb{D}^h_{Y} L_{h^*D} (M, F)),
  \]
  together with the factorization
  \[
  \gamma^\vee,h_X(L_{h^*D}(M, F)) : L_{h^*D}(M, F) \xrightarrow{\gamma^\vee(L_{h^*D}(M, F))} \Gamma^\vee_X L_{h^*D}(M, F) \xrightarrow{\text{col}^h D_{Y} L_{h^*D}((j, j_*)((-)) \text{od}(-))} \Gamma^\vee,h_X L_{h^*D}(M, F).
  \]

- We get the functor
  \[
  \Gamma^\vee,O_Z : C_{D(2)fil}(S) \to C_{D(2)fil}(S),
  \]
  \[(M, F) \mapsto \Gamma^\vee,O_Z(M, F) := \text{Cone}(\beta_Z((M, F)) : \beta_Z(M, F) \to (M, F)),
  \]
together we the factorization
\[ \gamma_{Z_0}^O(M, F) : (M, F) \xrightarrow{\gamma_{Z}^O(M, F)} \Gamma_Z^O(M, F) \xrightarrow{b_{S/Z}(M, F)} \Gamma_{Z_0}^O(M, F). \]

Since \( M \mapsto M/\mathcal{I}_Z M \) is a right exact functor, \( M \mapsto \Gamma_{Z_0}^O M \) send Zariski, resp. usu, local equivalence between projective complexes of presheaves to Zariski, resp. usu local equivalence, and thus induces in the derived category
\[ L\Gamma_{Z_0}^O : \mathcal{D}_{fil, \infty}(S) \to \mathcal{D}_{fil, \infty}(S), \]
\[ (M, F) \mapsto \Gamma_{Z_0}^O L_D(M, F) := \text{Cone}(b_Z(L_D(M, F)) : \mathcal{I}_Z L_D(M, F) \to L_D(M, F)). \]

- We get the functor
\[ \Gamma_Z^O : C_{D(2)fil}(S) \to C_{D(2)fil}(S), \]
\[ (M, F) \mapsto \Gamma_Z^O(M, F) := \text{Cone}(b_Z^O((M, F)) : (M, F) \to (M, F) \otimes_{O_S} \mathcal{D}_S^K(\mathcal{I}_Z D_S)), \]
together we the factorization
\[ \gamma_Z^O(M, F) : (M, F) \xrightarrow{\Gamma_Z^O} \Gamma_Z^O(M, F) \xrightarrow{\gamma_{Z}^O(M, F)} (M, F). \]
- We have, for \( (M, F) \in C_{D(2)fil}(S) \), a canonical isomorphism
\[ I(D, \gamma^O)(M, F) : \mathcal{D}_S^K \Gamma_Z^O(M, F) \xrightarrow{\sim} \Gamma_Z^O \mathcal{D}_S^K(M, F) \]
which gives the transformation map in \( C_{D(2)fil}(S) \)
\[ T(D, \gamma^O)(M, F) : \Gamma_Z^O \mathcal{D}_S^K(M, F) \to \mathcal{D}_S^K \Gamma_Z^O(M, F) \]

Let \( S \in \text{AnSp}(\mathbb{C}) \). Let \( i : Z \to S \) a closed embedding and denote \( j : S \setminus Z \to S \) the complementary open embedding. More generally, let \( h : Y \to S \) a morphism with \( Y, S \in \text{AnSp}(\mathbb{C}) \), \( S \) smooth, and let \( i : X \to Y \) a closed embedding and denote by \( j : Y \setminus X \to Y \) the open complementary.

- We get the functor
\[ \Gamma_Z : C_{D^{\infty}(2)fil}(S) \to C_{D^{\infty}(2)fil}(S), \]
\[ (M, F) \mapsto \Gamma_Z(M, F) := \text{Cone}(\text{ad}(j^*, j_*)((M, F)) : (M, F) \to j_* j^*((M, F)))[-1], \]
together we the canonical map \( \gamma_Z(M, F) : \Gamma_Z(M, F) \to (M, F) \), and more generally the functor
\[ \Gamma_X : C_{h^*D^{\infty}(2)fil}(Y) \to C_{h^*D^{\infty}(2)fil}(Y), \]
\[ (M, F) \mapsto \Gamma_X(M, F) := \text{Cone}(\text{ad}(j^*, j_*)((M, F)) : (M, F) \to j_* j^*((M, F)))[-1], \]
together we the canonical map \( \gamma_X(M, F) : \Gamma_X(M, F) \to (M, F) \).
- We get the functor
\[ \Gamma_Z^Y : C_{D^{\infty}(2)fil}(S) \to C_{D^{\infty}(2)fil}(S), \]
\[ (M, F) \mapsto \Gamma_Z^Y(M, F) := \text{Cone}(\text{ad}(j^*, j_*)((M, F)) : j_! j^*(M, F) \to (M, F)), \]
together we the canonical map \( \gamma_Z^Y(M, F) : (M, F) \to \Gamma_Z^Y(M, F), \) and more generally the functor
\[ \Gamma_X^Y : C_{h^*D^{\infty}(2)fil}(Y) \to C_{h^*D^{\infty}(2)fil}(Y), \]
\[ (M, F) \mapsto \Gamma_X^Y(M, F) := \text{Cone}(\text{ad}(j^*, j_*)((M, F)) : j_! j^*(M, F) \to (M, F)), \]
together we the canonical map \( \gamma_X^Y(M, F) : (M, F) \to \Gamma_X^Y(M, F) \).
• We get the functor
\[ \Gamma_{Z}^{\vee, h} : C_{D^\infty \fil}(S) \to C_{D^\infty \fil}(S), \quad (M, F) \mapsto \Gamma_{Z}^{\vee, h}(M, F) := \mathbb{D}_{S}^{\infty, K} L_{D^\infty} \Gamma_{Z} E(\mathbb{D}_{S}^{\infty, K}(M, F)), \]

which gives the transformation map in
\[ \Gamma_{Z}^{\vee, h} : C_{D^\infty \fil}(S) \to C_{D^\infty \fil}(S), \quad (M, F) \mapsto \Gamma_{Z}^{\vee, h} \Gamma_{Z} L_{D^\infty}(M, F), \]

and more generally the functor
\[ \Gamma_{X}^{\vee, h} : C_{h^* D^\infty \fil}(Y) \to C_{h^* D^\infty \fil}(Y), \quad (M, F) \mapsto \Gamma_{X}^{\vee, h}(M, F) := \mathbb{D}_{Y}^{h^* \infty, K} L_{h^* D^\infty} \Gamma_{X} E(\mathbb{D}_{Y}^{h^* \infty, K}(M, F)), \]

together with the factorization
\[ \gamma_{Z}^{\vee, h}(L_{D^\infty}(M, F)) : L_{D^\infty}(M, F) \xrightarrow{\gamma_{Z}^{\vee, h}(L_{D^\infty}(M, F))} \Gamma_{Z} L_{D^\infty}(M, F) \]
\[ \to \Gamma_{Z}^{\vee, h} L_{D^\infty}(M, F). \]

• We get the functor
\[ \Gamma_{Z}^{\vee, O} : C_{D^\infty \fil}(S) \to C_{D^\infty \fil}(S), \quad (M, F) \mapsto \Gamma_{Z}^{\vee, O}(M, F) := \text{Cone}(b_{Z}(M, F)) : \mathcal{I}_{Z}(M, F) \to (M, F), \]

together with the factorization
\[ \gamma_{Z}^{\vee, O}(M, F) : (M, F) \xrightarrow{\gamma_{Z}^{\vee, O}(M, F)} \Gamma_{Z}^{\vee, O}(M, F). \]

• We get the functor
\[ \Gamma_{Z}^{O} : C_{D^\infty \fil}(S) \to C_{D^\infty \fil}(S), \quad (M, F) \mapsto \Gamma_{Z}^{O}(M, F) := \text{Cone}(b_{Z}(M, F)) : (M, F) \to (M, F) \otimes_{O_{S}} \mathbb{D}_{S}^{K}(\mathcal{I}_{Z} D_{S}), \]

together with the factorization
\[ \gamma_{Z}^{O}(M, F) : (M, F) \xrightarrow{\gamma_{Z}^{O}(M, F)} \Gamma_{Z}^{O}(M, F). \]

• We have, for \((M, F) \in C_{D^\infty \fil}(S)\), a canonical isomorphism
\[ I(D, \gamma_{Z}^{O})(M, F) : \mathbb{D}_{S}^{K, \infty} \Gamma_{Z}^{\vee, O}(M, F) \xrightarrow{\gamma_{Z}^{O}(M, F)} \Gamma_{Z}^{O}(M, F), \]

which gives the transformation map in \(C_{D^\infty \fil}(S)\)
\[ T(D, \gamma_{Z}^{O})(M, F) : \Gamma_{Z}^{\vee, O} \mathbb{D}_{S}^{\infty, K}(M, F) \to \mathbb{D}_{S}^{\infty, K} \Gamma_{Z}^{O}(M, F). \]

In the analytic case, we have

**Definition 65.** Let \(S \in \text{AnSm}(\mathbb{C})\). For \((M, F) \in C_{D^\infty \fil}(S)\), we have the map in \(C_{D^\infty \fil}(S)\)
\[ T(\infty, \gamma)(M, F) := (I(T(j, \otimes)(-), -)) : \]
\[ J_{S}(\Gamma_{Z}(M, F)) := \Gamma_{Z}(M, F) \otimes_{D_{S}} (D_{S}^{\infty, F^{ord}}) \to \Gamma_{Z}((M, F) \otimes_{D_{S}} (D_{S}^{\infty, F^{ord}})) := \Gamma_{Z} J_{S}(M, F), \]

Let \(i : Z \hookrightarrow S\) a closed embedding, with \(Z, S \in \text{SmVar}(\mathbb{C})\) or \(Z, S \in \text{AnSm}(\mathbb{C})\). We have the functor
\[ i^{\vee} : C_{D^\infty \fil}(S) \to C_{D^\infty \fil}(Z), (M, F) \mapsto i^{\vee}(M, F) := \text{Hom}_{i^{*}D_{S}}((D_{S^{+}Z}, F^{ord}), i^{*}(M, F)) \]

where the (left) \(D_{Z}\) module structure on \(i^{\vee}M\) comes from the right module structure on \(D_{S^{+}Z}\), resp. \(O_{Z}\). We denote by
• for \((M, F) \in C_{Dfil}(S)\), the canonical map in \(C_{Dfil}(S)\)
\[
\text{ad}(i_{\text{mod}}, i^\sharp)(M, F) : i_{\text{mod}}i^\sharp(M, F) := i_*(\text{Hom}_{i^*D_S}((D_{S \rightarrow Z}, F_{\text{ord}}), i^*(M, F)) \otimes_{D_Z} (D_{S \rightarrow Z}, F_{\text{ord}})) \\
\rightarrow (M, F), \phi \otimes P \mapsto \phi(P)
\]

• for \((N, F) \in C_{Dfil}(Z)\), the canonical map in \(C_{Dfil}(Z)\)
\[
\text{ad}(i_{\text{mod}}, i^\sharp)(N, F) : (N, F) \rightarrow i^\sharp i_{\text{mod}}(N, F) := \text{Hom}_{i^*D_S}(D_{S \rightarrow Z}, i^*i_*(N, F) \otimes_{D_Z} (D_{S \rightarrow Z}, F_{\text{ord}})) \\
n \mapsto (P \mapsto n \otimes P)
\]

The functor \(i^\sharp\) induces in the derived category the functor:
\[
Ri^\sharp : D_{Dfil}(S) \rightarrow D_{Dfil}(Z),
\]
\[\text{and } R\dot{\text{H}}om_{i^*D_S}(D_{Z \rightarrow S}, F_{\text{ord}}, i^*(M, F)) = \mathcal{H}om_{i^*D_S}(D_{Z \rightarrow S}, F_{\text{ord}}, E(i^*(M, F))).\]

**Proposition 68.** Let \(i : Z \hookrightarrow S\) a closed embedding, with \(Z, S \in \text{SmVar}(\mathbb{C})\) or \(Z, S \in \text{AnSm}(\mathbb{C})\). The functor \(i_{\text{mod}} : C_D(Z) \rightarrow C_D(S)\) admit a right adjoint which is the functor \(i^\sharp : C_D(S) \rightarrow C_D(Z)\) and
\[
\text{ad}(i_{\text{mod}}, i^\sharp)(N) : N \rightarrow i^\sharp i_{\text{mod}}N \text{ and } \text{ad}(i_{\text{mod}}, i^\sharp)(M) : i_{\text{mod}}i^\sharp M \rightarrow M
\]
are the adjonction maps.

**Proof.** See [16] for the algebraic case. The analytic case is completely analogue.

One of the main results in \(D\) modules is Kashiwara equivalence:

**Theorem 18.** Let \(i : Z \hookrightarrow S\) a closed embedding with \(Z, S \in \text{SmVar}(\mathbb{C})\), or with \(Z, S \in \text{AnSm}(\mathbb{C})\).

(i) The functor \(i_{\text{mod}} : \text{QCoh}_D(Z) \rightarrow \text{QCoh}_D(S)\) is an equivalence of category whose inverse is \(i^\sharp := a_+i^\sharp : \text{QCoh}_D(S) \rightarrow \text{QCoh}_D(Z)\). That is, for \(M \in \text{QCoh}_D(S)\) and \(N \in \text{QCoh}_D(Z)\), the adjonction maps
\[
\text{ad}(i_{\text{mod}}, i^\sharp)(M) : i_{\text{mod}}i^\sharp M \simto M, \text{ ad}(i_{\text{mod}}, i^\sharp)(N) : i^\sharp i_{\text{mod}}N \simto N
\]
are isomorphisms.

(ii) The functor \(\int_i = i_{\text{mod}} : D_{D,c}(Z) \rightarrow D_{D,c}(S)\) is an equivalence of category whose inverse is \(Ri^\sharp : D_{D,c}(S) \rightarrow D_{D,c}(Z)\). That is, for \(M \in D_{D,c}(S)\) and \(N \in D_{D,c}(Z)\), the adjonction maps
\[
\text{ad}(\int_i Ri^\sharp)(M) : \int_i Ri^\sharp M \simto M, \text{ ad}(\int_i Ri^\sharp)(N) : Ri^\sharp \int_i N \simto N
\]
are isomorphisms.

We have a canonical embedding of rings \(D_Z \hookrightarrow D_{Z \rightarrow S} := i^*D_S \otimes_{i^*D_S} O_Z\). We denote by \(C_{i^*D}(Z)\) the category whose objects are complexes of presheaves \(M\) of \(i^*D_S\) modules on \(Z\) such that the cohomology presheaves \(H^n M\) have an induced structure of \(D_Z\) modules. We denote by
\[
q_K : K_{O_S}(i_*O_Z) \rightarrow i_*O_Z
\]
the Kozzuc complex which is a resolution of the \(O_S\) module \(i_*O_Z\) of length \(c = \text{codim}(Z, S)\) by locally free sheaves of finite rank. The fact that it is a locally free resolution of finite rank comes from the fact that \(Z\) is a locally complete intersection in \(S\) since both \(Z\) and \(S\) are smooth. We denote again
\[
q_K = i^*q_K : K_{i^*O_S}(O_Z) := i^*K_{O_S}(i_*O_Z) \rightarrow i^*i_*O_Z = O_Z
\]
We denote by \(K_{i^*O_S}(O_Z) := \text{Hom}_{i^*O_S}(K_{i^*O_S}(O_Z), i^*O_S)\) its dual, so that we have a canonical map
\[
q_K^\vee : K_{i^*O_S}(O_Z) \rightarrow O_Z[-c].
\]
Let \(M \in C_D(S)\). The \(i^*D_S\) module structure on \(\text{Hom}_{i^*O_S}(K_{i^*O_S}(O_Z), i^*O_S)\) and \(K_{i^*O_S}(O_Z) \otimes_{i^*O_S} i^*M\) induce a canonical \(D_Z\) module structure on the cohomology groups \(H^n\text{Hom}_{i^*O_S}(K_{i^*O_S}(O_Z), i^*M)\) and \(H^n(K_{i^*O_S}(O_Z) \otimes_{i^*O_S} i^*M)\) for all \(n \in \mathbb{Z}\).

The projection formula for ringed spaces (proposition [3]) implies the following lemma:
Lemma 9. Let \( i : Z \rightarrow S \) a closed embedding with \( Z, S \in \text{Var}(\mathbb{C}) \) or with \( Z, S \in \text{AnSp}(\mathbb{C}) \). Denote by \( j : U := S \setminus Z \rightarrow Z \) the open complementary embedding. Then, if \( i \) is a locally complete intersection embedding (e.g. if \( Z, S \) are smooth), we have for \( M \in \mathcal{C}_U(U) \), \( L_i \ast \mod R_j, M = 0 \).

**Proof.** We have

\[
i_\ast L_i \ast \mod R_j, M := i_\ast(i^\ast L_O(j_* E(M)) \otimes i_* O_S) O_Z \\
\xrightarrow{T(i, \otimes)(L_O(j_* E(M)))^{-1}} L_O(j_* E(M)) \otimes O_S i_\ast O_Z \qquad (1)
\]

where \( T(i, \otimes)(L_O(j_* E(M)))O_Z \) being an equivalence Zariski, resp. usu, local by proposition 10 and follows from the fact that \( j^\ast K_O(S, i_\ast O_Z) \) is acyclic. But

\[
T(i, \otimes)(L_O(j_* E(M)))O_Z : (j_* E(M)) \otimes O_S K_O(S, i_\ast O_Z) \rightarrow j_* (E(M) \otimes O_U j^\ast K_O(S, i_\ast O_Z))
\]

is an equivalence Zariski, resp. usu, local by proposition 9 since \( K_O(S, i_\ast O_Z) \) is a finite complex of locally free \( O_S \) modules of finite rank.

**Definition**-**Proposition** 18. Let \( i : Z \rightarrow S \) a closed embedding with \( Z, S \in \text{SmVar}(\mathbb{C}) \). Denote by \( c = \text{codim}(Z, S) \). Then, for \( M \in \mathcal{C}_{D,c}(S) \), we have by Kashiwara equivalence the following map in \( \mathcal{C}_D(S) \):

\[
K_{Z/S}(M) : \Gamma_Z E(M) \xrightarrow{\text{adj}(i^\ast \mod, i^\ast \mod)^{-1}} i^\ast \mod \Gamma_Z E(M) \xrightarrow{\gamma_Z} i^\ast \mod \gamma^! \Gamma_Z E(M) \xrightarrow{\text{Hom}(qK, E(i^\ast M))} \gamma Z, \text{Hom}(O_Z, T(i, \otimes)(E(M))) \xrightarrow{i^\ast \mod} K_{i^\ast O_S}(O_Z) \otimes i^\ast O_S M
\]

which is an equivalence Zariski, resp. usu, local. It gives the isomorphism in \( \mathcal{D}_D(S) \)

\[
K_{Z/S}(M) : R\Gamma Z, M \rightarrow i^\ast \mod K_{i^\ast O_S}(O_Z) = i^\ast \mod L_i \ast \mod M\llbracket c \rrbracket
\]

**Proof.** Follows from theorem 18 lemma 9; see 16 for the algebraic case, the proof in the analytic case is completely similar.

**Definition** 66. Let \( f : X \rightarrow S \) be a morphism, with \( X, S \in \text{SmVar}(\mathbb{C}) \) or \( X, S \in \text{AnSm}(\mathbb{C}) \). Consider the factorization \( f : X \xrightarrow{i} X \times S \xrightarrow{p_S} S \), where \( i \) is the graph embedding and \( p_S : X \times S \rightarrow S \) is the projection.

(i) Then, for \( (M, F) \in \mathcal{C}_{D(2), fil}(S) \) we set

\[
f^\ast \mod\llbracket - \rrbracket, g \Gamma (M, F) := \Gamma_X E(p_S^\ast \mod\llbracket - \rrbracket(M, F)) \in \mathcal{C}_{D(2), fil, \infty}(X \times S),
\]

It induces in the derived category

\[
Rf^\ast \mod\llbracket - \rrbracket, g \Gamma (M, F) := f^\ast \mod\llbracket - \rrbracket, g \Gamma (M, F) := \Gamma_X E(p_S^\ast \mod\llbracket - \rrbracket(M, F)) \in \mathcal{D}_{D(2), fil, \infty}(X \times S),
\]

By definition-proposition 18, we have in the algebraic case \( L_i \ast \mod f^\ast \mod, g \Gamma M = Lf^\ast \mod M \in \mathcal{D}_D(X) \).

(ii) Then, for \( (M, F) \in \mathcal{C}_{D(2), fil}(S) \) we set

\[
Lf^\ast \mod\llbracket - \rrbracket, g \Gamma (M, F) := \Gamma_X L_D p_S^\ast \mod\llbracket - \rrbracket(M, F) := \mathcal{D}_{2}^L L_D \Gamma_X E(D^L_S L_D p_S^\ast \mod\llbracket - \rrbracket(M, F)) \in \mathcal{D}_{D(2), fil, \infty}(X \times S).
\]

In the analytical case we also have

**Definition** 67. Let \( f : X \rightarrow S \) be a morphism, with \( X, S \in \text{AnSm}(\mathbb{C}) \). Consider the factorization \( f : X \xrightarrow{i} X \times S \xrightarrow{p_S} S \), where \( i \) is the graph embedding and \( p_S : X \times S \rightarrow S \) is the projection.
(i) Then, for \((M, F) \in C_{D^\infty(2)fil}(S)\) we set

\[
f^{*\text{mod}[\cdot], \Gamma}(M, F) := \Gamma_X E(p_S^*\text{mod}[\cdot](M, F)) \in C_{D^\infty(2)fil,\infty}(X \times S),
\]

It induces in the derived category

\[
Rf^{*\text{mod}[\cdot], \Gamma}(M, F) := f^{*\text{mod}[\cdot], \Gamma}(M, F) := \Gamma_X E(p_S^*\text{mod}[\cdot](M, F)) \in D_{D^\infty(2)fil,\infty}(X \times S),
\]

(ii) Then, for \((M, F) \in C_{D^\infty(2)fil}(S)\) we set

\[
Lf^{*\text{mod}[\cdot], \Gamma}(M, F) := \Gamma_X^{\vee, h} L_D^* p_S^*\text{mod}[\cdot](M, F) := \mathbb{D}_S^K L_D \Gamma_X E(\mathbb{D}_S^K L_D p_S^*\text{mod}[\cdot](M, F)) \in D_{D^\infty(2)fil,\infty}(X \times S).
\]

4.2.4 The 2 functors and transformations maps for D modules on the smooth complex algebraic varieties and the complex analytic manifolds

By the definitions and the propositions 43, 44, 66 for the algebraic case, and the propositions 46, 47, 67 for the analytic case,

- we have the 2 functors on SmVar(\(\mathbb{C}\)):
  - \(C_{D(2)fil}(\cdot) : \text{SmVar}(\mathbb{C}) \rightarrow C_{D(2)fil}(\cdot)\), \(S \mapsto C_{D(2)fil}(S), (f : T \rightarrow S) \mapsto f^{*\text{mod}}, (f : T \rightarrow S) \mapsto f^{*\text{mod}[\cdot]}\),
  - \(D_{D(2)fil, r}(\cdot) : \text{SmVar}(\mathbb{C}) \rightarrow D_{D(2)fil, r}(\cdot)\), \(S \mapsto D_{D(2)fil, r}(S), (f : T \rightarrow S) \mapsto Lf^{*\text{mod}}, (f : T \rightarrow S) \mapsto Lf^{*\text{mod}[\cdot]}\),
  - \(D_{D(2)fil, \infty}(\cdot) : \text{SmVar}(\mathbb{C}) \rightarrow D_{D(2)fil, \infty}(\cdot)\), \(S \mapsto D_{D(2)fil, \infty}(S), (f : T \rightarrow S) \mapsto f^{FDR}\),

- we have the 2 functors on AnSm(\(\mathbb{C}\)):
  - \(C_{D(2)fil}(\cdot) : \text{AnSm}(\mathbb{C}) \rightarrow C_{D(2)fil}(\cdot)\), \(S \mapsto C_{D(2)fil}(S), (f : T \rightarrow S) \mapsto f^{*\text{mod}}, (f : T \rightarrow S) \mapsto f^{*\text{mod}[\cdot]}\),
  - \(D_{D(2)fil, r}(\cdot) : \text{AnSm}(\mathbb{C}) \rightarrow D_{D(2)fil, r}(\cdot)\), \(S \mapsto D_{D(2)fil, r}(S), (f : T \rightarrow S) \mapsto Lf^{*\text{mod}}, (f : T \rightarrow S) \mapsto Lf^{*\text{mod}[\cdot]}\),
  - \(D_{D(2)fil, \infty}(\cdot) : \text{AnSm}(\mathbb{C}) \rightarrow D_{D(2)fil, \infty}(\cdot)\), \(S \mapsto D_{D(2)fil, \infty}(S), (f : T \rightarrow S) \mapsto f^{FDR}\),

- we have also the 2 functors on AnSm(\(\mathbb{C}\)):
  - \(C_{D^\infty(2)fil}(\cdot) : \text{AnSm}(\mathbb{C}) \rightarrow C_{D^\infty(2)fil}(\cdot)\), \(S \mapsto C_{D^\infty(2)fil}(S), (f : T \rightarrow S) \mapsto f^{*\text{mod}}, (f : T \rightarrow S) \mapsto f^{*\text{mod}[\cdot]}\),
  - \(D_{D^\infty(2)fil, r}(\cdot) : \text{AnSm}(\mathbb{C}) \rightarrow D_{D^\infty(2)fil, r}(\cdot)\), \(S \mapsto D_{D^\infty(2)fil, r}(S), (f : T \rightarrow S) \mapsto Lf^{*\text{mod}}, (f : T \rightarrow S) \mapsto Lf^{*\text{mod}[\cdot]}\),
  - \(D_{D^\infty(2)fil, \infty}(\cdot) : \text{AnSm}(\mathbb{C}) \rightarrow D_{D^\infty(2)fil, \infty}(\cdot)\), \(S \mapsto D_{D^\infty(2)fil, \infty}(S), (f : T \rightarrow S) \mapsto f^{FDR}\),

inducing the following commutative diagrams of functors:

\[
\begin{array}{ccc}
\text{SmVar}(\mathbb{C}) & \xrightarrow{f \mapsto f^{*\text{mod}}} & C_{D(2)fil}(\cdot) \\
\downarrow \text{An} & & \downarrow \text{an} \\
\text{AnSm}(\mathbb{C}) & \xrightarrow{f \mapsto f^{*\text{mod}}} & C_{D(2)fil}(\cdot)
\end{array}
\quad
\begin{array}{ccc}
\text{SmVar}(\mathbb{C}) & \xrightarrow{f \mapsto Lf^{*\text{mod}}} & D_{D(2)fil, r}(\cdot) \\
\downarrow \text{An} & & \downarrow \text{an} \\
\text{AnSm}(\mathbb{C}) & \xrightarrow{f \mapsto Lf^{*\text{mod}}} & D_{D(2)fil, r}(\cdot)
\end{array}
\]

where, for \(S \in \text{AnSm}(\mathbb{C})\),

156
Proof.

Follows by definition from proposition 57.

Proposition 69. Consider a commutative diagram and a factorization

\[
D_0 = \begin{array}{ccc}
X & \xrightarrow{f} & S \\
\downarrow{g'} & & \downarrow{g} \\
X' & \xrightarrow{f'} & T
\end{array}
\]
\[
S_0 = \begin{array}{ccc}
X & \xrightarrow{i} & Y \\
\downarrow{g'} & & \downarrow{g''} \\
X' & \xrightarrow{i'} & Y'T
\end{array}
\]

with \(X, X', Y, S, T \in \text{Var}(\mathbb{C})\) or \(X, X', Y, S, T \in \text{AnSp}(\mathbb{C})\), \(i, i'\) being closed embeddings, and \(p, p'\) the projections. Denote by \(D\) the right square of \(D_0\). We have a factorization \(i' : X' \xrightarrow{i_1} X_T = X \times_Y S Y \times T \xrightarrow{\delta} Y \times T\), where \(i_0, i_1\) are closed embedding. Assume \(S, T, Y, Y'\) are smooth.

(i) For \((M, F) \in \mathcal{C}_{\mathcal{D}fil}(Y \times S)\), the canonical map in \(C_{p^* \mathcal{O}_{\mathcal{D}fil}}(Y \times T)\) (c.f. definition-proposition[16],

\[
E(\Omega_{(Y' \times T)/(X \times S)/(T/S})(M, F)) \circ T(g'', E)(- \circ T(g'', \gamma)(-)
\]

\[
g'' \Gamma_X E((\Omega^*_Y \times S, F_b) \otimes_O Y \times S) (M, F) \rightarrow \Gamma_{X_T} E((\Omega^*_Y \times T, F_b) \otimes_O Y \times T) g'' \text{ mod } (M, F)
\]

is a map in \(C_{p^* \mathcal{D}fil}(Y \times T)\).

(ii) For \((M, F) \in \mathcal{C}_{\mathcal{D}fil}(Y \times S)\), the canonical map in \(C_{\mathcal{O}_{\mathcal{D}fil}}(T)\) (c.f. definition-proposition[17] with \(L_D\) instead of \(L_O\),

\[
T^0(\mathcal{O})(M, F) \circ g'' \Gamma_X E((\Omega^*_Y \times S, F_b) \otimes_O Y \times S) (M, F) \rightarrow p'^* \Gamma_X T^0(\mathcal{O}^*_Y \times T, F_b) \otimes_O Y \times T) g'' \text{ mod } (M, F)
\]

is a map in \(C_{\mathcal{D}fil}(T)\).

(iii) For \((N, F) \in \mathcal{C}_{\mathcal{D}fil}(Y \times T)\), the canonical map in \(C_{p^* \mathcal{O}_{\mathcal{D}fil}}(Y \times T)\)

\[
T(X' / X_T, \gamma)(-) : \Gamma_X E((\Omega^*_Y \times T, F_b) \otimes_O Y \times T) (N, F) \rightarrow \Gamma_{X_T} E((\Omega^*_Y \times T, F_b) \otimes_O Y \times T) (N, F)
\]

is a map in \(C_{p^* \mathcal{D}fil}(Y \times T)\).

(iv) For \(M = \Omega_Y\), we have \(T^0(\mathcal{O})(Y \times S) = T^0(\mathcal{O})\) as complexes of \(\mathcal{D}\) modules and \(T^0(\Omega_Y \times T, Y \times T) = T^0(\Omega_Y \times T, Y \times T)\) as complexes of \(p^* \mathcal{D}\) modules.

Proof. Follows by definition from proposition[54].

In the analytical case, we also have

Proposition 70. Consider a commutative diagram and a factorization

\[
D_0 = \begin{array}{ccc}
X & \xrightarrow{f} & S \\
\downarrow{g'} & & \downarrow{g} \\
X' & \xrightarrow{f'} & T
\end{array}
\]
\[
S_0 = \begin{array}{ccc}
X & \xrightarrow{i} & Y \\
\downarrow{g'} & & \downarrow{g''} \\
X' & \xrightarrow{i'} & Y
\end{array}
\]

with \(X, X', Y, S, T \in \text{AnSp}(\mathbb{C})\), \(i, i'\) being closed embeddings, and \(p, p'\) the projections. Denote by \(D\) the right square of \(D_0\). We have a factorization \(i' : X' \xrightarrow{i_1} X_T = X \times_Y S Y \times T \xrightarrow{\delta} Y \times T\), where \(i_0, i_1\) are closed embedding. Assume \(S, T, Y, Y'\) are smooth.

157
(i) For \((M,F) \in C_{D^{\infty}fil}(Y \times S)\), the canonical map in \(C_{p^{\ast}O_{T}fil}(Y \times T)\) (c.f. definition-proposition [77]),

\[
E(\Omega_{(Y^{\ast}\times T)/(X^{\ast}\times S)}(\Theta/S)\cdot(M,F)) \circ T(g^{\ast},E)(-): g^{\ast}\gamma X E((\Omega_{Y^{\ast}\times S})^{\ast},F_{b}) \otimes_{O_{Y^{\ast}\times S}}(M,F) \to \Gamma_{Y^{\ast}}(\Omega_{Y^{\ast}\times T}/T,F_{b}) \otimes_{O_{Y^{\ast}\times T}}g^{\ast}\ast\ast\gamma (M,F)
\]

is a map in \(C_{p^{\ast}T^{\infty}fil}(Y \times T)\).

(ii) For \((M,F) \in C_{D^{\infty}fil}(Y \times S)\), the canonical map in \(C_{O_{T}fil}(T)\) (c.f. definition-proposition [77] with \(L_{D^{\infty}}\) instead of \(L_{O}^{\ast}\))

\[
T_{\omega}^{\ast}(D)(M,F)^{\gamma} : g^{\ast}E(\Omega_{\gamma}(\Omega_{Y^{\ast}\times S})^{\ast},F_{b}) \otimes_{O_{Y^{\ast}\times S}}(M,F) \to p_{\ast}\Gamma_{Y^{\ast}}(\Omega_{Y^{\ast}\times T}/T,F_{b}) \otimes_{O_{Y^{\ast}\times T}}g^{\ast}\ast\ast\gamma (M,F)
\]

is a map in \(C_{D^{\infty}fil}(T)\).

(iii) For \((N,F) \in C_{D^{\infty}fil}(Y \times T)\), the canonical map in \(C_{p^{\ast}O_{T}fil}(Y \times T)\)

\[
T_{\omega}(X^{\ast}/T,T_{\omega}^{\ast}(D)(M,F)^{\gamma} : g^{\ast}E(\Omega_{\gamma}(\Omega_{Y^{\ast}\times S})^{\ast},F_{b}) \otimes_{O_{Y^{\ast}\times S}}(M,F) \to p_{\ast}\Gamma_{Y^{\ast}}(\Omega_{Y^{\ast}\times T}/T,F_{b}) \otimes_{O_{Y^{\ast}\times T}}g^{\ast}\ast\ast\gamma (M,F)
\]

is a map in \(C_{D^{\infty}fil}(Y \times T)\).

(iv) For \(M = O_{Y}\), we have \(T_{\omega}^{\ast}(D)(O_{Y^{\ast}\times S})^{\gamma} = T_{\omega}^{\ast}(D)^{\gamma}\) as complexes of \(D_{\infty}^{\ast}\) modules and \(T_{\omega}^{\ast}(X^{\ast}/T,O_{Y^{\ast}\times S})^{\gamma} = T_{\omega}^{\ast}(X^{\ast}/T,T)^{\gamma}\) as complexes of \(p^{\ast}D_{\infty}^{\ast}\) modules.

Proof. Follows from proposition [69] \(\square\)

Similarly, we have:

Proposition 71. Let \(p : Y \times S \to S\) a projection and \(i : X \hookrightarrow Y \times S\) a closed embedding with \(S,Y \in \text{SmVar}(\mathbb{C})\).

(i) For \((M,F) \in C_{Dfil}(Y \times S)\) the canonical map in \(C_{p^{\ast}O_{fil}}(Y^{an}\times S^{an})\) (see definition-proposition [77])

\[
E(\Omega_{(Y^{an}\times S^{an})/(Y^{an}\times S)}(T_{\infty}/T,F_{b}) \otimes_{O_{Y^{an}\times S^{an}}} (M,F)) \circ T_{an}^{\ast}(an,h)(-):
\]

\[
\Gamma_{Y}(\Omega_{Y^{an}\times S^{an}}(\Omega_{Y^{an}\times S^{an}}^{\ast},F_{b}) \otimes_{O_{Y^{an}\times S^{an}}}(M,F))^{an} \to \Gamma_{Y}^{an}(\Omega_{Y^{an}\times S^{an}}^{\ast},F_{b}) \otimes_{O_{Y^{an}\times S^{an}}}(M,F)^{an}
\]

is a map in \(C_{D^{\infty}fil}(Y^{an}\times S)\).

(ii) For \((M,F) \in C_{Dfil}(Y \times S)\) the canonical map in \(C_{O_{fil}}(S^{an})\) (see definition-proposition [77])

\[
T_{\omega}(an,h)^{\gamma} : (p_{\ast}\Gamma_{Y}(\Omega_{Y^{an}\times S^{an}}^{\ast},F_{b}) \otimes_{O_{Y^{an}}}(M,F))^{an} \to p_{\ast}\Gamma_{Y}^{an}(\Omega_{Y^{an}\times S^{an}}^{\ast},F_{b}) \otimes_{O_{Y^{an}}}(M,F)^{an}
\]

is a map in \(C_{D_{fil}}(S^{an})\).

(iii) For \(M = O_{Y}\), we have \(T_{\omega}^{\ast}(an,h)^{\gamma} = T_{\omega}^{\ast}(an,h)^{\gamma}\) as complexes of \(D_{S}\) modules

Proof. Follows by definition from proposition [69] \(\square\)

Let \(p : Y \times S \to S\) a projection with \(Y,S \in \text{SmVar}(\mathbb{C})\) or with \(Y,S \in \text{AnSm}(\mathbb{C})\). Let \(j : V \hookrightarrow Y \times S\) an open embedding. Consider (see proposition [69]), for \((M,F) \in C_{Dfil}(Y \times S)\), the canonical transformation map in \(C_{p^{\ast}T^{\infty}fil}(Y \times S)\)

\[
k \circ T_{\omega}(j^{\ast},(E(M,F)) : (\Omega_{Y^{\ast}\times S^{an}}^{\ast},F_{b}) \otimes_{O_{Y^{an}}} j_{\ast}^{\ast}(E(M,F))
\]

\[
\frac{D_{R}(Y^{an}\times S^{an})}{(\text{ad}(j^{\ast}j_{\ast})(-))} \to j^{\ast}(\Omega_{Y^{an}\times S^{an}}^{\ast},F_{b}) \otimes_{O_{Y^{an}}} j_{\ast}^{\ast}(E(M,F)) = j^{\ast}(\Omega_{Y^{an}\times S^{an}}^{\ast},F_{b}) \otimes_{O_{Y^{an}}} j^{\ast}(E(M,F))
\]

\[
\frac{k \circ D_{R}(Y^{an}\times S^{an})}{(\text{ad}(j^{\ast}j_{\ast})(E(M,F)))} \to j_{\ast}E(j^{\ast}(\Omega_{Y^{an}\times S^{an}}^{\ast},F_{b}) \otimes_{O_{Y^{an}}} E(M,F)))
\]

We have then:

158
**Proposition 72.** Let \( p : Y \times S \to S \) a projection with \( Y, S \in \text{SmVar}(\mathbb{C}) \) or with \( Y, S \in \text{AnSm}(\mathbb{C}) \). Let \( i : X \hookrightarrow Y \times S \) a closed embedding. Then, for \((M, F) \in C_{Dfii}(Y \times S)\)

(i) the canonical map in \( C_{Dfii}(Y) \) (definition 54)

\[
T^O_w(\gamma, \otimes)(M, F) := (I, k \circ T^O_w(j, \otimes)(E(M, F))) : (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} \Gamma_X E(M, F) \to \Gamma_X E((\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} E(M, F)),
\]

is a \((1-)\)filtered Zariski, resp usu, local equivalence.

(ii) the map of point (i) gives the following canonical isomorphism in \( D_{p^-Dfii}(Y)\)

\[
\Gamma_X E((\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} E(M, F)) \xrightarrow{DR(Y \times S/S)(k)\otimes(M,F)} \Gamma_X E((\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} E(M, F)).
\]

Proof. (i): By proposition 60

- \( T^O_w(j, \otimes)(M, F) : (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} j_*j^*E(M, F) \to j_*E(j^*((\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} E(M, F))) \)
  is a filtered Zariski, resp usu, local equivalence in \( C_{p^-Dfii}(Y \times S)\) and

- \( DR(Y \times S/S)(k) : (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} E(M, F) \to (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} E(M, F) \)
  is a filtered Zariski, resp usu, local equivalence in \( C_{p^-Dfii}(Y \times S)\).

(ii): Follows from (i).

In the analytic case, we also have

**Proposition 73.** Let \( p : Y \times S \to S \) a projection with \( Y, S \in \text{AnSm}(\mathbb{C}) \). Let \( i : X \hookrightarrow Y \) a closed embedding. Then, for \((M, F) \in C_{D^-fii}(Y \times S)\)

(i) the canonical map in \( C_{D^-fii}(Y) \)

\[
T^O_w(\gamma, \otimes)(M, F) := (I, T^O_w(j, \otimes)(E(M, F))) : (\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} \Gamma_X E(M, F) \to \Gamma_X E((\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} E(M, F)).
\]

is a map in \( C_{D^-fii}(Y \times S) \). Proposition 72 says that it is a filtered equivalence usu local,

(ii) the map of point (i) gives the following canonical isomorphism in \( D_{p^-D^-fii}(Y \times S)\)

\[
\Gamma_X E((\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} E(M, F)) \xrightarrow{DR(Y \times S/S)(k)\otimes(M,F)} \Gamma_X E((\Omega^\bullet_{Y \times S/S}, F_b) \otimes_{O_{Y \times S}} E(M, F)).
\]

Proof. (i): By proposition 61

- \( T^O_w(j, \otimes)(M) : (\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} j_*j^*E(M) \to j_*E(j^*(\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} E(M))) \)
  is an equivalence usu local in \( C_{p^-D^-}(Y \times S) \) and

- \( DR(Y \times S/S)(k) : (\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} E(M) \to (\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} E(M) \)
  is an equivalence usu local in \( C_{p^-D^-}(Y \times S) \).

(ii): Follows from (i).
• $p(M_1, F) : (M_1, F) \to p_{\ast \mathrm{mod}} p^{\ast \mathrm{mod}[\ast]}(M_1, F)$ in $C_{D(2)fil}(S_1)$, for $(M_1, F) \in C_{Dfil(2)}(S_1)$, which is the composite

\[
p(M_1, F) : (M_1, F) \xrightarrow{\mathrm{ad}(p^\ast, p_\ast)(M_1)} p_\ast p^\ast(M_1, F) \xrightarrow{m_1} p_\ast((\Omega_{S_{12}/S_1}^\ast, F_0) \otimes_{p^\ast O_{S_1}} p^\ast(M_1, F)) \xrightarrow{\equiv} p_\ast((\Omega_{S_{12}/S_1}^\ast, F_0) \otimes_{O_{S_{12}}} p_{\ast \mathrm{mod}}(M_1, F) = p_{\ast \mathrm{mod}} p^{\ast \mathrm{mod}[\ast]}(M_1, F)
\]

where $m_1 : p^\ast M_1 \to p^\ast M_1 \otimes_{p^\ast O_{S_1}} \Omega_{S_{12}/S_1}$ is given by $m_1(m) = m \otimes 1$.

• $p(M_{12}, F) : p^{\ast \mathrm{mod}[\ast]} p_{\ast \mathrm{mod}}(M_{12}, F) \to (M_{12}, F)$ in $C_{Dfil}(S_1 \times S_2)$, for $(M_{12}, F) \in C_{D}(S_1 \times S_2)$, which is the composite

\[
p(M_{12}, F) : p^{\ast \mathrm{mod}[\ast]} p_{\ast \mathrm{mod}}(M_{12}, F) = p_\ast p^\ast((M_{12}, F) \otimes_{O_{S_{12}}} (\Omega_{S_{12}/S_1}^\ast, F_0)) \otimes_{p^\ast O_{S_1}} O_{S_{12}} \xrightarrow{m_{12}} (M_{12}, F)
\]

where $m_{12} : M_{12} \otimes_{p^\ast O_{S_1}} \Omega_{S_{12}/S_1} \to M_{12}$ is the multiplication map:

- $m_{12}(M_{12} \otimes_{p^\ast O_{S_1}} \Omega_{S_{12}/S_1}) = 0$ for $p \neq 0$ and
- $m_{12} : M_{12} \otimes_{p^\ast O_{S_1}} \Omega_{S_{12}/S_1} \to O_{S_{12}} \to M_{12}$ is given by $m_{12}(m \otimes f) = fm$.

We have then $p(p^{\ast \mathrm{mod}[\ast]}(M_1, F)) \circ p^{\ast \mathrm{mod}[\ast]} p(M_1, F) = I_{p^{\ast \mathrm{mod}[\ast]}(M_1, F)}$. It gives the following maps

• $p(M_{12}) : (M_{12}, F) \to p^{\ast \mathrm{mod}[\ast]} \int_{M_{12}} p_{\ast \mathrm{mod}}(M_{12}, F)$ in $D_{D(2)fil}(S_1 \times S_2)$, for $(M_{12}, F) \in C_{Dfil,h}(S_1 \times S_2)$, given by

\[
p(M_{12}) : (M_{12}, F) \xrightarrow{\delta(M_{12}, F)} D^K_S LDP_{\ast \mathrm{mod}}(M_{12}, F) \xrightarrow{\cdot_{(p,D)}} D^K_S LDP^{\ast \mathrm{mod}[\ast]} p_{\ast \mathrm{mod}} E(D^K_S L_D(M_{12}, F)) \xrightarrow{\int_{p_{\ast \mathrm{mod}}}} (M_{12}, F)
\]

• $p(M_1, F) : \int_{M_1} p^{\ast \mathrm{mod}[\ast]}(M_1, F) \to (M_1, F)$ in $D_{Dfil}(S_1)$, for $M_1 \in C_{Dfil,h}(S_1)$, given by

\[
p(M_1, F) : \int_{M_1} p^{\ast \mathrm{mod}[\ast]}(M_1, F) = D^K_S LDP_{\ast \mathrm{mod}} E(D^K_S p^{\ast \mathrm{mod}[\ast]} L_D(M_1, F)) \xrightarrow{\cdot_{(p,D)}} D^K_S L_D(M_1, F) \xrightarrow{\int_{p_{\ast \mathrm{mod}}}} (M_1, F)
\]

so that $p^{\ast \mathrm{mod}[\ast]}(p(M_1, F)) \circ p^{\ast \mathrm{mod}[\ast]} p(M_1, F) = I_{p^{\ast \mathrm{mod}[\ast]}(M_1, F)}$.

**Definition 68.** (i) Consider a commutative diagram in SmVar($\mathbb{C}$) which is cartesian, together with its factorization

\[
D = (f, q) = X \times T \xrightarrow{f'} T \times S \xrightarrow{f''} X \times T \times S \xrightarrow{p''} T \times S,
\]

\[
S \xrightarrow{q'} X \xrightarrow{q} T \xrightarrow{q'' = i \times q} X \times S \xrightarrow{p} S
\]

where the squares are cartesian, $f = p \circ i$ being the graph factorization and $q, q'$ the projections. We have, for $(M, F) \in C_{D(2)fil,\infty}(X)$, the following transformation map in $C_{D(2)fil,\infty}(T \times S)$:

\[
T^{\ast \mathrm{mod}[\ast]}(f, q)(M, F) : q^{\ast \mathrm{mod}} p_\ast E((\Omega_{X \times T} \times S, F_0) \otimes O_{X \times S} \overset{i_{\ast \mathrm{mod}}}{\otimes} (M, F))\]

\[
T^{\ast \mathrm{mod}(q, i, q'')(M, F)) : p_\ast E((\Omega_{X \times T} \times S, F_0) \otimes O_{X \times T} \times S \overset{q''}{\otimes} (M, F))\]

\[
p_\ast E(T^{D^{\ast \mathrm{mod}[\ast]}(i, q'')(M, F)) \otimes I) : p_\ast E((\Omega_{X \times T} \times S, F_0) \otimes O_{X \times T} \times S \overset{i''}{\otimes} (M, F))
\]

160
where

\[
T^{D\text{mod}}(i, q')(M, F) : q''^{\text{mod}i_{\text{mod}}}(M, F) := q''^{\text{mod}i_{\text{mod}}}(\Delta X, q^{*\text{mod}}D_{X \times S}, F^{\text{ord}}) \xrightarrow{q^{*\text{mod}}i_{\text{mod}}(\Delta X, q^{*\text{mod}}D_{X \times S}, F^{\text{ord}})} i_{*}q^{*\text{mod}}(\Delta X, q^{*\text{mod}}D_{X \times S}, F^{\text{ord}}) \xrightarrow{=} i_{*}q^{*\text{mod}}(\Delta X, q^{*\text{mod}}D_{X \times S}, F^{\text{ord}}) \xrightarrow{=} i_{*}q^{*\text{mod}}(\Delta X, q^{*\text{mod}}D_{X \times S}, F^{\text{ord}})
\]

(ii) Consider a commutative diagram in SmVar(\mathbb{C}) which is cartesian, together with its factorization

\[
D = (f, g) = \xrightarrow{f'} X_{T} \xrightarrow{f} S \hspace{1cm} D' = (f', g) = \xrightarrow{f''} X_{T} \xrightarrow{f} S
\]

where the squares are cartesian, \(f = p \circ i\), \(g = q \circ l\) being the graph factorizations. We have, for \((M, F) \in D_{(2)f\text{d},\infty}(X)\), the following transformation map in \(D_{(2)f\text{d},\infty}(T \times S)\):

\[
T^{D\text{mod}}(f, g)((M, F)) : R_{g}^{\text{mod}\Gamma}(M, F) \int_{f}^{\text{FLR}} (M, F) := \Gamma_{T}E(q^{*\text{mod}}p_{*}E((\Omega_{X \times S}, F_{b}) \otimes_{O_{X \times S}} i_{*}q^{*\text{mod}}(M, F)))
\]

\[
\xrightarrow{\Gamma_{T}E(T^{D\text{mod}}(f, g)(M, F))} \Gamma_{T}E(p_{*}^{\text{FLR}}E((\Omega_{X \times T \times S}, F_{b}) \otimes_{O_{X \times T \times S}} i_{*}q^{*\text{mod}}(M, F)))
\]

\[
\xrightarrow{=} p_{*}^{\text{FLR}}E((\Omega_{X \times T \times S}, F_{b}) \otimes_{O_{X \times T \times S}} i_{*}q^{*\text{mod}}(M, F)))
\]

\[
\xrightarrow{=} p_{*}^{\text{FLR}}E((\Omega_{X \times T \times S}, F_{b}) \otimes_{O_{X \times T \times S}} (i_{*}q^{*\text{mod}}(M, F)))
\]

(ii) We have, for \(M \in D_{D}(X)\), the following transformation map in \(D_{D}(T)\):

\[
T^{D\text{mod}}(f, g)(M) : g^{*\text{mod}}(M, F) \int_{f}^{\text{FLR}} (M) = l_{\text{mod}}^{*}q_{\text{mod}}^{*} \int_{f}^{\text{FLR}} (M) \xrightarrow{=} l_{\text{mod}}^{*}q_{\text{mod}}^{*} \int_{f}^{\text{FLR}} (M) \xrightarrow{=} l_{\text{mod}}^{*}q_{\text{mod}}^{*} \int_{f}^{\text{FLR}} (M)
\]

where \(l_{\text{mod}}^{*}\text{ad}(t^{*}, l_{\text{mod}}^{*})(-)^{-1}\) is an isomorphism by lemma [4]

In the analytic case, we have:
Definition 69. Consider a commutative diagram in AnSm(\( \mathbb{C} \)) which is cartesian together with a factorization

\[
D = (f, g) = X_T \xrightarrow{f'} T \xrightarrow{g'} Y \xrightarrow{T} ^p S
\]

where \( Y \in \text{AnSm}(\mathbb{C}) \), \( i, i' \) are closed embeddings and \( p, p' \) the projections.

(i) We have, for \((M, F) \in D_{D(2)fil, \infty}(X)\), the following transformation map in \( D_{D(2)fil, \infty}(T \times S)\)

\[
T^{D_{\text{mod}}(f, g)}((M, F)) \colon Rg^* \int_{f}^{FDR} (M, F) \rightarrow \int_{f'}^{FDR} Rg'_{*} \Gamma(M, F)
\]

is defined in the same way as in definition 68

(ii) For \((M, F) \in D_{D^\infty(2)fil, \infty}(X)\), the following transformation map in \( D_{D^\infty(2)fil, \infty}(T \times S)\)

\[
T^{D_{\text{mod}}(f, g)}((M, F)) : Rg^* \int_{f}^{FDR} (M, F) \rightarrow \int_{f'}^{FDR} Rg'_{*} \Gamma(M, F)
\]

is defined in the same way as in (ii) : see definition 68.

In the algebraic case, we have the following proposition:

Proposition 74. Consider a cartesian square in SmVar(\( \mathbb{C} \))

\[
D = X_T \xrightarrow{f'} T \xrightarrow{g'} Y \xrightarrow{T} ^p S
\]

(i) For \((M, F) \in D_{D(2)fil, \infty,c}(X)\),

\[
T^{D_{\text{mod}}(f, g)}((M, F)) : Rg^* \int_{f}^{FDR} (M, F) \rightarrow \int_{f'}^{FDR} Rg'_{*} \Gamma(M, F)
\]

is an isomorphism in \( D_{D(2)fil, \infty}(T)\).

(ii) For \( M \in D_{D, c}(X)\),

\[
T^{D_{\text{mod}}(f, g)}(M) : g^* \int_{f}^{FDR} M \rightarrow \int_{f'}^{FDR} g'_{*} \Gamma M
\]

is an isomorphism in \( D_{D}(T)\).

Proof. Follows from the projection case and the closed embedding case.

In the analytic case, we have similarly:

Proposition 75. Consider a cartesian square in AnSm(\( \mathbb{C} \))

\[
D = X_T \xrightarrow{f'} T \xrightarrow{g'} Y \xrightarrow{T} ^p S
\]

162
(i) Assume that \( f' \) is proper. For \((M,F) \in D_{\mathcal{D}(2)fil,\infty,h}(X),\) 

\[
T^{\mathcal{D}_{\text{mod}}}((M,F), (N,F)) : Rg^* \int_f (M,F) \xrightarrow{\sim} \int_{f'} Rg'^* (M,F)
\]

is an isomorphism in \(D_{\mathcal{D}(2)fil,\infty}(T)\).

(ii) For \((M,F) \in D_{\mathcal{D}(\infty)fil,\infty,h}(X),\) 

\[
T^{\mathcal{D}_{\text{mod}}}((M,F), (N,F)) : Rg^* \int_f (M,F) \xrightarrow{\sim} \int_{f'} Rg'^* (M,F)
\]

is an isomorphism in \(D_{\mathcal{D}(\infty)fil,\infty}(T)\).

**Proof.** (i): Similar to the proof of proposition [74]

(ii): Similar to the proof of proposition [74]

**Definition 70.** Let \( f : X \rightarrow S \) a morphism with \( X,S \in \text{SmVar}(\mathbb{C}) \).

(i) We have, for \((M,F) \in C_{\mathcal{D}fil}(S)\) and \((N,F) \in C_{\mathcal{D}fil}(X)\), we have the map in \( C_{\mathcal{D}fil}(S) \)

\[
T^{\mathcal{D}_{\text{mod},0}}((\otimes, f))((M,F), (N,F)) : (M,F) \otimes_{O_S} \int^0_{f_{\otimes}} (N,F) \otimes_{O_S} \int^0_{f_{\otimes}} f_*(N,F) \otimes_{D_X} (D_{X \rightarrow S, F^{\text{ord}}}) \xrightarrow{T(\otimes,f)(-,-)} f_*(f^*(M,F) \otimes_{f^*O_X} (N,F) \otimes_{D_X} (D_{X \rightarrow S, F^{\text{ord}}})) \xrightarrow{\sim} f_*(f^*\otimes_{X(S,F)} (N,F) \otimes_{D_X} (D_{X \rightarrow S, F^{\text{ord}}})) =: f^\delta_0(f^*\otimes_{X(S,F)} (N,F) \otimes_{D_X} (D_{X \rightarrow S, F^{\text{ord}}}))
\]

(ii) Consider the cartesian square 

\[
\begin{matrix}
D = X & \xrightarrow{i} & X \times S \\
\downarrow f & & \downarrow f_{\times S} \\
S & \xrightarrow{\Delta_S} & S \times S
\end{matrix}
\]

where \( i_f = (f \times I_S) \circ \Delta_X : X \rightarrow X \times S \) is the graph embedding. Then, for \((M,F) \in C_{\mathcal{D}(2)fil}(S)\) and \((N,F) \in C_{\mathcal{D}fil}(X)\), we have the map in \( D_{\mathcal{D}(2)fil,r}(S) \)

\[
T^{\mathcal{D}_{\text{mod}}}((\otimes, f))((M,F), (N,F)) : \int_f (N,F) \otimes_{O_X} \int^mod_{D_{-}} (M,F) = \int_f \int^mod_{D_{-}} i^*_{f,D_{-}}(p_X^*N \otimes p_S^*M) \xrightarrow{T^{\mathcal{D}_{\text{mod}}}((\Delta_S,f_{\times I_S})(-,-))} \Delta^*_{\otimes D_{-}} \int_{(f_{\times I_S})} (p_X^*N \otimes p_S^*M) = (\int_f (N,F)) \otimes_{O_S} (M,F)
\]

Clearly if \( i : Z \hookrightarrow S \) is a closed embedding with \( Z,S \in \text{SmVar}(\mathbb{C}) \) or with \( Z,S \in \text{AnSmVar}(\mathbb{C}) \), then \( T^{\mathcal{D}_{0}(\otimes,i)}((M,N) = T^{\mathcal{D}_{0}(\otimes,i)}((M,N) \in D_{\mathcal{D}(2)fil,\infty}(S)) \).

We have then the following :

**Proposition 76.** (i) Let \( i : Z \hookrightarrow S \) is a closed embedding with \( Z,S \in \text{SmVar}(\mathbb{C}) \), then for \((M,F) \in C_{\mathcal{D}fil}(S)\) and \((N,F) \in C_{\mathcal{D}fil}(Z)\)

\[
T^{\mathcal{D}_{0}(\otimes,i)}((M,F), (N,F)) : (M,F) \otimes_{O_Z} i^*_{\otimes D_{-}} ((M,F) \otimes_{O_Z} (N,F)) \xrightarrow{\sim} i^*_{\otimes D_{-}} (i^*_{\otimes D_{-}} (M,F) \otimes_{O_Z} (N,F))
\]

is an isomorphism in \( C_{\mathcal{D}fil}(S) \).
Theorem 19. A product \( f : X \rightarrow S \) a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \). Then, for \((M,F) \in \mathcal{C}_{D(2)fil}(X)\) and \((N,F) \in \mathcal{C}_{D(2)fil}(S)\),

\[
T_{D\text{mod}}^{\varnothing}(\varnothing,f)((M,F),(N,F)) : \int_f^{\text{FDR}} ((M,F) \otimes_{O_X} f_{*\text{mod}}^i(N,F)) \xymatrix{\sim\ar@{..>}[r] &} (\int_f^{\text{FDR}} (M,F) \otimes_{O_Y} (N,F))
\]

is an isomorphism in \( D_{\mathcal{C}_{D(2)fil},\infty}(S) \).

Proof. (i): Follows from proposition 11. (ii): Follows from proposition 71. \(\square\)

Let \( f : X \rightarrow S \) a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \). Consider the graph embedding \( f : X \xymatrix{i} X \times S \xymatrix{p} S \), with \( X, Y, S \in \text{SmVar}(\mathbb{C}) \). We have, for \((M,F) \in \mathcal{C}_{Dfil}(X)\), the canonical isomorphism in \( \mathcal{C}_{D(2)fil}(S^{an})\)

\[
an_X^i \circ \eta \circ L_D(p \circ \eta (M,F) \otimes_{O_{X\times S}} (O_{X\times S}, V)) \xymatrix{\sim\ar@{..>}[r] &} f_*(E((D_{X\leftarrow S}, F^{ord}) \otimes_{DX} L_D(M,F)))^{an} \xymatrix{\sim\ar@{..>}[r] &} f_*E((D_{X\leftarrow S} \otimes_{DX} L_D(M^{an}, F))^{an})
\]

We then define and study the transformation map between the direct image functor and the analytical functor for D-modules:

Definition 71. Let \( f : X \rightarrow S \) a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \).

(i) We have for \((M,F) \in \mathcal{C}_{D(2)fil}(X)\) the canonical map in \( \mathcal{C}_{D(2)fil}(S^{an})\)

\[
T_{D\text{mod}}^{\varnothing}(an,f)(M,F) : an^{\text{mod}}_S(p_* E((\Omega^{\bullet}_{X/S,S}, F_b) \otimes_{O_{X\times S}} i^\text{mod}(M,F)))
\]

(ii) Consider the graph embedding \( f : X \xymatrix{i} X \times S \xymatrix{p} S \), with \( X, Y, S \in \text{SmVar}(\mathbb{C}) \). We have, for \((M,F) \in \mathcal{C}_{Dfil}(X)\), the canonical map in \( \mathcal{C}_{D(2)fil}(S^{an})\)

\[
T_{D\text{mod}}^{\varnothing}(an,f)(M,F) : an^{\text{mod}}_S(p_* E((\Omega^{\bullet}_{Y \times S/S,S}, F_b) \otimes_{O_{Y \times S}} i^\text{mod}(M,F)))
\]

In order to prove that this map gives an isomorphism in the derived category in the non filtered case if \( f \) is proper and \( M \) coherent, we will need the following (c.f.\[16\]):

Theorem 19. A product \( X \times S \) of a smooth projective variety \( X \) and a smooth affine variety \( S \) is D-affine.

Proof. See \[16\] theorem 1.6.5. \(\square\)

A main result is that we have the following version of the first GAGA theorem for coherent D-modules:

Theorem 20. Let \( f : X \rightarrow S \) a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \). Let \( M \in \mathcal{D}_{D(2)fil,c}(X) \), for \( r = 1, \ldots, \infty \). If \( f \) is proper,

\[
T_{D\text{mod}}^{\varnothing}(an,f)(M,F) : (\int_f M)^{an} \xymatrix{\sim\ar@{..>}[r] &} \int_{f^{an}} (M^{an})
\]

is an isomorphism.
Proof. We may assume that \( f \) is projective, so that we have a factorization \( f : X \overset{i}{\hookrightarrow} \mathbb{P}^N \times S \overset{p}{\rightarrow} S \) where \( i \) is a closed embedding and \( p \) the projection. The question being local on \( S \), we may assume that \( S \) is affine. Since \( \mathbb{P}^N \times S \) is \( D \)-affine by theorem \([13]\) we have by proposition \([10] \text{(iii)} \) a complex \( F \in \mathcal{C}_D(\mathbb{P}^N \times S) \) such that \( i_{\text{mod}} M = F \cong F \in D_{\mathcal{R}_r}(\mathbb{P}^N \times S) \) and each \( F^n \) is a direct summand of a free \( D_{\mathcal{P}^N \times S} \) module of finite rank. The theorem now follows from the fact that \( \int_p D_{\mathbb{P}^N \times S} \cong D_S[-N] \) and the fact that \((D_S)^{an} = D_{Sm}^\ast\).

We also have

**Definition 72.** (i) Let \( f : X \rightarrow S \) a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \) or with \( X, S \in \text{AnSm}(\mathbb{C}) \). We have, for \( M, N \in C_{D_{fil}}(X) \), the canonical transformation map in \( D_{D_{fil},\infty}(S) \)

\[
T^0\mathcal{D}(f, hom)((M, F), (N, F)) : Rf_*R\text{Hom}_{D_S}(f^*(M, F), (N, F)) \rightarrow
Rf_*R\text{Hom}_{D_X}(f^*(M, F) \otimes_{D_X} L_D(D_{X \rightarrow S}, F^{ord}), (N, F) \otimes_{D_X} L_D(D_{X \rightarrow S}, F^{ord}))
\]

\[
= \text{RHom}_{D_X}(f_!(M, F), f_!(N, F))
\]

(ii) Let \( f : X \rightarrow S \) a morphism with \( X, S \in \text{AnSm}(\mathbb{C}) \). We have, for \( (M, F), (N, F) \in C_{D_{fil}}(S) \), the canonical transformation map in \( D_{D_{fil}}(S) \)

\[
T^0\mathcal{D}(f, hom)((M, F), (N, F)) : Rf_*R\text{Hom}_{D_S}(f^*(M, F), (N, F)) \rightarrow
Rf_*R\text{Hom}_{D_X}(f^*(M, F) \otimes_{D_X} L_D(D_{X \rightarrow S}, F^{ord}), (N, F) \otimes_{D_X} L_D(D_{X \rightarrow S}, F^{ord}))
\]

\[
= \text{RHom}_{D_X}(f_!(M, F), f_!(N, F))
\]

**Definition 73.** Let \( f : X \rightarrow S \) a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \) or with \( X, S \in \text{AnSm}(\mathbb{C}) \). We have, for \( (M, F), (N, F) \in C_{D_{fil}}(S) \), the canonical transformation map in \( C_{D_{fil}}(X) \)

\[
T^\mathcal{D}(f, hom)((M, F), (N, F)) : f^*\text{Hom}_{D_S}(f^*(M, F), (N, F))
\]

\[
\overset{T(f, hom)((M, F), (N, F))}{\xrightarrow{\text{Hom}_{D_S}(f^*(M, F), (N, F))}}
\]

\[
\Rightarrow \text{Hom}_{D_X}(f^*(M, F) \otimes_{D_S} L_{f^*D}(D_{X \rightarrow S}, F^{ord}), f^*(N, F) \otimes_{D_S} L_{f^*D}(D_{X \rightarrow S}, F^{ord}))
\]

\[
\cong \text{Hom}_{D_X}(f^{*\text{mod}}(M, F), f^{*\text{mod}}(N, F))
\]

which is the one given by Kashiwara (see \([13]\)).

In the algebraic case, we have, in the non filtered case, the six functor formalism for holonomic D-modules:

**Theorem 21.** Let \( f : X \rightarrow S \) a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \).

(i) We have, for \( M \in D_{D,h}(X) \) and \( N \in D_{D,h}(S) \) a canonical isomorphism in \( D_D(S) \)

\[
I^{D\text{mod}}(Lf^{*\text{mod}}[-], \int_f)\mathcal{D}(M, N) : Rf_*R\text{Hom}_{D_X}(Lf^{*\text{mod}}[-], N) \cong \text{RHom}_{D_S}(N, \int_f M).
\]

(ii) We have, for \( M \in D_{D,h}(X) \) and \( N \in D_{D,h}(S) \) a canonical isomorphism in \( D_D(X) \)

\[
I^{D\text{mod}}(\int_f Lf^{*\text{mod}}[-])\mathcal{D}(M, N) : R\text{Hom}_{D_X}(\int_f M, N) \cong Rf_*R\text{Hom}_{D_S}(M, Lf^{*\text{mod}}[-], N).
\]
Proposition 77. Consider a cartesian square in SmVar(C).

\[ D = X' \xrightarrow{f'} T, \]
\[ g \downarrow \quad \downarrow g \]
\[ X \xrightarrow{f} S \]

We have, for \( M \in C_{D,h}(X) \), the following transformation maps

\[ T_1^{D_{mod}}(D)(M) : Lg^{*_{mod}[-]} \int_f M \xrightarrow{\text{ad}(Lg^{*_{mod}}[-],f)(-)} \int_{f'} Lf^{*_{mod}[-]} Lg^{*_{mod}[-]} \int_f M \xrightarrow{-} \]
\[ \int_{f'} Lg_{FDR}^{*_{mod}[-]} Lf^{*_{mod}[-]} \int_f M \xrightarrow{\text{ad}(Lg^{*_{mod}[-]},f)(M)} \int_{f'} Lg_{FDR}^{*_{mod}[-]} M \]

and

\[ T_2^{D_{mod}}(D)(M,F) : \int_{f''} Lg^{*_{mod}[-]} M \xrightarrow{\text{ad}(f''_!,Lf^{*_{mod}}[-])(-)} \int_{f''} Lg^{*_{mod}[-]} Lf^{*_{mod}[-]} \int_{f''} M \xrightarrow{-} \]
\[ \int_{f''} Lg^{*_{mod}[-]} M \int_{f''} Lg^{*_{mod}[-]} Lf^{*_{mod}} \int_{f''} Lg^{*_{mod}[-]} \int_{f''}^{FDR} M \]

Corollary 2. Let \( f : X \to S \) a morphism with \( X, S \in \text{SmVar}(\mathbb{C}) \). Then,

- \((Lf^{*_{mod}[-]},f) : D_{D,h}(S) \to D_{D,h}(X)\) is a pair of adjoint functors.
- \((f, Lf^{*_{mod}[-]}) : D_{D,h}(S) \to D_{D,h}(X)\) is a pair of adjoint functors.

Proof. Follows immediately from theorem [21] by taking global sections. \(\square\)

Proposition 77. Consider a cartesian square in SmVar(C)

\[ D = X' \xrightarrow{f'} X \]
\[ g \downarrow \quad \downarrow g \]
\[ T \xrightarrow{f''} S \]

Assume that \( f \) (and hence \( f' \)) is proper. Then, for \((M,F) \in D_{D(2)_{fin},h}(X)\),

- \( T_1^{D_{mod}}(f,g)(M) : Lg^{*_{mod}[-]} \int_f M \xrightarrow{\sim} \int_{f'} Lg^{*_{mod}[-]} M \) and
- \( T_2^{D_{mod}}(f,g)(M) : \int_{f''} Lg^{*_{mod}[-]} M \xrightarrow{\sim} Lg^{*_{mod}[-]} \int_{f''} M \)

are isomorphisms in \( D_{D(T)} \).

Proof. Follows from proposition [74] and the fact that the map \( T_1^{D_{mod}}(f,g)(M) \) is given by the composite

\[ T_1^{D_{mod}}(f,g)(M)[d_T - d_S] : Lg^{*_{mod}} \int_f (M,F) = L\mathbb{D}_T Lg^{*_{mod}} L\mathbb{D}_S \int_f M \xrightarrow{T(f,f')(\cdot)} \]
\[ L\mathbb{D}_T Lg^{*_{mod}} \int_f L\mathbb{D}_X M \xrightarrow{(L\mathbb{D}_T^{D_{mod}}(f,g)(\mathbb{D}_X M))^{-1}} L\mathbb{D}_T \int_f Lg^{*_{mod}} \mathbb{D}_X M \]
\[ \xrightarrow{T(f',f'')(\cdot)} \int_{f'} L\mathbb{D}_{X_T} Lg^{*_{mod}} \mathbb{D}_X (M,F) = \int_{f'} Lg^{*_{mod}} M \]

166
and the map $T_2^{D_{\text{mod}}}(f,g)(M, F)$ is given by the composite

$$T_2^{D_{\text{mod}}}(f,g)(M)[d_T - d_S]: \int_{f_!} Lg^{*_{\text{mod}}} M = \mathbb{D}T \int_{f_!} \mathbb{D}_{X_f} Lg^{*_{\text{mod}}} M ~ d(-) \circ T(f,g)(-),$$

\[\int_{f_!} Lg^{*_{\text{mod}}} M \xrightarrow{T^{D_{\text{mod}}}(f,g)(M)^{-1}} \mathbb{D}T Lg^{*_{\text{mod}}} \int_f \mathbb{D}_X M = Lg^{*_{\text{mod}}}(M, F) \int_{f_!} M \]

\[\square\]

### 4.3 The D modules on singular algebraic varieties and singular complex analytic spaces

In this subsection by defining the category of complexes of filtered D-modules in the singular case and there functorialities.

#### 4.3.1 Definition

In all this subsection, we fix the notations:

- For $S \in \text{Var}(\mathbb{C})$, we denote by $S = \bigcup_i S_i$ an open cover such that there exits closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. We have then closed embeddings $i_j : S_j : \bigcap_i S_i S_j \hookrightarrow \tilde{S}_j : \Pi_{i \in I} \tilde{S}_i$. Then for $I \subset J$, we denote by $j_{IJ} : S_J \hookrightarrow S_I$ the open embedding and $p_{IJ} : \tilde{S}_J \rightarrow \tilde{S}_I$ the projection, so that $p_{IJ} \circ i_j = i_I \circ j_{IJ}$. This gives the diagram of algebraic varieties $(\tilde{S}_I) \in \text{Fun}(\mathbb{P}(\mathbb{N}), \text{Var}(\mathbb{C}))$ which gives the diagram of sites $(\tilde{S}_I) := \text{Ouv}(\tilde{S}_I) \in \text{Fun}(\mathbb{P}(\mathbb{N}), \text{Cat})$. For $I \subset J$, we denote by $m : \tilde{S}_I \setminus (S_I \setminus S_J) \hookrightarrow \tilde{S}_J$ the open embedding.

- For $S \in \text{AnSp}(\mathbb{C})$ we denote by $S = \bigcup_i S_i$ an open cover such that there exits closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{AnSm}(\mathbb{C})$. We have then closed embeddings $i_i : S_I = \bigcap_i S_i \hookrightarrow \tilde{S}_i : \Pi_{i \in I} \tilde{S}_i$. Then for $I \subset J$, we denote by $j_{IJ} : S_J \hookrightarrow S_I$ the open embedding and $p_{IJ} : \tilde{S}_J \rightarrow \tilde{S}_I$ the projection, so that $p_{IJ} \circ i_j = i_I \circ j_{IJ}$. This gives the diagram of analytic spaces $(\tilde{S}_I) \in \text{Fun}(\mathbb{P}(\mathbb{N}), \text{AnSp}(\mathbb{C}))$ which gives the diagram of sites $(\tilde{S}_I) := \text{Ouv}(\tilde{S}_I) \in \text{Fun}(\mathbb{P}(\mathbb{N}), \text{Cat})$. For $I \subset J$, we denote by $m : \tilde{S}_I \setminus (S_I \setminus S_J) \hookrightarrow \tilde{S}_J$ the open embedding.

The first definition is from [27] remark 2.1.20, where we give a shifted version to have compatibility with perverse sheaves.

**Definition 74.** Let $S \in \text{Var}(\mathbb{C})$ and let $S = \bigcup_i S_i$ an open cover such that there exist closed embeddings $i_i S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$; or let $S \in \text{AnSp}(\mathbb{C})$ and let $S = \bigcup_i S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{AnSm}(\mathbb{C})$. Then, $\text{PSh}_{D(2)fil}(S/\tilde{S}_I) \subset \text{PSh}_{D(2)fil}(\tilde{S}_I)$ is the full subcategory

- whose objects are $(M, F) = ((M_I, F)_{I \subset [1, \ldots, l]}, s_{IJ})$, with
  
  - $(M_I, F) \in \text{PSh}_{D(2)fil}(\tilde{S}_I)$ such that $\mathcal{I}_{S_I} M_I = 0$, in particular $(M_I, F) \in \text{PSh}_{D(2)fil,S_I}(\tilde{S}_I)$
  
  - $s_{IJ} = m^* p_{IJ,*(M_I, F)[d_{\tilde{S}_I} - d_{\tilde{S}_J}]}$ for $I \subset J$, are isomorphisms, $p_{IJ} : \tilde{S}_J \rightarrow \tilde{S}_I$ being the projection, satisfying for $I \subset J \subset K$, $p_{IJ} s_{JK} \circ s_{IJ} = s_{IK}$

- the morphisms $m : (M, F) \rightarrow (N, F)$ between $(M, F) = ((M_I, F)_{I \subset [1, \ldots, l]}, s_{IJ})$ and $(N, F) = ((N_I, F)_{I \subset [1, \ldots, l]}, r_{IJ})$ are by definition a family of morphisms of complexes, $m = (m_I : (M_I, F) \rightarrow (N_I, F))_{I \subset [1, \ldots, l]}$ such that $r_{IJ} \circ m_I = p_{IJ} s_{IJ}$ in $C_{D(2)fil}(\tilde{S}_J)$.  

}[167]
We denote by 
\[ \mathcal{H} \text{ol}_{D(2)fil}(S/(\tilde{S})) \subset \text{Coh}_{D(2)fil}(S/(\tilde{S})) \subset \text{PSh}_{D(2)fil}(S/(\tilde{S})) \]
the full subcategory consisting of \(((M_1, F), s_{1,l})\) such that \(M_1\) is coherent, resp. holonomic. We have the full subcategories
\[ \mathcal{H} \text{ol}_{D(1,0)fil}(S/(\tilde{S})), \text{PSh}_{D(1,0)fil}(S/(\tilde{S})) \subset \text{PSh}_{D(2)fil}(S/(\tilde{S})) \]
consisting of \(((M_1, F, W), s_{1,l})\) such that \(W^p M_1\) are \(D_{\tilde{S}_1}\) submodules.

A morphism \(m = (m_1) : \(((M_1), s_{1,l}) \rightarrow ((N_1), r_{1,l})\) in \(C(\text{PSh}_{D}/(S/(\tilde{S})))\) is a Zariski, resp. usu, local equivalence if all the \(m_i\) are Zariski, resp. usu, local equivalences. A morphism \(m = (m_1) : \(((M_1, F), s_{1,l}) \rightarrow ((N_1, F), r_{1,l})\) in \(C(\text{PSh}_{D(2)fil}(S/(\tilde{S})))\) is an r-filtered Zariski, resp. usu, local equivalence if all the \(m_i\) are r-filtered Zariski, resp. usu, local equivalence.

Let \(S \in \text{Var}(\mathbb{C})\) or \(S \in \text{AnSp}(\mathbb{C})\).

- If \(S \in \text{Var}(\mathbb{C})\), let \(S = \cup_{i=1}^l S_i\) an open cover such that there exist closed embeddings \(i_i : S_i \rightarrow \tilde{S}_i\) with \(\tilde{S}_i \in \text{SmVar}(\mathbb{C})\), and let \(S = \cup_{i=1}^l S_i\) an other open cover such that there exist closed embeddings \(i_i' : S_i' \rightarrow \tilde{S}_i'\) with \(\tilde{S}_i' \in \text{SmVar}(\mathbb{C})\).
- If \(S \in \text{AnSp}(\mathbb{C})\), let \(S = \cup_{i=1}^l S_i\) an open cover such that there exist closed embeddings \(i_i : S_i \rightarrow \tilde{S}_i\) with \(\tilde{S}_i \in \text{AnSm}(\mathbb{C})\), and let \(S = \cup_{i=1}^l S_i\) an other open cover such that there exist closed embeddings \(i_i' : S_i' \rightarrow \tilde{S}_i'\) with \(\tilde{S}_i' \in \text{AnSm}(\mathbb{C})\).

Denote \(L = [1, \ldots, l], L' = [1, \ldots, l']\) and \(L'' = [1, \ldots, l] \cup [1, \ldots, l']\). We have then the refined open cover \(S = \cup_{k \in L} S_k\) and we denote for \(I \subseteq L\), \(S_{I,J} := \cap_{k \in I,J} S_k\) and \(S_{I,J} := \Pi_{k \in I,J} S_k\), so that we have a closed embedding \(i_{I,J} : S_{I,J} \rightarrow \tilde{S}_{I,J}\). For \(I \subseteq J \subseteq I\), denote by \(p_{I,J} : S_{I,J} \rightarrow S_{I,J}^I\) the projection. We then have a natural transfer map
\[ T_S^{L'/L} : \text{PSh}_{Dfil}(S/(\tilde{S})) \rightarrow \text{PSh}_{Dfil}(S/(\tilde{S})) , \]
\[ ((M_1, F), s_{1,l}) \rightarrow (\text{ho lim}_{I \subseteq L} p_{I,J}^{s_{1,l},s_{1,l}}(p_{I,1}^{s_{1,l},s_{1,l}}(M_1, F))/\mathcal{I}_{S_{I,J}^I}, s_{1,l}''), \]
with, in the homotopy limit, the natural transition morphisms
\[ p_{I,J}^{s_{1,l},s_{1,l}}(p_{I,1}^{s_{1,l},s_{1,l}}(M_1, F))/\mathcal{I}_{S_{I,J}^I} \rightarrow p_{I,J}^{s_{1,l},s_{1,l}}(p_{I,1}^{s_{1,l},s_{1,l}}(M_1, F))/\mathcal{I}_{S_{I,J}^I}(J \subseteq I) \]
for \(J \subseteq I\), and
\[ s_{I,J} := \text{holim}_{I \subseteq L} m^* p_{I,J}^{s_{1,l},s_{1,l}}(p_{I,1}^{s_{1,l},s_{1,l}}(M_1, F))/\mathcal{I}_{S_{I,J}^I} \]
\[ \rightarrow \text{holim}_{I \subseteq L} p_{I,J}^{s_{1,l},s_{1,l}}(p_{I,1}^{s_{1,l},s_{1,l}}(M_1, F))/\mathcal{I}_{S_{I,J}^I} \]
\[ \rightarrow \text{holim}_{I \subseteq L} p_{I,J}^{s_{1,l},s_{1,l}}(p_{I,1}^{s_{1,l},s_{1,l}}(M_1, F))/\mathcal{I}_{S_{I,J}^I} \]

**Definition-Proposition 19.** Let \(S \in \text{Var}(\mathbb{C})\) and let \(S = \cup_{i=1}^l S_i\) an open cover such that there exist closed embeddings \(i_i S_i \rightarrow \tilde{S}_i\) with \(\tilde{S}_i \in \text{SmVar}(\mathbb{C})\); or let \(S \in \text{AnSp}(\mathbb{C})\) and let \(S = \cup_{i=1}^l S_i\) an open cover such that there exist closed embeddings \(i_i S_i \rightarrow \tilde{S}_i\) with \(\tilde{S}_i \in \text{AnSm}(\mathbb{C})\). Then \(\text{PSh}_{D(2)fil}(S/(\tilde{S}))\) does not depend on the open covering of \(S\) and the closed embeddings and we set
\[ \text{PSh}_{D(2)fil}(S) := \text{PSh}_{D(2)fil}(S/(\tilde{S})) \]
We denote by \(C_{D(2)fil}^0(S) := C(\text{PSh}_{D(2)fil}(S/(\tilde{S})))\) and by \(D_{D(2)fil}^0(S) := \text{Ho}_{Fr\text{top}}(C_{D(2)fil}^0(S))\) its localization with respect to r-filtered Zariski, resp. usu, local equivalences.
Proof. It is obvious that $T^L/L : \text{PSh}_{Dfil}(S/(S_I)) \to \text{PSh}_*(S/(S_I))$ is an equivalence of category with inverse $T^L/L : \text{PSh}_{Dfil}(S/(S_I)) \to \text{PSh}_*(S/(S_I))$. \qed

We now give the definition of our category:

**Definition 75.** Let $S \in \text{Var}(\mathbb{C})$ and let $S = \bigcup_i S_i$ an open cover such that there exist closed embeddings $\iota_i : S_i \hookrightarrow \widehat{S}_i$ with $\widehat{S}_i \in \text{SmVar}(\mathbb{C})$; or let $S \in \text{AnSp}(\mathbb{C})$ and let $S = \bigcup_i S_i$ an open cover such that there exist closed embeddings $\iota_i : S_i \hookrightarrow \widehat{S}_i$ with $\widehat{S}_i \in \text{AnSm}(\mathbb{C})$. Then, $C_{Dfil}(S/(\widehat{S}_I)) \subset C_{Dfil}(S/(S_I))$ is the full subcategory

- whose objects are $(M,F) = ((M_I,F)_{I \subset [1,\cdots,l]},u_{IJ})$, with
  
  $$(M,F) \in C_{Dfil}(S/(\widehat{S}_I)) \text{ (see definition 52)},$$
  
  $$(u_{IJ} : m^\ast(M,F) \to m^\ast p_{IJ\ast}(M,F)[d_{IJ} - d_{IJ}]) \text{ for } J \subset I, \text{ are morphisms, } p_{IJ} : \widehat{S}_J \to \widehat{S}_I \text{ being the projection, satisfying for } I \subset J \subset K, p_{IJ} \ast u_{JK} \circ u_{IJ} = u_{IK} \text{ in } C_{Dfil}(\widehat{S}_I).$$

- the morphisms $m : ((M,F),u_{IJ}) \to ((N,F),v_{IJ})$ between $((M,F)_{I \subset [1,\cdots,l]},u_{IJ})$ and $(N,F) = ((N_I,F)_{I \subset [1,\cdots,l]},v_{IJ})$ being a family of morphisms of complexes, $m = (m_I : (M,F) \to (N_I,F))_{I \subset [1,\cdots,l]}$

such that $v_{IJ} \circ m_{IJ} = p_{IJ}\ast m_I \circ u_{IJ}$ in $C_{Dfil}(\widehat{S}_I)$.

We denote by $C_{Dfil}(S/(\widehat{S}_I)) \subset C_{Dfil}(S/(S_I))$ the full subcategory consisting of objects $((M,F),u_{IJ})$ such that the $u_{IJ}$ are $\infty$-filtered Zariski, resp. usu, local equivalences.

Let $S \in \text{Var}(\mathbb{C})$ and let $S = \bigcup_i S_i$ an open cover such that there exist closed embeddings $\iota_i : S_i \hookrightarrow \widehat{S}_i$ with $\widehat{S}_i \in \text{SmVar}(\mathbb{C})$; or let $S \in \text{AnSp}(\mathbb{C})$ and let $S = \bigcup_i S_i$ an open cover such that there exist closed embeddings $\iota_i : S_i \hookrightarrow \widehat{S}_i$ with $\widehat{S}_i \in \text{AnSm}(\mathbb{C})$. Then, We denote by

$$C_{Dfil}(S/(\widehat{S}_I)) \subset C_{Dfil}(S/(S_I)) \subset C_{Dfil}(S/(\widehat{S}_I))$$

the full subcategories consisting of those $((M,F),u_{IJ}) \in C_{Dfil}(S/(\widehat{S}_I))$ such that $(M,F) \in C_{Dfil}(S/(S_I))$, that is such that $a_tH^nM_I$ are coherent for all $n \in \mathbb{Z}$ and all $I \subset [1,\cdots,l]$, resp. such that $(M,F) \in C_{Dfil}(S/(\widehat{S}_I))$, that is such that $a_tH^nM_I$ are holonomic for all $n \in \mathbb{Z}$ and all $I \subset [1,\cdots,l]$. We denote by

$$C_{Dfil}(S/(\widehat{S}_I)) \subset C_{Dfil}(S/(S_I)) \subset C_{Dfil}(S/(\widehat{S}_I))$$

the full subcategories consisting of those $((M,F),u_{IJ}) \in C_{Dfil}(S/(\widehat{S}_I))$ such that $W^\ast M_I$ are $D_{\widehat{S}_I}$ submodules (resp. and $a_tH^nM_I$ holonomic).

A morphism $m = (m_I) : ((M_I),u_{IJ}) \to ((N_I),v_{IJ})$ in $C_{D}(S/(\widehat{S}_I))$ is a Zariski, resp. usu, local equivalence if all the $m_I$ are Zariski, resp. usu, local equivalence. A morphism $m = (m_I) : ((M_I),u_{IJ}) \to ((N_I),v_{IJ})$ in $C_{Dfil}(S/(\widehat{S}_I))$ is an $r$-filtered Zariski, resp. usu, local equivalence if all the $m_I$ are $r$-filtered Zariski, resp. usu, local equivalence.

In the analytic case, we also define in the same way:

**Definition 76.** Let $S \in \text{AnSp}(\mathbb{C})$ and let $S = \bigcup_i S_i$ an open cover such that there exist closed embeddings $\iota_i : S_i \hookrightarrow \widehat{S}_i$ with $\widehat{S}_i \in \text{AnSm}(\mathbb{C})$. Then, $C_{Dfil}(S/(\widehat{S}_I)) \subset C_{Dfil}(S/(S_I))$ is the full subcategory

- whose objects are $(M,F) = ((M_I,F)_{I \subset [1,\cdots,l]},u_{IJ})$, with
  
  $$(M,F) \in C_{Dfil}(S/(\widehat{S}_I)) \text{ (see definition 56)},$$
  
  $$(u_{IJ} : m^\ast(M,F) \to m^\ast p_{IJ\ast}(M,F)[d_{IJ} - d_{IJ}]) \text{ for } J \subset I, \text{ are morphisms, } p_{IJ} : \widehat{S}_J \to \widehat{S}_I \text{ being the projection, satisfying for } I \subset J \subset K, p_{IJ} \ast u_{JK} \circ u_{IJ} = u_{IK} \text{ in } C_{Dfil}(\widehat{S}_I).$$
- the morphisms \( m : ((M_I, F), u_{IJ}) \to ((N_I, F), v_{IJ}) \) between \( (M, F) = ((M_I, F)_{I \subseteq [1, \cdots, q]}, u_{IJ}) \) and \( (N, F) = ((N_I, F)_{I \subseteq [1, \cdots, q]}, v_{IJ}) \) being a family of morphisms of complexes,

\[
m = (m_I : (M_I, F) \to (N_I, F))_{I \subseteq [1, \cdots q]}
\]

such that \( v_{IJ} \circ m_I = p_{IJ} \circ m \) in \( C_{D^{\infty}}(S/(\tilde{S})) \).

We denote by \( C_{D^{\infty}}(S/(\tilde{S})) \subseteq C_{D^{\infty}}(S/(\tilde{S})) \) the full subcategory consisting of objects \( ((M_I, F), u_{IJ}) \) such that \( u_{IJ} \) are \( \infty \)-filtered usu local equivalence.

Let \( S \in \text{AnSp}(\mathbb{C}) \) and let \( S = \sqcup S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \owns \tilde{S}_i \) with \( \tilde{S}_i \in \text{AnSm}(\mathbb{C}) \). We denote by

\[
C_{D^{(2)_\text{fil},h}}(S/(\tilde{S})) \subseteq C_{D^{(2)_\text{fil},c}}(S/(\tilde{S})) \subseteq C_{D^{(2)_\text{fil}}}(S/(\tilde{S}))
\]

the full subcategories consisting of \( ((M_I, F), u_{IJ}) \subseteq C_{D^{(2)_\text{fil}}}(S/(\tilde{S})) \) such that \( M_I, F \in C_{D^{(2)_\text{fil}}(S/(\tilde{S}))} \), that is such that \( a^n M_I \) are coherent for all \( n \in \mathbb{Z} \) and all \( I \subseteq [1, \cdots I] \), resp. such that \( M_I, F \in C_{D^{(2)_\text{fil}}(S/(\tilde{S}))} \), that is such that \( a^n M_I \) are holonomic for all \( m \in \mathbb{Z} \) and all \( I \subseteq [1, \cdots I] \). We denote by

\[
C_{D^{(1, 0)_\text{fil},h}}(S/(\tilde{S})) \subseteq C_{D^{(1, 0)_\text{fil},c}}(S/(\tilde{S})) \subseteq C_{D^{(1, 0)_\text{fil}}}(S/(\tilde{S}))
\]

the full subcategories consisting of those \( ((M_I, F), u_{IJ}) \in C_{D^{(1, 0)_\text{fil}}}(S/(\tilde{S})) \) such that \( W^n M_I \) are \( D_{\tilde{S}_i} \) submodules (resp. and \( a^n M_I \) holonomic).

A morphism \( m = (m_I) : ((M_I, u_{IJ}) \to ((N_I, v_{IJ})) \) in \( C_{D^{(2)_\text{fil}}(S/(\tilde{S}))} \) is said to an usu local equivalence if all the \( m_I \) are usu local equivalences. A morphism \( m = (m_I) : ((M_I, F), u_{IJ} \to ((N_I, F), v_{IJ})) \) in \( C_{D^{(2)_\text{fil}}(S/(\tilde{S}))} \) is said to an r-filtered usu local equivalence if all the \( m_I \) are r-filtered usu local equivalences.

**Definition 77.** Let \( S \in \text{Var}(\mathbb{C}) \) and let \( S = \sqcup S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \owns \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \); or \( S \in \text{AnSp}(\mathbb{C}) \) and let \( S = \sqcup S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \owns \tilde{S}_i \) with \( \tilde{S}_i \in \text{AnSm}(\mathbb{C}) \). We denote by

\[
D_{D^{(2)_\text{fil},h}}(S/(\tilde{S})) := \text{Ho}_F(\text{top})(C_{D^{(2)_\text{fil}}}(S/(\tilde{S})))
\]

the localizations with respect to \( \infty \)-filtered Zariski, resp. usu, local equivalences. We have

\[
D_{D^{(1, 0)_\text{fil},h}}(S/(\tilde{S})) \subseteq D_{D^{(2)_\text{fil},h}}(S/(\tilde{S})) \subseteq D_{D^{(2)_\text{fil},\infty}}(S/(\tilde{S}))
\]

the full subcategories which are the image of \( C_{D^{(2)_\text{fil},h}}(S/(\tilde{S})) \), resp. of \( C_{D^{(1, 0)_\text{fil},h}}(S/(\tilde{S})) \), by the localization functor \( D(\text{top}) : C_{D^{(2)_\text{fil}}}(S/(\tilde{S})) \to D_{D^{(2)_\text{fil},\infty}}(S/(\tilde{S})) \).

In the analytic case, we also have

**Definition 78.** Let \( S \in \text{AnSp}(\mathbb{C}) \) and let \( S = \sqcup S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \owns \tilde{S}_i \) with \( \tilde{S}_i \in \text{AnSm}(\mathbb{C}) \). We denote by

\[
D_{D^{(2)_\text{fil},h}}(S/(\tilde{S})) := \text{Ho}_{F(\text{top})}(C_{D^{(2)_\text{fil}}}(S/(\tilde{S}))
\]

the localizations with respect to usu local equivalence. We have then

\[
D_{D^{(1, 0)_\text{fil},h}}(S/(\tilde{S})) \subseteq D_{D^{(2)_\text{fil},h}}(S/(\tilde{S})) \subseteq D_{D^{(2)_\text{fil},\infty}}(S/(\tilde{S}))
\]

the full subcategories with are the image of \( C_{D^{(2)_\text{fil},h}}(S/(\tilde{S})) \), resp. \( C_{D^{(1, 0)_\text{fil},h}}(S/(\tilde{S})) \), by the localization functor \( D(\text{usu}) : C_{D^{(2)_\text{fil}}}(S/(\tilde{S})) \to D_{D^{(2)_\text{fil},\infty}}(S/(\tilde{S})) \).
**Definition 79.** Let \( S \in \operatorname{Var}(\mathbb{C}) \) and let \( S = \cup_i S_i \) an open cover such that there exist closed embeddings \( i_i S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \operatorname{SmVar}(\mathbb{C}) \). Or let \( S \in \operatorname{AnSp}(\mathbb{C}) \) and let \( S = \cup_i S_i \) an open cover such that there exist closed embeddings \( i_i S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \operatorname{AnSm}(\mathbb{C}) \).

(i) We denote by

\[
C_{D(2)fil}(S/(\tilde{S}_i))^0 \subset C_{D(2)fil}(S/(\tilde{S}_i))
\]

the full subcategory consisting of \(((M_1, F), u_{1J}) \in C_{D(2)fil}(S/(\tilde{S}_i))\) such that

\[
H^n((M_1, F), u_{1J}) = (H^n(M_1, F), H^n u_{1J}) \in \mathcal{PSh}_{D(2)fil}^0(S/(\tilde{S}_i))
\]

that is such that the \( H^n u_{1J} \) are isomorphisms. We denote by \( D_{D(2)fil}(S/(\tilde{S}_i))^0 := D(\operatorname{top})(C_{D(2)fil}(S/(\tilde{S}_i))^0) \) its image by the localization functor.

(ii) We have the full embedding functor

\[
i_{S/(\tilde{S}_i)}^0 : C_{D(2)fil}(S) := C_{D(2)fil}(S/(\tilde{S}_i)) \hookrightarrow C_{D(2)fil}(S/(\tilde{S}_i)),
\]

\[
((M_1, F), s_{1J}) \mapsto ((M_1, F), s_{1J})
\]

By definition, \( i_{S/(\tilde{S}_i)}^0(C_{D(1,0)fil}(S/(\tilde{S}_i))) \subset C_{D(1,0)fil}(S/(\tilde{S}_i)) \). This full embedding induces in the derived category the functor

\[
i_{S/(\tilde{S}_i)}^0 : D_{D(2)fil,\infty}(S) := D_{D(2)fil,\infty}(S/(\tilde{S}_i)) \rightarrow D_{D(2)fil,\infty}(S/(\tilde{S}_i)),
\]

\[
((M_1, F), s_{1J}) \mapsto ((M_1, F), s_{1J})
\]

**Proposition 78.** Let \( S \in \operatorname{Var}(\mathbb{C}) \) and let \( S = \cup_i S_i \) an open cover such that there exist closed embeddings \( i_i S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \operatorname{SmVar}(\mathbb{C}) \). Or let \( S \in \operatorname{AnSp}(\mathbb{C}) \) and let \( S = \cup_i S_i \) an open cover such that there exist closed embeddings \( i_i S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \operatorname{AnSm}(\mathbb{C}) \). Then,

\[
i_{S/(\tilde{S}_i)}^0 : D_{D(2)fil,\infty}(S) \rightarrow D_{D(2)fil,\infty}(S/(\tilde{S}_i))
\]

is a full embedding whose image is \( D_{D(2)fil,\infty}(S/(\tilde{S}_i))^0 \), that is consists of \(((M_1, F), s_{1J}) \in C_{D(2)fil}(S/(\tilde{S}_i))\) such that

\[
H^n((M_1, F), s_{1J}) := (H^n(M_1, F), H^n s_{1J}) \in \mathcal{PSh}_{D(2)fil}(S/(\tilde{S}_i)).
\]

and

\[
i_{S}^0 := i_{S/(\tilde{S}_i)}^0 : D_{D(2)fil,\infty}(S) \rightarrow D_{D(2)fil,\infty}(S/(\tilde{S}_i))^0
\]

the induced equivalence of categories.

**Proof.** Standard. \( \square \)

We finish this subsection by the statement a result of kashiwara in the singular case.

**Definition 80.** Let \( S \in \operatorname{AnSp}(\mathbb{C}) \) and \( S = \cup_{i=1}^J S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \operatorname{AnSm}(\mathbb{C}) \).

(i) We denote by

\[
C_{D(1,0)fil,\text{rh}}(S/(\tilde{S}_i)) \subset C_{D2fil,\text{rh}}(S/(\tilde{S}_i)) \subset C_{D2fil,h}(S/(\tilde{S}_i))
\]

the full subcategories consisting of \(((M_1, F,W), u_{1J}) \in C_{D(2)fil}(S/(\tilde{S}_i))\) such that \( a_{usu}H^n M_1 \) are regular holonomic, resp. and \( W^n M_1 \) are \( D_{\tilde{S}_i} \) submodules. We denote by

\[
D_{D(1,0)fil,\infty,\text{rh}}(S) \subset C_{D2fil,\infty,\text{rh}}(S) \subset C_{D2fil,\infty,h}(S)
\]

the image of \( C_{D(1,0)fil,\text{rh}}(S/(\tilde{S}_i)) \), resp. \( C_{D2fil,\text{rh}}(S/(\tilde{S}_i)) \), by the localization functor \( D(\text{usu}) : C_{D2fil,\infty,\text{rh}}(S/(\tilde{S}_i)) \rightarrow D_{D(2)fil,\infty}(S/(\tilde{S}_i)) \).

171
(ii) We will consider the functor

\[ J_S : C_{\mathcal{D}(2)fil}(S/\tilde{S}_I) \to C_{\mathcal{D}^\infty(2)fil}(S/\tilde{S}_I), \]

\[ ((M_I, F), u_{1, I}) \to J_S((M_I, F), u_{1, I}) := (J_{S_I}(M_I, F), J(u_{1, I})) := ((M_I \otimes_{D_S} D_S^\infty, F), J(u_{1, I})) \]

with, denoting for short \( d_{1, J} := d_{\tilde{S}_J} - d_{\tilde{S}_I} \),

\[ J(u_{1, I}) : J(M_I, F) \xrightarrow{J(u_{1, I})} J(p_{1, J*}(M_I, F)[d_{1, J}]) \xrightarrow{T_{(p_{1, J}, j)}()^{-1}} p_{1, J*}J(M_I, F)[d_{1, J}]. \]

Of course \( J_S(C_{\mathcal{D}(1,0)fil}(S/\tilde{S}_I)) \subset C_{\mathcal{D}^\infty(1,0)fil}(S/\tilde{S}_I)). \)

Proposition 79. Let \( S \in \text{AnSp}(\mathbb{C}) \) and \( S = \bigcup_{i=1}^I S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{AnSm}(\mathbb{C}) \). Then the functor

\[ J_S : C_{\mathcal{D}(2)fil}(S/\tilde{S}_I) \to C_{\mathcal{D}^\infty(2)fil}(S/\tilde{S}_I), \]

satisfy \( J_S : C^\infty_{\mathcal{D}(2)fil}(S/\tilde{S}_I) \subset C^\infty_{\mathcal{D}^\infty(2)fil}(S/\tilde{S}_I)) \) and induces an equivalence of category

\[ J_S : D_{\mathcal{D}(2)fil, \infty, rh}(S/\tilde{S}_I) \to D_{\mathcal{D}^\infty(2)fil, \infty, h}(S/\tilde{S}_I). \]

and \( J_S(D_{\mathcal{D}(1,0)fil, \infty, rh}(S/\tilde{S}_I)) \subset D_{\mathcal{D}^\infty(1,0)fil, \infty}(S/\tilde{S}_I). \)

Proof. Follows immediately from the smooth case (proposition 61). \( \square \)

4.3.2 Duality in the singular case

The definition of Saito’s category comes with a dual functor:

**Definition 81.** Let \( S \in \text{Var}(\mathbb{C}) \) and let \( S = \bigcup S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow S_I \) with \( S_i \in \text{SmVar}(\mathbb{C}) \); or let \( S \in \text{AnSp}(\mathbb{C}) \) and \( S = \bigcup S_i \) an open cover such that there exist closed embedding \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{AnSm}(\mathbb{C}) \). We have the dual functor:

\[ \mathcal{D}^K_S : C^0_{\mathcal{D}fil}(S/\tilde{S}_I) \to C^0_{\mathcal{D}fil}(S/\tilde{S}_I), ((M_I, \bar{F}), s_{1, I}) \to (\mathcal{D}^K_{S_I}(M_I, F), s^d_{1, I}), \]

with, denoting for short \( d_{1, J} := d_{\tilde{S}_J} - d_{\tilde{S}_I} \),

\[ u^d_{1, J} : \mathcal{D}^K_{S_I}(M_I, F) \xrightarrow{\mathcal{D}^K_{S_I}(s^d_{1, J})} \mathcal{D}^K_{S_I}p_{1, J*}(M_I, F)[d_{1, J}] \xrightarrow{T_{(p_{1, J}, j)}()^{-1}} p_{1, J*}\mathcal{D}^K_{S_J}(M_I, F)[d_{1, J}], \]

It induces in the derived category the functor

\[ L\mathcal{D}^K_{S} : D^0_{\mathcal{D}fil}(S/\tilde{S}_I) \to D^0_{\mathcal{D}fil}(S/\tilde{S}_I), ((M_I, \bar{F}), s_{1, I}) \to L\mathcal{D}^K_{S}Q((M_I, F), s_{1, I}), \]

with \( q : Q((M_I, F), s_{1, I}) \to ((M_I, F), s_{1, I}) \) a projective resolution.

In the analytic case we also define

**Definition 82.** Let \( S \in \text{AnSp}(\mathbb{C}) \) and \( S = \bigcup S_i \) an open cover such that there exist closed embedding \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{AnSm}(\mathbb{C}) \). We have the dual functor:

\[ \mathcal{D}^K_{S, \infty} : C^\infty_{\mathcal{D}fil}(S/\tilde{S}_I) \to C^\infty_{\mathcal{D}fil}(S/\tilde{S}_I), ((M_I, \bar{F}), u_{1, I}) \to (\mathcal{D}^K_{S_I}(M_I, F), u^d_{1, I}), \]

with \( u^d_{1, I} \) defined similarly as in definition 61. It induces in the derived category the functor

\[ L\mathcal{D}^K_{S, \infty} : D^\infty_{\mathcal{D}fil}(S/\tilde{S}_I) \to D^\infty_{\mathcal{D}fil}(S/\tilde{S}_I), ((M_I, \bar{F}), u_{1, I}) \to L\mathcal{D}^K_{S, \infty}Q((M_I, F), u^d_{1, I}), \]

with \( q : Q((M_I, F), s_{1, I}) \to ((M_I, F), s_{1, I}) \) a projective resolution.
4.3.3 Inverse image in the singular case

We give in this subsection the inverse image functors between our categories.

Let \( n : S' \to S \) be an open embedding with \( S \in \text{Var}(\mathbb{C}) \) and let \( S = \bigcup_s S_s \) an open cover such that there exist closed embeddings \( i_i : S_i \to \tilde{S}_i \) with \( \tilde{S}_i \in \text{SInv}(\mathbb{C}) \); or let \( n : S' \to S \) be an open embedding with \( S \in \text{AnSp}(\mathbb{C}) \) and let \( S = \bigcup_s S_s \) an open cover such that there exist closed embeddings \( i_i : S_i \to \tilde{S}_i \) with \( \tilde{S}_i \in \text{SAnSp}(\mathbb{C}) \). Denote \( S' := n^{-1}(S_1) = S_1 \cap S' \) and \( nI := n_{S'} : S' \to S' \) the open embeddings. Consider open embeddings \( \tilde{n}_I : \tilde{S}_1' \to \tilde{S}_1 \) such that \( \tilde{S}_1' \cap \tilde{S}_I = S_I' \), that is which are lift of \( n_I \). We have the functor

\[
n^* : C_{Dfil}(S/(\tilde{S}_1)) \to C_{Dfil}(S^o/(\tilde{S}_I)),
\]

\[
(M, F) = ((M_I, F), u_{IJ}) \mapsto n^*(M, F) := (\tilde{n}_I)^*(M, F) := (\tilde{n}_I^*(M_I, F), n^*u_{IJ})
\]

which derive trivially.

Let \( f : X \to S \) be a morphism, with \( X, S \in \text{Var}(\mathbb{C}) \), such that there exist a factorization \( f : X \xrightarrow{l} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SInv}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection, and consider \( S = \bigcup_{i=1}^k S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \to \tilde{S}_i \) with \( \tilde{S}_i \in \text{SInv}(\mathbb{C}) \); or let \( f : X \to S \) be a morphism, with \( X, S \in \text{AnSp}(\mathbb{C}) \), such that there exist a factorization \( f : X \xrightarrow{l} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SAnSp}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection and consider \( S = \bigcup_{i=1}^k S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \to \tilde{S}_i \), with \( \tilde{S}_i \in \text{AnSp}(\mathbb{C}) \). Then, \( X = \bigcup_{i=1}^k X_i \) with \( X_i := f^{-1}(S_i) \). Denote by \( p_{IJ} : \tilde{S}_J \to \tilde{S}_I \) and \( \tilde{p}_{IJ} : Y \times \tilde{S}_J \to Y \times \tilde{S}_I \) the projections and by

\[
\begin{align*}
E_{IJ} = & \quad \tilde{S}_J \xrightarrow{\tilde{S}_I \setminus (\tilde{S}_J \setminus \tilde{S}_I)^{m_{IJ}}} \tilde{S}_J \\
E'_{IJ} = & \quad \tilde{S}_J \setminus X_J \xrightarrow{m_{IJ}} Y \times \tilde{S}_J \xrightarrow{\tilde{S}_I \setminus (\tilde{S}_J \setminus \tilde{S}_I)^{m_{IJ}}} \tilde{S}_J
\end{align*}
\]

the commutative diagrams. The (graph) inverse image functors is :

\[
f^{*\text{mod}[-], \Gamma} : C_{Dfil}(S/(\tilde{S}_1)) \to C_{Dfil}(X/(Y \times \tilde{S}_1)),
\]

\[
(M, F) = ((M_I, F), u_{IJ}) \mapsto f^{*\text{mod}[-], \Gamma}(M, F) := (\Gamma_{X_I}E(p_{S_I}^{*\text{mod}[-]}(M_I, F)), \tilde{f}_J^{*\text{mod}[-]}u_{IJ})
\]

with, denoting for short \( d_{IJ} := d_{\tilde{S}_I} - d_{\tilde{S}_J} \),

\[
\tilde{f}_J^{*\text{mod}[-]}u_{IJ} : \Gamma_{X_I}E(p_{S_I}^{*\text{mod}[-]}(M_I, F)) \xrightarrow{\Gamma_{X_I}E(p_{S_I}^{*\text{mod}[-]}(u_{IJ}))} \Gamma_{X_I}E(p_{S_I}^{*\text{mod}[-]}(p_{IJ}, (M_I, F)[d_{IJ}]))) \xrightarrow{\Gamma_{X_I}E(p_{IJ}^{*\text{mod}[-]}p_{S_I}^{*\text{mod}[-]}(M_I, F)[d_{IJ} + d_{IJ}]}) \xrightarrow{\Gamma_{X_I}E(p_{IJ}^{*\text{mod}[-]}p_{S_I}^{*\text{mod}[-]}(M_I, F)[d_{IJ} + d_{IJ}]}) \xrightarrow{\Gamma_{X_I}E(p_{IJ}^{*\text{mod}[-]}p_{S_I}^{*\text{mod}[-]}(M_I, F)[d_{IJ} + d_{IJ}]})
\]

It induces in the derived categories the functor

\[
Rf^{*\text{mod}[-], \Gamma} : D_{D(2)}^{fil, \infty}(S/(\tilde{S}_1)) \to D_{D(2)}^{fil, \infty}(X/(Y \times \tilde{S}_1)),
\]

\[
(M, F) = ((M_I, F), u_{IJ}) \mapsto Rf^{*\text{mod}[-], \Gamma}(M, F) := ((\Gamma_{X_I}E(p_{S_I}^{*\text{mod}[-]}(M_I, F)), \tilde{f}_J^{*\text{mod}[-]}u_{IJ}).
\]

It gives by duality the functor

\[
Lf^{*\text{mod}[-], \Gamma} : D_{D(2)}^{fil, \infty}(S/(\tilde{S}_1))^0 \to D_{D(2)}^{fil, \infty}(X/(Y \times \tilde{S}_1))^0,
\]

\[
(M, F) = ((M_I, F), u_{IJ}) \mapsto Lf^{*\text{mod}[-], \Gamma}(M, F) := \text{LD}_{S_i}K'Rf^{*\text{mod}[-], \Gamma}L\text{D}_{S_i}K'_{S_i}(M, F),
\]

where \( \text{LD}_{S_i}K'_{S_i}(S/(\tilde{S}_1)) \xrightarrow{\sim} D_{D(2)}^{fil, \infty}(S/(\tilde{S}_1))^0 \) is the isomorphism of definition [79].
Let \( f : X \to S \) be a morphism, with \( X, S \in \text{AnSp}(\mathbb{C}) \), such that there exist a factorization \( f; X \xrightarrow{\pi} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{AnSm}(\mathbb{C}) \), \( \pi \) a closed embedding and \( p_S \) the projection and consider \( S = \bigcup_{i=1}^n S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \bar{S}_i \), with \( \bar{S}_i \in \text{AnSm}(\mathbb{C}) \). Then, \( X = \bigcup_{i=1}^n X_i \) with \( X_i := f^{-1}(S_i) \). We have also the functors,

\[
\Gamma(M, F) \mapsto f^{\ast \text{mod}[-, \Gamma]}_\ast : C^D_{\ast \text{hil}}(S/(\bar{S}_i)) \to C^D_{\ast \text{hil}}(X/(Y \times \bar{S}_i)),
\]

\[
(M, F) = ((M_1, F), u_{1j}) \mapsto f^{\ast \text{mod}[-, \Gamma]}_\ast (M, F) := (\Gamma X_i E_{\ast \text{mod}[-]}(M_1, F), f_j^{\ast \text{mod}[-]} u_{1j}j)
\]

with, denoting for short \( d_{1j} := d_{S_j} - d_{S_i} \),

\[
f_j^{\ast \text{mod}[-]} u_{1j} : \Gamma X_i E_{\ast \text{mod}[-]}(M_1, F) \xrightarrow{\Gamma X_{1j} E_D((\theta_{S_j})^-)(u_{1j})} \Gamma X_{1j} E_{\ast \text{mod}[-]} P_{1j} \ast (M_1, F)[d_{1j}] \xrightarrow{\Gamma X_{1j} E_D((\theta_{S_j})^-) \ast (P_{1j} \ast (M_1, F)[d_{1j}] + d_{1j})} \Gamma X_{1j} E_{\ast \text{mod}[-]} P_{1j} \ast (M_1, F)[d_{1j}]
\]

\[
\cong p_{1j} \ast \Gamma X_{1j} E_{\ast \text{mod}[-]}(M_1, F)[d_{1j}]
\]

It induces in the derived categories, the functor

\[
Rf^{\ast \text{mod}[-, \Gamma]}_\ast : D_{\text{D}^\infty_{\ast \text{hil}}}((S/(\bar{S}_i)) \to D_{\text{D}^\infty_{\ast \text{hil}}}((X/(Y \times \bar{S}_i)),
\]

\[
(M, F) = ((M_1, F), u_{1j}) \mapsto Rf^{\ast \text{mod}[-, \Gamma]}_\ast (M, F) := (\Gamma X_i E_{\ast \text{mod}[-]}(M_1, F), f_j^{\ast \text{mod}[-]} u_{1j}j)
\]

It gives by duality the functor

\[
L f^{\ast \text{mod}[-, \Gamma]}_\ast : D_{\text{D}^\infty_{\ast \text{hil}}}((S/(\bar{S}_i)) \to D_{\text{D}^\infty_{\ast \text{hil}}}((X/(Y \times \bar{S}_i)),
\]

\[
(M, F) = ((M_1, F), u_{1j}) \mapsto L f^{\ast \text{mod}[-, \Gamma]}_\ast (M, F) := L D_{\ast \text{hil}}(S/(\bar{S}_i)) (R f^{\ast \text{mod}[-, \Gamma]}_\ast (M, F), f_j^{\ast \text{mod}[-]} u_{1j}j)
\]

where \( q^0 : D_{\text{D}^\infty_{\ast \text{hil}}}((S/(\bar{S}_i)) \to D_{\text{D}^\infty_{\ast \text{hil}}}((S/(\bar{S}_i)) \) is the isomorphism of definition [70].

The following proposition are then easy :

**Proposition 80.** Let \( f_1 : X \to Y \) and \( f_2 : Y \to S \) two morphism with \( X, Y, S \in \text{Var}(\mathbb{C}) \). Assume there exist factorizations \( f_1 : X \xrightarrow{i_1} Y' \times Y \xrightarrow{p_Y} Y \) and \( f_2 : Y \xrightarrow{i_2} Y'' \times S \xrightarrow{p_S} S \) with \( Y', Y'' \in \text{SmVar}(\mathbb{C}) \), \( i_1, i_2 \) closed embeddings and \( p_S, p_Y \) the projections. We have then the factorization

\[
f_2 \circ f_1 : X \xrightarrow{(i_2 \circ i_1)_{\text{hil}}} Y' \times Y'' \xrightarrow{p_S} S.
\]

We have, for \( (M, F) \in C_{\text{D}^\infty_{\ast \text{hil}}}((S/(\bar{S}_i)) \), \( Rf_2 \circ f_1)^{\ast \text{mod}[-, \Gamma]}_\ast (M, F) = R f_2^{\ast \text{mod}[-, \Gamma]}_\ast (M, F) \).

**Proof.** Follows from the that the fact that for \( (M, F) = ((M_1, F), u_{1j}) \in C_{\text{D}^\infty_{\ast \text{hil}}}((S/(\bar{S}_i)) \),

\[
(\Gamma X_i E_{\ast \text{mod}[-]}(M_1, F), \tilde{f}_j^{\ast \text{mod}[-]} u_{1j}j) \cong (\Gamma X_i E_{\ast \text{mod}[-]}(M_1, F), \tilde{f}_j^{\ast \text{mod}[-]} u_{1j}j)
\]

by proposition [33] (i) and the fact that \( X_i \subset \tilde{f}_j^{-1}(Y_1) \). ☐

**Proposition 81.** Let \( f_1 : X \to Y \) and \( f_2 : Y \to S \) two morphism with \( X, Y, S \in \text{Var}(\mathbb{C}) \). Assume there exist factorizations \( f_1 : X \xrightarrow{i_1} Y' \times Y \xrightarrow{p_Y} Y \) and \( f_2 : Y \xrightarrow{i_2} Y'' \times S \xrightarrow{p_S} S \) with \( Y', Y'' \in \text{SmVar}(\mathbb{C}) \), \( i_1, i_2 \) closed embeddings and \( p_S, p_Y \) the projections. We have then the factorization

\[
f_2 \circ f_1 : X \xrightarrow{(i_2 \circ i_1)_{\text{hil}}} Y' \times Y'' \xrightarrow{p_S} S.
\]

We have, for \( (M, F) \in C_{\text{D}^\infty_{\ast \text{hil}}}((S/(\bar{S}_i)) \), \( (M, F) \in C_{\text{D}^\infty_{\ast \text{hil}}}((S/(\bar{S}_i)) \), \( R(f_2 \circ f_1)^{\ast \text{mod}[-, \Gamma]}_\ast (M, F) = R f_2^{\ast \text{mod}[-, \Gamma]}_\ast (M, F) \).

**Proof.** Similar to the proof of proposition [80] ☐
4.3.4 Direct image functor in the singular case

We define the direct image functors between our category.

Let \( f : X \to S \) be a morphism with \( X, S \in \text{Var}(\mathbb{C}) \), and assume there exist a factorization \( f : X \xrightarrow{l} Y \xrightarrow{p} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_s \) a the projection; or let \( f : X \to S \) be a morphism with \( X, S \in \text{AnSp}(\mathbb{C}) \), and assume there exist a factorization \( f : X \xrightarrow{l} Y \xrightarrow{p} S \) with \( Y \in \text{AnSm}(\mathbb{C}) \), \( l \) a closed embedding and \( p_s \) a the projection. Let \( S = \bigcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow S_i \) with \( S_i \in \text{SmVar}(\mathbb{C}) \); resp. let \( S = \bigcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow S_i \) with \( S_i \in \text{AnSm}(\mathbb{C}) \). Then \( X = \bigcup_{i=1}^l X_i \) with \( X_i := f^{-1}(S_i) \). Denote, for \( I \subset [1, \ldots, l] \), \( S_I = \bigcap_{i \in I} S_i \) and \( X_I = \prod_{i \in I} X_i \). For \( I \subset [1, \ldots, l] \), denote by \( \tilde{S}_I = \Pi_{i \in I} \tilde{S}_i \). We then have, for \( I \subset [1, \ldots, l] \), closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_I \) and the following commutative diagrams which are cartesian (take \( Y = \mathbb{P}^{N,a} \) in the algebraic case)

\[
\begin{array}{c}
\xymatrix{
 f_I = f|_{X_I} : X_I 
 \ar[r]^{l_i} 
 & Y \times S_I 
 \ar[r]^{p_S} 
 & S_I 
 & \bigtriangleup \\
 \ar[r]_{i_i} & Y \times \tilde{S}_I 
 \ar[r]^{p_{S_I}} & \tilde{S}_I 
 & \bigtriangleup \\
 \ar[r]_{p_{l,I}} & Y \times \tilde{S}_I 
 & \bigtriangleup \\
 \ar[r]_{p_{I,J}} & \tilde{S}_I
}
\end{array}
\]

with \( l_i : l|_{X_I}, i_i = i \times i_i \), \( p_{S_I} \) and \( p_{S_I} \) are the projections and \( p_{l,I} = I \times p_{l,J} \). Then \( \tilde{f}_I := p_{S_I} : Y \times \tilde{S}_I \to \tilde{S}_I \) is a lift of \( f_I = f|_{X_I} \). We define the direct image functor on our category by

\[
\begin{align*}
\int_{f}^{\text{FDR}} : D_{D(2)fil, \infty}(X) & \to D_{D(2)fil, \infty}(S), \\
((M, F), u_{1, J}) & \mapsto (\int_{f_{mod}}^{\text{FDR}}(M, F), h^k(u_{1, J}))
\end{align*}
\]

It induces in the derived categories the functor

\[
\int_{f}^{\text{FDR}} : D_{D(2)fil, \infty}(X) \to D_{D(2)fil, \infty}(S), \\
((M, F), u_{1, J}) \mapsto (\int_{f_{mod}}^{\text{FDR}}(M, F), h^k(u_{1, J}))
\]

Let \( f : X \to S \) be a morphism with \( X, S \in \text{AnSp}(\mathbb{C}) \), and assume there exist a factorization \( f : X \xrightarrow{l} Y \xrightarrow{p} S \) with \( Y \in \text{AnSm}(\mathbb{C}) \), \( l \) a closed embedding and \( p_s \) a the projection. Let \( S = \bigcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow S_i \) with \( S_i \in \text{AnSm}(\mathbb{C}) \). Then \( X = \bigcup_{i=1}^l X_i \) with \( X_i := f^{-1}(S_i) \). We also have the functors

\[
\begin{align*}
\int_{f_{mod}}^{\text{FDR}} : C_{D(2)fil, \infty}(X/\{Y \times \tilde{S}_I\}) & \to C_{D(2)fil, \infty}(S/\{\tilde{S}_I\}), \\
((M, F), u_{1, J}) & \mapsto (\int_{f_{mod}}^{\text{FDR}}(M, F), h^k(u_{1, J}))
\end{align*}
\]

where \( h^k(u_{1, J})[d_Y] \) is given as above,

\[
\begin{align*}
\int_{f}^{\text{FDR}} : D_{D(2)fil, \infty}(X) & \to D_{D(2)fil, \infty}(S), \\
((M, F), u_{1, J}) & \mapsto (\int_{f_{mod}}^{\text{FDR}}(M, F), h^k(u_{1, J}))
\end{align*}
\]

175
where $f^k(u_{ij})[d_y]$ is given as above.

In the algebraic case, we have the followings:

**Proposition 82.** Let $f_1 : X \to Y$ and $f_2 : Y \to S$ two morphism with $X,Y,S \in \text{QPVar}(\mathbb{C})$ quasi-projective. Then there exist factorizations $f_1 : X \xrightarrow{(\iota_1)} Y' \times Y \xrightarrow{\pi_Y} Y$ and $f_2 : Y \xrightarrow{\iota_2} Y'' \times S \xrightarrow{p_S} S$ with $Y' = \mathbb{P}^{n,o} \subset \mathbb{P}^N,Y'' = \mathbb{P}^{n,o} \subset \mathbb{P}^N$ open subsets, $l_1,l_2$ closed embeddings and $p_S,\pi_Y$ the projections. We have then the factorization $f_2 \circ f_1 : X \xrightarrow{(l_2 \circ l_1) \circ \delta_1} Y' \times Y'' \times S \xrightarrow{p_S} S$. Let $i : S \hookrightarrow \tilde{S}$ a closed embedding with $\tilde{S} = \mathbb{P}^{n,o} \subset \mathbb{P}^n$ an open subset.

(i) Let $(M,F) \in C_{D(2)}(\pi_{\tilde{S}}(X/(Y' \times Y'' \times \tilde{S})))$. Then, we have $\int_{f_2 \circ f_1}^{\text{FDR}}(M,F) = \int_{f_2}^{\text{FDR}}(\int_{f_1}^{\text{FDR}}(M,F))$ in $D_{D(2)_{\text{fil}},\infty}(S/(\tilde{S}_1))$.

(ii) Let $(M,F) \in C_{D(2)}(\pi_{\tilde{S}}(X/(Y' \times Y'' \times \tilde{S})))$. Then, we have $\int_{f_2 \circ f_1}^{\text{FDR}}(M,F) = \int_{f_2}^{\text{FDR}}(\int_{f_1}^{\text{FDR}}(M,F))$ in $D_{D(2)_{\text{fil},h}(S/(\tilde{S}_1))}$.

**Proof.** (i): By the smooth case: proposition 81, we have an isomorphism

$$\int_{f_2}^{\text{FDR}} \int_{f_1}^{\text{FDR}} (M,F) := \int_{\tilde{S}_1}^{\text{FDR}} \int_{\tilde{S}_1}^{\text{FDR}} (M,F) \sim \int_{\tilde{S}_1}^{\text{FDR}} (M,F) := \int_{f_2 \circ f_1}^{\text{FDR}} (M,F).$$

(ii): Follows from (i).

In the analytic case, we have the followings:

**Proposition 83.** Let $f_1 : X \to Y$ and $f_2 : Y \to S$ two morphism with $X,Y,S \in \text{AnSp}(\mathbb{C})$ quasi-projective. Then there exist factorizations $f_1 : X \xrightarrow{\iota_1} Y' \times Y \xrightarrow{\pi_Y} Y$ and $f_2 : Y \xrightarrow{\iota_2} Y'' \times S \xrightarrow{p_S} S$ with $Y' = \mathbb{P}^{n,o} \subset \mathbb{P}^N,Y'' = \mathbb{P}^{n,o} \subset \mathbb{P}^N$ open subsets, $l_1,l_2$ closed embeddings and $p_S,\pi_Y$ the projections. We have then the factorization $f_2 \circ f_1 : X \xrightarrow{(l_2 \circ l_1) \circ \delta_1} Y' \times Y'' \times S \xrightarrow{p_S} S$. Let $i : S \hookrightarrow \tilde{S}$ a closed embedding with $\tilde{S} = \mathbb{P}^{n,o} \subset \mathbb{P}^n$ an open subset.

(i) Let $(M,F) \in C_{D(2)}(\pi_{\tilde{S}}(X/(Y' \times Y'' \times \tilde{S})))$. Then, we have $\int_{f_2 \circ f_1}^{\text{FDR}}(M,F) = \int_{f_2}^{\text{FDR}}(\int_{f_1}^{\text{FDR}}(M,F))$ in $D_{D(2)_{\text{fil}},\infty}(S/(\tilde{S}_1))$.

(ii) Let $(M,F) \in C_{D(2)}(\pi_{\tilde{S}}(X/(Y' \times Y'' \times \tilde{S})))$. Then, we have $\int_{f_2 \circ f_1}^{\text{FDR}}(M,F) = \int_{f_2}^{\text{FDR}}(\int_{f_1}^{\text{FDR}}(M,F))$ in $D_{D(2)_{\text{fil},h}(S/(\tilde{S}_1))}$.

**Proof.** (i): By the smooth case: proposition 82, we have an isomorphism

$$\int_{f_2}^{\text{FDR}} \int_{f_1}^{\text{FDR}} (M,F) := \int_{\tilde{S}_1}^{\text{FDR}} \int_{\tilde{S}_1}^{\text{FDR}} (M,F) \sim \int_{\tilde{S}_1}^{\text{FDR}} (M,F) := \int_{f_2 \circ f_1}^{\text{FDR}} (M,F).$$

(ii): Follows from (i).

### 4.3.5 Tensor product in the singular case

Let $S \in \text{Var}(\mathbb{C})$ and let $S = \cup S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$; or let $S \in \text{AnSp}(\mathbb{C})$ and $S = \cup S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{AnSp}(\mathbb{C})$. We have the tensor product functors

$$(-) \otimes_{\tilde{S}_i} (-) : C_{D(2)}(\pi_{\tilde{S}_i}(S/(\tilde{S}_i))) \to C_{D(2)}(\pi_{\tilde{S}_i}(S/(\tilde{S}_i))),$$

$$(((M_1,F),u_{ij}),((N_1,F),v_{ij})) \mapsto ((M_1,F) \otimes_{\tilde{S}_i} (N_1,F)\mid d_{\tilde{S}_i},u_{ij} \otimes v_{ij}),$$

176
with, denoting for short \(d_{IJ} := d_{S_J} - d_{S_I}\) and \(d_I := d_{S_I},\)

\[
u_{IJ} \otimes v_{IJ} : (M_I, F) \otimes_{O_{S_i}} (N_I, F)[d_I] \xrightarrow{T[p_{I,J}^{reg},p_{I,J})](-)[d_I]} p_{IJ,*} p_{I,J}^{reg,mod}((M_I, F) \otimes_{O_{S_i}} (N_I, F))[d_I] \\
\xrightarrow{=} p_{IJ,*} p_{I,J}^{reg,mod}((M_I, F) \otimes_{O_{S_i}} (N_I, F))[d_I] \\
I_{(p_{I,J}^{reg},p_{I,J})}(-,-)(u_{IJ}) \otimes I_{(p_{I,J}^{reg},p_{I,J})}(-,-)(v_{IJ})[d_I]} p_{IJ,*}((M_I, F) \otimes_{O_{S_i}} (N_I, F))[d_I] + d_{IJ}.
\]

Let \(S \in \text{AnSp}(\mathbb{C})\) and \(S = \cup S_i\) an open cover such that there exist closed embeddings \(i_i : S_i \hookrightarrow \tilde{S}_i\) with \(\tilde{S}_i \in \text{AnSm}(\mathbb{C})\). We have the tensor product functors

\[
(-) \otimes_{O_{\tilde{S}_i}}^\sim (-) : C_{D^\infty_{fil}}^\ast(S/(\tilde{S}_i)) \rightarrow C_{D^\infty_{fil}}(\tilde{S}_i/S).
\]

\[
((M_I, F), u_{IJ}), ((N_I, F), v_{IJ})) \mapsto ((M_I, F) \otimes_{O_{S_i}} (N_I, F), u_{IJ} \otimes v_{IJ}),
\]

with \(u_{IJ} \otimes v_{IJ}\) as above.

**Proposition 84.** Let \(S \in \text{Var}(\mathbb{C})\). Denote \(\Delta_S : S \hookrightarrow S \times S\) the diagonal embedding. Let \(S = \cup S_i\) an open cover such that there exist closed embeddings \(i_i : S_i \hookrightarrow \tilde{S}_i\) closed embedding with \(\tilde{S}_i \in \text{SmVar}(\mathbb{C})\); or let \(S \in \text{AnSp}(\mathbb{C})\) and \(S = \cup S_i\) an open cover such that there exist closed embedding \(i_i : S_i \hookrightarrow \tilde{S}_i\) with \(\tilde{S}_i \in \text{AnSm}(\mathbb{C})\). We have, for \((M_I, F), u_{IJ})\), \(((N_I, F), v_{IJ})) \in C_{D^\infty_{fil}}(\tilde{S}_i/S),\)

\[
((M_I, F), u_{IJ}), ((N_I, F), v_{IJ})) \mapsto \Delta_S^\ast((M_I, F), u_{IJ}),(N_I, F), v_{IJ}))
\]

**Proof.** Follows from proposition 18.

\[\Box\]

### 4.3.6 The 2 functors of D modules on the category of complex algebraic varieties and on the category of complex analytic spaces, and the transformation maps

**Definition 83.** Consider a commutative diagram in \(\text{Var}(\mathbb{C})\) which is cartesian:

\[
\begin{array}{ccc}
D &=& X_T \\
&\searrow & \downarrow g' \\
&\downarrow g & \downarrow g \\
X &\overset{f}{\longrightarrow} & S
\end{array}
\]

Assume there exist factorizations \(f : X \overset{l_1}{\longrightarrow} Y_1 \times S \overset{p_S}{\longrightarrow} S,\) \(g : T \overset{l_2}{\longrightarrow} Y_2 \times S \overset{p_S}{\longrightarrow} S,\) with \(Y_1, Y_2 \in \text{SmVar}(\mathbb{C}),\)

\(l_1, l_2\) closed embeddings and \(p_S, p_S\) the projections. Then, the above commutative diagram factors through

\[
\begin{array}{ccc}
D &=& f' : X_T \\
&\searrow & \downarrow l' \\
&\downarrow l'_2 & \downarrow l_2 \\
Y_1 \times T &\overset{p_F}{\longrightarrow} & T \\
&\searrow & \downarrow l_2 \\
&\downarrow l'_2 = t \times l_2 & \downarrow l_2 \\
Y_1 \times Y_2 &\overset{p_{Y_1} \times S}{\longrightarrow} & Y_2 \times S \\
&\searrow & \downarrow p_S \\
f : X &\longrightarrow & Y_1 \times S \\
&\searrow & \downarrow p_S \\
&\downarrow p_X & \downarrow p_S \\
Y_1 \times S &\overset{p_S}{\longrightarrow} & S
\end{array}
\]

whose squares are cartesian. Let \(S = \cup S_i\) be an open cover such that there exist closed embeddings \(i_i : S_i \hookrightarrow \tilde{S}_i\) with \(\tilde{S}_i \in \text{SmVar}(\mathbb{C})\). Then \(X = \cup X_i\) and \(T = \cup T_i\) with \(X_i := f^{-1}(S_i)\) and \(T_i := f^{-1}(S_i)\). Moreover, \(f_i = f_i|_{X_i} : X_i \rightarrow S_i\) lift to \(\tilde{f}_i := p_{S_i} : Y_1 \times \tilde{S}_i \rightarrow \tilde{S}_i\) and \(g_i = g_{T_i} : T_i \rightarrow S_i\) lift to

\[\Box\]

177
\( \hat{g}_i := p_{S_i} : Y_2 \times \tilde{S}_i \to \tilde{S}_i \). We then have the following commutative diagram whose squares are cartesian

\[
\begin{array}{cccc}
X & \xrightarrow{f'} & Y_1 \times T & \xrightarrow{p_F} & T \\
\downarrow{l_2} & & \downarrow{l_2} & & \\
X \times Y_2 & \xrightarrow{l'_2=l\times b} & Y_1 \times Y_2 \times \tilde{S}_i & \xrightarrow{p_Y \times \tilde{S}_i} & Y_2 \times \tilde{S}_i \\
\downarrow{p_X} & & \downarrow{p_Y \times \tilde{S}_i} & & \downarrow{\hat{g}_i} \\
X & \xrightarrow{i_1 \circ l_1} & Y_1 \times \tilde{S}_i & \xrightarrow{\hat{g}_i} & \tilde{S}_i \\
\end{array}
\]

We then define, for \((M, F) = ((M_1, F), u_{1J}) \in C_{D(2)}(X/(Y_1 \times \tilde{S}_1))\), the following canonical transformation map in \(D_{D(2)_{fil,\infty}}(T/(Y_2 \times \tilde{S}_1))\), using proposition 72.

\[
T^{D_{mod}}(f, g)(M, F) : R^*g_{mod, \Gamma} \int_f^{FDR} (M, F) := (\Gamma_{T_1} E(\hat{g}_i^{mod} p_{S_i}^* E((\Omega_{Y_1 \times \tilde{S}_i}^{\cdot} / \tilde{S}_i, \tilde{F}_b) \otimes_{O_{Y_1 \times \tilde{S}_i}} (M_1, F)), f^k(g_i^{mod}(u_{1J})))) \\
\]

In the analytic case, we have

**Definition 84.** Consider a commutative diagram in \(\text{AnSp}(\mathbb{C})\) which is cartesian:

\[
\begin{array}{ccc}
D = (f, g) & = & X \xrightarrow{f'} T \\
\downarrow{g'} & & \downarrow{g} \\
X & \xrightarrow{f} & S \\
\end{array}
\]

Assume there exist factorizations \(f : X \xrightarrow{l_1} Y_1 \times S \xrightarrow{p_S} S\), \(g : T \xrightarrow{l_2} Y_2 \times S \xrightarrow{p_S} S\), with \(Y_1, Y_2 \in \text{AnSp}(\mathbb{C})\), \(l_1, l_2\) closed embeddings and \(p_S, p_S\) the projections.

(i) We have, for \((M, F) \in D_{D(2)_{fil,\infty,h}}(X/(Y_1 \times \tilde{S}_1))\), the following transformation map in \(D_{D(2)_{fil,\infty}}(T/(Y_2 \times \tilde{S}_1))\)

\[
T^{D_{mod}}(f, g)((M, F)) : R^*g_{mod, \Gamma} \int_f^{FDR} (M, F) \to \int_{f'}^{FDR} R^*g_{mod, \Gamma}(M, F)
\]

is defined in the same way as in definition 83.

(ii) For \((M, F) \in D_{D(\infty)_{fil,\infty}}(X/(Y_1 \times \tilde{S}_1))\), the following transformation map in \(D_{D(\infty)_{fil,\infty}}(T/(Y_2 \times \tilde{S}_1))\)

\[
T^{D_{mod}}(f, g)((M, F)) : R^*g_{mod, \Gamma} \int_f^{FDR} (M, F) \to \int_{f'}^{FDR} R^*g_{mod, \Gamma}(M, F)
\]

is defined in the same way as in (ii) : see definition 83.
In the algebraic case, we have the following:

**Proposition 85.** Consider a commutative diagram in $\text{Var}(\mathbb{C})$

$$D = (f, g) = X_T \xrightarrow{f'} T \xrightarrow{g'} S$$

which is cartesian. Assume there exist factorizations $f : X \xrightarrow{l_1} Y_1 \times S \xrightarrow{p_S} S$, $g : T \xrightarrow{l_2} Y_2 \times S \xrightarrow{p_S} S$, with $Y_1, Y_2 \in \text{SmVar}(\mathbb{C})$, $l_1, l_2$ closed embeddings and $p_S, p_S$ the projections. For $(M, F) = ((M, l), u_{l,l}) \in C_{D(2)fil,\infty}(X/(Y \times \tilde{S}_l))$,

$$T^{D\text{mod}}(f, g) : Rg^{*\text{mod }, \Gamma} \int_f^{FDR} (M, F) \to \int_{f'}^{FDR} Rg'^{*\text{mod }, \Gamma}(M, F)$$

is an isomorphism in $D_{D(2)fil,\infty}(T/(Y_2 \times \tilde{S}_l))$.

**Proof.** Similar to the proof of proposition [73] the maps

$$T^O(p_{S_l}, \tilde{g}_l)(M, F) : \tilde{g}_l^{*\text{mod }}p_{S_l, *E}((\Omega_{Y \times \tilde{S}_l}/\tilde{S}_l, F_b) \otimes O_{Y \times \tilde{S}_l}(M, F)) \to$$

$$p_{T_l, *E}((\Omega_{Y \times \tilde{T}_l}/\tilde{T}_l, F_b) \otimes O_{Y \times \tilde{T}_l}\tilde{g}_l^{*\text{mod }}(M, F))$$

are $\infty$-filtered Zariski local equivalences since $\tilde{g}_l : Y_2 \times \tilde{S}_l \to \tilde{S}_l$ are projections. \[\square\]

**Proposition 86.** Consider a commutative diagram in $\text{AnSp}(\mathbb{C})$

$$D = (f, g) = X_T \xrightarrow{f'} T \xrightarrow{g'} S$$

which is cartesian. Assume that $f$ (hence $f'$) is proper and that there exist factorizations $f : X \xrightarrow{l_1} Y_1 \times S \xrightarrow{p_S} S$, $g : T \xrightarrow{l_2} Y_2 \times S \xrightarrow{p_S} S$, with $Y_1, Y_2 \in \text{AnSm}(\mathbb{C})$, $l_1, l_2$ closed embeddings and $p_S, p_S$ the projections.

(i) For $(M, F) = ((M, l), u_{l,l}) \in C_{D(2)fil,\infty}(X/(Y_1 \times \tilde{S}_l))$

$$T^{D\text{mod}}(f, g) : Rg^{*\text{mod }, \Gamma} \int_f^{FDR} (M, F) \to \int_{f'}^{FDR} Rg'^{*\text{mod }, \Gamma}(M, F)$$

is an isomorphism in $D_{D(2)fil,\infty}(T/Y_2 \times \tilde{S}_l)$.

(ii) For $(M, F) = ((M, l), u_{l,l}) \in C_{D(2)fil,\infty}(X/(Y_1 \times \tilde{S}_l))$

$$T^{D\text{mod}}(f, g) : Rg^{*\text{mod }, \Gamma} \int_f^{FDR} (M, F) \to \int_{f'}^{FDR} Rg'^{*\text{mod }, \Gamma}(M, F)$$

is an isomorphism in $D_{D(2)fil,\infty}(T/(Y_2 \times \tilde{S}_l))$.

**Proof.** (i): Similar to the proof of proposition [85]

(ii): Similar to the proof of proposition [85] \[\square\]
Definition 85. Let \( f : X \to S \) be a morphism, with \( X, S \in \text{Var}(\mathbb{C}) \), such that there exist a factorization \( f; X \xrightarrow{p} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection, and consider \( S = \bigcup_{i=1}^{l} S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \), with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \); Then, \( X = \bigcup_{i=1}^{l} X_i \) with \( X_i := f^{-1}(S_i) \). We have, for \( (M, F) = ((M_1, F), u_{ij}) \in C_{D(fid)}(S/(\tilde{S}_i)) \), the canonical transformation map in \( D_{(2)fid}(T^an/(\tilde{T}_i)^an) \)

\[
T_{\text{mod}}^an(\gamma_f)(M, F) : \frac{f^*\text{mod}[\cdot, \gamma_f](M, F) \odot \gamma_{pi}}{(T_{\text{mod}}^an(\gamma_f))(-)} = (\Gamma_{\tilde{T}_i} E(p_{\tilde{S}_i}^*\text{mod}[\cdot](M_1, F)) \odot \gamma_{pi})_{\gamma_{pi}} = (f^*\text{mod}[-]u_{ij})_{\gamma_{pi}}
\]

where the equality is obvious (see proposition 85).

Definition 86. Let \( f : X \to S \) a morphism with \( X, S \in \text{Var}(\mathbb{C}) \). Assume there exist a factorization \( f; X \xrightarrow{p} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \bigcup_{i=1}^{l} S_i \) be an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) closed embeddings with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). We have, for \( (M, F) = ((M_1, F), u_{ij}) \in C_{D(fid)}(X/Y \times \tilde{S}_i) \), the following transformation map in \( D_{D fid}(X^an/\gamma_{pi}(Y \times \tilde{S}_i)) \)

\[
T_{D fid}(an, f)(M, F) : \left( \int_{\gamma_{pi}} \frac{F}{an} (M, F)^an \right) = (p_{\tilde{S}_i} E(\Gamma_{\tilde{T}_i} L_D(M_1, F)) \odot \gamma_{pi})_{\gamma_{pi}} = (f^k(u_{ij})^an) \]

Theorem 22. Let \( f : X \to S \) a morphism with \( X, S \in \text{Var}(\mathbb{C}) \). Assume there exist a factorization \( f; X \xrightarrow{p} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \bigcup_{i=1}^{l} S_i \) be an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) closed embeddings with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). Let \( M \in D_{D fid,c}(X/Y \times \tilde{S}_i) \). If \( f \) is proper,

\[
T_{\text{D fid}}^an(Jf)(M) : \left( \int_{an} (M)^an \right) \cong \int_{\gamma_{pi}} (M)^an
\]

is an isomorphism.

Proof. By theorem 20, \( T_{\text{D fid}}^an(p_{\tilde{S}_i}, an)(M_1) \) are usu local equivalences.

In the analytic case, we have the following canonical transformation maps

Definition 87. Let \( f : X \to S \) be a morphism, with \( X, S \in \text{AnSp}(\mathbb{C}) \), such that there exist a factorization \( f; X \xrightarrow{p} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{AnSm}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection, and consider \( S = \bigcup_{i=1}^{l} S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \), with \( \tilde{S}_i \in \text{AnSm}(\mathbb{C}) \); Then, \( X = \bigcup_{i=1}^{l} X_i \) with \( X_i := f^{-1}(S_i) \). We have, for \( (M, F) = ((M_1, F), u_{ij}) \in C_{D(fid)}(S/(\tilde{S}_i)) \), the canonical transformation map in \( D_{D fid}(T/(\tilde{T}_i)) \) obtained by the canonical maps given in definition 85 and definition 86:

\[
T(f, \infty)(M, F) : J_f(f^*\text{mod}[-], \gamma_f)(M, F) := (J_{\tilde{T}_i} E(p_{\tilde{S}_i}^*\text{mod}[-](M_1, F)), J(f^*\text{mod}[-]u_{ij}))
\]

\[
(T_{\text{D fid}}^an, J_f, \gamma_{pi})(-)(-)(-) \rightarrow (\Gamma_{\tilde{T}_i} E(p_{\tilde{S}_i}^*\text{mod}[-](M_1, F)), J(u_{ij})) = f^*\text{mod}[-], \gamma_f(J_S(M, F))
\]

180
4.4 The category of complexes of quasi-coherent sheaves whose cohomology sheaves has a structure of D-modules

4.4.1 Definition on a smooth complex algebraic variety or smooth complex analytic space and the functorialities

Let $X \in \text{SmVar}(\mathbb{C})$ or let $X \in \text{AnSm}(\mathbb{C})$. Recall that (see definition \[50\] section 4.1) $C_{O_X,fil,D}(X)$ is the category

- whose objects $(M, F) \in C_{O_X,fil,D}(X)$ are filtered complexes of presheaves of $O_X$ modules $(M, F) \in C_{O_X,fil}(X)$ whose cohomology presheaves $H^n(M, F) \in \text{PSh}_{O_X,fil}(X)$ are endowed with a structure of filtered $D_X$ modules for all $n \in \mathbb{Z}$.

- whose set of morphisms $\text{Hom}_{C_{O_X,fil,D}(X)}((M, F), (N, F)) \subset \text{Hom}_{C_{O_X,fil}(X)}((M, F), (N, F))$ between $(M, F), (N, F) \in C_{O_X,fil,D}(X)$ are the morphisms of filtered complexes of $O_X$ modules $m : (M, F) \to (N, F)$ such that $H^n m : H^n(M, F) \to H^n(N, F)$ is $D_X$ linear, i.e. is a morphism of (filtered) $D_X$ modules, for all $n \in \mathbb{Z}$.

More generally, let $h : X \to S$ a morphism with $X, S \in \text{SmVar}(\mathbb{C})$ or with $X, S \in \text{AnSm}(\mathbb{C})$. Then, $C_{h^* O_S,fil,h^* D}(X)$ the category

- whose objects $(M, F) \in C_{h^* O_S,fil,h^* D}(X)$ are filtered complexes of presheaves of $h^* O_S$ modules $(M, F) \in C_{h^* O_S,fil}(X)$ whose cohomology presheaves $H^n(M, F) \in \text{PSh}_{h^* O_S,fil}(X)$ are endowed with a structure of filtered $h^* D_S$ modules for all $n \in \mathbb{Z}$.

- whose set of morphisms $\text{Hom}_{C_{h^* O_S,fil,h^* D}(X)}((M, F), (N, F)) \subset \text{Hom}_{C_{h^* O_S,fil}(X)}((M, F), (N, F))$ between $(M, F), (N, F) \in C_{h^* O_S,fil,h^* D}(X)$ are the morphisms of filtered complexes of $h^* D_S$ modules $m : (M, F) \to (N, F)$ such that $H^n m : H^n(M, F) \to H^n(N, F)$ is $h^* D_S$ linear, i.e. is a morphism of (filtered) $h^* D_S$ modules, for all $n \in \mathbb{Z}$.

**Definition 88.** Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$. Let $Z \subset S$ a closed subset. Denote by $j : S \setminus Z \hookrightarrow S$ the open complementary embedding.

(i) We denote by $C_{O_S,fil,Z}(S) \subset C_{O_S,D}(S)$ the full subcategory consisting of $(M, F) \in C_{O_S,D}(S)$ such that such that $j^* H^n(M, F) = 0$ for all $n \in \mathbb{Z}$.

(ii) We denote by $C_{O_S,fil,D,Z}(S) \subset C_{O_S,fil,D}(S)$ the full subcategory consisting of $(M, F) \in C_{O_S,fil,D}(S)$ such that there exist $r \in \mathbb{N}$ such that $j^* E_{p,q}^r(M, F) = 0$ for all $p, q \in \mathbb{Z}$, note that by definition $r$ does NOT depend on $p$ and $q$.

We look at functoriality

- Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$. Let $(M, F) \in C_{O_S,fil,D}(S)$. Then, the canonical morphism $q : L_0(M, F) \to (M, F)$ in $C_{O_S,fil}(S)$ being a quasi-isomorphism of $O_S$ modules, we get in a unique way $L_0(M, F) \in C_{O_S,fil,D}(S)$ such that $q : L_0(M, F) \to (M, F)$ is a morphism in $C_{O_S,fil,D}(S)$.

- Let $f : X \to S$ be a morphism with $X, S \in \text{SmVar}(\mathbb{C})$, or let $f : X \to S$ be a morphism with $X, S \in \text{AnSm}(\mathbb{C})$. Let $(M, F) \in C_{O_S,fil,D}(S)$. Then, $f^* \text{mod} H^n(M, F) := (O_X, F_b) \otimes_{f^* O_S} f^* H^n(M, F)$ is canonical a filtered $D_X$ module (see section 4.1 or 4.2). Consider the canonical surjective map $q(f) : H^n f^* \text{mod} H^n(M, F) \to f^* \text{mod} H^n(M, F)$. Then, $q(f)$ is an isomorphism if $f$ is smooth. Let $h : U \to S$ be a smooth morphism with $U, S \in \text{SmVar}(\mathbb{C})$, or let $h : U \to S$ be a smooth morphism with $U, S \in \text{AnSm}(\mathbb{C})$. We get the functor $h^* \text{mod} : C_{O_U,fil,D}(S) \to C_{O_U,fil,D}(U), (M, F) \mapsto h^* \text{mod}(M, F)$.
Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$, and let $i : Z \hookrightarrow S$ a closed embedding and denote by $j : S \setminus Z \hookrightarrow S$ the open complementary. For $M \in C_{O_S, \mathcal{D}}(S)$, the cohomology presheaves of

$$
\Gamma_Z M := \text{Cone}(\text{ad}(j^* j_*)(M) : M \to j_* j^* M)[-1]
$$

has a canonical $D_S$-module structure (as $j^* H^n M$ is a $j^* D_S$ module, $H^n j_* j^* M = j_* j^* H^n M$ has an induced structure of $D_S$ module), and $\gamma_Z(M) : \Gamma_Z M \to M$ is a map in $C_{O_S, \mathcal{D}}(S)$. For $Z_2 \subset Z$ a closed subset and $M \in C_{O_S, \mathcal{D}}(S)$, $T(Z_2/Z, \gamma)(M) : \Gamma_{Z_2} M \to \Gamma_Z M$ is a map in $C_{O_S, \mathcal{D}}(S)$. We get the functor

$$
\Gamma_Z : C_{O_S, \mathcal{D}}(S) \to C_{O_S, \mathcal{D}}(S),
(M, F) \mapsto \Gamma_Z(M, F) := \text{Cone}(\text{ad}(j^* j_*)((M, F)) : (M, F) \to j_* j^* (M, F))[-1],
$$

together we the canonical map $\gamma_Z(M, F) : \Gamma_Z(M, F) \to (M, F)$

More generally, let $h : Y \to S$ a morphism with $Y, S \in \text{Var}(\mathbb{C})$ or $Y, S \in \text{AnSp}(\mathbb{C})$, $S$ smooth, and let $i : X \hookrightarrow Y$ a closed embedding and denote by $j : Y \setminus X \to Y$ the open complementary. For $M \in C_{h^* O_S, h^* \mathcal{D}}(Y)$,

$$
\Gamma_X M := \text{Cone}(\text{ad}(j^* j_*)(M) : M \to j_* j^* M)[-1]
$$

has a canonical $h^* D_S$-module structure, (as $j^* H^n M$ is a $j^* h^* D_S$ module, $H^n j_* j^* M = j_* j^* H^n M$ has an induced structure of $j^* h^* D_S$ module), and $\gamma_X(M) : \Gamma_X M \to M$ is a map in $C_{h^* O_S, h^* \mathcal{D}}(Y)$. For $X_2 \subset X$ a closed subset and $M \in C_{h^* O_S, h^* \mathcal{D}}(Y)$, $T(Z_2/Z, \gamma)(M) : \Gamma_{X_2} M \to \Gamma_X M$ is a map in $C_{h^* O_S, h^* \mathcal{D}}(Y)$. We get the functor

$$
\Gamma_X : C_{h^* O_S, h^* \mathcal{D}}(Y) \to C_{h^* O_S, h^* \mathcal{D}}(Y),
(M, F) \mapsto \Gamma_X(M, F) := \text{Cone}(\text{ad}(j^* j_*)((M, F)) : (M, F) \to j_* j^* (M, F))[-1],
$$

together we the canonical map $\gamma_X(M, F) : \Gamma_X(M, F) \to (M, F)$

Let $f : X \to S$ be a morphism with $X, S \in \text{SmVar}(\mathbb{C})$, or let $f : X \to S$ be a morphism with $X, S \in \text{AnSm}(\mathbb{C})$. Consider the factorization $f : X \xrightarrow{i} X \times S \xrightarrow{p} S$, where $l$ is the graph embedding and $p$ the projection. We get from the two preceding points the functor

$$
f^{\text{mod, } \Gamma} : C_{O_S, \mathcal{D}}(S) \to C_{O_X, \mathcal{D}}(X \times S), (M, F) \mapsto f^{\text{mod, } \Gamma}(M, F) := \Gamma_X p^\text{mod}(M, F),
$$

and

$$
f^{\text{mod}[-1, \Gamma]} : C_{O_S, \mathcal{D}}(S) \to C_{O_X, \mathcal{D}}(X \times S), (M, F) \mapsto f^{\text{mod}[-1, \Gamma]}(M, F) := \Gamma_X E(p^\text{mod}(M, F))[-d_X],
$$

which induces in the derived categories the functor

$$
Rf^{\text{mod}[-1, \Gamma]} : D_{O_S, \mathcal{D}}(S) \to D_{O_X, \mathcal{D}}(X \times S), (M, F) \mapsto Rf^{\text{mod}[-1, \Gamma]}(M, F) := \Gamma_X E(p^\text{mod}[-1](M, F)).
$$

For $(M, F) \in C_{O_S, \mathcal{D}}(S)$ or $(M, F) \in C_{O_S, \mathcal{D}}(S)$, the canonical map in $C_{O_X, \mathcal{D}}(X \times S)$

$$
\text{ad}(i^{\text{mod, } i_*})(-) : L_0 \Gamma_X E(p^\text{mod}(M, F)) \to i_* i^{\text{mod}L_0 \Gamma_X E(p^\text{mod}(M, F))}
$$

gives in the derived category, the canonical map in $D_{O_X, \mathcal{D}}(X \times S)$

$$
I(f^{\text{mod, } \Gamma})(M, F) : Rf^{\text{mod, } \Gamma}(M, F) = L_0 \Gamma_X E(p^\text{mod}(M, F)) \xrightarrow{\text{ad}(i^{\text{mod, } i_*})(-)} i_* i^{\text{mod}L_0 \Gamma_X E(p^\text{mod}(M, F))} \cong i_* i^{\text{mod}L_0 \Gamma_X E(p^\text{mod}(M, F))} = Lf^\text{mod}(M, F)
$$

where the isomorphism is given by lemma [7].
Let $S \in \text{SmVar}(\mathbb{C})$. We have the analytical functor:

$(-)^\text{an}: C_{\text{O}_S \text{fil}, \mathcal{D}}(S) \to C_{\text{O}_S \text{fil}, \mathcal{D}}(S^{\text{an}})$, $(M, F) \mapsto (M, F)^{\text{an}} := \text{an}_{\text{mod}}^S(M, F) := (M, F) \otimes_{\text{an}_{\text{mod}}^S \text{O}_S \text{S}^\text{an}}$

which induces in the derived category

$(-)^{\text{an}}: D_{\text{O}_S \text{fil}, \mathcal{D}}(S) \to D_{\text{O}_S \text{fil}, \mathcal{D}}(S^{\text{an}})$, $((M, F) \mapsto (M, F)^{\text{an}} := \text{an}_{S}^S(M, F))$

since $\text{an}_{S}^S$ is an exact functor.

We have, for $f : T \to S$ with $T, S \in \text{SmVar}(\mathbb{C})$ or with $T, S \in \text{AnSm}(\mathbb{C})$, the commutative diagrams of functors

\[ C_{\mathcal{D}_f}(T) \xrightarrow{\alpha_T} C_{\mathcal{O}_{\mathcal{D}_f}}(T) \xrightarrow{\alpha_S} C_{\mathcal{O}_{\mathcal{D}_f}}(S) \]

\[ D_{\mathcal{D}_f}(T) \xrightarrow{\alpha_T} D_{\mathcal{O}_{\mathcal{D}_f}}(T) \xrightarrow{\alpha_S} D_{\mathcal{O}_{\mathcal{D}_f}}(S) \]

where $\alpha_S$ and $\alpha_T$ are the forgetful functors.

4.4.2 Definition on a singular complex algebraic variety or singular complex analytic space and the functorialities

**Definition 89.** Let $S \in \text{Var}(\mathbb{C})$ and let $S = \bigcup_i S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$; or let $S \in \text{AnSp}(\mathbb{C})$ and let $S = \bigcup_i S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{AnSm}(\mathbb{C})$. Then, $C_{\mathcal{O}_{\mathcal{D}_f}}(S/\tilde{S}_i)$ is the category

- whose objects are $(M, F) = ((M_I, F)_{I \subseteq [1, \ldots, l]}, u_{IJ})$, with
  - $(M_I, F) \in C_{\mathcal{O}_{\tilde{S}_I}}(\tilde{S}_I)$,
  - $u_{IJ} : m^* (M_I, F) \to m^* p_{IJ*} (M_I, F) \mid d_{\tilde{S}_I}$ for $I \subseteq J$, are morphisms, $p_{IJ} : \tilde{S}_J \to \tilde{S}_I$ being the projection, satisfying for $I \subseteq J \subseteq K$, $p_{IJ} \circ u_{JK} = u_{IK}$ in $C_{\mathcal{O}_{\tilde{S}_J}}(\tilde{S}_I)$;

- whose morphisms $m : ((M_I, F), u_{IJ}) \to ((N_I, F), v_{IJ})$ between $(M, F) = ((M_I, F)_{I \subseteq [1, \ldots, l]}, u_{IJ})$ and $(N, F) = ((N_I, F)_{I \subseteq [1, \ldots, l]}, v_{IJ})$ are a family of morphisms of complexes,
  \[ m = (m_I : (M_I, F) \to (N_I, F))_{I \subseteq [1, \ldots, l]} \]

such that $v_{IJ} \circ m_I = p_{IJ*} m_J \circ u_{IJ}$ in $C_{\mathcal{O}_{\tilde{S}_J}}(\tilde{S}_I)$.

We denote by $C_{\mathcal{O}_{\mathcal{D}_f}}(S/\tilde{S}_I)$ the full subcategory consisting of objects $((M_I, F), u_{IJ})$ such that the $u_{IJ}$ are $\infty$-filtered Zariski, resp. usw. local equivalences, and

$D_{\mathcal{O}_{\mathcal{D}_f}, \infty}(S/\tilde{S}_I) := \text{Ho}_{\infty} C_{\mathcal{O}_{\mathcal{D}_f}}(S/\tilde{S}_I)$

the derived category.

Let $f : X \to S$ be a morphism, with $X, S \in \text{Var}(\mathbb{C})$, such that there exist a factorization $f; X \xrightarrow{i} Y \times S \xrightarrow{p_S} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection, and consider $S = \bigcup_{i=1}^l S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$, with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$; or let $f : X \to S$ be a morphism, with $X, S \in \text{AnSp}(\mathbb{C})$, such that there exist a factorization $f; X \xrightarrow{i} Y \times S \xrightarrow{p_S} S$ with $Y \in \text{AnSm}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection and consider $S = \bigcup_{i=1}^l S_i$ an open cover
such that there exist closed embeddings \( i_t : S_t \hookrightarrow \tilde{S}_t \), with \( \tilde{S}_t \in \text{AnSm}(\mathbb{C}) \). Then, \( X = \cup_{t=1}^\infty X_t \) with \( X_t := f^{-1}(S_t) \).

Denote by \( p_{IJ} : \tilde{S}_J \to \tilde{S}_I \) and \( p'_{IJ} : Y \times \tilde{S}_J \to Y \times \tilde{S}_I \) the projections and by

\[
E_{IJ} = \tilde{S}_J \setminus S_J \xrightarrow{m_J} \tilde{S}_J , \quad E'_{IJ} = Y \times \tilde{S}_J \setminus X_J \xrightarrow{m'_J} Y \times \tilde{S}_J , \quad E_{fIJ} = \tilde{X}_J \xrightarrow{f_J} \tilde{S}_J
\]

the commutative diagrams. We then have the filtered De Rham the inverse image functor:

\[
f^{\text{mod}[-],R} : C_{O\text{fil,}
\mathcal{D}}(S/(\tilde{S}_t)) \to C_{O\text{fil,}
\mathcal{D}}(X/(Y \times \tilde{S}_t)), \quad (M, F) = ((M_t, F), u_{IJ}) \mapsto f^{\text{mod}[-],R}(M, F) := (\Gamma_{X_t} E(p_{S_t}^{\text{mod}[-]}(M_t, F)), \tilde{f}_{IJ}^{\text{mod}[-]} u_{IJ})
\]

with, denoting for short \( d_{IJ} := d_{S_J} - d_{S_I} \):

\[
f_{IJ}^{\text{mod}[-]} u_{IJ} : \Gamma_{X_t} E(p_{S_t}^{\text{mod}[-]}(M_t, F)) \stackrel{\Gamma_{\tilde{X}_t} E(p_{\tilde{S}_t}^{\text{mod}[-]})(u_{IJ})}{\longrightarrow} \Gamma_{X_t} E(p_{\tilde{S}_t}^{\text{mod}[-]} p'_{IJ}(M_t, F)[d_{IJ}]) \longrightarrow \Gamma_{X_t} E(p_{\tilde{S}_t}^{\text{mod}[-]}(M_t, F)[d_Y + d_{IJ}]) \equiv \tilde{f}_{IJ}^{\text{mod}[-]} u_{IJ}
\]

It induces in the derived categories, the functor

\[
Rf^{\text{mod}[-],R} : D_{O\text{fil,}
\mathcal{D},\infty}(S/(\tilde{S}_t)) \to D_{O\text{fil,}
\mathcal{D},\infty}(X/(Y \times \tilde{S}_t)), \quad (M, F) = ((M_t, F), u_{IJ}) \mapsto Rf^{\text{mod}[-],R}(M, F) := (\Gamma_{X_t} E(p_{S_t}^{\text{mod}[-]}(M_t, F)), \tilde{f}_{IJ}^{\text{mod}[-]} u_{IJ})
\]

By definition, for \( f : T \to S \) with \( T, S \in \text{QPVar}(\mathbb{C}) \) or with \( T, S \in \text{AnSp}(\mathbb{C})^{QP} \), after considering a factorization \( f : T \xrightarrow{\ell} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection, the commutative diagrams of functors

\[
C_{\text{Dfil}}(S/(\tilde{S}_t)) \xrightarrow{o_{S}} C_{\text{Dfil}}(S/(\tilde{S}_t)) \quad , \quad D_{\text{Dfil}}(S/(\tilde{S}_t)) \xrightarrow{o_{S}} D_{\text{Dfil}}(S/(\tilde{S}_t)) \\
C_{\text{Dfil}}(T/(Y \times \tilde{S}_t)) \xrightarrow{o_{\ell}} C_{\text{Dfil}}(T/(Y \times \tilde{S}_t)) \quad , \quad D_{\text{Dfil}}(T/(Y \times \tilde{S}_t)) \xrightarrow{o_{\ell}} D_{\text{Dfil}}(T/(Y \times \tilde{S}_t))
\]

where \( o_S \) and \( o_{\ell} \) are the forgetful functors.

Let \( f : X \to S \) be a morphism, with \( X, S \in \text{Var}(\mathbb{C}) \), such that there exist a factorization \( f : X \xrightarrow{\ell} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection, and consider \( S = \cup_{t=1}^\infty S_t \) an open cover such that there exist closed embeddings \( i_t : S_t \hookrightarrow S_t \), with \( S_t \in \text{SmVar}(\mathbb{C}) \). Then, \( X = \cup_{t=1}^\infty X_t \) with \( X_t := f^{-1}(S_t) \). We have, for \( (M, F) = ((M_t, F), u_{IJ}) \in C_{O\text{fil,}
\mathcal{D}}(S/(\tilde{S}_t))^\vee \), the canonical transformation map in \( D_{O\text{fil,}
\mathcal{D}}(T^{\text{an}}/(T^{\text{an}}_t))^\vee \)

\[
T^{\text{mod}(an, \gamma)}(M, F) : \quad f^{\text{mod}[-],R}(M, F)^{an} := ((\Gamma_{T_t} E(p_{S_t}^{\text{mod}[-]}(M_t, F)))^{an}, (f^{\text{mod}[-],an} u_{IJ})^{an}) \]

\[
\text{(T}_{T^{an}}^{\text{mod}(an, \gamma)}(\ell^-)) \xrightarrow{(T^{an}_{T^{an}} E((p_{\tilde{S}_t}^{\text{mod}[-]}(M_t, F)))^{an}, f^{\text{mod}[-],an} u_{IJ})^{an})
\]

\[
\equiv (\Gamma_{T^{an}} E(p_{\tilde{S}_t}^{\text{mod}[-]}(M_t^{an}, F)), f^{\text{mod}[-],an} u_{IJ})^{an} =: f^{\text{mod}[-],R}(M, F)^{an}
\]

where the equality is obvious.

184
5 The category of mixed Hodge modules on complex algebraic varieties and complex analytic spaces and the functorialities

For $S \in \mathrm{Top}$ a topological space endowed with a stratification $S = \sqcup_{k=1}^{d} S_k$ by locally closed subsets $S_k$ together with the perversity $p(S_k)$, we denote by $\mathcal{P}(S, W) \subseteq D_{\text{fil}}(S)$ the category of filtered perverse sheaves of abelian groups. For a locally compact (hence Hausdorff) topological space, we denote by $D_c(S) \subseteq D(S)$ the full subcategory of complexes of presheaves whose cohomology sheaves are constructible.

5.1 The De Rahm functor for D modules on a complex analytic space

Let $S \in \mathcal{A}_{\text{Sm}}(\mathbb{C})$. Recall we have the dual functor

$$\mathbb{D}_S : C(S) \to C(S), \quad K \mapsto \mathbb{D}_S(K) := \mathcal{H}om(K, E(\mathbb{Z}_S))$$

which induces the functor

$$L\mathbb{D}_S : D(S) \to D(S), \quad K \mapsto L\mathbb{D}_S(K) := \mathbb{D}_S(LK) := \mathcal{H}om(LK, E_{\text{et}}(\mathbb{Z}_S)).$$

Let $S \in \mathcal{A}_{\text{Sm}}(\mathbb{C})$.

- The functor

$$M \in \mathcal{P}_{\text{ShD}}(S) \mapsto DR(S)(M) := \Omega^\bullet_S \otimes_{\mathcal{O}_S} M \in C_{C_S}(S)$$

which sends a $D_S$ module to its De Rham complex (see section 4) induces, after shifting by $d_S$ in order to send holonomic module (degree zero) to perverse sheaves, in the derived category the functor

$$DR(S)[\cdot] : D_{\text{D}}(S) \to D_{C_S}(S), \quad M \mapsto DR(S)[\cdot](M) := \Omega^\bullet_S \otimes_{\mathcal{O}_S} M[d_S] \simeq K_S \otimes_{D_S}^L M \cong \mathcal{H}om_{D_S}(\mathbb{D}_S L DM, E(O_S))[d_S]$$

and, by functoriality, the functor

$$DR(S)[\cdot] : D_{\text{D}0_{\text{fil}}, \infty} \to D_{C_S f_{\text{fil}}, \infty}(S),$$

$$(M, W) \mapsto DR(S)[\cdot](M, W) := (\Omega^\bullet_S, F_k) \otimes_{\mathcal{O}_S} (M, W)[d_S] = K_S \otimes_{D_S} (M, W)$$

- On the other hand, we have the functor

$$C_{C_S}(S) \to C_{D_S}(S), \quad K \mapsto \mathcal{H}om_{C_S}(L_{\mathbb{D}S}(LK), E(O_S))[\cdot] d_S$$

together with, for $K \in C_{C_S}(S)$, the canonical map

$$s(K) : K \to DR(S)[\cdot](J_S^{-1}\mathcal{H}om_{C_S}(L_{\mathbb{D}S}(LK), E(O_S))[\cdot] d_S)$$

$$\xrightarrow{s(K)} \mathcal{H}om_{D_S}(\mathbb{D} K_L D_{\text{D}0_{\text{fil}}}, \mathcal{H}om_{C_S}(L_{\mathbb{D}S}(LK), E(O_S)), E(O_S)),$$

c $\in \Gamma(S^a, L(K)) \mapsto s(K)(c) = (\phi \in \Gamma(S^{\alpha_0}, L_D \mathcal{H}om(L_{\mathbb{D}S}(K), E(O_S))) \mapsto \phi(c))$

where $S^{\alpha_0} \subseteq S^a \subset S$ are open subsets.

The main result is Riemann-Hilbert equivalence:

**Theorem 23.** Let $S \in \mathcal{A}_{\text{Sm}}(\mathbb{C})$.

(i) The functor $J_S : D_{D_S}(S) \to D_{D^{\infty}}(S)$ is an equivalence of category. Moreover, for $K \in C(S)$, we have $\mathcal{H}om(L(K), E(O_S)) \in C_{D^{\infty}}(S)$. 

185
(ii) The restriction of the De Rahm functor to the full subcategory $D_{\mathcal{D}, rh}(S) \subset D_{\mathcal{D}}(S)$ is an equivalence of category

$$DR(S)[-1] : D_{\mathcal{D}, rh}(S) \xrightarrow{\sim} D_{C_{S,c}}(S)$$

whose inverse is the functor

$$K \in C_{C_{S,c}}(S) \mapsto J^{-1}\text{Hom}_{C_{S,c}}(\mathbb{D}S_{L}(K), E(O_{S}))[-d_{S}],$$

the map $s(K) : K \xrightarrow{\sim} DR(S)[-1](J^{-1}\text{Hom}_{C_{S,c}}(L_{C}\mathbb{D}S_{L}(K), E(O_{S})))$ being an isomorphism.

(iii) The De Rahm functor $DR(S)[-1]$ sends regular holonomic modules to perverse sheaves.

Proof. See [18].

Let $S \in \text{AnSp}(C)$ and $S = \bigcup_{i=1}^{J} S_{i}$ an open cover such that there exists closed embeddings $i_{i} : S_{i} \hookrightarrow \tilde{S}_{i}$.

- The De Rham functor is in this case

$$DR(S)[-1] : D_{D_{0}\text{fil}, \infty}(S) \rightarrow D_{C_{S,fil}, \infty}(S), M = ((M_{I}, W), u_{IJ}) \mapsto DR(S)[-1](M, W) := (DR(\tilde{S}_{i})[-1](M_{I}, W), DR[−1](u_{IJ})) := (\Omega_{\tilde{S}_{i}}^{\bullet} \otimes_{O_{S_{i}}}(M_{I}, W), DR^{[-1]}(u_{IJ}))$$

with, denoting for short $d_{I} = d_{\tilde{S}_{i}}$

$$DR[-1](u_{IJ}) : \Omega_{\tilde{S}_{i}}^{\bullet} \otimes_{O_{S_{i}}}(M_{I}, W)[d_{I}] \xrightarrow{\text{ad}(p_{IJ}, p_{IJ}^{\ast})(-))} p_{IJ}^{\ast}p_{IJ}^{\ast}\Omega_{\tilde{S}_{i}}^{\bullet} \otimes_{O_{\tilde{S}_{i}}}(M_{I}, W)[d_{I}]$$

and considering the diagrams

$$D_{IJ} = \begin{array}{c}
\tilde{S}_{i} \xrightarrow{p_{IJ}} \tilde{S}_{j} \\
\text{ij} \uparrow \\
S_{i} \xrightarrow{j_{IJ}} S_{j}
\end{array}$$

we get the functor

$$C_{S,fil}(S) \xrightarrow{T(S(S_{i}))} C_{S,fil}(S/(S_{i})) \rightarrow C_{D_{0}\text{fil}}(S/(S_{i})),$$

$$(K, W) \mapsto (\text{Hom}_{C_{S}}(L_{C}\mathbb{D}_{S_{i}}(Li_{I}j_{I}^{\ast}(K, W)), E(O_{S_{i}}))[-d_{S_{i}}], u_{IJ}(K, W))$$

where

$$u_{IJ}(K, W) : \text{Hom}_{C_{S}}(L_{C}\mathbb{D}_{S_{i}}(Li_{I}j_{I}^{\ast}(K, W)), E(O_{S_{i}}))[-d_{S_{i}}]$$

Moreover, for $(K, W) \in C_{fil}(S)$, we have

$$(\text{Hom}_{C_{S}}(L_{C}\mathbb{D}_{S_{i}}(Li_{I}j_{I}^{\ast}(K, W)), E(O_{S_{i}}))[-d_{S_{i}}], u_{IJ}(K, W)) \in C_{D_{0}\text{fil},\text{h}}(S)^{0}$$

186
and a canonical map in $D_{fil}(S) = D_{fil}(\tilde{S}_1)$

$$s(K) : T(S/(S_1))(K, W) := (L(i_1, j_1^* (K, W)), I) \to DR(S)[−1](J_S^1 Hom_{C, S_1}(L_{C, \mathbb{D}_S} \circ L(i_1, j_1^* (K, W))), E(O_{\tilde{S}_1})[−d_{\tilde{S}_1}], u_{1J}(K, W))$$

Corollary 3. Let $S \in \text{AnSp}(\mathbb{C})$. Let $S = \bigcup_{i=1}^{d} S_i$ an open cover such that there exists closed embeddings $i_1 : S_i \hookrightarrow S_i$. The restriction of the De Rahm functor to the full subcategory $D^0_{D, rh}(S) \subset D^0_{S}(S)$ is an equivalence of category

$$DR(S)[−1] : D^0_{D, rh}(S) \xrightarrow{\sim} D_{C, S, c}(S)$$

whose inverse is the functor

$$K \mapsto J_S^1 (Hom_{C, S_1}(L_{C, \mathbb{D}_S} \circ L(i_1, j_1^* K), E(O_{\tilde{S}_1})[−d_{\tilde{S}_1}], u_{1J}(K))$$

the map

$$s(K) : T(S/(S_1))(K, W) := (L(i_1, j_1^* (K, W)), I) \to DR(S)[−1](J_S^1 Hom_{C, S_1}(L_{C, \mathbb{D}_S} \circ L(i_1, j_1^* (K, W))), E(O_{\tilde{S}_1})[−d_{\tilde{S}_1}], u_{1J}(K, W))$$

being an isomorphism.

Proof. Follows from theorem [23](ii), see [27].

Proposition 87. (i) Let $S \in \text{AnSm}(\mathbb{C})$. Then, for $M \in C_{D, c}(S)$, there is a canonical isomorphism

$$T(D, DR)(M) : \mathbb{D}_S^{\mathbb{C}} DR(S)[−1](M) \xrightarrow{\sim} DR(S)[−1](\mathbb{D}_S^{\mathbb{C}} L_D M)$$

(ii) Let $S \in \text{AnSp}(\mathbb{C})$. Let $S = \bigcup_{i=1}^{d} S_i$ an open cover such that there exists closed embeddings $i_1 : S_i \hookrightarrow S_i$. Then, for $M = (M_i, u_{1J}) \in C^{o}_{D, c}(S/(\tilde{S}_1))$, there is a canonical isomorphism

$$T(D, DR)(M) : \mathbb{D}_S^{\mathbb{C}} DR(S)[−1](M) \xrightarrow{\sim} DR(S)[−1](L \mathbb{D}_S^{\mathbb{C}} M)$$

Proof. (i):See [16].

(ii): Follows from (i), see [27].

We have the following transformation maps:

- Let $g : T \to S$ a morphism with $T, S \in \text{AnSm}(\mathbb{C})$. We have, for $(M, W) \in C_{D_{fil, c}}(S)$, the canonical transformation map in $D_{fil, c}(T)$:

$$T(g, DR)(M, W) : g^*(DR(S)[−1](M, W)) := g^*(\Omega_T^* \otimes_{O_T} L_D(M, W))[d_S] \xrightarrow{\Omega_{T/S}(L_D(M, W))}[d_S] \xrightarrow{\Omega_T^* \otimes_{O_T} g^*}(L_D(M, W))[d_S] =: DR(T)[−1](Lg^*[−1](M, W))$$

Note that this transformation map is NOT an isomorphism in general. It is an isomorphism if $g$ is a smooth morphism. If $g$ is a closed embedding, it is an isomorphism for $M$ non characteristic with respect to $g$.

- Let $j : S^o \hookrightarrow S$ an open embedding with $S \in \text{AnSm}(\mathbb{C})$. We have, for $(M, W) \in C_{D_{fil, c}}(S^o)$, the canonical transformation map in $D_{fil, c}(S)$:

$$T(j, DR)(M, W) : DR(S)[−1](j_* (M, W)) := \Omega_S^* \otimes_{O_S} j_* (M, W)[d_S] \xrightarrow{T(j, DR)(L_D(M, W))[d_S]} j_* (\Omega_{S^o}^* \otimes_{O_{S^o}} L_D(M, W))[d_S] =: j_* DR(S)[−1](M, W)$$

which is an isomorphism (see proposition [72]).
Let $g : T \to S$ a morphism with $T,S \in \text{AnSp}(\mathbb{C})$. Assume there exist a factorization $g : T \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S$ with $Y \in \text{AnSp}(\mathbb{C})$, $\iota$ a closed embedding and $p_S$ the projection. Let $S = \bigcup_i S_i$ an open covers such that there exist closed embeddings $i_i : S_i \hookrightarrow S_i$ with $S_i \in \text{AnSp}(\mathbb{C})$. We have, for $M = (M_I,u_I) \in C_{D,c}(S/(\tilde{S}_I))$, the canonical transformation map

$$
\begin{align*}
T^!(g,DR)(M) : T(\{(Y \times \tilde{S}_I)\}) &\xrightarrow{(\iota^!DR(S)[-\iota],\iota^!M)\text{an}} (\Omega_{Y \times \tilde{S}_I/LD(M,w)}) \\
&\xrightarrow{(\iota^!DR(S)[-\iota],\iota^!M)\text{an}} (\iota^!DR(S)[-\iota],\iota^!M)\text{an}
\end{align*}
$$

which is an isomorphism.

**Proposition 88.** Let $f : T \to S$ a morphism with $T,S \in \text{Var}(\mathbb{C})$. Assume there exist a factorization $f : T \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $\iota$ a closed embedding and $p_S$ the projection. Let $S = \bigcup_i S_i$ an open covers such that there exist closed embeddings $i_i : S_i \hookrightarrow S_i$ with $S_i \in \text{SmVar}(\mathbb{C})$. Then, for $M = (M_I,u_I) \in C_{D,h}(S/(\tilde{S}_I))$,

$$
\begin{align*}
DR(T)[-\iota](T^m(\text{an},\gamma_T)(M)) &\xrightarrow{DR(T)[-\iota]} DR(T)[-\iota]((\Gamma_T, E\{f^\text{mod}[\cdot], \Gamma \})\text{an}) \\
&\xrightarrow{DR(T)[-\iota]} DR(T)[-\iota]((\Gamma_T, E\{f^\text{mod}[\cdot], \Gamma \})\text{an})
\end{align*}
$$

is an isomorphism.

**Proof.** See [10].

In the algebraic case, we have by proposition 88 the following canonical isomorphisms:

**Definition 90.**

(i) Let $f : T \to S$ a morphism with $T,S \in \text{Var}(\mathbb{C})$. Assume there exist a factorization $f : T \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $\iota$ a closed embedding and $p_S$ the projection. We have, for $M = (M_I,u_I) \in C_{D,h}(S/(\tilde{S}_I))^0$, the canonical map

$$
\begin{align*}
T^!(f,DR)(M) : f^!DR(S)[-\iota](\text{an}) &\xrightarrow{T^!(f,DR)(M)} DR(T)[-\iota](M^\text{an}) \\
&\xrightarrow{DR(T)[-\iota]} DR(T)[-\iota](M^\text{an})
\end{align*}
$$

which is an isomorphism by proposition 88.

(ii) Let $f : T \to S$ a morphism with $T,S \in \text{Var}(\mathbb{C})$. Assume there exist a factorization $f : T \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $\iota$ a closed embedding and $p_S$ the projection. We have, for $M = (M_I,u_I) \in C_{D,h}(S/(\tilde{S}_I))^0$, the canonical transformation map

$$
\begin{align*}
T(f,DR)(M) : DR(T)[-\iota](f^\text{mod}[\cdot], \Gamma M)\text{an}) &\xrightarrow{T(f,DR)(M)} DR(T)[-\iota](f^\text{mod}[\cdot], \Gamma M)\text{an}) \\
&\xrightarrow{DR(T)[-\iota]} DR(T)[-\iota](f^\text{mod}[\cdot], \Gamma M)\text{an})
\end{align*}
$$

which is an isomorphism by (i) and proposition 88.
(iii) Let $f : T \to S$ a morphism with $T, S \in \text{QPVar}(\mathbb{C})$. Consider a factorization $f : T \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S$ with $Y = \mathbb{P}^N, o \subset \mathbb{P}^N$ an open subset, $\iota$ a closed embedding, and $p_S$ the projection. We have, for $M \in C_{D, h}(T/Y \times \hat{S})^\circ$, the canonical transformation map

$$T_{\iota}(f, \text{DR})(M) : DR(S)^{[-\iota]}((\int_f M)^{an}) \xrightarrow{\text{ad}(f, Rf)^{[-\iota]}} Rf_* f^* DR(S)^{[-\iota]}((\int_f M)^{an})$$

$$Rf_* DR(T)^{[-\iota]}((Lf_{\text{mod}}^{[-\iota]}, T \int_f M)^{an}) \xrightarrow{Rf_* (f, \text{DR})(f, M)} Rf_* DR(T)^{[-\iota]}((\int_f M)^{an})$$

which is an isomorphism by GAGA in the proper case and by the open embedding case (c.f. proposition [83]).

(iv) Let $f : T \to S$ a morphism with $T, S \in \text{QPVar}(\mathbb{C})$. Consider a factorization $f : T \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S$ with $Y = \mathbb{P}^N, o \subset \mathbb{P}^N$ an open subset, $\iota$ a closed embedding, and $p_S$ the projection. We have, for $M \in C_{D, h}(T)$, the canonical transformation map

$$T_{\iota}(f, \text{DR})(M) : Rf_1 DR(T)^{[-\iota]}((\int_f M)^{an})$$

$$Rf_1 DR(T)^{[-\iota]}((Lf_{\text{mod}}^{[-\iota]}, T \int_f (M)^{an}) \xrightarrow{\text{ad}(f, Rf)^{[-\iota]}} Rf_1 DR(T)^{[-\iota]}((\int_f M)^{an})$$

$$T^\iota(f, \text{DR})(f, M) \xrightarrow{\text{ad}(f, Rf)^{[-\iota]}} DR(S)^{[-\iota]}((\int_f M)^{an})$$

which is an isomorphism by (iii) and proposition [87].

5.2 The filtered Hodge direct image, the filtered Hodge inverse image, and the hodge support section functors for mixed hodge modules

We consider in the algebraic and analytic case the following categories:

- Let $S \in \text{AnSm}(\mathbb{C})$. The category $C_{D(1, 0)fil, rh}(S) \times_1 C_{fil}(S)$ is the category
  - whose set of objects is the set of triples $\{((M, F, W), (K, W), \alpha)\}$ with
    $$(M, F, W) \in C_{D(1, 0)fil, rh}(S), (K, W) \in C_{fil}(S), \alpha : (K, W) \otimes C_S \to DR(S)^{[-\iota]}((M, W))$$
  - and whose set of morphisms are
    $$\phi = (\phi_D, \phi_C) : ((M_1, F, W), (K_1, W), \alpha_1) \to ((M_2, F, W), (K_2, W), \alpha_2)$$
    where $\phi_D : (M_1, F, W) \to (M_2, F, W)$ and $\phi_C : (K_1, W) \to (K_2, W)$ are morphisms such that
    $$\alpha_2 \circ DR(S)^{[-\iota]}(\phi_D) = \phi_C \circ \alpha_1$$
    in $D_{fil}(S)$.

We have then the full embedding

$$\text{PSh}_{D(1, 0)fil, rh}(S) \times_1 P_{fil}(S) \hookrightarrow C_{D(1, 0)fil, rh}(S) \times_1 D_{fil}(S)$$

The category $D_{D(1, 0)fil, rh}(S) \times_1 D_{fil}(S)$ is then the category

- whose set of objects is the set of triples $\{((M, F, W), (K, W), \alpha)\}$ with
  $$(M, F, W) \in D_{D(1, 0)fil, rh}(S), (K, W) \in D_{fil}(S), \alpha : (K, W) \otimes C_S \to DR(S)^{[-\iota]}((M, W))$$
  where $DR(S)^{[-\iota]}$ is the De Rahm functor and $\alpha$ is an isomorphism in $D_{fil}(S)$,
and whose set of morphisms are

$$\phi = (\phi_D, \phi_C): ((M_1, F, W), (K_1, W), \alpha_1) \to ((M_2, F, W), (K_2, W), \alpha_2)$$

where $$\phi_D : (M_1, F, W) \to (M_2, F, W)$$ and $$\phi_C : (K_1, W) \to (K_2, W)$$ are morphisms such that $$\alpha_2 \circ DR(S)^{-1}(\phi_D) = \phi_C \circ \alpha_1$$ in $$D_{fil}(S)$$.

together with the localization functor

$$(D(usu), D(usu)) : C_{D((1,0)fil, rh}(S) \times_1 C_{fil}(S) \to D_{D((1,0)fil, rh}(S) \times_1 D_{fil}(S)$$

• Let $$S \in \text{AnSp}(\mathbb{C})$$. Let $$S = \cup_{i \in I} S_i$$ an open cover such that there exists closed embeddings $$i_i : S_i \to \tilde{S}_i$$ with $$\tilde{S}_i \in \text{AnSm}(\mathbb{C})$$. The category $$C_{D((1,0)fil, rh}(S/\tilde{S}_I)) \times_1 C_{fil}(S)$$ is the category

  – whose set of objects is the set of triples $$\{(((M_1, F, W), u_{1I}), (K_1, W), \alpha_1) \to (((M_2I, F, W), u_{1I}), (K_2, W), \alpha_2)$$

  where $$\phi_D : (M_1, F, W) \to (M_2, F, W)$$ and $$\phi_C : (K_1, W) \to (K_2, W)$$ are morphisms such that $$\alpha_2 \circ DR(S)^{-1}(\phi_D) = \phi_C \circ \alpha_1$$ in $$D_{fil}(S)$$.

We have then full embeddings

$$\text{PSh}^0_{D((1,0)fil, rh}(S/\tilde{S}_I)) \times_1 D_{fil}(S) \to C^0_{D((1,0)fil, rh}(S/\tilde{S}_I)) \times_1 D_{fil}(S)$$

The category $$D_{D((1,0)fil, rh}(S/\tilde{S}_I)) \times_1 D_{fil}(S)$$ is then the category

  – whose set of objects is the set of triples $$\{(((M, F, W), u_{1I}), (K, W), \alpha) \to (((M_2I, F, W), u_{1I}), (K_2, W), \alpha_2)$$

  where $$\phi_D : (M_1, F, W) \to (M_2, F, W)$$ and $$\phi_C : (K_1, W) \to (K_2, W)$$ are morphisms such that $$\alpha_2 \circ DR(S)^{-1}(\phi_D) = \phi_C \circ \alpha_1$$ in $$D_{fil}(S)$$.

We have then a full embedding

$$D^0_{D((1,0)fil, rh}(S/\tilde{S}_I)) \times_1 D_{fil}(S) \to D^0_{D((1,0)fil, rh}(S/\tilde{S}_I)) \times_1 D_{fil}(S)$$

We have then a full embedding

$$D^0_{D((1,0)fil, rh}(S/\tilde{S}_I)) \times_1 D_{fil}(S) \to D^0_{D((1,0)fil, rh}(S/\tilde{S}_I)) \times_1 D_{fil}(S)$$
\[\text{Let } S \in \text{SmVar}(\mathbb{C}). \text{ The category } C_{D(1,0)fil, rh}(S) \times_I C_{fil}(S^{an}) \text{ is the category}
\]

- whose set of objects is the set of triples \(\{((M, F, W), (K, W), \alpha)\}\) with \((M, F, W) \in C_{D(1,0)fil, rh}(S), (K, W) \in C_{fil}(S^{an}), \alpha : (K, W) \otimes \mathbb{C}_{S^{an}} \to DR(S)^{[-1]}((M, W)^{an})\) where \(DR(S)^{[-1]}\) is the De Rahm functor and \(\alpha\) is an isomorphism in \(D_{fil}(S^{an})\),

- and whose set of morphisms are

\[\phi = (\phi_D, \phi_C) : ((M_1, F, W), (K_1, W), \alpha_1) \to ((M_2, F, W), (K_2, W), \alpha_2)\]

where \(\phi_D : (M_1, F, W) \to (M_2, F, W)\) and \(\phi_C : (K_1, W) \to (K_2, W)\) are morphisms such that \(\alpha_2 \circ DR(S)^{[-1]}(\phi_D) = \phi_C \circ \alpha_1\) in \(D_{fil}(S^{an})\).

We have then the full embedding

\[\text{PSh}_{D(1,0)fil, rh}(S) \times_I P_{fil}(S^{an}) \hookrightarrow C_{D(1,0)fil, rh}(S) \times_I D_{fil}(S^{an})\]

The category \(D_{D(1,0)fil, rh}(S) \times_I D_{fil}(S^{an})\) is then the category

- whose set of objects is the set of triples \(\{((M, F, W), (K, W), \alpha)\}\) with \((M, F, W) \in D_{D(1,0)fil, rh}(S), (K, W) \in D_{fil}(S^{an}), \alpha : (K, W) \otimes \mathbb{C}_{S} \to DR(S)^{[-1]}((M, W)^{an})\) where \(DR(S)^{[-1]}\) is the De Rahm functor and \(\alpha\) is an isomorphism in \(D_{fil}(S^{an})\),

- and whose set of morphisms are

\[\phi = (\phi_D, \phi_C) : ((M_1, F, W), (K_1, W), \alpha_1) \to ((M_2, F, W), (K_2, W), \alpha_2)\]

where \(\phi_D : (M_1, F, W) \to (M_2, F, W)\) and \(\phi_C : (K_1, W) \to (K_2, W)\) are morphisms such that \(\alpha_2 \circ DR(S)^{[-1]}(\phi_D) = \phi_C \circ \alpha_1\) in \(D_{fil}(S^{an})\).

together with the localization functor

\[(D(zar), D(usu)) : C_{D(1,0)fil, rh}(S) \times_I C_{fil}(S^{an}) \to D_{D(1,0)fil, rh}(S) \times_I D_{fil}(S^{an})\]

\[\text{Let } S \in \text{Var}(\mathbb{C}). \text{ Let } S = \bigcup_{i \in I} S_i \text{ an open cover such that there exists closed embeddings } i : S_i \hookrightarrow \tilde{S}_i \text{ with } \tilde{S}_i \in \text{SmVar}(\mathbb{C}). \text{ The category } C_{D(1,0)fil, rh}(S/\tilde{S}_i) \times_I C_{fil}(S^{an}) \text{ is the category}
\]

- whose set of objects is the set of triples \(\{(((M_I, F, W), u_{I,J}), (K, W), \alpha)\}\) with \(((M_I, F, W), u_{I,J}) \in C_{D(1,0)fil, rh}(S/\tilde{S}_i), (K, W) \in C_{fil}(S^{an}), \alpha : T(S/\tilde{S}_i)(K, W) \otimes \mathbb{C}_{S} \to DR(S)^{[-1]}(((M_I, W), u_{I,J})^{an})\) where \(DR(S)^{[-1]}\) is the De Rahm functor and \(\alpha\) is an isomorphism in \(D_{fil}(S^{an})\),

- and whose set of morphisms are

\[\phi = (\phi_D, \phi_C) : (((M_{I_1}, F, W), u_{I,J}), (K_1, W), \alpha_1) \to (((M_{I_2}, F, W), u_{I,J}), (K_2, W), \alpha_2)\]

where \(\phi_D : ((M_{I_1}, F, W), u_{I,J}) \to ((M_{I_2}, F, W), u_{I,J})\) and \(\phi_C : (K_1, W) \to (K_2, W)\) are morphisms such that \(\alpha_2 \circ DR(S)^{[-1]}(\phi_D) = \phi_C \circ \alpha_1\) in \(D_{fil}(S^{an})\).

We have then full embeddings

\[\text{PSh}^0_{D(1,0)fil, rh}(S/\tilde{S}_i) \times_I P_{fil}(S^{an}) \hookrightarrow C^0_{D(1,0)fil, rh}(S/\tilde{S}_i) \times_I D_{fil}(S^{an})\]

\[\text{PSh}^0_{D(1,0)fil, rh}(S/\tilde{S}_i) \times_I P_{fil}(S^{an}) \hookrightarrow C^0_{D(1,0)fil, rh}(S/\tilde{S}_i) \times_I D_{fil}(S^{an})\]

The category \(D_{D(1,0)fil, rh}(S/\tilde{S}_i) \times_I D_{fil}(S^{an})\) is then the category

This induces the functors

\[
\begin{align*}
((M_1, F, W), u_{1J}) \in D_{D(1,0)}fil,\text{r}h(S/(\tilde{S}_I)), (K, W) \in D_{fil}(S^{an}), \\
\alpha : (K, W) \otimes C_{S^{an}} \to DR(S)[1]((M_1, W), u_{1J})^{an}
\end{align*}
\]

where \( DR(S) \) is the De Rahm functor and \( \alpha \) is an isomorphism in \( D_{fil}(S) \),

and whose set of morphisms are

\[
\phi = (\phi_D, \phi_C) : (((M_1, F, W), u_{1J}), (K_1, W), \alpha_1) \to (((M_2, F, W), u_{1J}), (K_2, W), \alpha_2)
\]

where \( \phi_D : ((M_1, F, W), u_{1J}) \to ((M_2, F, W), u_{1J}) \) and \( \phi_C : (K_1, W) \to (K_2, W) \) are morphisms such that \( \alpha_2 \circ DR(S)[1](\phi_D^{an}) = \phi_C \circ \alpha_1 \).

together with the localization functor

\[
(D(\piar), D(\text{usu})) : C_{D(1,0)}fil,\text{r}h(S/(\tilde{S}_I)) \times I C_{fil}(S^{an}) \to D_{D(1,0)}fil,\text{r}h(S/(\tilde{S}_I)) \times I D_{fil}(S^{an})
\]

We have then a full embedding

\[
D_{D(1,0)}fil,\text{r}h(S/(\tilde{S}_I)) \times I D_{fil}(S^{an}) \xrightarrow{\phi_0} D_{D(1,0)}fil,\text{r}h(S/(\tilde{S}_I))^{0} \times I D_{fil}(S^{an})
\]

\[
\hookrightarrow D_{D(1,0)}fil,\text{r}h(S/(\tilde{S}_I)) \times I D_{fil}(S^{an})
\]

**Proposition 89.** Let \( S \in \text{SmVar}(\mathbb{C}) \) or \( S \in \text{AnSm}(\mathbb{C}) \). Let \( Z = V(\mathfrak{l}) \subset S \) a Zariski closed subset. Consider \((M, F) \in \text{PSh}_{D(2)}fil(S)\). Then, a \( V_Z \)-filtration for \((M, F)\) (see definition 49) if it exists is unique. In particular if \( m : (M_1, F) \to (M_2, F) \) a morphism with \((M_1, F), (M_2, F) \in \text{PSh}_{D(2)}fil(S)\), we have \( m(V_2^p M_1) \subset V_2^p M_2 \), that is we get \( m : (M_1, F, V_Z) \to (M_2, F, V_Z) \).

**Proof.** Standard. See [8] for example.

The main tool is the nearby and vanishing cycle functors

**Definition 91.** Let \( S \in \text{SmVar}(\mathbb{C}) \) or \( S \in \text{AnSm}(\mathbb{C}) \). Let \( D = V(s) \subset S \) a (Cartier) divisor, where \( s \in \Gamma(S, L) \) is a section of the line bundle \( L = L_D \) associated to \( D \). We then have the zero section embedding \( i : S \to L \). We denote \( L_0 = i(S) \) and \( j : L^0 := L \setminus L_0 \to L \) the open complementary subset. Denoting \( C_{D(2)}fil(S)^{sp} \subset C_{D(2)}fil(S) \) the full subcategory consisting of objects for which the \( V_D \) filtration exist, which is then unique by proposition 89, we have the nearby cycle functor

\[
\psi_D : C_{D(2)}fil(S)^{sp} \to C_{D(2)}fil(D/(S)), (M, F) \mapsto \psi_D(M, F) := \text{Gr}_{V_S, 1} i_{**mod}(M, F)
\]

and the vanishing cycle functor

\[
\phi_D : C_{D(2)}fil(S)^{sp} \to C_{D(2)}fil(D/(S)), (M, F) \mapsto \phi_D(M, F) := \text{Gr}_{V_S, 0} i_{**mod}(M, F)
\]

This induces the functors

\[
\begin{align*}
\psi_D : \text{PSh}_{D(1,0)}fil,\text{r}h(S) \times I P_{fil}(S^{an}) & \to \text{PSh}_{D(2)}fil,\text{r}h,D(S) \times I P_{fil,D}(S^{an}) \\
((M, F, W), (K, W), \alpha) & \mapsto \psi_D((M, F, W), (K, W), \alpha) := (\psi_D(M, F, W), \psi_D(K, W), \psi_D(\alpha))
\end{align*}
\]

and the vanishing cycle functor

\[
\phi_D : \text{PSh}_{D(1,0)}fil,\text{r}h(S) \times I D_{fil}(S^{an}) \to \text{PSh}_{D(2)}fil,\text{r}h,D(S) \times I P_{fil,D}(S^{an}) \\
((M, F, W), (K, W), \alpha) & \mapsto \phi_D((M, F, W), (K, W), \alpha) := (\phi_D(M, F, W), \phi_D(K, W), \phi_D(\alpha))
\]

We have the category of mixed Hodge modules over a complex algebraic variety or a complex analytic space \( S \) defined by, for \( S \) smooth, by induction on dimension of \( S \), and for \( S \) singular using embeddings into smooth complex algebraic varieties, resp. smooth complex analytic spaces:
Definition 92. [27]

(i) Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$. The category of Hodge modules over $S$ is the full subcategory

$$\iota_S : \text{HM}(S) \hookrightarrow \text{PSh}_{\text{fil},\text{rh}}(S) \times_1 P(S),$$

given inductively by

- for $i_0 : s_0 \hookrightarrow S$ a closed point, $i_{0*}\iota_{\text{pt}} : \text{HM}_{s_0}(S) = HS \hookrightarrow \text{PSh}_{\text{fil},\text{rh},s_0}(S) \times_1 P_{s_0}(S)$ consist of Hodge structures

- $((M,F,K),\alpha) \in \text{PSh}_{\text{fil},\text{rh}}(S) \times_1 P(S)$ belongs to $\text{HM}(S)$ if and only if for all proper maps $f : S^0 \to \mathbb{A}^1$, $j : S^0 \hookrightarrow S$ being an open subset, it is specializable along $S^0 \subset S^0 \times \mathbb{A}^1$, that is the $V_{S^0}$-filtration exists (see proposition 91 for the uniqueness of the $V_{S^0}$-filtration), and

$$\phi_{f^{-1}(0),1}(j^* (M,F),j^* K,j^* \alpha) \in \text{HM}_{f^{-1}(0)}(S^0) \hookrightarrow \text{PSh}_{\text{fil},\text{rh},f^{-1}(0)}(S^0) \times_1 P_{f^{-1}(0)}(S^0)$$

see definition 91.

(ii) Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$. The category of mixed Hodge modules over $S$ is the full subcategory

$$\iota_S : \text{MHM}(S) \hookrightarrow \text{MHW}(S) \hookrightarrow \text{PSh}_{\text{D(1),0},\text{fil},\text{rh}}(S) \times_1 P_{\text{fil}}(S),$$

consisting of objects $((M,F,W),(K,W),\alpha) \in \text{PSh}_{\text{D(1),0},\text{fil},\text{rh}}(S) \times_1 P_{\text{fil}}(S)$ which for all proper maps $f : S^0 \to \mathbb{A}^1$, $j : S^0 \hookrightarrow S$ being an open subset, $(M,F,W)$ is specializable along $S^0 \subset S^0 \times \mathbb{A}^1$, that is the $V_{S^0}$-filtration exists (see proposition 91 for the uniqueness of the $V_{S^0}$-filtration), and satisfy

$$(\text{Gr}^W_i (M,F,W),\text{Gr}^W_i (K,W),\text{Gr}^W_i \alpha) \in \text{HM}(S).$$

As usual, for $Z \subset S$ a closed subset and $j : S\setminus Z \hookrightarrow S$ the open complementary subset, we denote $\text{MHW}_{Z}(S) \subset \text{MHM}(S)$ the full subcategory consisting of $((M,F,W),(K,W),\alpha) \in \text{MHM}(S)$ such that $j^* (M,F,W),(K,W),\alpha) := (j^* (M,F,W),j^* (K,W),j^* \alpha) = 0$.

(iii) Let $S \in \text{Var}(\mathbb{C})$ or $S \in \text{AnSp}(\mathbb{C})$ non smooth. Take an open cover $S = \cup_i S_i$ so that there are closed embedding $S_i \hookrightarrow \tilde{S}_i$, with $S_i \in \text{SmVar}(\mathbb{C})$, resp $S_i \in \text{AnSm}(\mathbb{C})$. The category of mixed Hodge modules over $S$ is the full subcategory

$$\iota_S : \text{MHM}(S) \hookrightarrow \text{MHW}(S) \hookrightarrow \text{PSh}_{\text{D(1),0},\text{fil},\text{rh}}(S/\tilde{S}_i) \times_1 P_{\text{fil}}(S)$$

consisting of objects

$$(((M_i,F,W),u_{1,i}), (K,W),\alpha) \in \text{PSh}_{\text{D(1),0},\text{fil},\text{rh}}^0(S/\tilde{S}_i) \times_1 P_{\text{fil}}(S)$$

such that $((M_i,F,W),T(S/\tilde{S}_i)(K,W),\alpha) \in (\text{MHM}_{S_i}(<\tilde{S}_i)>)$ (see (ii)). The category $\text{MHM}(S)$ does NOT depend on the open cover an the closed embedding by proposition 91.

- Let $S \in \text{SmVar}(\mathbb{C})$. We consider the canonical functor

$$\pi_S : C(\text{MHW}(S)) \xrightarrow{\iota_S} C_{\text{D(1),0},\text{fil}}(S) \times_1 C_{\text{fil}}(S^{\text{an}}) \xrightarrow{p_S} C_{\text{D(1),0},\text{fil}}(S), ((M,F,W),(K,W),\alpha) \mapsto (M,F,W)$$

where $p_S$ is the projection functor. Then $\pi_S(\text{MHW}(S)) \subset \text{PSh}_{\text{D(1),0},\text{fil}}(S)$ is the subcategory consisting of $(M,F,W) \in \text{PSh}_{\text{D(1),0},\text{fil}}(S)$ such that $((M,F,W),(K,W),\alpha) \in \text{MHW}(S)$ is a $W$ filtered Hodge module for some $(K,W) \in C_{\text{fil}}(S)$. It induces in the derived category the functor

$$\pi_S : D(\text{MHW}(S)) \xrightarrow{\iota_S} D_{\text{D(1),0},\text{fil},\text{inf}}(S) \times_1 D_{\text{fil}}(S^{\text{an}}) \xrightarrow{p_S} D_{\text{D(1),0},\text{fil},\text{inf}}(S), ((M,F,W),(K,W),\alpha) \mapsto (M,F,W)$$

after localization with respect to $\infty$-filtered Zariski and usu local equivalence.
• Let \( S \in \text{Var}(\mathbb{C}) \) non smooth. Take an open cover \( S = \bigcup_i S_i \) such that there are closed embedding \( S_i \hookrightarrow \tilde{S}_i \), with \( S_i \in \text{SmVar}(\mathbb{C}) \). We consider the canonical functor

\[
\pi_S : C(MHW(S)) \to C_{D(1,0)fil}(S/(\tilde{S}_i)) \times_I C_{fil}(S^{an}),
\]

where \( p_S \) is the projection functor. Then \( \pi_S(MHW(S)) \subset \text{PSh}_{D(1,0)fil}(S/(\tilde{S}_i)) \) is the subcategory consisting of \( ((M, F, W), u_{IJ}) \in \text{PSh}_{D(1,0)fil}(S/(\tilde{S}_i)) \) such that \( ((M, F, W), u_{IJ}), (K, W, \alpha) \in MHW(S) \) is a \( W \) filtered Hodge module for some \( (K, W) \in C_{fil}(S) \). It induces in the derived category the functor

\[
\pi_S : D(MHW(S)) \xrightarrow{\iota_S} D_{D(1,0)fil,\infty}(S/(\tilde{S}_i)) \times_I D_{fil}(S^{an}),
\]

after localization with respect to \( \infty \)-filtered Zariski and usu local equivalence.

We have from the work of Beilinson the following:

**Theorem 24.**

(i) Let \( S \in \text{SmVar}(\mathbb{C}) \). Then the full embedding

\[
\iota_S : MHM(S) \hookrightarrow \text{PSh}_{D(1,0)fil,\rh}(S) \times_I P_{fil}(S^{an}) \to C_{D2fil,\rh}(S) \times_I D_{fil}(S^{an})
\]

induces a full embedding

\[
\iota_S : D(MHM(S)) \hookrightarrow D_{D(1,0)fil,\infty,\rh}(S) \times_I D_{fil}(S^{an})
\]

whose image consists of \( ((M, F, W), (K, W, \alpha) \in D_{D(1,0)fil,\infty,\rh}(S) \times_I D_{fil}(S^{an}) \) such that

\[
(H^n(M, F, W), H^n(K, W, H^n \alpha) \in MHM(S)
\]

for all \( n \in \mathbb{Z} \).

(ii) Let \( S \in \text{Var}(\mathbb{C}) \). Let \( S = \bigcup_{i \in I} S_i \) an open cover such that there exists closed embedding \( i_i : S_i \hookrightarrow \tilde{S}_i \), with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). Then the full embedding

\[
\iota_S : MHM(S) \hookrightarrow \text{PSh}_{D(1,0)fil,\rh}(S/(\tilde{S}_i)) \times_I P_{fil}(S^{an}) \to C_{D2fil,\rh}(S/(\tilde{S}_i)) \times_I C_{fil}(S^{an})
\]

induces a full embedding

\[
\iota_S : D(MHM(S)) \hookrightarrow D_{D(1,0)fil,\infty,\rh}(S/(\tilde{S}_i)) \times_I D_{fil}(S^{an})
\]

whose image consists of \( ((M_f, F, W), (K, W, \alpha) \in D_{D(1,0)fil,\infty,\rh}(S/(\tilde{S}_i)) \times_I D_{fil}(S^{an}) \) such that

\[
(H^n(M_f, F, W), H^n(K, W, H^n \alpha) \in MHM(S)
\]

for all \( n \in \mathbb{Z} \).

**Proof.** (i): We proceed by induction on the dimension of \( S \). For \( S = \{ \text{pt} \} \), it is the theorem for absolute Hodge complexes, see [9]. We then proceed as in [19] for perverse sheaves.

(ii): Follows from (i).

We have from [27] the following proposition which shows us how to construct inductively mixed Hodge modules, as we do for perverse sheaves:

194
Proposition 90. (i) Let \( S \in \text{AnSm}(\mathbb{C}) \). Let \( D = V(s) \subset S \) a (Cartier) divisor, where \( s \in \Gamma(S,L) \) is a section of the line bundle \( L = L_D \) associated to \( D \). We then have the zero section embedding \( i : S \hookrightarrow L \). We denote \( L_0 = i(S) \) and \( j : L^0 := L \setminus L_0 \hookrightarrow L \) the open complementary subset. We denote by \( MHW(S) \) the category whose set of objects consists of
\[
\{(\mathcal{M},N,a,b),\mathcal{M} \in MHW(S)\} \quad \text{where} \quad MHW(S) \subset MHW(D)\]

where \( MHW(S) \) is the full subcategory of extendable objects, i.e. (bi)filtered \( D_S \) module which are specializable along \( D \). The functor (see definition [71])
\[
(j^*,\phi_{D_1},c,v) : MHW(S) \to MHW(S) \times_j MHW(D),
((M,F,W),(K,W),\alpha) \mapsto ((j^*(M,F,W),j^*(K,W),j^*\alpha),\phi_{D_1}((M,F,W),(K,W),\alpha),\text{can},\text{var})
\]
is an equivalence of category.

(ii) Let \( S \in \text{SmVar}(\mathbb{C}) \). Let \( D = V(s) \subset S \) a (Cartier) divisor, where \( s \in \Gamma(S,L) \) is a section of the line bundle \( L = L_D \) associated to \( D \). We then have the zero section embedding \( i : S \hookrightarrow L \). We denote \( L_0 = i(S) \) and \( j : L^0 := L \setminus L_0 \hookrightarrow L \) the open complementary subset. We denote by \( MHW(S) \) the category whose set of objects consists of
\[
\{(\mathcal{M},N,a,b),\mathcal{M} \in MHW(S)\} \quad \text{where} \quad MHW(S) \subset MHW(D)\]

The functor (see definition [71])
\[
(j^*,\phi_{D_1},c,v) : MHW(S) \to MHW(S) \times_j MHW(D),
((M,F,W),(K,W),\alpha) \mapsto ((j^*(M,F,W),j^*(K,W),j^*\alpha),\phi_{D_1}((M,F,W),(K,W),\alpha),\text{can},\text{var})
\]
is an equivalence of category.

Proof. See [27].

Let \( S \in \text{Var}(\mathbb{C}) \) or \( S \in \text{AnSp}(\mathbb{C}) \).

- If \( S \in \text{Var}(\mathbb{C}) \), let \( S = \bigcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \), with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \), and let \( S = \bigcup_{i=1}^l S_{i'} \) an other open cover such that there exist closed embeddings \( i_i' : S_{i'} \hookrightarrow \tilde{S}_{i'} \), with \( \tilde{S}_{i'} \in \text{SmVar}(\mathbb{C}) \).

- If \( S \in \text{AnSp}(\mathbb{C}) \), let \( S = \bigcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \), with \( \tilde{S}_i \in \text{AnSm}(\mathbb{C}) \), and let \( S = \bigcup_{i=1}^l S_{i'} \) an other open cover such that there exist closed embeddings \( i_i' : S_{i'} \hookrightarrow \tilde{S}_{i'} \), with \( \tilde{S}_{i'} \in \text{AnSm}(\mathbb{C}) \).

Denote \( L = [1,\ldots,l] \), \( L' = [1,\ldots,l'] \) and \( L'' := [1,\ldots,l] \cup [1,\ldots,l'] \). We then have the refined open cover \( S = \bigcup_{k \in L} S_k \) and we define for \( I \sqcup I' \subset L'' \), \( s_{I,I'} := \bigcap_{k \in I \sqcup I'} S_k \), so that we have a closed embedding \( i_{I,I'} : S_{I,I'} \hookrightarrow \tilde{S}_{I,I'} \). Consider \( \pi_S^l(MHM(S)) \subset \text{PSh}_{DFU}(S/(S_I)) \), \( \pi_{I'}^l(MHM(S)) \subset \text{PSh}_{DFU}(S/(S_{I'})) \), for \( I \sqcup I' \subset J \sqcup J' \), denote by \( p_{I,I'}: \tilde{S}_{J,I'} \to \tilde{S}_{I,I'} \) the projection. We then have a natural transfer map
\[
T_{S/L''}^l : \pi_S^l(MHM(S)) \to \pi_{I'}^l(MHM(S)),
((M,F,W),s_{I,J}) \mapsto (\lim_{I \sqcup J} p_{I,J}^{*,(I,J)*}, (\text{Gr}_V_{I,I'}^l \times_{\text{Gr}_V_{J,J'}^l} (M_I,F), s_{I,J}^r),
\]
with, in the homotopy limit, the natural transition morphisms
\[
p_{I,J}^*(\text{Gr}_V_{I,I'}^l \times_{\text{Gr}_V_{J,J'}^l} (M_I,F)) \to p_{I,J}^*(\text{Gr}_V_{I,I'}^l \times_{\text{Gr}_V_{J,J'}^l} (M_I,F))
\]
\[
\text{ad}(p_{I,J}^{*,(I,J)*}, p_{I,J}^*) \cdot (p_{I,J}^{*,(I,J)*}, p_{I,J}^*) \cdot (\text{Gr}_V_{I,I'}^l \times_{\text{Gr}_V_{J,J'}^l} (M_I,F))
\]
195
for $J \subset I$, and

$$s_{I,J} : \varprojlim_{I \in L} m^* p_{I,J}^*(\Gr_{V_{I,J}}) \to \varprojlim_{I \in L} p_{I,J}^*(\Gr_{V_{I,J}})$$

Proposition 91. (i) Let $S \subset \text{Var}(\mathbb{C})$ and let $S = \bigcup_i S_i$ an open cover such that there exist closed embeddings $i_i S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. Then $\pi_S(MHM(S) \subset \text{PSh}_{\mathcal{D}_{(2)fil}}(S/(\tilde{S}_i))$ does not depend on the open covering of $S$ and the closed embeddings. More precisely, let $S = \bigcup_{i=1}^{t} S_i$ an other open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. Then,

$$T^L_{S} : \pi^L_S(MHM(S)) \to \pi^L_S(MHM(S))$$

is an equivalence of category with inverse is $T^L_{S} : \pi^L_S(MHM(S)) \to \pi^L_S(MHM(S))$.

(ii) Let $S \in \text{AnSp}(\mathbb{C})$ and let $S = \bigcup_i S_i$ an open cover such that there exist closed embeddings $i_i S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{AnSm}(\mathbb{C})$. Then $\pi_S(MHM(S) \subset \text{PSh}_{\mathcal{D}_{(2)fil}}(S/(\tilde{S}_i))$ does not depend on the open covering of $S$ and the closed embeddings. More precisely, let $S = \bigcup_{i=1}^{t} S_i$ an other open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{AnSm}(\mathbb{C})$. Then,

$$T^L_{S} : \pi^L_S(MHM(S)) \to \pi^L_S(MHM(S))$$

is an equivalence of category with inverse is $T^L_{S} : \pi^L_S(MHM(S)) \to \pi^L_S(MHM(S))$.

Proof. Follows from proposition [30] see [27].

The main results of Saito, which implies in the algebraic case the six functor formalism on $DMHM(-)$ are the followings

Theorem 25. Let $S \subset \text{Var}(\mathbb{C})$. The category of mixed Hodge modules is the full subcategory

$$\iota : MHM(S) \hookrightarrow MHW(S) \to \text{PSh}_{\mathcal{D}_{(1,0)fil, rh}}(S) \times I \text{P}_{fil}(S^{an})$$

consisting of objects

$$((M, F, W), (K, W), \alpha) = (((M_1, F, W), u_{I,J}), (K, W), \alpha) \in \text{PSh}_{\mathcal{D}_{(1,0)fil, rh}}(S) \times I \text{P}_{fil}(S^{an})$$

such that $((M, F, W)^{an}, (K, W), \alpha) := (((M_1^{an}, F, W), u_{I,J}), (K, W), \alpha) \in MHM(S^{an})$.

Proof. Follows from GAGA and the extendability in the algebraic case (proposition [30]).

Definition 93. Let $S \subset \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$. We denote by $VHM(HS(S) \subset \text{PSh}_{\mathcal{D}_{(1,0)fil, rh}}(S) \times I \text{P}_{fil}(S^{an})$ the full subcategory consisting of variation of mixed Hodge structure, whose objects consist of

$$(((L, W) \otimes O_S, F), (L, W), \alpha) \subset \text{PSh}_{\mathcal{D}_{(1,0)fil, rh}}(S) \times I \text{P}_{fil}(S^{an})$$

with

- $L_S \in \text{PSh}(S^{an})$ a local system,
- the $D_S$ module structure on $(L_S, W) \otimes O_S$ is given by the flat connection associated to the local system $L_S$,
- $F^p(W^q L_S \otimes O_S) \subset (W^q L_S \otimes O_S)$ are locally free $O_S$ subbundle satisfying Griffiths transversality for the $D_S$ module structure (i.e. for the flat connection).

196
• \( \alpha : (L_S, W) \to DR(S)^{\perp}((L_S, W) \otimes O_S) \) is the isomorphism given by theorem [23].

**Theorem 26.** Let \( S \in \text{SmVar}(\mathbb{C}) \) or \( S \in \text{AnSm}(\mathbb{C}) \).

(i) A variation of mixed Hodge structure \(((L_S, W) \otimes O_S, F), (L_S, W), \alpha) \in \text{VMHS}(S) \) (see definition [23]) is a mixed module. That is \( \text{VMHS}(S) \subset \text{MHM}(S) \).

(ii) For \(((M, F, W), (K, W), \alpha) \in \text{MHM}(S) \) a mixed Hodge module, there exist an open subset \( j : S^o \to S \), such that \( j^*((M, F, W), (K, W), \alpha) := (j^*(M, F, W), j^*(K, W), j^*\alpha) \in \text{VMHS}(S^o) \). That is a mixed Hodge module is generically a variation of mixed Hodge structure.

**Proof.** See [27]. \( \square \)

**Theorem 27.** (i) Let \( f : X \to S \) a projective morphism with \( X, S \in \text{AnSp}(\mathbb{C}) \), where projective means that there exist a factorization \( f : X \xrightarrow{1} \mathbb{P}^N \times S \xrightarrow{p_S} S \) with \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \bigcup_{i=1}^s S_i \) an open cover such that there exits closed embeddings \( i_i : S_i \hookrightarrow S \) with \( \tilde{S}_i \in \text{AnSm}(\mathbb{C}) \). For \( I \subset \{1, \ldots, s\} \), recall that we denote \( S_I := \cap_{i \in I} S_i \) and \( X_I := f^{-1}(S_I) \). We have then the following commutative diagram

\[
\begin{array}{ccc}
X_I & \xrightarrow{ij_I} & \mathbb{P}^N \times \tilde{S}_I \\
\downarrow j'_I & & \downarrow \tilde{p}_S \\
X_J & \xrightarrow{ij_J} & \mathbb{P}^N \times \tilde{S}_J
\end{array}
\]

whose right square is cartesian (see section 5). Then, for

\[
((M, F, W), (K, W), \alpha) = (((M_I, F, W), u_{IJ}), (K, W), \alpha) \in \text{MHM}(X),
\]

where \(((M_I, F, W), u_{IJ}) \in C_{D2\text{fil}}(X_I/(\mathbb{P}^N \times \tilde{S}_I)) \), \( (K, W) \in C_{\text{fil}}(X) \), we have for all \( n \in \mathbb{Z} \),

\[
(H^n \int_f^{\text{FDR}} ((M_I, F, W), u_{IJ}), R^n f_*(K, W), H^n f_*(\alpha)) \in \text{MHM}(S)
\]

(ii) Let \( f : X \to S \) a projective morphism with \( X, S \in \text{Var}(\mathbb{C}) \), where projective means that there exist a factorization \( f : X \xrightarrow{1} \mathbb{P}^N \times S \xrightarrow{p_S} S \) with \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \bigcup_{i=1}^s S_i \) an open cover such that there exits closed embeddings \( i_i : S_i \hookrightarrow S \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). For \( I \subset \{1, \ldots, s\} \), recall that we denote \( S_I := \cap_{i \in I} S_i \) and \( X_I := f^{-1}(S_I) \). We have then the following commutative diagram

\[
\begin{array}{ccc}
X_I & \xrightarrow{ij_I} & \mathbb{P}^N \times \tilde{S}_I \\
\downarrow j'_I & & \downarrow \tilde{p}_S \\
X_J & \xrightarrow{ij_J} & \mathbb{P}^N \times \tilde{S}_J
\end{array}
\]

whose right square is cartesian (see section 5). Then, for

\[
((M, F, W), (K, W), \alpha) = (((M_I, F, W), u_{IJ}), (K, W), \alpha) \in D(\text{MHM}(X)),
\]

where \(((M_I, F, W), u_{IJ}) \in C_{D2\text{fil}}(X_I/(\mathbb{P}^N \times \tilde{S}_I)) \), \( (K, W) \in C_{\text{fil}}(X^{an}) \), we have

\[
H^n(\int_f^{\text{FDR}} ((M_I, F, W), u_{IJ}), Rf_*(K, W), f_*(\alpha)) \in \text{MHM}(S)
\]

for all \( n \in \mathbb{Z} \).
Proof. (i): See [27].

(ii): By (i) \( (H^n f_\ast ((M, F, W)^{an}), R^n f_\ast (K, W), H^n f_\ast (\alpha)) \in M\text{HM}(S^{an}) \) for all \( n \in \mathbb{Z} \). On the other hand, \( T^P(an, f)(M, F, W) : (\int f_\ast ((M, F, W)^{an}) \xrightarrow{\sim} \int ((M, F, W)^{an}) \) is an isomorphism since \( f \) is proper by theorem GAGA for mixed hodge modules : see [27]. \( \square \)

**Theorem 28.** (i) Let \( S \in \text{AnSp}(\mathbb{C}) \). Let \( Y \in \text{AnSm}(\mathbb{C}) \) and \( p_S : Y \times S \to S \) the projection. Let \( S = \cup_{i=1}^s S_i \) an open cover such that there exits closed embeddings \( i_I : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{AnSm}(\mathbb{C}) \). For \( I \subseteq [1, \ldots, s] \), recall that we denote \( S_I := \cap_{i \in I} S_i \). We have then the following commutative diagram

\[
\begin{array}{c}
Y \times \tilde{S}_I \\
p_{I,J} \downarrow \\
Y \times \tilde{S}_J
\end{array}
\]

which is cartesian (see section 5). Then, for

\[
((M, F, W), (K, W), \alpha) = ((M_{ij}, F, W), u_{IJ}), (K, W), \alpha) \in \text{M\text{HM}}(S),
\]

where \((M_{IJ}, F, W), u_{IJ}) \in C_{D2\text{fil}} (S_I/(\tilde{S}_I)), (K, W) \in C_{\text{fil}} (S),

\[
-
(p_{\text{mod}[-]}^s (M, F, W), p_{\text{mod}[-]}^s (K, W), p_{\text{mod}[-]}^s (\alpha)) := ((p_{\text{mod}[-]}^s (M_I, F, W), p_{\text{mod}[-]}^s (K, W), p_{\text{mod}[-]}^s (\alpha)) \in M\text{HM}(S).
\]

(ii) Let \( S \in \text{Var}(\mathbb{C}) \). Let \( Y \in \text{SmVar}(\mathbb{C}) \) and \( p_S : Y \times S \to S \) the projection. Let \( S = \cup_{i=1}^s S_i \) an open cover such that there exits closed embeddings \( i_I : S_I \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). For \( I \subseteq [1, \ldots, s] \), recall that we denote \( S_I := \cap_{i \in I} S_i \). We have then the following commutative diagram

\[
\begin{array}{c}
Y \times \tilde{S}_I \\
p_{I,J} \downarrow \\
Y \times \tilde{S}_J
\end{array}
\]

which is cartesian (see section 5). Then, for

\[
((M, F, W), (K, W), \alpha) = ((M_{ij}, F, W), u_{IJ}), (K, W), \alpha) \in D(M\text{HM}(S))
\]

where \((M_{IJ}, F, W), u_{IJ}) \in C_{D2\text{fil}} (S_I/(\tilde{S}_I)), (K, W) \in C_{\text{fil}} (S^{an}), we have

\[
-
(p_{\text{mod}[-]}^s (M, F, W), (K, W), \alpha) := ((p_{\text{mod}[-]}^s (M_I, F, W), p_{\text{mod}[-]}^s (K, W), p_{\text{mod}[-]}^s (\alpha)) \in D(M\text{HM}(S)).
\]

Proof. (i): See [27].

(ii): Follows immediately from (i) since \((p_{\text{mod}[-]}^s (M_I, F, W))^{an} = p_{\text{mod}[-]}^s ((M_I, F, W)^{an}) \).

We have, by the results of Saito, the following key definition.

198
Definition 94. (i) Let $S \in \text{SmVar}(\mathbb{C})$ or $S \in \text{AnSm}(\mathbb{C})$. Let $D = V(s) \subset S$ a divisor with $s \in \Gamma(S, L)$ and $L$ a line bundle ($S$ being smooth, $D$ is Cartier). Denote by $j : S^o := S \setminus D \to S$ the open complementary embedding. Let $(M, F, W) \in \pi_S(MHW(S^o))$. Assume that $(M, F, W)$ is specializable along $D$, that is the $V_S$-filtration exists (see proposition 90 for the uniqueness of a $V_S$-filtration). Then, by proposition 90

- there exist
  \[ j^s_{*Hdg}(M, F, W) := (j^s, \phi_{D1}, c, v)^{-1}((M, F, W), \psi_{D1}(M, F, W)(-1)) \in \pi_S(MHM(S)) \]
  unique such that $j^*j^s_{*Hdg}(M, F, W) = (M, F, W)$ and $DR(S)(j^s_{*Hdg}(M, F, W)) = j_*DR(S^o)(M, W)$,
  - there exist
  \[ j^i_{*Hdg}(M, F, W) := (j^i, \phi_{D1}, c, v)^{-1}((M, F, W), \psi_{D1}(M, F, W)) \in \pi_S(MHM(S)) \]
  unique such that $j^*j^i_{*Hdg}(M, F, W) = (M, F, W)$ and $DR(S)(j^i_{*Hdg}(M, F, W)) = j_*DR(S^o)(M, W)$.

Moreover for $(M', F, W) \in \pi_S(MHM(S))$, by proposition 90

- there is a canonical map $\text{ad}(j^*, j^s_{*Hdg})(M', F, W) : (M', F, W) \to j^s_{*Hdg}j^*(M', F, W)$ in $\pi_S(MHM(S))$,
- there is a canonical map $\text{ad}(j^i_{*Hdg}, j^*)((M', F, W) : j^i_{*Hdg}j^*(M', F, W) \to (M', F, W)$ in $\pi_S(MHM(S))$.

(ii) Let $S \in \text{SmVar}(\mathbb{C})$. Let $Z = V(\mathcal{I}) \subset S$ an arbitrary closed subset, $\mathcal{I} \subset O_S$ being an ideal subsheaf. Taking generators $\mathcal{I} = (s_1, \ldots, s_r)$, we get $Z = V(s_1, \ldots, s_r) = \cap_{i=1}^r Z_i \subset S$ with $Z_i = V(s_i) \subset S$. $s_i \in \Gamma(S, L_i)$ and $L_i$ a line bundle. Note that $Z$ is an arbitrary closed subset, $d_Z \geq d_X - r$ needing not be a complete intersection. Denote by $j : S^o := S \setminus Z \to S$, $j_I : S^o \setminus \mathcal{I} : \cup_{i \in I}(S^o \setminus Z_i) \overset{j_I} \to S$ the open complementary embeddings, where $I \subset \{1, \ldots, r\}$. For $(M, F, W) \in \pi_S(C(MHM(S^o)))$, we define by (i)

- the (bi)-filtered complex of $D_S$-modules
  \[ j^s_{*Hdg}(M, F, W) := \lim_{\{(z_i)_{i \in [1, \ldots, r]} : z_i \in S, (\cap_i z_i = z) \}} \text{Tot} \text{card} d_{\mathcal{I}}(j^s_{*Hdg}(M, F, W)) \in \pi_S(C(MHM(S))), \]
  where the horizontal differential are given by, if $I \subset J$, $d_{IJ} := \text{ad}(j^s_{*Hdg}, j^i_{*Hdg})(j^s_{*Hdg}(M, F, W))$,
  $j_{IJ} : S^o \to S^o$ being the open embedding, and $d_{IJ} = 0$ if $I \notin J$,
  - the (bi)-filtered complex of $D_S$-modules
  \[ j^i_{*Hdg}(M, F, W) := \lim_{\{(z_i)_{i \in [1, \ldots, r]} : z_i \in S, (\cap_i z_i = z) \}} \text{Tot} \text{card} d_{\mathcal{I}}(j^i_{*Hdg}(M, F, W)) \in \pi_S(C(MHM(S))), \]
  where the horizontal differential are given by, if $I \subset J$, $d_{IJ} := \text{ad}(j^i_{*Hdg}, j^j_{*Hdg})(j^i_{*Hdg}(M, F, W))$,
  $j_{IJ} : S^o \to S^o$ being the open embedding, and $d_{IJ} = 0$ if $I \notin J$.

By definition, we have for $(M, F, W) \in \pi_S(C(MHM(S^o)))$, $j^*j^s_{*Hdg}(M, F, W) = (M, F, W)$ and $j^*j^i_{*Hdg}(M, F, W) = (M, F, W)$. For $(M', F, W) \in \pi_S(C(MHM(S)))$, there is, by construction,

- a canonical map $\text{ad}(j^*, j^s_{*Hdg})(M', F, W) : (M', F, W) \to j^s_{*Hdg}j^*(M', F, W)$,
- a canonical map $\text{ad}(j^i_{*Hdg}, j^*)(M', F, W) : j^i_{*Hdg}j^*(M', F, W) \to (M', F, W)$.

For $(M, F, W) \in \pi_S(C(MHM(S^o)))$,

- we have the canonical map in $C_{D(1,0)\mu}(S)$
  \[ T(j^s_{*Hdg}, j_*)((M, F, W) := k \circ \text{ad}(j^*, j_*)(j^s_{*Hdg}(M, F, W)) : j^s_{*Hdg}(M, F, W) \to j_*E(M, F, W), \]

199
– we have the canonical map in $C_{D(1,0)}^\text{fil}(S)$
\[
\]
the canonical maps.

**Remark 9.** Let $j : S^o \to S$ an open embedding, with $S \in \text{SmVar}(\mathbb{C})$. Then, for $((M,F,W), (K,W), \alpha) \in M\text{HM}(S^o)$,

- the map $T(j_!,j^!_{Hdg})(M,W) : j_!(M,W) \to j^!_{Hdg} (M,W)$ in $C_{D\text{H}\text{M}}(S)$ is a filtered quasi-isomorphism
  (apply the functor $\text{DR}^{\text{Hdag}}(S^o)$ and use theorem 94 and theorem 96).

- the map $T(j^!_{Hdg},j_*)(M,W) : j^!_{Hdg} (M,W) \to j_* E(M,W)$ in $C_{D\text{H}\text{M}}(S)$ is a filtered quasi-isomorphism
  (apply the functor $\text{DR}^{\text{Hdag}}(S^o)$ and use theorem 94 and theorem 96).

Hence, for $((M,F,W), (K,W), \alpha) \in M\text{HM}(S^o)$,

- we get, for all $p, n \in \mathbb{N}$, monomorphisms
  \[
  F^p H^n T(j_!,j^!_{Hdg})(M,F,W) : F^p H^n j_!(M,F,W) \hookrightarrow F^p H^n j^!_{Hdg} (M,F,W)
  \]
in $\text{PSh}_D(S)$, but $F^p H^n j_!(M,F,W) \neq F^p H^n j^!_{Hdg} (M,F,W)$ in general (it leads to different F-filtrations).

- we get, for all $p, n \in \mathbb{N}$, monomorphisms
  \[
  T(j^!_{Hdg},j_*)(M,F,W) : F^p H^n j^!_{Hdg} (M,F,W) \to F^p H^n j_* E(M,F,W)
  \]
in $\text{PSh}_D(S)$, but $F^p H^n j^!_{Hdg} (M,F,W) \neq F^p H^n j_* E(M,F,W)$ in general (it leads to different F-filtrations).

**Definition 95.** Let $f : X \to S$ a morphism with $X, S \in \text{SmVar}(\mathbb{C})$. Consider a compactification $f : X \xrightarrow{j} \bar{X} \xrightarrow{i} S$ of $f$, in particular $j$ is an open embedding and $i$ is proper.

(i) For $(M,F,W) \in \pi_X(C(M\text{HM}(X)))$, we define, using definition 74
\[
\int^!_{f^!} (M,F,W) := \int^!_{f^!} j^!_{Hdg} (M,F,W) \in D_{D(1,0)}^\text{fil,\infty}(S)
\]
It does not depend on the choice of the compactification by the unicity of proposition 96. By theorem 24, for $(M,F,W) \in \pi_X(C(M\text{HM}(X)))$, $H^i \int^!_{f^!} (M,F,W) \in \pi_S(C(M\text{HM}(S)))$ for all $i \in \mathbb{Z}$. Note that $H^i \int^!_{f^!} (M,F,W) = 0$ for all $i < 0$ if $(M,F,W) \in \pi_X(M\text{HM}(X))$. We then set

\[ - \text{ for } (M,F,W) \in \pi_X(M\text{HM}(X)), \quad f^!_{Hdg} (M,F,W) := H^0 \int^!_{f^!} (M,F,W) \in \pi_S(M\text{HM}(S)), \]
\[ - \text{ for } (M,F,W) \in \pi_X(M\text{HM}(X)), \quad f^!_{Hdg} I (M,F,W) \in \pi_S(D(M\text{HM}(S))) \text{ where } k : (M,F,W) \to I(M,F,W) \text{ is the image by } \pi_S \text{ of an injective resolution in } M\text{HM}(S). \]

(ii) For $(M,F,W) \in \pi_X(C(M\text{HM}(X)))$, we define, using definition 74
\[
\int^!_{f^!} (M,F,W) := \int^!_{f^!} j^!_{Hdg} (M,F,W) \in D_{D(1,0)}^\text{fil,\infty}(S)
\]
It does not depend on the choice of the compactification by the unicity of proposition 96. By theorem 24, for $(M,F,W) \in \pi_X(C(M\text{HM}(X)))$, $H^i \int^!_{f^!} (M,F,W) \in \pi_S(C(M\text{HM}(S)))$ for all $i \in \mathbb{Z}$. Note that $H^i \int^!_{f^!} (M,F,W) = 0$ for all $i < 0$ if $(M,F,W) \in \pi_X(M\text{HM}(X))$. We then set
Proposition 92. Let $f_1 : X \to Y$ and $f_2 : Y \to S$ two morphism with $X, Y, S \in \text{SmVar}(\mathbb{C})$.

(i) Let $(M, F, W) \in \pi_X(C(MHM(X)))$. Then,
\[
R(f_2 \circ f_1)_*^{Hdg}(M, F) = Rf_{2*}^{Hdg} Rf_{1*}^{Hdg}(M, F) \in \pi_S(D(MHM(S))).
\]
Proposition 90.

(ii) Let $(M, F, W) \in \pi_S(C(MHM(S)))$. Then,
\[
R(f_2 \circ f_1)_*^{Hdg}(M, F) = Rf_{2*}^{Hdg} Rf_{1*}^{Hdg}(M, F) \in \pi_S(D(MHM(S))).
\]

Proof. (i): Follows from the unicity of the functor $j_!^{Hdg}$ by proposition 90.

(ii): Follows from the unicity of the functor $j_!^{Hdg}$ by proposition 90.

We make the following key definition

Definition 96. Let $S \in \text{SmVar}(\mathbb{C})$. Let $Z \subseteq S$ a closed subset. Denote by $j : S \setminus Z \hookrightarrow S$ the complementary open embedding.

(i) We define using definition 94 the filtered Hodge support section functor
\[
\Gamma_Z^{Hdg} : \pi_S(C(MHM(S)) \to \pi_S(C(MHM(S)), \quad (M, F, W) \mapsto \Gamma_Z^{Hdg}(M, F, W) := \text{Cone}(\text{ad}(j_!^{Hdg}, j^*))(M, F, W) \in \pi_S(D(MHM(S))),
\]

where $\pi_S(C(MHM(S))$ is the image by $\pi_S$ of an injective resolution in $\text{MHM}(S)$. Together we the canonical map $\gamma_Z^{Hdg}(M, F, W) : \Gamma_Z^{Hdg}(M, F, W) \to (M, F, W)$. We then have the canonical map in $\text{C}_{\mathcal{D}(2,f)}(S)$
\[
T(\Gamma_Z^{Hdg}, \Gamma_Z)(M, F, W) := (I, T(j_!^{Hdg}, j^*)(M, F, W)) : \Gamma_Z^{Hdg}(M, F, W) \to \Gamma_Z E(M, F, W)
\]

unique up to homotopy such that $\gamma_Z^{Hdg}(M, F, W) = \gamma_Z(E(M, F, W)) \circ T(\Gamma_Z^{Hdg}, \Gamma_Z)(M, F, W)$.

(i') Since $j_!^{Hdg} : \pi_{S^o}(C(MHM(S^o)) \to \pi_S(C(MHM(S))$ is an exact functor, $\Gamma_Z^{Hdg}$ induces the functor
\[
\Gamma_Z^{Hdg} : \pi_S(D(MHM(S)) \to \pi_S(D(MHM(S)), \quad (M, F, W) \mapsto \Gamma_Z^{Hdg}(M, F, W)
\]

(ii) We define using definition 94 the dual filtered Hodge support section functor
\[
\Gamma_Z^{\vee,Hdg} : \pi_S(C(MHM(S)) \to \pi_S(C(MHM(S)), \quad (M, F, W) \mapsto \Gamma_Z^{\vee,Hdg}(M, F, W) := \text{Cone}(\text{ad}(j_!^{Hdg}, j^*))(M, F, W) \in \pi_S(D(MHM(S))),
\]

where $\pi_S(C(MHM(S))$ is the image by $\pi_S$ of an injective resolution in $\text{MHM}(S)$. Together we the canonical map $\gamma_Z^{\vee,Hdg}(M, F, W) : \Gamma_Z^{\vee,Hdg}(M, F, W) \to (M, F, W)$.

We then have the canonical map in $\text{C}_{\mathcal{D}(2,f)}(S)$
\[
T(\Gamma_Z^{\vee,h}, \Gamma_Z^{\vee,Hdg})(M, F, W) := (I, T(j_!^{Hdg}, j^*)(M, F, W)) : \Gamma_Z^{\vee,h}(M, F, W) \to \Gamma_Z^{\vee,Hdg}(M, F, W)
\]

unique up to homotopy such that $\gamma_Z^{\vee,Hdg}(M, F, W) = \gamma_Z^{\vee}(E(M, F, W)) \circ T(\Gamma_Z^{\vee,h}, \Gamma_Z^{\vee,Hdg})(M, F, W)$.

(ii') Since $j_!^{Hdg} : \pi_{S^o}(C(MHM(S^o)) \to \pi_S(C(MHM(S))$ is an exact functor, $\Gamma_Z^{Hdg,\vee}$ induces the functor
\[
\Gamma_Z^{\vee,Hdg} : \pi_S(D(MHM(S)) \to \pi_S(D(MHM(S)), \quad (M, F, W) \mapsto \Gamma_Z^{\vee,Hdg}(M, F, W)
\]
We now give the definition of the filtered Hodge inverse image functor:

**Definition 97.**

(i) Let $i : Z \hookrightarrow S$ be a closed embedding, with $Z, S \in \text{SmVar}(\mathbb{C})$. Then, for $(M, F, W) \in \pi_S(C(MHM(S)))$, we set

$$i^{\text{mod}}_{\text{Hdg}}(M, F, W) := i^* S^{-1} \Gamma_Z^{\text{Hdg}}(M, F, W) \in \pi_Z(D(MHM(Z)))$$

and

$$j^{\text{mod}}_{\text{Hdg}}(M, F, W) := j^* S^{-1} \Gamma_Z^{\text{Hdg}}(M, F, W) \in \pi_Z(D(MHM(Z)))$$

using the fact that $S_Z : \pi_Z(D(MHM(Z)) \rightarrow \pi_S(D(MHM_Z(S)))$ is an equivalence of category since $S_Z : D(MHM_Z(S)) \rightarrow D(MHM_Z(S))$ is an equivalence of category by [27].

(ii) Let $f : X \rightarrow S$ be a morphism, with $X, S \in \text{SmVar}(\mathbb{C})$. Consider the factorization $f : X \xrightarrow{i} X \times S \xrightarrow{p_S} S$, where $i$ is the graph embedding and $p_S : X \times S \rightarrow S$ is the projection.

- For $(M, F, W) \in \pi_S(C(MHM(S)))$ we set
  
  $$f^{\text{mod}}_{\text{Hdg}}(M, F, W) := i^{\text{mod}}_{\text{Hdg}} p_S^{\text{mod}[\cdot]}(M, F, W)(d_X)[2d_X] \in \pi_X(D(MHM(X)))$$

- For $(M, F, W) \in \pi_S(C(MHM(S)))$ we set
  
  $$f^{\text{mod}}_{\text{Hdg}}(M, F, W) := j^{\text{mod}}_{\text{Hdg}} p_S^{\text{mod}[\cdot]}(M, F, W) \in \pi_S(D(MHM(S)))$$

If $j : S' \hookrightarrow S$ is a closed embedding, we have (see [27]), for $(M, F, W) \in \pi_S(C(MHM(S)))$,

$$j^{\text{mod}}_{\text{Hdg}}(M, F, W) = j^{\text{mod}}_{\text{Hdg}}(M, F, W) = j^*(M, F, W) \in \pi_{S'\text{-mod}}(D(MHM(S')))$$

(iii) Let $f : X \rightarrow S$ be a morphism, with $X, S \in \text{SmVar}(\mathbb{C})$ or $X, S \in \text{AnSm}(\mathbb{C})$. Consider the factorization $f : X \xrightarrow{i} X \times S \xrightarrow{p_S} S$, where $i$ is the graph embedding and $p_S : X \times S \rightarrow S$ is the projection.

- For $(M, F, W) \in \pi_S(C(MHM(S)))$ we set
  
  $$f^{\text{mod}}_{\text{Hdg}}(M, F, W) := \Gamma_X^{\text{Hdg}} p_S^{\text{mod}[\cdot]}(M, F, W)(d_X)[2d_X] \in \pi_X \times S(C(MHM(X \times S)))$$

We have for $(M, F, W) \in \pi_S(C(MHM(S)))$, the canonical map in $C_{D(1,0)fil}(X \times S)$

$$T(f^{\text{mod}}_{\text{Hdg}}, f^{\text{mod}}_{\text{Hdg}})(M, F, W) : f^{\text{mod}}_{\text{Hdg}} p_S^{\text{mod}[\cdot]}(M, F, W) := \Gamma_X^{\text{Hdg}} p_S^{\text{mod}[\cdot]}(M, F, W)$$

$$\xrightarrow{T(\Gamma_X^{\text{Hdg}}, p_S^{\text{mod}[\cdot]})(\gamma)} \Gamma_X E(p_S^{\text{mod}[\cdot]}(M, F, W)) =: f^{\text{mod}}_{\text{Hdg}} p_S^{\text{mod}[\cdot]}(M, F, W)$$

- For $(M, F, W) \in \pi_S(C(MHM(S)))$ we set
  
  $$f^{\text{mod}}_{\text{Hdg}}(M, F, W) := \Gamma_X^{\text{Hdg}} p_S^{\text{mod}[\cdot]}(M, F, W) \in \pi_X \times S(C(MHM(X \times S)))$$

We have for $(M, F, W) \in \pi_S(C(MHM(S)))$, the canonical map in $C_{D(1,0)fil}(X \times S)$

$$T(f^{\text{mod}}_{\text{Hdg}}, f^{\text{mod}}_{\text{Hdg}})(M, F, W) : f^{\text{mod}}_{\text{Hdg}} p_S^{\text{mod}[\cdot]}(M, F, W) := \Gamma_X^{\text{Hdg}} p_S^{\text{mod}[\cdot]}(M, F, W)$$

$$\xrightarrow{T(\Gamma_X^{\text{Hdg}}, p_S^{\text{mod}[\cdot]})(\gamma)} \Gamma_X E(p_S^{\text{mod}[\cdot]}(M, F, W)) =: f^{\text{mod}}_{\text{Hdg}} p_S^{\text{mod}[\cdot]}(M, F, W)$$

**Proposition 93.** Let $f_1 : X \rightarrow Y$ and $f_2 : Y \rightarrow S$ two morphism with $X, Y, S \in \text{SmVar}(\mathbb{C})$.

(i) Let $(M, F, W) \in \pi_S(C(MHM(S)))$. Then,

$$(f_2 \circ f_1)^{\text{mod}}_{\text{Hdg}} (M, F) = f^{\text{mod}}_{\text{Hdg}} f^{\text{mod}}_{\text{Hdg}} (M, F) \in \pi_X(D(MHM(X))).$$

202
(ii) Let \((M, F, W) \in \pi_S(C(MHM(S)))\). Then,

\[(f_2 \circ f_1)_{Hdg}^\sim(M, F) = f_{1Hdg}^\sim f_{2Hdg}^\sim(M, F) \in \pi_X(D(MHM(X)))\]

Proof. (i): Follows from the unicity of the functor \(j_{Hdg}^\sim\).

(ii): Follows from the unicity of the functor \(j_{Hdg}^\sim\).

Definition-Proposition 20. (i) Let \(g : S' \to S\) a morphism with \(S', S \in \text{SmVar}(\mathbb{C})\) and \(i : Z \hookrightarrow S\) a closed subset. Then, for \((M, F, W) \in \pi_S(C(MHM(S)))\), there is a canonical map in \(\pi_S(C(MHM(S' \times S)))\)

\[T_{Hdg}^\sim(g, \gamma)(M, F, W) : g_{Hdg}^\sim \Gamma_{Z \times Z'}^Hdg(M, F, W) \to \Gamma_{Z \times Z'}^Hdg(g, \gamma)(M, F, W)\]

unique up to homotopy such that

\[\gamma_{Z \times Z'}^{Hdg}(g_{Hdg}^\sim \Gamma_{Z \times Z'}^Hdg(M, F, W)) \circ T_{Hdg}^\sim(g, \gamma)(M, F, W) = g_{Hdg}^\sim \Gamma_{Z \times Z'}^Hdg(M, F, W).\]

(i)' Let \(g : S' \to S\) a morphism with \(S', S \in \text{SmVar}(\mathbb{C})\) and \(i : Z \hookrightarrow S\) a closed subset. Then, for \((M, F, W) \in \pi_S(C(MHM(S)))\), there is a canonical isomorphism in \(\pi_S(C(MHM(S' \times S)))\)

\[T_{Hdg}^\sim(g, \gamma)(M, F, W) : g_{Hdg}^\sim \Gamma_{Z \times Z'}^Hdg(M, F, W) \cong g_{Hdg}^\sim \Gamma_{Z \times Z'}^Hdg(M, F, W)\]

unique up to homotopy such that

\[\gamma_{Z \times Z'}^{Hdg}(g_{Hdg}^\sim \Gamma_{Z \times Z'}^Hdg(M, F, W)) \circ T_{Hdg}^\sim(g, \gamma)(M, F, W) = T_{Hdg}^\sim(g, \gamma)(M, F, W).\]

(ii) Let \(S \in \text{SmVar}(\mathbb{C})\) and \(i_1 : Z_1 \hookrightarrow S, i_2 : Z_2 \hookrightarrow Z_1\) be closed embeddings. Then, for \((M, F, W) \in \pi_S(C(MHM(S)))\),

- there is a canonical map \(T(Z_2/Z_1, \gamma_{Hdg})(M, F, W) : \Gamma_{Z_2}^{Hdg}(M, F, W) \to \Gamma_{Z_1}^{Hdg}(M, F, W)\)

in \(\pi_S(C(MHM(S)))\) unique up to homotopy such that

\[\gamma_{Z_2}^{Hdg}(G, F) \circ T(Z_2/Z_1, \gamma_{Hdg})(G, F) = \gamma_{Z_1}^{Hdg}(G, F)\]

together with a distinguish triangle in \(K(\pi_S(C(MHM(S)))\))

\[\Gamma_{Z_2}^{Hdg}(M, F, W) \xrightarrow{T(Z_2/Z_1, \gamma_{Hdg})(M, F, W)} \Gamma_{Z_1}^{Hdg}(M, F, W) \xrightarrow{\text{add}(j_{Z_2}^{Hdg})_{Z_1}^{Hdg}(G, F)} \Gamma_{Z_1 \setminus Z_2}^{Hdg}(G, F) \to \Gamma_{Z_2}^{Hdg}(G, F)[1]\]

- there is a canonical map \(T(Z_2/Z_1, \gamma_{Hdg})(M, F, W) : \Gamma_{Z_2}^{Hdg}(M, F, W) \to \Gamma_{Z_2}^{Hdg}(M, F, W)\)

in \(\pi_S(C(MHM(S)))\) unique up to homotopy such that

\[\gamma_{Z_2}^{Hdg}(M, F, W) = T(Z_2/Z_1, \gamma_{Hdg})(M, F, W) \circ \gamma_{Z_1}^{Hdg}(M, F, W).\]

together with a distinguish triangle in \(K(\pi_S(C(MHM(S)))\))

\[\Gamma_{Z_2}^{Hdg}(M, F, W) \xrightarrow{\text{add}(j_{Z_2}^{Hdg})_{Z_1}^{Hdg}(M, F, W)} \Gamma_{Z_2}^{Hdg}(M, F, W) \xrightarrow{T(Z_2/Z_1, \gamma_{Hdg})(M, F, W)} \Gamma_{Z_2}^{Hdg}(M, F, W) \to \Gamma_{Z_2}^{Hdg}(M, F, W)[1]\]

Proof. Follows from the projection case and the closed embedding case using the adjunction maps. □

We have by proposition \(\textbf{98}\) and proposition \(\textbf{92}\) the 2 functors on \(\text{SmVar}(\mathbb{C})\) :
• \( \pi(D(MHM(-))) : \text{SmVar}(\mathbb{C}) \to \pi(D(MHM(-))) \), \( S \mapsto \pi_S(D(MHM(S))) \), \( (f : T \to S) \mapsto \text{Rf}_{*}^{Hdg} \).

• \( \pi(D(MHM(-))) : \text{SmVar}(\mathbb{C}) \to \pi(D(MHM(-))) \), \( S \mapsto \pi_S(D(MHM(S))) \), \( (f : T \to S) \mapsto \text{Rf}_{*}^{Hdg} \).

• \( \pi(D(MHM(-))) : \text{SmVar}(\mathbb{C}) \to \pi(D(MHM(-))) \), \( S \mapsto \pi_S(D(MHM(S))) \), \( (f : T \to S) \mapsto \text{Rf}_{*}^{Hdg} \).

• \( \pi(D(MHM(-))) : \text{SmVar}(\mathbb{C}) \to \pi(D(MHM(-))) \), \( S \mapsto \pi_S(D(MHM(S))) \), \( (f : T \to S) \mapsto \text{Rf}_{*}^{Hdg} \).

The definitions 96 and 97 immediately extends to the non smooth case:

**Definition 98.** Let \( S \in \text{Var}(\mathbb{C}) \). Let \( Z \subset S \) a closed subset. Let \( S = \bigcup_{i} S_i \) an open cover such that there exist closed embeddings \( i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). Denote \( Z_t := Z \cap S_i \). Denote by \( j : S \setminus Z \hookrightarrow S \) and \( j : \tilde{S}_i \setminus Z_t \hookrightarrow \tilde{S}_i \) the complementary open embeddings.

**(i)** We define using definition 94 the filtered Hodge support section functor

\[
\Gamma_{Z}^{Hdg} : \pi(C(MHM(S))) \to \pi(C(MHM(S))), \quad ((M_{i}, F, W), u_{i,j}) \mapsto \Gamma_{Z}^{Hdg}((M_{i}, F, W), u_{i,j}) := \text{Cone}(\text{ad}(j_{!}^{*}, j_{*}^{Hdg})((M_{i}, F, W), u_{i,j}) : ((M_{i}, F, W), u_{i,j}) \to (\Gamma_{Z}^{Hdg}j_{*}^{*}(M_{i}, F, W), j_{!}(u_{i,j}))[-1],
\]

together with the canonical map \( \gamma_{Z}^{Hdg}((M_{i}, F, W), u_{i,j}) : \Gamma_{Z}^{Hdg}((M_{i}, F, W), u_{i,j}) \to ((M_{i}, F, W), u_{i,j}). \)

We then have the canonical map in \( C_{\mathbb{Z}(2)f_{d}(\tilde{S}_i)} \)

\[
T(\Gamma_{Z}^{Hdg}, \Gamma_{Z})(M_{i}, F, W, u_{i,j}) := (I, T(j_{!}^{Hdg}, j_{*}^{Hdg})(M_{i}, F, W)) : \Gamma_{Z}^{Hdg}((M_{i}, F, W), u_{i,j}) \to (\Gamma_{Z}E(M_{i}, F, W), \Gamma(u_{i,j}))
\]

unique up to homotopy such that

\[
\gamma_{Z}^{Hdg}((M_{i}, F, W), u_{i,j}) = (\gamma_{Z}(E(M_{i}, F, W))) \circ T(\Gamma_{Z}^{Hdg}, \Gamma_{Z})(M_{i}, F, W, u_{i,j}).
\]

**(i)** Since \( \gamma_{Z}^{Hdg} : \pi_{S_{i}}(C(MHM(\tilde{S}_i \setminus S_i))) \to \pi_{S_{i}}(C(MHM(\tilde{S}_i))) \) are exact functors, \( \Gamma_{Z}^{Hdg} \) induces the functor

\[
\Gamma_{Z}^{Hdg} : \pi_{S}(D(MHM(S))) \to \pi_{S}(D(MHM(S))), \quad ((M_{i}, F, W), u_{i,j}) \mapsto \Gamma_{Z}^{Hdg}((M_{i}, F, W), u_{i,j})
\]

**(ii)** We define using definition 94 the dual filtered Hodge support section functor

\[
\Gamma_{Z}^{\vee,Hdg} : \pi(C(MHM(S))) \to \pi(C(MHM(S))), \quad ((M_{i}, F, W), u_{i,j}) \mapsto \Gamma_{Z}^{\vee,Hdg}((M_{i}, F, W), u_{i,j}) := \text{Cone}(\text{ad}(j_{!}^{Hdg}, j_{*}^{*})((M_{i}, F, W), u_{i,j}) : \Gamma_{Z}^{\vee,Hdg}j_{*}^{*}(M_{i}, F, W, u_{i,j}) \to ((M_{i}, F, W), u_{i,j}))
\]

together we the canonical map \( \gamma_{Z}^{\vee,Hdg}((M_{i}, F, W), u_{i,j}) : ((M_{i}, F, W), u_{i,j}) \to \Gamma_{Z}^{\vee,Hdg}((M_{i}, F, W), u_{i,j}). \)

We then have the canonical map in \( C_{\mathbb{Z}(2)f_{d}(\tilde{S}_i)} \)

\[
T(\Gamma_{Z}^{\vee,h}, \Gamma_{Z}^{Hdg})(M_{i}, F, W, u_{i,j}) := (I, T(j_{!}^{Hdg}, j_{*}^{Hdg})(M_{i}, F, W, u_{i,j}) : (\Gamma_{Z}^{\vee,h}(M_{i}, F, W), \Gamma_{Z}^{\vee,h}(u_{i,j})) \to \Gamma_{Z}^{\vee,Hdg}((M_{i}, F, W), u_{i,j})
\]

unique up to homotopy such that

\[
\gamma_{Z}^{\vee,Hdg}((M_{i}, F, W), u_{i,j}) = T(\Gamma_{Z}^{\vee,h}, \Gamma_{Z}^{Hdg})(M_{i}, F, W, u_{i,j}) \circ \gamma_{Z}^{\vee,h}(M_{i}, F, W).
\]
(ii) Since $j_{Hdg}^{\nu} : \pi_S(C(MHM(\tilde{S}_1 \setminus S_1))) \rightarrow \pi_S(C(MHM(\tilde{S}_1)))$ are exact functors, $\Gamma_{Z}^{Hdg, \nu}$ induces the functors

$$\Gamma_{Z}^{\nu, Hdg} : \pi_S(D(MHM(S)) \rightarrow \pi_S(D(MHM(S))), ((M_1, F, W), u_{1J}) \rightarrow \Gamma_{Z}^{\nu, Hdg}((M_1, F, W), u_{1J})$$

\[\text{Definition 99. Let } f : X \rightarrow S \text{ a morphism with } X, S \in \text{Var}(\mathbb{C}). \text{ Assume there exist a factorization } f : X \xrightarrow{I} Y \times S \xrightarrow{P_S} S \text{ with } Y \in \text{SmVar}(\mathbb{C}), I \text{ a closed embedding and } P_S \text{ the projection. Let } S = \cup_{i \in I} \text{ an open cover such that there exist closed embeddings } i : S_i \rightarrow \tilde{S}_i \text{ with } \tilde{S}_i \in \text{SmVar}(\mathbb{C}). \text{ Denote } X_I := f^{-1}(S_I). \text{ We have then } X = \cup_{i \in I} X_i \text{ and the commutative diagrams} \]

\[
f : X_I \xrightarrow{l_I} Y \times S_I \xrightarrow{P_S} S_I \xrightarrow{u_I} S_I\]

(i) For $((M_1, F, W), u_{1J}) \in \pi_S(C(MHM(S)))$ we set (see definition 98 for $l$)

$$f_{Hdg}^{\nu, \text{mod}}((M_1, F, W), u_{1J}) := \Gamma_X^{Hdg}(p_{S_i}^{\nu, \text{mod}}[-](M_1, F, W), u_{1J})(2d_Y) \in \pi_X(C(MHM(X)))$$

We have for $((M_1, F, W), u_{1J}) \in \pi_S(C(MHM(S)))$, the canonical map in $C_{D(1,0) \Gamma l}(X/Y \times \tilde{S}_1)$

$$T(f_{Hdg}^{\nu, \text{mod}}, f_{Hdg}^{\nu, \Gamma})(M_1, F, W), u_{1J}) : f_{Hdg}^{\nu, \text{mod}}((M_1, F, W), u_{1J}) := \text{a map of exact functors}$$

\[\text{ defined by } \Gamma_X E(p_{S_i}^{\nu, \text{mod}}[-](M_1, F, W), f_{Hdg}^{\nu, \text{mod}}[-]u_{1J})) = f_{Hdg}^{\nu, \text{mod}}[-]T(M, F, W)\]

(ii) For $((M_1, F, W), u_{1J}) \in \pi_S(C(MHM(S)))$ we set (see definition 98 for $l$)

$$f_{Hdg}^{\nu, \text{mod}}(M, F, W) := \Gamma_X^{Hdg}(p_{S_i}^{\nu, \text{mod}}[-](M_1, F, W), p_{S_i}^{\nu, \text{mod}}[-]u_{1J}) \in \pi_X(C(MHM(X)))$$

We have for $(M, F, W) \in \pi_S(C(MHM(S)))$, the canonical map in $C_{D(1,0) \Gamma l}(X/Y \times \tilde{S}_1)$

$$T(f_{Hdg}^{\nu, \text{mod}}, f_{Hdg}^{\nu, \Gamma})(M_1, F, W), u_{1J}) : f_{Hdg}^{\nu, \text{mod}}[-]T(M, F, W) := \text{a map of exact functors}$$

\[\text{ defined by } \Gamma_X E(p_{S_i}^{\nu, \text{mod}}[-](M_1, F, W), f_{Hdg}^{\nu, \text{mod}}[-]u_{1J})) = f_{Hdg}^{\nu, \text{mod}}[-](M, F, W)\]

From the D-module case on algebraic varieties and the constructible sheaves case on CW complexes, we get :

\[\text{Definition 100. Let } f : X \rightarrow S \text{ a morphism with } X, S \in \text{QPVar}(\mathbb{C}). \text{ Then, since } X \text{ is quasi-projective, there exist a factorization } f : X \xrightarrow{l} \mathbb{P}^{N, o} \times S \xrightarrow{P_S} S \text{ with } n_0 : \mathbb{P}^{N, o} \hookrightarrow \mathbb{P}^{N} \text{ an open subset, } l \text{ a closed embedding and } P_S \text{ the projection. Since } S \text{ is quasi-projective, there exist a closed embedding } i : S \hookrightarrow S \text{ with } \tilde{S} \in \text{SmVar}(\mathbb{C}). \text{ We have then the commutative diagram} \]

\[\text{ define by } \Gamma_X E(p_{\mathbb{P}^{N, o} \times S}^{\nu, \text{mod}}[-](M_1, F, W), f_{Hdg}^{\nu, \text{mod}}[-]u_{1J})) = f_{Hdg}^{\nu, \text{mod}}[-](M, F, W)\]
\((i)\) For \(((M,F,W),(K,W),\alpha) \in D(MHM(X))\), where \((M,F,W) \in C_{D(1,0)fil}(X/\mathbb{P}^{N,\alpha} \times \tilde{S})\) and \((K,W) \in C_{fil}(X^{an})\), we define, using theorem \(27\) \(\text{ii}\) for \(p_S\) and definition \(9\) for \(n\),

\[ f_{\ast}\text{Hdg}((M,F,W),(K,W),\alpha) : = \left(Rf_{\ast}\text{Hdg}(M,F,W), Rf_{\ast}(K,W), f_{\ast}(\alpha)\right) \]

\[ : = \left(Rf_{\ast}\text{Hdg}^\ast Hdg(M,F,W), Rf_{\ast}(K,W), f_{\ast}(\alpha)\right) \in D(MHM(S)) \]

with

\[ f_{\ast}(\alpha) : Rf_{\ast}(K,W) \xrightarrow{Rf_{\ast}(\alpha)} Rf_{\ast}DR(T)|^{-1}|((M,W)^an) \xrightarrow{T_{(f,DR)}((M,W))} DR(S)|^{-1}|(\int f_{\ast}(M,W))^an = DR(S)|^{-1}|((Rf_{\ast}\text{Hdg}(M,W))^an) \]

see definition \(9\) and remark \(9\)

\((ii)\) For \(((M,F,W),(K,W),\alpha) \in D(MHM(X))\), where \((M,F,W) \in C_{D(1,0)fil}(X/\mathbb{P}^{N,\alpha} \times \tilde{S})\) and \((K,W) \in C_{fil}(X^{an})\), we define, using theorem \(27\) \(\text{ii}\) for \(p_S\) and definition \(9\) for \(n\),

\[ f_{\ast}\text{Hdg}((M,F,W),(K,W),\alpha) : = \left(Rf_{\ast}\text{Hdg}(M,F,W), Rf_{\ast}(K,W), f_{\ast}(\alpha)\right) \]

\[ : = \left(Rf_{\ast}\text{Hdg}^\ast Hdg(M,F,W), Rf_{\ast}(K,W), f_{\ast}(\alpha)\right) \in D(MHM(S)) \]

with

\[ f_{\ast}(\alpha) : Rf_{\ast}(K,W) \xrightarrow{Rf_{\ast}(\alpha)} Rf_{\ast}DR(T)|^{-1}|((M,W)^an) \xrightarrow{T_{(f,DR)}((M,W))} DR(S)|^{-1}|(\int f_{\ast}(M,W))^an = DR(S)|^{-1}|((Rf_{\ast}\text{Hdg}(M,W))^an) \]

see definition \(9\) and remark \(9\)

\((iii)\) For \(((M,F,W),(K,W),\alpha) \in D(MHM(S))\), where \((M,F,W) \in C_{D(1,0)fil}(S/\tilde{S})\), \((K,W) \in C_{fil}(S^{an})\), we define, using definition \(9\) (see theorem \(28\) \(\text{ii}\) for \(p_S\) and definition \(78\) for \(i \circ l\)),

\[ f^{\ast}\text{Hdg}((M,F,W),(K,W),\alpha) : = \left(f^{\ast}\text{Hdg}^\ast Hdg(M,F,W), f^{\ast}(K,W), f^{\ast}(\alpha)\right) \]

\[ : = \left(\Gamma_X^\ast p_{S_{\ast}}^{\ast}\mod[-](M,F,W), \Gamma_X^\ast p_{S_{\ast}}(K,W), f^{\ast}(\alpha)\right) \in D(MHM(X)) \]

with

\[ f^{\ast}(\alpha) : f^{\ast}(K,W) \xrightarrow{f^{\ast}(\alpha)} f^{\ast}DR(S)|(M,W)^an \xrightarrow{T(f,DR)((M,W))} DR(T)|^{-1}|((Lf^{\ast}\mod[-]\Gamma(M,W))^an) = DR(T)|^{-1}|((f^{\ast}\text{Hdg}(M,W))^an) \]

see definition \(77\) and remark \(7\) For \(j : S^o \hookrightarrow S\) an open embedding and \(((M,F,W),(K,W),\alpha) \in D(MHM(S^o))\), we have (see \(27\))

\[ f^{\ast}\text{Hdg}((M,F,W),(K,W),\alpha) = (j^{\ast}(M,F,W), j^{\ast}(K,W), j^{\ast}(\alpha)) \in D(MHM(S^o)). \]

\((iv)\) For \(((M,F,W),(K,W),\alpha) \in D(MHM(S))\), where \((M,F,W) \in C_{D(1,0)fil}(S/\tilde{S})\), \((K,W) \in C_{fil}(S^{an})\), we define, using definition \(9\) (see theorem \(28\) \(\text{ii}\) for \(p_S\) and definition \(78\) for \(i \circ l\)),

\[ f^{\ast}\text{Hdg}((M,F,W),(K,W),\alpha) : = \left(f^{\ast}\text{Hdg}^\ast Hdg(M,F,W), f^{\ast}(K,W), f^{\ast}(\alpha)\right) \]

\[ : = \left(\Gamma_X^\ast p_{S_{\ast}}^{\ast}\mod[-](M,F,W)(d_X)[2d_X], \Gamma_X^\ast p_{S_{\ast}}(K,W), f^{\ast}(\alpha)\right) \in D(MHM(X)) \]

with

\[ f^{\ast}(\alpha) : f^{\ast}(K,W) \xrightarrow{f^{\ast}(\alpha)} f^{\ast}DR(S)|(M,W)^an \xrightarrow{T(f,DR)((M,W))^{-1}} DR(T)|^{-1}|((Lf^{\ast}\mod[-]\Gamma(M,W))^an) = DR(T)|^{-1}|((f^{\ast}\text{Hdg}(M,W))^an) \]
Proof. Theorem 29. Let \( j : S^o \hookrightarrow S \) an open embedding and \( ((M, F, W), (K, W), \alpha) \in D(MHM(S)) \), we have (see \cite{92})

\[
j^Hdg((M, F, W), (K, W), \alpha) = (j^*(M, F, W), j^*(K, W), j^*\alpha) \in D(MHM(S^o)).
\]

Using the unicity of proposition \cite{92} we see that these definitions does NOT depends on the choice of the factorization \( f : X \to Y \times S \xrightarrow{p_2} S \) of \( f \). Moreover, using the unicity of proposition \cite{92} we see that they are 2 functors on the category of quasi-projective complex algebraic varieties \( \text{Var}(\C) \)

- By definition, we have

\[
l_S^{-1}(\int_{\tilde{\mathcal{F}}_S} n_*Hdg(M, F, W), Rf_*(K, W), f_*(\alpha)) = Rf_*Hdg((M, F, W), (K, W), \alpha) \in D(MHM(S)).
\]

and for \( j : S^o \hookrightarrow S \) an open embedding and \( ((M, F, W), (K, W), \alpha) \in D(MHM(S^o)), \)

\[
j_*Hdg((M, F, W), (K, W), \alpha) = (j_*Hdg(M, F, W), Rj_*(K, W), j_*\alpha) \in D(MHM(S)).
\]

By definition, we have

\[
l_S^{-1}(\int_{\tilde{\mathcal{F}}_S} n*Hdg(M, F, W), Rf!(K, W), f!(\alpha)) = RF_{Hdg}((M, F, W), (K, W), \alpha) \in D(MHM(S)).
\]

and for \( j : S^o \hookrightarrow S \) an open embedding and \( ((M, F, W), (K, W), \alpha) \in D(MHM(S^o)), \)

\[
j!Hdg((M, F, W), (K, W), \alpha) = (j!Hdg(M, F, W), j!(K, W), j!(\alpha)) \in D(MHM(S)).
\]

We have then the following

Theorem 29. Let \( f : X \to S \) a morphism with \( X, S \in \text{Var}(\C), X \) quasi-projective. Then,

(i) \((f^*Hdg, f_*Hdg) : D(MHM(S)) \to D(MHM(X))\) is a pair of adjoint functors,

(ii) \((f^*Hdg, f_*Hdg) : D(MHM(S)) \to D(MHM(X))\) is a pair of adjoint functors.

Proof. For the projection case see section 4. For the open embedding see definition \cite{100}.

Definition \cite{100} gives by proposition \cite{92} and proposition \cite{92} the following 2 functors:

- We have the following 2 functor on the category of complex algebraic varieties

\[
D(MHW(\cdot)) : \text{Var}(\C) \to \text{TriCat}, \quad S \mapsto D(MHW(S)),
\]

\[
(f : T \to S) \mapsto (f^*Hdg : (M, F, W), (K, W), \alpha) \mapsto f^*Hdg((M, F, W), (K, W), \alpha) := (f^*Hdg(M, F, W), f^*(K, W), f^*(\alpha)).
\]

- We have the following 2 functor on the category of complex quasi-projective algebraic varieties

\[
D(MHW(\cdot)) : \text{QPVar}(\C) \to \text{TriCat}, \quad S \mapsto D(MHW(S)),
\]

\[
(f : T \to S) \mapsto (f_*Hdg : (M, F, W), (K, W), \alpha) \mapsto f_*Hdg((M, F, W), (K, W), \alpha) := (Rf_*Hdg(M, F, W), Rf_*(K, W), f_*(\alpha)).
\]

- We have the following 2 functor on the category of complex quasi-projective algebraic varieties

\[
D(MHW(\cdot)) : \text{QPVar}(\C) \to \text{TriCat}, \quad S \mapsto D(MHW(S)),
\]

\[
(f : T \to S) \mapsto (f!Hdg : (M, F, W), (K, W), \alpha) \mapsto f!Hdg((M, F, W), (K, W), \alpha) := (RF_{Hdg}(M, F, W), RF!(K, W), f!(\alpha)).
\]
We have the following 2 functor on the category of complex algebraic varieties

\[ D(MHW(\cdot)) : \text{Var}(\mathbb{C}) \to \text{TriCat}, \, S \mapsto D(MHW(S)), \]

\[ (f : T \to S) \mapsto (f^Hdg : ((M, F, W), (K, W), \alpha) \mapsto f^Hdg((M, F, W), (K, W), \alpha) := (f^Hdg(M, F, W), f^Hdg(K, W), f^Hdg(\alpha))). \]

For a commutative diagram in \text{Var}(\mathbb{C})

\[
D = \begin{array}{ccc}
X & f & S \\
\downarrow g & & \downarrow g \\
X' & f' & T
\end{array}
\]

with \(S, T, X', X\) quasi-projective, we have, for \(((M, F, W), (K, W), \alpha) \in D(MHM(X))\) using theorem \(^{[29]}\) the following transformations maps

\[ T_1^{Hdg}(D)((M, F, W), (K, W), \alpha) : \]

\[ g^Hdg f^Hdg((M, F, W), (K, W), \alpha) \xrightarrow{\text{ad}(f^Hdg, f^Hdg)(-)} f_1^Hdg \circ f^Hdg g^Hdg f^Hdg((M, F, W), (K, W), \alpha) \xrightarrow{g^Hdg} f'_1^Hdg \circ f^Hdg g^Hdg f^Hdg((M, F, W), (K, W), \alpha) \]

and

\[ T_2^{Hdg}(D)((M, F, W), (K, W), \alpha) : \]

\[ f_1^Hdg g^Hdg f^Hdg((M, F, W), (K, W), \alpha) \xrightarrow{\text{ad}(f^Hdg, f^Hdg)(-)} f_1^Hdg \circ f^Hdg g^Hdg f^Hdg((M, F, W), (K, W), \alpha) \xrightarrow{f_1^Hdg} g^Hdg f^Hdg((M, F, W), (K, W), \alpha) \]

One consequence of the unicity of proposition \(^{[31]}\) is the following:

**Proposition 94.** For a commutative diagram in \text{Var}(\mathbb{C})

\[
D = \begin{array}{ccc}
X & f & S \\
\downarrow g & & \downarrow g \\
X' & f' & T
\end{array}
\]

which is cartesian, with \(S, T, X', X\) quasi-projective and \(f\) (hence \(f'\) proper), and \(((M, F, W), (K, W), \alpha) \in D(MHM(X))\)

\[ T_1^{Hdg}(f, g) : ((M, F, W), (K, W), \alpha) : \]

\[ g^Hdg f^Hdg((M, F, W), (K, W), \alpha) \xrightarrow{\text{ad}(f^Hdg, f^Hdg)(-)} f_1^Hdg \circ f^Hdg g^Hdg f^Hdg((M, F, W), (K, W), \alpha) \]

is an isomorphism.

**Proof.** See \(^{[27]}\).

**□**

**Proposition 95.** (i) Let \(S \in \text{AnSp}(\mathbb{C})\). Take an open cover \(S = \bigcup_{i=1}^n S_i\) such that there exists closed embeddings \(i_i : S_i \hookrightarrow S\), with \(\tilde{S}_i \in \text{AnSm}(\mathbb{C})\). Then for \(((M_I, F, W), u_{IJ}), (K, W), \alpha), (((N_I, F, W), v_{IJ}), (K', W), \alpha') \in MHM(S)\)

\[ (((M_I, F, W), u_{IJ}) \otimes_{O_S} ((N_I, F, W), v_{IJ}), (K, W) \otimes (K', W), \alpha \otimes \alpha') \in MHM(S) \]

208
(ii) Let $S \in \text{Var}(\mathbb{C})$. Take an open cover $S = \bigcup_{i=1}^{l} S_i$ such that there exists closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. Then for $((M_1, F, W), u_{1J}), (K, W), \alpha), ((N_1, F, W), v_{1J}), (K', W), \alpha') \in M\text{HM}(S)$

$$(((M_1, F, W), u_{1J}) \otimes_{O_S} ((N_1, F, W), v_{1J}), (K, W) \otimes (K', W), \alpha \otimes \alpha') \in M\text{HM}(S)$$

Proof. See [27].

- Let $S \in \text{AnSp}(\mathbb{C})$. Take an open cover $S = \bigcup_{i=1}^{l} S_i$ such that there exists closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{AnSp}(\mathbb{C})$. By proposition [95(i)], the functor

$$((- \otimes_{O_S}) (-), (-) \otimes (-)) : (C\text{D}_{(1,0)}(S/\tilde{S}_i)) \times_i C\text{f}_U(S)^2 \to C\text{D}_{(1,0)}(S/\tilde{S}_i) \times_i C(S)^2,$$

$$(((M_1, F, W), u_{1J}), (K, W), \alpha), ((N_1, F, W), v_{1J}), (K', W), \alpha')) \mapsto$$

$$(((M_1, F, W), u_{1J}) \otimes_{O_S} ((N_1, F, W), v_{1J}), (K, W) \otimes (K', W), \alpha \otimes \alpha')$$

restricts to a functor $((- \otimes_{O_S}) (-), (-) \otimes (-)) : C(M\text{HM}(S)^2 \to C(M\text{HM}(S))$.

- Let $S \in \text{Var}(\mathbb{C})$. Take an open cover $S = \bigcup_{i=1}^{l} S_i$ such that there exists closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. By proposition [95(ii)], the functor

$$(-) \otimes (-) : (C\text{D}_{(1,0)}(S/\tilde{S}_i)) \times_i C\text{f}_U(S)^2 \to C\text{D}_{(1,0)}(S/\tilde{S}_i) \times_i C(S^\text{an})^2$$

$$(((M_1, F, W), u_{1J}), (K, W), \alpha), ((N_1, F, W), v_{1J}), (K', W), \alpha')) \mapsto$$

$$(((M_1, F, W), u_{1J}) \otimes_{O_S} ((N_1, F, W), v_{1J}), (K, W) \otimes (K', W), \alpha \otimes \alpha')$$

restricts to a functor $((- \otimes_{O_S}) (-), (-) \otimes (-)) : C(M\text{HM}(S)^2 \to C(M\text{HM}(S))$.

For $X \in \text{SmVar}(\mathbb{C})$, we have, by definition

$$Z_X^{Hdg} := a_x^{Hdg} z_{\text{pt}}^{Hdg} := ((O_X, F_b)[d_X], Z_X, \alpha(X)) \in D(M\text{HM}(X)),$$

with $\alpha(X) : \mathbb{C}_X \hookrightarrow (0 \to O_X \to \Omega_X \to \cdots K_X)$. If $X \in \text{SmVar}(\mathbb{C})$,

$$Z_X^{Hdg} := a_x^{Hdg} z_{\text{pt}}^{Hdg} := ((O_X, F_b)[d_X], Z_X^{\text{an}}, \alpha(X^{\text{an}})) \in D(M\text{HM}(X)).$$

Let $X \in \text{Var}(\mathbb{C})$ non smooth. Take an open cover $X = \bigcup_{i=1}^{l} X_i$ such that there exists closed embeddings $i_i : X_i \hookrightarrow \tilde{X}_i$ with $\tilde{X}_i \in \text{SmVar}(\mathbb{C})$. Then, by definition

$$Z_X^{Hdg} := a_x^{Hdg} z_{\text{pt}}^{Hdg} := ((\Gamma_{\tilde{X}_i}^{\text{V}} [O_{\tilde{X}_i}, F_b][d_{\tilde{X}_i}], o_{\tilde{X}_i/\tilde{S}_i}, (Z_X^{\text{an}}, W), \alpha(X) / \tilde{X}_i)) \in D(M\text{HM}(X)).$$

with

$$\alpha(X / \tilde{X}_i) : (\Gamma_{\tilde{X}_i}^{\text{V}}, \alpha(\tilde{X}_i)) : T(X / \tilde{X}_i)(Z_X^{\text{an}}) := (i_i, Z_X^{\text{an}}, I) \to DR(X)^{-1}((\Gamma_{\tilde{X}_i}^{\text{V}} [O_{\tilde{X}_i}, F_b][d_{\tilde{X}_i}], o_{\tilde{X}_i/\tilde{S}_i})$$

We finish this section by the following proposition

**Proposition 96.** Let $Y \in \text{PSmVar}(\mathbb{C})$ and $i : Z \rightarrow S$ a closed embedding with $Z$ smooth. Denote by $j : U := S \setminus Z \rightarrow Y$ the complementary open subset.

(i) We have

$$a_{U}^{Hdg} z_{U}^{Hdg} := a_{U}^{Hdg}((O_U, F_b), (R_{U} Z_U^{\text{an}}, W), a_U, \alpha(U)) \Rightarrow \left( \int_{av}^{\text{FDR}} a_{Hdg}^{U} (O_U, F_b), (R_{U} Z_U^{\text{an}}, W), a_U, \alpha(U) \right)$$

$$\Rightarrow \left( \int_{av}^{\text{FDR}} \text{Cone}(D_\mathcal{S} \text{ad}(i_{*\text{mod}} t^*)^{-1} : (O_Y, F_b) \to i_{*\text{mod}} (O_D, F_b), (R_{U} Z_U^{\text{an}}, W), a_U, \alpha(U) \right)$$

$$\Rightarrow \left( \text{Cone}(E(O_D/Y)(D) : \Gamma(Y, E(O_D^{\text{fil}}, F_b)) \rightarrow \Gamma(D, E(O_D^{\text{fil}}, F_b), W), (R_{U} Z_U^{\text{an}}, W), a_U, \alpha(U) \right)$$

209
Proof. (i) For $O \in \mathcal{O}$, the algebraic and analytic filtered De Rham realizations for $\mathbf{O}$ are given by

$$a_{U \text{Hdg}, \mathbf{O}} := a_{U \text{Hdg}, \mathbf{O}}((O_U, F), (\mathbf{Z}_{U^\text{an}}, \alpha(U))) \xrightarrow{\sim} (\int_{a_Y}^{\text{FDR}} j_*^{\text{Hdg}}(O_U, F, W), (R^a_{U*} \mathbf{Z}_{U^\text{an}}, W), a_U(a(U)))$$

$$\xrightarrow{\sim} (\int_{a_Y}^{\text{FDR}} \text{Cone}(\text{ad}(i_{*\text{mod}}, H^i(\mathcal{O}_E)(O_Y, F_b)[c] \to (O_Y, F_b)), (R^a_{U*} \mathbf{Z}_{U^\text{an}}, W), a_U(a(U)))$$

$$\xrightarrow{\sim} (\text{Cone}(i_{DS} : \Gamma(D, E(\Omega^*_Y \mathbf{Hdg}, F_b))[c] \to \Gamma(Y, E(\Omega^*_Y F_b), (R^a_{U*} \mathbf{Z}_{U^\text{an}}, W), a_U(a(U)))$$

(ii) We have

$$a_{U \text{Hdg}, \mathbf{O}}(\mathbf{Z}^E_{U^\text{an}}) \xrightarrow{\sim} (\Gamma(Y, E(\Omega^*_Y \mathbf{Hdg}, F, W), (R^a_{U*} \mathbf{Z}_{U^\text{an}}, W), a_U(a(U)))$$

and

$$a_{U \text{Hdg}, \mathbf{O}}(\mathbf{Z}^E_{U^\text{an}}) := (\Gamma(Y, E(\Omega^*_Y \mathbf{Hdg}, F, W), (R^a_{U*} \mathbf{Z}_{U^\text{an}}, W), a_U(a(U)))$$

6 The algebraic and analytic filtered De Rham realizations for Voevodsky relative motives

6.1 The algebraic filtered De Rham realization functor

6.1.1 The algebraic Gauss-Manin filtered De Rham realization functor and its transformation map with pullbacks

Consider, for $S \in \text{Var}(\mathbb{C})$, the following composition of morphism in $\text{RCat}$ (see section 2)

$$\check{e}(S) : (\text{Var}(\mathbb{C})/S, O_{\text{Var}(\mathbb{C})/S}) \xrightarrow{\rho_S} (\text{Var}(\mathbb{C})^\text{sm}/S, O_{\text{Var}(\mathbb{C})^\text{sm}/S}) \xrightarrow{\text{c}(S)} (S, O_S)$$

with, for $X/S = (X, h) \in \text{Var}(\mathbb{C})/S$,

- $O_{\text{Var}(\mathbb{C})/S}(X/S) := O_X(X)$,
- $(\check{e}(S))^* O_S(X/S) \to O_{\text{Var}(\mathbb{C})/S}(X/S)) := (h^* O_S \to O_X)$.

and $O_{\text{Var}(\mathbb{C})^\text{sm}/S} := \rho_S, O_{\text{Var}(\mathbb{C})/S}$, that is, for $U/S = (U, h) \in \text{Var}(\mathbb{C})^\text{sm}/S$, $O_{\text{Var}(\mathbb{C})^\text{sm}/S}(U/S) := O_{\text{Var}(\mathbb{C})/S}(U) := O_U(U)$.

Definition 101. (i) For $S \in \text{Var}(\mathbb{C})$, we consider the complexes of presheaves

$$\Omega^*_{/S} := \text{coker}(\Omega_{\text{Var}(\mathbb{C})/S/\check{e}(S))^* O_S} : \Omega^*_{/\check{e}(S)^* O_S} \to \Omega^*_{\text{Var}(\mathbb{C})/S} \in C_{O_S}(\text{Var}(\mathbb{C})/S)$$

which is by definition given by

- for $X/S$ a morphism $\Omega^*_{/S}(X/S) = \Omega^*_{X/S}(X)$
- for $g : X'/S \to X/S$ a morphism,

$$\Omega^*_{/S}(g) := \Omega_{(X'/S)/(\check{e}(S))}(X') \to \Omega^*_{X'/S}(X') \to \Omega^*_{X/S}(X') \quad \omega \mapsto \Omega_{(X'/S)/(\check{e}(S))}(X')$$

(ii) For $S \in \text{Var}(\mathbb{C})$, we consider the complexes of presheaves

$$\Omega^*_{/S} := \rho_S, \Omega^*_{/S} = \text{coker}(\Omega_{\text{Var}(\mathbb{C})^\text{sm}/S/\check{e}(S))^* O_S} : \Omega^*_{\check{e}(S)^* O_S} \to \Omega^*_{\text{Var}(\mathbb{C})^\text{sm}/S} \in C_{O_S}(\text{Var}(\mathbb{C})^\text{sm}/S)$$

which is by definition given by
– for \( U/S \) a smooth morphism \( \Omega^s_{U/S}(U/S) = \Omega^s_{U/S}(U) \)
– for \( g : U'/S \to U/S \) a morphism,
\[
\Omega^s_{U/S}(g) := \Omega_{U'/U/(S/S)}(U') : \Omega^s_{U/S}(U) \to g^*\Omega_{U'/S}(U') \to \Omega^s_{U'/S}(U')
\]
\[
\omega \mapsto \Omega_{U'/U/(S/S)}(U')(\omega) := g^*(\omega) : (\alpha \in \wedge^k T_{U'}(U') \mapsto \omega(dg(\alpha)))
\]

**Remark 10.** For \( S \in \text{Var}(\mathbb{C}) \), \( \Omega^s_{U/S} \in C(\text{Var}(\mathbb{C})/S) \) is by definition a natural extension of \( \Omega^s_{U/S} \in C(\text{Var}(\mathbb{C})^{sm}/S) \). However \( \Omega^s_{U/S} \in C(\text{Var}(\mathbb{C})/S) \) does NOT satisfy cdh descent.

For a smooth morphism \( h : U \to S \) with \( S, U \in \text{SmVar}(\mathbb{C}) \), the cohomology presheaves \( H^n\Omega^s_{U/S} \) of the relative De Rham complex
\[
DR(U/S) := \Omega^s_{U/S} := \text{coker}(h^*\Omega_S \to \Omega_U) \in C_{h^*\mathcal{O}_S}(U)
\]
for all \( n \in \mathbb{Z} \), have a canonical structure of a complex of \( h^*D_S \) modules given by the Gauss Manin connexion: for \( S^0 \subset S \) an open subset, \( U^0 = h^{-1}(S^0) \), \( \gamma \in \Gamma(S^0, T_S) \) a vector field and \( \bar{\omega} \in \Omega^p_{U/S}(U^0)^c \), the action is given by
\[
\gamma \cdot [\omega] = [i(\bar{\gamma})\partial \omega],
\]
\( \omega \in \Omega^p_U(U) \) being a representative of \( \bar{\omega} \) and \( \bar{\gamma} \in \Gamma(U^0, T_U) \) a relevelement of \( \gamma \) (\( h \) is a smooth morphism), so that
\[
DR(U/S) := \Omega^s_{U/S} := \text{coker}(h^*\Omega_S \to \Omega_U) \in C_{h^*\mathcal{O}_S,h^*\mathcal{O}_S}(U)
\]
with this \( h^*D_S \) structure. Hence we get \( h^*\Omega^s_{U/S} \in C_{\mathcal{O}_S,h^*\mathcal{O}_S}(S) \) considering this structure. Since \( h \) is a smooth morphism, \( \Omega^p_{U/S} \) are locally free \( \mathcal{O}_U \) modules.

The point (ii) of the definition \([12]\) above gives the object in \( DA(S) \) which will, for \( S \) smooth, represent the algebraic Gauss-Manin De Rham realisation. It is the class of an explicit complex of presheaves on \( \text{Var}(\mathbb{C})^{sm}/S \).

**Proposition 97.** Let \( S \in \text{Var}(\mathbb{C}) \).

(i) For \( U/S = (U, h) \in \text{Var}(\mathbb{C})^{sm}/S \), we have \( e(U), h^*\Omega^s_{U/S} = \Omega^s_{U/S} \).

(ii) The complex of presheaves \( (\Omega^s_{U/S}, F_b) \in C_{\mathcal{O}_S, \mathcal{O}_S}(\text{Var}(\mathbb{C})^{sm}/S) \) is 2-filtered \( \mathbb{A}^1 \) local for the etale topology. Note that however, for \( p > 0 \), the complexes of presheaves \( \Omega^s_{U/S} \) are NOT \( \mathbb{A}^1 \) local. On the other hand, \( (\Omega^s_{U/S}, F_b) \) admits transferts (recall that means \( \text{Tr}(S), \text{Tr}(S)\Omega^s_{U/S} = \Omega^s_{U/S} ) \).

(iii) If \( S \) is smooth, we get \( (\Omega^s_{U/S}, F_b) \in C_{\mathcal{O}_S, \mathcal{O}_S}(\text{Var}(\mathbb{C})^{sm}/S) \) with the structure given by the Gauss Manin connexion. Note that however the \( D_S \) structure on the cohomology groups given by Gauss Manin connexion does NOT comes from a structure of \( D_S \) module structure on the filtered complex of \( \mathcal{O}_S \) module. The \( D_S \) structure on the cohomology groups satisfy a non trivial Griffith transversality (in the non projection cases), whereas the filtration on the complex is the trival one.

**Proof.** (i): Let \( h' : V \to U \) a smooth morphism with \( V \in \text{Var}(\mathbb{C}) \). We have then
\[
h^*\Omega^p_{U/S}(V \xrightarrow{h'} U) = \Omega^p_{U/S}(V \xrightarrow{h'} U) \to \Omega^p_{U/S}(V).
\]
Hence, if \( h' : V \to U \) is in particular an open embedding, \( h^*\Omega^p_{U/S}(V \xrightarrow{h'} U) = \Omega^p_{U/S}(V) \). This proves the equality.

(ii): We prove that \( E_{ct}(\Omega^s_{U/S}, F_b) \in C_{\mathcal{O}_S, \mathcal{O}_S}(\text{Var}(\mathbb{C})^{sm}/S) \) is 2-filtered \( \mathbb{A}^1 \) invariant. We follow \([20]\). Denote by
\[
P_a : \text{Var}(\mathbb{C})^{sm}/S \to \text{Var}(\mathbb{C})^{sm}/S,
\]
\[
U/S = (U, h) \to U \times \mathbb{A}^1/S := (U \times \mathbb{A}^1, h \circ p), \ g : U/S \to V/S \mapsto g \times I : U \times \mathbb{A}^1/S \to V \times \mathbb{A}^1/S
\]
the morphism of site. Consider the map in $C(\text{Var}(\mathbb{C})^{sm}/S)$

$$\phi := \text{ad}(P^*_a, P_{a*})(-): \Omega^*_S \to P_{a*}P^*_a \Omega^*_S$$

which is given, for $U/S \in \text{Var}(\mathbb{C})^{sm}/S$ by

$$\text{ad}(P^*_a, P_{a*})(-)(U/S) = \Omega(U \times \mathbb{A}^1/U)/(S/S)(U \times \mathbb{A}^1): \Omega^*_U(U) \to \Omega^*_U(U \times \mathbb{A}^1), \ \omega \mapsto p^*\omega$$

where $p: U \times \mathbb{A}^1 \to U$ is the projection. On the other hand consider the map in $C(\text{Var}(\mathbb{C})^{sm}/S)$

$$\psi := I_0^*: P_{a*}P^*_a \Omega^*_S \to \Omega^*_S$$

given, for $U/S \in \text{Var}(\mathbb{C})^{sm}/S$ by

$$I_0^*(U/S): \Omega^*_U(U \times \mathbb{A}^1) \to \Omega^*_U(U), \ \omega \mapsto i_0^*\omega$$

where $i_0: U \hookrightarrow U \times \mathbb{A}^1$ is closed embedding given by $i_0(x) := (x, 0)$. Then,

- we have $\phi \circ \psi = I$
- considering the map in $\text{PSh}(\mathbb{N} \times \text{Var}(\mathbb{C})^{sm}/S)$

$$H: P_{a*}P^*_a \Omega^*_S[1] \to P_{a*}P^*_a \Omega^*_S$$

given for $U/S \in \text{Var}(\mathbb{C})^{sm}/S$ by

$$H(U/S)\Omega^p_{U \times \mathbb{A}^1/S}(U \times \mathbb{A}^1) \to \Omega^{p-1}_{U \times \mathbb{A}^1/S}(U \times \mathbb{A}^1),$$

$$H(U/S)(p^*\omega \wedge q^*(f(s)ds)) = (\int_0^t f(s)ds)p^*\omega, \ H(U/S)(p^*\omega \wedge q^*f) = 0,$$

note that $g(t) = \int_0^t f(s)ds$ is algebraic since $f \in O_{\mathbb{A}^1}(\mathbb{A}^1)$ is a polynomial, we have $\psi \circ \phi - I = \partial H + H\partial$.

This shows that

$$\text{ad}(P^*_a, P_{a*})(-) : \Omega^*_S \to P_{a*}P^*_a \Omega^*_S$$

is an homotopy equivalence whose inverse is $I_0^*$. Hence, by proposition 7

$$\text{ad}(P^*_a, P_{a*})(-) : E_{et}(\Omega^*_S, F_b) \to E_{et}(P_{a*}P^*_a \Omega^*_S, F_b) = E_{et}P_{a*}P^*_a \Omega^*_S, F_b)$$

is a 2-filtered quasi-isomorphism, that is $E_{et}(\Omega^*_S, F_b) \in C_{O_S}^{et}(\text{Var}(\mathbb{C})^{sm}/S)$ is 2-filtered $\mathbb{A}^1$ invariant.

(iii): For $h: U \to S$ a smooth morphism with $U, S \in \text{SmVar}(\mathbb{C})$, recall that the $h^*D_S(U) = D_S(h(U))$ structure on $H^p\Omega^*_S(U/S) := H^p\Omega^*_U(U)$ is given by, for $\hat{\omega} \in \Omega^p_{U/S}(U)^c$, $\gamma \cdot [\hat{\omega}] = [\iota(\hat{\gamma}) \partial \omega], \ \omega \in \Omega^p(U^c)$ being a representative of $\hat{\omega}$ and $\hat{\gamma} \in \Gamma(U^c, T_U)$ a relevent of $\hat{\gamma}$ (h is a smooth morphism). Now, if $g: V/S \to U/S$ is a morphism, where $h': V \to S$ is a smooth morphism with $V \in \text{SmVar}(\mathbb{C})$, we have

$$g^*(\gamma \cdot \hat{\omega}) = g^*(\iota(\hat{\gamma}) \partial \omega) = \iota(\hat{\gamma}) \partial g^*\omega = \gamma \cdot (g^*\hat{\omega})$$

that is $H^p\Omega^*_S(g): H^p\Omega^*_U(U/S) \to H^p\Omega^*(V/S)$ is a map of $D_S(h(U))$ modules.

We have the following canonical transformation map given by the pullback of (relative) differential forms:

Let $g: T \to S$ a morphism with $T, S \in \text{Var}(\mathbb{C})$. Consider the following commutative diagram in $R\text{Cat}$:

$$D(g, e): (\text{Var}(\mathbb{C})^{sm}/T, O_{\text{Var}(\mathbb{C})^{sm}/T}) \xrightarrow{P(g)} (\text{Var}(\mathbb{C})^{sm}/S, O_{\text{Var}(\mathbb{C})^{sm}/S})$$

$$\downarrow e(T) \downarrow e(S)$$

$$\downarrow P(g) \downarrow (S, O_S)$$

212
It gives (see section 2) the canonical morphism in $C_{g^*O_S} fil(\text{Var}(\mathbb{C})^{sm}/T)$

$$\Omega^*_{(T/S)} := \Omega^*(O_{\text{Var}(\mathbb{C})}^{sm}/T / g^*O_{\text{Var}(\mathbb{C})}^{sm}/S) / (O_T / g^*O_S) :$$

$$g^*(\Omega^*_{/S}, F_b) = \Omega^*_g O_{\text{Var}(\mathbb{C})}^{sm}/S / g^*E \cdot O_S \to (\Omega^*_g, F_b) = \Omega^*_g O_{\text{Var}(\mathbb{C})}^{sm}/T / (e(T) \cdot O_T)$$

which is by definition given by the pullback on differential forms: for $(V/T) = (V, h) \in \text{Var}(\mathbb{C})^{sm}/T$,

$$\Omega^*_{(T/S)}(V/T) : g^*(\Omega^*_{/S})(V/T) := \lim_{(b': U \to S) \in \text{Sm}, g' \in V \cup U, h, g} \frac{\Omega^*_U(U)}{\Omega^*_{(V/U) / (T/S)}(V/T)} \to \Omega^*_T(V) := \Omega^*_T(V/T)$$

$$
\omega \mapsto \Omega^*_{(V/U) / (T/S)}(V/T)(\omega) := g^*\omega.
$$

If $S$ and $T$ are smooth, $\Omega^*_{(T/S)} : g^*(\Omega^*_{/S}, F_b) \to (\Omega^*_T, F_b)$ is a map in $C_{g^*O_S} fil, g^*D_S(\text{Var}(\mathbb{C})^{sm}/T)$. It induces the canonical morphisms in $C_{g^*O_S} fil, g^*D_S \text{Var}(\mathbb{C})^{sm}/T$:

$$E \Omega^*_{(T/S)} : g^*E_{et}(\Omega^*_{/S}, F_b) \to E_{et}(\Omega^*_T, F_b),$$

and

$$E \Omega^*_{(T/S)} : g^*E_{zar}(\Omega^*_{/S}, F_b) \to E_{zar}(\Omega^*_T, F_b).$$

**Definition 102.** (i) Let $g : T \to S$ a morphism with $T, S \in \text{Var}(\mathbb{C})$. We have, for $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$, the canonical transformation in $C_{O_{T}} fil(T)$:

$$T^O(g, \Omega_{/T})(F) : g^{*T}O_{\text{et}} \text{Hom}(T, E_{et}(\Omega^*_{/S}, F_b)) \xrightarrow{\sim} (g^*T^O \text{Hom}(T, E_{et}(\Omega^*_{/S}, F_b))) \otimes g^*O_S O_T$$

$$T(e,g)(-) \circ T^O(g, \Omega_{/T})(-) \to L_0(T, g^*T \text{Hom}(T, E_{et}(\Omega^*_{/S}, F))) \otimes g^*O_S O_T$$

$$T(g,\text{hom})(F, E_{et}(\Omega^*_S, F_b)) \otimes I \to L_0(T, \text{Hom}(g^*F, g^*E_{et}(\Omega^*_S, F_b))) \otimes g^*O_S O_T$$

$$\text{ev}(\text{hom}, \otimes)(-,-,-) \to L_0(T, \text{Hom}(g^*F, g^*E_{et}(\Omega^*_S, F_b))) \otimes g^*E_{et}(\Omega^*_S, F_b) \otimes g^*E_{et}(\Omega^*_S, F_b) \otimes g^*E_{et}(\Omega^*_S, F_b)$$

$$\to L_0(T, \text{Hom}(g^*F, g^*E_{et}(\Omega^*_S, F_b))) \otimes g^*E_{et}(\Omega^*_S, F_b) \otimes g^*E_{et}(\Omega^*_S, F_b) \otimes g^*E_{et}(\Omega^*_S, F_b)$$

where $m(\alpha \otimes h) := h \cdot \alpha$ is the multiplication map.

(ii) Let $g : T \to S$ a morphism with $T, S \in \text{Var}(\mathbb{C})$, $S$ smooth. Assume there is a factorization $g : T \xrightarrow{l} Y \times S \xrightarrow{p_S} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. We have, for $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$, the canonical transformation in $C_{O_{T}} fil(Y \times S)$:

$$T^O(g, \Omega_{/T})(F) : g^{*T}O_{\text{et}} \text{Hom}(T, E_{et}(\Omega^*_{/S}, F_b)) \xrightarrow{\sim} \Gamma_T E_{zar}(p^*_{S,T}O_{\text{et}} \text{Hom}(T, E_{et}(\Omega^*_{/S}, F_b)))$$

$$T^O(p_{S,T}, \Omega_{/T})(F) \to \Gamma_T E_{zar}(e(T \times S), \text{Hom}(p^*_{S,T}F, E_{et}(\Omega^*_{/Y \times S}, F_b)))$$

$$\to e(T \times S), \Gamma_T \text{Hom}(p^*_{S,T}F, E_{et}(\Omega^*_{/Y \times S}, F_b))$$

$$I(\gamma, \text{hom})(-,-,-) \to e(T \times S), \text{Hom}(\Gamma^*_{Y} p^*_{S,T}F, E_{et}(\Omega^*_{/Y \times S}, F_b)).$$

For $Q \in \text{Proj PSh}(\text{Var}(\mathbb{C})^{sm}/S)$,

$$T(g, \Omega_{/T})(Q) : g^{*T}O_{\text{et}} \text{Hom}(T, E_{et}(\Omega^*_{/S}, F_b)) \to e(T \times S), \text{Hom}(\Gamma^*_{Y} p^*_{S,T}Q, E_{et}(\Omega^*_{/Y \times S}, F_b))$$

is a map in $C_{O_{T}} fil, D(Y \times S)$. 

213
The following easy lemma describe these transformation map on representable presheaves:

**Lemma 10.** Let $g : T \to S$ a morphism with $T, S \in \text{Var}(\mathbb{C})$ and $h : U \to S$ is a smooth morphism with $U \in \text{Var}(\mathbb{C})$. Consider a commutative diagram whose square are cartesian:

$$
\begin{align*}
g : T & \xrightarrow{l} S \times Y \xrightarrow{p_S} S \\
& \uparrow h' \quad \quad \downarrow h \\
g' : U_T & \xrightarrow{l'} U \times Y \xrightarrow{p_U} U
\end{align*}
$$

with $l, l'$ the graph embeddings and $p_S, p_U$ the projections. Then $g^*Z(U/S) = Z(U_T/T)$ and

(i) we have the following commutative diagram in $C_{\text{Orf-d}}(T)$ (see definition 7 and definition 102(i)):

$$
\begin{align*}
g^* \text{Loc}(S), \text{Hom}^* (Z(U/S), E_{et}(\Omega^*_S, F_b)) & \xrightarrow{T(g, \Omega_f)(Z(U/S))} \text{Hom}^* (Z(U_T/T), E_{et}(\Omega^*_U, F_b)) \\
& \downarrow k \\
g^* \text{Loc}(S), \text{Hom}^* (Z(U/S), E_{zar}(\Omega^*_S, F_b)) & \xrightarrow{T(g, \Omega_f)(Z(U/S))} \text{Hom}^* (Z(U_T/T), E_{zar}(\Omega^*_U, F_b)) \\
& = \downarrow k \\
g^* \text{Loc}(h), E_{zar}(\Omega^*_U, F_b) & \xrightarrow{T_{zar}^*(g, h)} h'^* E_{zar}(\Omega^*_U, F_b)
\end{align*}
$$

(ii) if $Y, S \in \text{SmVar}(\mathbb{C})$, we have the following commutative diagram in $C_{\text{Orf-d}}(Y \times S)$ (see definition 7 and definition 102(ii)):

$$
\begin{align*}
g^* \text{Loc}(S), \text{Hom}^* (Z(U/S), E_{et}(\Omega^*_S, F_b)) & \xrightarrow{T(g, \Omega_f)(Z(U/S))} \text{Hom}^* (Z(U_T/T), E_{et}(\Omega^*_U, F_b)) \\
& \downarrow k \\
g^* \text{Loc}(S), \text{Hom}^* (Z(U/S), E_{zar}(\Omega^*_S, F_b)) & \xrightarrow{T(g, \Omega_f)(Z(U/S))} \text{Hom}^* (Z(U_T/T), E_{zar}(\Omega^*_U, F_b)) \\
& = \downarrow k \\
g^* \text{Loc}(h), E_{zar}(\Omega^*_U, F_b) & \xrightarrow{T_{zar}^*(ps, h)(-)} h'^* T_{U_T} E_{zar}(\Omega^*_U, F_b)
\end{align*}
$$

where $j : T \setminus T \times S \hookrightarrow T \times S$ is the open complementary embedding,

with

$$
k : E_{zar}(h^* \Omega^*_S, F_b) \to E_{et}(E_{zar}(h^* \Omega^*_S, F_b)) = E_{et}(h^* \Omega^*_S, F_b),
$$

which is a (1-)filtered Zariski local equivalence.

**Proof.** The commutative diagram follows from Yoneda lemma and proposition 97(i). On the other hand, $k : E_{zar}(\Omega^*_S, F_b) \to E_{et}(\Omega^*_S, F_b)$ is a (1-)filtered Zariski local equivalence by theorem 10 and proposition 97(ii)

In the projection case, we have the following:

**Proposition 98.** Let $p : S_{12} \to S_1$ is a smooth morphism with $S_1, S_{12} \in \text{AnSp}(\mathbb{C})$. Then if $Q \in C(\text{Var}(\mathbb{C})^{an}/S_1)$ is projective,

$$
T(p, \Omega_f)(Q) : p^* \text{Hom}^* (Q, E_{et}(\Omega^*_S, F_b)) \to E_{et}(S_{12}, \text{Hom}^* (p^* Q, E_{et}(\Omega^*_{S_{12}}, F_b))
$$

is an isomorphism.
Proof. Follows from lemma [10] and base change by smooth morphisms of quasi-coherent sheaves.

Let $S \in \text{Var}(\mathbb{C})$ and $h : U \to S$ a morphism with $U \in \text{Var}(\mathbb{C})$. We then have the canonical map given by the wedge product

$$\omega_{U/S} : \Omega^1_{U/S} \otimes \Omega^1_{U/S} \to \Omega^1_{U/S}; \alpha \otimes \beta \mapsto \alpha \wedge \beta.$$  

Let $S \in \text{Var}(\mathbb{C})$ and $h_1 : U_1 \to S$, $h_2 : U_2 \to S$ two morphisms with $U_1, U_2 \in \text{Var}(\mathbb{C})$. Denote $h_{12} : U_{12} := U_1 \times_S U_2 \to S$ and $p_{121} : U_1 \times_S U_2 \to U_1$, $p_{212} : U_1 \times_S U_2 \to U_2$ the projections. We then have the canonical map given by the wedge product

$$\omega(U_{12}/S) : p^*_{121}\Omega^1_{U_1/S} \otimes_{OS} p^*_{212}\Omega^1_{U_2/S} \to \Omega^1_{U_{12}/S}; \alpha \otimes \beta \mapsto p^*_{121}\alpha \wedge p^*_{212}\beta,$$

which gives the map

$$E\omega(U_{12}/S) : h_{12}^*E_{zar}(\Omega^1_{U_{12}/S}) \otimes_{OS} h_{12}^*E_{zar}(\Omega^1_{U_{12}/S}) \to h_{12}^*E_{zar}(\Omega^1_{U_{12}/S}) \otimes_{OS} h_{12}^*E_{zar}(\Omega^1_{U_{12}/S})$$

Let $S \in \text{Var}(\mathbb{C})$. We have the canonical map in $C_{OS,fil}(\text{Var}(\mathbb{C})^{m}/S)$

$$\omega_S : (\Omega^1_{S, F}) \otimes_{OS} (\Omega^1_{S, F}) \to (\Omega^1_{S, F})$$

given by for $h : U \to S \in \text{Var}(\mathbb{C})^{m}/S$

$$\omega_S(U/S) : (\Omega^1_{U/S, F}) \otimes_{OS} (\Omega^1_{U/S, F})(U) \to (\Omega^1_{U/S, F})(U)$$

It gives the map

$$E\omega_S : E_{et}(\Omega^1_{S, F}) \otimes_{OS} E_{et}(\Omega^1_{S, F}) \to E_{et}(\Omega^1_{S, F}) \otimes_{OS} E_{et}(\Omega^1_{S, F})$$

If $S \in \text{SmVar}(\mathbb{C})$,

$$\omega_S : (\Omega^1_{S, F}) \otimes_{OS} (\Omega^1_{S, F}) \to (\Omega^1_{S, F})$$

is a map in $C_{OS,fil, D}(\text{Var}(\mathbb{C})^{m}/S)$.

**Definition 103.** Let $S \in \text{Var}(\mathbb{C})$. We have, for $F, G \in C(\text{Var}(\mathbb{C})^{m}/S)$, the canonical transformation in $C_{OS,fil}(S)$:

$$T(\otimes, \Omega)(F, G) : e(S)_{\ast}\text{Hom}(F, E_{et}(\Omega_{S}^1, F)) \otimes_{OS} e(S)_{\ast}\text{Hom}(G, E_{et}(\Omega_{S}^1, F))$$

$$\xrightarrow{e(S)_{\ast}\text{Hom}(F, E_{et}(\Omega_{S}^1, F)) \otimes_{OS} e(S)_{\ast}\text{Hom}(G, E_{et}(\Omega_{S}^1, F))} e(S)_{\ast}\text{Hom}(F \otimes G, E_{et}(\Omega_{S}^1, F))$$

If $S \in \text{SmVar}(\mathbb{C})$, $T(\otimes, \Omega)(F, G)$ is a map in $C_{OS,fil, D}(S)$.

**Lemma 11.** Let $S \in \text{Var}(\mathbb{C})$ and $h_1 : U_1 \to S$, $h_2 : U_2 \to S$ two morphisms with $U_1, U_2 \in \text{Var}(\mathbb{C})$. Denote $h_{12} : U_{12} := U_1 \times_S U_2 \to S$ and $p_{121} : U_1 \times_S U_2 \to U_1$, $p_{212} : U_1 \times_S U_2 \to U_2$ the projections. We then have the following commutative diagram

$$\begin{array}{ccc}
E\omega(U_{12}/S) & \xrightarrow{k} & E\omega(U_{12}/S) \\
\downarrow & & \downarrow \\
h_{12}^*E_{zar}(\Omega^1_{U_{12}/S}, F) & \xrightarrow{k} & h_{12}^*E_{zar}(\Omega^1_{U_{12}/S}, F)
\end{array}$$

215
with
\[ k : E_{zar}(\Omega^i_{/S}, F_b) \to E_{et}(E_{zar}(\Omega^i_{/S}, F_b)) = E_{et}(\Omega^i_{/S}, F_b). \]
which is a filtered Zariski local equivalence.

Proof. Follows from Yoneda lemma. \qed

Let \( S \in \text{Var}(\mathbb{C}) \) and \( S = \bigcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). For \( I \subset [1, \cdots, l] \), denote by \( S_I := \bigcap_{i \in I} S_i \) and \( j_I : S_I \hookrightarrow S \) the open embedding. We then have closed embeddings \( i_I : S_I \hookrightarrow \tilde{S}_I := \bigcap_{i \in I} \tilde{S}_i \). Consider, for \( I \subset J \), the following commutative diagram

\[
\begin{array}{ccc}
D_{I,J} = & S_I & \xrightarrow{i_I} \tilde{S}_I \\
& j_{I,J} & \downarrow \quad p_{I,J} \\
S_J & \tilde{S}_J & \\
\end{array}
\]

and \( j_{I,J} : S_J \hookrightarrow S_I \) is the open embedding so that \( j_I \circ j_{I,J} = j_J \). Considering the factorization of the diagram \( D_{I,J} \) by the fiber product:

\[
D_{I,J} = \tilde{S}_J \xrightarrow{i_J} \tilde{S}_I \times_{S_I} \tilde{S}_{J \setminus I} \xrightarrow{p_{I,J}} \tilde{S}_I \]

the square of this factorization being cartesian, we have for \( F \in C(\text{Var}(\mathbb{C})^{sm}/S) \) the canonical map in \( C(\text{Var}(\mathbb{C})^{sm}/\tilde{S}_J) \)

\[
S(D_{I,J})(F) : Li_{I,J} j^*_J F \xrightarrow{q_1} i_{I,J} j^*_J F = (i_I \times I) \ast l_{I,J} j^*_J F \xrightarrow{(i_I \times I) \ast (p_{I,J} \circ l_{I,J})} (i_I \times I) \ast p_{I,J} l_{I,J} j^*_J F \xrightarrow{T(p_{I,J} \circ l_{I,J})(-)^{-1}} p_{I,J} l_{I,J} j^*_J F = p_{I,J} l_{I,J} j^*_J F
\]

which factors through

\[
S(D_{I,J})(F) : Li_{I,J} j^*_J F \xrightarrow{S_1(D_{I,J})(F)} p_{I,J} l_{I,J} j^*_J F \xrightarrow{q_1} p_{I,J} l_{I,J} j^*_J F
\]

Definition 104. (i) Let \( S \in \text{SmVar}(\mathbb{C}) \). We have the functor

\[
C(\text{Var}(\mathbb{C})^{sm}/S)^{op} \to C_{O_{diff},p}(S), \quad F \mapsto (e(S), \text{Hom}^i_L(L(i_I j^*_J F), E_{et}(\Omega^i_{/S}, F_b))[\cdot_{d_{S,J}}], u^q_{I,J}(F))
\]

(ii) Let \( S \in \text{Var}(\mathbb{C}) \) and \( S = \bigcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). For \( I \subset [1, \cdots, l] \), denote by \( S_I := \bigcap_{i \in I} S_i \) and \( j_I : S_I \hookrightarrow S \) the open embedding. We then have closed embeddings \( i_I : S_I \hookrightarrow \tilde{S}_I := \bigcap_{i \in I} \tilde{S}_i \). We have the functor

\[
C(\text{Var}(\mathbb{C})^{sm}/S)^{op} \to C_{O_{diff},p}(S/\tilde{S}_I), \quad F \mapsto (e(\tilde{S}_I), \text{Hom}^i_L(L(i_I j^*_J F), E_{et}(\Omega^i_{/\tilde{S}_I}, F_b))[\cdot_{d_{S,J}}], u^q_{I,J}(F))
\]

where

\[
\begin{align*}
u^q_{I,J}(F)[d_{S,J}] : & e(\tilde{S}_I), \text{Hom}^i_L(L(i_I j^*_J F), E_{et}(\Omega^i_{/\tilde{S}_I}, F_b)) \\
& \text{ad}[p_{I,J} \cdot (p_{I,J} \circ l_{I,J})^{-1}] \circ p_{I,J} \circ l_{I,J} \circ e(\tilde{S}_I) & \text{Hom}^i_L(L(i_I j^*_J F), E_{et}(\Omega^i_{/\tilde{S}_I}, F_b)) \\
& p_{I,J} \circ l_{I,J} \circ e(\tilde{S}_I) & \text{Hom}^i_L(L(i_I j^*_J F), E_{et}(\Omega^i_{/\tilde{S}_I}, F_b)) \\
& p_{I,J} \circ l_{I,J} \circ e(\tilde{S}_I) & \text{Hom}^i_L(L(i_I j^*_J F), E_{et}(\Omega^i_{/\tilde{S}_I}, F_b)) \\
& p_{I,J} \circ l_{I,J} \circ e(\tilde{S}_I) & \text{Hom}^i_L(L(i_I j^*_J F), E_{et}(\Omega^i_{/\tilde{S}_I}, F_b))
\end{align*}
\]

216
For \( I \subset J \subset K \), we have obviously \( p_{IJK} u_{JK}(F) = u_{IK}(F) \).

We will prove in corollary \( \square \) below that \( u_{IJ}(F) \) are \( \infty \)-filtered Zariski local equivalence. We then have the following key proposition

**Proposition 99.** Let \( S \in \text{Var}(\mathbb{C}) \). Let \( m : Q_1 \to Q_2 \) be an equivalence \((\mathbb{A}^1, \text{et})\) local in \( C(\text{Var}(\mathbb{C})^{sm}/S) \) with \( Q_1, Q_2 \) complexes of projective presheaves. Then,

\[
e(S) \text{Hom}(m, E_{et}(\Omega^*_S, F_b)) : e(S) \text{Hom}^*(Q_2, E_{et}(\Omega^*_S, F_b)) \to e(S) \text{Hom}^*(Q_1, E_{et}(\Omega^*_S, F_b))
\]

is an \( \infty \)-filtered quasi-isomorphism (in fact it is a 2-filtered quasi-isomorphism). It is thus an isomorphism in \( D_{O_{Sfil}, D_{\infty}}(S) \) if \( S \) is smooth.

**Proof.** By proposition 97(ii), \( E_{et}(\Omega^*_S, F_b) \in C_{O_{Sfil}, D_S}(\text{Var}(\mathbb{C})^{sm}/S) \) is 2-filtered \( \mathbb{A}^1 \) invariant. The result then follows by lemma \( \square \).

**Definition 105.** (i) We define, using definition 104, by proposition 99, the filtered algebraic Gauss-Manin realization functor defined as

\[
\mathcal{F}^{GM}_S : \text{DA}(S)^{op} \to D_{O_{Sfil}, D_{\infty}}(S), \quad M \mapsto \mathcal{F}^{GM}_S(M) := e(S) \text{Hom}^*(L(F), E_{et}(\Omega^*_S, F_b))[-d_S]
\]

where \( F \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is such that \( M = D(\mathbb{A}^1, \text{et})(F) \).

(ii) Let \( S \in \text{Var}(\mathbb{C}) \) and \( S = \bigcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i : S_i \to \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). For \( I \subset [1, \ldots, l] \), denote by \( S_I = \cap_{i \in I} S_i \) and \( j_I : S_I \to S \) the open embedding. We then have closed embeddings \( i_I : S_I \to \tilde{S}_I := \bigcup_{i \in I} \tilde{S}_i \). We define, using definition 104 and corollary \( \square \) by proposition 99 the filtered algebraic Gauss-Manin realization functor defined as

\[
\mathcal{F}^{GM}_S : \text{DA}(S)^{op} \to D_{O_{Sfil}, D_{\infty}}(S/\tilde{S}_I), \quad M \mapsto \mathcal{F}^{GM}_S(M) := \left( (e(\tilde{S}_I) \text{Hom}^*(L(i_I j_I^* F), E_{et}(\Omega^*_S, F_b)))[-d_{S_I}], u_{IJ}(F) \right)
\]

where \( F \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is such that \( M = D(\mathbb{A}^1, \text{et})(F) \).

**Proposition 100.** For \( S \in \text{Var}(\mathbb{C}) \), the functor \( \mathcal{F}^{GM}_S \) is well defined.

**Proof.** Let \( S \in \text{Var}(\mathbb{C}) \) and \( S = \bigcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i : S_i \to \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). Denote, for \( I \subset [1, \ldots, l] \), \( S_I = \cap_{i \in I} S_i \) and \( j_I : S_I \to S \) the open embedding. We then have closed embeddings \( i_I : S_I \to \tilde{S}_I := \bigcup_{i \in I} \tilde{S}_i \). Let \( M \in \text{DA}(S) \). Let \( F, F' \in C(\text{Var}(\mathbb{C})^{sm}/S) \) such that \( M = D(\mathbb{A}^1, \text{et})(F) = D(\mathbb{A}^1, \text{et})(F') \). Then there exist by definition a sequence of morphisms in \( C(\text{Var}(\mathbb{C})^{sm}/S) \) :

\[
F = F_1 \xrightarrow{s_1} F_2 \xrightarrow{s_2} F_3 \xrightarrow{s_3} \cdots \xrightarrow{s_k} F' = F_s
\]

where, for \( 1 \leq k \leq s \), and \( s_k \) are \((\mathbb{A}^1, \text{et})\) local equivalence. But if \( s : F_1 \to F_2 \) is an equivalence \((\mathbb{A}^1, \text{et})\) local,

\[
L(i_{1*} j_I^* s) \circ L(i_{1*} j_I^* F_1) \to L(i_{1*} j_I^* F_2)
\]

is an equivalence \((\mathbb{A}^1, \text{et})\) local, hence

\[
(\text{Hom}^*(L(i_{1*} j_I^* s), E_{et}(\Omega^*_{\tilde{S}_I}, F_b)) \to (\text{Hom}^*(L(\tilde{S}_I) \circ L(i_{1*} j_I^* F_2), E_{et}(\Omega^*_{\tilde{S}_I}, F_b))), u_{IJ}(F_2))
\]

is an \( \infty \)-filtered quasi-isomorphism by proposition 99. \( \square \)
Let \( f : X \to S \) a morphism with \( S, X \in \text{Var}(\mathbb{C}) \). Assume that there is a factorization
\[
f : X \xrightarrow{l} Y \times S \xrightarrow{p_S} S
\]
of \( f \), with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \bigcup_{i=1}^{l} S_i \) an open cover such that there exist closed embeddings \( i_{j} : S_i \hookrightarrow S \) with \( S_i \in \text{SmVar}(\mathbb{C}) \). We have \( X = \bigcup_{i=1}^{l} X_i \) with \( X_i := f^{-1}(S_i) \). Denote, for \( I \subset \{1, \cdots, l\} \), \( S_I = \cap_{i \in I} S_i \) and \( X_I = \cap_{i \in I} X_i \). For \( I \subset \{1, \cdots, l\} \), denote by \( \tilde{S}_I = \bigoplus_{i \in I} \tilde{S}_i \). We then have, for \( I \subset \{1, \cdots, l\} \), closed embeddings \( i_I : S_I \hookrightarrow \tilde{S}_I \) and the following commutative diagrams which are cartesian
\[
\begin{align*}
\xymatrix{ f_I = f|_{X_I} : X_I \ar[r]^{l_I} \ar[d]_{i_I} & Y \times S_I \ar[r]^{p_S} \ar[d]_{i_I} & S_I \ar[d]_{p_{S,I}} \ar[d]^{p_{I,J}} & Y \times \tilde{S}_I \ar[r]^{p_{S}} & \tilde{S}_I}
\end{align*}
\]
with \( l_I : l_{X_I}, i'_I = I \times i_I, p_{S,I} \) and \( p_{S,J} \) are the projections and \( p_{I,J} = I \times p_{I,J} \), and we recall that we denote by \( j_j : \tilde{S}_I \setminus S_I \hookrightarrow \tilde{S}_I \) and \( j'_j : Y \times \tilde{S}_I \setminus X_I \hookrightarrow Y \times S_I \) the open complementary embeddings. We then have the commutative diagrams
\[
\begin{align*}
D_{I,J} &= S_I \xrightarrow{i_J} \tilde{S}_I, \quad D'_{I,J} = X_I \xrightarrow{i'_{I,J}} Y \times \tilde{S}_I, \\
\end{align*}
\]
and the factorization of \( D'_{I,J} \) by the fiber product:
\[
\begin{align*}
D'_{I,J} &= X_I \xrightarrow{i'_{I,J}} Y \times \tilde{S}_I, \quad D'_{I,J} = X_I \xrightarrow{i'_{I,J}} Y \times \tilde{S}_J
\end{align*}
\]
where \( j_{I,J} : X_I \hookrightarrow X_J \) is the open embedding. Consider
\[
F(X/S) := p_{S,J}\Gamma_X\mathbb{Z}(Y \times S/Y \times S) \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S)
\]
so that \( D(A^1, et)(F(X/S)) = M(X/S) \). Then, by definition,
\[
F_{SG}^{M}(M^{BM}(X/S)) := (e(S_I), \text{Hom}(L(i_{I,J}^{*}\gamma^{*}F(X/S)), E_{cl}(\Omega_{S,J}, F_{b})[-d_{S,J}], u_{I,J}(F(X/S)))
\]
On the other hand, let
\[
Q(X_I/\tilde{S}_I) := p_{S,I}\Gamma_X\mathbb{Z}(Y \times \tilde{S}_I/Y \times S_I) \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S_I),
\]
see definition[10]. We have then for \( I \subset \{1, \cdots, l\} \) the following map in \( C(\text{Var}(\mathbb{C})^{\text{sm}}/\tilde{S}_I) \):
\[
\begin{align*}
N_I(X/S) : Q(X_I/\tilde{S}_I) & = p_{S,I}\Gamma_X\mathbb{Z}(Y \times \tilde{S}_I/Y \times S_I) \xrightarrow{p_{S,I}\text{ad}(i_{I,J}^{*}, j_{I,J}^{*})} \\
p_{S,I}^{*}i_{I,J}^{*}\Gamma_X^{*}\mathbb{Z}(Y \times \tilde{S}_I/Y \times S_I)[dy] & \xrightarrow{p_{S,I}^{*}(i_{I,J}^{*}, j_{I,J}^{*})(-)} p_{S,I}^{*}i_{I,J}^{*}\Gamma_X^{*}\mathbb{Z}(Y \times S_I/Y \times S_I)[dy] \\
\xrightarrow{\tilde{t}_{S,I}^{*}(i_{I,J}^{*}, j_{I,J}^{*})} & i_{I,J}^{*}p_{S,I}^{*}\Gamma_X^{*}\mathbb{Z}(Y \times S_I/Y \times S_I)[dy] = i_{I,J}^{*}j_{I,J}^{*}F(X/S)
\end{align*}
\]
We have then for $I \subseteq J$ the following commutative diagram in $C(\text{Var}(\mathbb{C})^{sm}/\tilde{S}_J)$:

\[
\begin{array}{ccc}
p^*_Ij_p^*s_{\tilde{S}_I} \Gamma_X^\vee Z(Y \times \tilde{S}_I/Y \times \tilde{S}_I) & \xrightarrow{p^*_IJNi(X/S)} & p^*_Ij_1p^*_JF(X/S) \\
\downarrow H_{IJ} & & \downarrow S(D_{IJ})(F(X/S)) \\
p^*_Ij_p^*s_{\tilde{S}_J} \Gamma_X^\vee Z(Y \times \tilde{S}_J/Y \times \tilde{S}_J) & \xrightarrow{N_J(X/S)} & i_Jj_2F(X/S)
\end{array}
\]

with

\[
H_{IJ} : p^*_Ij_p^*s_{\tilde{S}_J} \Gamma_X^\vee Z(Y \times \tilde{S}_J/Y \times \tilde{S}_J)
\]

This say that the maps $N_J(X/S)$ induces a map in $C(\text{Var}(\mathbb{C})^{sm}/(S/\tilde{S}_J))$

\[(N_J(X/S)) : (Q(X_1/\tilde{S}_J), H_{IJ}) \rightarrow (i_Jj_2F(X/S), S(D_{IJ})(F(X/S))).\]

We denote by $v^*_IJ(F(X/S))$ the composite

\[
v^*_IJ(F(X/S))[d_{\tilde{S}_J}] : e(\tilde{S}_I)_* \text{Hom}(Q(X_1/\tilde{S}_I), E_{et}(\Omega^\bullet_{/\tilde{S}_J}, F_b))
\]

\[
\xrightarrow{\text{ad}(p^*_IJ \circ p^*_J)(-)} p_{IJ}^* \text{Hom}(Q(X_1/\tilde{S}_I), E_{et}(\Omega^\bullet_{/\tilde{S}_J}, F_b))
\]

\[
\xrightarrow{p_{IJ}^* [T(p_{IJ}, \gamma)](Q(X_1/\tilde{S}_J))} p_{IJ}^* e(\tilde{S}_I)_* \text{Hom}(p_J^*Q(X_1/\tilde{S}_I), E_{et}(\Omega^\bullet_{/\tilde{S}_J}, F_b))
\]

\[
\xrightarrow{\text{Hom}(H_{IJ}, E_{et}(\Omega^\bullet_{/\tilde{S}_J}, F_b))} p_{IJ}^* e(\tilde{S}_J)_* \text{Hom}(Q(X_1/\tilde{S}_J), E_{et}(\Omega^\bullet_{/\tilde{S}_J}, F_b)).
\]

On the other hand, we have the following map in $C_{\text{Ofil}, D, S_I}(\tilde{S}_J)$

\[
w^*_IJ(X/S)[d_{\tilde{S}_J}] : p_{S_J}^* \Gamma_X^\vee E_{zar}(\Omega^\bullet_{/\tilde{S}_J}, F_b)
\]

\[
\xrightarrow{\text{ad}(p^*_IJ \circ p^*_J)(-)} p_{IJ}^* \text{Hom}(Q(X_1/\tilde{S}_I), E_{et}(\Omega^\bullet_{/\tilde{S}_J}, F_b))
\]

\[
\xrightarrow{T^*_w(p^*_Ij_p^*s_{\tilde{S}_J})} p_{IJ}^* p_{S_J}^* \Gamma_X^\vee E_{zar}(\Omega^\bullet_{/\tilde{S}_J}, F_b)
\]

\[
\xrightarrow{\text{Hom}(H_{IJ}, E_{et}(\Omega^\bullet_{/\tilde{S}_J}, F_b))} p_{IJ}^* \Gamma_X^\vee E_{zar}(\Omega^\bullet_{/\tilde{S}_J}, F_b).
\]

**Lemma 12.**

(i) The map in $C(\text{Var}(\mathbb{C})^{sm}/(S/\tilde{S}_J))$

\[(N_I(X/S)) : (Q(X_1/\tilde{S}_J), H_{IJ}) \rightarrow (L(i_Jj_2F(X/S)), S'(D_{IJ})(F(X/S))).\]

is an equivalence ($A^1$, et) local.

(ii) The maps $(N_I(X/S))$ induces an infinite filtered quasi-isomorphism in $C_{\text{Ofil}, D}(S/(\tilde{S}_J))$

\[
(H_{I,J}(N_I(X/S), E_{et}(\Omega^\bullet_{/\tilde{S}_J}, F_b))) :
\]

\[
(e(\tilde{S}_I)_* \text{Hom}(L(i_Jj_2F(X/S)), E_{et}(\Omega^\bullet_{/\tilde{S}_J}, F_b))[-d_{\tilde{S}_I}], u^*_IJ(F(X/S))) \rightarrow
\]

\[
(e(\tilde{S}_I)_* \text{Hom}(Q(X_1/\tilde{S}_I), E_{et}(\Omega^\bullet_{/\tilde{S}_J}, F_b))[-d_{\tilde{S}_I}], v^*_IJ(F(X/S)))
\]

(iii) The maps $(I(\gamma, \text{hom})(-,-))$ and $(k : E_{zar}(p^*_S \Omega^\bullet_{/\tilde{S}_J}, F_b) \rightarrow E_{et}(p^*_S \Omega^\bullet_{/\tilde{S}_J}, F_b))$ induce an (1-)filtered Zariski local equivalence in $C_{\text{Ofil}, D}(S/(\tilde{S}_J))$

\[
(k \circ I(\gamma, \text{hom})(-,-)) : (p^*_S^* \Gamma_X E_{zar}(\Omega^\bullet_{/\tilde{S}_J}, F_b)[-d_{\tilde{S}_J}], w^*_IJ(X/S))
\]

\[
\rightarrow (e(\tilde{S}_I)_* \text{Hom}(Q(X_1/\tilde{S}_I), E_{et}(\Omega^\bullet_{/\tilde{S}_J}, F_b))[-d_{\tilde{S}_I}], v^*_IJ(F(X/S)))
\]

219
Proof. (i): Follows from theorem \[14\].

(ii): These maps induce a morphism in \( C_{Ofd,D}(S/\tilde{S}_I) \) by construction. The fact that it is an \( \infty \)-filtered quasi-isomorphism follows from (i) and proposition \[99\].

(iii): These maps induce a morphism in \( C_{Ofd,D}(S/\tilde{S}_I) \) by construction. \( \square \)

**Proposition 101.** Let \( f : X \to S \) a morphism with \( S, X \in \text{Var}(\mathbb{C}) \). Let \( S = \bigsqcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \to \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). Then \( X = \bigsqcup_{i=1}^l X_i \) with \( X_i := f^{-1}(S_i) \). Denote, for \( I \subset [1, \cdots, l] \), \( S_I = \cap_{i \in I} S_i \) and \( X_I = \cap_{i \in I} X_i \). Assume there exist a factorization

\[
 f : X \xrightarrow{i} Y \times S \xrightarrow{p_S} S
\]

of \( f \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. We then have, for \( I \subset [1, \cdots, l] \), the following commutative diagrams which are cartesian

\[
\begin{array}{ccc}
X & \xrightarrow{i_i} & S_i \\
\downarrow & & \downarrow \quad \downarrow \\
X \times S_I & \xrightarrow{p_S} & S_I
\end{array}
\]

\[
\begin{array}{ccc}
Y & \xrightarrow{i_i} & S_I \\
\downarrow & & \downarrow \\
Y \times S_I & \xrightarrow{p_S} & S_I
\end{array}
\]

\[
\begin{array}{ccc}
Y \times S_I & \xrightarrow{p_{S_I}} & S_I \\
\downarrow & & \downarrow \\
Y & \xrightarrow{p_{S_I}} & S_I
\end{array}
\]

\[
\begin{array}{ccc}
Y \times S_I & \xrightarrow{p_{S_I}} & S_I \\
\downarrow & & \downarrow \\
Y & \xrightarrow{p_{S_I}} & S_I
\end{array}
\]

Let \( F(X/S) := p_{S_I} \Gamma^X \mathcal{Z}(Y \times S/Y \times S) \). The transformations maps \( (N_I(X/S), Q(X_I/\tilde{S}_I) \to \tilde{i}_I \tilde{j}_I^* F(X/S)) \) and \( (k \circ I(\gamma, \text{Hom})(\cdot, \cdot)) \), for \( I \subset [1, \cdots, l] \), induce an isomorphism in \( D_{Ofd,D,\infty}(S/\tilde{S}_I) \)

\[
\begin{array}{c}
\xrightarrow{I_{GM}(X/S)} \\
\xrightarrow{(e(\tilde{S}_I), \text{Hom}(L(i_i \tilde{j}_I^* F(X/S)), E_{et}(\tilde{\Omega}^*_S, F_b))[-d_{\tilde{S}_I}], u_{l,I}^q F(X/S)))} \\
\xrightarrow{(e(\tilde{S}_I), \text{Hom}(L(N_I(X/S), E_{et}(\tilde{\Omega}^*_S, F_b))))} \\
\xrightarrow{(k \circ I(\gamma, \text{Hom})(\cdot, \cdot))^{-1}} \\
\xrightarrow{(p_{S_I}, \Gamma X_I E_{zar}(\tilde{\Omega}^*_Y \times S_I/F_b))[-d_{\tilde{S}_I}], w_{l,I} F(X/S))}
\end{array}
\]

**Proof.** Follows from lemma \[12\]. \( \square \)

**Corollary 4.** Let \( S \in \text{Var}(\mathbb{C}) \) and \( S = \bigsqcup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \to \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). For \( F \in C(\text{Var}(\mathbb{C})^{\text{sm}}) \) such that \( D(A^1, \text{et})(F) \in DA_c(S) \), \( u_{l,f}^q F \) are \( \infty \)-filtered Zariski local equivalence.

Proof. Let \( f : X \to S \) a morphism with \( X \in \text{Var}(\mathbb{C}) \) such that there exist a factorization, \( f : X \xrightarrow{i} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Then, by lemma \[12\](ii) and (iii), \( u_{l,f}^q F(X/S) \) are Zariski local equivalences since \( w_{l,f} F(X/S) \) are isomorphisms. \( \square \)

We now define the functorialities of \( F_{GM}^S \) with respect to \( S \) which makes \( F_{GM}^S \) a morphism of 2-functor.

**Definition 106.** Let \( g : T \to S \) a morphism with \( T, S \in \text{SmVar}(\mathbb{C}) \). Consider the factorization \( g : T \xrightarrow{l} X \times S \xrightarrow{p_S} S \) where \( l \) is the graph embedding and \( p_S \) the projection. Let \( M \in DA_c(S) \) and \( F \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S) \) such that \( M = D(A^1_0, \text{et})(F) \). Then, \( D(A^1_0, \text{et})(g^* F) = g^* M \).

(i) We have then the canonical transformation in \( D_{Ofd,D,\infty}(T \times S) \) (see definition \[102\]):

\[
T(g, F_{GM}^S)(M) : Rg^{\text{mod}[\cdot]}_{\ast} T_{GM}^S(M) := g^{\text{mod}[\cdot]}_{\Gamma} e(S), \text{Hom}^\bullet(F, E_{et}(\tilde{\Omega}^*_S, F_b))[-d_T]
\]

\[
\text{e}(T \times S), \text{Hom}^\bullet(F, E_{et}(\tilde{\Omega}^*_T \times S, F_b))[-d_T] =: T_{GM}^S(l_* g^*(M, W)).
\]
(ii) We have then the canonical transformation in $D_{OJ}, \infty(T)$ (see definition [102]):

$$T^O(g, F^{GM})(M, W): \mathrm{Lg^\ast \mod[-]} F^S_{GM}(M) := g^\ast \mod e(S), \mathrm{Hom}^\bullet(LF, E_{et}(\Omega_{/S}^2, F_b))[-d_T]$$

$$\xrightarrow{T^O(g, \Omega^\ast_{/S})(LF)} e(T), \mathrm{Hom}^\bullet(g^\ast LF, E_{et}(\Omega_{/S}^2, F_b))[-d_T] := F^S_{GM}(g^\ast M).$$

We give now the definition in the non smooth case Let $g: T \rightarrow S$ a morphism with $T, S \in \var{C}$. Assume we have a factorization $g: T \xrightarrow{\phi} Y \times S \xrightarrow{p_S} S$ with $Y \in \var{SmVar}(C)$, $l$ a closed embedding and $p_S$ the projection. Let $S = \cup_{i=1}^l S_i$ be an open cover such that there exists closed embeddings $i_i: S_i \hookrightarrow S_i$ with $S_i \in \var{SmVar}(C)$ Then, $T = \cup_{i=1}^l T_i$ with $T_i := g^{-1}(S_i)$ and we have closed embeddings $i'_{i} := i_i \circ l : T_i \hookrightarrow Y \times S_i$. Moreover $	ilde{g}_i := p_{S_i}: Y \times \tilde{S}_i \rightarrow \tilde{S}_i$ is a lift of $g_i := g|_{T_i}: T_i \rightarrow S_i$. We recall the commutative diagram :

$$E_{IJ}(g) = (Y \times \tilde{S}_i)\setminus T_i \xrightarrow{m_{ij}} Y \times \tilde{S}_j , E_{IJ} = \tilde{S}_i \setminus S_i \xrightarrow{m_{ij}} \tilde{S}_j , E_{IJ} = (Y \times \tilde{S}_j)\setminus T_j \xrightarrow{m_{ij}} Y \times \tilde{S}_j$$

For $I \subset J$, denote by $p_{IJ} : \tilde{S}_J \rightarrow \tilde{S}_I$ and $p'_{IJ} := I_J \oplus p_{IJ} : Y \times \tilde{S}_J \rightarrow Y \times \tilde{S}_I$ the projections, so that $\tilde{g}_I \circ p'_{IJ} = p_{IJ} \circ \tilde{g}_J$. Consider, for $I \subset J \subset [1, \ldots, l]$, resp. for each $I \subset [1, \ldots, l]$, the following commutative diagrams in $\var{Var}(C)$

$$D_{IJ} = S_{IJ} \xrightarrow{i_{IJ}} \tilde{S}_J , D'_{IJ} = T_{IJ} \xrightarrow{i'_{IJ}} Y \times \tilde{S}_J \xrightarrow{D_{gJ}} S_{IJ} \xrightarrow{i_{IJ}} \tilde{S}_J$$

and $j_{IJ} : S_I \hookrightarrow S_J$ is the open embedding so that $j_I \circ j_{IJ} = j_J$. Let $F \in \var{C}(\var{Var}(C)^{S^m}/S).$ Recall (see section 2) that since $j_I^\ast i'_{IJ}^\ast j_J^\ast g^\ast F = 0$, the morphism $T(D_{gJ})(j_I^\ast F) : \tilde{g}^\ast i_{IJ}^\ast j_I^\ast F \rightarrow i'_{IJ}^\ast j_J^\ast g^\ast F$ factors through $T(D_{gJ})(j_I^\ast F) : \tilde{g}^\ast i_{IJ}^\ast j_I^\ast F \rightarrow i'_{IJ}^\ast j_J^\ast g^\ast F$

We then have, for each $I \subset [1, \ldots, l]$, the morphism

$$T(a, \gamma)(D_{gJ})(j_I^\ast F) : \Gamma_{T_I} \tilde{g}^\ast L(i_{IJ}^\ast j_I^\ast F) \xrightarrow{T(g_{T_I} L)(-)}$$

$$\Gamma_{T_J} L(i'_{IJ}^\ast j_J^\ast F) = L(i'_{IJ}^\ast j_J^\ast F) \rightarrow (T^\ast(D_{gJ})(j_I^\ast F)) \rightarrow L(i'_{IJ}^\ast j_J^\ast g^\ast F)$$

and the following diagram in $\var{C}(\var{Var}(C)^{S^m}/Y \times \tilde{S}_I)$ commutes

$$\xymatrix{ \Gamma_{T_J} \tilde{g}^\ast L(i_{IJ}^\ast j_I^\ast F) \ar@{-}[r]^{\Gamma_{T_I} \tilde{g}^\ast L(i_{IJ}^\ast j_I^\ast F)} & \Gamma_{T_I} \tilde{g}^\ast L(i_{IJ}^\ast j_I^\ast F) \ar@{-}[r]^{T^\ast(D_{gJ})(j_I^\ast F)} & L(i'_{IJ}^\ast j_J^\ast g^\ast F) \ar@{-}[r]^{q_{ij}(g^\ast F)} & \tilde{l}_{ij}^\ast g_{ij}^\ast F = i'_{ij}^\ast j_J^\ast g^\ast F }$$

We have the following commutative diagram in $\var{C}(\var{Var}(C)^{S^m}/Y \times \tilde{S}_J)$

$$\xymatrix{ p_{IJ} p_{IJ} i_{IJ}^\ast j_I^\ast F = \tilde{g}^\ast \hat{p}_{IJ} i_{IJ}^\ast j_I^\ast F \ar@{-}[d]_{\tilde{g}^\ast S(D_{IJ})(F)} \ar@{-}[r]^{p_{IJ} T(D_{gJ})(j_I^\ast F)} & p_{IJ} i'_{IJ}^\ast j_J^\ast F = \tilde{g}^\ast \hat{p}_{IJ} i'_{IJ}^\ast j_J^\ast F \ar@{-}[l]_{\tilde{g}^\ast S(D_{IJ})(F)} \ar@{-}[r]^{p_{IJ} T(D_{gJ})(j_I^\ast F)} & p_{IJ} i'_{IJ}^\ast j_J^\ast F = \tilde{g}^\ast \hat{p}_{IJ} i'_{IJ}^\ast j_J^\ast F \ar@{-}[d]_{\tilde{g}^\ast S(D_{IJ})(F)} \ar@{-}[r]^{p_{IJ} T(D_{gJ})(j_I^\ast F)} & }$$
This gives, after taking the functor $L$, the following commutative diagram in $\text{C}(\text{Var}(\mathbb{C})^{sm}/Y \times \tilde{S}_I)$

$$
\begin{array}{c}
\Gamma_{T^s_p}^\gamma \delta''_p \Gamma_{T^s_p}^\gamma \delta''_p L(i_1 \times j_i^* F) = \Gamma_{T^s_p}^\gamma \delta''_p \Gamma_{T^s_p}^\gamma \delta''_p L(i_1 \times j_i^* F) \\
\xrightarrow{\delta''_p S^g(D_{ij})(F)} \\
\xrightarrow{\delta''_p T_{ij}^\gamma (D_{ij})(j_i^* F)} \\
\xrightarrow{\delta''_p T_{ij}^\gamma (D_{ij})(j_i^* F)} \\
\Gamma_{T^s_p}^\gamma \delta''_p L(i_1 \times j_i^* g^* F) \\
\end{array}
$$

(55)

The fact that the diagrams commutes says that the maps $T_{ij}^\gamma (D_{ij})(j_i^* F)$ define a morphism in $\text{C}(\text{Var}(\mathbb{C})^{sm}/(T/(Y \times \tilde{S}_I)))$

$$(T_{ij}^\gamma (D_{ij})(j_i^* F)) : (\Gamma_{T^s_p}^\gamma \delta''_p L(i_1 \times j_i^* F), \delta''_p S^g(D_{ij})(F)) \rightarrow (L(i_1 \times j_i^* g^* F), S^g(D_{ij})(g^* F))$$

We denote by $\tilde{g}_{ij}^\ast u_{ij}^F(F)_1$ the composite

$$
\begin{aligned}
\tilde{g}_{ij}^\ast u_{ij}^F(F)_1 [dy + d\tilde{S}_I] : & e(Y \times \tilde{S}_I), \Gamma_{T^s_p}^\gamma \delta''_p L(i_1 \times j_i^* F), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b) \\
\xrightarrow{\text{ad}(\delta''_p \gamma(-))} & \delta''_p \gamma(-) \rightarrow \delta''_p \gamma(-) \\
\text{ad}(\delta''_p \gamma(-)) & \rightarrow p_{ij}^\gamma \gamma(-) e(Y \times \tilde{S}_I), \Gamma_{T^s_p}^\gamma \delta''_p L(i_1 \times j_i^* F), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b) \\
\xrightarrow{T_{ij}^\gamma (D_{ij})(j_i^* F))} & \delta''_p T_{ij}^\gamma (D_{ij})(j_i^* F)) \\
\text{Cone}(\text{ad}(\delta''_p \gamma(-))) & \rightarrow \delta''_p T_{ij}^\gamma (D_{ij})(j_i^* F)) \\
\xrightarrow{\text{Hom}(\delta''_p (S^g(D_{ij})(F)), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b))} & \delta''_p T_{ij}^\gamma (D_{ij})(j_i^* F)) \\
\xrightarrow{\text{Hom}(\delta''_p (S^g(D_{ij})(F)), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b))} & \delta''_p T_{ij}^\gamma (D_{ij})(j_i^* F)) \\
\end{aligned}
$$

We denote by $\tilde{g}_{ij}^\ast u_{ij}^F(F)_2$ the composite

$$
\begin{aligned}
\tilde{g}_{ij}^\ast u_{ij}^F(F)_2 [dy + d\tilde{S}_I] : & e(Y \times \tilde{S}_I), \Gamma_{T^s_p}^\gamma \delta''_p L(i_1 \times j_i^* F), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b) \\
\xrightarrow{\text{ad}(\delta''_p \gamma(-))} & \delta''_p \gamma(-) \rightarrow \delta''_p \gamma(-) \\
\text{ad}(\delta''_p \gamma(-)) & \rightarrow p_{ij}^\gamma \gamma(-) e(Y \times \tilde{S}_I), \Gamma_{T^s_p}^\gamma \delta''_p L(i_1 \times j_i^* F), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b) \\
\xrightarrow{T_{ij}^\gamma (D_{ij})(j_i^* F))} & \delta''_p T_{ij}^\gamma (D_{ij})(j_i^* F)) \\
\text{Cone}(\text{ad}(\delta''_p \gamma(-))) & \rightarrow \delta''_p T_{ij}^\gamma (D_{ij})(j_i^* F)) \\
\xrightarrow{\text{Hom}(\delta''_p (S^g(D_{ij})(F)), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b))} & \delta''_p T_{ij}^\gamma (D_{ij})(j_i^* F)) \\
\xrightarrow{\text{Hom}(\delta''_p (S^g(D_{ij})(F)), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b))} & \delta''_p T_{ij}^\gamma (D_{ij})(j_i^* F)) \\
\end{aligned}
$$

We then have the following lemma :

**Lemma 13.**

(i) The morphism in $\text{C}(\text{Var}(\mathbb{C})^{sm}/(T/(Y \times \tilde{S}_I)))$

$$(T_{ij}^\gamma (D_{ij})(j_i^* F)) : (\Gamma_{T^s_p}^\gamma \delta''_p L(i_1 \times j_i^* F), \delta''_p S^g(D_{ij})(F)) \rightarrow (L(i_1 \times j_i^* g^* F), S^g(D_{ij})(g^* F))$$

is an equivalence (\mathbb{A}^1, et) local.

(ii) Denote for short $dy_I = -dy - d\tilde{S}_I$. The maps $\text{Hom}((T_{ij}^\gamma (D_{ij})(j_i^* F)), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b))$ induce an $\infty$-filtered quasi-isomorphism in $\text{C}(\text{Var}(\mathbb{C})^{sm}/(T/(Y \times \tilde{S}_I)))$

$$
\text{Hom}(T_{ij}^\gamma (D_{ij})(j_i^* F), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b)) : \\
\text{Hom}((T_{ij}^\gamma (D_{ij})(j_i^* F), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b)) [dy_I], u_{ij}^F(g^* F)) \\
\xrightarrow{(e(Y \times \tilde{T}_I), \text{Hom}(L(i_1 \times j_i^* g^* F), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b)) [dy_I], u_{ij}^F(g^* F))} \\
\text{Hom}((\Gamma_{T^s_p}^\gamma \delta''_p L(i_1 \times j_i^* F), E_{et}(\Omega_{/Y \times \tilde{S}_I}^\bullet, F_b)) [dy_I], \tilde{g}_{ij}^\ast u_{ij}^F(F)_2)
$$

222
(iii) The maps \( T(\tilde{g}_I, \Omega_\ast)(L(i_1^I, j_1^I F)) \) (see definition \([102]\)) induce a morphism in \( C_{O_{fil,D}}(T/(Y \times \tilde{S}_I)) \)

\[
(\Gamma T_I E_{zar}(\tilde{g}_I^{mod} e(\tilde{S}_I), \text{Hom}^\ast(L(i_1, j_1^I F), E_{et}(\Omega_{\tilde{S}_I}^\ast, F_b)))|dy_1, \tilde{g}_I^{mod} u_{ij}^I(F)) \rightarrow \\
(\Gamma T_I(e(Y \times \tilde{S}_I), \text{Hom}(\tilde{g}_I^t_1 L(i_1, j_1^I F), E_{et}(\Omega_{Y \times \tilde{S}_I}^\ast, F_b)))|dy_1, \tilde{g}_j u_{ij}^I(F_1))
\]

Proof. (i): Follows from theorem \([14]\).

(ii): These maps induce a morphism in \( C_{O_{fil,D}}(T/(Y \times \tilde{S}_I)) \) by construction. The fact that this morphism is an \( \infty \)-filtered equivalence Zariski local follows from (i) and proposition \([19]\).

(iii): These maps induce a morphism in \( C_{O_{fil,D}}(T/(Y \times \tilde{S}_I)) \) by construction. \( \square \)

Definition 107. Let \( g : T \rightarrow S \) a morphism with \( T, S \in \text{Var}(\mathbb{C}) \). Assume we have a factorization \( g : T \xrightarrow{\tilde{g}_I} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( I \) a closed embedding and \( p_S \) the projection. Let \( S = \cup_{i=1}^I S_i \) be an open cover such that there exists closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). Then, \( T = \cup_{i=1}^I T_i \) with \( T_i := g_1^{-1}(S_i) \) and we have closed embeddings \( i_i' := i_i \circ e : T_i \hookrightarrow Y \times \tilde{S}_i \). Moreover \( \tilde{g}_I := p_{\tilde{S}_I} : Y \times \tilde{S}_I \rightarrow \tilde{S}_I \) is a lift of \( g_I : T_I \rightarrow S_I \). Denote for short \( dy_i := dy + d\tilde{S}_I \). Let \( M \in \text{DA}_c(S) \) and \( F \in C(\text{Var}(\mathbb{C})^m/S) \) such that \( M = D(A^1_\alpha, et)(F) \). Then, \( D(A^1_\alpha, et)(g^\ast M) = g^\ast M \). We have, by lemma \([13]\) the canonical transformation in \( D_{O_{fil,D}, \infty}(T/(Y \times \tilde{S}_I)) \)

\[
T(g, F^{GM})(M) : Rg^{mod} e(\tilde{g}_I, \text{Hom}^\ast(L(i_1, j_1^I F), E_{et}(\Omega_{\tilde{S}_I}^\ast, F_b)))|dy_i - d\tilde{S}_i, \tilde{g}_I^{mod} u_{ij}^I(F)) \rightarrow \\
(\Gamma T_I(e(Y \times \tilde{S}_I), \text{Hom}(\tilde{g}_I^t_1 L(i_1, j_1^I F), E_{et}(\Omega_{Y \times \tilde{S}_I}^\ast, F_b)))|dy_i - d\tilde{S}_i, \tilde{g}_j u_{ij}^I(F_1))
\]

Proposition 102. (i) Let \( g : T \rightarrow S \) a morphism with \( T, S \in \text{Var}(\mathbb{C}) \). Assume we have a factorization \( g : T \xrightarrow{\tilde{g}_I} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( I \) a closed embedding and \( p_S \) the projection. Let \( S = \cup_{i=1}^I S_i \) be an open cover such that there exists closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). Then, \( T = \cup_{i=1}^I T_i \) with \( T_i := g_1^{-1}(S_i) \) and we have closed embeddings \( i_i' := i_i \circ e : T_i \hookrightarrow Y \times \tilde{S}_i \). Moreover \( \tilde{g}_I := p_{\tilde{S}_I} : Y \times \tilde{S}_I \rightarrow \tilde{S}_I \) is a lift of \( g_I : T_I \rightarrow S_I \). Let \( f : X \rightarrow S \) a morphism with \( X \in \text{Var}(\mathbb{C}) \). Assume that there is a factorization \( f : X \xrightarrow{\tilde{f}_I} Y_1 \times S \xrightarrow{p_S} S \) with \( Y_1 \in \text{SmVar}(\mathbb{C}) \), \( I \) a closed embedding and \( p_S \) the projection. We have then the following commutative diagram whose squares are cartesian diagrams.

\[
f' : X_T \longrightarrow Y_1 \times T \longrightarrow T \\
\downarrow \quad \downarrow \quad \downarrow \\
f'' = f \times I : Y_2 \times X \longrightarrow Y_1 \times Y_2 \times S \longrightarrow Y_2 \times S \\
\downarrow \quad \downarrow \quad \downarrow \\
f : X \longrightarrow Y_1 \times S \longrightarrow S
\]
Consider \(F(X/S) := p_{S,2} \Gamma_X^* Z(Y_1 \times S/Y_1 \times S)\) and the isomorphism in \(C(\text{Var}(\mathbb{C})^{sm}/S)\):

\[
T(f, g, F(X/S)) : g^* F(X/S) \xrightarrow{p_{T,2}} g^* p_{S,2} \Gamma_X^* Z(Y_1 \times S/Y_1 \times S) \cong F(X_T/T).
\]

which gives in \(DA(S)\) the isomorphism \(T(f, g, F(X/S)) : g^* M(X/S) \cong M(X_T/T)\). Then, the following diagram in \(D_{O_T^{fil},D,\infty}(T/(Y_2 \times \tilde{S}_2))\) commutes

\[
\begin{array}{ccc}
Rg^{*\text{mod}, T} F_S^{GM}(M(X/S)) & \xrightarrow{T(g,F^{GM})(M(X/S))} & F_T^{GM}(M(X_T/T)) \\
\downarrow I^{GM}(X/S) & & \downarrow I^{GM}(X_T/T) \\
g^{*\text{mod}}[-1] \Gamma(p_{S,1} \Gamma_X^* \Omega_{Y_1 \times S_1 \times S_1}^* F_b)[-d_{S_1}] & \xrightarrow{(T(g \times t,\gamma)(-)) \circ T_{\omega}^{GM}(g, p_{S,1})} & (p_{Y_2 \times \tilde{S}_1} \Gamma_{X_T^*} \Omega_{Y_2 \times Y_1 \times S_2 \times S_1}^* F_b)[-d_{Y_2} - w_{I,1}]
\end{array}
\]

(ii) Let \(g : T \to S\) a morphism with \(T, S \in \text{SmVar}(\mathbb{C})\). Let \(f : X \to S\) a morphism with \(X \in \text{Var}(\mathbb{C})\). Assume that there is a factorization \(f : X \xrightarrow{p} Y \times S \xrightarrow{p_S} S\), with \(Y \in \text{SmVar}(\mathbb{C})\), \(l\) a closed embedding and \(p_S\) the projection. Consider \(F(X/S) := p_{S,2} \Gamma_X^* Z(Y \times Y \times Y)\) and the isomorphism in \(C(\text{Var}(\mathbb{C})^{sm}/S)\):

\[
T(f, g, F(X/S)) : g^* F(X/S) \xrightarrow{p_{T,2}} g^* p_{S,2} \Gamma_X^* Z(Y \times S/Y \times S) \cong F(X_T/T).
\]

which gives in \(DA(S)\) the isomorphism \(T(f, g, F(X/S)) : g^* M(X/S) \cong M(X_T/T)\). Then, the following diagram in \(D_{O_T^{fil},D,\infty}(T)\) commutes

\[
\begin{array}{ccc}
Lg^{*\text{mod}, -1} F_S^{GM}(M(X/S)) & \xrightarrow{T^O(g,F^{GM})(M(X/S))} & F_T^{GM}(M(X_T/T)) \\
\downarrow I^{GM}(X/S) & & \downarrow I^{GM}(X_T/T) \\
g^{*\text{mod}} L_O(p_{S,2} \Gamma_X^* \Omega_{Y \times Y \times Y}^* F_b)[-d_T] & \xrightarrow{(T(g \times t,\gamma)(-)) \circ T_{\omega}^{GM}(g, p_{S,2})} & p_{Y \times T} \Gamma_{X_T^*} \Omega_{Y \times Y / T}^* F_b)[-d_T] \\
\downarrow T^{\omega}(\gamma)(O_X \times S) & & \downarrow T^{\omega}(\gamma)(O_Y \times T) \\
Lg^{*\text{mod}} \int_{p_{S}}^{\text{FDR}} \Gamma_X E(O_Y \times S, F_b)[-d_Y - d_T] & \xrightarrow{T^{\omega}(g,f)(\gamma) \circ E(O_Y \times S, F_b)} & \int_{p_{T}}^{\text{FDR}} \Gamma_{X_T} E(O_Y \times T, F_b)[-d_Y - d_T].
\end{array}
\]

Proof. Follows immediately from definition. \(\square\)

We have the following theorem:

**Theorem 30.** (i) Let \(g : T \to S\) is a morphism with \(T, S \in \text{Var}(\mathbb{C})\). Assume there exist a factorization \(g : T \xrightarrow{p} Y \times S \xrightarrow{p_S} S\) with \(Y \in \text{SmVar}(\mathbb{C})\), \(l\) a closed embedding and \(p_S\) the projection. Let \(S = \bigcup_{i=1}^{I} S_i\) be an open cover such that there exists closed embeddings \(i_i : S_i \hookrightarrow S_i\) with \(S_i \in \text{SmVar}(\mathbb{C})\). Then, for \(M \in DA_c(S)\)

\[
T(g,F^{GM})(M) : Rg^{*\text{mod}, -1} F_S^{GM}(M) \xrightarrow{\sim} F_T^{GM}(g^* M)
\]

is an isomorphism in \(D_{O_T^{fil},D,\infty}(T/(Y \times \tilde{S}_2))\).

(ii) Let \(g : T \to S\) is a morphism with \(T, S \in \text{SmVar}(\mathbb{C})\). Then, for \(M \in DA_c(S)\)

\[
T^O(g,F^{GM})(M) : Lg^{*\text{mod}, -1} F_S^{GM}(M) \xrightarrow{\sim} F_T^{GM}(g^* M)
\]

is an isomorphism in \(D_{O_T}(T)\).
(iii) A base change theorem for algebraic De Rham cohomology: Let \( g : T \to S \) be a morphism with \( T, S \in \text{SmVar}(\mathbb{C}) \). Let \( h : U \to S \) be a smooth morphism with \( U \in \text{Var}(\mathbb{C}) \). Then the map (see definition \([7]\))
\[
T^n_{\partial}(g,h) : Lg^{\ast \text{mod}} Rh_{\ast}(\Omega_{U/S}^{\bullet}, F_b) \simto Rh_{\ast}(\Omega_{U/T}^{\bullet}, F_b)
\]

is an isomorphism in \( D_{O_T}(T) \).

**Proof.** (i): Follows from proposition \([98]\). (ii): Follows from proposition \([102]\)(ii) and the base change for algebraic D modules (proposition \([13]\)). (iii): Follows from (ii) and lemma \([10]\). \( \square \)

We finish this subsection by a consequence of proposition \([97]\) and theorem \([14]\):

**Theorem 31.** Let \( X \in \text{PSmVar}(\mathbb{C}) \) and \( D = \bigcup D_i \subset X \) a normal crossing divisor. Consider the open embedding \( j : U := X \setminus D \hookrightarrow X \). Then, the inclusion
\[
j^{\ast} : \Gamma(X, E_{zar}(\Omega_X^{\bullet}(\log D), F_b)) \hookrightarrow \Gamma(U, E_{zar}(\Omega_U^{\bullet}, F_b))
\]

is an \( \infty \)-filtered quasi-isomorphism, that is
\[
j^{\ast} : F^p H^n(U, \mathbb{C}) := F^p H^n \Gamma(X, E_{zar}(\Omega_X^{\bullet}(\log D), F_b)) \simto F^p H^n \Gamma(U, E_{zar}(\Omega_U^{\bullet}, F_b)) =: F^p H^n(U, \mathbb{C})
\]
is an isomorphism for all \( n, p \in \mathbb{Z} \) (note that it is obviously injective since \( j^{\ast} : H^n \Gamma(X, E_{zar}(\Omega_X^{\bullet}(\log D))) \simto H^n \Gamma(U, E_{zar}(\Omega_U^{\bullet})) \) is an isomorphism if we forgot filtrations). Note that however, it is NOT a filtered quasi-isomorphism (for example if \( U \) is affine \( H^q(U, \Omega_U^{\bullet}) = 0 \) for \( q > 0 \) that it is not an isomorphism on the \( E_1 \) terms of the spectral sequences in general.

**Proof.** For simplicity, we may assume that \( i : D \hookrightarrow X \) is a smooth divisor. Then, by theorem \([13]\) there is a purity isomorphism in \( \text{DA}(\mathbb{C}) \)
\[
P(D/X) : \text{Cone}(a_{X \setminus D}(j_\ast, j_\ast)(\mathbb{Z}(X/X))) : \mathbb{Z}(U) \to \mathbb{Z}(X)) \simto \mathbb{Z}(D)[1]
\]
is an equivalence (\( \mathbb{A}^1, \text{et} \)) local in \( C(\text{SmVar}(\mathbb{C})) \), with \( a_X : X \to \text{pt} \) the terminal map. Hence, by proposition \([97]\) we get an isomorphism in \( D_{f, \infty}(\mathbb{Z}) \)
\[
e(\text{Spec } \mathbb{C})_\ast \text{Hom}(P(D/X), E_{et}(\Omega_{\mathbb{C} \setminus D}^{\bullet}, F_b)) : \text{Cone}(j^{\ast} : \Gamma(X, E_{zar}(\Omega_{U}^{\bullet}, F_b)) \to \Gamma(U, E_{zar}(\Omega_{U}^{\bullet}, F_b))[1]) \simto \Gamma(D, E_{zar}(\Omega_{U}^{\bullet}, F_b)[1]).
\]
which gives the isomorphism in \( D_{f, \infty}(\mathbb{Z}) \),
\[
j^{\ast} : \text{Cone}(c(j^{\ast}) \circ e(\text{Spec } \mathbb{C})_\ast \text{Hom}(P(D/X), E_{et}(\Omega_{\mathbb{C} \setminus D}^{\bullet}, F_b))^{-1} : \Gamma(D, E_{zar}(\Omega_{U}^{\bullet}, F_b)[1]) \to \Gamma(X, E_{zar}(\Omega_{U}^{\bullet}, F_b)) \simto \Gamma(U, E_{zar}(\Omega_{U}^{\bullet}, F_b))
\]
where \( c(j^{\ast}) : \text{Cone}(j^{\ast}) \to \Gamma(X, E_{zar}(\Omega_{U}^{\bullet}, F_b))[-1] \) is the canonical map, which induces the isomorphisms
\[
H^n j^{\ast} : F^p H^n \text{Cone} \Gamma(D, E_{zar}(\Omega_{U}^{\bullet}, F_b))[1] \to \Gamma(X, E_{zar}(\Omega_{U}^{\bullet}, F_b)) \simto F^p H^n \Gamma(U, E_{zar}(\Omega_{U}^{\bullet}, F_b)).
\]

\( \square \)

**Definition 108.** Let \( S \in \text{SmVar}(\mathbb{C}) \). We have, for \( M, N \in \text{DA}(S) \) and \( F, G \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S) \) projective such that \( M = D(\mathbb{A}^1, \text{et})(F) \) and \( N = D(\mathbb{A}^1, \text{et})(G) \), the following transformation map in \( D_{f, \infty}(\mathbb{P}) \)
\[
T(F_S^{GM}, \otimes)(M, N) := (\epsilon(S)_\ast \text{Hom}(F, E_{et}(\Omega_{\mathbb{C} \setminus D}^{\bullet}, F_b)) \otimes_{O_S} (\epsilon(S)_\ast \text{Hom}(G, E_{et}(\Omega_{\mathbb{C} \setminus D}^{\bullet}, F_b)))[d_S]
\]
\[
\simto (\epsilon(S)_\ast \text{Hom}(F \otimes G, E_{et}(\Omega_{\mathbb{C} \setminus D}^{\bullet}, F_b)))[d_S] =: F_S^{GM}(M \otimes N)
\]

225
We now give the definition in the non smooth case:

**Definition 109.** Let \( S \in \text{Var}(\mathbb{C}) \) and \( S = \bigcup_{i=1}^l S_i \) an open affine covering and denote, for \( I \subset [1, \ldots, l] \), \( S_I = \bigcap_{i \in I} S_i \) and \( j_I : S_I \hookrightarrow S \) the open embedding. Let \( i_I : S_i \hookrightarrow \tilde{S_i} \) closed embeddings, with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). We have, for \( M, N \in \text{DA}(S) \) and \( F, G \in C(\text{Var}(\mathbb{C})^m/S) \) such that \( M = D(\mathbb{A}^1, \text{et})(F) \) and \( N = D(\mathbb{A}^1, \text{et})(G) \), the following transformation map in \( D_{\mathbb{O}_S,D}(S/(\tilde{S}_I)) \):

\[
T(F_S^GM, \otimes)(M, N) : F_S^GM(M) \otimes_{\mathbb{O}_S} F_S^GM(N) :=
\]

\[
= (e(\tilde{S}_I)_* \text{Hom}(L(i_I j_I^* F), E_{\text{et}}(\Omega_{\tilde{S}_I/S}^*, F_b))[d_{\tilde{S}_I}], u_{I I}(F)) \otimes_{\mathbb{O}_S} (e(\tilde{S}_I)_* \text{Hom}(L(i_I j_I^* G), E_{\text{et}}(\Omega_{\tilde{S}_I/S}^*, F_b))[d_{\tilde{S}_I}], u_{I I}(G))
\]

\[
\begin{array}{c}
\rightarrow ((e(\tilde{S}_I)_* \text{Hom}(L(i_I j_I^* F), E_{\text{et}}(\Omega_{\tilde{S}_I/S}^*, F_b)))[d_{\tilde{S}_I}], u_{I I}(F \otimes G))
\end{array}
\]

\[
\begin{array}{c}
\rightarrow (e(\tilde{S}_I)_* \text{Hom}(L(i_I j_I^* (F \otimes G), E_{\text{et}}(\Omega_{\tilde{S}_I/S}^*, F_b)))[d_{\tilde{S}_I}], u_{I I}(F \otimes G)) =: F_S^GM(M \otimes N)
\end{array}
\]

**Proposition 103.** Let \( f_1 : X_1 \rightarrow S, f_2 : X_2 \rightarrow S \) two morphism with \( X_1, X_2, S \in \text{Var}(\mathbb{C}) \). Assume that there exist factorizations \( f_1 : X_1 \xrightarrow{l_1} Y_1 \times_S S, f_2 : X_2 \xrightarrow{l_2} Y_2 \times_S S \) with \( Y_1, Y_2 \in \text{SmVar}(\mathbb{C}), l_1, l_2 \) closed embeddings and \( p_S \) the projections. We have then the factorization

\[
f_1 \times f_2 : X_{12} := X_1 \times_S X_2 \xrightarrow{l_1 \times l_2} Y_1 \times Y_2 \times_S S \xrightarrow{p_S} S
\]

Let \( S = \bigcup_{i=1}^l I_i \) an open affine covering and denote, for \( I \subset [1, \ldots, l] \), \( I_I = \bigcap_{i \in I} I_i \) and \( j_I : S_I \hookrightarrow S \) the open embedding. Let \( i_I : S_i \hookrightarrow \tilde{S_i} \) closed embeddings, with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). We have, for \( M, N \in \text{DA}(S) \) and \( F, G \in C(\text{Var}(\mathbb{C})^m/S) \) such that \( M = D(\mathbb{A}^1, \text{et})(F) \) and \( N = D(\mathbb{A}^1, \text{et})(G) \), the following commutative diagram in \( D_{\mathbb{O}_S,D}(S/\tilde{S}_I) \):

\[
F_S^GM(M(X_1/S)) \otimes_{\mathbb{O}_S} F_S^GM(M(X_2/S)) \xrightarrow{T(F_S^GM, \otimes)(M(X_1/S), M(X_2/S))} F_S^GM(M(X_1/S) \otimes M(X_2/S))
\]

\[
F_S^GM(M(X_1/S) \otimes M(X_2/S)) \xrightarrow{I(F_S^GM \otimes)(M(X_1/S), M(X_2/S))} F_S^GM(M(X_1 \times_S X_2/S))
\]

\[
\begin{array}{c}
\downarrow^{F_S^GM(X_1/S)} \\
\downarrow^{F_S^GM(X_2/S)}
\end{array}
\]

\[
\begin{array}{c}
(p_{\tilde{S}_I} \Gamma_{X_1} E_{\text{zar}}(\Omega_{Y_1 \times_S \tilde{S}_I/S}^*, F_b)[d_{\tilde{S}_I}], u_{I I}(X_1/S)) \otimes_{\mathbb{O}_S} (p_{\tilde{S}_I} \Gamma_{X_2} E_{\text{zar}}(\Omega_{Y_2 \times_S \tilde{S}_I/S}^*, F_b)[d_{\tilde{S}_I}], u_{I I}(X_2/S))
\end{array}
\]

\[
\begin{array}{c}
(p_{\tilde{S}_I} \Gamma_{X_{12}} E_{\text{zar}}(\Omega_{Y_{12} \times_S \tilde{S}_I/S}^*, F_b)[d_{\tilde{S}_I}], u_{I I}(X_{12}/S))
\end{array}
\]

**Proof.** Immediate from definition.

\[\square\]
6.1.2 The algebraic filtered De Rham realization functor and the commutativity with the six operation

We recall (see section 2), for \( f : T \rightarrow S \) a morphism with \( T, S \in \text{Var}(C) \), the commutative diagrams of sites \( \mathbf{29} \) and \( \mathbf{30} \):

\[
\begin{array}{c}
\text{Var}(C)^2/T \xrightarrow{\mu_T} \text{Var}(C)^{2,pr}/T \\
\downarrow \rho_T \downarrow \rho_T \\
\text{Var}(C)^{2,sm}/T \xrightarrow{\mu_T} \text{Var}(C)^{2,smpr}/T \\
\downarrow P(f) \downarrow P(f) \\
\text{Var}(C)^2/S \xrightarrow{\mu_S} \text{Var}(C)^{2,pr}/S \\
\downarrow \rho_S \downarrow \rho_S \\
\text{Var}(C)^{2,sm}/S \xrightarrow{\mu_S} \text{Var}(C)^{2,smpr}/S \\
\end{array}
\]

Let \( S \in \text{Var}(C) \). We have for \( F \in C(\text{Var}(C)^{sm}/S) \) the canonical map in \( C(\text{Var}(C)^{sm}/S) \)

\[
\text{Gr}(F) : \text{Gr}_{S_s}^{12} \mu_S \circ F \Gamma \rightarrow F,
\]

\[
\text{Gr}(F)(U/S) : \Gamma^\vee_U F(U \times S/U \times S) \xrightarrow{\text{ad}(l_*(p_*(F)(U \times S/U \times S)))} h^* F(U/U) = F(U/S)
\]

where \( h : U \rightarrow S \) is a smooth morphism with \( U \in \text{Var}(C) \) and \( h : U \xrightarrow{l} U \times S \xrightarrow{p} S \) is the graph factorization with \( l \) the graph embedding and \( p \) the projection.

**Definition 110.** (i) For \( S \in \text{Var}(C) \), we have the filtered complexes of presheaves

\[
(\Omega^*_S, F_b) \in C_{O_S,fil}(\text{Var}(C)^2/S)
\]

given by

- for \( ((X, Z), h) = (X, Z)/S \in \text{Var}(C)^2/S \),

\[
(\Omega^*_S((X, Z)/S), F_b) : \Gamma^\vee_Z L_{h^*} (\Omega^*_X/S, F_b)(X) := D h^* L_{h^*} \Omega_{\text{zar}} (D h^* L h^* (\Omega^*_X/S, F_b))(X)
\]
- for \( g : (X_1, Z_1)/S = ((X_1, Z_1), h_1) \to (X, Z)/S = ((X, Z), h) \) a morphism in \( \text{Var}(\mathbb{C})^2/S \),

\[
\Omega_{S/S}^\Gamma(g) : \Gamma_{Z/S}^h \circ \text{h} \circ \Omega_{X/S, F_b}(X) \xrightarrow{i_{\lambda}} g^* \text{h}^* \circ \text{h} \circ \Omega_{Z/S} \circ \Gamma_{Z/S} \circ \text{h} \circ \Omega_{X/S, F_b}(X_1)
\]

\[
= g^* \text{h}^* \circ \text{h} \circ \Omega_{X/S, F_b}(X_1)
\]

\[
\xrightarrow{\text{d}_h \circ \text{h} \circ \Omega_{X/S, F_b}(X_1)} \text{d}_h \circ \text{h} \circ \Omega_{Z/S} \circ \Gamma_{Z/S} \circ \text{h} \circ \Omega_{X/S, F_b}(X_1)
\]

\[
\xrightarrow{\text{d}_h \circ \text{h} \circ \Omega_{X/S, F_b}(X_1)} \text{d}_h \circ \text{h} \circ \Omega_{Z/S} \circ \Gamma_{Z/S} \circ \text{h} \circ \Omega_{X/S, F_b}(X_1)
\]

\[
\Gamma_{Z/S} \circ \text{h} \circ \Omega_{X/S, F_b}(X_1)
\]

\[
\xrightarrow{\text{d}_h \circ \text{h} \circ \Omega_{X/S, F_b}(X_1)} \text{d}_h \circ \text{h} \circ \Omega_{Z/S} \circ \Gamma_{Z/S} \circ \text{h} \circ \Omega_{X/S, F_b}(X_1)
\]

where \( i_{\lambda} \) is the arrow of the inductive limit.

For \( S \in \text{SmVar}(\mathbb{C}) \), we get

\[
(\Omega_{S/S}^\Gamma, F_b) := \text{h} \circ \Omega_{S/S}^\Gamma, F_b) \in C_{O_{S/S}, D_S}(\text{Var}(\mathbb{C})^2 HttpServletRequest / S)
\]

(ii) For \( S \in \text{SmVar}(\mathbb{C}) \), we have the canonical map \( C_{O_{S/S}, D_S}(\text{Var}(\mathbb{C})^2 HttpServletRequest / S) \)

\[
\text{Gr}_S^0(\Omega_{S/S}) : \text{Gr}_S^0(\Omega_{S/S}^\Gamma, F_b) \to (\Omega_{S/S}^\Gamma, F_b)
\]

given by, for \( U/S = (U, h) \in \text{Var}(\mathbb{C})^2 HttpServletRequest / S \)

\[
\text{Gr}_S^0(\Omega_{S/S})(U/S) : \text{Gr}_S^0(\Omega_{S/S}^\Gamma, F_b)(U/S) := \Gamma_{U/S}^h \circ \text{h} \circ \Omega_{S/S}^\Gamma, F_b(U \times S)
\]

\[
\xrightarrow{\text{d}_h \circ \text{h} \circ \Omega_{S/S}^\Gamma, F_b(U \times S)} \text{d}_h \circ \text{h} \circ \Omega_{S/S}^\Gamma, F_b(U \times S)
\]

\[
\text{d}_h \circ \text{h} \circ \Omega_{S/S}^\Gamma, F_b(U \times S)
\]

\[
\xrightarrow{\text{d}_h \circ \text{h} \circ \Omega_{S/S}^\Gamma, F_b(U \times S)} \text{d}_h \circ \text{h} \circ \Omega_{S/S}^\Gamma, F_b(U \times S)
\]

where \( h : U \xrightarrow{i_U} U \times S \xrightarrow{p_S} S \) is the graph factorization with \( i_U \) the graph embedding and \( p_S \) the projection.

We will use the following map from the property of mixed Hodge module (see section 5) together with the specialization map of a filtered D module for a closed embedding (see definition 19):

**Definition-Proposition 21.** (i) Let \( l : Z \to S \) a closed embedding with \( S, Z \in \text{SmVar}(\mathbb{C}) \). Consider an open embedding \( j : S^o \to S \). We then have the cartesian square

\[
\begin{array}{ccc}
S^o & \xrightarrow{j} & S \\
\text{f} & & \text{i} \\
Z^o := Z \times_S S^o & \xrightarrow{\text{j}^o} & Z
\end{array}
\]

where \( j^o \) is the open embedding given by base change. Using proposition 18 and theorem 20, the isomorphisms \( G_{Z,D}(O_S, F_b) \) for \( D \subset S \) a closed subset of definition-proposition 19 induces a canonical isomorphism in \( C_D(1,0)_{fil}(Z) \)

\[
G(Z, j_0)(O_S, F_b) : l^! \text{Gr}_{V_Z, 0} j_1^{Hdg}(O_{S^o}, F_b) \cong j_1^{Hdg}(O_{Z^o}, F_b).
\]

228
(ii) Let $l : Z \hookrightarrow S$ and $k : Z' \hookrightarrow Z$ be closed embeddings with $S, Z, Z' \in \text{SmVar}(\mathbb{C})$. Consider an open embedding $j : S^o \hookrightarrow S$. We then have the commutative diagram whose squares are cartesian.

\[
\begin{array}{ccc}
S^o & \xrightarrow{j} & S \\
\downarrow{l'} & & \downarrow{l} \\
Z^o := Z \times_S S^o' & \xrightarrow{k} & Z \\
\uparrow{k'} & & \\
Z' := Z' \times_S S^o' & \longrightarrow & Z'
\end{array}
\]

where $j'$ is the open embedding given by base change. Then,

\[
G(Z', j')_!(O_S, F_b) = G(Z', j'')(O_Z, F_b) \circ (k^* \text{Gr}_{VZ'}, 0 G(Z, j)(O_S, F_b)) : k^* \text{Gr}_{VZ'}, 0 l^* \text{Gr}_{VZ, 0} j_1^{\text{Hdg}}(O_{S^o}, F_b) \xrightarrow{k^* \text{Gr}_{VZ'}, 0} k^* \text{Gr}_{VZ'}, 0 j_1''^{\text{Hdg}}(O_{S^o}, F_b) \xrightarrow{G(Z', j'')(O_Z, F_b)} j_1''^{\text{Hdg}}(O_{S^o}, F_b).
\]

in $C_{D(1,0)_{fl}}(Z')$.

(iii) Consider a commutative diagram whose squares are cartesian

\[
\begin{array}{ccc}
S^{oo} & \xrightarrow{j_2} & S^o \\
\downarrow{l'} & & \downarrow{l} \\
Z^{oo} := Z \times_S S^{oo} & \xrightarrow{j_3} & Z^o := Z \times_S S^{j_1'} \\
\uparrow{k} & & \\
Z := Z \times_S S^j
\end{array}
\]

where $j_1, j_2$, and hence $j_1', j_2'$ are open embeddings. We have then the following commutative diagram

\[
l^* \text{Gr}_{VZ, 0} j_1^{\text{Hdg}}(O_{S^o}, F_b) \xrightarrow{\text{ad}(j_2^{\text{Hdg}}, j_2^{'\text{Hdg}})(O_{S^o}, F_b)} l^* \text{Gr}_{VZ, 0} (j_1 \circ j_2')^{\text{Hdg}}(O_{S^{oo}}, F_b).
\]

\[
\begin{array}{ccc}
G(Z, j)_!(O_S, F_b) & \xrightarrow{G(Z, j)_!(j_1 \circ j_2')^{\text{Hdg}}(O_{S^{oo}}, F_b)} & G(Z', j'')_!(O_{S^{oo}}, F_b) \\
\text{ad}(j_2^{\text{Hdg}}, j_2^{''\text{Hdg}})(O_{Z^{oo}}, F_b) & & \text{ad}(j_2^{\text{Hdg}}, j_2^{''\text{Hdg}})(O_{Z^{oo}}, F_b) \\
\end{array}
\]

Proof. (i): By definition of $j_1^{\text{Hdg}} : \pi_{S^o}(\text{MHM}(S^o)) \to \pi_S(\text{C(MHM}(S)))$, we have to construct the isomorphism for each complement of a (Cartier) divisor $j = j_D : S^o = S \setminus D \to S$. In this case, we have the closed embedding $i : S \hookrightarrow L$ given by the zero section of the line bundle $L = L_D$ associated to $D$. We have then, using definition-proposition [13] the canonical isomorphism in $\pi_{Z}(\text{MHW}(Z^o) \times_j \text{MHW}(D \cap Z))$

\[
G_0(Z, j)_!(O_S, F_b) : (j^{*s}, \phi_{(D \cap Z)_1}, c, v) \circ (l^* \text{Gr}_{VZ, 0} j_1^{\text{Hdg}}(O_{S^o}, F_b)) \xrightarrow{\text{can, var}} (i^* G_{Z^o, 0}(\text{MHW}(O_{S^o}, F_b))).
\]

Hence, using proposition [10] we have

\[
G(Z, j)_!(O_S, F_b) := (j^{*s}, \phi_{(D \cap Z)_1}, c, v)^{-1} (G_0(Z, j)_!(i_{\text{mod}}(O_S, F_b))) : l^* \text{Gr}_{VZ, 0} j_1^{\text{Hdg}}(O_{S^o}, F_b) \xrightarrow{\text{can, var}} j_1^{\text{Hdg}}(O_{S^o}, F_b).
\]

229
is an isomorphism in $\pi_2(MHM(Z))$. Now for $j : S^o \rightarrow S$ an arbitrary open embedding, we set

$$G(Z, j)(O_S, F_b) := \lim_{(D), R \subset D_i \subset S} (G(Z, j_{D,i})(O_{S^o}, F_b)) : l^* \ Gr_U, a j^Hdg(O_{S^o}, F_b) \cong j^Hdg(O_{S^o}, F_b)$$

(ii): Follows from definition-proposition 15

(iii): Follows from definition-proposition 15

Using definition-proposition 20 in the projection case, and the specialization map given in definition 49 and the isomorphism of definition-proposition 21 in the closed embedding case, we have the following canonical map:

**Definition 111.** Consider a commutative diagram in $SmVar(C)$ whose square are cartesian

```
\begin{array}{ccccccc}
Z_T & \xrightarrow{\nu} & T & \xrightarrow{j_1} & T \setminus Z_T & \xrightarrow{l} & Z \\
\downarrow{g'} & & \downarrow{\iota} & & \downarrow{\iota \times j} & & \downarrow{p_S} \\
T & \xrightarrow{I \times i} & S & \xrightarrow{p_S} & \phi S & \xrightarrow{l \times j} & T \times S \setminus (T \times Z) \\
\downarrow{Z} & & \downarrow{S} & & \downarrow{S \setminus Z} & & \\
Z & \xrightarrow{i} & S & \xrightarrow{j} & S \setminus Z
\end{array}
```

where $i$ and hence $I \times i$ and $i'$, are closed embeddings, $j$, $I \times j$, $j'$ are the complementary open embeddings and $g : T \xrightarrow{l} T \times S \xrightarrow{p_S} S$ is the graph factorization, where $l$ is the graph embedding and $p_S$ the projection. We have, by definition-proposition 20, definition 47, proposition 20 and theorem 20, the canonical map in $C_{D(1,0),fa}(T)$

$$a(g, Z)(O_S, F_b) : g^* \text{mod} \Gamma_Z^{Hdg}(O_S, F_b) = l^* \text{mod} p_S^* \text{mod} \Gamma_Z^{Hdg}(O_S, F_b)$$

$$\xrightarrow{l^* \text{mod} p_S^{Hdg}(p, \gamma') (O_S, F_b)} l^* \text{mod} p_S^* \text{mod} \Gamma^{Hdg}(O_T \times S, F_b)$$

$$\xrightarrow{spv_2 (\Gamma_{T \times Z}^{Hdg}(O_T \times S, F_b))} l^* \ Gr_{\nu, T}(\Gamma_{T \times Z}^{Hdg}(O_T \times S, F_b)) \xrightarrow{G(T, (I \times j)) \gamma (O_T \times S, F_b)} \Gamma_{Z_T}^{Hdg}(O_T, F_b)$$

where the last map is the isomorphism given in definition-proposition 21.

**Lemma 14.** (i) For $g : T \rightarrow S$ and $g : T' \rightarrow T$ two morphism with $S, T, T' \in SmVar(C)$, considering the commutative diagram whose squares are cartesian

```
\begin{array}{ccccccc}
Z_{T'} & \xrightarrow{\iota''} & T' & \xrightarrow{j''} & T' \setminus Z_{T'} & \xrightarrow{g'} & Z_T \\
\downarrow{g'} & & \downarrow{g'} & & \downarrow{g'} & & \downarrow{g'} \\
Z_T & \xrightarrow{i} & T & \xrightarrow{j} & T \setminus Z_T & \xrightarrow{g} & S \setminus Z
\end{array}
```

we have then

$$a(g \circ g', Z)(O_S, F_b) = a(g', Z_T)(O_T, F_b) \circ (g' \text{mod} a(g, Z)(O_S, F_b)) :$$

$$(g \circ g') \text{mod} \Gamma_Z^{Hdg}(O_S, F_b) = g' \text{mod} g' \text{mod} \Gamma_Z^{Hdg}(O_S, F_b) \xrightarrow{g' \text{mod} a(g, Z)(O_S, F_b)} g' \text{mod} \Gamma_{Z_T}^{Hdg}(O_T, F_b)$$

$$\xrightarrow{a(g', Z_T)(O_T, F_b)} \Gamma_{Z_{T'}}^{Hdg}(O_{T'}, F_b).$$
(ii) For \( g : T \to S \) a morphism with \( S, T \in \text{SmVar}(\mathbb{C}) \), considering the commutative diagram whose squares are cartesian

\[
\begin{array}{ccc}
Z'_T & \xrightarrow{k'} & Z_T \xrightarrow{i'} & T \\
\downarrow{g} & & \downarrow{g} & & \downarrow{g} \\
Z' & \xrightarrow{k} & Z & \xrightarrow{i} & S
\end{array}
\]

we have then the following commutative diagram:

\[
g^{\ast \text{mod}} \Gamma^\vee_{Z, Hdg}(O_{S, F_b}) \xrightarrow{a(g, Z)(O_S, F_b)} \Gamma^\vee_{Z'_T, Hdg}(O_{S, F_b}) \xrightarrow{\gamma Z'_{T}} \Gamma^\vee_{Z_T, Hdg}(O_{T, F_b})
\]

Proof. (i): Follows from definition-proposition 21 (ii) (ii): Follows from definition-proposition 21 (iii)

We can now define the main object:

**Definition 112.** (i) For \( S \in \text{SmVar}(\mathbb{C}) \), we consider the filtered complexes of presheaves

\[
(\Omega^\bullet_{/S} \Gamma^{pr}, F_{DR}) \in C_{D_{int}}(\text{Var}(\mathbb{C})^{2, \text{smpr}}/S)
\]

given by,

- for \( (Y \times S, Z)/S = ((Y \times S, Z), p) \in \text{Var}(\mathbb{C})^{2, \text{smpr}}/S \),

\[
(\Omega^\bullet_{/S} \Gamma^{pr}((Y \times S, Z)/S), F_{DR}) := ((\Omega^{\bullet}_{Y \times S/S}) \otimes_{O_Y \times S} \Gamma^\vee_{Z, Hdg}(O_{Y \times S, F_b}))(Y \times S)
\]

with the structure of \( p^* D_S \) module given by proposition 54.

- for \( g : (Y_1 \times S, Z_1)/S = ((Y_1 \times S, Z_1), p_1) \to (Y \times S, Z)/S = ((Y \times S, Z), p) \) a morphism in \( \text{Var}(\mathbb{C})^{2, \text{smpr}}/S \), denoting for short \( Z := Z \times \times Y \times S \):

\[
\Omega^\bullet_{/S} \Gamma^{pr}(g) : (\Omega^{\bullet}_{Y_1 \times S/S}) \otimes_{O_{Y_1 \times S}} \Gamma^\vee_{Z_1, Hdg}(O_{Y_1 \times S, F_b})(Y_1 \times S)
\]

\[
\xrightarrow{i_-} g^*((\Omega^{\bullet}_{Y \times S/S}) \otimes_{O_Y \times S} \Gamma^\vee_{Z, Hdg}(O_{Y \times S, F_b}))(Y_1 \times S)
\]

\[
\xrightarrow{\Omega_{Y_1 \times S/S}} (\Omega^{\bullet}_{Y \times S/S}) \otimes_{O_Y \times S} \Gamma^\vee_{Z, Hdg}(O_{Y \times S, F_b})(Y_1 \times S)
\]

\[
\xrightarrow{DR_{Y_1 \times S/S}(a(g, Z)(O_Y \times S, F_b))} (\Omega^{\bullet}_{Y_1 \times S/S}) \otimes_{O_{Y_1 \times S}} \Gamma^\vee_{Z, Hdg}(O_{Y_1 \times S, F_b})(Y_1 \times S)
\]

where

* \( i_- \) is the arrow of the inductive limit,
* we recall that

\[
\Omega_{(Y_1 \times S)/S}((\Omega^\bullet_{Y \times S/S} \otimes_{O_Y \times S} \Gamma^\vee_{Z, Hdg}(O_{Y \times S, F_b}))) : \Gamma^\vee_{Z, Hdg}(O_{Y \times S, F_b}) \to (\Omega^\bullet_{Y_1 \times S/S}) \otimes_{O_{Y_1 \times S}} \Gamma^\vee_{Z_1, Hdg}(O_{Y_1 \times S, F_b})
\]

is the map given in definition-proposition 14 which is \( p_1^* D_S \) linear by proposition 57.
**Definition 113.** For where \( S \) is given in definition \[ \text{[11]} \]

* the map

\[
a(g, Z)(O_Y \times S, F_b) : g^{* \text{mod}} \Gamma_Z^{\vee, Hdg}(O_Y \times S, F_b) \to \Gamma_Z^{\vee, Hdg}(O_Y \times S, F_b)
\]

is the map given in definition \[ \text{[11]} \]

* the map

\[
T(Z_1 / \tilde{Z}, \gamma^{\vee, Hdg})(O_Y \times S, F_b) : \Gamma_Z^{\vee, Hdg}(O_Y \times S, F_b) \to \Gamma_Z^{\vee, Hdg}(O_Y \times S, F_b)
\]

is given in definition-proposition \[ \text{[20]} \]

For \( g : ((Y_1 \times S, Z_1), p_1) \to ((Y \times S, Z), p) \) and \( g' : ((Y'_1 \times S, Z'_1), p_1) \to ((Y_1 \times S, Z_1), p) \) two morphisms in \( \text{Var}(\mathbb{C})^{2, \text{alp}} / S \), we have

\[
\Omega^{\bullet, \text{pr}} / S (g \circ g') = \Omega^{\bullet, \text{pr}} / S (g') \circ \Omega^{\bullet, \text{pr}} / S (g) : (\Omega_Y \times S, F_b) \otimes_{O_Y \times S} \Gamma_{Z_1}^{\vee, Hdg}(O_Y \times S, F_b))(Y \times S)
\]

\[
\frac{\Omega^{\bullet, \text{pr}} / S (g)}{\Omega_Y \times S, F_b} \otimes_{O_Y \times S} \Gamma_{Z_1}^{\vee, Hdg}(O_Y \times S, F_b))(Y_1 \times S)
\]

\[
\frac{\Omega^{\bullet, \text{pr}} / S (g')}{\Omega_Y \times S, F_b} \otimes_{O_Y \times S} \Gamma_{Z'_1}^{\vee, Hdg}(O_Y \times S, F_b))(Y'_1 \times S),
\]

since, denoting for short \( \tilde{Z} := Z \times_Y S (Y_1 \times S) \) and \( \tilde{Z}' := Z \times_Y S (Y'_1 \times S) \),

\[ \text{we have by lemma \[ \text{[11]} \]i)} \]

\[
a(g \circ g', \tilde{Z}')(O_Y \times S, F_b) = a(g', \tilde{Z}')(O_Y \times S, F_b) \circ g^{* \text{mod}} a(g, Z)(O_Y \times S, F_b),
\]

\[ \text{we have by lemma \[ \text{[11]} \]ii)} \]

\[
T(Z_1 / \tilde{Z}', \gamma^{\vee, Hdg})(O_Y \times S, F_b) \circ a(g', \tilde{Z}')(O_Y \times S, F_b)
\]

\[
= a(g', Z_1)(O_Y \times S, F_b) \circ g^{* \text{mod}} T(Z_1 / \tilde{Z}, \gamma^{\vee, Hdg})(O_Y \times S, F_b).
\]

(ii) For \( S \in \text{SmVar}(\mathbb{C}) \), we have the canonical map \( C_{O_{\text{sf} \times D_S}(\text{Var}(\mathbb{C})^{\text{sm}} / S)} \)

\[
\text{Gr}(\Omega / S) : \text{Gr}_{12}(\Omega^{* \text{pr}} / S, F_{DR}) \to (\Omega^{* \text{pr}} / S, F_b)
\]

given by, for \( U / S = (U, h) \in \text{Var}(\mathbb{C})^{\text{sm}} / S \)

\[
\text{Gr}(\Omega / S)(U / S) : \text{Gr}_{12}(\Omega^{* \text{pr}} / S, F_{DR})(U / S) := (\Omega_U \times S, F_b) \otimes_{O_U \times S} \Gamma_U^{\vee, Hdg}(O_U \times S, F_b))(U / S)
\]

\[
\text{add}(U, h) \otimes (U \times S) \to \mu_U \text{mod} \Gamma_U^{\vee, Hdg}(O_U \times S, F_b))(U)
\]

\[
\Omega_U(U \times S)(U / S) \to (\Omega_U \times S, F_b) \otimes_{O_U \times S} \mu_U \text{mod} \Gamma_U^{\vee, Hdg}(O_U \times S, F_b))(U)
\]

where \( h : U \xrightarrow{i_U} U \times S \xrightarrow{p_S} S \) is the graph factorization with \( i_U \) the graph embedding and \( p_S \) the projection, note that \( a(i_U, U) \) is an isomorphism since for \( j_U : U \times S \hookrightarrow U \times S \) the open complementary \( \text{mod} \Gamma_U^{\vee, Hdg}(M, F, W) = 0). \)

**Definition 113.** For \( S \in \text{SmVar}(\mathbb{C}) \), we have the canonical map \( C_{O_{\text{sf} \times D_S}(\text{Var}(\mathbb{C})^{2, \text{alp}} / S)} \)

\[
T(\Omega / S) : \mu_S(\Omega^{* \text{pr}} / S, F_b) \to (\Omega^{* \text{pr}} / S, F_{DR})
\]

232
given by, for $(Y \times S, X)/S = ((Y \times S, Z), p) \in \text{Var}(\mathbb{C})^{2,smpr}/S$

$$T(\Omega^\Gamma_S)((Y \times S, Z)/S) :$$

$$(\Omega^\Gamma_{/S}, F_b)((Y \times S, Z)/S) := \mathbb{D}^p \circ \mathbb{O} \circ L \circ \Gamma \circ e_{zar}(\mathbb{D}^p \circ \mathbb{O} \circ L \circ \Gamma)(\mathbb{O}^\bullet_{\times S/S}(S, F_b))(Y \times S)$$

$$\Rightarrow \text{DR}(Y \times S/S(\mathbb{Y}^\Gamma_{Hdg}(O_{Y \times S}))(Y \times S)$$

$$\Rightarrow ((\Omega^\Gamma_{\times S/S}, F_b) \otimes_{O_{Y \times S}} \Gamma^\wp_{Hdg}(O_{Y \times S}, F_b))(Y \times S) =: (\Omega^\bullet_{/S} p_{\text{DR}} F_{\text{DR}}((Y \times S, Z)/S).$$

By definition $\text{Gr}(\Omega^\Gamma_S) \circ \text{Gr}_S, T(\Omega^\Gamma_S) = \text{Gr}^O(\Omega^\Gamma_S).$

Remark 11. (i) Let $S \in \text{Var}(\mathbb{C}).$ We have by definition $\mathbb{O}_{12a}(\Omega^\bullet_{/S} F_b) = (\Omega^\bullet_{/S}, F_b) \in \text{C}_{O_{\text{fib}}}(\text{Var}(\mathbb{C})^{sm}/S).$

Moreover, if $S \in \text{SmVar}(\mathbb{C}),$ $\mathbb{O}_{12a}(\Omega^\bullet_{/S}, F_b) = (\Omega^\bullet_{/S}, F_b) \in \text{C}_{O_{\text{fib}}, D_S}(\text{Var}(\mathbb{C})^{sm}/S).$

(ii) Let $S \in \text{Var}(\mathbb{C}).$ Then, $(\Omega^\bullet_{/S}, F_b) \in \text{C}_{O_{\text{fib}}}(\text{Var}(\mathbb{C})^2/S)$ is a natural extension of

$$(\Omega^\bullet_{/S}, F_b) := \mathbb{O}_{S\ast}(\Omega^\bullet_{/S}, F_b) \in \text{C}_{O_{\text{fib}}}(\text{Var}(\mathbb{C})^{2,sm}/S),$$

but does NOT satisfy cdh descent.

The point definition [122] above gives the object in DA($S$) which will, for $S$ smooth, represent the algebraic De Rham realisation in $D_S$ modules. It is the class of an explicit complex of presheaves on $\text{Var}(\mathbb{C})^{sm}/S.$

Proposition 104. Let $S \in \text{Var}(\mathbb{C}).$

(i) The complex of presheaves $(\Omega^\bullet_{/S}, F_b) \in \text{C}_{O_{\text{fib}}}(\text{Var}(\mathbb{C})^{2,sm}/S)$ is 2-filtered $\mathbb{A}^1_S$ local for the Zariski or etale topology (see definition [16]) and admits transfers (i.e. $\text{Tr}(S)_\ast, \text{Tr}(S)^\ast \Omega^\bullet_{/S} = \Omega^\bullet_{/S}$).

(ii) The complex of presheaves $(\Omega^\bullet_{/S} p, F_{\text{DR}}) \in \text{C}_{D_{\text{fib}}}(\text{Var}(\mathbb{C})^{2,smpr}/S)$ is 2-filtered $\mathbb{A}^1_S$ local for the Zariski or etale topology (see definition [16]) and admits transfers (i.e. $\text{Tr}(S), \text{Tr}(S)^\ast \Omega^\bullet_{/S} = \Omega^\bullet_{/S} p$).

Proof. (i): Follows from proposition [17].

(ii): Let $(Y \times S, Z)/S = ((Y \times S, Z), p) \in \text{Var}^{2,smpr}(\mathbb{C})$ and $p_a : (Y \times \mathbb{A}^1 \times S, Z \times \mathbb{A}^1) \rightarrow (Y \times S, Z)$ the projection, $i_0 : (Y \times S, Z) \rightarrow (Y \times \mathbb{A}^1 \times S, Z \times \mathbb{A}^1)$ closed embedding. Then,

$$a(p_a, Z) : p_a^{\ast \mod} \Gamma^\wp_{Hdg}(O_{Y \times S}, F_b)) \rightarrow \Gamma^\wp_{Hdg}(O_{Y \times \mathbb{A}^1 \times S}, F_b).$$

a quasi-isomorphism in $\pi_{Y \times \mathbb{A}^1 \times S}(C(\mathbb{M}H(M)(Y \times \mathbb{A}^1 \times S))).$ Since a morphism of mixed Hodge module is strict for the F-filtration,

$$a(p_a, Z) : p_a^{\ast \mod} \Gamma^\wp_{Hdg}(O_{Y \times S}, F_b) \rightarrow \Gamma^\wp_{Hdg}(O_{Y \times \mathbb{A}^1 \times S}, F_b).$$

is a (1)-filtered quasi-isomorphism in $C_{D_{\text{fib}}}(Y \times \mathbb{A}^1 \times S).$ On the other hand, as, for all $p \in Z,$

$$I(p_a, p_{\ast})(\cdot, -)(\Omega_{(Y \times \mathbb{A}^1 \times S)/Y \times S})_{(S/S)}(\Gamma^\wp_{Hdg}(O_{Y \times S}, F_b))) :$$

$$\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} F_{p \ast} \ast \Gamma^\wp_{Hdg}(O_{Y \times S}, F_b)$$

$$\rightarrow p_{\ast}(\Omega^\bullet_{Y \times \mathbb{A}^1 \times S/S} \otimes_{O_{Y \times \mathbb{A}^1 \times S}} F_{p \ast} \ast \Gamma^\wp_{Hdg}(O_{Y \times S}, F_b))$$

233
is an homotopy equivalence whose inverse is
\[
p_\ast(I(i_0^g, i_0))(-, -)(\Omega_{Y \times S/Y \times S}(S/S)) \ni \Gamma_Z^{\mathcal{V}, H_dg}(O_{Y \times S, F_b}) \to \Omega_{Y \times S/S} \otimes_{O_{Y \times S}}\left( i_0^\ast \Gamma_Z^{\mathcal{V}, H_dg}(O_{Y \times S, F_b}) \right)
\]
(see the proof of proposition 9), for all \( p \in \mathbb{Z} \), the map
\[
E_{ct}(I(p_\ast, p_\ast)(-, -)(\Omega_{Y \times S/Y \times S}(S/S)) \ni \Gamma_Z^{\mathcal{V}, H_dg}(O_{Y \times S, F_b}) \to \Omega_{Y \times S/S} \otimes_{O_{Y \times S}}\left( i_0^\ast \Gamma_Z^{\mathcal{V}, H_dg}(O_{Y \times S, F_b}) \right)
\]
is a 2-filtered quasi-isomorphism by proposition 7. Hence,
\[
E_{ct}(g^\ast(\Omega_{Y/S}^\mathcal{V}, F_b)) : E_{ct}(\Omega_{Y \times S/S} \otimes_{O_{Y \times S}}\Gamma_Z^{\mathcal{V}, H_dg}(O_{Y \times S, F_b}) \to E_{ct}(\Omega_{Y \times S/S} \otimes_{O_{Y \times S}}\Gamma_Z^{\mathcal{V}, H_dg}(O_{Y \times S, F_b})
\]
is a 2-filtered isomorphism. □

We have the following canonical transformation map given by the pullback of (relative) differential forms:

- Let \( g : T \to S \) a morphism with \( T, S \in \text{Var}(\mathbb{C}) \). We have the canonical morphism in \( C_{g^\ast\mathcal{O}_{S,fil,+d_S}}(\text{Var}(\mathbb{C})^{2,sm}/T) \)

\[
\Omega_{(T/S)}^\Gamma : g^\ast(\Omega_{Y/S}^\mathcal{V}, F_b) \to (\Omega_{T}^\mathcal{V}, F_b)
\]

induced by the pullback of differential forms: for \( (V, Z_1)/T = ((V, Z_1), h) \in \text{Var}(\mathbb{C})^{2,sm}/T, \)

\[
g^\ast(\Omega_{Y/S}^\mathcal{V}, (V, Z_1)/T) := \lim_{(h: (U, Z) \to (S_{\text{sm}, g_1})(V, Z_1) \to (U, Z_1), h, g)} \Omega_{(U, Z)/S}^\mathcal{V},
\]

\[
\Omega_{(T/S)}^\mathcal{V}(V, Z_1)/T := \Omega_{(U, Z)/S}^\mathcal{V} \to \Omega_{(U, Z_1)/S}^\mathcal{V} \to \Omega_{(V, Z)/S}^\mathcal{V}(V, Z_1)/T),
\]

where \( g^\prime : U_T := U \times S T \to U \) is the base change map and \( q : \Omega_{Y \times T/S}^\mathcal{V} \to \Omega_{Y_1 \times T/S}^\mathcal{V} \) is the quotient map. If \( T, S \in \text{SmVar}(\mathbb{C}), \)

\[
\Omega_{(T/S)}^\mathcal{V} : g^\ast(\Omega_{Y/S}^\mathcal{V}, F_b) \to (\Omega_{T}^\mathcal{V}, F_b)
\]
is a morphism in \( C_{g^\ast\mathcal{O}_{S,fil,+d_S}}(\text{Var}(\mathbb{C})^{2,sm}/T) \) It induces the canonical morphisms in \( C_{g^\ast\mathcal{O}_{S,fil,+d_S}}(\text{Var}(\mathbb{C})^{2,sm}/T) \):

\[
E\Omega_{(T/S)}^\Gamma : g^\ast E_{ct}(\Omega_{Y/S}^\mathcal{V}, F_b) \to E_{ct}(g^\ast(\Omega_{Y/S}^\mathcal{V}, F_b)) \to E_{ct}(\Omega_{T/S}^\Gamma, F_b)
\]

and

\[
E\Omega_{(T/S)}^\Gamma : g^\ast E_{zar}(\Omega_{Y/S}^\mathcal{V}, F_b) \to E_{zar}(g^\ast(\Omega_{Y/S}^\mathcal{V}, F_b)) \to E_{zar}(\Omega_{T/S}^\Gamma, F_b).
\]
• Let \( g : T \to S \) a morphism with \( T, S \in \text{SmVar}(\mathbb{C}) \). We have the canonical morphism in \( C_{g^*D_{fil}(\text{Var}(\mathbb{C}))^{2,\text{spr}} / T} \)

\[
\Omega^{\Gamma,pr}_{/(T/S)} : g^*(\Omega^{\Gamma,pr}_{/S}, F_{DR}) \to (\Omega^{\Gamma,pr}_{/T}, F_{DR})
\]

induced by the pullback of differential forms: for \( ((Y_1 \times T, Z_1) / T) = ((Y_1 \times T, Z_1), p) \in \text{Var}(\mathbb{C})^{2,\text{spr}} / T \),

\[
g^*\Omega^{\Gamma,pr}_{/S}((Y_1 \times T, Z_1) / T) := \lim_{\to} \Omega^{\Gamma,pr}_{/(T/S)}((Y_1 \times T, Z_1) / S)
\]

where \( g' = (I_Y \times g) : Y \times T \to Y \times S \) is the base change map and \( q(M) : \Omega_{Y_1 \times T/S} \otimes \Omega_{Y_1 \times T} (M, F) \to \Omega_{Y_1 \times T/S} \otimes \Omega_{Y_1 \times T} (M, F) \) is the quotient map. It induces the canonical morphisms in \( C_{g^*D_{fil}(\text{Var}(\mathbb{C}))^{2,\text{spr}} / T} \):

\[
E\Omega^{\Gamma,pr}_{/(T/S)} : g^*E_{\text{et}}(\Omega^{\Gamma,pr}_{/S}, F_{DR}) \xrightarrow{T(g,E)(-)} E_{\text{et}}(g^*(\Omega^{\Gamma,pr}_{/S}, F_{DR})) \xrightarrow{E_{\text{et}}(\Omega^{\Gamma,pr}_{/(T/S)})} E_{\text{et}}(\Omega^{\Gamma,pr}_{/T}, F_{DR})
\]

and

\[
E\Omega^{\Gamma,pr}_{/(T/S)} : g^*E_{\text{zar}}(\Omega^{\Gamma,pr}_{/S}, F_{DR}) \xrightarrow{T(g,E)(-)} E_{\text{zar}}(g^*(\Omega^{\Gamma,pr}_{/S}, F_{DR})) \xrightarrow{E_{\text{zar}}(\Omega^{\Gamma,pr}_{/(T/S)})} E_{\text{zar}}(\Omega^{\Gamma,pr}_{/T}, F_{DR}).
\]

**Definition 114.** Let \( g : T \to S \) a morphism with \( T, S \in \text{SmVar}(\mathbb{C}) \). We have, for \( F \in C(\text{Var}(\mathbb{C})^{2,\text{spr}} / S) \), the canonical transformation in \( C_{D_{fil}(T)} \):

\[
T(g, \Omega^{\Gamma,pr}_{/T} )(F) : g^* \text{mod} L_{De}(S), \text{Gr}_{12} \text{Hom}^* (F, E_{\text{et}}(\Omega^{\Gamma,pr}_{/S}, F_{DR}))
\]

\[
\xrightarrow{\tau} (g^* L_{De}(S), \text{Hom}^* (F, E_{\text{et}}(\Omega^{\Gamma,pr}_{/S}, F_{DR}))) \otimes g^* \mathcal{O}_T O_T
\]

\[
\xrightarrow{T(g, \text{Gr}_{12})(- \circ T(e, g)(-)) \otimes q} e(T), \text{Gr}_{12} g^* \text{Hom}^* (F, E_{\text{et}}(\Omega^{\Gamma,pr}_{/S}, F_{DR})) \otimes g^* \mathcal{O}_T O_T
\]

\[
\xrightarrow{(T(g, \text{hom})(- \circ \text{hom})(-)) \otimes I} e(T), \text{Gr}_{12} \text{Hom}^* (g^* F, g^* E_{\text{et}}(\Omega^{\Gamma,pr}_{/S}, F_{DR})) \otimes g^* \mathcal{O}_T O_T
\]

\[
\xrightarrow{\text{hom}^* (g^* F, (\Omega^{\Gamma,pr}_{/(T/S)} \otimes I))} e(T), \text{Gr}_{12} \text{Hom}^* (g^* F, E_{\text{et}}(\Omega^{\Gamma,pr}_{/T}, F_{DR}))
\]

Let \( S \in \text{Var}(\mathbb{C}) \). Recall that for and \( h : U \to S \) a morphism with \( U \in \text{Var}(\mathbb{C}) \), we have the canonical map given by the wedge product

\[
w_{U/S} : \Omega^*_{U/S} \otimes \mathcal{O}_S \to \Omega^*_{U/S} \otimes \mathcal{O}_S \otimes \mathcal{O}_S : \alpha \otimes \beta \mapsto \alpha \wedge \beta.
\]

Let \( S \in \text{Var}(\mathbb{C}) \) and \( h_1 : U_1 \to S, h_2 : U_2 \to S \) two morphisms with \( U_1, U_2 \in \text{Var}(\mathbb{C}) \). Denote \( h_{12} : U_{12} := U_1 \times S U_2 \to S \) and \( p_{112} : U_1 \times S U_2 \to U_1, p_{212} : U_1 \times S U_2 \to U_2 \) the projections. Recall we have the canonical map given by the wedge product

\[
w_{(U_1, U_2)/S} : p_{112}^* \Omega^*_{U_1/S} \otimes \mathcal{O}_S \otimes p_{212}^* \Omega^*_{U_2/S} \to \Omega^*_{U_{12}/S} : \alpha \otimes \beta \mapsto p_{112}^* \alpha \wedge p_{212}^* \beta
\]

which gives the map

\[
Ew_{(U_1, U_2)/S} : h_1^* E_{\text{zar}}(\Omega^*_{U_1/S}) \otimes \mathcal{O}_S \otimes h_2^* E_{\text{zar}}(\Omega^*_{U_2/S}) \to h_{12}^* E_{\text{zar}}(p_{112}^* \Omega^*_{U_1/S} \otimes \mathcal{O}_S \otimes p_{212}^* \Omega^*_{U_2/S})
\]

Let \( S \in \text{SmVar}(\mathbb{C}) \).
The complex of presheaves \((\Omega^\bullet_S, F_b) \in CO_{S,fil,D_S}(\text{Var}(\mathbb{C})^{2,sm}/S)\) have a monoidal structure given by the wedge product of differential forms: for \(h : (U, Z) \to S \in \text{Var}(\mathbb{C})^2/S\), the map
\[
DR(-)(\gamma_Z^{\vee,h}(-)) \circ w_{U/S} : (\Omega^\bullet_{U/S}, F_b) \otimes_{p^*OS} (\Omega^\bullet_{U/S}, F_b) \to \Gamma^\vee_Z Lh^*O_S(\Omega^\bullet_{U/S}, F_b)
\]
factors through
\[
DR(-)(\gamma_Z^{\vee,Hdg}(-)) \circ w_{U/S} : (\Omega^\bullet_{U/S}, F_b) \otimes_{p^*OS} (\Omega^\bullet_{U/S}, F_b)
\]
unique up to homotopy, giving the map in \(C_{O_{S,fil,D_S}}(\text{Var}(\mathbb{C})^{2,smpr}/S)\):
\[
w_S : (\Omega^\bullet_{/S}, F_b) \otimes_{OS} (\Omega^\bullet_{/S}, F_b) \to (\Omega^\bullet_{/S}, F_b)
\]
given by for \(h : (U, Z) \to S \in \text{Var}(\mathbb{C})^{2,sm}/S\),
\[
w_S((U, Z)/S) : (\Gamma^\vee_Z Lh^*O_S(\Omega^\bullet_{U/S}, F_b) \otimes_{p^*OS} \Gamma^\vee_Z Lh^*O_S(\Omega^\bullet_{U/S}, F_b))(U)
\]
which induces the map in \(CO_{S,fil,D_S}(\text{Var}(\mathbb{C})^{2,sm}/S)\)
\[
Ew_S : E_{et}(\Omega^\bullet_{/S}, F_b) \otimes_{OS} E_{et}(\Omega^\bullet_{/S}, F_b) \to E_{et}(\Omega^\bullet_{/S}, F_b) \otimes_{OS} (\Omega^\bullet_{/S}, F_b))
\]
given by the functoriality of the Godement resolution (see section 2).

The complex of presheaves \((\Omega^\bullet_{S}^{pr}, F_{DR}) \in CD_{S,fil}(\text{Var}(\mathbb{C})^{2,smpr}/S)\) have a monoidal structure given by the wedge product of differential forms: for \(p : (Y \times S, Z) \to S \in \text{Var}(\mathbb{C})^{2,smpr}/S\), the map
\[
DR(-)(\gamma_Z^{\vee,Hdg}(-)) \circ w_{Y \times S/S} : (\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} (O_{Y \times S}, F_b)) \otimes_{p^*OS} (\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} (O_{Y \times S}, F_b)) \to (\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} (O_{Y \times S}, F_b))
\]
factors through
\[
DR(-)(\gamma_Z^{\vee,Hdg}(-)) \circ w_{Y \times S/S} : (\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} (O_{Y \times S}, F_b) \otimes_{p^*OS} (\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} (O_{Y \times S}, F_b))
\]
unique up to homotopy, giving the map in \(CD_{S,fil}(\text{Var}(\mathbb{C})^{2,smpr}/S)\):
\[
w_S : (\Omega^\bullet_{/S}^{pr}, F_{DR}) \otimes_{OS} (\Omega^\bullet_{/S}^{pr}, F_{DR}) \to (\Omega^\bullet_{/S}^{pr}, F_{DR})
\]
given by for \(p : (Y \times S, Z) \to S \in \text{Var}(\mathbb{C})^{2,smpr}/S\),
\[
w_S((Y \times S, Z)/S) : ((\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} (O_{Y \times S}, F_b)) \otimes_{p^*OS} (\Omega^\bullet_{Y \times S/S} \otimes_{O_{Y \times S}} (O_{Y \times S}, F_b))
\]

236
which induces the map in $C_{Dfu}(\text{Var}(\mathbb{C})^{2,smpr}/S)$

$$
Ew_S : E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR}) \otimes_{O_S} E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR}) \rightarrow E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR})
$$

by the functoriality of the Godement resolution (see section 2).

**Definition 115.** Let $S \in \text{SmVar}(\mathbb{C})$. We have, for $F,G \in C(\text{Var}(\mathbb{C})^{2,smpr}/S)$, the canonical transformation in $C_{Dfu}(S)$:

$$
T(\otimes, \Omega)(F,G) : e(S), Gr^{12}_{S*} \text{Hom}(F, E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR})) \otimes_{O_S} e(S) \ast Gr^{12}_{S*} \text{Hom}(G, E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR}))
$$

$$
\rightarrow e(S) \ast Gr^{12}_{S*} \text{Hom}(F, E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR})) \otimes_{O_S} \text{Hom}(G, E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR}))
$$

$$
\rightarrow e(S) \ast Gr^{12}_{S*} \text{Hom}(F \otimes G, (E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR})) \otimes_{O_S} E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR}))
$$

$$
\rightarrow e(S) \ast Gr^{12}_{S*} \text{Hom}(F \otimes G, (E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR})) \otimes_{O_S} E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR}))
$$

We now define the filtered De Rahm realization functor.

**Definition 116.** (i) Let $S \in \text{SmVar}(\mathbb{C})$. We have, using definition 112 and definition 36, the functor

$$
C(\text{Var}(\mathbb{C})^{sm}/S) \rightarrow C_{Dfu}(S), F \mapsto \lim_{r(\mathbb{C})^{sm}/S(LF)} e(S), Gr^{12}_{S*} \text{Hom}^\bullet(L\rho_{S*}, Gr^{12}_{S*} LR_{X,\ast}(\ast)/S(\rho^*_{S} L(F), E_{ct}(\Omega^\bullet_{/S}^{\Gamma,pr}, F_{DR}))[-d_S])
$$

(ii) Let $S \in \text{Var}(\mathbb{C})$ and $S = \bigcup_{i=1}^{r} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. For $I \subset [1, \cdots, r]$, denote by $S_I := \cap_{i \in I} S_i$ and $j_I : S_I \hookrightarrow S$ the open embedding. We then have closed embeddings $i_I : S_I \hookrightarrow \tilde{S}_I := \cap_{i \in I} \tilde{S}_i$. Consider, for $I \subset J$, the following commutative diagram

$$
D_{IJ} = \begin{array}{ccc}
S_I & \xrightarrow{iI} & \tilde{S}_I \\
\downarrow{jIJ} & & \downarrow{pIJ} \\
S_J & \xrightarrow{iJ} & \tilde{S}_J 
\end{array}
$$

and $j_{IJ} : S_J \hookrightarrow S_I$ is the open embedding so that $j_I \circ j_{IJ} = j_I$. We have, using definition 112 and definition 36, the functor

$$
C(\text{Var}(\mathbb{C})^{sm}/S) \rightarrow C_{Dfu}(S/(\tilde{S}_I)), F \mapsto \lim_{r(\mathbb{C})^{sm}/S(LF)} e'(\tilde{S}_I) \ast \text{Hom}^\bullet(L\rho_{\tilde{S}_I*}, Gr^{12}_{\tilde{S}_I*} LR_{X,\ast}(\ast)/\tilde{S}_I(\rho^*_{\tilde{S}_I} L(i_{I+J} F), E_{ct}(\Omega^\bullet_{/\tilde{S}_I}^{\Gamma,pr}, F_{DR}))[-d_{\tilde{S}_I}] u^*_{IJ}(F))
$$

where we have denoted for short $e'(\tilde{S}_I) = e(\tilde{S}_I) \circ Gr^{12}_{\tilde{S}_I*}$, the limits run over the Corti-Hanamura resolutions

$$
r(\mathbb{C})^{sm}/S_L(\mathbb{C})(i_{I+J} F)) = R_{X,\ast}(\tilde{S}_I)(\rho^*_{\tilde{S}_I} L(i_{I+J} F)) \to D_{\tilde{S}_I}(\rho^*_{\tilde{S}_I} L(i_{I+J} F))
$$

237
Let (ii) Let (i) Let

We have the following key proposition:

For $I \subset J \subset K$, we have obviously $p_{IJ} \circ u_{JK}(F) = u_{IK}(F)$. We will prove in corollary below that $u_{IJ}(F)$ are $\infty$-filtered Zariski local equivalence.

We have the following key proposition:

**Proposition 105.** Let $S \in \text{SmVar}(C)$.

(i) Let $m : Q_1 \to Q_2$ be an etale local equivalence local with $Q_1, Q_2 \in C(\text{Proj PSh(Var}(C)^{sm}/S))$ complexes of representable presheaves. Then,

\[ e(S), Gr^{12}_S, Hom^\bullet(Lp_{S*}, Gr^{12}_S LR(X^*, D^+)/S(\rho^*_S L(i_1 J^* F)), E_{et}(\Omega^{\bullet, F, pr}_{/S}, F_{DR})) \]

\[ \lim_{r_{(X^*, D^+)/S}(Q_1)} e(S), Gr^{12}_S, Hom^\bullet(Lp_{S*}, Gr^{12}_S LR(X^*, D^+)/S(\rho^*_S L(i_1 J^* F)), E_{et}(\Omega^{\bullet, F, pr}_{/S}, F_{DR})) \]

\[ \to \lim_{r_{(X^*, D^+)/S}(Q_2)} e(S), Gr^{12}_S, Hom^\bullet(Lp_{S*}, Gr^{12}_S LR(X^*, D^+)/S(\rho^*_S L(i_1 J^* F)), E_{et}(\Omega^{\bullet, F, pr}_{/S}, F_{DR})) \]

is a 2-filtered quasi-isomorphism. It is thus an isomorphism in $D_{dfil}(S)$.

(ii) Let $m : Q_1 \to Q_2$ be an equivalence $(A^1, et)$ local with $Q_1, Q_2 \in C(\text{Proj PSh(Var}(C)^{sm}/S))$ complexes of representable presheaves. Then,

\[ e(S), Gr^{12}_S, Hom^\bullet(Lp_{S*}, Gr^{12}_S LR(X^*, D^+)/S(\rho^*_S L(i_1 J^* F)), E_{et}(\Omega^{\bullet, F, pr}_{/S}, F_{DR})) \]

\[ \lim_{r_{(X^*, D^+)/S}(Q_1)} e(S), Gr^{12}_S, Hom^\bullet(Lp_{S*}, Gr^{12}_S LR(X^*, D^+)/S(\rho^*_S L(i_1 J^* F)), E_{et}(\Omega^{\bullet, F, pr}_{/S}, F_{DR})) \]

\[ \to \lim_{r_{(X^*, D^+)/S}(Q_2)} e(S), Gr^{12}_S, Hom^\bullet(Lp_{S*}, Gr^{12}_S LR(X^*, D^+)/S(\rho^*_S L(i_1 J^* F)), E_{et}(\Omega^{\bullet, F, pr}_{/S}, F_{DR})) \]

is an 2-filtered quasi-isomorphism. It is thus an isomorphism in $D_{dfil}(S)$.

**Proof.** (i): Let $h : U \to S$ a smooth morphism with $U \in \text{Var}(C)$. Note that $U$ is smooth since $S$ is smooth. Let $(r_1 : U \to U)_{i \in [1, \ldots, s]}$ an etale cover of $U$. Consider the Chech cover

\[ (U^\bullet/S) := ((U_L, h_L) := (U_1 \times U_2 \times \cdots \times U_s, h \circ (r_1 \times \cdots \times r_s)) \]

\[ \lim_{r_{(r_1 \times \cdots \times r_s)}(U^\bullet/S)} (U_L, h_L) := \bigcup_{i \in [1, \ldots, s]} (U_i, h \circ r_i) \]

\[ \to (U, h) \]
Take (see definition-proposition $\mathbb{12}$) a compactification of $r : (U_\bullet/S) \to U/S$

$$(X_{i0}/S := ((X_{L0}, f_{L0}) \xrightarrow{f_{L0}} \ldots \xrightarrow{f_{L0}} \sqcup_{i \in L}(X_i, f_i)) \xrightarrow{\bar{f}_0} (X_0, f_0)$$

where $f_0 : X_0 \to S$ is a compactification of $h : U \to S$ and $f_{L0} : X_{L0} \to S$ are compactification of $h_l : U_l := U_{i1} \times U \times \cdots \times U_{i_l} \to S$. Denote $Z := X_0/U$ and $Z_l := X_{L0}/U_l$. Take (see again definition-proposition $\mathbb{12}$) a resolution $\epsilon : (X, D) \to (X_0, Z)$ of the pair $(X_0, Z)$ and resolutions $\epsilon_l : (X_l, D_l) \to (X_{L0}, Z_l)$ of the pairs $(X_{L0}, Z_l)$, fitting in another compactification of $r : (U_\bullet/S) \to U/S$

$$(X_\bullet/S : (X_L, f_L) \xrightarrow{f_{L0}} \ldots \xrightarrow{f_{L0}} \sqcup_{i \in L}(X_i, f_i)) \xrightarrow{\bar{f}} (X, f)$$

Denote by $j : U \to X$ and $j_\bullet : U_\bullet \to X_\bullet$ the open embeddings. We have the factorization

$$j_\bullet : U_\bullet \xrightarrow{j^{10}} \bar{f}^{-1}(U) \xrightarrow{j^0} X^*$$

where $j^{10}$ and $j^0$ are open embeddings. Consider the graph embeddings $\bar{f} : X_\bullet \xrightarrow{j} X_\bullet \times X \xrightarrow{\bar{f}_{X\times X}} X$. Denote for short $j^* := j \times I : U \times X \to X \times S$, $j^* := j_\bullet \times I : U_\bullet \times X \to X_\bullet \times X$, and $\bar{f}^* := \bar{f} \times I : X_\bullet \times X \to X_\bullet \times S = X \times S$. We have the factorization

$$j^* : U_\bullet \times S \xrightarrow{j^{10} := (j^{10} \times I)} \bar{f}^{*,-1}(U \times S) \xrightarrow{j^{0} := (j_0 \times I)} X^*$$

We have then by definition the following commutative diagram, with for short $e = e(S) \circ \mathrm{Gr}^1_{S_\bullet}$

$$\begin{array}{ccc}
\varepsilon_\bullet & \mathbb{H}om^\bullet(LPS_\bullet, \text{Gr}^{12\bullet}_{S\bullet} L_{R(X,D)/S}(\mathbb{Z}(U/S)), E_{ct}(\Omega^\bullet_{S\bullet} \Gamma_{pr}, F_{DR})) & \mathbb{H}om^\bullet(LPS_\bullet, \text{Gr}^{12\bullet}_{S\bullet} L_{R^\mathbb{G}(H)(r),-}) \\
\downarrow & \Downarrow & \Downarrow \\
\mathbb{H}om^\bullet(LPS_\bullet, \text{Gr}^{12\bullet}_{S\bullet} L_{R(X,D)/S}(\mathbb{Z}(U_\bullet/S)), E_{ct}(\Omega^\bullet_{S\bullet} \Gamma_{pr}, F_{DR})) & \mathbb{H}om^\bullet(LPS_\bullet, \text{Gr}^{12\bullet}_{S\bullet} L_{R^\mathbb{G}(H)(r),-}) & \\
\end{array}$$

where,

- since $f : X \to S$ is surjective proper morphism, we have the equivalences $(\mathbb{1}, et)$ local in $C(\text{Var}(\mathbb{C}))/S$

$$T(f_\bullet, f_\star)(\mathbb{Z}(X/X)) := ([\Delta_X] : f_\bullet(\mathbb{Z}(X/X)) \to Lf_\star E_{ct}(\mathbb{Z}(X/X)))(d_X - d_S)[2d_X - 2d_S]$$

and

$$T(f_\bullet, f_\star)(\mathbb{Z}(D/\mathbb{Z})) := ([\Delta_{D/\mathbb{Z}}] : f_\bullet(\mathbb{Z}(D/\mathbb{Z})) \to Lf_\star E_{ct}(\mathbb{Z}(D/\mathbb{Z})))(d_X - d_S)[2d_X - 2d_S]$$

given in definition $\mathbb{12}$

- since $f_\bullet : X_\bullet \to S$ is given by surjective proper morphisms, we have the equivalences $(\mathbb{1}, et)$ local in $C(\text{Var}(\mathbb{C}))/S$

$$T(f_{\bullet*} f_\star)(\mathbb{Z}(X_\bullet/X_\bullet)) := ([\Delta_{X_\bullet}] : f_{\bullet*}(\mathbb{Z}(X_\bullet/X_\bullet)) \to Lf_\star E_{ct}(\mathbb{Z}(X_\bullet/X_\bullet)))(d_X - d_S)[2d_X - 2d_S]$$

and

$$T(f_{\bullet*} f_\star)(\mathbb{Z}(D_{\bullet/\mathbb{Z}})) := ([\Delta_{D_{\bullet/\mathbb{Z}}}]) : f_{\bullet*}(\mathbb{Z}(D_{\bullet/\mathbb{Z}})) \to Lf_\star E_{ct}(\mathbb{Z}(D_{\bullet/\mathbb{Z}})))(d_X - d_S)[2d_X - 2d_S]$$

given in definition $\mathbb{12}$

\[239\]
Now, the two horizontal arrows are 2-filtered quasi-isomorphism by proposition $\text{[104]}$ and lemma $\text{[2]}$. The arrow given by the composition of the two maps of the right column is a filtered quasi-isomorphism by proposition $\text{[104]}$. The upper arrow of the right column is a filtered quasi-isomorphism by proposition $\text{[12]}$. Hence the arrow of the left column is a 2-filtered quasi-isomorphism which proves (i).

(ii): Let $h : U \to S$ a smooth morphism with $U \in \text{Var}(\mathbb{C})$. Denote $p : U \times \mathbb{A}^1 \to U$ the projection. Let $f_0 : X_0 \to S$ is a compactification of $h : U \to S$ (see definition-proposition $\text{[12]}$). Denote $Z := X_0 \cup U$. Then $p_0 : X_0 \times \mathbb{P}^1 \to X_0$ is a compactification of $p : U \times \mathbb{A}^1 \to U$. Take (see again definition-proposition $\text{[12]}$) a resolution $e : (X, D) \to (X_0, Z)$ of the pair $(X_0, Z)$. Then $e' : (X \times \mathbb{P}^1, (D \times \mathbb{P}^1) \cup (X \times \{\infty\})) \to (X_0 \times \mathbb{P}^1, (Z \times \mathbb{P}^1) \cup (X_0 \times \{\infty\})$ is a resolution of the pair $(X_0 \times \mathbb{P}^1, (Z \times \mathbb{P}^1) \cup (X_0 \times \{\infty\}))$. Denote by $j : U \to X$ the open embedding. Then $\bar{p} : X \times \mathbb{P}^1 \to X \times S \to X \times S$. We have then by definition the following commutative diagram, with for short $e = e(S) \circ \text{Gr}_{12}^S$,

\[
e_* \text{Hom}^* (L\rho_{S*,} \text{Gr}_{12}^S \text{LR}_{(X,D)/S}(\mathbb{Z}(U)/S)), E_{et}(\Omega^*_{\mathbb{Z}/S}, F_{DR})) \longrightarrow p_* E_{et}(\Omega^*_{X \times S/S}, F_b) \otimes O^{j_!}_{U \times S, F_b}
\]

where,

- since $f : X \to S$ is surjective proper morphism, we have the equivalences $(\mathbb{A}^1, et)$ local in $C(\text{Var}(\mathbb{C})/S)$

\[T(f_!, f_*) : (\mathbb{Z}(U)/S)) \to Lf_* E_{et}(\mathbb{Z}(X/X))(d_X - d_S)[2d_X - 2d_S] \]

and

\[T(f_!, f_*) : (\mathbb{Z}(D_I/X)) \to Lf_* E_{et}(\mathbb{Z}(D_I/X))(d_X - d_S)[2d_X - 2d_S] \]

given in definition $\text{[42]}$.

- since $f \circ p_X : X \times \mathbb{P}^1 \to S$ is a surjective proper morphism, we have the equivalences $(\mathbb{A}^1, et)$ local in $C(\text{Var}(\mathbb{C})/S)$

\[T((f \circ p)_!, (f \circ p)_*) : (\mathbb{Z}(X \times \mathbb{P}^1/X \times \mathbb{P}^1)) \to L(f \circ p)_* E_{et}(\mathbb{Z}(X \times \mathbb{P}^1/X \times \mathbb{P}^1))(d_X + 1 - d_S)[2d_X + 1 - 2d_S] \]

and

\[T((f \circ p)_!, (f \circ p)_*) : (\mathbb{Z}(D_I \times \mathbb{P}^1/X \times \mathbb{P}^1)) \to L(f \circ p)_* E_{et}(\mathbb{Z}(D_I \times \mathbb{P}^1/X \times \mathbb{P}^1))(d_X + 1 - d_S)[2d_X + 1 - 2d_S] \]

given in definition $\text{[42]}$.

Now, by proposition $\text{[104]}$ and lemma $\text{[2]}$ the two horizontal arrows of the right column are 2-filtered quasi-isomorphism. The arrow given by the composition of the two maps of the right column is a filtered quasi-isomorphism by proposition $\text{[104]}$. Hence the arrow of the left column is a 2-filtered quasi-isomorphism which proves (ii).
Definition 117.  (i) Let $S \in \text{SmVar}(\mathbb{C})$. We define using definition 116(i) and proposition 105(ii) the filtered algebraic De Rahm realization functor defined as

$$\mathcal{F}_{S}^{\text{DR}} : \text{DA}_{c}(S) \to D_{\text{fil}, \infty}(S), M \mapsto \mathcal{F}_{S}^{\text{DR}}(M) := \lim_{r(\mathbb{X}, D^{*})/S(L(F))} e(S)_{*} \text{Gr}^{1}_{J_{S}} \text{Hom}^{\bullet}(L\rho_{S*} \text{Gr}^{12}_{S_{L}} L_{R}(\mathbb{X}, D^{*}), S(\rho_{S}^{*} L(F)), E_{et}(\Omega_{/S}^{F, pr}, F_{DR}))[-d_{S}]$$

where $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$ is such that $M = D(\mathbb{A}^{1}, \text{et})(F)$.

(ii) For the Corti-Hanamura weight structure $W$ on $\text{DA}_{c}(S)^{-}$, we define using definition 116(i) and proposition 105(ii)

$$\mathcal{F}_{S}^{\text{DR}} : \text{DA}_{c}(S) \to D_{\text{fil}, \infty}(S), M \mapsto \mathcal{F}_{S}^{\text{DR}}((M, W)) := \lim_{r(\mathbb{X}, D^{*})/S(L(F, W))} e(S)_{*} \text{Gr}^{1}_{J_{S}} \text{Hom}^{\bullet}(L\rho_{S*} \text{Gr}^{12}_{S_{L}} L_{R}(\mathbb{X}, D^{*}), S(\rho_{S}^{*} L(F, W)), E_{et}(\Omega_{/S}^{F, pr}, F_{DR}))[-d_{S}]$$

where $(F, W) \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)$ is such that $M = D(\mathbb{A}^{1}, \text{et})(F, W)$ using corollary 9. Note that the filtration induced by $W$ is a filtration by sub $D_{S}$ module, which is a stronger property then Grifffitz transversality. Of course, the filtration induced by $F$ satisfy only Griffitz transversality in general.

(ii) Let $S \in \text{Var}(\mathbb{C})$ and $S = \bigcup_{i=1}^{l} S_{i}$ an open cover such that there exist closed embeddings $i_{i} : S_{i} \hookrightarrow \tilde{S}_{i}$ with $\tilde{S}_{i} \in \text{SmVar}(\mathbb{C})$. For $I \subset \{1, \cdots, l\}$, denote by $S_{I} = \cap_{i \in I} S_{i}$ and $j_{I} : S_{I} \to S$ the open embedding. We then have closed embeddings $j_{I} : S_{I} \to \tilde{S}_{I} := \Pi_{i \in I} \tilde{S}_{i}$. We define, using definition 116(ii), proposition 105(ii) and corollary 9, the filtered algebraic De Rahm realization functor defined as

$$\mathcal{F}_{S}^{\text{DR}} : \text{DA}_{c}(S) \to D_{\text{fil}, \infty}(S/(\tilde{S}_{I})), M \mapsto \mathcal{F}_{S}^{\text{DR}}(M) := \left( \lim_{r(\mathbb{X}, D^{*})/S(L(F, W))} e'_{\tilde{S}_{I}} \text{Hom}^{\bullet}(L\rho_{\tilde{S}_{I}*} \text{Gr}^{12}_{\tilde{S}_{I}} L_{R}(\mathbb{X}, D^{*}), S(\rho_{\tilde{S}_{I}}^{*} L(F, W)), E_{et}(\Omega_{/\tilde{S}_{I}}^{F, pr}, F_{DR}))[-d_{\tilde{S}_{I}}], u^{q}_{j_{I}}(F) \right)$$

where $F \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)$ is such that $(M, W) = D(\mathbb{A}^{1}, \text{et})(F, W)$ using corollary 7. Note that the filtration induced by $W$ is a filtration by sub $D_{\tilde{S}}$-modules, which is a stronger property then Griffitz transversality. Of course, the filtration induced by $F$ satisfy only Griffitz transversality in general.

Proposition 106. For $S \in \text{Var}(\mathbb{C})$ and $S = \bigcup_{i=1}^{l} S_{i}$ an open cover such that there exist closed embeddings $i_{i} : S_{i} \hookrightarrow \tilde{S}_{i}$ with $\tilde{S}_{i} \in \text{SmVar}(\mathbb{C})$, the functor $\mathcal{F}_{S}^{\text{DR}}$ is well defined.

Proof. Let $S \in \text{Var}(\mathbb{C})$ and $S = \bigcup_{i=1}^{l} S_{i}$ an open cover such that there exist closed embeddings $i_{i} : S_{i} \hookrightarrow \tilde{S}_{i}$ with $\tilde{S}_{i} \in \text{SmVar}(\mathbb{C})$. Denote, for $I \subset \{1, \cdots, l\}$, $S_{I} = \cap_{i \in I} S_{i}$ and $j_{I} : S_{I} \to S$ the open embedding. We then have closed embeddings $i_{I} : S_{I} \hookrightarrow \tilde{S}_{I} := \Pi_{i \in I} \tilde{S}_{i}$. Let $M \in \text{DA}(S)$. Let $F, F' \in C(\text{Var}(\mathbb{C})^{sm}/S)$
such that $M = D(\mathbb{A}_1, et)(F) = D(\mathbb{A}_1, et)(F')$. Then there exist by definition a sequence of morphisms in $C(\text{Var}(\mathbb{C})^{sm}/S)$:

$$F = F_1 \xrightarrow{s_1} F_2 \xrightarrow{s_2} F_3 \xrightarrow{s_3} \ldots \xrightarrow{s_k} F' = F_k$$

where, for $1 \leq k \leq s$, and $s_k$ are $(\mathbb{A}_1, et)$ local equivalence. But if $s : F_1 \xrightarrow{} F_2$ is an equivalence $(\mathbb{A}_1, et)$ local,

$$L(i_1, j_1^*) s : L(i_1, j_1^* F_1) \rightarrow L(i_1, j_1^* F_2)$$

is an equivalence $(\mathbb{A}_1, et)$ local, hence

$$\text{Hom}_{\text{Gr}^H_{\mathbb{A}_1}}(L(i_1, j_1^*) s), E_{et}(\Omega_{/\mathcal{F}}^{\mathbb{A}_1, pr}, F_{DR}) :$$

$$(\lim_{r \rightarrow (-)} e'_{\mathcal{S}_j}), \text{Hom}(L p s, \text{Gr}^H_{\mathbb{A}_1})_{\mathcal{S}_j}(\rho_{\mathcal{S}_j}, L(i_1, j_1^* F_1)), E_{et}(\Omega_{/\mathcal{F}}^{\mathbb{A}_1, pr}, F_{DR}), u_{ij}^q(F_1))$$

$$(\lim_{r \rightarrow (-)} e'_{\mathcal{S}_j}), \text{Hom}(L p s, \text{Gr}^H_{\mathbb{A}_1})_{\mathcal{S}_j}(\rho_{\mathcal{S}_j}, L(i_1, j_1^* F_2)), E_{et}(\Omega_{/\mathcal{F}}^{\mathbb{A}_1, pr}, F_{DR}), u_{ij}^q(F_2))$$

is an $\infty$-filtered quasi-isomorphism by proposition [105].

Let $f : X \xrightarrow{} S$ a morphism with $S, X \in \text{Var}(\mathbb{C})$. Assume there exists a factorization

$$f : X \xrightarrow{l} Y \xrightarrow{p_S} S$$

of $f$, with $l$ a closed embedding, $Y \in \text{SmVar}(\mathbb{C})$ and $p_S$ the projection. Let $\tilde{Y} \in \text{PSmVar}(\mathbb{C})$ a compactification of $Y$ with $\tilde{Y} \setminus Y = D$ a normal crossing divisor, denote $k : D \rightarrow \tilde{Y}$ the closed embedding and $n : Y \rightarrow \tilde{Y}$ the open embedding. Denote $\tilde{X} \subset \tilde{Y} \xrightarrow{} S$ the closure of $X \subset \tilde{Y} \xrightarrow{} S$. We have then the following commutative diagram in $\text{Var}(\mathbb{C})$

$$\begin{array}{ccc}
X & \xrightarrow{l} & Y \times S \\
\downarrow & \downarrow & \downarrow \\
X & \xrightarrow{l} & Y \times S \\
\downarrow & \downarrow & \downarrow \\
Z := X \setminus X & \xrightarrow{i_Z} & D \times S
\end{array}$$

Let $S = \bigcup_{i=1}^{l} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. We have $X = \bigcup_{i=1}^{l} X_i$ with $X_i := f^{-1}(S_i)$. Denote, for $I \subset [1, \ldots, l]$, $S_I = \cap_{i \in I} S_i$ and $X_I = \cap_{i \in I} X_i$. For $I \subset [1, \ldots, l]$, denote by $\tilde{S}_I = \prod_{i \in I} \tilde{S}_i$. We then have, for $I \subset [1, \ldots, l]$, closed embeddings $i_I : S_I \hookrightarrow \tilde{S}_I$ and for $I \subset J$, the following commutative diagrams which are cartesian

$$\begin{array}{ccc}
f_I = f|_{X_I} : X_I & \xrightarrow{i_I} & Y \times S_I \\
\downarrow & \downarrow & \downarrow \\
Y \times \tilde{S}_I & \xrightarrow{i_I} & \tilde{S}_I
\end{array}$$

with $i_I : l_I|_{X_I}$, $i_I' = I \times i_I$, $p_{\tilde{S}_I}$ and $p_{\tilde{S}_I}$ are the projections and $p_{\tilde{S}_I} = I \times p_{\tilde{S}_I}$, and we recall that we denote by $j_I : \tilde{S}_I \setminus X_I \hookrightarrow \tilde{S}_I$ and $j_I' : Y \times \tilde{S}_I \setminus X_I \hookrightarrow Y \times \tilde{S}_I$ the open complementary embeddings. We then have the commutative diagrams

$$\begin{array}{ccc}
D_{IJ} = S_I & \xrightarrow{i_{IJ}} & \tilde{S}_I \\
\downarrow & \downarrow & \downarrow \\
S_I & \xrightarrow{i_I} & \tilde{S}_I
\end{array}$$

$$\begin{array}{ccc}
D_{IJ}' = X_I & \xrightarrow{j_{IJ}'} & Y \times \tilde{S}_I \\
\downarrow & \downarrow & \downarrow \\
X_I & \xrightarrow{j_I} & Y \times \tilde{S}_I
\end{array}$$

\[242\]
and the factorization of $D'_{i,j}$ by the fiber product:

$$D'_{i,j} = X_j \overset{\iota_{ol,j}}{\longrightarrow} Y \times \tilde{S}_j, \quad D'_{i,j} = X_j \overset{\tilde{i}_{ol,j}}{\longrightarrow} Y \times \tilde{S}_j,$$

where $j'_{i,j} : X_j \hookrightarrow X_I$ is the open embedding. Consider

$$F(X/S) := p_{S_I}\Gamma_{X}^\vee \mathcal{Z}(Y \times S/Y \times S) \in C(\text{Var}(\mathbb{C})^{sm}/S)$$

so that $D(\mathbb{A}^1, et)(F(X/S)) = M(X/S)$ since $Y$ is smooth. Then, by definition,

$$F^{DR}_S(M(X/S)) := \left( \lim_{\longrightarrow} \epsilon'(\tilde{S}_I)_{\ast} \text{Hom}(L\rho_{S_I}, \Gamma_{S_I}^{12\ast} LR((Y \times S_I)_{\ast} E_{\ast})/\tilde{S}_I(p_{S_I}^\ast L(i_{I,j})_{\ast} F(X/S))) \right)$$

$$E_{cd}(\Omega_{/\tilde{S}_I}^\bullet \overset{pr}{\longrightarrow} F_{DR}), [-d_{S_I}, u_{I,j}^{\ast} F(X/S)) \right).$$

On the other hand, let

$$Q(X_I/\tilde{S}_I) := p_{S_I}^{-1} \Gamma_{X_I}^\vee \mathcal{Z}(Y \times \tilde{S}_I/Y \times \tilde{S}_I) \in C(\text{Var}(\mathbb{C})^{sm}/\tilde{S}_I),$$

We have then for $I \subset [1, I]$ the map in $C(\text{Var}(\mathbb{C})^{sm}/\tilde{S}_I)$:

$$N_I(X/S) : Q(X_I/\tilde{S}_I) = p_{S_I}^{-1} \Gamma_{X_I}^\vee \mathcal{Z}(Y \times \tilde{S}_I/Y \times \tilde{S}_I) \overset{\text{ad}(i_{I,j}^\ast, i_{I,j})}{\longrightarrow}$$

$$p_{S_I, I_I, I_j}^{-1} \Gamma_{X_I}^\vee \mathcal{Z}(Y \times S_I/Y \times S_I) \overset{T((i_{I,j}^\ast, i_{I,j})}{\longrightarrow} p_{S_I}^{-1} \Gamma_{X_I}^\vee \mathcal{Z}(Y \times S_I/Y \times S_I)$$

We then have the commutative diagram in $C(\text{Var}(\mathbb{C})^{sm}/\tilde{S}_I)$

$$\begin{array}{ccc}
N_I(X/S) & \overset{p_{I,j}^\ast L_{I,j}^\ast j_I^\ast F(X/S)}{\longrightarrow} & p_{i_{I,j}}^\ast L_{I,j}^\ast j_I^\ast F(X/S) \\
\downarrow H_{I,j} & & \downarrow T^U(D_{I,j}(j_I^\ast F(X/S))) \\
Q(X_I/\tilde{S}_I) & \overset{N_J(X/S)}{\longrightarrow} & L_{I,j}^\ast j_I^\ast F(X/S)
\end{array}$$

with

$$H_{I,j} : p_{I,j}^\ast p_{S_I} \Gamma_{X_I}^\vee \mathcal{Z}(Y \times \tilde{S}_I/Y \times \tilde{S}_I) \overset{T((p_{I,j}^\ast p_{I,j}, i_{I,j}^\ast))}{\longrightarrow} p_{S_I}^{-1} \Gamma_{X_I}^\vee \mathcal{Z}(Y \times S_I/Y \times S_I) \overset{T((p_{I,j}^\ast, i_{I,j}^\ast))}{\longrightarrow} p_{S_I}^{-1} \Gamma_{X_I}^\vee \mathcal{Z}(Y \times S_I/Y \times S_I).$$

The diagram say that the maps $N_I(X/S)$ induces a map in $C(\text{Var}(\mathbb{C})^{sm}/(S/\tilde{S}_I))$

$$(N_I(X/S)) : (Q(X_I/\tilde{S}_I), J(p_{I,j}^\ast, p_{I,j}^\ast, i_{I,j}^\ast, i_{I,j}^\ast, i_{I,j}^\ast)(-, -))(H_{I,j})$$

$$\to (L_{I,j}^\ast j_I^\ast F(X/S), J(p_{I,j}^\ast, p_{I,j}^\ast, i_{I,j}^\ast, i_{I,j}^\ast, i_{I,j}^\ast)(-, -) T^U(D_{I,j}(j_I^\ast F(X/S))))).$$

243
Denote $\tilde{X}_I := \tilde{X} \cap (\tilde{Y} \times S_I) \subset \tilde{Y} \times \tilde{S}_I$ the closure of $X_I \subset \tilde{Y} \times \tilde{S}_I$, and $Z_I :=\tilde{Z} \cap (\tilde{Y} \times S_I) = \tilde{X}_I \setminus X_I$.

Consider for $I \subset [1, \cdots l]$ and $I \subset J$ the following commutative diagrams in $\text{Var}(\mathbb{C})$

\[
\begin{array}{c}
X_I \xrightarrow{l_I} Y \times \tilde{S}_I \\
\downarrow \quad \downarrow \quad \downarrow \quad \downarrow \\
X_J \xrightarrow{l_J} Y \times \tilde{S}_J \\
\end{array}
\quad , \quad \begin{array}{c}
\tilde{Y} \times \tilde{S}_I \xrightarrow{p_{S_I}} \tilde{S}_I \\
\downarrow \quad \downarrow \quad \downarrow \quad \downarrow \\
\tilde{Y} \times \tilde{S}_J \xrightarrow{p_{S_J}} \tilde{S}_J \\
\end{array}
\]

\[
\begin{array}{c}
Z_I = \tilde{X}_I \setminus X_I \xrightarrow{\lambda_I} D \times \tilde{S}_I \\
\end{array}
\]

Let $\epsilon_1 : ((\tilde{Y} \times \tilde{S}_I)_1, E_1) \rightarrow (\tilde{Y} \times \tilde{S}_I, X_I)$ a desingularization of the pair $(\tilde{Y} \times \tilde{S}_I, Z_I)$, $\epsilon_2 : ((\tilde{Y} \times \tilde{S}_I)_2, E_2) \rightarrow (\tilde{Y} \times \tilde{S}_I, X_I)$ a desingularization of the pair $(\tilde{Y} \times \tilde{S}_I, X_I)$ and a morphism $\epsilon_{12} : (\tilde{Y} \times \tilde{S}_I)_2 \rightarrow (\tilde{Y} \times \tilde{S}_I)_1$ such that the following diagram commutes (see definition-proposition 12): 

\[
\begin{array}{c}
(\tilde{Y} \times \tilde{S}_I)_2 \xrightarrow{\epsilon_{12}} (\tilde{Y} \times \tilde{S}_I)_1 \\
\downarrow \quad \downarrow \quad \downarrow \quad \downarrow \\
\tilde{Y} \times \tilde{S}_I \xrightarrow{\epsilon_2} \tilde{Y} \times \tilde{S}_I \\
\end{array}
\]

We have then the two canonical maps in $C(\text{Var}(\mathbb{C})^{2,smpr}/(\tilde{S}_I))$

\[
L\rho_{S_I}^* \text{Gr}^{12\ast}_{S_I} L\text{R}_{(\tilde{Y} \times \tilde{S}_I)\ast,E_{\ast}}/(\tilde{S}_I)(\rho_{S_I}^*Q(X_I/\tilde{S}_I))
\]

\[
\begin{align*}
&:= L\rho_{S_I}^* \text{Gr}^{12\ast}_{S_I} L(\text{Cone}(\text{Cone}(p_{S_I},\epsilon_{1,1}E_{1r}(l_{Z_1\ast}(\tilde{Z}((E_{1r} \times E_{1r}),(u_{1I}) \rightarrow p_{S_I},\epsilon_{1,1}E_{1r}(Z(\tilde{Y} \times \tilde{S}_I)_1/(\tilde{Y} \times \tilde{S}_I)_1)))\\
&\rightarrow \text{Cone}(p_{S_I},\epsilon_{1,2}E_{1r}(l_{Z_1\ast}(\tilde{Z}((E_{1r} \times E_{1r}),(u_{1I}) \rightarrow p_{S_I},\epsilon_{1,2}E_{1r}(Z(\tilde{Y} \times \tilde{S}_I)_1/(\tilde{Y} \times \tilde{S}_I)_1)))\\
&\xrightarrow{(T(p_{S_I},\epsilon_{1,1}),(p_{S_I},\epsilon_{1,1}))}(-1)\text{.}T(p_{S_I},\epsilon_{1,1}),(p_{S_I},\epsilon_{1,1}),-1))
\end{align*}
\]

\[
L\rho_{S_I}^* \text{Gr}^{12\ast}_{S_I} L(\text{Cone}(\text{Cone}(p_{S_I},\epsilon_{2,1}E_{2r}(l_{Z_1\ast}(\tilde{Z}((E_{2r} \times E_{2r}),(u_{1I}) \rightarrow p_{S_I},\epsilon_{2,1}E_{2r}(Z(\tilde{Y} \times \tilde{S}_I)_2/(\tilde{Y} \times \tilde{S}_I)_2)))\\
&\rightarrow \text{Cone}(\text{Cone}(\text{Cone}(p_{S_I},\epsilon_{2,1}E_{2r}(l_{Z_1\ast}(\tilde{Z}((E_{2r} \times E_{2r}),(u_{1I}) \rightarrow p_{S_I},\epsilon_{2,1}E_{2r}(Z(\tilde{Y} \times \tilde{S}_I)_2/(\tilde{Y} \times \tilde{S}_I)_2)))\\
&\xrightarrow{(T(p_{S_I},\epsilon_{1,1}),(p_{S_I},\epsilon_{1,1}))}(-1)\text{.}T(p_{S_I},\epsilon_{1,1}),(p_{S_I},\epsilon_{1,1}),-1))
\end{align*}
\]

\[
\begin{array}{c}
\text{Cone}(Z(\tilde{Y} \times \tilde{S}_I, Z_I)/\tilde{S}_I) \rightarrow Z((\tilde{Y} \times \tilde{S}_I, X_I)/\tilde{S}_I)(-d_{Y}[-2d_{Y}]
\end{array}
\]

where,

- the arrow which is denoted as an equality is an homotopy equivalence,

- since $p_{S_I} \circ \epsilon_1 : (\tilde{Y} \times \tilde{S}_I)_1 \rightarrow \tilde{S}_I$ is a surjective proper morphism, we have the equivalences ($A^1, ct$) local in $C(\text{Var}(\mathbb{C})/\tilde{S}_I)$

\[
T((p_{S_I} \circ \epsilon_1)_2,(p_{S_I} \circ \epsilon_1)_2)[Z((\tilde{Y} \times \tilde{S}_I)_1/(\tilde{Y} \times \tilde{S}_I)_1)):\n\]

\[
(p_{S_I} \circ \epsilon_1)_2\text{Z}((\tilde{Y} \times \tilde{S}_I)_1/(\tilde{Y} \times \tilde{S}_I)_1) \rightarrow L(p_{S_I} \circ \epsilon_1)_2E_{ct}(Z((\tilde{Y} \times \tilde{S}_I)_1/(\tilde{Y} \times \tilde{S}_I)_1))(d_{Y}[-2d_{Y}]
\]

and

\[
T((p_{S_I} \circ \epsilon_1)_2,(p_{S_I} \circ \epsilon_1)_2)[Z(E_1, (\tilde{Y} \times \tilde{S}_I)_1)):\n\]

\[
(p_{S_I} \circ \epsilon_1)_2\text{Z}(E_1,(\tilde{Y} \times \tilde{S}_I)_1) \rightarrow L(p_{S_I} \circ \epsilon_1)_2E_{ct}(Z(E_1,(\tilde{Y} \times \tilde{S}_I)_1))(d_{Y}[-2d_{Y}]
\]

given in definition 12
• since $p_{S_i} \circ e_2 : (\bar{Y} \times \bar{S}_l)_2 \to \bar{S}_l$ is a surjective proper morphism, we have the equivalences $(\mathbb{A}^1, et)$ local in $C(Var(C)/\bar{S}_l)$

$$T((p_{S_i} \circ e_2)_2, (p_{S_i} \circ e_2)_*)(\mathbb{Z}((\bar{Y} \times \bar{S}_l)_2/((\bar{Y} \times \bar{S}_l)_1)) : (p_{S_i} \circ e_2)_2 \mathbb{Z}((\bar{Y} \times \bar{S}_l)_2/((\bar{Y} \times \bar{S}_l)_1)) \to L(p_{S_i} \circ e_2_2, E_{et}(\mathbb{Z}((\bar{Y} \times \bar{S}_l)_2/((\bar{Y} \times \bar{S}_l)_1))(d_\mathcal{Y}[2d_\mathcal{Y}])$$

and

$$T((p_{S_i} \circ e_2)_4, (p_{S_i} \circ e_2)_*)(\mathbb{Z}(E_{2*}/((\bar{Y} \times \bar{S}_l)_2)) : (p_{S_i} \circ e_2)_2 \mathbb{Z}(E_{2*}/((\bar{Y} \times \bar{S}_l)_2)) \to L(p_{S_i} \circ e_2_2, E_{et}(\mathbb{Z}(E_{2*}/((\bar{Y} \times \bar{S}_l)_2))(d_\mathcal{Y}[2d_\mathcal{Y}])$$

given in definition 12.

We denote by $v_{1,J}^q(F(X/S))$ the composite

$$v_{1,J}^q(F(X/S)[d_{S_j}]) = e'(\tilde{S}_l)_* \mathcal{H}om(Lp_{S_i}^*, \text{Gr}^{12^*}_{\tilde{S}_l} \text{LR}_{((\bar{Y} \times \bar{S}_l)_*, E^*)/\bar{S}_l}(p_{S_i}^* Q(X_i/\bar{S}_l)), E_{et}(\Omega^{*G_{pr}}, F_{DR}))$$

for $p_{1,J}^q(F(X/S)[d_{S_j}]) = e'(\tilde{S}_l)_* \mathcal{H}om(Lp_{S_i}^*, \text{Gr}^{12^*}_{\tilde{S}_l} \text{LR}_{((\bar{Y} \times \bar{S}_l)_*, E^*)/\bar{S}_l}(p_{S_i}^* Q(X_i/\bar{S}_l)), E_{et}(\Omega^{*G_{pr}}, F_{DR}))$

On the other hand, we have in $\pi_X(C(MHM(\bar{X}))) \subset C_{D\mathcal{F}i}(\bar{X} / ((\bar{Y} \times \bar{S}_l))$

$$(\text{Cone}(T(Z_1/\bar{X}_i, \gamma, H^d)(\cdot)) : (\Gamma_{\bar{X}_i}^{\vee,Hdg}(O_Y \times S_l, F_{XJ}), X_{1,J}(\bar{X}/S)) \to (\Gamma_{Z_1}^{\vee,Hdg}(O_Y \times S_l, F_{XJ}), X_{1,J}(Z/S))$$

with

• for the closed embedding $\bar{X} \subset \bar{Y} \times S_j$ we consider the map in $\pi_{\bar{Y} \times S_j}(C(MHM(\bar{Y} \times \bar{S}_l)))$

$$X_{1,J}((\bar{X}/S)_i) : \Gamma_{\bar{X}_i}^{\vee,Hdg}(O_Y \times S_l, F_{XJ}, F_{B}) \overset{\text{ad}(p_{1,J}^* p_{1,J}^* \cdot (-))}{\longrightarrow} \Gamma_{\bar{X}_i}^{\vee,Hdg}(O_Y \times S_l, F_{XJ}, F_{B})$$

• for the closed embedding $\bar{Z} \subset \bar{Y} \times S_j$ we consider the map in $\pi_{\bar{Y} \times S_j}(C(MHM(\bar{Y} \times \bar{S}_l)))$

$$X_{1,J}(Z/S)_i : \Gamma_{Z_1}^{\vee,Hdg}(O_Y \times S_l, F_{XJ}, F_{B}) \overset{\text{ad}(p_{1,J}^* p_{1,J}^* \cdot (-))}{\longrightarrow} \Gamma_{Z_1}^{\vee,Hdg}(O_Y \times S_l, F_{XJ}, F_{B})$$

• for the closed embedding $\bar{X} \subset Y \times S_j$ we consider the map in $\pi_{\bar{Y} \times S_j}(C(MHM(\bar{Y} \times \bar{S}_l)))$

$$X_{1,J}(X/S)_i(-d_\mathcal{Y}[2d_\mathcal{Y}] : \Gamma_{X_i}^{\vee,Hdg}(O_Y \times S_l, F_{XJ}, F_{B}) \overset{\text{ad}(p_{1,J}^* p_{1,J}^* \cdot (-))}{\longrightarrow} \Gamma_{X_i}^{\vee,Hdg}(O_Y \times S_l, F_{XJ}, F_{B})$$
The maps \( x_{IJ}(X/S) \) gives the following maps in \( C_{\mathcal{D}fil,S_j}(\tilde{S}_J) \)

\[
\begin{align*}
\omega_J(X/S)(-d_Y)-2dy & : p_{S_j*E_{zar}}((\Omega_{X,S_j/S_j}^\bullet, F_b) \otimes_{O_{Y,S_j}} (n \times I)^{Hdg}_X \Gamma_{\mathcal{V}^Y} Hdg(Y \otimes_{\tilde{S}_j} F_b)) \\
\text{ad}(p_{IJ*}p_{IJ}) & \rightarrow p_{IJ*}p_{IJ}, E_{zar}((\Omega_{X,S_j/S_j}^\bullet, F_b) \otimes_{O_{Y,S_j}} (n \times I)^{Hdg}_X \Gamma_{\mathcal{V}^Y} Hdg(Y \otimes_{\tilde{S}_j} F_b)) \\
(\pi_J, E_{str}(-(\pi_J, \pi_J)) & \rightarrow p_{S_j*E_{zar}}((\Omega_{Y,S_j,S_j/S_j}^\bullet, F_b) \otimes_{O_{Y,S_j}} (n \times I)^{Hdg}_X \Gamma_{\mathcal{V}^Y} Hdg(Y \otimes_{\tilde{S}_j} F_b)) \\
& \rightarrow p_{S_j*E_{zar}}((\Omega_{Y,S_j,S_j/S_j}^\bullet, F_b) \otimes_{O_{Y,S_j}} (n \times I)^{Hdg}_X \Gamma_{\mathcal{V}^Y} Hdg(Y \otimes_{\tilde{S}_j} F_b)).
\end{align*}
\]

We have the following lemma

**Lemma 15.**

(i) The map in \( C(\varomathcal{V}(\mathbb{C})^{sm}/(S/\tilde{S}_j)) \)

\[
(N_I(X/S) : (Q(X_I/\tilde{S}_1), H_{IJ}) \rightarrow (L(i_{1*}j_{1*} F(X/S)), T^s(D_{IJ}))(F(X/S)).
\]

is an equivalence \( (A^1, et) \) local.

(ii) The maps \( (N_I(X/S)) \) induces an \( \infty \)-filtered quasi-isomorphism in \( C_{\mathcal{D}fil}(S/(\tilde{S}_j)) \)

\[
(\text{Hom}(\mathcal{Gr}_{S_j}^{12*} R^C \mathcal{V}^H N_I(X/S), E_{et}(\Omega_{j,S_j}^{*,F,pr}, F_b))) : \\
(\lim_{r, (-)} e^i((\tilde{S}_j), \text{Hom}(Lp_{S_j*} \mathcal{Gr}_{S_j}^{12*} L_{(r,-)}(-, (\rho^*_S L(i_{1*}j_{1*} F(X/S))))) E_{et}(\Omega_{j,S_j}^{*,F,pr}, F_{DR}))(d_Y)-2dy, d_{S_j}, \omega_{IJ}(X/S)) \\
\rightarrow (\lim_{r, (-)} e^i((\tilde{S}_j), \text{Hom}(Lp_{S_j*} \mathcal{Gr}_{S_j}^{12*} L_{(r,-)}(-, (\rho^*_S Q(X/I/S)))) E_{et}(\Omega_{j,S_j}^{*,F,pr}, F_{DR}))(d_Y)-2dy, d_{S_j}, \omega_{IJ}(X/S))
\]

(iii) The maps \( (I_3((\tilde{X}_I, Z_1)/\tilde{S}_1)) \) induce an \( \infty \)-filtered Zariski local equivalence in \( C_{\mathcal{D}fil}(S/(\tilde{S}_j)) \)

\[
(\text{Hom}(I_3((\tilde{X}_I, Z_1)/\tilde{S}_1), k) : \\
(p_{S_j*E_{zar}}((\Omega_{Y,S_j,S_j/S_j}^\bullet, F_b) \otimes_{O_{Y,S_j}} (n \times I)^{Hdg}_X \Gamma_{\mathcal{V}^Y} Hdg(Y \otimes_{\tilde{S}_j} F_b))(d_Y)-2dy, d_{S_j}, \omega_{IJ}(X/S)) \\
\rightarrow (e^i((\tilde{S}_j), \text{Hom}(Lp_{S_j*} \mathcal{Gr}_{S_j}^{12*} L_{(r,-)}(-, (\rho^*_S Q(X/I/S)))) E_{et}(\Omega_{j,S_j}^{*,F,pr}, F_{DR}))(d_Y)-2dy, d_{S_j}, \omega_{IJ}(X/S))
\]

**Proof.** (i): See lemma **121**

(ii): These maps induce a morphism in \( C_{\mathcal{D}}(S/(\tilde{S}_j)) \) by construction. It is an \( \infty \)-filtered quasi-isomorphism by (i) and proposition **10X**

(iii): The fact that these maps define a morphism in \( C_{\mathcal{D}}(S/(\tilde{S}_j)) \) follows from the commutative diagrams in \( C(\varomathcal{V}(\mathbb{C})^{2,simp}/(S_J)) \) for \( I \subset J \)

\[
\begin{align*}
p_{IJ*}Lp_{S_j*} & \mathcal{Gr}_{S_j}^{12*} L_{((\tilde{X}_I, Z_1)/S_j)(\rho^*_S Q(X/I/S))} p_{IJ*} L_{((\tilde{X}_I, Z_1)/S_j)} p_{IJ*} \text{Cone}(Z((\tilde{X}_I, Z_1)/\tilde{S}_j)\to Z((\tilde{Y} \times S_1, \tilde{X}_I)/\tilde{S}_1)) \\
\downarrow & T_{(p_{IJ*}R^C H^j)}(-) \\
Lp_{S_j*} & \mathcal{Gr}_{S_j}^{12*} L_{((\tilde{X}_I, Z_1)/S_j)(\rho^*_S p_{IJ*} Q(X/I/S))} p_{IJ*} \text{Cone}(Z((\tilde{X}_I, Z_1)/S_j)\to Z((\tilde{Y} \times S_1, p_{IJ*}^{-1}(X/I))/\tilde{S}_j)) \\
\uparrow & R^C H^j (H_{IJ}) \\
Lp_{S_j*} & \mathcal{Gr}_{S_j}^{12*} L_{((\tilde{X}_I, Z_1)/S_j)(\rho^*_S Q(X/I/S))} p_{IJ*} \text{Cone}(Z((\tilde{X}_I, Z_1)/S_j)\to Z((\tilde{Y} \times S_1, X/I)/\tilde{S}_j)) \\
\downarrow & I_3((\tilde{X}_I, Z_1)/\tilde{S}_1) \\
Lp_{S_j*} & \mathcal{Gr}_{S_j}^{12*} L_{((\tilde{X}_I, Z_1)/S_j)(\rho^*_S Q(X/I/S))} \text{Cone}(Z((\tilde{X}_I, Z_1)/S_j)\to Z((\tilde{Y} \times S_1, X/I)/\tilde{S}_j))
\end{align*}
\]

On the other hand, it is an \( \infty \)-filtered quasi-isomorphism by proposition **9X** since we have by Yoneda
lemma the following commutative diagram

\[
\begin{array}{c}
p_{\tilde{S}_I}^\ast E_{zar}(\Omega^\bullet_{Y \times \tilde{S}_I/S_1}, F_b) \otimes O_{Y \times \tilde{S}_I}((n \times I)_\ast)^Hdg \Gamma_{Y \times \tilde{S}_I/S_1}(O_{E_{i_2} \times \tilde{S}_I}, F_b)) \\
\rightarrow \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \ Quad
Proposition 107. We conclude by theorem 27 since $f_{\tilde{S}_1}$

Proof. Follows from the resolution of a constructible motive by Corti-Hanamura motives and proposition 15(ii) and (iii), where $\rho_{S_i}$ are Zariski local equivalences.

Corollary 5. Let $S \in \text{Var}(\mathbb{C})$ and $S = \cup_{i=1}^{n} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_1$ with $\tilde{S}_1 \in \text{SmVar}(\mathbb{C})$. For $F \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S)$ such that $D(\mathbb{A}^1, \text{et})(F) \in \mathbb{D}_c(S)$, $u^q_{1J}(F)$ are filtered Zariski local equivalence.

Proof. Follows from the resolution of a constructible motive by Corti-Hanamura motives and proposition 107. By theorem 15, $M$ is isomorphic in $\mathbb{D}(S)$ to a generalized distinguish triangle of Corti-Hanamura motives, i.e.

\[ M \sim \text{Cone}(M(X_0/S)[d_0] \to \cdots \to M(X_n/S)[d_n]) \]

where $f_0 : X_0 \to S, \ldots, f_n : X_n \to S$ are projective morphism with $X_0, \ldots, X_n \in \text{SmVar}(\mathbb{C})$. By lemma 15(ii) and (iii), $u^q_{1J}(F(X_r/S))$ are filtered Zariski local equivalence since $w_{1J}(X_r/S)$ are filtered Zariski local equivalences.

Corollary 6. Let $S \in \text{Var}(\mathbb{C})$ and $S = \cup_{i=1}^{n} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_1$ with $\tilde{S}_1 \in \text{SmVar}(\mathbb{C})$. Then, for $F \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S)$ such that $M = D(\mathbb{A}^1, \text{et})(F) \in \mathbb{D}_c(S)$,

\[ H^iF_S^{\text{dR}}(M, W) := ((e'^{(\tilde{S}_1)}), \text{Hom}^{\bullet}(L\rho_{S_i*} \text{Gr}_{\tilde{S}_1}^{12} \text{LR}_{((\mathbb{Y} \times \tilde{S}_1), \mathbb{E}^r)/\tilde{S}_1}(\rho_{S_i}^*, L(i_i,j_i^*(F, W)))), E_\text{et}(\Omega^{\bullet, pr}_{/\tilde{S}_1}, F_{\text{dR}})[-d_{\tilde{S}_1}], u^q_{1J}(F, W) \in \pi_S(MHM(S)) \]

for all $i \in \mathbb{Z}$.

Proof. Follows from the resolution of a constructible motive by Corti-Hanamura motives and proposition 107. By theorem 15, $M$ is isomorphic in $\mathbb{D}(S)$ to a generalized distinguish triangle of Corti-Hanamura motives, i.e.

\[ M \sim \text{Cone}(M(X_0/S)[d_0] \to \cdots \to M(X_n/S)[d_n]) \]

where $f_0 : X_0 \to S, \ldots, f_n : X_n \to S$ are projective morphism with $X_0, \ldots, X_n \in \text{SmVar}(\mathbb{C})$. For $0 \leq r \leq n$, consider a factorization $f_r : X_r \to Y \times S \to S$, where $l_r$ is a closed embedding, $Y \in \mathbb{P}^N$ and $p_S$ the projection. Then,

\[ F_S^{\text{dR}}(M(X_r/S)) = (p_{S_i*}(\Omega^{\bullet}_{Y \times \tilde{S}_1/S_i}, F_b) \otimes_{O_{Y \times \tilde{S}_1}} \Gamma^{\vee, H^d_{\mathbb{D}^r}}(O_{Y \times \tilde{S}_1}, F_b))(dy)[2dy - d_{\tilde{S}_1}], w_{1J}(X_r/S) \in \mathbb{D}_{\text{dR}}(S) \]

by proposition 107. We conclude by theorem 27 since $f_r$ are projective.
**Proposition 108.** For $S \in \text{Var}(\mathbb{C})$ not smooth, the functor (see corollary [9])

\[ \iota_S^{-1}\mathcal{F}_{S,DR}(S)^{op} \to \pi_S(D(MH M(S))) \]

does not depend on the choice of the open cover $S = \cup_i S_i$ and the closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$.

**Proof.** Let $S = \cup_{i=1}^{l'} S_i$ is an other open cover together with closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$ for $l + 1 \leq i \leq l'$. Then, for $J' \subset I' \subset [l + 1, \ldots, l'] = L'$ and $J \subset L = [1, \ldots, l]$,

\[ T^{L/L'}_S(\iota_S^{-1}\lim_{r \to -(-)} e'(\tilde{S}_i)_* \text{Hom}(L\rho_{S_i*} \text{Gr}^{12*}_{S_i} LR_{X_i, D^*}/S_i, (\rho_{S_i*} L(i_1,j_1^!) F)), E_{et}(\Omega^*_{/S_i}, F_{DR}))[d_{S_i}], u_{I,J}(F)) \]

\[ = (\lim_{r \to -(-)} \text{ho lim}_{l \in L} p_{V(1(l')^*)}^* \text{Gr}^{12*}_{S_i} LR_{X_i, D^*}/S_i, (\rho_{S_i*} L(i_1,j_1^!) F)), E_{et}(\Omega^*_{/S_i}, F_{DR}))[d_{S_i}], u_{I,J}(F)) \]

\[ = (\text{ho lim}_{l \in L} p_{V(1(l')^*)}^* \text{Gr}^{12*}_{S_i} LR_{X_i, D^*}/S_i, (\rho_{S_i*} L(i_1,j_1^!) F)), E_{et}(\Omega^*_{/S_i}, F_{DR}))[d_{S_i}], u_{I,J}(F)) \]

\[ \xrightarrow{\text{add}(\text{mod})_{l \in L} p_{V(1(l')^*)}^* \text{Gr}^{12*}_{S_i} LR_{X_i, D^*}/S_i, (\rho_{S_i*} L(i_1,j_1^!) F)), E_{et}(\Omega^*_{/S_i}, F_{DR}))[d_{S_i}], u_{I,J}(F)) \]

is an $\infty$-filtered Zariski local equivalence, since all the morphisms are $\infty$-filtered Zariski local equivalences by corollary [5] and proposition [91].

We have the canonical transformation map between the filtered De Rham realization functor and the Gauss-Manin realization functor :

**Definition 118.** Let $S \in \text{Var}(\mathbb{C})$ and $S = \cup_{i=1}^{l} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. Let $M \in \text{DA}_{c}(S)$ and $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$ such that $M = D(A^1, et)(F)$. We have, using definition [112(ii)], the canonical map in $D_{\text{Shul}, \text{D}, \infty}(S)(\tilde{S}_i(F))$

\[ T(F^{GM}_{S}, F^{EDR}_{S})(M) : \]

\[ \overrightarrow{\text{Gr}^{12*}_{S_i} LR_{X_i, D^*}/S_i, (\rho_{S_i*} L(i_1,j_1^!) F)), E_{et}(\Omega^*_{/S_i}, F_{DR}))[d_{S_i}], u_{I,J}(F)) \]

\[ \overleftarrow{\text{Gr}^{12*}_{S_i} LR_{X_i, D^*}/S_i, (\rho_{S_i*} L(i_1,j_1^!) F)), E_{et}(\Omega^*_{/S_i}, F_{DR}))[d_{S_i}], u_{I,J}(F)) \]

\[ \text{Hom}(\rho_{S_i*}, \text{Gr}^{12*}_{S_i} LR_{X_i, D^*}/S_i, (\rho_{S_i*} L(i_1,j_1^!) F)), E_{et}(\Omega^*_{/S_i}, F_{DR}))[d_{S_i}], u_{I,J}(F)) \]

\[ =: \mathcal{F}^{EDR}_{S}(M) \]
We now define the functorialities of $\mathcal{F}_{S}^{FDR}$ with respect to $S$ which makes $\mathcal{F}_{FDR}$ a morphism of 2 functor.

**Definition 119.** Let $S \in \text{Var}(\mathbb{C})$. Let $Z \subset S$ a closed subset. Let $S = \cup_{i=1}^{d} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. Denote $Z_1 := Z \cap S_1$. We then have closed embeddings $Z_1 \hookrightarrow S_1 \hookrightarrow \tilde{S}_1$.

(i) For $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$, we will consider the following canonical map in $\pi_{S}(D(MHM(S))) \subset D_{D(1,0)fu}(S/\tilde{S}_1))$

$$
T(\Gamma_{Z}^{V,Hdg} \cap \Omega_{/S}^{pr}) (F,W) : \\
\Gamma_{Z}^{V,Hdg} \phi_{S}^{-1}(\lim_{r \to (-)} e'(\tilde{S}_i)_{*} \text{Hom}^{*}(L\rho_{S_1*} \text{Gr}_{S_i}^{12*} L\mathcal{R}_{(X,*,D*,\gamma)/S_i} \rho_{S_1}^{*} \mathcal{L}(i_1,j_1^{*} F, W)), \\
E_{et}(\Omega_{/S_i}^{pr}, F_{DR})[-d_{S_i}], u_{ij}^{S}(F,W)) \\
\text{Hom}^{*}(L\rho_{S_1*} \text{Gr}_{S_i}^{12*} L\mathcal{R}_{(X,*,D*,\gamma)/S_i} \rho_{S_1}^{*} \mathcal{L}(i_1,j_1^{*} F, W)), \\
E_{et}(\Omega_{/S_i}^{pr}, F_{DR})[-d_{S_i}], u_{ij}^{S}(F,W)) \xrightarrow{=} \\
\Gamma_{Z}^{V,Hdg} \phi_{S}^{-1}(\lim_{r \to (-)} e'(\tilde{S}_i)_{*} \text{Hom}^{*}(L\rho_{S_1*} \text{Gr}_{S_i}^{12*} L\mathcal{R}_{(X,*,D*,\gamma)/S_i} \rho_{S_1}^{*} \mathcal{L}(i_1,j_1^{*} F, W)), \\
E_{et}(\Omega_{/S_i}^{pr}, F_{DR})[-d_{S_i}], u_{ij}^{S}(F,W)).
$$

with

$$
u_{ij}^{S}(F)[d_{S_i}] : e'(\tilde{S}_i)_{*} \text{Hom}^{*}(L\rho_{S_1*} \text{Gr}_{S_i}^{12*} L\mathcal{R}_{(X,*,D*,\gamma)/S_i} \rho_{S_1}^{*} \mathcal{L}(i_1,j_1^{*} F)), E_{et}(\Omega_{/S_i}^{pr}, F_{DR})) \xrightarrow{p_{1j}, T(p_{1j}, \Omega^{pr}) (-) \circ \text{ad}(p_{1j}^{ad}, p_{1j})(-) p_{1j}}$$

(ii) For $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$, we have also the following canonical map in $\pi_{S}(D(MHM(S))) \subset$
\(D_{\Omega(0,fu)}(S/(\tilde{S}_t))\) 

\[ T(\Gamma^H_{\tilde{S}_t}, \Omega^F_{\tilde{S}_t})(F,W) : \]

\[ e'(\tilde{S}_t), \text{Hom}^*(L\rho_{\tilde{S}_t}, \text{Gr}^{12}_S \text{LR}_{(\times^*, D^*, -)} / \tilde{S}_t (\rho^*_S \Gamma Z, E(i_{D^*} j^{*}_n \mathbb{D}(F, W))), \]

\[ E_{\text{ct}}(\Omega^F_{\tilde{S}_t}, F_{DR})[-d_{\tilde{S}_t}, u_{1}^{H, Z, d}(F,W)) \]

\[ \Gamma^H_{\tilde{S}_t} e'(\tilde{S}_t), \text{Hom}^*(L\rho_{\tilde{S}_t}, \text{Gr}^{12}_S \text{LR}_{(\times^*, D^*, -)} / \tilde{S}_t (\rho^*_S \Gamma Z, E(i_{D^*} j^{*}_n \mathbb{D}(F, W))), \]

\[ E_{\text{ct}}(\Omega^F_{\tilde{S}_t}, F_{DR})[-d_{\tilde{S}_t}, u_{1}^{H, Z, d}(F,W)) \]

with

\[ u_{H, Z, d}(F)[d_{\tilde{S}_t}] : e'(\tilde{S}_t), \text{Hom}^*(L\rho_{\tilde{S}_t}, \text{Gr}^{12}_S \text{LR}_{(\times^*, D^*, -)} / \tilde{S}_t (\rho^*_S \Gamma Z, E(i_{D^*} j^{*}_n \mathbb{D}(F, W))), \]

\[ p_{12}, T(p_{12}, \Omega^{p_{12}}) \rightarrow \text{ad}(p_{12}^{p_{12}}) \rightarrow \text{ad}(p_{12}^{p_{12}}) \rightarrow \text{ad}(p_{12}^{p_{12}}) \]

\[ p_{12}, e'(\tilde{S}_t), \text{Hom}^*(L\rho_{\tilde{S}_t}, \text{Gr}^{12}_S \text{LR}_{(\times^*, D^*, -)} / \tilde{S}_t (\rho^*_S \Gamma Z, E(i_{D^*} j^{*}_n \mathbb{D}(F, W))), \]

\[ E_{\text{ct}}(\Omega^F_{\tilde{S}_t}, F_{DR}) \]

This transformation map will, with the projection case, gives the transformation between the pullback functors.

**Definition 120.** Let \( g : T \rightarrow S \) a morphism with \( T, S \in \text{SmVar}(\mathbb{C}) \). Consider the factorization \( g : T \rightarrow S \rightarrow \mathbb{P}_S \) where \( l \) is the graph embedding and \( p_S \) the projection. Let \( M \in D_{\text{Smvar}}(S^{\text{op}}) \) and \( (F, W) \in C_{\text{smvar}}(S^{\text{op}}) \) such that \( (M, W) = D(A^1_S, et)(F, W) \). Then, \( D(A^1_S, et)(g^* M) = g^* M \) and there exist \( (F', W) \in C_{\text{smvar}}(S^{\text{op}}) \) and an equivalence \( (A^1, et) \) local \( e : F' \rightarrow (F', W) \) such that \( D(A^1_T \times S, et)(F', W) = (F', W) = D(A^1_{T T}, et)(F', W) \). We have then the canonical transformation in \( \pi_T(D(MHM(T))) \)
using definition [114] and definition [119(i)]:

\[ T(g, X_{\mathcal{F}^{\mathcal{F}^{\mathcal{D}}}}(M) : g^{\text{mod}, H_{\mathcal{D}} g} X_{\mathcal{F}^{\mathcal{F}^{\mathcal{D}}}}(M) := \]

\[ \Gamma_{T}^{v, H_{\mathcal{D}} g} \tau_{T}^{-1}(p_{S}^{\text{mod}}[-\epsilon(S), \text{Gr}_{12}^{2} \mathcal{H}om((\mathcal{L}_{T} \times_{S} \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}}), \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}})))](\mathcal{L}_{T} \times_{S} \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}})))](\mathcal{L}_{T} \times_{S} \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}})) \]

\[ E_{et}(\Omega_{T}^{\mathcal{F}^{\mathcal{F}^{\mathcal{D}}}}^{1}, F_{\mathcal{D}})([-d_{S}]) \]

\[ \Gamma_{T}^{v, H_{\mathcal{D}} g} \tau_{T}^{-1}(e(T \times S), \mathcal{H}om((\mathcal{L}_{T} \times_{S} \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}}), \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}})))](\mathcal{L}_{T} \times_{S} \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}})) \]

\[ E_{et}(\Omega_{T}^{\mathcal{F}^{\mathcal{F}^{\mathcal{D}}}}^{1}, F_{\mathcal{D}})([-d_{S}]) \]

\[ \Gamma_{T}^{v, H_{\mathcal{D}} g} \tau_{T}^{-1}(e(T \times S), \mathcal{H}om((\mathcal{L}_{T} \times_{S} \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}}), \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}})))](\mathcal{L}_{T} \times_{S} \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}})) \]

\[ E_{et}(\Omega_{T}^{\mathcal{F}^{\mathcal{F}^{\mathcal{D}}}}^{1}, F_{\mathcal{D}})([-d_{S}]) \]

\[ \Gamma_{T}^{v, H_{\mathcal{D}} g} \tau_{T}^{-1}(e(T \times S), \mathcal{H}om((\mathcal{L}_{T} \times_{S} \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}}), \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}})))](\mathcal{L}_{T} \times_{S} \mathcal{L}_{T}^{12} T_{T}^{\mathcal{X}}/(\mathcal{X}_{T}^{12} T_{T}^{\mathcal{X}})) \]

\[ E_{et}(\Omega_{T}^{\mathcal{F}^{\mathcal{F}^{\mathcal{D}}}}^{1}, F_{\mathcal{D}})([-d_{S}]) \]

where the last equality follows from proposition [108].

We give now the definition in the non smooth case. Let \( g : T \to S \) a morphism with \( T, S \in \text{Var}(C) \). Assume we have a factorization \( g : T \xrightarrow{i} Y \times S \xrightarrow{\pi_{S}} S \) with \( Y \in \text{SmVar}(C) \), \( l \) a closed embedding and \( p_{S} \) the projection. Let \( S = \bigcup_{i=1}^{l} S_{i} \) be an open cover such that there exists closed embeddings \( i_{1} : S_{i} \to \tilde{S}_{i} \) with \( \tilde{S}_{i} \in \text{SmVar}(C) \). Then, \( T = \bigcup_{i=1}^{l} T_{i} \) with \( T_{i} := g^{-1}(S_{i}) \) and we have closed embeddings \( i_{i} : i_{1} \circ l : T_{i} \to Y \times \tilde{S}_{i} \). Moreover \( \tilde{g}_{i} := p_{S_{i}} : Y \times \tilde{S}_{i} \to \tilde{S}_{i} \) is a lift of \( g_{i} := g_{T_{i}} : T_{i} \to S_{i} \). We recall the commutative diagram:

\[
E_{I_{j}g} = (Y \times \tilde{S}_{j}) \setminus T_{j} \xrightarrow{m_{j}} Y \times \tilde{S}_{j}, E_{I_{j}} = \tilde{S}_{j} \setminus \tilde{S}_{j}, E_{I_{j}} = \left( Y \times \tilde{S}_{j} \right) \setminus T_{j} \xrightarrow{m_{j}} Y \times \tilde{S}_{j}
\]

For \( I \subset J \), denote by \( p_{I_{j}} : \tilde{S}_{j} \to \tilde{S}_{j} \) and \( p'_{I_{j}} : \tilde{S}_{j} \to \tilde{S}_{j} \) the projections, so that \( \tilde{g}_{i} \circ p'_{I_{j}} = p_{I_{j}} \circ \tilde{g}_{j} \). Consider, for \( I \subset J \subset [1, \ldots, l] \), the following commutative diagrams in \( \text{Var}(C) \):

\[
\tilde{S}_{j} \xrightarrow{\tilde{g}_{i}} \tilde{S}_{j}, D_{I_{j}} = \tilde{S}_{j} \]

\[
T_{j} \xrightarrow{p_{I_{j}}} Y \times \tilde{S}_{j}, D_{g_{I}} = \tilde{S}_{j} \]

\[
T_{j} \xrightarrow{\tilde{g}_{i}} Y \times \tilde{S}_{j}, T_{j} \xrightarrow{p_{I_{j}}} Y \times \tilde{S}_{j}
\]

252
and $j_{IJ} : S_J \hookrightarrow S_I$ is the open embedding so that $j_I \circ j_{IJ} = j_J$. Let $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$. Recall (see section 2) that since $j_I^\ast i_{IJ}^\ast g^\ast F = 0$, the morphism $T(D_{gl})(j_I^\ast F) : \tilde{g}_I^\ast i_{IJ}^\ast j_I^\ast g^\ast F \to i_{IJ}^\ast j_I^\ast g^\ast F$ factors through

$$T(D_{gl})(j_I^\ast F) : \tilde{g}_I^\ast i_{IJ}^\ast j_I^\ast F \xrightarrow{\gamma_{X,I}^\vee(-)} \Gamma_{X,I}^\vee(j_I^\ast F) \xrightarrow{T^\vee(D_{gl})(j_I^\ast F)} i_{IJ}^\ast j_I^\ast g^\ast F.$$  

and that the fact that the diagrams commute says that the maps $T^\vee,\gamma(D_{gl})(j_I^\ast F)$ define a morphism in $C(\text{Var}(\mathbb{C})^{sm}/(T/(\mathbb{Y} \times S_I)))$

$$(T^\vee,\gamma(D_{gl})(j_I^\ast F)) : (\Gamma_{T_I}^\vee,\tilde{g}_I^\ast L(i_{IJ}^\ast F), T^\vee(D_{IJ})(j_I^\ast F) \circ T(T_I/T_I \times \tilde{S}_{J,I}, \gamma_{I})(-) \circ T(p_{IJ}, \gamma_{I})(-)) \to (L(i_{IJ}^\ast j_I^\ast g^\ast F), T^\vee(D_{IJ})(j_I^\ast g^\ast F))$$

Denote for short $d_{IJ} := -d_Y - d_{\tilde{S}_J}$. We denote by $\tilde{g}_J^\ast u_{IJ}^\ast F(F)$ the composite

$$e'(Y \times \tilde{S}_J) : \text{Hom}(Lp_{Y \times \tilde{S}_J}, Gr^{12s}_{Y \times \tilde{S}_J}) L_{R}(X^{\vee,E^\vee})/Y \times \tilde{S}_J (\rho_{J}^\ast \tilde{g}_J^\ast L(i_{IJ}^\ast F), T_{et}(\Omega^t_{Y/\tilde{S}_J}, F_{DR}))$$

We denote by $\tilde{g}_J^\ast u_{\overline{IJ}}^\ast F(F)[-d_{YJ}]:$

$$e'(Y \times \tilde{S}_J) : \text{Hom}(Lp_{Y \times \tilde{S}_J}, Gr^{12s}_{Y \times \tilde{S}_J}) L_{R}(X^{\vee,E^\vee})/Y \times \tilde{S}_J (\rho_{J}^\ast \tilde{g}_J^\ast L(i_{IJ}^\ast F), T_{et}(\Omega^t_{Y/\tilde{S}_J}, F_{DR}))$$

We then have the following lemma: 

**Lemma 16.** (i) The morphism in $C(\text{Var}(\mathbb{C})^{sm}/(T/(\mathbb{Y} \times \tilde{S}_I)))$

$$(T^\vee,\gamma(D_{gl})(j_I^\ast F)) : (\Gamma_{T_I}^\vee,\tilde{g}_I^\ast L(i_{IJ}^\ast F), T^\vee(D_{IJ})(j_I^\ast F) \circ T(T_I/T_I \times \tilde{S}_{J,I}, \gamma_{I})(-)) \circ T(p_{IJ}, \gamma_{I})(-)) \to (L(i_{IJ}^\ast j_I^\ast g^\ast F), T^\vee(D_{IJ})(j_I^\ast g^\ast F))$$

is an equivalence ($A^1, \text{et}$) local.
(ii) The maps $\text{Hom}((T_{\Omega^*} \gamma(D_g))(j_1^* F)), E_{et}(\Omega^{*\Gamma, pr}, F_{DR}))$ induce an $\infty$-filtered quasi-isomorphism in $C_{Dfil}(T/(Y \times \tilde{S}_1))$

$$\text{Hom}(LR_{Y \times \tilde{S}_1}^C \text{Gr}_{Y \times \tilde{S}_1}^{12*}, T^q \gamma(D_g))(j_1^* F), E_{et}(\Omega^{*\Gamma, pr}, F_{DR}))|_{d_Y I} :$$

$$\text{Hom}(LR_{X \times D^*}^C (\rho_{Y \times \tilde{S}_1}^{*\Gamma, pr}, F_{DR})|_{d_Y I}, \tilde{g}_J^* u_I^*(F))$$

(iii) The maps $T(\tilde{g}_I, \Omega^{*\Gamma, pr})(-)$ (see definition [114]), induce a morphism in $C_{Dfil}(T/(Y \times \tilde{S}_1))$

$$T(\tilde{g}_I, \Omega^{*\Gamma, pr})(-)[d_Y I] :$$

$$\text{Hom}(LR_{X \times D^*}^C (\rho_{Y \times \tilde{S}_1}^{*\Gamma, pr}, F_{DR})|_{d_Y I}, \tilde{g}_J^* u_I^*(F)).$$

Proof. (i): Follows from theorem [13].

(ii): These morphisms induce a morphism in $C_{Dfil}(T/(Y \times \tilde{S}_1))$ by construction. The fact that this morphism is an $\infty$-filtered equivalence Zariski local follows from (i) and proposition [105].

(iii): These morphisms induce a morphism in $C_{Dfil}(T/(Y \times \tilde{S}_1))$ by construction. \hfill \square

**Definition 121.** Let $g : T \rightarrow S$ a morphism with $T, S \in \text{Var}(\mathbb{C})$. Assume we have a factorization $g : T \xrightarrow{l} Y \times S \xrightarrow{p} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. Let $S = \bigcup_{i=1}^n S_i$ be an open cover such that there exists closed embeddings $i_S : S_i \hookrightarrow S$ with $S_i \in \text{SmVar}(\mathbb{C})$. Then, $T = \bigcup_{i=1}^n T_i$ with $T_i := g^{-1}(S_i)$ and we have closed embeddings $i_{T_i} := i_S \circ l : T_i \hookrightarrow Y \times S_i$. Moreover, $\tilde{g}_I := p_{S_i} : Y \times S_i \rightarrow S_i$ is a lift of $g_I := g_{T_i} : T_i \rightarrow S_i$. Let $M \in \text{DA}_c(S)$ and $(F, W) \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)$ such that $(M, W) = D(\mathbb{A}^1_c, et)(F, W)$. Then, $D(\mathbb{A}^1_c, et)(g^* F) = g^* M$ and there exist $(F', W) \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)$ and an equivalence $(\mathbb{A}^1_c, et)$ local $e : g^* (F, W) \rightarrow (F', W)$ such that $D(\mathbb{A}^1_c, et)(F', W) = (g^* M, W)$. Denote for short $d_{Y I} := -d_Y - d_{S_i}$. We have, using definition [114] and definition [114](i), by lemma [114] the
Proposition 109. Let $g : T \to S$ a morphism with $T, S \in \text{Var}(\mathbb{C})$. Assume we have a factorization $g : T \xrightarrow{1} Y_2 \times S \xrightarrow{p_2} S$ with $Y_2 \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_2$ the projection. Let $S = \bigcup_{i=1}^{m} S_i$ be an open cover such that there exists closed embeddings $i_i : S_i \hookrightarrow S$ with $S_i \in \text{SmVar}(\mathbb{C})$. Then, $T = \bigcup_{i=1}^{m} T_i$ with $T_i := g^{-1}(S_i)$ and we have closed embeddings $i'_i := i_i \circ l : T_i \hookrightarrow Y_2 \times S_i$. Moreover $\tilde{g}_T : Y \times S_i \to S_i$ is a lift of $g_T : T_i \to S_i$. Let $f : X \to S$ a morphism with $X \in \text{Var}(\mathbb{C})$ such that there exists a factorization $f : X \xrightarrow{1} Y_1 \times S \xrightarrow{p_2} S$, with $Y_1 \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_2$ the projection. We have then the following commutative diagram whose squares are cartesian.
Take a smooth compactification $\bar{Y}_1 \in \text{PSmVar}(\mathbb{C})$ of $Y_1$, denote $\bar{X}_1 \subset \bar{Y}_1 \times \tilde{S}_I$ the closure of $X_I$, and $Z_I := \bar{X}_1 \setminus X_I$. Consider $F(X/S) := p_{S,T} \Gamma^\alpha Z(Y_1 \times S/Y_1 \times S) \in C(\text{Var}(\mathbb{C})^m/S)$ and the isomorphism in $C(\text{Var}(\mathbb{C})^m/T)$

$$T(f,g,F(X/S)) : g^* F(X/S) := g^* p_{S,T} \Gamma^\alpha Z(Y_1 \times S/Y_1 \times S) \sim \ 
\text{proof.}$$

**Theorem 32.** Let $g : T \to S$ a morphism, with $S,T \in \text{Var}(\mathbb{C})$. Assume we have a factorization $g : T \twoheadrightarrow Y_S \xrightarrow{\mathbb{P}} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. Let $M \in \text{DA}_c(S)$. Then map $\pi_T(D(MHM(T)))$

$$T(g, F^{\mathbb{F}DR}(M) : g^{\mathbb{I}}_{Hdg} F^\mathbb{F}DR(M) \sim \mathbb{F}^D_T(g^* M)$$

with $d_{Y_2} = d_{Y_1} + d_{Y_2}$.

Proof. Follows immediately from definition.

**Definition 122.**

- Let $f : X \to S$ a morphism with $X,S \in \text{Var}(\mathbb{C})$. Assume there exist a factorization $f : X \twoheadrightarrow Y \xrightarrow{p} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. We have, for $M \in \text{DA}_c(X)$, the following transformation map in $\pi_S(D(MHM(S)))$

$$T_s(f, F^{\mathbb{F}DR}(M) : F^\mathbb{F}DR(R_f,M) \xrightarrow{\text{ad}(p^{\mathbb{I}}_{Hdg} F^{\mathbb{F}DR}(R_f,M))} R_f^{Hdg} F^{\mathbb{F}DR}(R_f,M)$$

Clearly, for $p : Y \times S \to S$ a projection with $Y \in \text{PSmVar}(\mathbb{C})$, we have, for $M \in \text{DA}_c(Y \times S)$, $T_s(p, F^{\mathbb{F}DR}(M) = T_s(p, F^{\mathbb{F}DR}(M)[dy]$.

- Let $S \in \text{Var}(\mathbb{C})$. Let $Y \in \text{SmVar}(\mathbb{C})$ and $p : Y \times S \to S$ the projection. We have then, for $M \in \text{DA}(Y \times S)$ the following transformation map in $\pi_S(D(MHM(S)))$

$$T_s(p, F^{\mathbb{F}DR}(M) : p^{Hdg} F^{\mathbb{F}DR}(L_p,M) \xrightarrow{\text{ad}(p^{\mathbb{I}}_{Hdg} F^{\mathbb{F}DR}(L_p,M))} R_p^{Hdg} F^{\mathbb{F}DR}(L_p,M)$$

256
Let $f : X \to S$ a morphism with $X, S \in \mathbf{Var}(\mathbb{C})$. Assume there exist a factorization $f : X \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S$ with $Y \in \mathbf{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. We have then, using the second point, for $M \in \mathbf{DA}(X)$ the following transformation map in $\pi_S(D(MHM(S)))$

$$T_l(f, \mathcal{F}^{FDR})(M) : R\pi_l^{Hdg} F_X^{FDR}(M, W) \cong R\pi_l^{Hdg} F_Y^{FDR}(I_* M) \xrightarrow{T_l(p, \mathcal{F}^{FDR})(I_* M)} F_S^{FDR}(L_{p_{Y/S}} I_* M) \xrightarrow{\varphi} F_S^{FDR}(Rf_* M)$$

Let $f : X \to S$ a morphism with $X, S \in \mathbf{Var}(\mathbb{C})$. Assume there exist a factorization $f : X \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S$ with $Y \in \mathbf{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. We have, using the third point, for $M \in \mathbf{DA}(S)$, the following transformation map in in $\pi_X(D(MHM(X)))$

$$T_l(f, \mathcal{F}^{FDR})(M) : F_X^{FDR}(f^! M) \xrightarrow{\text{ad}(Rf_!^{Hdg}, f^! \mathcal{F}^{FDR}(f^! M))} F_S^{FDR}(Rf_!^{Hdg} F_X^{FDR}(f^! M)) \xrightarrow{T_l(p_S, \mathcal{F}^{FDR})(f^! M)} F_S^{FDR}(Rf_!^{Hdg} F_Y^{FDR}(f^! M)) \xrightarrow{\varphi} F_S^{FDR}(Rf_* M)$$

Proposition 110. Let $S \in \mathbf{Var}(\mathbb{C})$. Let $Y \in \mathbf{SmVar}(\mathbb{C})$ and $p : Y \times S \to S$ the projection. Let $S = \bigcup_{i=1}^{l} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow S_i$ with $S_i \in \mathbf{SmVar}(\mathbb{C})$. For $I \subset [1, \ldots, l]$, we denote by $S_1 = \cap_{i \in I} S_i$, $j_I : S_1 \hookrightarrow S$ and $j_I : Y \times S_1 \hookrightarrow Y \times S$ the open embeddings. We then have embeddings $i_1 : S_1 \hookrightarrow Y \times S_1$, and we denote by $p_{S_1} : Y \times S_1 \to S_1$ the projections. Let $f' : X' \to Y \times S$ a morphism, with $X' \in \mathbf{Var}(\mathbb{C})$ such that there exists a factorization $f' : X' \xrightarrow{i'} Y' \times Y \times S \xrightarrow{p'} Y \times S$ with $Y' \in \mathbf{SmVar}(\mathbb{C})$, $l'$ a closed embedding and $p'$ the projection. Denoting $X'_I := f'^{-1}(Y \times S_1)$, we have closed embeddings $i'_I : X'_I \hookrightarrow Y' \times Y \times S_1$ Consider

$$F(X'/Y \times S) := p_Y \times_{S, Z} \Gamma_X (Y' \times Y \times S/Y' \times Y \times S) \in C(\mathbf{Var}(\mathbb{C})^m / Y \times S)$$

and $F(X'/S) := p_Y F(X'/Y \times S) \in C(\mathbf{Var}(\mathbb{C})^m / S)$, so that $L_{p_Y} M(X'/Y \times S)[-2d_Y] = : M(X'/S)$. Then, the following diagram in $\pi_S(D(MHM(S))) \subset D_{\mathcal{D}(1,0)_{f_1 \{\infty\}}(S/Y \times S_1)}$, where the vertical maps are given by proposition [17]

$$\begin{array}{ccc}
R\pi_l^{Hdg} F_Y^{FDR}(M) & \xrightarrow{\text{ad}(Rf_!^{Hdg}, f^! \mathcal{F}^{FDR}(f^! M))} & F_S^{FDR}(Rf_!^{Hdg} F_Y^{FDR}(f^! M)) \\
\xrightarrow{T_l(p, \mathcal{F}^{FDR})(l' X'/Y \times S)} & & \xrightarrow{T_l(p_S, \mathcal{F}^{FDR})(f^! M)} F_S^{FDR}(Rf_!^{Hdg} F_Y^{FDR}(f^! M)) \\
\xrightarrow{i(X'/S)} & & \xrightarrow{i(X'/S)}
\end{array}
$$

Proof. Immediate from definition. \hfill \square

Theorem 33. (i) Let $f : X \to S$ a morphism with $X, S \in \mathbf{Var}(\mathbb{C})$. Assume there exist a factorization $f : X \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S$ with $Y \in \mathbf{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. Then, for $M \in \mathbf{DA}_c(X)$, the map given in definition [5]

$$T_l(f, \mathcal{F}^{FDR})(M) : Rf_!^{Hdg} F_X^{FDR}(M) \xrightarrow{\varphi} F_S^{FDR}(Rf_* M)$$

is an isomorphism in $\pi_S(D(MHM(S)))$.

(ii) Let $f : X \to S$ a morphism with $X, S \in \mathbf{Var}(\mathbb{C})$, $S$ quasi-projective. Assume there exist a factorization $f : X \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S$ with $Y \in \mathbf{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. We have, for $M \in \mathbf{DA}_c(X)$, the map given in definition [5]

$$T_l(f, \mathcal{F}^{FDR})(M) : F_S^{FDR}(Rf_* M) \xrightarrow{\varphi} F_S^{FDR}(Rf_* M)$$

is an isomorphism in $\pi_S(D(MHM(S)))$. 257
(iii) Let $f : X \to S$ a morphism with $X, S \in \text{Var}(\mathbb{C})$, $S$ quasi-projective. Assume there exist a factorization $f : X \xrightarrow{i} Y \times S \xrightarrow{p_S} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. Then, for $M \in \text{DA}_c(S)$, the map given in definition 1.3 is an isomorphism in $\pi_X(D(MHM(X)))$.

Proof. (i): By proposition 110 and proposition 107 for $S \in \text{Var}(\mathbb{C})$, $Y \in \text{SmVar}(\mathbb{C})$, $p : Y \times S \to S$ the projection and $M \in \text{DA}_c(Y \times S)$,

$$T_i(p, \mathcal{F}^{FDR})(M) : R^p_{Hdg} \mathcal{F}^{FDR}_{Y \times S}(M) \to \mathcal{F}^{FDR}_S(Rp_M)$$

is an isomorphism.

(ii): Consider first an open embedding $n : S^o \hookrightarrow S$ with $S \in \text{Var}(\mathbb{C})$ so that there exist a closed embedding $i : S \hookrightarrow S$ with $S \in \text{SmVar}(\mathbb{C})$. Then, since

$$n^* : C(\text{Var}(\mathbb{C})^m / S) \to C(\text{Var}(\mathbb{C})^m / S^o)$$

is surjective, $n^* : \text{DA}(S) \to \text{DA}(S^o)$ is surjective. Denote by $i : Z = S \setminus S^o \hookrightarrow S$ the complementary closed embedding. By [9], $\text{DA}_c(S)$ is generated by motives of the form

$$\text{DA}_c(S) = \langle M(X'/S) = f_i^* E(Z_{X'}) \rangle, f' : X' \to S \text{ proper with } X' \in \text{SmVar}(\mathbb{C}),$$

$$f^{-1}(Z) = X' \text{ or } f^{-1}(Z) = \bigcup D_i = D \subset X' > .$$

If $f'^{-1}(Z) = X'$, $n^* M(X'/S) = 0$. So let consider the case $f'^{-1}(Z) = \bigcup D_i = D \subset X'$ is a normal crossing divisor. Denote $f'_D : f'_D : D \to Z$, $D_I = \bigcap D_i$ and $i''_D : D_I \hookrightarrow X'$, $n' : X'^o = X' \setminus D \to X'$ the complementary open embedding and $f'^o : f'|_{X'^o} : X'^o \to S$. Denote $L = [1, \ldots, l]$. We have then a generalized distinguished triangle in $\text{DA}(X')$

$$a(n', i') : n'_* n'^* E_{et}(Z_{X'}) \xrightarrow{\sim} \text{Cone} (\gamma_D (-) : \Gamma_D E_{et}(Z_{X'}) \to E_{et}(Z_{X'}))$$

$$\xrightarrow{\sim} \text{Cone} (\Gamma_{D_i} E_{et}(Z_{X'}) \to \cdots \to \bigoplus_{i=1}^{l} E_{et}(Z_{X'}))$$

$$\xrightarrow{\sim} \text{Cone} (i''_* i''_! E_{et}(Z_{X'}) \to \cdots \to \bigoplus_{i=1}^{l} i''_* i''_! E_{et}(Z_{X'}) \xrightarrow{\text{add} (i''_* i''_! (E_{et}(Z_{X'})))} E_{et}(Z_{X'}))$$

$$\xrightarrow{\sim} \text{Cone} (i''_* Z_{D_i}[-1] \to \cdots \to \bigoplus_{i=1}^{l} i''_* Z_{D_i}[-1] \to Z_{X'})$$

where the first isomorphism is the image of an homotopy equivalence by definition, the second one is the image of an homotopy equivalence by definition-proposition [11ii], the third one follows by the localization property (see section 3, theorem [12]) and the last one follows from purity since the $D_I$ and $X'$ are smooth (see section 3, theorem [14]). Similarly, we have a generalized distinguished triangle in $D(MHM(X'))$

$$a^\text{mod}(n', i') : n'^{Hdg} n'^* (O_{X'}, F_b) \xrightarrow{\sim} \text{Cone} \Gamma_{D}^{Hdg} (O_{X'}, F_b) : \Gamma_{D}^{Hdg} (O_{X'}, F_b) \to (O_{X'}, F_b))$$

$$\xrightarrow{\sim} \text{Cone} \bigoplus_{i=1}^{l} \Gamma_{D_i}^{Hdg} (O_{X'}, F_b) \to \cdots \to \bigoplus_{i=1}^{l} \Gamma_{D_i}^{Hdg} (O_{X'}, F_b) \xrightarrow{\text{add} (i''_* i''_! (O_{X'}))} (O_{X'}, F_b))$$

$$\xrightarrow{\sim} \text{Cone} (i''_* (O_{D_i}, F_b)[-1] \to \cdots \to \bigoplus_{i=1}^{l} i''_* (O_{D_i}, F_b)[-1] \xrightarrow{\text{add} (i''_* i''_! (O_{X'}))} \cdots \to (O_{X'}, F_b))$$

258
where the first isomorphism is the image of an homotopy equivalence by definition, the second one is the image of an homotopy equivalence by definition–proposition 20 and the third one follows by the localization property of mixed Hodge modules (see section 5). Consider $n^*M(X'/S) = M(X''/S')$. We have then the factorization

$$T_*(n, F^{FDR})(n^*M(X'/S)) : F^{FDR}_{S}(Rn^*n^*M(X'/S)) = F^{FDR}_{S}(n^*n^*f_!E_{et}(Z_{X'}))$$

$$T_*(f, F^{FDR})(n^*n^*f_!E_{et}(Z_{X'})) \rightarrow T_*(n, F^{FDR})(n^*n^*f_!E_{et}(Z_{X'}))$$

$$= \text{Cone}(Rf_!Hdg \mathcal{F}^{FDR}_{X'}(i_{L*}Z_{D_l}[-l] \rightarrow \bigoplus_{i=1}^l i_{L*}'Z_{D_i}[-1] \rightarrow Z_{X'}))$$

$$\cong \text{Cone}(Rf_!Hdg \mathcal{F}^{FDR}_{X'}(i_{L*}Z_{X'}[-l]) \rightarrow \bigoplus_{i=1}^l Rf_!Hdg \mathcal{F}^{FDR}_{X'}(i_{L*}'Z_{X'}[-1]) \rightarrow Rf_!Hdg \mathcal{F}^{FDR}_{X'}(Z_{X'}))$$

$$\cong \text{Cone}(Rf_!Hdg \mathcal{F}^{FDR}_{X'}(i_{L*}Z_{X'}[-l]) \rightarrow \bigoplus_{i=1}^l Rf_!Hdg \mathcal{F}^{FDR}_{X'}(i_{L*}'Z_{X'}[-1]) \rightarrow Rf_!Hdg \mathcal{F}^{FDR}_{X'}(Z_{X'}))$$

Since all the morphism involved are isomorphisms, $T_*(n, F^{FDR})(n^*M(X'/S))$ is an isomorphism. Hence, $T_*(n, F^{FDR})(M)$ is an isomorphism for all $M \in DA(S'^*)$. Consider now the case of a general morphism $f : X \to S$, $X, S \in \text{Var}(\mathbb{C})$, $S$ quasi-projective, which factors trough $f : X \to Y \times S \stackrel{\Phi}{\to} S$ with some $Y \in \text{SmVar}(\mathbb{C})$. By definition, for $M \in DA_c(X)$

$$T_*(f, F^{FDR})(M) : F^{FDR}_{S}(Rf_!M) = F^{FDR}_{S}(Rf_!\mathcal{F}^{FDR}(M))$$

$$T_*(f, F^{FDR})(M) : Rf_!Hdg \mathcal{F}^{FDR}_{Y \times S}(l_*M) = Rf_!Hdg \mathcal{F}^{FDR}_{Y \times S}(l_*M)$$

Hence, we have to show that for $S \in \text{Var}(\mathbb{C})$, $Y \in \text{SmVar}(\mathbb{C})$, $p : Y \times S \to S$ the projection, and $M \in DA_c(Y \times S)$,

$$T_*(p, F^{FDR})(M) : F^{FDR}_{S}(Rn_!M) \rightarrow Rn_!Hdg \mathcal{F}^{FDR}_{Y \times S}(M)$$

is an isomorphism. Take a smooth compactification $\bar{Y} \in \text{PSmVar}(\mathbb{C})$ of $Y$. Denote by $n_0 : Y \to \bar{Y}$ and $n := n_0 \times \iota_S : Y \times S \to \bar{Y} \times S$ the open embeddings and by $\bar{p} : \bar{Y} \times S \to S$ the projection. We have $p = \bar{p} \circ n : Y \times S \to S$, which gives the factorization

$$T_*(p, F^{FDR})(M) : F^{FDR}_{S}(Rn_!M) \rightarrow F^{FDR}_{S}(R\bar{p}_!Rn_!M)$$

$$\cong \text{Cone}(Rf_!Hdg \mathcal{F}^{FDR}_{X'}(i_{L*}Z_{D_l}[-l] \rightarrow \bigoplus_{i=1}^l i_{L*}'Z_{D_i}[-1] \rightarrow Z_{X'}))$$

$$\cong \text{Cone}(Rf_!Hdg \mathcal{F}^{FDR}_{X'}(i_{L*}Z_{X'}[-l]) \rightarrow \bigoplus_{i=1}^l Rf_!Hdg \mathcal{F}^{FDR}_{X'}(i_{L*}'Z_{X'}[-1]) \rightarrow Rf_!Hdg \mathcal{F}^{FDR}_{X'}(Z_{X'}))$$

By the open embedding case $T_*(n, F^{FDR})(M)$ is an isomorphism. On the other hand, since $\bar{p}$ is proper, $T_*(\bar{p}, F^{FDR})(Rn_!M) = T_*(\bar{p}, F^{FDR})(Rn_!M)$ is an isomorphism by (i).
(iii): Denote by \( n : Y \times S \setminus X \rightarrow Y \times S \) the complementary open embedding. We have, for \( M \in DA_c(S) \), the factorization

\[
T^i(f, \mathcal{F}^{FDR})(M) : \mathcal{F}^{FDR}_X (f^1 M) = \mathcal{F}^{FDR}_{Y \times S} (\star_* p_S^* M) \xrightarrow{\mathcal{F}^{FDR}_{Y \times S} (u(n.)) \circ \mathcal{F}^{FDR}_{Y \times S} (\text{Cone}(p_S^1 M \rightarrow Rn^* p_S^1 M)[-1])} \text{Cone}(\mathcal{F}^{FDR}_{Y \times S} (p_S^1 M) \rightarrow \mathcal{F}^{FDR}_{Y \times S} (Rn^* p_S^1 M)[-1])
\]

\[
\xrightarrow{\mathcal{F}^{FDR}_{Y \times S}((p_S^1 M) \circ \mathcal{T''(p_S, \mathcal{F}^{FDR}(M)), \mathcal{T''(p_S, \mathcal{F}^{FDR}(M)))})}
\]

\[
\text{Cone}(p_S^{* \text{mod}[-1]} \mathcal{F}^{FDR}_S (M) \rightarrow n^1 \mathcal{H}^d g^* n^* p_S^{* \text{mod}[-1]} \mathcal{F}^{FDR}_S (M)[-1]) \xrightarrow{\mathcal{F}^{FDR}_S (M)}
\]

By (ii), \( T(n, \mathcal{F}^{FDR})(p_S^1 M) \) is an isomorphism. On the other hand, since \( p_S \) is a smooth morphism, \( T^i(p_S, \mathcal{F}^{FDR}(M)) = T(p_S, \mathcal{D} \mathcal{F}^{FDR}(M))[dy] \); hence, \( T^i(p_S, \mathcal{F}^{FDR}(M)) \) is an isomorphism by theorem \( 62 \).

Lemma 17. Let \( g : T \rightarrow S \) a morphism with \( T, S \in \text{Var}(\mathbb{C}) \). Assume we have a factorization \( g : T \xrightarrow{l} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \bigcup S_i \) be an open cover such that there exists closed embeddings \( i_i : S_i \rightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \text{SmVar}(\mathbb{C}) \). Then, \( T = \bigcup T_i \) with \( T_i := g^{-1}(S_i) \) and we have closed embeddings \( i_i' : i_i \circ l : T_i \rightarrow Y \times \tilde{S}_i \). Moreover \( g_l := p_{S_i} : Y \times \tilde{S}_i \rightarrow \tilde{S}_i \) is a lift of \( g_l := g_l T_i : T \rightarrow \tilde{S}_i \). Let \( M \in DA_c(S)^- \) and \( (F, W) \in C_{fil}(\text{Var}(\mathbb{C})^m/s) \) such that \( (M, W) = D(\mathcal{A}_S^+, et)(F, W) \). Then, \( g^1 M = Ld g^* LD_S M, D(\mathcal{A}_T^+, et)(g^* LD_S L F) = g^* LD_S M \) and there exist \( (F', W) \in C_{fil}(\text{Var}(\mathbb{C})^m/s) \) and an equivalence \( (\mathcal{A}_T^+, et) \text{loc} e : (F', W) \rightarrow (g^* LD_S L (F, W)) \) such that \( D(\mathcal{A}_T^+, et)(F', W) = g^* LD_S (M, W) \) and, using definition \( 114 \) and definition \( 119(i) \) and lemma \( 10 \), the map in \( \pi_T(D(MHM(T))) \subset D_{D(1.0)fil, \infty}(T/(Y \times \tilde{S}_i)) \)

\[
T^i(g, \mathcal{F}^{FDR})(M) : \mathcal{F}^{FDR}_T (g^1 M) \rightarrow g^{* \text{mod}} \mathcal{F}^{FDR}_S (M)
\]
given in definition [122] is the inverse of the following map

\[ \Gamma_T^H d g^{-1}(g, \mathcal{F}^{FD R}(M)) : g^\text{mod}^{-1} \mathcal{F}_S^{FD R}(M) \rightarrow \mathcal{F}_T^{FD R}(g^t M) \]

\[ \cong (\Gamma_T^H d g^{-1}(g^\text{mod}) \lim_{r \rightarrow (-)} \text{e}'(\tilde{S}_i), \text{Hom}(L \rho_{\tilde{S}_i} g_{\tilde{S}_i}^t, Lr_{(X', D')/\tilde{S}_i}(\rho_{\tilde{S}_i}^* L(i_{1*}j_1^* \text{D}_S L(F, W)))) \]

\[ \text{E}_{et}(\Omega^\bullet_{/\tilde{S}_i}, \mathcal{F}_{D R})[(-d Y_R | q)] \xrightarrow{\Gamma_T^H d g^{-1}(g^\text{mod})} \text{Hom}(T(\tilde{g}_i^t, T^{\mathcal{G} H}(-)))^{-1}, \]

\[ \Gamma_T^H d g^{-1}(\lim_{r \rightarrow (-)} \text{e}'(Y \times \tilde{S}_i), \text{Hom}(L \rho_{Y \times \tilde{S}_i} g_{Y \times \tilde{S}_i}^t, Lr_{(Y \times X', Y \times D')/Y \times \tilde{S}_i}(\rho_{Y \times \tilde{S}_i}^* \tilde{g}_i^t L(i_{1*}j_1^* \text{D}_S L(F, W)))) \]

\[ \text{E}_{et}(\Omega^\bullet_{/Y \times \tilde{S}_i}, \mathcal{F}_{D R})[dy_1], \tilde{g}_j^t u^q_{d j_1}(D_S L(F, W)) \xrightarrow{\Gamma_T^H d g^{-1}(g^\text{mod})} \text{Hom}(R_{\mathcal{S}_i}^{\mathcal{G} H}(\mathcal{D}_S L(F, W))^{-1}, \]

\[ \Gamma_T^H d g^{-1}(\lim_{r \rightarrow (-)} \text{e}'(Y \times \tilde{S}_i), \text{Hom}(L \rho_{Y \times \tilde{S}_i} g_{Y \times \tilde{S}_i}^t, Lr_{(X', E')/Y \times \tilde{S}_i}(\rho_{Y \times \tilde{S}_i}^* \tilde{g}_i^t L(i_{1*}j_1^* \text{D}_S L(F, W)))) \]

\[ \text{E}_{et}(\Omega^\bullet_{/Y \times \tilde{S}_i}, \mathcal{F}_{D R})[dy_1], \tilde{g}_j^t u^q_{d j_1}(D_S L(F, W)) \xrightarrow{\Gamma_T^H d g^{-1}(g^\text{mod})} \text{Hom}(R_{\mathcal{S}_i}^{\mathcal{G} H}(\mathcal{D}_S L(F, W))^{-1}, \]

**Proposition 111.** Let \( g : T \rightarrow S \) a morphism with \( T, S \in \text{Var}(\mathcal{C}) \). Assume we have a factorization \( g : T \rightarrow Y \times S \rightarrow S \) with \( Y \in \text{SmVar}(\mathcal{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \bigcup_{i=1}^n S_i \) be an open cover such that there exists closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( S_i \in \text{SmVar}(\mathcal{C}) \). Then, \( T = \bigcup_{i=1}^n T_i \) with \( T_i := g^{-1}(S_i) \) and we have closed embeddings \( i_i' := i_i \circ l : T_i \hookrightarrow Y \times \tilde{S}_i \). Moreover \( \tilde{g}_i := p_{S_i} : Y \times \tilde{S}_i \rightarrow \tilde{S}_i \) is a lift of \( g_i := g|_{T_i} : T_i \rightarrow S_i \). Let \( M \in \text{DA}_s(S) \) and \( F \in \text{C}(\text{Var}(\mathcal{C})^{\text{sm}}/S) \) such that \( M = D(\mathcal{A}_S^{et}(F)) \). Then, \( D(\mathcal{A}_S^{et})(g^t F) = g^t M \). Then the following diagram in \( DA_{DA}^{DA}(T/(Y \times \tilde{S}_i)) \)

\[ \begin{array}{c}
Rg^* \text{mod} [-\Gamma, \mathcal{F}^{GM}_S(LD_S M)] \xrightarrow{T(g^{GM}_S(LD_S M))} g_{H d g}^* \text{mod} [-\Gamma, \mathcal{F}^{FD R}_S(M)] \xrightarrow{I(g^{FD R}_S(M))} \mathcal{F}^{FD R}_S(M) \\
\mathcal{F}^{GM}_T(g^* LD_S M) = LD_T g^* M \xrightarrow{T(g^{GM}_T(g^* M))} \mathcal{F}^{FD R}_T(g^t M) \end{array} \]

**Proof.** Follows from lemma [17]
Definition 123. Let $S \in \text{SmVar}(\mathbb{C})$. We have, for $M, N \in DA(S)$ and $(F,W), (G,W) \in C_{fil}(\text{Var}(\mathbb{C}^{sm}/S))$ projective such that $(M,W) = D(\mathbb{A}^1, et)(F,W)$ and $(N,W) = D(\mathbb{A}^1, et)(G,W)$, the following transformation map in $\pi_S(D(MHM(S)))$

\[
T(F^\text{FDR}, \otimes)(M,N) : F^\text{FDR}_S(M) \otimes_{O_S} F^\text{FDR}_S(N)
\]

\[
\xrightarrow{\sim} (\lim_{r \rightarrow (-)} e'(S) \ast \text{Hom}(L\rho_S, \text{Gr}^{12^*}_{S} LR(X^*, D^*)/S(\rho^*_S(F,W)), E_{et}(\Omega^{\bullet,F,pr}_S, F_{\text{FDR}}) [-d_S]) \otimes [-])
\]

\[
(\lim_{r \rightarrow (-)} e'(S) \ast \text{Hom}(L\rho_S, \text{Gr}^{12^*}_{S} LR(X^*, D^*)/S(\rho^*_S(F,W)), E_{et}(\Omega^{\bullet,F,pr}_S, F_{\text{FDR}}) [-d_S])
\]

\[
\xrightarrow{\sim} \lim_{r \rightarrow (-), r \rightarrow (-)} (e'(S) \ast \text{Hom}(L\rho_S, \text{Gr}^{12^*}_{S} LR(X^*, D^*)/S(\rho^*_S(F,W)), E_{et}(\Omega^{\bullet,F,pr}_S, F_{\text{FDR}}) [-d_S])
\]

\[
\xrightarrow{T(\otimes, \Omega^{\bullet,F,pr}_S)(-,-)} e'(S) \ast \text{Hom}(L\rho_S, \text{Gr}^{12^*}_{S} LR(X^*, D^*)/S(\rho^*_S(F,W)), E_{et}(\Omega^{\bullet,F,pr}_S, F_{\text{FDR}}) [-d_S])
\]

\[
e'(S) \ast \text{Hom}(L\rho_S, \text{Gr}^{12^*}_{S} LR(X^*, D^*)/S(\rho^*_S(G,W)), E_{et}(\Omega^{\bullet,F,pr}_S, F_{\text{FDR}}) [-d_S])
\]

We now give the definition in the non smooth case:

Definition 124. Let $S \in \text{Var}(\mathbb{C})$ and $S = \cup_{i=1}^I S_i$ an open affine covering and denote, for $I \subset [1, \cdots, I], S_I = \cap_{i \in I} S_i$ and $j_I : S_I \hookrightarrow S$ the open embedding. Let $i_I : S_I \rightarrow \tilde{S}_I$ closed embeddings, with $\tilde{S}_I \in \text{SmVar}(\mathbb{C})$. We have, for $M, N \in DA(S)$ and $(F,W), (G,W) \in C_{fil}(\text{Var}(\mathbb{C}^{sm}/S))$ such that $(M,W) = D(\mathbb{A}^1, et)(F,W)$ and $(N,W) = D(\mathbb{A}^1, et)(G,W)$, the following transformation map in
π_S(D(MHM(S)) ∈ D_{D(1,0)fid}(S/⟨S⟩))

\[ T(F^FDR_S, \otimes)(M, N) : F^FDR_S(M) \otimes L^[-1] \otimes F^FDR_S(N) \]

\[ \overset{\cong}{\longrightarrow} (\lim_{r \to (-)} e'(⟨S⟩), \text{Hom}^* (L\rho^i_{S\bar{i}_*} \text{Gr}^{12*}_{S\bar{i}} LR_{X^*, D^*}/S\bar{i}, \rho^i_{S\bar{i}} L(i_{1*}j^i_1(F,W))), E_{et}(\Omega^*_{/S\bar{i}}, F_{DR})[-d_{S\bar{i}}], u_{IJ}(F \otimes G)) \]

\[ (\lim_{r \to (-)} e'(⟨S⟩), \text{Hom}^* (L\rho^i_{S\bar{i}_*} \text{Gr}^{12*}_{S\bar{i}} LR_{X^*, D^*}/S\bar{i}, \rho^i_{S\bar{i}} L(i_{1*}j^i_1(F,W))) \otimes R_{(X^*, D^*)/S\bar{i}}(\rho^i_{S\bar{i}} L(i_{1*}j^i_1(F,W))), E_{et}(\Omega^*_{/S\bar{i}}, F_{DR})[-d_{S\bar{i}}], u_{IJ}(F \otimes G)) \]

Proposition 112. Let \( f_1 : X_1 \to S \), \( f_2 : X_2 \to S \) two morphism with \( X_1, X_2, S \in \text{Var}(\mathbb{C}) \). Assume that there exist factorizations \( f_1 : X_1 \xrightarrow{\lambda} Y_1 \xrightarrow{\psi} S \), \( f_2 : X_2 \xrightarrow{\lambda} Y_2 \xrightarrow{\psi} S \) with \( Y_1, Y_2 \in \text{SmVar}(\mathbb{C}) \), \( l_1, l_2 \) closed embeddings and \( \psi \) the projections. We have then the factorization

\[ f_{12} := f_1 \times f_2 : X_{12} := X_1 \times_S X_2 \xrightarrow{l_1 \times l_2} Y_1 \times Y_2 \xrightarrow{\psi} S \]

Let \( S = \bigcup_{I = 1}^{l-1} S_I \) an open affine covering and denote, for \( I \subset \{1, \ldots, I\} \), \( S_I = \cap_{\alpha \in I} S_I \) and \( j_I : S_I \to S \) the open embedding. Let \( i_I : S_I \to S \), \( \bar{S}_I \) closed embeddings, with \( \bar{S}_I \in \text{SmVar}(\mathbb{C}) \). We have then the following commutative diagram in \( \pi_S(D(MHM(S)) \subset D_{D(1,0)fid}(S/⟨S⟩)) \) where the vertical maps are given by proposition [107]

\[ F^FDR_S(M(X_1/S)) \otimes L^[-1] \otimes F^FDR_S(M(X_2/S)) \]

\[ \overset{\cong}{\longrightarrow} (I(X_1/S) \otimes I(X_2/S), F^FDR_S(M(X_1/S) \otimes M(X_2/S)) \]

\[ R^Hdg_{12}(\Gamma^V_{X_1/S}(O_{Y_1 \times_S S_i, F_0}(d_1)), x_{IJ}(X_1/S)) \otimes_{O_S} R^Hdg_{12}(\Gamma^V_{X_2/S}(O_{Y_2 \times_S S_i, F_0}(d_2)), x_{IJ}(X_2/S)) \]

\[ \overset{\cong}{\longrightarrow} (E_{W_{Y_1 \times S_i, Y_2 \times S_i}}(d_{12}), x_{IJ}(X_1/S)) \]

with \( d_1 = d_{Y_1}, d_2 = d_{Y_2} \) and \( d_{12} = d_{Y_1} + d_{Y_2} \).

Proof. Immediate from definition.
Proof. Follows from proposition \[112\]

We have the following easy proposition

Proposition 113. Let \( S \in \text{Var}(\mathbb{C}) \) and \( S = \bigcup_{i=1}^{l} S_i \) an open affine covering and denote, for \( I \subset [1, \cdots, l] \), \( S_I = \cap_{i \in I} S_i \) and \( j_I : S_I \hookrightarrow S \) the open embedding. Let \( i_i : S_i \hookrightarrow S \) closed embeddings, with \( S_i \in \text{SmVar}(\mathbb{C}) \). We have, for \( M, N \in \text{DA}(S) \) and \( F, G \in C(\text{Var}(\mathbb{C})^{sm}/S) \) such that \( M = D(\mathbb{A}^1, \text{et})(G) \) and \( N = D(\mathbb{A}^1, \text{et})(G) \), the following commutative diagram in \( D_{O_S^{\text{fil}}, \Omega^{\infty}}(S/(S_I)) \)

\[
\begin{array}{c}
F_X^M(LD_S M) \otimes_{D_S} F_X^M(LD_S N) \\
\downarrow T(F_X^M, \otimes)(LD_S M, LD_S N) \\
F_X^M(LD_S(M \otimes N))
\end{array}
\]

\[
\begin{array}{c}
\left\{ T(F_X^M, F_X^M, \otimes)(M \otimes N) \right\} \\
\downarrow T(F_X^M, \otimes)(M, N) \\
F_X^M(M \otimes N)
\end{array}
\]

Proof. Immediate from definition. \( \square \)

6.2 The analytic filtered De Rahm realization functor

6.2.1 The analytic Gauss-Manin filtered De Rham realization functor and its transformation map with pullbacks

Consider, for \( S \in \text{AnSp}(\mathbb{C}) \), the following composition of morphism in \( \text{RCat} \) (see section 2)

\[
\tilde{e}(S) : (\text{AnSp}(\mathbb{C})/S, O_{\text{AnSp}(\mathbb{C})/S}) \overset{\rho_{S}}{\longrightarrow} (\text{AnSp}(\mathbb{C})^{sm}/S, O_{\text{AnSp}(\mathbb{C})^{sm}/S}) \overset{e(S)}{\longrightarrow} (S, O_S)
\]

with, for \( X/S = (X, h) \in \text{AnSp}(\mathbb{C})/S \),

- \( O_{\text{AnSp}(\mathbb{C})/S}(X/S) := O_X(X) \),
- \( (\tilde{e}(S))^* O_S(X/S) \to O_{\text{AnSp}(\mathbb{C})/S}(X/S) := (h^* O_S \to O_X) \).

and \( O_{\text{AnSp}(\mathbb{C})^{sm}/S} := \rho_{S, *}, O_{\text{AnSp}(\mathbb{C})/S} \), that is, for \( U/S = (U, h) \in \text{AnSp}(\mathbb{C})^{sm}/S \), \( O_{\text{AnSp}(\mathbb{C})^{sm}/S}(U/S) := O_{\text{AnSp}(\mathbb{C})/S}(U/S) := O_U(U) \)

Definition 125. (i) For \( S \in \text{Var}(\mathbb{C}) \), we consider the complexes of presheaves

\[
\Omega^*_S := \text{coker}(\Omega O_{\text{AnSp}(\mathbb{C})/S}/S)^{e(S)}O_S : \Omega^*_e(S)^*O_S \to \Omega^*_O_{\text{AnSp}(\mathbb{C})/S}) \in CO_S(\text{AnSp}(\mathbb{C})/S)
\]

which is by definition given by

- for \( X/S \) a morphism \( \Omega^*_S(X/S) = \Omega^*_X/S(X) \)
- for \( g : X'/S \to X/S \) a morphism,

\[
\Omega^*_S(g) := \Omega_{(X'/S)/(S/S)}(X') : \Omega^*_X(S)(X) \to g^* \Omega_X/S(X) \to \Omega^*_X/S(X')
\]

\[\omega \mapsto \Omega_{(X'/S)/(S/S)}(X')(\omega) := g^*(\omega) : (\alpha \in \wedge^k T_{X'}(X') \mapsto \omega(dg(\alpha)))\]
(ii) For \( S \in \text{AnSp}(\mathbb{C}) \), we consider the complexes of presheaves

\[
\Omega^*_{U/S} := \rho_{S*,U/S} = \text{coker}(\Omega_{O_{\text{AnSp}(\mathbb{C})^{sm}}/\epsilon(S) \cdot O_S : \Omega^*_{O_S} \cdot O_S \to \Omega^*_{O_{\text{AnSp}(\mathbb{C})^{sm}}/\epsilon(S)}) \in C_{O_S}(\text{AnSp}(\mathbb{C})^{sm}/S)
\]

which is by definition given by

- for \( U/S \) a smooth morphism \( \Omega^*_{U/S}(U/S) = \Omega^*_{U/S}(U) \)
- for \( g : U'/S \to U/S \) a morphism,

\[
\Omega^*_{U/S}(g) := \Omega^{U'/U}(S/S/\epsilon(S))(U') : \Omega^*_{U/S}(U) \to g^*\Omega^*_{U/S}(U') \to \Omega^*_{U'/S}(U')
\]

\[
\omega \mapsto \Omega^{(U'/U)/(S/S/\epsilon(S))}(U') \omega := g^*(\omega) := (\alpha \in \wedge^k T_{U/S}(U') \mapsto \omega(\partial g(\alpha)))
\]

**Remark 12.** For \( S \in \text{AnSp}(\mathbb{C}) \), \( \Omega^*_{U/S} \in C(\text{AnSp}(\mathbb{C})/S) \) is by definition a natural extension of \( \Omega^*_{U/S} \in C(\text{AnSp}(\mathbb{C})^{sm}/S) \). However \( \Omega^*_{U/S} \in C(\text{AnSp}(\mathbb{C})/S) \) does **not** satisfy cdh descent.

For a smooth morphism \( h : U \to S \) with \( S,U \in \text{AnSm}(\mathbb{C}) \), the cohomology presheaves \( H^n\Omega^*_{U/S} \) of the relative De Rham complex

\[
DR(U/S) := \Omega^*_{U/S} := \text{coker}(h^*\Omega_S \to \Omega_U) \in C_{h^*O_S}(U)
\]

for all \( n \in \mathbb{Z} \), have a canonical structure of a complex of \( h^*D_S^\infty \) modules given by the Gauss Manin connexion: for \( S' \subset S \) an open subset, \( U' = h^{-1}(S') \), \( \gamma \in \Gamma(S', T_S) \) a vector field and \( \hat{\omega} \in \Omega^p_{U/S}(U'/\epsilon(S)) \) a closed form, the action is given by

\[
\gamma \cdot \omega = [\hat{\omega}] = [\gamma(\hat{\omega}) \partial \omega],
\]

\( \omega \in \Omega^p_U(U') \) being a representative of \( \omega \) and \( \hat{\gamma} \in \Gamma(U'/\epsilon(S), T_U) \) a relevevement of \( \gamma \) (\( h \) is a smooth morphism), so that

\[
DR(U/S) := \Omega^*_{U/S} := \text{coker}(h^*\Omega_S \to \Omega_U) \in C_{h^*O_S,h^*D\infty}(U)
\]

with this \( h^*D_S^\infty \) structure. Hence we get \( h_*\Omega^*_{U/S} \in C_{O_S,D\infty}(S) \) considering this structure. Since \( h \) is a smooth morphism, \( \Omega^p_{U/S} \) are locally free \( O_U \) modules.

The point (ii) of the definition above gives the object in \( \text{DA}(S) \) which will, for \( S \) smooth, represent the analytic Gauss-Manin De Rham realisation. It is the class of an explicit complex of presheaves on \( \text{AnSp}(\mathbb{C})^{sm}/S \).

**Proposition 114.** Let \( S \in \text{Var}(\mathbb{C}) \).

(i) For \( U/S = (U,h) \in \text{AnSp}(\mathbb{C})^{sm}/S \), we have \( e(U)_* \Omega^*_{U/S} = \Omega^*_{U/S} \).

(ii) The complex of presheaves \( (\Omega^*_{U/S}, F_k) \in C_{O_S,hU}(\text{AnSp}(\mathbb{C})^{sm}/S) \) is 2-filtered \( D_3 \) invariant. Note that however, for \( p > 0 \), the complexes of presheaves \( \Omega^{*2p} \) are **not** \( D_3 \) local. On the other hand, \( (\Omega^*_{U/S}, F_k) \) admits transferts (recall that means \( \text{Tr}(S)_* \cdot \Omega^*_{U/S} = \Omega^*_{S/S} \)).

(iii) If \( S \) is smooth, we get \( (\Omega^*_{U/S}, F_k) \in C_{O_S,hU,D_3}(\text{Var}(\mathbb{C})^{sm}/S) \) with the structure given by the Gauss Manin connexion. Note that however the \( D_3^\infty \) structure on the cohomology groups given by Gauss Manin connexion does **not** come from a structure of \( D_3^\infty \) module structure on the filtered complex of \( O_S \) module. The \( D_3^\infty \) structure on the cohomology groups satisfy a non trivial Griffitz transversality (in the non projection cases), whereas the filtration on the complex is the trivial one.

**Proof.** Similar to the proof of proposition 97.
Let $g : T \to S$ a morphism with $T, S \in \text{AnSp}(\mathbb{C})$. Consider the following commutative diagram in $\text{RCat}$:

$$
D(g, e) : (\text{AnSp}(\mathbb{C})^{sm}/T, O_{\text{AnSp}(\mathbb{C})^{sm}}/T) \xrightarrow{p(g)} (\text{AnSp}(\mathbb{C})^{sm}/S, O_{\text{AnSp}(\mathbb{C})^{sm}}/S)
$$

$$
\begin{array}{ccc}
(T, O_T) & \xrightarrow{p(g)} & (S, O_S) \\
\downarrow{e(T)} & & \downarrow{e(S)} \\
(T, O_T) & \xrightarrow{p(g)} & (S, O_S)
\end{array}
$$

It gives (see section 2) the canonical morphism in $C_{g^*O_S} \text{fil}(\text{Var}(\mathbb{C})^{sm}/T)$

$$
\Omega^\bullet((\mathbb{C}, F_b) = \Omega^\bullet_{g^*O_S^{\text{sm}}/S} / g^*e(S)^*O_S \to (\mathbb{C}, F_b) = \Omega^\bullet_{O_S^{\text{sm}}/T/e(T)^*O_T}
$$

which is by definition given by the pullback on differential forms: for $(V/T) = (V, h) \in \text{Var}(\mathbb{C})^{sm}/T$,

$$
\Omega^\bullet((\mathbb{C}, F_b) = \Omega^\bullet_{((\mathbb{C}, F_b)) \xrightarrow{\Omega^\bullet_{(V/U)/(T/S)(V/T)}} \Omega^\bullet_{V/T}(V) = \Omega^\bullet_{T}(V/T)
$$

If $S$ and $T$ are smooth, $\Omega^\bullet((\mathbb{C}, F_b) = \Omega^\bullet_{(\mathbb{C}, F_b)}$ is a map in $C_{g^*O_S} \text{fil}, g^*D^S_{\text{AnSp}(\mathbb{C})^{sm}/T}$ It induces the canonical morphism in $C_{g^*O_S} \text{fil}, g^*D^S_{\text{AnSp}(\mathbb{C})^{sm}/T}$:

$$
E_{\Omega^\bullet((\mathbb{C}, F_b)} = g^*E_{\text{usu}}(\Omega^\bullet_{S, F_b}) \xrightarrow{p(g, e)} E_{\text{usu}}(g^\bullet S, F_b) \xrightarrow{e_{\text{usu}}(\Omega^\bullet_{T/S})} E_{\text{usu}}(\Omega^\bullet_{T, F_b}).
$$

**Definition 126.**

(i) Let $g : T \to S$ a morphism with $T, S \in \text{AnSp}(\mathbb{C})$. We have, for $F \in C(\text{AnSp}(\mathbb{C})^{sm}/S)$, the canonical transformation in $C_{O_T} (T)$ :

$$
T^\bullet(g, \Omega^\bullet_{T})(F) = g^\bullet L_{O_T} e(S) \circ \text{Hom}^\bullet(F, E_{\text{usu}}(\Omega^\bullet_{S, F_b}))
$$

$$
\xrightarrow{\text{ev_{h}}(\text{usu}) \circ \text{hom}_{\bullet}(-,-)} L_{O_T} e(T) \circ \text{Hom}^\bullet(g^\bullet F, g^\bullet E_{\text{usu}}(\Omega^\bullet_{S, F_b}))
$$

$$
\xrightarrow{T(g, e)} L_{O_T} e(T) \circ \text{Hom}^\bullet(g^\bullet F, g^\bullet E_{\text{usu}}(\Omega^\bullet_{S, F_b}))
$$

where $m(\alpha \odot h) := h.\alpha$ is the multiplication map.

(ii) Let $g : T \to S$ a morphism with $T, S \in \text{AnSp}(\mathbb{C})$, $S$ smooth. Assume there is a factorization $g : T \xrightarrow{\pi} Y \times S$ with $\pi$ a closed embedding, $Y \in \text{AnSm}(\mathbb{C})$ and $p_S$ the projection. We have, for $F \in C(\text{AnSp}(\mathbb{C})^{sm}/S)$, the canonical transformation in $C_{O_T} (T)$ :

$$
T(g, \Omega^\bullet_{T})(F) = g^\bullet L_{O_T} e(S) \circ \text{Hom}^\bullet(F, E_{\text{usu}}(\Omega^\bullet_{S, F_b}))
$$

$$
\xrightarrow{\text{ev_{h}}(\text{usu}) \circ \text{hom}_{\bullet}(-,-)} L_{O_T} e(T) \circ \text{Hom}^\bullet(g^\bullet F, g^\bullet E_{\text{usu}}(\Omega^\bullet_{S, F_b}))
$$

$$
\xrightarrow{T(g, e)} L_{O_T} e(T) \circ \text{Hom}^\bullet(g^\bullet F, g^\bullet E_{\text{usu}}(\Omega^\bullet_{S, F_b}))
$$

$$
\xrightarrow{I(g, \text{usu}) \circ \text{hom}_{\bullet}(-,-)} L_{O_T} e(T) \circ \text{Hom}^\bullet(g^\bullet F, g^\bullet E_{\text{usu}}(\Omega^\bullet_{S, F_b}))
$$

266
For \( Q \in Proj \text{PSh} (\text{AnSp}(\mathbb{C})^{sm}/S) \),

\[ T(g, \Omega_\cdot)(Q) : g^{*\text{mod}, \Gamma} e(S) \circ \text{Hom}^*(Q, E_{usu}(\Omega^*_{/S}, F_b)) \rightarrow e(T \times S) \circ \text{Hom}^*(T_{\Gamma} T_{\cdot}^* p_{S} Q, E_{usu}(\Omega^*_Y, F_b)) \]

is a map in \( C_{O_{\text{fild}}.D\cdot}(Y \times S) \).

The following easy lemma describe these transformation map on representable presheaves:

**Lemma 18.** Let \( g : T \rightarrow S \) a morphism with \( T, S \in \text{AnSp}(\mathbb{C}) \) and \( h : U \rightarrow S \) is a smooth morphism with \( U \in \text{AnSp}(\mathbb{C}) \). Consider a commutative diagram whose square are cartesian:

\[
\begin{array}{ccc}
g : T & \xrightarrow{l} & S \\
& \downarrow{h'} & \downarrow{h} \\
g' : U_T & \xrightarrow{l'} & U \times Y \\
& \uparrow{p_{S}} & \uparrow{p_{U}}
\end{array}
\]

with \( l, l' \) the graph embeddings and \( p_{S}, p_{U} \) the projections. Then \( g^* \mathbb{Z}(U/S) = \mathbb{Z}(U_T/T) \) and

(i) we have the following commutative diagram in \( C_{O_{\text{fild}}(T)} \) (see definition \# and definition \#120(\textit{i})):

\[
\begin{array}{ccc}
g^{*\text{mod}} L_{O} e(S) \circ \text{Hom}^*(\mathbb{Z}(U/S), E_{usu}(\Omega^*_S, F_b)) & \xrightarrow{T(g, \Omega_\cdot)(\mathbb{Z}(U/S))} & e(T) \circ \text{Hom}^*(\mathbb{Z}(U_T/T), E_{usu}(\Omega^*_{/T}, F_b)) \\
& \downarrow{=} & \downarrow{=} \\
g^{*\text{mod}} L_{O} h_{*} E_{usu}(\Omega^*_U, F_b) & \xrightarrow{T_{\cdot}^{mod}(g, h)} & h_{*} E_{usu}(\Omega^*_{/T}, F_b)
\end{array}
\]

(ii) if \( Y, S \in \text{AnSm}(\mathbb{C}) \), we have the following commutative diagram in \( C_{O_{\text{fild}}.D\cdot}(T) \) (see definition \# and definition \#120(\textit{ii})):

\[
\begin{array}{ccc}
g^{*\text{mod}, \Gamma} e(S) \circ \text{Hom}^*(\mathbb{Z}(U/S), E_{usu}(\Omega^*_S, F_b)) & \xrightarrow{T(g, \Omega_\cdot)(\mathbb{Z}(U/S))} & e(T) \circ \text{Hom}^*(\mathbb{Z}(U_T/T), E_{usu}(\Omega^*_{/T}, F_b)) \\
& \downarrow{=} & \downarrow{=} \\
g^{*\text{mod}, \Gamma} h_{*} E_{usu}(\Omega^*_U, F_b) & \xrightarrow{T_{\cdot}^{\Gamma}(\gamma, \cdot)(\cdot) \circ T_{\cdot}^{\Gamma}(p_{S}, h)(\cdot)} & h_{*} E_{usu}(\Omega^*_{/T}, F_b)
\end{array}
\]

where \( j : T \cap T \times S \rightarrow T \times S \) is the open complementary embedding.

**Proof.** Obvious. \( \square \)

**Proposition 115.** Let \( p : S_{12} \rightarrow S_{1} \) a smooth morphism with \( S_{1}, S_{12} \in \text{AnSp}(\mathbb{C}) \). Then if \( Q \in \text{C(AnSp(\mathbb{C})^{sm}/S_{1})} \) is projective,

\[ T(p, \Omega_\cdot)(Q) : p^{*\text{mod}, e(S_{1})} e(S_{12}) \circ \text{Hom}^*(Q, E_{usu}(\Omega^*_{S_{1}}, F_b)) \rightarrow e(S_{12}) \circ \text{Hom}^*(p^* Q, E_{usu}(\Omega^*_{S_{12}}, F_b)) \]

is an isomorphism.

**Proof.** Similar to the proof of proposition \#98 \( \square \)

Let \( S \in \text{AnSp}(\mathbb{C}) \) and \( h : U \rightarrow S \) a morphism with \( U \in \text{AnSp}(\mathbb{C}) \). We then have the canonical map given by the wedge product

\[ w_{U/S} : \Omega^*_U \otimes_{O_S} \Omega^*_U \rightarrow \Omega^*_U ; \alpha \otimes \beta \mapsto \alpha \wedge \beta. \]
Let \( S \in \text{Var}(\mathbb{C}) \) and \( h_1 : U_1 \rightarrow S \), \( h_2 : U_2 \rightarrow S \) two morphisms with \( U_1, U_2 \in \text{AnSp}(\mathbb{C}) \). Denote \( h_{12} : U_{12} := U_1 \times_S U_2 \rightarrow S \) and \( p_{112} : U_1 \times_S U_2 \rightarrow U_1 \), \( p_{212} : U_1 \times_S U_2 \rightarrow U_2 \) the projections. We then have the canonical map given by the wedge product

\[
\omega_{(U_1, U_2)/S} : p_{112}^* \Omega_{U_1/S} \otimes p_{212}^* \Omega_{U_2/S} \rightarrow \Omega_{U_{12}/S}; \alpha \otimes \beta \mapsto p_{112}^* \alpha \wedge p_{212}^* \beta
\]

which gives the map

\[
E \omega_{(U_1, U_2)/S} : h_1^* E_{usu}(\Omega_{U_1/S}) \otimes_{O_S} h_2^* E_{usu}(\Omega_{U_2/S})
\]

\[
\overset{\text{ad}(p_{112}^*, p_{212}^*)(-) \otimes \text{ad}(p_{212}^*, p_{212}^*)(-)}{\longrightarrow}
\overset{T(\otimes E)(- \circ (p_{112}, E)(-) \otimes (p_{212}, E)(-))}{\rightarrow}
\overset{h_{12}^* (p_{112}^* E_{usu}(\Omega_{U_1/S}) \otimes_{h_1^* O_S} p_{212}^* E_{usu}(\Omega_{U_2/S}))}{\rightarrow}
\overset{h_{12}^* E_{zar}(p_{112}^* \Omega_{U_1/S} \otimes_{O_S} p_{212}^* \Omega_{U_2/S})}{\rightarrow}
\]

Let \( S \in \text{AnSp}(\mathbb{C}) \). We have the canonical map in \( C_{O_S \text{fil}}(\text{AnSp}(\mathbb{C})^{sm}/S) \)

\[
w_S : (\Omega^*_S, F_b) \otimes_{O_S} (\Omega^*_S, F_b) \rightarrow (\Omega^*_S, F_b)
\]

given by for \( h : U \rightarrow S \in \text{AnSp}(\mathbb{C})^{sm}/S \)

\[
w_S(U/S) : (\Omega^*_U/S, F_b) \otimes_{h^* O_S} (\Omega^*_U/S, F_b)(U) \xrightarrow{w_{U/S}(U)} (\Omega^*_U/S, F_b)(U)
\]

It gives the map

\[
E w_S : E_{usu}(\Omega^*_S, F_b) \otimes_{O_S} E_{usu}(\Omega^*_S, F_b) \overset{\cong}{\rightarrow} E_{usu}((\Omega^*_S, F_b) \otimes_{O_S} (\Omega^*_S, F_b)) \xrightarrow{E_{usu}(w_S)} E_{usu}(\Omega^*_S, F_b)
\]

If \( S \in \text{AnSm}(\mathbb{C}) \),

\[
w_S : (\Omega^*_S, F_b) \otimes_{O_S} (\Omega^*_S, F_b) \rightarrow (\Omega^*_S, F_b)
\]

is a map in \( C_{O_S \text{fil}, D^\infty}(\text{Var}(\mathbb{C})^{sm}/S) \).

**Definition 127.** Let \( S \in \text{AnSp}(\mathbb{C}) \). We have, for \( F, G \in C(\text{AnSp}(\mathbb{C})^{sm}/S) \), the canonical transformation in \( C_{O_S \text{fil}}(S) \):

\[
T(\otimes, \Omega)(F, G) : e(S)_* \text{Hom}(F, E_{usu}(\Omega^*_S, F_b)) \otimes_{O_S} e(S)_* \text{Hom}(G, E_{usu}(\Omega^*_S, F_b))
\]

\[
\overset{\cong}{\rightarrow}
\overset{e(S)_* \text{Hom}(F, E_{usu}(\Omega^*_S, F_b)) \otimes_{O_S} \text{Hom}(G, E_{usu}(\Omega^*_S, F_b))}{\rightarrow}
\overset{\text{Hom}(F \otimes G, E_{usu})}{\rightarrow}
\overset{\text{Hom}(F \otimes G, E_{usu})}{\rightarrow}
\]

If \( S \in \text{AnSm}(\mathbb{C}) \), \( T(\otimes, \Omega)(F, G) \) is a map in \( C_{O_S \text{fil}, D^\infty}(S) \).

**Lemma 19.** Let \( S \in \text{AnSp}(\mathbb{C}) \) and \( h_1 : U_1 \rightarrow S \), \( h_2 : U_2 \rightarrow S \) two smooth morphisms with \( U_1, U_2 \in \text{AnSp}(\mathbb{C}) \). Denote \( h_{12} : U_{12} := U_1 \times_S U_2 \rightarrow S \) and \( p_{112} : U_1 \times_S U_2 \rightarrow U_1 \), \( p_{212} : U_1 \times_S U_2 \rightarrow U_2 \) the projections. We then have the following commutative diagram

\[
\begin{array}{ccc}
\text{Hom}(F, E_{usu}(\Omega^*_S, F_b)) \otimes_{O_S} \text{Hom}(G, E_{usu}(\Omega^*_S, F_b)) & \xrightarrow{T(\otimes, \Omega)(F, G)} & \text{Hom}(F \otimes G, E_{usu}(\Omega^*_S, F)) \\
\downarrow & & \downarrow \\
\omega_{(U_1, U_2)/S} : p_{112}^* \Omega_{U_1/S} \otimes p_{212}^* \Omega_{U_2/S} & \xrightarrow{E \omega_{(U_1, U_2)/S}} & p_{112}^* \Omega_{U_{12}/S} \otimes p_{212}^* \Omega_{U_{12}/S} \\
\end{array}
\]

\[=\]

\[
\begin{array}{ccc}
h_1^* E_{usu}(\Omega_{U_1/S}^*) \otimes_{O_S} h_2^* E_{usu}(\Omega_{U_2/S}^*) & \xrightarrow{E w_{(U_1, U_2)/S}} & h_2^* E_{zar}(\Omega_{U_{12}/S}^*) \\
\end{array}
\]

268
We now define the analytic Gauss Manin De Rahm realization functor.

Let $S \in \text{AnSp}(\mathbb{C})$ and $S = \bigcup_{i=1}^{\#} \tilde{S}_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{AnSm}(\mathbb{C})$ an affine space. For $I \subset \{1, \cdots, \#\}$, denote by $S_I := \cap_{i \in I} S_i$ and $j_I : S_I \hookrightarrow S$ the open embedding. We then have closed embeddings $i_I : S_I \hookrightarrow \tilde{S}_I := \prod_{i \in I} \tilde{S}_i$. Consider, for $I \subset J$, the following commutative diagram

\[
\begin{array}{c}
D_{IJ} = \xymatrix{S_I \ar[r]^{i_I} \ar[d]_{j_{IJ}} & \tilde{S}_I \ar[d]^{j_I} \\
S_J \ar[r]_{i_J} & \tilde{S}_J }
\end{array}
\]

and $j_{IJ} : S_J \hookrightarrow S_I$ is the open embedding so that $j_I \circ j_{IJ} = j_J$. Considering the factorization of the diagram $D_{IJ}$ by the fiber product:

\[
\begin{array}{c}
D_{IJ} = \tilde{S}_J \times \tilde{S}_{I \setminus J} \ar[r]^{p_{IJ}} \ar[d]_{i_I \times i_J} & \tilde{S}_I \ar[d]^{i_I} \\
S_J \times \tilde{S}_{I \setminus J} \ar[r]_{i_J} & \tilde{S}_I 
\end{array}
\]

the square of this factorizing being cartesian, we have for $F \in C(\text{AnSp}(\mathbb{C})^m/S)$ the canonical map in $C(\text{AnSp}(\mathbb{C})^m/\tilde{S}_J)$

\[
S(D_{IJ})(F) : L_{i_I \times i_J} j^*_I j^*_J F \xrightarrow{\alpha} j_I j^*_J F = (i_I \times I)_* l_{I \setminus J} j^*_J F \xrightarrow{(i_I \times I)_* \alpha} (p_{IJ}^0)^* p^0_{IJ} j_I j^*_J F \xrightarrow{T(p_{IJ}, j)} p^0_{IJ} j_I j^*_J F
\]

which factors through

\[
S(D_{IJ})(F) : L_{i_I \times i_J} j^*_I j^*_J F \xrightarrow{\text{Spr}(D_{IJ})(F)} p^0_{IJ} j_I j^*_J F \xrightarrow{q} p^0_{IJ} j_I j^*_J F
\]

**Definition 128.**

(i) Let $S \in \text{AnSm}(\mathbb{C})$. We have the functor

\[
\text{Hom}^*(\cdot, E_{usu}(\Omega^*_S, F_b)) : C(\text{AnSp}(\mathbb{C})^m/S) \to C_{O_{fil} D_{fil}^{\infty}}(S), \quad F \mapsto e(S)_* \text{Hom}^*(LF, E_{usu}(\Omega^*_S, F_b)).
\]

(ii) Let $S \in \text{Var}(\mathbb{C})$ and $S = \bigcup_{i=1}^{\#} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. For $I \subset \{1, \cdots, \#\}$, denote by $S_I := \cap_{i \in I} S_i$ and $j_I : S_I \hookrightarrow S$ the open embedding. We then have closed embeddings $i_I : S_I \hookrightarrow \tilde{S}_I := \prod_{i \in I} \tilde{S}_i$. We have the functor

\[
C(\text{Var}(\mathbb{C})^m/S)^{op} \to C_{O_{fil} D_{fil}^{\infty}}(S/\tilde{S}_I), \quad F \mapsto (e(\tilde{S}_I)_* \text{Hom}^*(\text{An}_{\tilde{S}_I}^*, L(i_I j^*_I F), E_{usu}(\Omega^*_S, F_b))[d_{\tilde{S}_I}], u^0_{IJ}(F))
\]

where

\[
u^0_{IJ}(F)[d_{\tilde{S}_I}] : e(\tilde{S}_I)_* \text{Hom}^*(\text{An}_{\tilde{S}_I}^*, L(i_I j^*_I F), E_{usu}(\Omega^*_S, F_b))
\]

\[
\xrightarrow{\text{ad}(p_{IJ}^{0, \text{mod}}, \nu^0_{IJ})} p_{IJ}^{0, \text{mod}} e(\tilde{S}_I)_* \text{Hom}^*(\text{An}_{\tilde{S}_I}^*, L(i_I j^*_I F), E_{usu}(\Omega^*_S, F_b))
\]

\[
\xrightarrow{p_{IJ} \cdot T(\nu^{0, \Omega^*_S}(L(i_I j^*_I F)))} p_{IJ} \cdot e(\tilde{S}_I)_* \text{Hom}^*(\text{An}_{\tilde{S}_I}^*, p_{IJ}^{0, \Omega^*_S} L(i_I j^*_I F), E_{usu}(\Omega^*_S, F_b))
\]

\[
\xrightarrow{p_{IJ} \cdot e(\tilde{S}_I)_* \text{Hom}(\text{An}_{\tilde{S}_I}^*, S^*(D_{IJ})(F), E_{usu}(\Omega^*_S, F_b))} p_{IJ} \cdot e(\tilde{S}_I)_* \text{Hom}^*(\text{An}_{\tilde{S}_I}^*, L(i_I j^*_I F), E_{usu}(\Omega^*_S, F_b)).
\]

For $I \subset J \subset K$, we have obviously $p_{IJ} \circ u_{JK}(F) \circ u_{IJ}(F) = u_{IK}(F)$. 269
We will prove in corollary 7 below that $u_{i,f}(F)$ are $\infty$-filtered usu local equivalence.

**Proposition 116.** Let $S \in \text{AnSp}(\mathbb{C})$. Let $m : Q_1 \to Q_2$ be an equivalence $(\mathbb{D}^1, et)$ local in $C(\text{AnSp}(\mathbb{C})^{sm}/S)$ with $Q_1, Q_2$ complexes of projective presheaves. Then,

$$e(S)_*\text{Hom}(m, E_{usu}(\Omega_{S}^1, F_b)) : e(S)_*\text{Hom}^*(Q_2, E_{usu}(\Omega_{S}^1, F_b)) \to e(S)_*\text{Hom}^*(Q_1, E_{usu}(\Omega_{S}^1, F_b))$$

is a quasi-isomorphism. It is thus an isomorphism in $D_{Q_{f,i},D^=,\infty}(S)$ if $S$ is smooth.

**Proof.** Similar to the proof of proposition 99. □

**Definition 129.**

(i) We define, according to proposition 116, the filtered analytic Gauss-Manin realization functor defined as

$$F^M_{S,an} : DA_c(S)^{op} \to D_{Q_{f,i},D^=,\infty}(S), \quad M \mapsto F^M_{S,an}(M) := (e(S)_*\text{Hom}^*(\text{An}_{S}^c L(F), E_{usu}(\Omega_{S}^1, F_b))[d_S])$$

where $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$ is such that $M = D(\mathbb{A}^1, et)(F)$.

(ii) Let $S \in \text{Var}(\mathbb{C})$ and $S = \cup_{i=1}^l S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. For $I \subset [1, \cdots, l]$, denote by $S_I = \cap_{i \in I} S_i$ and $j_I : S_I \to S$ the open embedding. We then have closed embeddings $i_I : S_I \hookrightarrow \tilde{S}_I := \prod_{i \in I} \tilde{S}_i$. We define the filtered analytic Gauss-Manin realization functor defined as

$$F^M_{S,an} : DA_c(S)^{op} \to D_{Q_{f,i},D^=,\infty}(S/(\tilde{S}_I)), \quad M \mapsto F^M_{S,an}(M) := ((e(\tilde{S}_I)_*\text{Hom}^*(\text{An}_{\tilde{S}_I}^c L(i_{I,I}^*F), E_{usu}(\Omega_{\tilde{S}_I}^1, F_b))[d_{\tilde{S}_I}]), u_{I,I}^q(F))$$

where $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$ is such that $M = D(\mathbb{A}^1, et)(F)$, see definition 128 and corollary 7.

**Proposition 117.** For $S \in \text{Var}(\mathbb{C})$, the functor $F^M_{S} \circ GM$ is well defined.

**Proof.** Similar to the proof of proposition 110. □

**Proposition 118.** Let $f : X \to S$ a morphism with $S, X \in \text{Var}(\mathbb{C})$. Let $S = \cup_{i=1}^l S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. Then $X = \cup_{i=1}^l X_i$ with $X_i := f^{-1}(S_i)$. Denote, for $I \subset [1, \cdots, l]$, $S_I = \cap_{i \in I} S_i$ and $X_I = \cap_{i \in I} X_i$. Assume there exist a factorization

$$f : X \xrightarrow{l} Y \times S \xrightarrow{p_S} S$$

of $f$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. We then have, for $I \subset [1, \cdots, l]$, the following commutative diagrams which are cartesian

$$\begin{array}{ccc}
  f_I = f_{|X_I} : X_I & \xrightarrow{\cong} & Y \times S_I \xrightarrow{p_{S_I}} S_I \\
  \downarrow{i_I} & & \downarrow{p_{S,I}} \\
  Y \times \tilde{S}_I & \xrightarrow{p_{S,I}} & \tilde{S}_I
\end{array}$$
Let $F(X/S) := p_{S,t} \Gamma_{\times} \mathbb{Z}(Y \times S/Y \times S)$. The transformations maps $(N_i(X/S) : Q(X/\tilde{S}_i) \to \iota_{ij}j_1^*F(X/S))$ and $(k \circ I(\gamma, \text{hom})(-, -))$, for $I \subset [1, \ldots, l]$, induce an isomorphism in $D_{O_{\text{riv},\infty}}(S/\tilde{S}_i)$

\[ I^G(X/S) : \]

\[ \mathcal{F}_{S,\text{an}}^G(M(X/S)) := (e(\tilde{S}_i), \text{Hom}(\text{An}_{\tilde{S}_i}^* L(i_1 \iota_j^*F(X/S)), E_{\text{usu}}(\Omega_{\tilde{S}_i}^*, F_b))[-d_{\tilde{S}_i}], u_{ij}^j(F(X/S))) \]

\[ \xrightarrow{(e(\tilde{S}_i), \text{Hom}(\text{An}_{\tilde{S}_i}^* N_i(X/S), E_{\text{usu}}(\Omega_{\tilde{S}_i}^*, F_b)))} \]

\[ \xrightarrow{(e(\tilde{S}_i), \text{Hom}(\text{An}_{\tilde{S}_i}^* Q(X/\tilde{S}_i), E_{\text{usu}}(\Omega_{\tilde{S}_i}^*, F_b))[-d_{\tilde{S}_i}], v_{ij}^j(F(X/S)))} \]

\[ \xrightarrow{(I(\gamma, \text{hom})(-, -))^{-1}} (p_{\tilde{S}_i} \Gamma_{\times} E_{\text{usu}}(\Omega_{Y \times \tilde{S}_i/S}, F_b)[-d_{\tilde{S}_i}], w_{ij}(X/S)). \]

**Proof.** Similar to the proof of proposition 101.

**Corollary 7.** Let $S \in \text{Var}(\mathbb{C})$ and $S = \bigcup_{i=1}^l S_i$ an open cover such that there exist closed embeddings $i_i : S_i \to \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. For $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$ such that $D_\Delta^+(A_l)(F) \in D_{\Delta^+}_c(S)$, $u_{ij}^j(F)$ are $\infty$-filtered usu local equivalence.

**Proof.** Similar to corollary 4.

We now define the functoriality of $\mathcal{F}_{S}^G$ with respect to $S$ which makes $\mathcal{F}_{S}^G$ a morphism of 2-functor.

**Definition 130.** Let $g : T \to S$ a morphism with $T, S \in \text{SmVar}(\mathbb{C})$. Consider the factorization $g : T \xrightarrow{l} T \times S \xrightarrow{\pi_S} S$ where $l$ is the graph embedding and $\pi_S$ the projection. Let $M \in D_{\Delta^+}c(S)$ and $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$ such that $M = D(\Delta^+_{\text{an}}, et)(F)$. Then, $D(\Delta^+_{\text{an}}, et)(g^*F) = g^* M$.

(i) We have then the canonical transformation in $D_{\text{filt},\infty}(T \times S)$ (see definition 126):

\[ T(g, \mathcal{F}_{S}^G)(M) : \mathcal{F}_{\text{an}}^G(M) := g^{\text{smod}}, \mathcal{F}_{S,\text{an}}^G(M) := (e(S), \text{Hom}(\text{An}_S^* L(F), E_{\text{usu}}(\Omega_S^*, F_b)))[-d_T] \]

\[ \xrightarrow{\text{Hom}(\text{An}_S^* N(S), E_{\text{usu}}(\Omega_S^*, F_b)))} \xrightarrow{\text{Hom}(\text{An}_S^* Q(S/\tilde{S}_i), E_{\text{usu}}(\Omega_S^*, F_b))[-d_S], v_{ij}^j(F(X/S))} \]

\[ \xrightarrow{(I(\gamma, \text{hom})(-, -))^{-1}} (p_{\tilde{S}_i} \Gamma_{\times} E_{\text{usu}}(\Omega_{Y \times \tilde{S}_i/S}, F_b)[-d_{\tilde{S}_i}], w_{ij}(X/S)). \]

where the last isomorphism in the derived category comes from proposition 117.

(ii) We have then the canonical transformation in $D_{O_{\text{riv},\infty}}(T \times S)$ (see definition 126):

\[ T^O(g, \mathcal{F}_{S}^G)(M) : Lg^{\text{smod}, \text{an}} \mathcal{F}_{S,\text{an}}^G(M) := g^{\text{smod}, \text{an}} L(S), \text{Hom}(\text{An}_S^* L(F), E_{\text{usu}}(\Omega_S^*, F_b))[-d_T] \]

\[ \xrightarrow{T(\text{an}_S^* N(S), E_{\text{usu}}(\Omega_S^*, F_b)))} e(T \times S), \text{Hom}(\text{An}_S^* \Omega_S^* L(F), E_{\text{usu}}(\Omega_S^* X \times S, F_b))[-d_T] \]

\[ \xrightarrow{\text{Hom}(\text{An}_S^* N(S), E_{\text{usu}}(\Omega_S^*, F_b)))} \mathcal{F}_{S,\text{an}}^G(g^* M). \]

We give now the definition in the non smooth case Let $g : T \to S$ a morphism with $T, S \in \text{Var}(\mathbb{C})$. Assume we have a factorization $g : T \xrightarrow{l} Y \times S \xrightarrow{\pi_S} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $\pi_S$ the projection. Let $S = \bigcup_{i=1}^l S_i$ be an open cover such that there exists closed embeddings $i_i : S_i \to \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$ Then, $T = \bigcup_{i=1}^l T_i$ with $T_i := g^{-1}(S_i)$ and we have closed embeddings $i_i : i_i : T_i \to \tilde{S}_i$. Moreover $\tilde{g} t := p_{S_i} : Y \times \tilde{S}_i \to \tilde{S}_i$ is a lift of $g_t := g_{T_i} : T_i \to S_i$. We recall the commutative diagram:

\[
\begin{array}{ccc}
E_{i,j} = (Y \times \tilde{S}_i) \setminus T_i & \xrightarrow{m_j} & Y \times \tilde{S}_j, E_{i,j} = \tilde{S}_j \setminus S_j & \xrightarrow{m_j} & \tilde{S}_j & \xrightarrow{E_{i,j}} & (Y \times \tilde{S}_j) \setminus T_j & \xrightarrow{m_j} & Y \times \tilde{S}_j \\
\xrightarrow{p_{S_i}} & & \tilde{g}_i & \xrightarrow{p_{i,j}} & p_{i,j} & \xrightarrow{p_{i,j}} & p_{i,j} & \xrightarrow{p_{i,j}} & p_{i,j}
\end{array}
\]
For $I \subset J$, denote by $p_{IJ} : \tilde{S}_J \to \tilde{S}_I$ and $p'_{IJ} := I_Y \times p_{IJ} : Y \times \tilde{S}_J \to Y \times \tilde{S}_I$ the projections, so that $\tilde{g}_I \circ p'_{IJ} = p_{IJ} \circ \tilde{g}_J$. Consider, for $I \subset J \subset [1, \ldots, l]$, resp. for each $I \subset [1, \ldots, l]$, the following commutative diagrams in $\text{Var}(\mathbb{C})$

\[
D_{IJ} = S_I \xrightarrow{i_I} \tilde{S}_I , \quad D'_{IJ} = T_I \xrightarrow{i'_I} Y \times \tilde{S}_I \quad \text{and} \quad D_{IJ} = S_I \xrightarrow{i_I} \tilde{S}_I \quad \text{for} \quad j_{IJ} : S_J \to S_I \text{ is the open embedding so that } j_I \circ j_{IJ} = j_J.
\]

Let $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$. The fact that the diagrams commutes says that the maps $T^{\eta,\gamma}(D_{IJ})(j^*_I F)$ define a morphism in $C(\text{Var}(\mathbb{C})^{sm}/(T/(Y \times \tilde{S}_I)))$

\[
(T^{\eta,\gamma}(D_{IJ})(j^*_I F)) : (\Gamma^\gamma_T, \tilde{g}_I^* L(i_{i*}, j_{ij}^* F), \tilde{g}_J^* S^I(D_{IJ})(F)) \to (L(i'_{i*}, j'_{ij}^* g^* F), S^I(D'_{IJ})(g^* F))
\]

We then have the following lemma:

**Lemma 20.**

(i) The morphism in $C(\text{Var}(\mathbb{C})^{sm}/(T/(Y \times \tilde{S}_I)))$

\[
(T^{\eta,\gamma}(D_{IJ})(j^*_I F)) : (\Gamma^\gamma_T, L(i_{i*}, j_{ij}^* g^* F), S^I(D_{IJ})(F)) \to (i'_{i*}, j'_{ij}^* g^* F, S^I(D'_{IJ})(g^* F))
\]

is an equivalence ($\mathbb{A}^1$, et) local.

(ii) Denote for short $d_{Y} := -d_Y - d_{S_I}$. The maps $\text{Hom}(\mathbb{A}^*_Y \times \tilde{S}_I, (T^{\eta,\gamma}(D_{IJ})(j^*_I F)), E_{\text{usu}}(\Omega^{\bullet}_Y \times \tilde{S}_I, F_b))$

induce an $\infty$-filtered quasi-isomorphism in $C_{O}\text{filt},\mathcal{D}^\infty(T/(Y \times \tilde{S}_I))$

\[
(\text{Hom}(\mathbb{A}^*_Y \times \tilde{S}_I, T^{\eta,\gamma}(D_{IJ})(j^*_I F), E_{\text{usu}}(\Omega^{\bullet}_Y \times \tilde{S}_I, F_b))) : \\
(d_{Y}, \text{Hom}(\mathbb{A}^*_Y \times \tilde{S}_I, (\Gamma^\gamma_T, L(i_{i*}, j_{ij}^* g^* F), E_{\text{usu}}(\Omega^{\bullet}_Y \times \tilde{S}_I, F_b))[d_{Y}]), u_{ij}^* g^* F) \to \\
(d_{Y}, \text{Hom}(\mathbb{A}^*_Y \times \tilde{S}_I, (\Gamma^\gamma_T, L(i_{i*}, j_{ij}^* g^* F), E_{\text{usu}}(\Omega^{\bullet}_Y \times \tilde{S}_I, F_b))[d_{Y}]), u_{ij}^* g^* F)
\]

(iii) The maps $T(\tilde{g}_1, \Omega_I)(L(i_{i*}, j_{ij}^* F))$ (see definition 126) induce a morphism in $C_{O}\text{filt},\mathcal{D}^\infty(T/(Y \times \tilde{S}_I))$

\[
(T(\tilde{g}_1, \Omega_I)(L(i_{i*}, j_{ij}^* F))) : \\
(\Gamma_{T_1} E_{\text{zar}}(\tilde{g}_1^* u_{ij}^* g^* F)[d_{Y}], \text{Hom}(\mathbb{A}^*_Y \times \tilde{S}_I, (\Gamma^\gamma_T, L(i_{i*}, j_{ij}^* g^* F), E_{\text{usu}}(\Omega^{\bullet}_Y \times \tilde{S}_I, F_b))[d_{Y}]), u_{ij}^* g^* F) \to \\
(\Gamma_{T_1} E_{\text{zar}}(\tilde{g}_1^* u_{ij}^* g^* F)[d_{Y}], \text{Hom}(\mathbb{A}^*_Y \times \tilde{S}_I, (\Gamma^\gamma_T, L(i_{i*}, j_{ij}^* g^* F), E_{\text{usu}}(\Omega^{\bullet}_Y \times \tilde{S}_I, F_b))[d_{Y}]), u_{ij}^* g^* F)
\]

**Proof.** (i): Follows from theorem 14

(ii): Similar to lemma 13 ii).

(iii): Similar to lemma 13 iii).

\[\Box\]

**Definition 131.** Let $g : T \to S$ a morphism with $T, S \in \text{Var}(\mathbb{C})$. Assume we have a factorization $g : T \xrightarrow{\gamma_{\tilde{S}}} Y \times S \xrightarrow{p_{S}} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_{S}$ the projection. Let $S = \bigcup_{i=1}^l S_i$ be an open cover such that there exists closed embeddings $i_i : S_i \to \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. Then, $T = \bigcup_{i=1}^l T_i$ with $T_i := g_1^{-1}(S_i)$ and we have closed embeddings $i'_i := i_i \circ l : T_i \hookrightarrow Y \times \tilde{S}_i$. Moreover $\tilde{g}_I := p_{S_i} : Y \times \tilde{S}_i \to \tilde{S}_i$ is a lift of $g_1 := g_{T_i} : T_i \to S_i$. Denote for short $d_{T_i} := -d_Y - d_{S_i}$. Let $M \in DA_{\mathbb{C}}(S)$ and $F \in C(\text{Var}(\mathbb{C})^{sm}/S)$ such that $M = D(\mathbb{A}^1_S, et)(F)$. Then, $D(\mathbb{A}^1_T, et)(g^* F) = g^* M$. We
have, by lemma \[13\] the canonical transformation in \(D_{Ofil,D∞,∞}(T/(Y × S_1))\)

\[
\begin{align*}
T(g,F^{GM}(M)) & := \left. (\Gamma T_{1,E} \Gamma_r\tilde{g}_t^\text{mod} e(\tilde{S}_1), \text{Hom}^\bullet(\text{An}^*_S, L(i_1, j_1^*F), E_{usu}(\Omega^*_{Y/S_1}, F_b)))[dy_1, \tilde{g}_j^\text{mod} u^j_1(F)) \right| \\
& \quad \left| (\Gamma T_{1,E} E(T(\tilde{g}_r), (\text{An}^*_S, L(i_1, j_1^*F)))) \right|
\end{align*}
\]

\[
\begin{align*}
(\Gamma T_{1,E} \Gamma_r\tilde{g}_t^\text{mod} e(\tilde{S}_1), \text{Hom}^\bullet(\text{An}^*_Y \times \tilde{S}_1, \tilde{g}_t^\text{mod} L(i_1, j_1^*F), E_{usu}(\Omega^*_{Y \times \tilde{S}_1}, F_b))[dy_1, \tilde{g}_j^\text{mod} u^j_1(F)) & \quad \left| (\text{Hom}(\gamma, \text{usu}(\gamma, \gamma)) \right|
\end{align*}
\]

\[
\begin{align*}
(e(\times \tilde{S}_1), \text{Hom}^\bullet(\text{An}^*_Y \times \tilde{S}_1, \tilde{g}_t^\text{mod} L(i_1, j_1^*F), E_{usu}(\Omega^*_{Y \times \tilde{S}_1}, F_b))[dy_1, \tilde{g}_j^\text{mod} u^j_1(F)) & \quad \left| (\text{Hom}(\gamma, \text{usu}(\gamma, \gamma)) \right|
\end{align*}
\]

\[
\begin{align*}
(e(\times \tilde{S}_1), \text{Hom}^\bullet(\text{An}^*_Y \times \tilde{S}_1, \tilde{g}_t^\text{mod} L(i_1, j_1^*F), E_{usu}(\Omega^*_{Y \times \tilde{S}_1}, F_b))[dy_1, \tilde{g}_j^\text{mod} u^j_1(F)) & \quad \left| (\text{Hom}(\gamma, \text{usu}(\gamma, \gamma)) \right|
\end{align*}
\]

\[
\begin{align*}
(e(\times \tilde{S}_1), \text{Hom}^\bullet(\text{An}^*_Y \times \tilde{S}_1, \tilde{g}_t^\text{mod} L(i_1, j_1^*F), E_{usu}(\Omega^*_{Y \times \tilde{S}_1}, F_b))[dy_1, \tilde{g}_j^\text{mod} u^j_1(F)) & \quad \left| (\text{Hom}(\gamma, \text{usu}(\gamma, \gamma)) \right|
\end{align*}
\]

\[
\begin{align*}
T(g,F^{GM}(M)) & := \left. (\Gamma T_{1,E} \Gamma_r\tilde{g}_t^\text{mod} e(\tilde{S}_1), \text{Hom}^\bullet(\text{An}^*_S, L(i_1, j_1^*F), E_{usu}(\Omega^*_{Y/S_1}, F_b)))[dy_1, \tilde{g}_j^\text{mod} u^j_1(F)) \right| \\
& \quad \left| (\Gamma T_{1,E} E(T(\tilde{g}_r), (\text{An}^*_S, L(i_1, j_1^*F)))) \right|
\end{align*}
\]

**Proposition 119.** (i) Let \(g : T \to S\) a morphism with \(T,S \in \text{Var}(\mathbb{C})\). Assume we have a factorization \(g : T \xrightarrow{l} Y_2 \times S \xrightarrow{p_2} S\) with \(Y_2 \in \text{SmVar}(\mathbb{C})\), \(l\) a closed embedding and \(p_2\) the projection. Let \(S = \bigcup_{i=1}^l S_i\) be an open cover such that there exists closed embeddings \(i_i : S_i \to S_i, i_i \in \text{SmVar}(\mathbb{C})\). Then, \(T = \bigcup_{i=1}^l T_i, T_i := g^{-1}(S_i)\) and there exist closed embeddings \(i'_i := i_i \circ l : T_i \to Y_2 \times S_i\). Moreover \(g_i := p_{S_i} : Y \times \tilde{S}_1 \to S_i\) is a lift of \(g_i := g T_{1,E} : T_i \to S_i\). Let \(f : X \to S\) a morphism with \(X \in \text{Var}(\mathbb{C})\). Assume that there is a factorization \(f : X \xrightarrow{j} Y_1 \times S \xrightarrow{p_2} S\), with \(Y_1 \in \text{SmVar}(\mathbb{C})\), \(l\) a closed embedding and \(p_2\) the projection. We have then the following commutative diagram whose squares are cartesians:

\[
\begin{array}{ccc}
& f' : X_T & \\
& \downarrow & \downarrow & \downarrow \\
& f'' = f \times l : Y_2 \times X & \to Y_1 \times Y_2 \times S & \to Y_2 \times S \\
& \downarrow & \downarrow & \downarrow \\
f : X & \to Y_1 \times S & \to S \\
\end{array}
\]

Consider \(F(X/S) := p_{S_2} T X Y_1 \times S \times Y_1 \times S)[dy_1]\) and the isomorphism in \(C(\text{Var}(\mathbb{C})^\text{sm}/S)

\[
T(f,g,F(X/S)) := g^*F(X/S) \cong p_{S_2} T F_X Y_1 \times Y_1 \times S := F(X_T/T).
\]

which gives in \(\text{DA}(S)\) the isomorphism \(T(f,g,F(X/S)) : g^*M(X/S) \cong M(X_T/T)\). Then, the following diagram in \(D_{Ofil,D∞,∞}(T/(Y_2 \times \tilde{S}_1))\) commutes

\[
\begin{array}{ccc}
\text{Rg}^{\text{mod}, \Gamma} F^{GM}_{\text{S,an}}(M(X/S)) & \xrightarrow{T(g,F^{GM}(M(X/S)))} & F^{GM}_{\text{T,an}}(M(X_T/T)) \\
\downarrow & \Downarrow & \Downarrow \\
g^{\text{mod}, \Gamma} p_{S_2} T X Y_1 \times S [dY_1] & \xrightarrow{(T(\tilde{g}_r, \Gamma)(-)) \circ T_{\text{usu}}(\tilde{g}_r, \tilde{p}_{S_2})} & (p_{Y_2 \times S_1} T X T Y_2 \times Y_1 \times S_1 \times S_1)[dY_2] \end{array}
\]
(ii) Let $g : T \to S$ a morphism with $T, S \in \text{SmVar}(\mathbb{C})$. Let $f : X \to S$ a morphism with $X \in \text{Var}(\mathbb{C})$. Assume that there is a factorization $f : X \xrightarrow{\phi} Y \times S \xrightarrow{\pi_2} S$, with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $\pi_2$ the projection. Consider $F(X/S) := \pi_{S,\sharp}^*\Gamma^*_X \mathbb{Z}(Y \times S/Y \times S)$ and the isomorphism in $C(\text{Var}(\mathbb{C})^{sm}/S)$

$$T(f,g,F(X/S)) : g^*F(X/S) := g^*\pi_{S,\sharp}^*\Gamma^*_X \mathbb{Z}(Y \times S/Y \times S) \xrightarrow{\sim} p_{T,\sharp}^*\Gamma^*_X \mathbb{Z}(Y \times T/Y \times T)[d_Y] := F(X_T/T).$$

which gives in $DA(S)$ the isomorphism $T(f,g,F(X/S)) : g^*M(X/S) \xrightarrow{\sim} M(X_T/T)$. Then, the following diagram in $D_{O_{fil,\infty}}(T)$ commutes

$$
\begin{array}{ccc}
Lg^*\mathcal{F}^\Gamma_{S,an}(M(X/S)) & \xrightarrow{TO(g,F_{GM}(M(X/S)))} & \mathcal{F}^\Gamma_{T,an}(M(X_T/T)) \\
\downarrow T^\Gamma_{GM(X/S)} & & \downarrow T^\Gamma_{GM(X_T/T)} \\
g^*\mathcal{F}_{O(\pi^*\Gamma XE_\text{usu}(\Omega^*_Y \times S/F_t)[-d_T]} & \xrightarrow{(T(g \times I\gamma) \rightarrow T^\Gamma_{GM}(T^\Gamma_{GM}(T^\Gamma)) \rightarrow \mathcal{F}^\Gamma_{T,an}(T^\Gamma_{GM}(T^\Gamma))} & \mathcal{F}^\Gamma_{T,an}(T^\Gamma_{GM}(T^\Gamma)) \\
\downarrow T_{\omega}^\Gamma(\gamma \times \gamma)(O_{Y \times X}) & & \downarrow T_{\omega}^\Gamma(\gamma \times \gamma)(O_{Y \times X}) \\
Lg^*\mathcal{F}^\Gamma_{FDR}(\Gamma XE_\text{usu}(O_{Y \times S}^{-}F_t)[-d_Y - d_T]} & \xrightarrow{T^\Gamma_{mod(\pi_{S,\sharp})}(-)} & \mathcal{F}^\Gamma_{FDR}(\Gamma XE_\text{usu}(O_{Y \times S}^{-}F_t)[-d_Y - d_T]).
\end{array}
$$

Proof. Follows immediately from definition. \hfill \Box

**Theorem 35.** (i) Let $g : T \to S$ is a morphism with $T, S \in \text{Var}(\mathbb{C})$. Assume there exist a factorization $g : T \xrightarrow{\pi} Y \times S \xrightarrow{\pi_2} S$, with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $\pi_2$ the projection. Let $S = \bigcup_{i=1}^l S_i$ be an open cover such that there exists closed embeddings $i : S_i \hookrightarrow S$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. Then, for $M \in DA_c(S)$

$$T(g, F_{an}^\Gamma)(M) : Rg^*\mathcal{F}_{S,an}^\Gamma(M) \to \mathcal{F}_{T,an}^\Gamma(g^*M)$$

is an isomorphism in $D_{O_{fil,\infty}}(T/(Y \times \tilde{S}_i))$. (ii) Let $g : T \to S$ is a morphism with $T, S \in \text{SmVar}(\mathbb{C})$. Then, for $M \in DA_c(S)$

$$T(g, F_{an}^\Gamma)(M) : Lg^*\mathcal{F}_{S,an}^\Gamma(M) \to \mathcal{F}_{T,an}^\Gamma(g^*M)$$

is an isomorphism in $D_{O_{fil}}(T)$.

Proof. (i): Follows from proposition \[11\] proposition \[12] and proposition \[56\] : Second proof : In the analytic case only, we can give a direct proof of this proposition : Indeed, let $g : T \to S$ is a morphism with $T, S \in \text{AnSp}(\mathbb{C})$ and let $h : U \to S$ a smooth morphism with $U \in \text{AnSp}(\mathbb{C})$, then,

$$T^\omega_{\omega}(g,h) : g^*\mathcal{L}_D h^*E_\text{usu}(\Omega^*_U/S,F) \to h^*E_\text{usu}(\Omega^*_U/T,F)$$

is an equivalence usu local : consider the following commutative diagram

$$
\begin{array}{ccc}
\mathcal{L}_D h^*E_\text{usu}(\mathbb{Z}/O_S) & \xrightarrow{T(g,h)(E_\mathbb{Z}/O_S)} & h^*E_\text{usu}(\mathbb{Z}/O_T) \\
\downarrow T(g,h)((-,-)) & & \downarrow T(h^*,(-,-)) \\
g^*\mathcal{L}_D h^*E_\text{usu}(\mathbb{Z}/O_S) & \xrightarrow{T^\mod(g,h)(h^*O_S)} & h^*E_\text{usu}(\mathbb{Z}/O_T) \\
\downarrow g^*\mathcal{L}_D h^*E_\text{usu}(\mathbb{Z}/O_S) & & \downarrow k^*E_\text{usu}(\mathbb{Z}/O_T) \\
g^*\mathcal{L}_D h^*E_\text{usu}(\Omega^*_U/S) & \xrightarrow{T^\mod(g,h)} & h^*E_\text{usu}(\Omega^*_U/T) \\
\downarrow g^*\mathcal{L}_D h^*E_\text{usu}(\Omega^*_U/S) & & \downarrow k^*E_\text{usu}(\Omega^*_U/T)
\end{array}
$$

then,
• the maps $T(h', \otimes)(-, -)$ and $T(h, \otimes)(-, -)$ are usu local equivalence by proposition \([9]\)

• since $h : U \to S$ is a smooth morphism, the inclusion $\iota_{U/S} : h^*O_S \to \Omega^*_U$ is a quasi-isomorphism,

• since $h' : U_T \to T$ is a smooth morphism, the inclusion $\iota_{U_T/T} : h^*O_T \to \Omega^*_U$ is a quasi-isomorphism,

• since $U, U_T, S, T$ are paracompact topological spaces (in particular Hausdorff), $T(g, h)(E(Z_U)) : g^*h_*E(Z_U) \to h'_*E(Z_{U_T})$ is a quasi-isomorphism.

This fact, together with lemma \([13]\) proves the proposition. \(\square\)

We finish this subsection by a consequence of proposition \([14]\) and theorem \([14]\):

**Theorem 36.** Let $X \in \text{PSmVar}(\mathbb{C})$ and $D = \cup D_i \subset X$ a normal crossing divisor. Consider the open embedding $j : U := X \setminus D \hookrightarrow X$. Then, the inclusion

$$j^* : \Gamma(X, E_{\text{usu}}(\Omega^*_X(\log D), F_b)) \hookrightarrow \Gamma(U, E_{\text{usu}}(\Omega^*_U, F_b))$$

is an $\infty$-filtered quasi-isomorphism, that is

$$j^* : F^pH^n(U, \mathbb{C}) := F^pH^n\Gamma(X, E_{\text{usu}}(\Omega^*_X(\log D), F_b)) \simto F^pH^n\Gamma(U, E_{\text{usu}}(\Omega^*_U, F_b)) =: F^p_bH^n(U, \mathbb{C})$$

is an isomorphism for all $n, p \in \mathbb{Z}$ (note that it is obviously injective since $j^* : H^n\Gamma(X, E_{\text{usu}}(\Omega^*_X(\log D))) \simto H^n\Gamma(U, E_{\text{usu}}(\Omega^*_U))$ is an isomorphism if we forgot filtrations). Note that however, it is NOT a filtered quasi-isomorphism (for example if $U$ is affine $H^q(U, \mathbb{P}^n_U) = 0$ for $q > 0$) that it is not an isomorphism on the $E_1$ terms of the spectral sequences in general.

**Proof.** Similar to the proof of theorem \([31]\) \(\square\)

**Definition 132.** Let $S \in \text{Var}(\mathbb{C})$ and $S = \cup_{i=1}^f S_i$ an open affine covering and denote, for $I \subset [1, \cdots f]$, $S_I = \cap_{i \in I} S_i$ and $j_i : S_I \hookrightarrow S$ the open embedding. Let $i_i : S_i \hookrightarrow S_i$ closed embeddings, with $S_i \in \text{SmVar}(\mathbb{C})$. We have, for $M, N \in \text{DA}(S)$ and $F, G \in \text{C}(\text{Var}(\mathbb{C})^\text{sm}/S)$ such that $M = D(\mathbb{A}_1, \text{et})(F)$ and $N = D(\mathbb{A}_1, \text{et})(G)$, the following transformation map in $D_{\text{O}_{\text{fust}}, \mathcal{D}^\infty}(S/(S_i))$

$$T(\mathcal{F}^\text{GM}_{S, \text{an}}, \otimes)(M, N) : \mathcal{F}^\text{GM}_{S, \text{an}}(M) \otimes_{O_S} \mathcal{F}^\text{GM}_{S, \text{an}}(N) := (e(S_I), \text{Hom}(A^*_{S_I} L(i_{i_I j_I}^* F), E_{\text{usu}}(\Omega^*_{S_I}, F_b)), u \otimes G)) \otimes_{O_S}$$

$$\xrightarrow{(T \otimes_{O_{S_I}})(L(i_{i_I j_I}^* F), L(i_{i_I j_I}^* G))} (e(S_I), \text{Hom}(A^*_{S_I} L(i_{i_I j_I}^* F) \otimes A^*_{S_I} L(i_{i_I j_I}^* G), E_{\text{usu}}(\Omega^*_{S_I}, F_b)), u \otimes G))$$

We have in the analytical case the following:

**Proposition 120.** Let $S \in \text{Var}(\mathbb{C})$. Then, for $M, N \in \text{DA}_{\text{c}}(S)$

$$T(\otimes, \mathcal{F}^\text{GM}_{S, \text{an}})(M, N) : \mathcal{F}^\text{GM}_{S, \text{an}}(M \otimes N) \simto \mathcal{F}^\text{GM}_{S, \text{an}}(M) \otimes_{O_S} \mathcal{F}^\text{GM}_{S, \text{an}}(N)$$

is an isomorphism.
Proof. Assume first that $S$ is smooth. Let $h_1 : U_1 \to S$ and $h_2 : U_2 \to S$ smooth morphisms with $U_1, U_2 \in \Var_C$ and consider $h_{12} : U_1 \times_S U_2 \to S$. We then have by Lemma 10 the following commutative diagram

$$
eq (h_{12},\otimes)(\Omega_{U_1}^{\bullet}/S, \Omega_{U_2}^{\bullet}/S) \otimes_O S$$

Since $U_1, U_2 \in \AnSp_C$ are locally contractible topological spaces, the lower row is an equivalence usu local by Kunneth formula for topological spaces (see section 2). This proves the proposition in the case $S$ is smooth. Let $i^\natural : \overset{\sim}{S} \to S$ an open cover such that there exist closed embeddings $i_i : S_i \to \overset{\sim}{S}_i$ with $i_i \in \SmVar_C$. By definition, for $F, G \in C(\Var_C)^{sm}/S$ such that $M = D(\mathbb{A}_C^1, et)(F)$ and $N = D(\mathbb{A}_C^1, et)(G)$,

$$T(\otimes, F_{S,an}^G(M, N)) : e(\tilde{S}_I)_{\otimes} T(\otimes, \Omega_{\tilde{S}_I}^{\bullet}/S, \Omega_{\tilde{S}_I}^{\bullet}/S, F, G), \ u_{IJ}(F \otimes (F \otimes G))$$

$$\to (e(\tilde{S}_I))_{\otimes} T(\otimes, \Omega_{\tilde{S}_I}^{\bullet}/S, \Omega_{\tilde{S}_I}^{\bullet}/S, F, G), \ u_{IJ}(F \otimes G)$$

Since $L(i_{I\ast} j_{I}^{\natural} F), L(i_{I\ast} j_{I}^{\natural} G) \in D(\mathbb{A}_C^1(\tilde{S}_I)$, by the smooth case applied to $\tilde{S}_I$ for each $I$, $T(\otimes, F_{S,an}^G(M, N))$ is an equivalence usu local.

### 6.2.2 The analytic filtered De Rham realization functor

Recall from section 2 that, for $S \in \Var_C$ we have the following commutative diagrams of sites
and

\[ \text{AnSp}(\mathbb{C})^2 \simpr / S \xrightarrow{\text{Gr}^1_{S}} \text{AnSp}(\mathbb{C}) / S \]  
\[ \xrightarrow{\rho_S} \text{AnSp}(\mathbb{C})^2 \simpr / S \xrightarrow{\text{Gr}^2} \text{AnSp}(\mathbb{C})^s / S \]

\[ \text{Var}(\mathbb{C})^2 \simpr / S \xrightarrow{\text{Gr}^1_{S}} \text{Var}(\mathbb{C}) / S \]  
\[ \xrightarrow{\rho_S} \text{Var}(\mathbb{C})^2 \sm / S \xrightarrow{\text{Gr}^1_{S}} \text{Var}(\mathbb{C})^s / S \]

and that for \( f : T \rightarrow S \) a morphism with \( T, S \in \text{Var}(\mathbb{C}) \) we have the following commutative diagrams of site,

\[ \text{AnSp}(\mathbb{C})^2 / T^{an} \xrightarrow{\text{An}_T} \text{Var}(\mathbb{C})^2 / T \]  
\[ \xrightarrow{P(f)} \text{AnSp}(\mathbb{C})^2 / T^{an} \xrightarrow{\text{An}} \text{Var}(\mathbb{C})^2 / T \]

\[ \text{AnSp}(\mathbb{C})^2 / S^{an} \xrightarrow{\text{An}_S} \text{Var}(\mathbb{C})^2 / S \]  
\[ \xrightarrow{P(f)} \text{AnSp}(\mathbb{C})^2 / S^{an} \xrightarrow{\text{An}} \text{Var}(\mathbb{C})^2 / S \]

Definition 133. (i) For \( S \in \text{AnSp}(\mathbb{C}) \), we consider the filtered complexes of presheaves

\( (\Omega^\cdot_S, F_b) \in C_{O_S \text{fd}}(\text{AnSp}(\mathbb{C})^2 / S) \)

given by

- for \( ((X, Z), h) = (X, Z) / S \in \text{AnSp}(\mathbb{C})^2 / S \),
  \[
  (\Omega^\cdot_S((X, Z) / S), F_b) : = \Gamma^T Z L_h \cdot O(\Omega^T_{X/S}, F_b)(X)
  \]
  \[
  = \mathbb{D}_h \circ O_d L_{h \cdot O} \Gamma Z E_{usu}(\mathbb{D}_h \circ O_d L_{h \cdot O}(\Omega^T_{X/S}, F_b))(X)
  \]

- for \( g : (X_1, Z_1) / S = ((X_1, Z_1), h_1) \rightarrow (X, Z) / S = ((X, Z), h) \) a morphism in \( \text{AnSp}(\mathbb{C})^2 / S \),
  \[
  \Omega^\cdot_S(g) : \mathbb{D}_h \circ O_d L_{h \cdot O} \Gamma Z E_{usu}(\mathbb{D}_h \circ O_d L_{h \cdot O}(\Omega^T_{X/S}, F_b))(X)
  \]
  \[
  = \mathbb{D}_h \circ O_d L_{h \cdot O} \Gamma Z_1 E_{usu}(\mathbb{D}_h \circ O_d L_{h \cdot O}(\Omega^T_{X_1/S}, F_b))(X)
  \]

is given as in definition [110(i)]. For \( S \in \text{AnSm}(\mathbb{C}) \), we consider the complexes of presheaves

\( (\Omega^\cdot_S, F_b) := \rho_{S^*}(\Omega^\cdot_S, F_b) \in C_{O_S \text{fd}, D_S^s}(\text{AnSp}(\mathbb{C})^2 / s / S) \)

(ii) For \( S \in \text{AnSm}(\mathbb{C}) \), we have the canonical map \( C_{O_S \text{fd}, D_S^s}(\text{AnSp}(\mathbb{C})^s / S) \)

\[ \text{Gr}^O(\Omega^\cdot_S) : \text{Gr}^1_{S^*} \mu_{S^*}(\Omega^\cdot_S, F_b) \rightarrow (\Omega^\cdot_S, F_b) \]

given as in definition [110(ii)].
Definition 134. (i) For $S \in \text{SmVar}(\mathbb{C})$, we consider, using definition (133(i)), the filtered complexes of presheaves

$$(\Omega_{S_{\text{an}}}^{\bullet, p.r}, F_{DR}) \in C_{D_{S}^{\infty}}(\text{Var}(\mathbb{C})^{2, \text{smpr}}/S)$$

given by,

- for $(Y \times S, Z)/S = ((Y \times S, Z), p) \in \text{Var}(\mathbb{C})^{2, \text{smpr}}/S$,

$$((\Omega_{S_{\text{an}}}^{\bullet, p.r,(Y \times S, Z)/S}, F_{b}) := (\Omega_{S_{\text{an}}}^{\bullet, p.r,(Y \times S), F_{b}}) \otimes_{O_{Y \times S}} (\Gamma_{Z}^{\psi, Hdg}(O_{Y \times S}, F_{b}))^{an}((Y \times S)^{an})$$

with the structure of $p^{*}D_{S}$ module given by proposition 34.

- for $g : (Y_{1} \times S, Z_{1})/S = ((Y_{1} \times S, Z_{1}), p_{1}) \rightarrow (Y \times S, Z)/S = ((Y \times S, Z), p)$ a morphism in $\text{Var}(\mathbb{C})^{2, \text{smpr}}/S$,

$$\Omega_{S_{\text{an}}}^{\bullet, p.r,(g)} := (\Omega_{S_{\text{an}}}^{\bullet, p.r, g})^{an} : (\Omega_{S_{\text{an}}}^{\bullet, p.r,(Y_{1} \times S), F_{b}}) \otimes_{O_{Y \times S}} (\Gamma_{Z}^{\psi, Hdg}(O_{Y \times S}, F_{b}))^{an}((Y_{1} \times S)^{an}) \rightarrow ((\Omega_{S_{\text{an}}}^{\bullet, p.r,(Y_{1} \times S), F_{b}}) \otimes_{O_{Y \times S}} (\Gamma_{Z}^{\psi, Hdg}(O_{Y_{1} \times S}, F_{b}))^{an}((Y_{1} \times S)^{an})$$

For $S \in \text{SmVar}(\mathbb{C})$, we get the filtered complexes of presheaves

$$(\Omega_{S_{\text{an}}}^{\bullet, p.r, an}, F_{DR}) := An_{S}^{\text{mod}}(\Omega_{S_{\text{an}}}^{\bullet, p.r}, F_{DR}) := An_{S}(\Omega_{S_{\text{an}}}^{\bullet, p.r}, F_{DR}) \otimes_{O_{S}} O_{S_{an}} \in C_{D_{S}^{\infty}}(\text{AnSp}(\mathbb{C})^{2, \text{smpr}}/S).$$

(ii) For $S \in \text{SmVar}(\mathbb{C})$, we have the canonical map $C_{D_{S}^{\text{fil}}, D_{S}^{\infty}}(\text{Var}(\mathbb{C})^{sm}/S)$

$$\text{Gr}(\Omega_{S_{\text{an}}}^{\bullet}) : \text{Gr}_{S}(\Omega_{S_{\text{an}}}^{\bullet, p.r}, F_{b}) \rightarrow An_{S}(\Omega_{S_{\text{an}}}^{\bullet}, F_{b})$$

given by

$$\text{Gr}(\Omega_{S_{\text{an}}}^{\bullet})(U/S) := (\text{Gr}(\Omega_{S})(U/S))^{an} \otimes m :$$

$$J_{S}((\Omega_{(Y \times S), F_{b}})^{an} \otimes_{O_{(Y \times S)}} (\Gamma_{Z}^{\psi, Hdg}(O_{Y \times S}, F_{b}))^{an}((U \times S)^{an}) \rightarrow ((\Omega_{S_{an}}^{\bullet, p.r, an}, F_{b}) \otimes_{O_{S}} O_{S_{an}} \in C_{D_{S}^{\infty}}(\text{AnSp}(\mathbb{C})^{sm}/S).$$

where $\text{Gr}(\Omega_{S_{\text{an}}})(U/S)(\omega \otimes m \otimes P) := P(\text{Gr}(\Omega_{S})(U/S)(\omega \otimes m))$ with $P \in \Gamma(S, D_{S}^{\infty})$, see definition (133(ii)), which gives by adjunction

$$\text{Gr}(\Omega_{S_{\text{an}}}) := I(An_{S}^{\text{mod}}, An_{S})(\text{Gr}(\Omega_{S_{\text{an}}}^{\bullet})) : J_{S}(\text{Gr}_{S}(\Omega_{S_{\text{an}}}^{\bullet, p.r, an}, F_{b})) \rightarrow (\Omega_{S_{\text{an}}}^{\bullet}, F_{b})$$

in $C_{D_{S}^{\text{fil}}, D_{S}^{\infty}}(\text{AnSp}(\mathbb{C})^{sm}/S)$.

Definition 135. For $S \in \text{SmVar}(\mathbb{C})$, we have the canonical map in $C_{D_{S}^{\text{fil}}, D_{S}^{\infty}}(\text{Var}(\mathbb{C})^{2, \text{smpr}}/S)$

$$T(\Omega_{S_{\text{an}}}^{\bullet}) : An_{S}(\Omega_{S_{\text{an}}}^{\bullet, p.r, an}, F_{b}) \rightarrow (\Omega_{S_{\text{an}}}^{\bullet, p.r, an}, F_{DR})$$

given by, for $(Y \times S, X)/S = ((Y \times S, Z), p) \in \text{Var}(\mathbb{C})^{2, \text{smpr}}/S$

$$T(\Omega_{S_{\text{an}}}^{\bullet})(Y \times S, Z)/S := (T(\Omega_{S}^{\bullet}))(Y \times S, Z)/S)^{an} :$$

$$(\Omega_{S_{an}}^{\bullet}, F_{b}) \rightarrow (\Omega_{S_{an}}^{\bullet}, F_{b}) \otimes_{O_{Y \times S}} (\Gamma_{Z}^{\psi, Hdg}(O_{Y \times S}, F_{b}))^{an}((Y \times S)^{an}) \rightarrow (((\Omega_{Y \times S})^{an} \otimes_{O_{Y \times S}} (\Gamma_{Z}^{\psi, Hdg}(O_{Y \times S}, F_{b}))^{an}((Y \times S)^{an}) := (\Omega_{S_{an}}^{\bullet, p.r, an}, F_{DR})(Y \times S, Z)/S,$$

see definition (133). By definition we have $\text{Gr}(\Omega_{S_{\text{an}}}) = \text{Gr}(\Omega_{S_{\text{an}}}) \circ T(\Omega_{S_{\text{an}}}^{\bullet})$.

Proposition 121. (i) Let $S \in \text{AnSp}(\mathbb{C})$. The complex of presheaves $(\Omega_{S_{an}}^{\bullet}, F_{b}) \in C_{D_{S}^{\text{fil}}, D_{S}^{\infty}}(\text{AnSp}(\mathbb{C})^{2, \text{sm}}/S)$

is $\infty$-filtered $\mathcal{D}_{S}^{1}$ invariant (see definition (10) and admits transfers (i.e. $\text{Tr}(S)^{\bullet} \Omega_{S_{an}}^{\bullet} = \Omega_{S_{an}}^{\bullet}$).
(ii) Let $S \in \text{SmVar}(\mathbb{C})$. The complex of presheaves $(\Omega^*_{/\text{Sn}}, F_{DR}) \in C_{D^P, \text{fil}}(\text{AnSp}(\mathbb{C})^{2, \text{smpr}}/S)$ is $\infty$-filtered $D_S^+$ local for the usual or etale topology (see definition [16]) and admits transfers.

\textbf{Proof.} Similar to proposition [104].

We have the following canonical transformation map given by the pullback of (relative) differential forms:

Let $g : T \to S$ a morphism with $T, S \in \text{AnSm}(\mathbb{C})$.

- We have the canonical morphism in $C_{g^* \text{O}_{D^P, g^* D^P}}(\text{AnSp}(\mathbb{C})^{2, \text{sm}}/T)$

$$\Omega^\Gamma_{/\text{T/S}} : g^*(\Omega^\Gamma_{/\text{S}}, F_b) \to (\Omega^\Gamma_{/\text{T}}, F_b)$$

induced by the pullback of differential forms: for $((V, Z_1)/T) = ((V, Z_1), h) \in \text{AnSp}(\mathbb{C})^{2, \text{sm}}/T$,

$$\Omega^\Gamma_{/(T/S)/((V, Z_1)/T)} : g^*\Omega^\Gamma_{/S}((V, Z_1)/T) := \lim_{(h:(U, Z) \to \text{Sm}, g_1:(V, Z_1) \to (U, Z), h,g)} \Omega^\Gamma_{/S}((U, Z)/S)$$

$$\Delta^*_{\text{et}}(g')(\Omega^\Gamma_{/S}) \to \Omega^\Gamma_{/S}((V, Z_1)/S) \xrightarrow{\Gamma^\Gamma_{\text{et}}(g(Y \times T))} \Omega^\Gamma_{/T}((V, Z_1)/T),$$

where $g' : U_T := U \times_S T \to U$ is the base change map and $q : \Omega^\Gamma_{/Y \times T/S} \to \Omega^\Gamma_{1 \times T/ST}$ is the quotient map. It induces the canonical morphisms in $C_{g^* \text{O}_{D^P, g^* D^P}}(\text{AnSp}(\mathbb{C})^{2, \text{sm}}/T)$:

$$E\Omega^\Gamma_{/(T/S)} : g^*E_{et}(\Omega^\Gamma_{/S}, F_b) \xrightarrow{T(g, E_{et})(\Omega^\Gamma_{/S}, F_b)} E_{et}(g^*\Omega^\Gamma_{/S}, F_b) \xrightarrow{E_{et}(\Omega^\Gamma_{/(T/S)})} E_{et}(\Omega^\Gamma_{/T}, F_b)$$

- We have the canonical morphism in $C_{g^* D^P, \text{fil}}(\text{Var}(\mathbb{C})^{2, \text{smpr}}/T)$

$$\Omega^\Gamma_{/(T/S)^{an}} : g^*(\Omega^\Gamma_{/\text{Sn}}, F_{DR}) \to (\Omega^\Gamma_{/\text{T}^{an}}, F_{DR})$$

induced by the pullback of differential forms: for $((Y_1 \times T, Z_1)/T) = ((Y_1 \times T, Z_1), p) \in \text{Var}(\mathbb{C})^{2, \text{smpr}}/T$,

$$\Omega^\Gamma_{/(T/S)^{an}} : g^*\Omega^\Gamma_{/\text{Sn}}((Y_1 \times T, Z_1)/T) := \lim_{(h:(Y \times S, Z) \to \text{Sm}, g_1:(Y_1 \times T, Z_1) \to (Y \times T, Z_1), h,g)} \Omega^\Gamma_{/\text{Sn}}((Y, Z)/S)$$

$$\Delta^*_{\text{et}}(g')(\Omega^\Gamma_{/\text{Sn}}) \to \Omega^\Gamma_{/\text{Sn}}((Y_1 \times T, Z_1)/S) \xrightarrow{\Gamma^\Gamma_{\text{et}}(q(Y_1 \times T)^{an})} \Omega^\Gamma_{/\text{T}^{an}}((Y_1 \times T, Z_1)/T),$$

where $g' = (I_Y \times g) : Y \times T \to Y \times S$ is the base change map and

$$q(M) : \Omega_{(Y_1 \times T)^{an}/\text{Sn}} \otimes_{O_{(Y_1 \times T)^{an}}}(M, F) \to \Omega_{(Y_1 \times T)^{an}/\text{T}^{an}} \otimes_{O_{(Y_1 \times T)^{an}}}(M, F)$$

is the quotient map. It induces the canonical morphisms in $C_{g^* D^P, \text{fil}}(\text{Var}(\mathbb{C})^{2, \text{smpr}}/T)$:

$$E\Omega^\Gamma_{/(T/S)} : g^*E_{et}(\Omega^\Gamma_{/\text{Sn}}, F_{DR}) \xrightarrow{T(g, E_{et})(\Omega^\Gamma_{/\text{Sn}}, F_{DR})} E_{et}(g^*\Omega^\Gamma_{/\text{Sn}}, F_{DR}) \xrightarrow{E_{et}(\Omega^\Gamma_{/(T/S)^{an}})} E_{et}(\Omega^\Gamma_{/\text{T}^{an}}, F_{DR})$$

and

$$E\Omega^\Gamma_{/(T/S)^{an}} : g^*E_{zar}(\Omega^\Gamma_{/\text{Sn}}, F_{DR}) \xrightarrow{T(g, E_{zar})(\Omega^\Gamma_{/\text{Sn}}, F_{DR})} E_{zar}(g^*\Omega^\Gamma_{/\text{Sn}}, F_{DR}) \xrightarrow{E_{zar}(\Omega^\Gamma_{/(T/S)^{an}})} E_{zar}(\Omega^\Gamma_{/\text{T}^{an}}, F_{DR}).$$
Definition 136. Let $g : T \to S$ a morphism with $T, S \in \text{SmVar}(\mathbb{C})$. We have, for $F \in C(\text{Var}(\mathbb{C})^{2, \text{smpr}} / S)$, the canonical transformation in $C_{D^\infty f_{\text{fil}}(T)}$:

$$T(g, \Omega^\Gamma_{/T, \text{pr}})(F) : g^* \circ L_{D^\infty e}(S)_* \text{Gr}^{12}_S L_{\text{hom}}^\gamma (\text{An}_S^g F, E_{ct}(\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}}))$$

$$\xrightarrow{\text{ev}} (g^* L_{D^\infty e}(S)_* \text{Hom}^\bullet (F, E_{ct}(\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}}))) \otimes g^* O_T$$

$$T(g, \text{Gr}^{12}_S (-) e T) (-) O_T g^* \text{Hom}^\bullet (\text{An}_S^g F, E_{ct}(\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}})) \otimes g^* O_T$$

$$\text{ev}(\text{hom}, (-), (-)) \otimes g^* \text{Hom}^\bullet (\text{An}_S^g F, E_{ct}(\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}})) \otimes g^* O_T$$

$$\text{ev}(\text{hom}, (-), (-)) \otimes g^* \text{Hom}^\bullet (\text{An}_S^g F, E_{ct}(\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}})) \otimes g^* O_T$$

Given by $h : (U, Z) \to S \in \text{Var}(\mathbb{C})^{2, \text{sm}} / S$,

$$w_S : ((\Omega^\Gamma_{/U}, F_b) \otimes_{\text{Sm}} (\Omega^\Gamma_{/S}, F_b) \to (\Omega^\Gamma_{/U}, F_b)$$

which induces the map in $C_{O_{S f_{\text{fil}} D_S}(\text{Var}(\mathbb{C})^{2, \text{sm}} / S))$

$$E w_S : E_{ct}(\Omega^\Gamma_{/U}, F_b) \otimes_{\text{Sm}} E_{ct}(\Omega^\Gamma_{/S}, F_b) \to E_{ct}(\Omega^\Gamma_{/U}, F_b)$$

Let $S \in \text{SmVar}(\mathbb{C})$. We have the map in $C_{D_S^\infty f_{\text{fil}}(\text{Var}(\mathbb{C})^{2, \text{smpr}} / S)}$:

$$w_S : ((\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}}) \otimes_{\text{Sm}} (\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}}) \to (\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}})$$

Given by $p : (Y, Z) \to S \in \text{Var}(\mathbb{C})^{2, \text{smpr}} / S$,

$$w_S : ((\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}}) \otimes_{\text{Sm}} (\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}}) \to (\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}})$$

which induces the map in $C_{D_S^\infty f_{\text{fil}}(\text{Var}(\mathbb{C})^{2, \text{smpr}} / S)}$

$$E w_S : E_{ct}(\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}}) \otimes_{\text{Sm}} E_{ct}(\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}}) \to E_{ct}(\Omega^\Gamma_{/\text{Sm}, \text{pr}}, F_{\text{DR}})$$

by the functoriality of the Godemment resolution (see section 2).
Definition 137. Let $S \in \text{SmVar}(\mathbb{C})$. We have, for $F, G \in C(\text{Var}(\mathbb{C})^{2, \text{smpr}}/S)$, the canonical transformation in $C_{D^\infty-fil}(S^{an})$:

$$T(\otimes, \Omega)(F, G) :$$

$$e'(S), \text{Gr}_{S, G}^{12} \text{Hom}(\text{An}_S^* F, E_{et}(\Omega^*_{/S} F_{DR})) \otimes_{O_S} e(S)_* \text{Gr}_{S, G}^{12} \text{Hom}(\text{An}_S^* G, E_{et}(\Omega^*_{/S} F_{DR}))$$

$$\xrightarrow{\sim} e'(S), \text{Gr}_{S, G}^{12} \text{Hom}(\text{An}_S^* F \otimes \text{An}_S^* G, E_{et}(\Omega^*_{/S} F_{DR}) \otimes_{O_S} E_{et}(\Omega^*_{/S} F_{DR}))$$

$$\xrightarrow{T(\text{Hom}(\otimes)(\sim))} e'(S), \text{Gr}_{S, G}^{12} \text{Hom}(\text{An}_S^* (F \otimes G), E_{et}(\Omega^*_{/S} F_{DR}) \otimes_{O_S} E_{et}(\Omega^*_{/S} F_{DR}))$$

We now define the filtered analytic De Rham realization functor.

Definition 138. 
(i) Let $S \in \text{SmVar}(\mathbb{C})$. We have, using definition \[134\] and definition \[36\] the functor

$$C(\text{Var}(\mathbb{C})^{sm}/S) \rightarrow C_{D^\infty-fil}(S^{an}), \quad F \mapsto \lim_{r(\mathcal{X}^*, D^*)/S(LF)} e'(S), \text{Hom}^*(\text{An}_S^* L_{\rho}^S, \text{Gr}_{S, G}^{12s} \text{LR}_{(\mathcal{X}^*, D^*)/S}(\rho_S^* \mathcal{L}(F)), E_{et}(\Omega^*_{/S} F_{DR}))$$

$$[-d_S]$$

denoting for short $e'(S) = e(S) \circ \text{Gr}_{S}^{12s}$.

(ii) Let $S \in \text{Var}(\mathbb{C})$ and $S = \bigcup_{i=1}^{f} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \bar{S}_i$ with $\bar{S}_i \in \text{SmVar}(\mathbb{C})$. For $I \subset [1, \ldots, f]$, denote by $S_I := \cap_{i \in I} S_i$ and $j_j : S_I \hookrightarrow S$ the open embedding. We then have closed embeddings $i_i : S_I \hookrightarrow \bar{S}_I := \Pi_{i \in I} \bar{S}_i$. Consider, for $I \subset J$, the following commutative diagram

$$D_{IJ} = \begin{array}{ccc}
S_I & \xrightarrow{i_i} & \bar{S}_I \\
\downarrow j_I & & \downarrow j_I \\
S_J & \xrightarrow{i_J} & \bar{S}_J
\end{array}$$

and $j_I : S_J \hookrightarrow S_I$ is the open embedding so that $j_I \circ j_I = j_J$. We have, using definition \[134\] and definition \[36\] the functor

$$C(\text{Var}(\mathbb{C})^{sm}/S) \rightarrow C_{D^\infty-fil}(S^{an}/(\bar{S}_I^{an})), \quad F \mapsto \lim_{r(\mathcal{X}^*, D^*)/\bar{S}_I(LF)} e'(S_I), \text{Hom}^*(\text{An}_{S_I}^* L_{\rho_{S_I}} \text{Gr}_{S_I}^{12s} \text{LR}_{(\mathcal{X}^*, D^*)/\bar{S}_I}(\rho_{S_I}^* \mathcal{L}(i_I, j_I^* F)), E_{et}(\Omega^*_{/S_I} F_{DR}))$$

$$[-d_{S_I}], u_{IJ}^*(F))$$

$$= (\lim_{r(\mathcal{X}^*, D^*)/S_I(LF)} e'(S_I), \text{Hom}^*(\rho_{S_I}^* \mathcal{L}(i_I, j_I^* F)), \text{An}_{S_I}^* E_{et}(\Omega^*_{/S_I} F_{DR})(-d_{S_I}], u_{IJ}^*(F)))$$

where we have denoted for short $e'(S_I) = e(S_I) \circ \text{Gr}_{S_I}^{12s}$, the limits run over the Corti-Hanamura resolutions

$$r_{(\mathcal{X}^*, D^*)/S_I}(L(i_I, j_I^* F)) : R_{(\mathcal{X}^*, D^*)/S_I}(\rho_{S_I}^* \mathcal{L}(i_I, j_I^* F)) \rightarrow \mathcal{D}_{S_I}(\rho_{S_I}^* \mathcal{L}(i_I, j_I^* F))$$

281
Proof. We have the following key proposition:

\[ \lim_{\tau(X^*, D^*)/S} e'(S)_{\text{et}} \Hom^* (\mathcal{H}^* \text{gr} \mathcal{S} G \mathcal{R}^* L \text{et} \text{gr} \mathcal{S} (\rho^* S, \text{et} \rho^* S L(\mathcal{F})), \mathcal{E}_{\text{et}} (\Omega^*_{/S} \rho^* \text{an}^*, \mathcal{F}_{DR})) ]_{-d_S} \]

\[ \lim_{\tau(X^*, D^*)/S} e'(S)_{\text{et}} \Hom^* (\mathcal{H}^* \text{gr} \mathcal{S} G \mathcal{R}^* L \text{et} \text{gr} \mathcal{S} (\rho^* S, \text{et} \rho^* S L(\mathcal{F})), \mathcal{E}_{\text{et}} (\Omega^*_{/S} \rho^* \text{an}^*, \mathcal{F}_{DR})) ]_{-d_S} \]

For \( I \subset J \subset K \), we have obviously \( p_{IJ} \circ u_{JK}(F) = u_{IK}(F) \). We will prove in corollary 8 below that \( u_{1J}(F) \) are \( \infty \)-filtered Zariski local equivalence.

We have the following key proposition:

**Proposition 122.** Let \( S \in \text{SmVar} (\mathbb{C}) \).

(i) Let \( m : Q_1 \rightarrow Q_2 \) be an etale local equivalence local with \( Q_1, Q_2 \in C(\text{Proj} \text{PSh} (\text{Var}(\mathbb{C})^{sm}/S)) \) complexes of representable presheaves. Then,

\[ e'(S)_{\text{et}} \Hom^* (\mathcal{H}^* \text{gr} \mathcal{S} G \mathcal{R}^* L \text{et} \text{gr} \mathcal{S} (\rho^* S, \text{et} \rho^* S L(\mathcal{F})), \mathcal{E}_{\text{et}} (\Omega^*_{/S} \rho^* \text{an}^*, \mathcal{F}_{DR})) ]_{-d_S} \]

\[ \lim_{\tau(X^*, D^*)/S} e'(S)_{\text{et}} \Hom^* (\mathcal{H}^* \text{gr} \mathcal{S} G \mathcal{R}^* L \text{et} \text{gr} \mathcal{S} (\rho^* S, \text{et} \rho^* S L(\mathcal{F})), \mathcal{E}_{\text{et}} (\Omega^*_{/S} \rho^* \text{an}^*, \mathcal{F}_{DR})) ]_{-d_S} \]

is an \( \infty \)-filtered quasi-isomorphism. It is thus an isomorphism in \( D_{\text{fil}, \infty}(S) \).

(ii) Let \( m : Q_1 \rightarrow Q_2 \) be an equivalence \( (\mathbb{A}^1, \text{et}) \) local with \( Q_1, Q_2 \in C(\text{Proj} \text{PSh} (\text{Var}(\mathbb{C})^{sm}/S)) \) complexes of representable presheaves. Then,

\[ e'(S)_{\text{et}} \Hom^* (\mathcal{H}^* \text{gr} \mathcal{S} G \mathcal{R}^* L \text{et} \text{gr} \mathcal{S} (\rho^* S, \text{et} \rho^* S L(\mathcal{F})), \mathcal{E}_{\text{et}} (\Omega^*_{/S} \rho^* \text{an}^*, \mathcal{F}_{DR})) ]_{-d_S} \]

\[ \lim_{\tau(X^*, D^*)/S} e'(S)_{\text{et}} \Hom^* (\mathcal{H}^* \text{gr} \mathcal{S} G \mathcal{R}^* L \text{et} \text{gr} \mathcal{S} (\rho^* S, \text{et} \rho^* S L(\mathcal{F})), \mathcal{E}_{\text{et}} (\Omega^*_{/S} \rho^* \text{an}^*, \mathcal{F}_{DR})) ]_{-d_S} \]

is an \( \infty \)-filtered quasi-isomorphism. It is thus an isomorphism in \( D_{\text{fil}, \infty}(S) \).

Proof. Similar to the proof of proposition 105. □

**Definition 139.**

(i) Let \( S \in \text{SmVar} (\mathbb{C}) \). We define using definition 138(i) and proposition 122(ii) the filtered algebraic De Rahm realization functor defined as

\[ \mathcal{F}^\text{DR}_{S, an} : \text{DA}_{\mathbb{C}} (S) \rightarrow D_{\text{fil}, \infty}(S^{an}), M \mapsto \mathcal{F}^\text{DR}_{S} (M) := \lim_{\tau(X^*, D^*)/S} e'(S)_{\text{et}} \Hom^* (\mathcal{H}^* \text{gr} \mathcal{S} G \mathcal{R}^* L \text{et} \text{gr} \mathcal{S} (\rho^* S, \text{et} \rho^* S L(\mathcal{F})), \mathcal{E}_{\text{et}} (\Omega^*_{/S} \rho^* \text{an}^*, \mathcal{F}_{DR})) ]_{-d_S} \]

\[ \Rightarrow \lim_{\tau(X^*, D^*)/S} e'(S)_{\text{et}} \Hom^* (\mathcal{H}^* \text{gr} \mathcal{S} G \mathcal{R}^* L \text{et} \text{gr} \mathcal{S} (\rho^* S, \text{et} \rho^* S L(\mathcal{F})), \mathcal{E}_{\text{et}} (\Omega^*_{/S} \rho^* \text{an}^*, \mathcal{F}_{DR})) ]_{-d_S} \]
where $F \in C(\Var(\mathbb{C}))^{sm}/S$ is such that $M = D(\mathbb{A}^1, et)(F)$.

(i) For the Corti-Hanamura weight structure $W$ on $\DA_\mathbb{C}(S)^-$, we define using definition \text{1.39}(i) and proposition \text{1.22}(ii)

$$F_{S, an}^{FDR} : DA_\mathbb{C}^-(S) \to D_{D^{\infty}_{(1,0)fil, \infty}}(S^{an}), M \mapsto F_{S}^{FDR}(M, W) := \lim_{\alpha}(\alpha, S_i) \hom^\bullet(\mathcal{L}_{\alpha, S_i} L \rho_{S_i} \cdot \mathcal{L}_{X_i, D_{(0)}} / S_i, (\rho_{S_i} L(F, W)), E_{et}(\omega^{\bullet, pr, an}_{/S_i}, F_{DR}))[-d_{S_i}], u_{ij}^q(F))$$

where $(F, W) \in C_{fil}(\Var(\mathbb{C})^{sm}/S)$ is such that $M = D(\mathbb{A}^1, et)(F, W)$ using corollary \text{1.1}. Note that the filtration induced by $W$ is a filtration by sub $D_S$-module, which is a stronger property then Griffithz transversality in general.

(ii) Let $S \in \Var(\mathbb{C})$ and $S = \cup_{i=1}^I S_i$ an open cover such that there exist closed embeddings $i : S_i \to \tilde{S}_i$ with $\tilde{S}_i \in \SmVar(\mathbb{C})$. For $I \subset [1, \cdots, l]$, denote by $S_i = \cap_{j \in I} S_j$ and $j_i : S_i \to S$ the open embedding. We then have closed embeddings $j_i : S_i \to \tilde{S}_i := \prod_{j \in I} \tilde{S}_i$. We define, using definition \text{1.38}(ii), proposition \text{1.22}(ii) and corollary \text{1.6} the filtered algebraic De Rham realization functor defined as

$$F_{S, an}^{FDR} : DA_\mathbb{C}^-(S) \to D_{D^{\infty}_{(1,0)fil, \infty}}(S^{an}/(\tilde{S}_i^{an})), M \mapsto F_{S}^{FDR}(M) := \lim_{\alpha}(\alpha, S_i) \hom^\bullet(\mathcal{L}_{\alpha, S_i} L \rho_{S_i} \cdot \mathcal{L}_{X_i, D_{(0)}} / S_i, (\mathcal{L}_{\rho_{S_i} L(F, W)}, E_{et}(\omega^{\bullet, pr, an}_{/S_i}, F_{DR}))[-d_{S_i}], u_{ij}^q(F))$$

where $F \in C(\Var(\mathbb{C})^{sm}/S)$ is such that $M = D(\mathbb{A}^1, et)(F)$, see definition \text{1.10}.

(iii) For the Corti-Hanamura weight structure $W$ on $\DA_\mathbb{C}^-(S)$, using definition \text{1.10}(ii), proposition \text{1.10}(ii) and corollary \text{1.6},

$$F_{S, an}^{FDR} : DA_\mathbb{C}^-(S) \to D_{D^{\infty}_{(1,0)fil, \infty}}(S^{an}/(\tilde{S}_i^{an})), M \mapsto F_{S}^{FDR}(M, W) := \lim_{\alpha}(\alpha, S_i) \hom^\bullet(\mathcal{L}_{\alpha, S_i} L \rho_{S_i} \cdot \mathcal{L}_{X_i, D_{(0)}} / S_i, (\mathcal{L}_{\rho_{S_i} L(F, W)}), E_{et}(\omega^{\bullet, pr, an}_{/S_i}, F_{DR}))[-d_{S_i}], u_{ij}^q(F, W))$$

where $(F, W) \in C_{fil}(\Var(\mathbb{C})^{sm}/S)$ is such that $(M, W) = D(\mathbb{A}^1, et)(F, W)$ using corollary \text{1.7}. Note that the filtration induced by $W$ is a filtration by sub $D_{S_i}$-modules, which is a stronger property then Griffithz transversality. Of course, the filtration induced by $F$ satisfy only Griffithz transversality in general.

Proposition 123. For $S \in \Var(\mathbb{C})$ and $S = \cup_{i=1}^I S_i$ an open cover such that there exist closed embeddings $i : S_i \to \tilde{S}_i$ with $\tilde{S}_i \in SmVar(\mathbb{C})$, the functor $F_{S, an}^{FDR}$ is well defined.

Proof. Similar to the proof of proposition \text{1.10}.

Proposition 124. Let $f : X \to S$ a morphism with $S, X \in \Var(\mathbb{C})$. Assume there exist a factorization

$$f : X \xrightarrow{l} Y \times S \xrightarrow{pr} S$$

of $f$ with $Y \in \SmVar(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. Let $\tilde{Y} \in P\SmVar(\mathbb{C})$ a compactification of $Y$ with $\tilde{Y} \setminus Y = D$ a normal crossing divisor, denote $k : D \to \tilde{Y}$ the closed embedding and $n : Y \to \tilde{Y}$ the open embedding. Denote $\tilde{X} \subset Y \times S$ the closure of $X \subset \tilde{Y} \times S$. We have then the
following commutative diagram in $\text{Var}(\mathbb{C})$

Let $S = \bigcup_{i=1}^{r} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. Then $X = \bigcup_{i=1}^{r} X_i$ with $X_i := f^{-1}(S_i)$. Denote, for $I \subset [1, \ldots, l]$, $S_{\tilde{I}} = \bigcap_{i \in I} S_i$ and $X_{\tilde{I}} = \bigcap_{i \in I} X_i$. Denote $X_I := X \cap (Y \times S_I) \subset Y \times \tilde{S}_I$ the closure of $X_I \subset Y \times \tilde{S}_I$, and $Z_I := Z \cap (Y \times S_I) = X_I \setminus X_I \subset Y \times \tilde{S}_I$.

We have then for $I \subset [1, \ldots, l]$, the following commutative diagram in $\text{Var}(\mathbb{C})$

\[
\begin{array}{c}
X \\ X_i \\
\downarrow \quad \downarrow \quad \downarrow \\
Y \times S \\ Y \times \tilde{S}_I \\
\downarrow \quad \downarrow \quad \downarrow \\
Z := X \setminus X_i \\ Z_I := X_I \setminus X_I
\end{array}
\]

Let $F(X/S) := p_{S,I} \Gamma_Z(X \times S/X \times S)$. We have then the following isomorphism in $D_{\text{Dslash},\infty}(S/\tilde{S}_I)$

\[
I(X/S) : F_{\text{S,an}}^{\text{FDR}}(M(X/S)) \xrightarrow{\cong} (\lim_{r \to -} e'(\tilde{S}_I), \text{Hom}(\text{An}^*_{\tilde{S}_I} Lp_{\tilde{S}_I}, \text{Gr}_{\tilde{S}_I}^{12*} LR((Y \times \tilde{S}_I)^*, E^*)/\tilde{S}_I) (\rho_{\tilde{S}_I}^* L^i(j^i_! F(X/S))))
\]

\[
E_{\text{et}}(\Omega^*_{/\tilde{S}_I}, F_{\text{FDR}})[d_{\tilde{S}_I}], u^q_{i,j}(F(X/S)) \xrightarrow{(\text{Hom}(\text{An}^*_{\tilde{S}_I} Lp_{\tilde{S}_I}, \text{Gr}_{\tilde{S}_I}^{12*} LR((Y \times \tilde{S}_I)^*, E^*)/\tilde{S}_I) (\rho_{\tilde{S}_I}^* L^i(j^i_! F(X/S))))}
\]

\[
E_{\text{et}}(\Omega^*_{/\tilde{S}_I}, F_{\text{FDR}})[d_{\tilde{S}_I}], u^q_{i,j}(F(X/S)) \xrightarrow{(\text{Hom}(\text{An}^*_{\tilde{S}_I} L(j_i X_i, Z_i)/\tilde{S}_I) (\rho_{\tilde{S}_I}^* L^i(j^i_! F(X/S))))^{-1}}
\]

\[
(\tilde{p}_{\tilde{S}_I}, E_{\text{usu}}((\Omega^*_{Y \times \tilde{S}_I}, F_b) \otimes_{\text{O}_{Y \times S_I}} (n \times I)^H_{12*} \text{Hdg}(O_{(Y \times \tilde{S}_I)^{\text{an}}, F_b}) (d_Y)) [2dy - d_{\tilde{S}_I}], w_{i,j} F(X/S))
\xrightarrow{\cong} \tau_S R_{i,j}^H \text{Hdg}(O_{(Y \times \tilde{S}_I)^{\text{an}}, F_b}) (d_Y) [2dy], x_{i,j} F(X/S)) \xrightarrow{\cong} \tau_S R_{i,j}^H \text{Hdg}(O_{(Y \times \tilde{S}_I)^{\text{an}}, F_b}) (d_Y)
\]

Proof. Similar to the proof of proposition 10.7

**Corollary 8.** Let $S \in \text{Var}(\mathbb{C})$ and $S = \bigcup_{i=1}^{r} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. For $F \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S)$ such that $D(\mathbb{A}^1, \text{et})(F) \in \text{DA}_c(S)$, $u^q_{i,j}(F)$ are infinite-filtrated usw local equivalence.

Proof. Similar to the proof of corollary 5

**Corollary 9.** Let $S \in \text{Var}(\mathbb{C})$ and $S = \bigcup_{i=1}^{r} S_i$ an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. Then, for $F \in C(\text{Var}(\mathbb{C})^{\text{sm}}/S)$ such that $M = D(\mathbb{A}^1, \text{et})(F) \in \text{DA}_c(S)$,

\[
H^1 F_{\text{S,an}}^{\text{FDR}}(M, W) := ((e'(\tilde{S}_I), \text{Hom}^*_{\tilde{S}_I} Lp_{\tilde{S}_I}, \text{Gr}_{\tilde{S}_I}^{12*} LR((Y \times \tilde{S}_I)^*, E^*)/\tilde{S}_I) (\rho_{\tilde{S}_I}^* L^i(j^i_! F(W))))
\]

\[
E_{\text{et}}(\Omega_{/\tilde{S}_I}^*, F_{\text{FDR}})[d_{\tilde{S}_I}], u^q_{i,j}(F, W) \in \pi_S(MHM(S^{an}))
\]

284
for all \( i \in \mathbb{Z} \).

**Proof.** Similar to the proof of corollary \( \square \)

**Proposition 125.** For \( S \in \mathrm{Var}(\mathbb{C}) \) not smooth, the functor (see corollary \( \square \))

\[
 i_S^{-1} F_{S,an}^{\mathcal{F}DR} : \mathcal{D} \mathcal{A}_{\varepsilon}^-(S)^{\text{op}} \to \pi_S(D(MHM(S^{an})))
\]
does not depend on the choice of the open cover \( S = \cup_i S_i \) and the closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \mathrm{SmVar}(\mathbb{C}) \).

**Proof.** Similar to the proof of proposition \( \square \)

We have the canonical transformation map between the filtered analytic De Rham realization functor and the analytic Gauss-Manin realization functor:

**Definition 140.** Let \( S \in \mathrm{Var}(\mathbb{C}) \) and \( S = \cup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \mathrm{SmVar}(\mathbb{C}) \). Let \( M \in \mathcal{D} \mathcal{A}_\varepsilon(S) \) and \( F \in C(\mathrm{Var}(\mathbb{C})^{an}/S) \) such that \( M = D(k^1, et)(F) \). We have, using definition \( \square \), the canonical map in \( D_{O_{S,i}, D^{+\infty}}(S^{an}/\tilde{S}_i^{an}) \)

\[
 T(F_{S,an}^{GM}, F_{S,an}^{\mathcal{F}DR})(M) : \mathcal{F}_{S,an}^{GM}(LD_S M) := (e(\tilde{S}_1), \mathcal{H} \text{om}^*(\mathcal{A}_{\tilde{S}_1}^* \mathcal{L}(i_1 \ast j_1^* \mathcal{D}_S \mathcal{L} F), E_{et}(\Omega^*_{/\tilde{S}_1}, F_b)), u_{ij}^q(F))
\]

\[
 \xrightarrow{\mathcal{H} \text{om}(-, \mathcal{G} \mathcal{r}(\Omega^{\mathcal{F}DR}_{S^{an}}))^{-1}} J_S(e(\tilde{S}_1), \mathcal{H} \text{om}^*(\mathcal{A}_{\tilde{S}_1}^* \mathcal{L}(i_1 \ast j_1^* \mathcal{D}_S \mathcal{L} F), \mathcal{G} \mathcal{r}_{\tilde{S}_1}^* E_{et}(\Omega^*_{/\tilde{S}_1}, F_{\mathcal{F}DR})), u_{ij}^q(F))
\]

\[
 \xrightarrow{I_G(\mathcal{G} \mathcal{r}_{\tilde{S}_1}^* \mathcal{G} \mathcal{r}_{\tilde{S}_1}^*(-,-))} J_S(e(\tilde{S}_1), \mathcal{H} \text{om}^*(\mathcal{A}_{\tilde{S}_1}^* \mathcal{G} \mathcal{r}_{\tilde{S}_1}^{12*} \mathcal{L}(i_1 \ast j_1^* \mathcal{D}_S \mathcal{L} F), \mathcal{G} \mathcal{r}_{\tilde{S}_1}^* E_{et}(\Omega^*_{/\tilde{S}_1}, F_{\mathcal{F}DR})), u_{ij}^q(F))
\]

\[
 \xrightarrow{(\mathcal{H} \text{om}^*(\mathcal{A}_{\tilde{S}_1}^* \mathcal{G} \mathcal{r}_{\tilde{S}_1}^{12*} \mathcal{L}(i_1 \ast j_1^* \mathcal{D}_S \mathcal{L} F), \mathcal{G} \mathcal{r}_{\tilde{S}_1}^* E_{et}(\Omega^*_{/\tilde{S}_1}, F_{\mathcal{F}DR}))[-d_{\tilde{S}_1}], u_{ij}^q(F))}
\]

\[
 =: J_S(F_{S,an}^{\mathcal{F}DR}(M))
\]

We now define the functorialities of \( F_{S,an}^{\mathcal{F}DR} \) with respect to \( S \) which makes \( F_{\mathcal{F}DR} \) a morphism of 2-functor.

**Definition 141.** Let \( S \in \mathrm{Var}(\mathbb{C}) \). Let \( Z \subset S \) a closed subset. Let \( S = \cup_{i=1}^l S_i \) an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow \tilde{S}_i \) with \( \tilde{S}_i \in \mathrm{SmVar}(\mathbb{C}) \). Denote \( Z \subset := Z \cap S_i \). We then have closed embeddings \( Z \subset \hookrightarrow S_i \hookrightarrow \tilde{S}_i \).

(i) For \( F \in C(\mathrm{Var}(\mathbb{C})^{an}/S_i) \), we will consider the following canonical map in \( \pi_S(D(MHM(S^{an}))) \subset \)
\[ \Gamma^\vee,Hdg_{\mathcal{I}}(\lim_{r \to -} e'(\tilde{S}_t), \mathcal{H}om^\bullet(\mathcal{A}_{\tilde{S}_t}^*, L\rho_{\tilde{S}_t}^*, \mathcal{G}r_{\tilde{S}_t}^{12s} L\mathcal{R}_{(X^{*},D^*)/\tilde{S}_t}(\rho_{\tilde{S}_t}^s \Gamma^\vee_{\tilde{S}_t} L(i_* j^!_t(F,W))), \mathcal{E}_{et}(\Omega_{/\tilde{S}_t}^\bullet, F_{DR})[-d_{\tilde{S}_t}], u^q_{IJ}Z(F,W)) \]

\[ \mathcal{H}om^\bullet(\mathcal{A}_{\tilde{S}_t}^*, L\rho_{\tilde{S}_t}^*, \mathcal{G}r_{\tilde{S}_t}^{12s} L\mathcal{R}_{(X^{*},D^*)/\tilde{S}_t}(\rho_{\tilde{S}_t}^s \Gamma^\vee_{\tilde{S}_t} L(i_* j^!_t(F,W))), \mathcal{E}_{et}(\Omega_{/\tilde{S}_t}^\bullet, F_{DR})[-d_{\tilde{S}_t}], u^q_{IJ}Z(F,W)) \]

with \( u^q_{IJ}Z(F) \) given as in definition \ref{144}(ii).

(ii) For \( F \in \mathcal{C}(\mathcal{V}ar(\mathcal{C})^{an}/\mathcal{S}) \), we have also the following canonical map in \( \pi_S(D(MHM(\mathcal{S}^{an}))) \subset D_{\mathcal{D}(0, fu)}(\mathcal{S}^{an}/(\tilde{S}^\bullet_{\mathcal{I}})) \)

\[ T(\Gamma^\vee,Hdg_{\mathcal{I}}^,, \Omega^\bullet, F_{DR}) = T(\Gamma^\vee,Hdg_{\mathcal{I}}^,, \Omega^\bullet, F_{DR})[-d_{\tilde{S}_t}], u^q_{IJ}Z(F,W)) \]

\[ \mathcal{H}om^\bullet(\mathcal{A}_{\tilde{S}_t}^*, L\rho_{\tilde{S}_t}^*, \mathcal{G}r_{\tilde{S}_t}^{12s} L\mathcal{R}_{(X^{*},D^*)/\tilde{S}_t}(\rho_{\tilde{S}_t}^s \Gamma^\vee_{\tilde{S}_t} L(i_* j^!_t(F,W))), \mathcal{E}_{et}(\Omega_{/\tilde{S}_t}^\bullet, F_{DR})[-d_{\tilde{S}_t}], u^q_{IJ}Z(F,W)) \]

with \( u^q_{IJ}Z(F) \) given as in definition \ref{144}(ii).

**Definition 142.** Let \( g : T \to S \) a morphism with \( T, S \in \mathcal{V}ar(\mathcal{C}) \). Assume we have a factorization \( g : T \to Y \times S \xrightarrow{p_S} S \) with \( Y \in \mathcal{S}m\mathcal{V}ar(\mathcal{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \cup_{i=1}^n S_i \) be an open cover such that there exists closed embeddings \( i_i : S_i \to S_i \) with \( S_i \in \mathcal{S}m\mathcal{V}ar(\mathcal{C}) \). Then, \( T = \lim_{i=1}^n T_i \) with \( T_i := g^{-1}(S_i) \) and we have closed embeddings \( i_i' := i_i \circ l : T_i \to Y \times S_i \). Moreover \( \tilde{g}_t := \rho_{S_i} : Y \times \tilde{S}_t \to \tilde{S}_t \) is a lift of \( g_t := g|_{T_t} : T_t \to S_t \). Let \( M \in D_{\mathcal{A}_c}(S) \) and \( (F,W) \in C_{fu}(\mathcal{V}ar(\mathcal{C})^{an}/\mathcal{S}) \) such that \( (M,W) = D(\tilde{g}^* \mathcal{E}_S, et)(F,W) \). Then, \( D(\mathcal{A}_{\tilde{g}_t}, et)(g^* F) = g^* M \) and there exist \( (F',W) \in C_{fu}(\mathcal{V}ar(\mathcal{C})^{an}/\mathcal{S}) \) and an equivalence \( \tilde{g}^* \mathcal{E}_S \) local \( e : g^* (F,W) \to (F',W) \) such that \( D(\tilde{g}^* \mathcal{E}_S, et)(F',W) = (g^* M, W) \). We have, using definition \ref{139} and definition \ref{144}(ii), the canonical
map in \(\pi_T(D(MHM(T^{an}))) \subset D_{D(1,0)fi_i,\infty}(T^{an}/(Y^{an} \times \tilde{S}^{an}))\)

\[
T(g, T^{FD}_M) : g \xrightarrow{\text{mod}} T^{FD}_{an}(M) := \\
\left(\Gamma_T^{\vee, Hdg} \circ \alpha_T^{-1}(\lim_{r(\cdot)} e'(\tilde{S}_i), \text{Hom}(L An^*_{\tilde{S}_i} \rho_{\tilde{S}_i} \xrightarrow{LGr^{12}_S} R_{(X^*, D^*)/\tilde{S}_i}(\rho_{\tilde{S}_i} L(i_{1*}J_1^*(F, W)))), \right)
\]

\[
E_{et}(\Omega^{*, \text{pr, an}}_{/\tilde{S}_i}, F_{DR}))[\text{mod}] g_j^* T(\tilde{g}_j, T^{\text{pr, an}}_{/\tilde{S}_i})(F, W) \rightarrow E_{et}(\Omega^{*, \text{pr, an}}_{/\tilde{S}_i}, F_{DR}))[\text{mod}] g_j^* T(\tilde{g}_j, T^{\text{pr, an}}_{/\tilde{S}_i})(F, W)
\]

\[
\Gamma_T^{\vee, Hdg} \circ \alpha_T^{-1}(\lim_{r(\cdot)} e'(\tilde{S}_i), \text{Hom}(L An^*_{\tilde{S}_i} \rho_{\tilde{S}_i} \xrightarrow{Gr^{12}_S} L \rho_{\tilde{S}_i} \tilde{g}_j^* L(i_{1*}J_1^*(F, W))))
\]

\[
\Gamma_T^{\vee, Hdg} \circ \alpha_T^{-1}(\lim_{r(\cdot)} e'(\tilde{S}_i), \text{Hom}(L An^*_{\tilde{S}_i} \rho_{\tilde{S}_i} \xrightarrow{Gr^{12}_S} L \rho_{\tilde{S}_i} \tilde{g}_j^* L(i_{1*}J_1^*(F, W))))
\]

\[
\Gamma_T^{\vee, Hdg} \circ \alpha_T^{-1}(\lim_{r(\cdot)} e'(\tilde{S}_i), \text{Hom}(L An^*_{\tilde{S}_i} \rho_{\tilde{S}_i} \xrightarrow{Gr^{12}_S} L \rho_{\tilde{S}_i} \tilde{g}_j^* L(i_{1*}J_1^*(F, W))))
\]

**Proposition 126.** Let \(g : T \rightarrow S\) a morphism with \(T, S \in \text{Var}(\mathbb{C})\). Assume we have a factorization \(g : T \xrightarrow{i} Y_2 \times S \xrightarrow{p_S} S\) with \(Y_2 \in \text{SmVar}(\mathbb{C})\), \(l\) a closed embedding and \(p_S\) the projection. Let \(S = \bigcup_{i=1}^n S_i\) be an open cover such that there exists closed embeddings \(i_i : S_i \hookrightarrow S_i \) with \(S_i \in \text{SmVar}(\mathbb{C})\). Then, \(T = \bigcup_{i=1}^n T_i\) with \(T_i := g^{-1}(S_i)\) and we have closed embeddings \(i'_i := i_i \circ l : T_i \hookrightarrow Y_2 \times S_i\). Moreover \(\tilde{g}_l := p_{\tilde{S}_i} : Y \times \tilde{S}_i \rightarrow \tilde{S}_i\) is a lift of \(g_l := g_{T_i} : T_i \rightarrow S_i\). Let \(f : X \rightarrow S\) a morphism with \(X \in \text{Var}(\mathbb{C})\) such that there exists a factorization \(f : X \xrightarrow{l'} Y_1 \times S \xrightarrow{p_S} S\), with \(Y_1 \in \text{SmVar}(\mathbb{C})\), \(l\) a closed embedding and \(p_S\) the projection. We have then the following commutative diagram whose squares are cartesiens

\[
f' : X_T \rightarrow Y_1 \times T \rightarrow T
\]

\[
g' : Y_1 \times X \rightarrow Y_1 \times Y_2 \times S \rightarrow Y_2 \times S
\]

\[
f : X \rightarrow Y_1 \times S
\]

287
Take a smooth compactification \( \bar{Y}_1 \in \text{PSmVar}(\mathbb{C}) \) of \( Y_1 \), denote \( \bar{X}_1 \subset \bar{Y}_1 \times \bar{S}_I \) the closure of \( X_I \), and set \( Z_I := \bar{X}_I \backslash X_I \). Consider \( F(X/S) := p_{S,4} \Gamma^\vee_Z(Y_1 \times S/Y_1 \times S) \in C(\text{Var}(\mathbb{C})^{sm}/S) \) and the isomorphism in \( C(\text{Var}(\mathbb{C})^{sm}/T) \)

\[
T(f,g,F(X/S)) : g^* F(X/S) := g^* p_{S,4} \Gamma^\vee_Z(Y_1 \times S/Y_1 \times S) \xrightarrow{\sim} p_{T,4} \Gamma^\vee_{\bar{X}_1}(Y_1 \times T/Y_1 \times T) =: F(X_T/T)
\]

which gives in \( DA(T) \) the isomorphism \( T(f,g,F(X/S)) : g^* M(X/S) \xrightarrow{\sim} M(X_T/T) \). Then the following diagram in \( \pi_T(D(\text{MHM}(T))) \subset D_{D(1,0)_{fil,\infty}}(T/(Y_2 \times \bar{S}_I)) \), where the horizontal maps are given by proposition \( [127] \) commutes

\[
g^\text{mod,-1}_{Hdg} \mathcal{F}_{\text{an}}^{FDR}(M(X/S)) \xrightarrow{g^\text{mod,-1}_{Hdg} I(X/S)} g^\text{mod}_{Hdg} Rf^Hdg(\Gamma^\vee_{\bar{X}_1}(O_{(Y_1 \times \bar{S}_I)}\an, F_b)(d\gamma_1)[2d\gamma_2], x_{IJ}(X/S)) \xrightarrow{T(p_{\bar{S}_I},^\gamma,Hdg)(-)} Rf^Hdg_{\bar{S}_I}(\Gamma^\vee_{\bar{X}_1}(O_{(Y_1 \times \bar{S}_I)}\an, F_b)(d\gamma_1)[2d\gamma_2], x_{IJ}(X/S)) \xrightarrow{T(p^\text{mod}_{\bar{S}_I \times \bar{S}_I}, R_{\text{dg}} \hat{R}_{\text{V}_1 \times \bar{S}_I,Hdg})(-)} Rf^Hdg_{\bar{S}_I}(\Gamma^\vee_{\bar{X}_1}(O_{(Y_1 \times \bar{S}_I)}\an, F_b)(d\gamma_1)[2d\gamma_2], x_{IJ}(X_T/T))
\]

with \( d\gamma_{12} = d\gamma_1 + d\gamma_2 \).

Proof. Follows immediately from definition.

\[\square\]

**Theorem 37.** Let \( g : T \to S \) a morphism, with \( S, T \in \text{Var}(\mathbb{C}) \). Assume we have a factorization \( g : T \xrightarrow{f} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( I \) a closed embedding and \( p_S \) the projection. Let \( M \in DA_c(S) \). Then map in \( \pi_T(D(\text{MHM}(T^{an})) \)

\[
T(g, \mathcal{F}_{an}^{FDR})(M) : g^\text{mod}_{Hdg} \mathcal{F}_{\text{an}}^{FDR}(M) \xrightarrow{\sim} \mathcal{F}_{T,an}^{FDR}(g^* M)
\]

given in definition \( [142] \) is an isomorphism.

Proof. Follows from proposition \( [126] \) and proposition \( [124] \).

\[\square\]

**Definition 143.** • Let \( f : X \to S \) a morphism with \( X, S \in \text{Var}(\mathbb{C}) \). Assume there exist a factorization \( f : X \xrightarrow{\gamma} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( I \) a closed embedding and \( p_S \) the projection. We have, for \( M \in DA_c(X) \), the following transformation map in \( \pi_S(D(\text{MHM}(S^{an}))) \)

\[
T_*(f, \mathcal{F}_{an}^{FDR})(M) : \mathcal{F}_{X,an}^{FDR}(Rf_M) \xrightarrow{\text{ad}(f^\text{mod}_{Hdg} H_{\gamma}(\gamma))(-)} Rf^Hdg_{\gamma} \mathcal{F}_{X,an}^{FDR}(Rf_M)
\]

Clearly, for \( p : Y \times S \to S \) a projection with \( Y \in \text{PSmVar}(\mathbb{C}) \), we have, for \( M \in DA_c(Y \times S) \),

\[
T_*(p, \mathcal{F}_{an}^{FDR})(M) = T(p, \mathcal{F}_{an}^{FDR})(M)[2d\gamma]
\]

• Let \( S \in \text{Var}(\mathbb{C}) \). Let \( Y \in \text{SmVar}(\mathbb{C}) \) and \( p : Y \times S \to S \) the projection. We have then, for \( M \in DA(Y \times S) \) the following transformation map in \( \pi_S(D(\text{MHM}(S^{an}))) \)

\[
T_*(p, \mathcal{F}_{an}^{FDR})(M) : \mathcal{F}_{Y \times S,an}^{FDR}(M) \xrightarrow{\text{ad}(p^\text{mod}_{Hdg} p^{\text{mod}})(\gamma))} R_{p^\text{Hdg}} \mathcal{F}_{Y \times S,an}^{FDR}(p^* Lp_p(M)) \xrightarrow{T(p, \mathcal{F}_{an}^{FDR})(Lp_p(M),\gamma)} R_{p^\text{Hdg}} \mathcal{F}_{Y \times S,an}^{FDR}(p^* Lp_p(M)) \xrightarrow{\text{ad}(R^\text{Hdg} p^\text{mod})(\gamma))} p^\text{Hdg} \mathcal{F}_{Y \times S,an}^{FDR}(Lp_p(M))
\]

288
• Let $f : X \to S$ a morphism with $X, S \in \text{Var}(\mathbb{C})$. Assume there exist a factorization $f : X \hookrightarrow Y \times S \xrightarrow{p_S} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. We have then, using the second point, for $M \in \text{DA}(X)$ the following transformation map in $\pi_S(D(M\text{HM}(S^{an})))$

$$ T_{i}(f, F^{FDR}_{an}(M)) : R_{f_{1}}^{Hdg} F^{FDR}_{X, an}(M) := R_{f_{1}}^{Hdg} F^{FDR}_{X \times S, an}(l_{*} M), $$

$$ T_{(p, F^{FDR}_{an})(l_{*} M)} \Rightarrow_{\text{DA}(X)} \Rightarrow_{\text{DA}(S)} \Rightarrow_{\text{DA}(S, an)} \Rightarrow_{\text{DA}(S, an)} F_{S, an}^{FDR}(R_{f_{1}} M). $$

• Let $f : X \to S$ a morphism with $X, S \in \text{Var}(\mathbb{C})$. Assume there exist a factorization $f : X \hookrightarrow Y \times S \xrightarrow{p_S} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. We have, using the third point, for $M \in \text{DA}(S)$, the following transformation map in $\pi_X(D(M\text{HM}(X^{an})))$

$$ T_{i}^{(f, F^{FDR}_{an} \bigg|_{Y \times S, an}}(M) : F^{FDR}_{X, an}(f^{*}(M, W)) \xrightarrow{\text{ad}(R_{f_{1}}^{Hdg}, F^{FDR}_{X, an}(f^{*}(M)))} f_{1}^{*} R_{f_{1}}^{Hdg} F^{FDR}_{X, an}(f^{*}(M)) $$

$$ T_{(p_{S}, F^{FDR}_{an} \bigg|_{Y \times S, an}}(f^{*}(M)) \xrightarrow{Hdg} F^{FDR}_{X, an}(f^{*}(M, W)) \xrightarrow{\text{ad}(R_{f_{1}}^{Hdg}, f^{*}(M))} f_{1}^{*} R_{f_{1}}^{Hdg} F^{FDR}_{X, an}(f^{*}(M)). $$

**Proposition 127.** Let $S \in \text{Var}(\mathbb{C})$. Let $Y \in \text{SmVar}(\mathbb{C})$ and $p : Y \times S \to S$ the projection. Let $S = \bigcup_{I \subseteq \{1, \ldots, f\}} S_{I}$ an open cover such that there exist closed embeddings $i_{I}^{\circ} : S_{I} \hookrightarrow S$ with $S_{I} \in \text{SmVar}(\mathbb{C})$. For $I \subseteq \{1, \ldots, f\}$, we denote by $S_{I} \hookrightarrow S$ and $j_{I} : Y \times S_{I} \hookrightarrow Y \times S$ the open embeddings. We then have closed embeddings $i_{I} : Y \times S_{I} \hookrightarrow Y \times S$, and we denote by $p_{S_{I}} : Y \times S_{I} \to S_{I}$ the projections. Let $f' : X' \to Y \times S$ a morphism, with $X' \in \text{Var}(\mathbb{C})$ such that there exists a factorization $f' : X' \hookrightarrow Y' \times S \xrightarrow{p'} Y \times S$ with $Y' \in \text{SmVar}(\mathbb{C})$, $l'$ a closed embedding and $p'$ the projection.

Denoting $X'_{I} := f'^{-1}(Y \times S_{I})$, we have closed embeddings $i'_{I} : X'_{I} \hookrightarrow Y \times S_{I}$ Consider

$$ F(X'/Y \times S) := p_{Y \times S_{I}} \Gamma_{X'/Y \times S}(Y' \times Y \times S/Y' \times Y \times S) \in C(\text{Var}(\mathbb{C})^{an}/Y \times S) $$

and $F(X'/S) := p_{S} F(X'/Y \times S) \in C(\text{Var}(\mathbb{C})^{an}/S)$, so that $Lp_{S}(X'/Y \times S)[2d_{Y}] = M(X'/S)$. Then, the following diagram in $\pi_{S}(D(M\text{HM}(S^{an}))) \subseteq \text{DA}(S^{an} \times Y^{an} \times S^{an}))$, where the vertical maps are given by proposition 124 commutes

$$ \xymatrix{ R_{f_{1}}^{Hdg} F^{FDR}_{X, an}(M(X'/Y \times S)) \ar[rr]^{T_{(p, F_{an}^{FDR})(M(X'/Y \times S))}} \ar[dd]_{T_{(p_{S}, F_{an}^{FDR})(M(X'/S))}} & & F^{FDR}_{S, an}(M(X'/S)) \ar[dd]^{T_{(p_{S}, F_{an}^{FDR})((X'/S))}} \ar[rr]^{R_{f_{1}}^{Hdg} F^{FDR}_{X, an}(M(X'/S))} & & F^{FDR}_{S, an}(M(X'/S)) \ar[rr]^{R_{f_{1}}^{Hdg} F^{FDR}_{X, an}(M(X'/S))} & & } $$

Proof. Immediate from definition. \hfill \Box

**Theorem 38.** (i) Let $f : X \to S$ a morphism with $X, S \in \text{Var}(\mathbb{C})$. Assume there exist a factorization $f : X \hookrightarrow Y \times S \xrightarrow{p_{S}} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_{S}$ the projection. Then, for $M \in \text{DA}_{c}(X)$,

$$ T_{i}(f, F^{FDR}_{an}(M)) : R_{f_{1}}^{Hdg} F^{FDR}_{X, an}(M) \xrightarrow{\sim} F^{FDR}_{S, an}(R_{f_{1}} M) $$

is an isomorphism in $\pi_{S}(D(M\text{HM}(S^{an})))$

(ii) Let $f : X \to S$ a morphism with $X, S \in \text{Var}(\mathbb{C})$, $S$ quasi-projective. Assume there exist a factorization $f : X \hookrightarrow Y \times S \xrightarrow{p_{S}} S$ with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_{S}$ the projection. We have, for $M \in \text{DA}_{c}(X)$,

$$ T_{i}(f, F^{FDR}_{an}(M)) : F^{FDR}_{S, an}(R_{f_{1}} M) \xrightarrow{\sim} R_{f_{1}}^{Hdg} F^{FDR}_{X, an}(M) $$

is an isomorphism in $\pi_{S}(D(M\text{HM}(S^{an})))$. 

289
(iii) Let \( f : X \to S \) a morphism with \( X, S \in \text{Var}(\mathbb{C}) \), \( S \) quasi-projective. Assume there exist a factorization \( f : X \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Then, for \( M \in \text{DA}_{c}(S) \)

\[
T^{l}(f,F_{an}^{FDR})(M) : F_{X,an}^{FDR}(f^{1}M) \xrightarrow{\sim} f^{*}_{Hdg} F_{S,an}^{FDR}(M)
\]

is an isomorphism in \( \pi_{X}(D(MHM(X^{an}))). \)

Proof. Similar to the proof of theorem 33.

Proposition 128. Let \( g : T \to S \) a morphism with \( T,S \in \text{Var}(\mathbb{C}) \). Assume we have a factorization \( g : T \xrightarrow{\iota} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \bigcup_{i=1}^{l} S_{i} \) be an open cover such that there exists closed embeddings \( i_{i} : S_{i} \to S_{i} \) with \( S_{i} \in \text{SmVar}(\mathbb{C}) \). Then, \( T = \bigcup_{i=1}^{l} T_{i} \) with \( T_{i} := g^{-1}(S_{i}) \) and we have closed embeddings \( i_{i}' := i_{i} \circ l : T_{i} \to Y \times S_{i} \). Moreover \( \tilde{g}_{i} := p_{S_{i}} : Y \times S_{i} \to S_{i} \) is a lift of \( g_{i} := g|_{T_{i}} : T_{i} \to S_{i} \). Let \( M \in \text{DA}_{c}(S) \) and \( F \in C(\text{Var}(\mathbb{C})^{sm}/S) \) such that \( M = D(A^{1}_{S},ct)(F) \). Then, \( D(A^{1}_{T},ct)(g^{*}F) = g^{*}M \). Then the following diagram in \( D_{\text{fil},D^{\infty}_{c}}(T^{an}/(Y^{an} \times S_{i}^{an})) \) commutes

\[
\begin{array}{ccc}
R_{g}^{*}\text{mod}[-],T^{*}F_{S,an}^{GM}(L\mathcal{D}S M) & \xrightarrow{T(g,F_{S,an}^{GM}),R_{g}^{*}\text{mod}[-],T^{*}F_{S,an}^{GM}(M)} & R_{g}^{*}\text{mod}[-],T^{*}F_{S,an}^{GM}(M) \\
F_{T,an}^{GM}(g^{*}L\mathcal{D}S M) & \xrightarrow{T(g,F_{T,an}^{GM},F_{T,an}^{FR})(g^{*}M)} & F_{T,an}^{FR}(g^{*}M)
\end{array}
\]

Proof. Similar to the proof of proposition 111.

Definition 144. Let \( S \in \text{Var}(\mathbb{C}) \) and \( S = \bigcup_{i=1}^{l} S_{i} \) an open affine covering and denote, for \( I \subset [1,\cdots,l] \), \( S_{I} = \cap_{j \in I} S_{i} \) and \( j_{I} : S_{I} \to S \) the open embedding. Let \( i_{i} : S_{i} \to S_{i} \) closed embeddings, with \( S_{i} \in \text{SmVar}(\mathbb{C}) \). We have, for \( M,N \in \text{DA}(S) \) and \( (F,W),(G,W) \in C_{\text{fil}}(\text{Var}(\mathbb{C})^{sm}/S) \) such that \( (M,W) = D(A^{1},ct)(F,W) \) and \( (N,W) = D(A^{1},ct)(G,W) \), the following transformation map in
\[\pi_S(D(MHM(S^n))) \subset D_{D(1,0)\text{fu}}(S^n/(\tilde{S}^n))\]

\[T(F^{\text{FDR}}_{S,an}(M, N) : F^{\text{FDR}}_{S,an}(M) \otimes_{O_S} F^{\text{FDR}}_{S,an}(N)) \xrightarrow{\sim} (\lim_{r \to -} e^r(\tilde{S}_i), \text{Hom}^*(An_{\tilde{S}_i} S, \rho_{\tilde{S}_i}, Gr^{12s}_{\tilde{S}_i} LR_{(X^*, D^*)}(\tilde{S}_i, \rho_{\tilde{S}_i} L(i_1^* j_1^*(F, W))))\]

\[\xrightarrow{\sim} (\lim_{r \to -} e^r(\tilde{S}_i), \text{Hom}^*(An_{\tilde{S}_i} S, \rho_{\tilde{S}_i}, Gr^{12s}_{\tilde{S}_i} LR_{(X^*, D^*)}(\tilde{S}_i, \rho_{\tilde{S}_i} L(i_1^* j_1^*(F, W))))\]

**Proposition 129.** Let \(f_1 : X_1 \to S, f_2 : X_2 \to S\) two morphism with \(X_1, X_2, S \in \text{Var}(\mathbb{C})\). Assume that there exist factorizations \(f_1 : X_1 \xrightarrow{i_1} Y_1 \times S \xrightarrow{p_1} S, f_2 : X_2 \xrightarrow{i_2} Y_2 \times S \xrightarrow{p_2} S\) with \(Y_1, Y_2 \in \text{SmVar}(\mathbb{C})\), \(i_1, i_2\) closed embeddings and \(p_1, p_2\) the projections. We have then the factorization

\[f_{12} := f_1 \times f_2 : X_{12} := X_1 \times S X_2 \xrightarrow{i_1 \times i_2} Y_1 \times Y_2 \times S \xrightarrow{p_1 \times p_2} S\]

Let \(S = \bigcup_{i=1}^I S_i\) an open affine covering and denote, for \(I \subset [1, \cdots, I], S_I = \bigcap_{i \in I} S_i\) and \(j_I : S_I \to S\) the open embedding. Let \(i_i : S_I \to \tilde{S}_I\) closed embeddings, with \(\tilde{S}_I \in \text{SmVar}(\mathbb{C})\). We have then the following commutative diagram in \(\pi_S(DMHM(S^n)) \subset D_{D(1,0)\text{fu}}(S^n/(\tilde{S}^n))\) where the vertical maps are given by proposition [124]
Proof. Immediate from definition.

**Theorem 39.** Let $S \in \text{Var}(\mathbb{C})$ and $S = \bigcup_{i=1}^{l} S_i$ an open affine covering and denote, for $I \subset [1, \ldots, l]$, $S_I = \cap_{i \in I} S_i$ and $j_I : S_I \hookrightarrow S$ the open embedding. Let $i_i : S_i \hookrightarrow S_I$ closed embeddings, with $S_i \in \text{SmVar}(\mathbb{C})$. Then, for $M, N \in \text{DA}(S)$, the map in $\pi_S(D(MHM(S^{an})))$

$$T(F_{S,an}^{FDR}, \otimes)(M, N) : F_{S,an}^{FDR}(M) \otimes_{O_S} F_{S,an}^{FDR}(N) \sim - F_{S,an}^{FDR}(M \otimes N)$$

given in definition (144) is an isomorphism.

Proof. Follows from proposition (129).

We have the following easy proposition

**Proposition 130.** Let $S \in \text{Var}(\mathbb{C})$ and $S = \bigcup_{i=1}^{l} S_i$ an open affine covering and denote, for $I \subset [1, \ldots, l]$, $S_I = \cap_{i \in I} S_i$ and $j_I : S_I \hookrightarrow S$ the open embedding. Let $i_i : S_i \hookrightarrow S_I$ closed embeddings, with $S_i \in \text{SmVar}(\mathbb{C})$. We have, for $M, N \in \text{DA}(S)$ and $F, G \in C(\text{Var}(\mathbb{C})^{sm}/S)$ such that $M = D(\mathbb{A}^1, \text{et})(F)$ and $N = D(\mathbb{A}^1, \text{et})(G)$, the following commutative diagram in $D_{\text{OS,fil}, D, \infty}(S^{an}/(S_I^{an}))$

![Diagram](image.png)

Proof. Immediate from definition.

### 6.3 The transformation map between the analytic De Rahm functor and the analytification of the algebraic De Rahm functor

#### 6.3.1 The transformation map between the analytic Gauss Manin realization functor and the analytification of the algebraic Gauss Manin realization functor

Recall from section 2 that, for $f : T \rightarrow S$ a morphism with $T, S \in \text{Var}(\mathbb{C})$, we have the following commutative diagram of sites (18)

![Diagram](image.png)

We have the following canonical transformation map given by the pullback of (relative) differential forms: Let $S \in \text{Var}(\mathbb{C})$. Consider the following commutative diagram in $\text{RCat}$ :

$$D(an, e) : \left(\text{AnSp}(\mathbb{C})^{sm}/S^{an}, O_{\text{AnSp}(\mathbb{C})^{sm}/T}\right) \rightarrow \left(\text{Var}(\mathbb{C})^{sm}/S, O_{\text{Var}(\mathbb{C})^{sm}/S}\right)$$

$$\downarrow \epsilon(T) \quad \downarrow \epsilon(S)$$

$$(S^{an}, O_{S^{an}}) \quad \rightarrow (S, O_S)$$

292
It gives (see section 2) the canonical morphism in $\mathcal{C}$

$$\Omega_{/\mathcal{C}}(\Omega_{/\mathcal{C}})^{sm}/\mathcal{C}$$

which is by definition given by the analytification on differential forms: for $(V/S^an) = (V, h) \in \mathcal{C}^{sm}/\mathcal{C}^{an}$,

$$\Omega_{/(S^{an}/S)}(V/S^{an}) : \omega \in \mathcal{A}^{\bullet}_{/\mathcal{C}}(\Omega_{/\mathcal{C}})(V/S^{an}) := \lim_{(h' : U \to \text{Sm}, g' : V \to U^{an}, h, g)} \Omega_{h'}(S/U)$$

with $\omega \in \Gamma(U, \Omega^{an}_{/\mathcal{C}})$. It induces the canonical morphism in $\mathcal{C}^{sm}/\mathcal{C}^{an}$:

$$E\Omega_{/(S^{an}/S)} : \mathcal{A}_{/\mathcal{C}}^{\bullet}(\Omega_{/\mathcal{C}}, F_{h}) \xrightarrow{T(\mathcal{A}_{/\mathcal{C}}^{\bullet}(\Omega_{/\mathcal{C}}, F_{h}))-} E_{\mathcal{C}}(\mathcal{A}^{\bullet}_{/\mathcal{C}}(\Omega_{/\mathcal{C}}, F_{h})) \xrightarrow{E_{\mathcal{C}}(\mathcal{A}^{\bullet}_{/\mathcal{C}}(\Omega_{/\mathcal{C}}, F_{h}))-} E_{\mathcal{C}}(\mathcal{A}^{\bullet}_{/\mathcal{C}}(\Omega_{/\mathcal{C}}, F_{h}))$$

We have the following canonical transformation map given by the analytical functor:

**Definition 145.** Let $S \in \text{SmVar}(\mathcal{C})$.

(i) For $F \in \mathcal{C}(\text{Var}(\mathcal{C})^{sm}/S)$, we have the canonical transformation map in $\mathcal{C}^{sm}/\mathcal{C}^{an}$

$$T(an, \Omega_{/\mathcal{C}}^{\bullet})(F) : ((\mathcal{E}(S), \text{Hom}^{\bullet}(F, E_{\mathcal{C}}(\Omega_{/\mathcal{C}}^{\bullet}, F)))^{sm}) := O_{\mathcal{C}}^{\bullet} \otimes_{an^{\bullet}_{/\mathcal{C}}} O_{\mathcal{C}}^{\bullet} \mathcal{E}(S), \text{Hom}^{\bullet}(\mathcal{C}_{/\mathcal{C}}(\Omega_{/\mathcal{C}}^{\bullet}, F)))$$

(ii) We get from (i), for $F \in \mathcal{C}(\text{Var}(\mathcal{C})^{sm}/S)$, the canonical transformation map in $\text{PSh}_{\mathcal{C}}^{\text{sm}}(S^{an})$

$$T^{an}(\mathcal{E}(\Omega_{/\mathcal{C}}^{\bullet}, F)) : J_{S}H^{an}((\mathcal{E}(S), \text{Hom}^{\bullet}(\mathcal{C}_{/\mathcal{C}}(\Omega_{/\mathcal{C}}^{\bullet}, F)))^{an})$$

**Lemma 21.** Let $S \in \text{SmVar}(\mathcal{C})$.

(i) For $h : U \to S$ a smooth morphism with $U \in \text{SmVar}(\mathcal{C})$, the following diagram commutes

$$e(S), \text{Hom}^{\bullet}(\mathcal{Z}(U/S), E_{\mathcal{C}}(\Omega_{/\mathcal{C}}^{\bullet}, F_{h}))^{an} \xrightarrow{T(\mathcal{C}(\Omega_{/\mathcal{C}}^{\bullet}, \mathcal{Z}(U/S)))} e(S^{an}), \text{Hom}^{\bullet}(\mathcal{Z}(U^{an}/S^{an}), E_{\mathcal{C}}(\Omega_{/\mathcal{C}}^{\bullet}, F_{h}))$$

(ii) For $h : U \to S$ a smooth morphism with $U \in \text{SmVar}(\mathcal{C})$, the following diagram commutes

$$J_{S}(h, E_{\mathcal{C}}(\Omega_{/\mathcal{C}}^{\bullet}, F_{h}))^{an} \xrightarrow{T^{an}(\mathcal{C}(\Omega_{/\mathcal{C}}^{\bullet}, \mathcal{Z}(U/S)))} e(S^{an}), \text{Hom}^{\bullet}(\mathcal{Z}(U^{an}/S^{an}), E_{\mathcal{C}}(\Omega_{/\mathcal{C}}^{\bullet}, F_{h}))$$
Proof. Follows from Yoneda lemma. □

By definition of the algebraic analytic De Rahm realization functor, we have a natural transformation between them:

**Definition 146.** Let \( S \in \text{SmVar}(\mathbb{C}) \). Let \( M \in \text{DA}_c(S) \) and \( Q \in C(\text{Var}(\mathbb{C})^{sm}/S) \) projectively cofibrant such that \( M = D(\mathbb{A}^1_S, \text{et})(Q) \). We have the canonical transformation in \( D_{O_{fil},D}(S^{an}) \)

\[
T(\text{An}, F^G_{an})(M) : (F^G_{an}(M))^{an} := (e(S)_*, \text{Hom}^*(Q, E_{et}(\Omega^*_{/S}, F_b)))^{an}[−ds] \\
\xrightarrow{T(\text{an}, \Omega_*)_!(Q)} e(S)_* \text{Hom}^*(\text{An}^*_S Q, E_{et}(\Omega^*_{/S^{an}}, F_b))[−ds] \\
\overset{\simeq}{\longrightarrow} e(S)_* \text{Hom}^*(\text{An}^*_S Q, E_{usu}(\Omega^*_{/S^{an}}, F_b))[−ds] =: F^G_{S, an}(M)
\]

We give now the definition in the non smooth case : Let \( S \in \text{Var}(\mathbb{C}) \). Let \( S = \bigcup_{i=1}^l S_i \) be an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow S_i \) with \( S_i \in \text{SmVar}(\mathbb{C}) \). For \( I \subset J \), denote by \( p_{IJ} : S_J \to S_I \) the projection. Consider, for \( I \subset J \subset [1, \ldots, l] \), resp. for each \( I \subset [1, \ldots, l] \), the following commutative diagrams in \( \text{Var}(\mathbb{C}) \)

\[
D_{IJ} = \begin{array}{c}
S_j \\
\downarrow \quad \downarrow p_{IJ} \\
S_I \\
\end{array}
\xrightarrow{i_I} \begin{array}{c}
S_I \\
\downarrow i_J \\
S_J \\
\end{array}
\]

We then have the following lemma

**Lemma 22.** The maps \( T(\text{an}, \Omega_*)((l_{i_I,j_J} F)) \) induce a morphism in \( C_{O_{fil},D}(S/\tilde{S}_I) \)

\[
(T(\text{an}, \Omega_*)((l_{i_I,j_J} F))((l_{i_I,j_J} F))) : (e(\tilde{S}_I)_*, \text{Hom}^*(L(i_I,j_J F), E_{et}(\Omega^*_{/\tilde{S}_I}, F_b)))^{an}[−d_{S_I}], (u_{IJ}^q(F))^{an}) \\
\rightarrow (e(\tilde{S}_I)_*, \text{Hom}^*(\text{An}(\tilde{S}_I)_* L(i_I,j_J F), E_{et}(\Omega^*_{/\tilde{S}_I}, F_b))[−d_{S_I}], u_{IJ}^q(F))
\]

Proof. Obvious. □

**Definition 147.** Let \( S \in \text{Var}(\mathbb{C}) \). Let \( S = \bigcup_{i=1}^l S_i \) be an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow S_i \) with \( S_i \in \text{SmVar}(\mathbb{C}) \). For \( I \subset [1, \ldots, l] \), denote by \( i_I : S_I \hookrightarrow S_I = \Pi_{i \in I} S_i \). Let \( M \in \text{DA}_c(S) \) and \( F \in C(\text{Var}(\mathbb{C})^{sm}/S) \) such that \( M = D(\mathbb{A}^1_S, \text{et})(F) \). We have, by lemma 22, the canonical transformation in \( D_{O_{fil},D,\infty}(S^{an}) \)

\[
T(\text{An}, F^G_{\text{fin}}(M) : (F^G_{\text{fin}}(M))^{an} := (e(\tilde{S}_I)_*, \text{Hom}^*(L(i_I,j_I F), E_{et}(\Omega^*_{/\tilde{S}_I}, F_b)))^{an}[−d_{S_I}], (u_{IJ}^q(F))^{an}) \\
\xrightarrow{T(\text{an}, \Omega_*)_!(l_{i_I,j_I} F))} (e(\tilde{S}_I)_*, \text{Hom}^*(\text{An}(\tilde{S}_I)_* L(i_I,j_I F), E_{et}(\Omega^*_{/\tilde{S}_I}, F_b))[−d_{S_I}], u_{IJ}^q(F)) \\
\overset{\simeq}{\longrightarrow} (e(\tilde{S}_I)_*, \text{Hom}^*(\text{An}(\tilde{S}_I)_* L(i_I,j_I F), E_{usu}(\Omega^*_{/\tilde{S}_I}, F_b))[−d_{S_I}], u_{IJ}^q(F)) =: F^G_{S, an}(M)
\]

The following proposition says this transformation map between \( F^S_{an} \) and \( (F^{FDR}_{an})^{an} \) is functorial in \( S \in \text{Var}(\mathbb{C}) \), hence define a commutative diagram of morphism of 2-functor :

**Proposition 131.** (i) Let \( g : T \to S \) a morphism with \( T, S \in \text{Var}(\mathbb{C}) \). Assume there exist a factorization \( g : T \xrightarrow{b} Y \times S \xrightarrow{p_S} S \), with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \bigcup_{i=1}^l S_i \) be an open cover such that there exist closed embeddings \( i_i : S_i \hookrightarrow S_i \) with \( S_i \in \text{SmVar}(\mathbb{C}) \). We then have closed embedding \( i_i : S_i \hookrightarrow S_i = \Pi_{i \in I} S_i \) is a lift of \( g_{IJ} : g_{IJ} : T_I \to S_I \). Then, for \( M \in \text{DA}_c(S) \), the following diagram in \( D_{O_{fil},D,\infty}(T^{an}/(Y^{an} \times \tilde{S}_I^{an})) \)

\[
\begin{array}{cccc}
Rg^{∗\text{mod}[−],F}(F^G_{an}(M))^{an} & \xmapsto{Lg^{∗\text{mod}[−],F}(T(\text{An}, F^G_{an})(M))} & Rg^{∗\text{mod}[−],F}(F^G_{S, an}(M)) \\
(T(\text{an}, F^G_{an})(M))^{an} & \xmapsto{T(\text{an}, F^G_{an})(g^∗M)} & (F^G_{T, an}(g^∗M))^{an} \\
\end{array}
\]

294
(ii) Let $S \in \text{Var}(\mathbb{C})$. Let $S = \bigcup_{i=1}^j S_i$ be an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. Then, for $M, N \in \text{DA}_c(S)$, the following diagram in $D_{\text{O fid}} D_{\mathcal{D}, \infty}(S^{\text{an}}/(\tilde{S}_i^{\text{an}}))$

\[
(F^{\text{GM}}_S(M) \otimes_{O_S} F^{\text{GM}}_S(N))^{(T(\text{an},F^{\text{GM}}_S(M)) \otimes_{O^{\text{an}}_S} T(\text{an},F^{\text{GM}}_S(N))} \xrightarrow{=} (F^{\text{GM}}_S(M \otimes N))^{\text{an}}
\]

\[
\xymatrix{ (F^{\text{GM}}_S(M) \otimes_{O_S} F^{\text{GM}}_S(N))^{\text{an}} \ar[d]^{T(\text{an},F^{\text{GM}}_S(M)) \otimes_{O^{\text{an}}_S} T(\text{an},F^{\text{GM}}_S(N))} & (F^{\text{GM}}_S(M \otimes N))^{\text{an}} \ar[d] \\
F^{\text{GM}}_{\text{an}}(M) \otimes_{O^{\text{an}}_S} F^{\text{GM}}_{\text{an}}(N) & F^{\text{GM}}_{\text{an}}(M \otimes N) }
\]

Proof. Immediate from definition.

\[\square\]

**Proposition 132.** Let $f : X \to S$ a morphism with $S, X \in \text{Var}(\mathbb{C})$. Assume there exist a factorization

\[f : X \xrightarrow{l} Y \times S \xrightarrow{p} S\]

with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p$ the projection. Let $S = \bigcup_i S_i$ an open cover such that there exists closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$.

(i) We have then the following commutative diagram in $D_{\text{O fid}} D_{\mathcal{D}, \infty}(S^{\text{an}}/(\tilde{S}_i^{\text{an}}))$,

\[
(F^{\text{GM}}_S(M(X/S)))^{\text{an}} \xrightarrow{I^{\text{GM}}(X/S)^{\text{an}}} T(\text{an},F^{\text{an}}_{\text{an}}(M(X/S))) \xrightarrow{J^h(-) \circ H^n} H^n F^{\text{GM}}_{\text{an}}(M(X/S))
\]

\[
\xymatrix{ (F^{\text{GM}}_S(M(X/S)))^{\text{an}} \ar[d]^{I^{\text{GM}}(X/S)^{\text{an}}} & T(\text{an},F^{\text{an}}_{\text{an}}(M(X/S))) \ar[d] \\
J^h(-) \circ H^n F^{\text{GM}}_{\text{an}}(M(X/S)) & H^n F^{\text{GM}}_{\text{an}}(M(X/S)) }
\]

(ii) We have then the following commutative diagram in $P_{\text{Sh}} D_{\mathcal{D}, \infty}(S^{\text{an}}/(\tilde{S}_i^{\text{an}}))$,

\[J^h_{\text{Sh}} H^n(F^{\text{GM}}_S(M\text{BM}(X/S)))^{\text{an}} \xrightarrow{J^h(-) \circ H^n} H^n F^{\text{GM}}_{\text{an}}(M(X/S))\]

\[
\xymatrix{ J^h_{\text{Sh}} H^n(F^{\text{GM}}_S(M\text{BM}(X/S)))^{\text{an}} \ar[d]^{H^n(I^{\text{GM}}(X/S)^{\text{an}})} & J^h(-) \circ H^n F^{\text{GM}}_{\text{an}}(M(X/S)) \ar[d] \\
J^h_{\text{Sh}} H^n(F^{\text{GM}}_S(M\text{BM}(X/S)))^{\text{an}} & H^n F^{\text{GM}}_{\text{an}}(M(X/S)) }
\]

Proof. (i):Immediate from definition.

(ii):Follows from (i).

We deduce from proposition 132 and theorem 20 (GAGA for D-modules) the following:
Theorem 40. (i) Let $S \in \text{Var}(\mathbb{C})$. Then, for $M \in \text{DA}_c(S)$

$$J_S(-) \circ H^nT(\text{An}, \mathcal{F}^{GM}_\text{an})(M) : J_S(H^n(\mathcal{F}^{GM}_S(M))^\text{an}) \sim H^n\mathcal{F}^{GM}_{\text{S,an}}(M)$$

is an isomorphism in $\text{PSh}_\mathcal{D}(S^{\text{an}}/\tilde{S}^{\text{an}})$.

(ii) A relative version of Grothendieck GAGA theorem for De Rham cohomology Let $h : U \to S$ a smooth morphism with $S,U \in \text{SmVar}(\mathbb{C})$. Then,

$$J_S(-) \circ J_S\mathcal{T}_\omega(\text{an}, h) : J_S((R^n h_\ast \Omega^\bullet_{U/S})^{\text{an}}) \sim R^n h_\ast \Omega^\bullet_{\text{U,an}/\tilde{S}^{\text{an}}}$$

is an isomorphism in $\text{PSh}_\mathcal{D}(S^{\text{an}})$.

Proof. (i): Follows from proposition 132(ii) and theorem 20 using a resolution by Corti-Hanamura motives. (ii): Follows from (i) and lemma 21(ii).

6.3.2 The transformation map between the analytic filtered De Rham realization functor and the analytification of the filtered algebraic De Rham realization functor

Recall from section 2 that, for $S \in \text{Var}(\mathbb{C})$ we have the following commutative diagrams of sites

$$\begin{align*}
\text{AnSp}(\mathbb{C})^2/S & \xrightarrow{\mu_S} \text{AnSp}(\mathbb{C})^{2,pr}/S \\
\text{AnSp}(\mathbb{C})^{2,sm}/S & \xrightarrow{\rho_S} \text{AnSp}(\mathbb{C})^{2,smpr}/S \\
\text{Var}(\mathbb{C})^2/S & \xrightarrow{\rho_S} \text{Var}(\mathbb{C})^{2,smpr}/S \\
\text{Var}(\mathbb{C})^2/S & \xrightarrow{\mu_S} \text{Var}(\mathbb{C})^{2,smpr}/S
\end{align*}$$

and

$$\begin{align*}
\text{AnSp}(\mathbb{C})^{2,pr}/S & \xrightarrow{\text{Gr}^{12}_S} \text{AnSp}(\mathbb{C})/S \\
\text{AnSp}(\mathbb{C})^{2,smpr}/S & \xrightarrow{\text{Gr}^{2}_S} \text{AnSp}(\mathbb{C})^{sm}/S \\
\text{Var}(\mathbb{C})^{2,pr}/S & \xrightarrow{\text{Gr}^{2}_S} \text{Var}(\mathbb{C})/S \\
\text{Var}(\mathbb{C})^{2,sm}/S & \xrightarrow{\text{Gr}^{12}_S} \text{Var}(\mathbb{C})^{sm}/S
\end{align*}$$

296
and that for $f: T \to S$ a morphism with $T, S \in \text{Var}(\mathcal{C})$ we have the following commutative diagrams of sites:

$$
\begin{array}{ccc}
\text{AnSp}(\mathcal{C})^2/T^{an} & \xrightarrow{A_{\text{an}}} & \text{Var}(\mathcal{C})^2/T \\
\text{AnSp}(\mathcal{C})^2/T^{an} & \xrightarrow{P(f)} & \text{Var}(\mathcal{C})^2/T \\
\text{AnSp}(\mathcal{C})^2/S^{an} & \xrightarrow{p_S} & \text{Var}(\mathcal{C})^2/S \\
\text{AnSp}(\mathcal{C})^2/S^{an} & \xrightarrow{P(f)} & \text{Var}(\mathcal{C})^2/S \\
\end{array}
$$

Let $S \in \text{SmVar}(\mathcal{C})$. We have the canonical map in $C(\text{Var}(\mathcal{C})^{2,smpr}/S)$

$$
\Omega^{\Gamma, pr}_{/(S^{an}/S)}: (\Omega^{\bullet, \Gamma, pr}_{/S}, F_{\text{DR}}) \to (\Omega^{\bullet, \Gamma, pr}_{/S^{an}}, F_{\text{DR}})
$$
given by $p: (Y \times S, Z) \to S$ the projection with $Y \in \text{SmVar}(\mathcal{C})$,

$$
\Omega^{\Gamma, pr}_{/(S^{an}/S)}((Y \times S, Z)/S): \Omega_{Y \times S/S}^{\bullet} \otimes_{O_{Y \times S}} \Gamma^{\mathcal{Y}/S}_{Hd}(O_{Y \times S}, F_{\text{b}})
$$

We have the following canonical transformation map given by the analytical functor:

**Definition 148.** Let $S \in \text{SmVar}(\mathcal{C})$. For $F \in C(\text{Var}(\mathcal{C})^{2,smpr}/S)$, we have the canonical transformation map in $C_{\mathcal{D}^{\infty}_{\text{fil}}}(S^{an})$

$$
T(\text{an}, \Omega^{\Gamma, pr}_{/S})(F):
$$

(\epsilon(S), \text{Hom}^{\bullet}(F, E_{\text{et}}(\Omega^{\bullet, \Gamma, pr}_{/S}, F_{\text{DR}})))^{an} := O^{S^{an}} \otimes_{O_{S}} \text{an}^{S}(\epsilon(S), \text{Hom}^{\bullet}(F, E_{\text{et}}(\Omega^{\bullet, \Gamma, pr}_{/S}, F_{\text{DR}})))

$$
\xrightarrow{T(\text{an}, \text{et})(-)} O^{S^{an}} \otimes_{O_{S}} \text{an}^{S}(\epsilon(S), \text{Hom}^{\bullet}(F, E_{\text{et}}(\Omega^{\bullet, \Gamma, pr}_{/S}, F_{\text{DR}})))
$$

$$
\xrightarrow{\text{Hom}(\text{an}^{S}F, \text{an}^{S}E_{\text{et}}(\Omega^{\bullet, \Gamma, pr}_{/S^{an}}) \otimes m)} (\epsilon(S), \text{Hom}^{\bullet}(\text{an}^{S}F, \text{an}^{S}E_{\text{et}}(\Omega^{\bullet, \Gamma, pr}_{/S^{an}}, F_{\text{DR}})))
$$

By definition of the algebraic analytic De Rahm realization functor, we have a natural transformation between them:

**Definition 149.** Let $S \in \text{SmVar}(\mathcal{C})$. Let $M \in \text{DA}_{\mathcal{S}}(S)$ and $(F, W) \in C_{\text{fil}}(\text{Var}(\mathcal{C})^{an}/S)$ such that $(M, W) = D(\mathcal{A}_{\mathcal{S}}^{1}, \text{et})(F, W)$. We have the canonical transformation map $\pi_{S}(D(\mathcal{M}^{HM}(S))) \subset D_{\mathcal{D}^{\infty}_{\text{fil}}}(S^{an})$

$$
T(\text{an}, F^{\text{an}}_{\text{fil}})(M): (F^{\mathcal{S}_{\text{fil}}}_{/S^{an}}(M))^{an} :=
$$

$$
\xrightarrow{\lim_{r_{(X^{\ast}, D^{\ast})}/S(L(F, W))}} (\epsilon(S), \text{Hom}^{\bullet}(L^{\rho_{S}}L^{r_{(X^{\ast}, D^{\ast})}/S}(\rho_{S}^{2}L(F, W)), E_{et}(\Omega^{\bullet, \Gamma, pr}_{/S}, F_{\text{DR}})))^{an}
$$

$$
\xrightarrow{\lim_{r_{(X^{\ast}, D^{\ast})}/S(LF)}} e(S), \text{Hom}^{\bullet}(L^{r_{(X^{\ast}, D^{\ast})}/S}(\rho_{S}^{2}L(F, W)), E_{et}(\Omega^{\bullet, \Gamma, pr}_{/S^{an}}, F_{\text{DR}}))^{an}
$$

$$
\xrightarrow{\lim_{r_{(X^{\ast}, D^{\ast})}/S(LF)}} e(S), \text{Hom}^{\bullet}(L^{r_{(X^{\ast}, D^{\ast})}/S}(\rho_{S}^{2}L(F, W)), E_{asu}(\Omega^{\bullet, \Gamma, pr, an}_{/S^{an}}, F_{\text{DR}})) =: F^{\text{DR}}_{/S^{an}}(M)
$$

297
We give now the definition in the non smooth case: Let $S \in \text{Var}(\mathbb{C})$. Let $S = \bigcup_{i=1}^d S_i$ be an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$, with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. For $I \subset J$, denote by $p_{IJ} : \tilde{S}_J \rightarrow \tilde{S}_I$ the projection. Consider, for $I \subset J \subset [1, \ldots, l]$, resp. for each $I \subset [1, \ldots, l]$, the following commutative diagrams in $\text{Var}(\mathbb{C})$

$$D_{IJ} = \xymatrix{ S_I & \tilde{S}_I \ar[l]^-{i_i} 
\downarrow_{p_{IJ}} \ar[u]^-{i_j} & \tilde{S}_J \ar[l]^-{p_{IJ}} 
S_J & \tilde{S}_J }$$

We then have the following lemma

**Lemma 23.** The maps $T(an, \Omega)(-) \in C_{D^\infty(\text{id})}^*(S/(\tilde{S}_I))$

$$(T(an, \Omega^r_{/\tilde{S}_I})(Lp_{\tilde{S}_I*} \mathcal{G}_{\tilde{S}_I}^{0,2*} \mathcal{L}_{(\mathcal{X},d^r)_I/\tilde{S}_I}(\rho_{\tilde{S}_I}^*, L(i_I j_I^* F)) : \begin{array}{c}
\lim_{r_{(\mathcal{X},d^r)_I/(-)}} (e'(\tilde{S}_I)\cdot \text{Hom}^\bullet(Lp_{\tilde{S}_I*} \mathcal{G}_{\tilde{S}_I}^{0,2*} \mathcal{L}_{(\mathcal{X},d^r)_I/\tilde{S}_I}(\rho_{\tilde{S}_I}^*, L(i_I j_I^* F)), \mathcal{E}_{\text{ct}}((\Omega^r_{/\tilde{S}_I})^{\text{pr}}, \mathcal{F}_{\text{DR}}))^{\text{an}}, (u_{ij}^F(F))^\text{an}) 
\end{array}
\end{array}$$

Proof. Obvious.

**Definition 150.** Let $S \in \text{Var}(\mathbb{C})$. Let $S = \bigcup_{i=1}^d S_i$ be an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$ with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. For $I \subset [1, \ldots, l]$, denote $S_I = \cap_{i \in I} S_i$. We have then closed embeddings $i_I : S_I \hookrightarrow \tilde{S}_I = \Pi_{i \in I} \tilde{S}_i$. Let $M \in \text{DA}_c(S)$ and $(F,W) \in C_{\text{fil}}(\text{Var}(\mathbb{C})^m/S)$ such that $(M,W) = D(\mathbb{A}_{\mathbb{S}}^1, \text{et})(F,W)$. We have, by lemma 23, the canonical transformation map in $\pi_S(D(\text{MHM}(S)) \subset D_{D(1,0),\text{fil},\infty}(S^a)$

$$T(\text{An}, \mathcal{F}_{S}^\text{FDR})(M) : (\mathcal{F}_{S}^\text{FDR}(M))^{\text{an}} \rightarrow \left( \begin{array}{c}
\lim_{r_{(\mathcal{X},D^r)_I/(-)}} (e'(\tilde{S}_I)\cdot \text{Hom}^\bullet(Lp_{\tilde{S}_I*} \mathcal{G}_{\tilde{S}_I}^{0,2*} \mathcal{L}_{(\mathcal{X},D^r)_I/\tilde{S}_I}(\rho_{\tilde{S}_I}^*, L(i_I j_I^* (F,W)))), \mathcal{E}_{\text{ct}}((\Omega^r_{/\tilde{S}_I})^{\text{pr}}, \mathcal{F}_{\text{DR}}))^{\text{an}}, (u_{ij}^F(F,W))^{\text{an}} 
\end{array} \right)$$

The following proposition says this transformation map between $\mathcal{F}_{S}^{a}$ and $(\mathcal{F}_{S}^\text{FDR})^{an}$ is functorial in $S \in \text{Var}(\mathbb{C})$, hence define a commutative diagram of morphism of 2-functor:

**Proposition 133.** (i) Let $g : T \rightarrow S$ a morphism with $T,S \in \text{Var}(\mathbb{C})$. Assume there exist a factorization $g : T \xrightarrow{1} Y \times S \xrightarrow{p_S} S$ with, $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p_S$ the projection. Let $S = \bigcup_{i=1}^d S_i$ be an open cover such that there exist closed embeddings $i_i : S_i \hookrightarrow \tilde{S}_i$, with $\tilde{S}_i \in \text{SmVar}(\mathbb{C})$. We then have closed embedding $i_i \circ 1 : T_i \hookrightarrow Y \times S_i$ and $\tilde{g}_I := p_{\tilde{S}_I} : Y \times \tilde{S}_I \rightarrow \tilde{S}_I$ is a lift of $g_I := g|_{T_i} : T_i \rightarrow S_i$. 298
(i0) Then, for $M \in \text{DA}_{c}(S)$, the following diagram in $\pi_{T}(D(MHM(T^{an})) \subset D_{D(1,0)fil,\infty}(T^{an}/(Y^{an} \times \bar{S}_{I}^{an}))$, see definition [132] and definition [133] commutes

\[
g_{Hdg}^{\text{mod}}((\mathcal{F}_{S}^{\text{FDR}}(M))^{an}) = (g_{Hdg}^{\text{mod}}(\mathcal{F}_{S}^{\text{FDR}}(M)))^{\text{FDR}} \quad \text{commutes}
\]

\[
\begin{array}{ccc}
\mathcal{F}_{T}^{\text{FDR}}(g^{*}M)^{an} & \xrightarrow{(T(g,F_{S}^{\text{FDR}})(M))^{an}} & T(An,F_{S}^{\text{FDR}})(g^{*}M) \\
\uparrow & & \uparrow \\
\mathcal{F}_{T}^{\text{FDR}}(T^{an})(g^{*}M) & \xrightarrow{T(An,F_{S}^{\text{FDR}})(g^{*}M)} & \mathcal{F}_{T}^{\text{FDR}}(g^{*}M)
\end{array}
\]

(i1) Then, for $M \in \text{DA}_{c}(S)$, the following diagram in $\pi_{T}(D(MHM(T)) \subset D_{D(1,0)fil,\infty}(T^{an}/(Y^{an} \times \bar{S}_{I}^{an})$) commutes

\[
g_{Hdg}^{\text{mod}}((\mathcal{F}_{S}^{\text{FDR}}(M))^{an}) = (g_{Hdg}^{\text{mod}}(\mathcal{F}_{S}^{\text{FDR}}(M)))^{\text{FDR}} \quad \text{commutes}
\]

\[
\begin{array}{ccc}
\mathcal{F}_{T}^{\text{FDR}}(g^{*}M)^{an} & \xrightarrow{(T(g,F_{S}^{\text{FDR}})(M))^{an}} & T(An,F_{S}^{\text{FDR}})(g^{*}M) \\
\uparrow & & \uparrow \\
\mathcal{F}_{T}^{\text{FDR}}(T^{an})(g^{*}M) & \xrightarrow{T(An,F_{S}^{\text{FDR}})(g^{*}M)} & \mathcal{F}_{T}^{\text{FDR}}(g^{*}M)
\end{array}
\]

(i2) Then, for $M \in \text{DA}_{c}(T)$, the following diagram in $\pi_{S}(D(MHM(S^{an})) \subset D_{D(1,0)fil,\infty}(S^{an}/(\bar{S}_{I}^{an})$) commutes

\[
Rg^{Hdg}((\mathcal{F}_{T}^{\text{FDR}}(M))^{an}) = (Rg^{Hdg}((\mathcal{F}_{T}^{\text{FDR}}(M)))^{\text{FDR}} \quad \text{commutes}
\]

\[
\begin{array}{ccc}
\mathcal{F}_{S}^{FDR}(Rg_{*}M)^{an} & \xrightarrow{(T(g,F_{S}^{\text{FDR}})(M))^{an}} & T(An,F_{S}^{\text{FDR}})(Rg_{*}M) \\
\uparrow & & \uparrow \\
\mathcal{F}_{S}^{FDR}(T^{an})(Rg_{*}M) & \xrightarrow{T(An,F_{S}^{\text{FDR}})(Rg_{*}M)} & \mathcal{F}_{S}^{FDR}(Rg_{*}M)
\end{array}
\]

(i3) Then, for $M \in \text{DA}_{c}(T)$, the following diagram in $\pi_{S}(D(MHM(S^{an})) \subset D_{D(1,0)fil,\infty}(S^{an}/(\bar{S}_{I}^{an})$) commutes

\[
Rg^{Hdg}((\mathcal{F}_{T}^{\text{FDR}}(M))^{an}) = (Rg^{Hdg}((\mathcal{F}_{T}^{\text{FDR}}(M)))^{\text{FDR}} \quad \text{commutes}
\]

\[
\begin{array}{ccc}
\mathcal{F}_{S}^{FDR}(Rg_{*}M)^{an} & \xrightarrow{(T(g,F_{S}^{\text{FDR}})(M))^{an}} & T(An,F_{S}^{\text{FDR}})(Rg_{*}M) \\
\uparrow & & \uparrow \\
\mathcal{F}_{S}^{FDR}(T^{an})(Rg_{*}M) & \xrightarrow{T(An,F_{S}^{\text{FDR}})(Rg_{*}M)} & \mathcal{F}_{S}^{FDR}(Rg_{*}M)
\end{array}
\]

(ii) Let $S \in \text{Var}(\mathbb{C})$. Let $S = \bigcup_{i=1}^{\infty}S_{i}$ be an open cover such that there exist closed embeddings $i_{i} : S_{i} \hookrightarrow \bar{S}_{i}$ with $\bar{S}_{i} \in \text{SmVar}(\mathbb{C})$. Then, for $M, N \in \text{DA}_{c}(S)$, the following diagram in $\pi_{S}(D(MHM(S)) \subset D_{D(1,0)fil,\infty}(S^{an}/(\bar{S}_{I}^{an})$) commutes

\[
\begin{array}{ccc}
(\mathcal{F}_{S}^{\text{FDR}}(M) \otimes_{O_{S}} \mathcal{F}_{S}^{\text{FDR}}(N))^{an} & \xrightarrow{(T_{an} \otimes \mathcal{F}_{S}^{\text{FDR}})(M,N)^{an}} & (\mathcal{F}_{S}^{\text{FDR}}(M \otimes N))^{an} \\
\uparrow & & \uparrow \\
\mathcal{F}_{S}^{\text{FDR}}(M)^{an} \otimes_{O_{S}^{an}} (\mathcal{F}_{S}^{\text{FDR}}(N))^{an} & \xrightarrow{T(An,F_{S}^{\text{FDR}})(M \otimes N)} & \mathcal{F}_{S}^{\text{FDR}}(M \otimes N)
\end{array}
\]

Proof. Immediate from definition. \qed
Proposition 134. Let $f : X \to S$ a morphism with $S, X \in \text{Var}(\mathbb{C})$. Assume there exist a factorization

$$f : X \xrightarrow{1} Y \times S \xrightarrow{p} S$$

with $Y \in \text{SmVar}(\mathbb{C})$, $l$ a closed embedding and $p$ the projection. Let $S = \bigcup_{i} S_{i}$ an open affine cover and $i_{i} : S_{i} \hookrightarrow \tilde{S}_{i}$ closed embeddings with $\tilde{S}_{i} \in \text{SmVar}(\mathbb{C})$. We have then the following commutative diagram in $D_{\text{Fil,}\infty}(S^{an})$.

$$
\begin{array}{ccc}
(F_{S}^{FDR}(M(X/S)))^{an} & \xrightarrow{T(\text{An}, F_{S}^{FDR}(M(X/S)))} & F_{S}^{FDR}(M(X/S)) \\
I(X/S) & \downarrow & I(X/S) \\
\end{array}
$$

$$(R_{\theta}^{Hdg}(\Gamma_{X_{i}}(O_{Y \times S_{i}}, F_{b})(dy), x_{IJ}(X/S)))^{an} \xrightarrow{T^{\text{mod}}(\text{An}, F_{S}^{FDR})(-)} R_{\theta}^{Hdg}(\Gamma_{X_{i}}(O_{Y \times S_{i}}, F_{b})(dy), x_{IJ}(X/S)))$$

Proof. Immediate from definition.

We deduce from proposition 134 and theorem 20 (GAGA for D-modules) the following:

Theorem 41. Let $S \in \text{Var}(\mathbb{C})$. For $M \in \text{DA}_{c}(S)$, the map in $\pi_{S}(D(MHM(S^{an}))) \subset D_{\text{Fil,}\infty}(S^{an})$

$$T(\text{An}, F_{S}^{FDR}(M)) : (F_{S}^{FDR}(M))^{an} \rightarrow F_{S,an}^{FDR}(M)$$

given in definition 134 is an isomorphism.

Proof. Follows from proposition 134 and theorem 20.

We finish this subsection by the following easy proposition:

Proposition 135. Let $S \in \text{Var}(\mathbb{C})$. Let $S = \bigcup_{i=1}^{l} S_{i}$ be an open cover such that there exists closed embeddings $i_{i} : S_{i} \hookrightarrow \tilde{S}_{i}$ with $\tilde{S}_{i} \in \text{SmVar}(\mathbb{C})$. Let $M \in \text{DA}_{c}(S)$ and $F \in C(\text{Var}(\mathbb{C})^{an}/S)$ such that $M = D(\mathbb{A}_{S}^{1}, et)(F)$. Then the following diagram in $D_{\text{Fil,}\text{Fil}}(S/\tilde{S}_{i})$ commutes

$$
\begin{array}{ccc}
(F_{S}^{GM}(L \otimes_{S} M))^{an} & \xrightarrow{\mathcal{J}_{S}(T(F_{S}^{GM}, F_{S}^{FDR}(M)))^{an}} & J_{S}(F_{S}^{FDR}(M))^{an} \\
T(\text{An}, F_{S}^{GM}(L \otimes_{S} M)) & \downarrow & \downarrow \mathcal{J}_{S}(T(\text{An}, F_{S}^{FDR}(M))) \\
F_{S,an}^{GM}(L \otimes_{S} M) & \xrightarrow{T(F_{S,an}^{GM}, F_{S,an}^{FDR}(M))} & J_{S}(F_{S,an}^{FDR}(M)) \\
\end{array}
$$

Proof. Immediate from definition.

7 The Hodge realization functor for relative motives

7.1 The Betti realization functor

We have two definition of the Betti realization functor which coincide at least for constructible motives, one given by [1] using the analytical functor and one given in [7] by composing the analytical functor with the forgetful functor to the topological space of a complex analytic space which is a CW complex (see also [20] for the absolute case).

Definition 151. Let $S \in \text{Var}(\mathbb{C})$.

(i) The Ayoub’s Betti realization functor is

$$\text{Bti}_{S}^{*} : \text{DA}(S) \to D(S^{an}), \ M \in \text{DA}(S) \mapsto \text{Bti}_{S}^{*} M = \text{Re}(S^{an}), \ \text{An}_{S}^{*} M = c(S^{an}), \ \text{Sing}_{S}, \ \text{An}_{S}^{*} F$$

where $F \in C(\text{Var}(\mathbb{C})^{an}/S)$ is such that $M = D(\mathbb{A}_{S}^{1}, et)(F)$.
(ii) In [7], we define the Betti realization functor as
\[ \tilde{\text{Bti}}_S^* : \text{DA}(S) \to D(S_{an}) = D(S_{cw}) \] \[ M \mapsto \tilde{\text{Bti}}_S^* M = \text{Re}(S_{cw}) \] where \( F \in C(\text{Var}(\mathbb{C})^{sm}/S) \) is such that \( M = D(\mathbb{A}^1, et)(F) \).

(iii) For the Corti-Hanamura weight structure on \( \text{DA}^-(S) \), we have by functoriality of (i) the functor
\[ \text{Bti}_S^* : \text{DA}^-(S) \to D_{fil}^-(S_{an}) \] \[ M \mapsto \text{Bti}_S^* M = e(S_{an}) \] where \( (F, W) \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S) \) is such that \( (M, W) = D(\mathbb{A}^1, et)(F, W) \).

Note that by [7], \( \text{An}_S^* \) and \( \widetilde{Cw}_S^* \) derive trivially.

Note that, by considering the explicit \( D^1_S \) local model for presheaves on \( \text{AnSp}(\mathbb{C})^{sm}/S_{an} \), \( \text{Bti}_S^*(\text{DA}^-(S)) \subset D^-(S_{an}) \); by considering the explicit \( I^1_S \) local model for presheaves on \( \text{CW}^{sm}/S_{cw} \), \( \text{Bti}_S^*(\text{DA}^-(S)) \subset D^-(S_{an}) \).

**Definition 152.** Let \( f : T \to S \) a morphism, with \( T, S \in \text{Var}(\mathbb{C}) \). We have, for \( M \in \text{DA}(S) \), \((F, W) \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)\) such that \((M, W) = D(\mathbb{A}^1, et)(F, W)\), and an equivalence \( (\mathbb{A}^1, et) \) local \( e : f^*(F, W) \to (F', W') \) with \((F', W') \in C_{fil}(\text{Var}(\mathbb{C})^{sm}/S)\) such that \((f^*M, W) = D(\mathbb{A}^1, et)(F', W')\) the following canonical transformation map in \( D_{fil}(T) \):
\[
T(f, \text{Bti})(M) : f^* \text{Bti}_S^* M = f^* e(S_{an}), \text{sing}_S, \text{An}_S^*(F, W) \xrightarrow{T(f,e)(-)} e(T_{an}), f^* \text{sing}_S, \text{An}_S^*(F, W) \]
\[
\xrightarrow{e(T_{an}), T(f,e)(F,W)} e(T_{an}), f^* \text{sing}_S, f^* \text{An}_T^*(F, W) \xrightarrow{\text{An}_T^*(F, W)} e(T_{an}), \text{sing}_S, \text{An}_T^* M \]

**Theorem 42.** Let \( f : X \to S \) a morphism, with \( X, S \in \text{Var}(\mathbb{C}) \). For \( M \in \text{DA}_c(S) \),
\[
T(f, \text{Bti})(M) : f^* \text{Bti}_S^*(M) \xrightarrow{\text{Bti}_X^*} f^* (M)
\]
is an isomorphism in \( D_{fil}(X) \).

*Proof.* See [1].

**Definition 153.** Let \( f : X \to S \) a morphism, with \( X, S \in \text{Var}(\mathbb{C}) \). We have, for \( M \in \text{DA}_c(X) \),
the following transformation map
\[
T_c(f, \text{Bti})(M) : \text{Bti}_S^*(R_f M) \xrightarrow{\text{ad}(f^*, R_f)(\text{Bti}_S^*(M))} R_f f^* \text{Bti}_S^*(R_f M) \]
\[
= T_c(f, \text{Bti})(f^* R_f M) \xrightarrow{\text{Bti}_X^*(\text{ad}(f^*, R_f)(M))} R_f f^* \text{Bti}_X^*(M)
\]
Clearly, if \( l : Z \to S \) is a closed embedding, then \( T_c(l, \text{Bti})(M) \) is an isomorphism by theorem [42].

Let \( f : X \to S \) a morphism with \( X, S \in \text{Var}(\mathbb{C}) \). Assume there exist a factorization \( f : X \xrightarrow{l} Y \times S \xrightarrow{p_S} S \) with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p_S \) the projection. We have, then, for \( M \in \text{DA}_c(X) \), using theorem [12] for closed embeddings, the following transformation map
\[
T_{(f, F_{an}^{FDR})}(M) : R_f \text{Bti}_X^*(M) = R_{p_S} l_* \text{Bti}_X^*(M) \xrightarrow{T_c(l, \text{Bti})(M)^{-1}} R_{p_S} \text{Bti}(Y \times S)^*(l_* M)
\]
\[
= R_{p_S} p_S^* \text{Bti}(Y \times S)^*(f_! M) \xrightarrow{\text{ad}(R_{p_S} p_S^*, (-))} \text{Bti}(Y \times S)^*(f_! M)
\]
Clearly, for \( f : X \to S \) a proper morphism, with \( X, S \in \text{Var}(\mathbb{C}) \) we have, for \( M \in \text{DA}_c(Y \times S) \),
\[
T_{(f, \text{Bti})}(M) = T_c(f, \text{Bti})(M).
\]

301
• Let $f : X \to S$ a morphism with $X, S \in \text{Var}(\mathbb{C})$. We have, using the second point, for $M \in \text{DA}(S)$, the following transformation map

\[
T^i(f, \text{Bti}) (M) : \text{Bti}^*_X (f^i M) \xrightarrow{\text{ad}(f_i, Rf_i)(\text{Bti}^*_X (f^i M))} f^i Rf_i \text{Bti}^*_X (f^i M)
\]

\[
T_i(f, \text{Bti})(f^i M) : f^i \text{Bti}_S(f^i M) \xrightarrow{\text{Bti}_S(\text{ad}(f_i, f_i)(M))} f^i \text{Bti}_S(M)
\]

**Definition 154.** Let $S \in \text{Var}(\mathbb{C})$. We have, for $M, N \in \text{DA}(S)$ and $F, G \in C_i \text{Var}(\mathbb{C})^{em}(S)$ such that $M = D(\mathbb{A}^1, et)(F)$ and $N = D(\mathbb{A}^1, et)(G)$, the following transformation map in $D_{\text{Bti}}(S)$

\[
\text{Bti}_S^* M \otimes \text{Bti}_S^* N := (e(S), \text{sing}_{Gn}, \text{An}_S^* F) \otimes (e(S), \text{sing}_{Gn}, \text{An}_S^* G)
\]

\[
T(\text{sing}_{D*}, \otimes)(\text{An}_S^* F, \text{An}_S^* G) \xrightarrow{\text{Bti}_S^* (F \otimes G)} \text{Bti}_S^* (M \otimes N)
\]

**Theorem 43.** (i) Let $f : X \to S$ a morphism, with $X, S \in \text{Var}(\mathbb{C})$. For $M \in \text{DA}_c(X)$,

\[
T_i(f, \text{Bti})(M, W) : f_i \text{Bti}_X^*(M) \xrightarrow{\sim} \text{Bti}_S^* f_i M
\]

is an isomorphism.

(ii) Let $f : X \to S$ a morphism, with $X, S \in \text{Var}(\mathbb{C})$. For $M \in \text{DA}_c(X)$,

\[
T_i(f, \text{Bti})(M, W) : f_i \text{Bti}_X^* M \xrightarrow{\sim} \text{Bti}_S^* Rf_i M
\]

is an isomorphism.

(iii) Let $f : X \to S$ a morphism, with $X, S \in \text{Var}(\mathbb{C})$. For $M \in \text{DA}_c(S)$,

\[
T^i(f, \text{Bti})(M) : f^i \text{Bti}_S^* M \xrightarrow{\sim} \text{Bti}_X^* f^i M
\]

is an isomorphism.

(iv) Let $S \in \text{Var}(\mathbb{C})$. For $M, N \in \text{DA}_c(S)$,

\[
T(\otimes, \text{Bti})(M) : \text{Bti}_S^* M \otimes \text{Bti}_S^* N \xrightarrow{\sim} \text{Bti}_X^*(M \otimes N)
\]

is an isomorphism.

**Proof.** See [1].

The main result on the Betti realization functor is the following

**Theorem 44.** (i) We have $\text{Bti}_S^* = \tilde{\text{Bti}}_S^*$ on $\text{DA}^-(S)$

(ii) The canonical transformations $T(f, \text{Bti})$, for $f : T \to S$ a morphism in $\text{Var}(\mathbb{C})$, define a morphism of 2 functor

\[
\text{Bti}_S^* : \text{DA}(\cdot) \to D(\text{an}), \quad S \in \text{Var}(\mathbb{C}) \mapsto \text{Bti}_S^* : \text{DA}(S) \to D(S^\text{an})
\]

which is a morphism of homotopic 2 functor.

**Proof.** (i): See theorem [42] and theorem [43]

(ii): Follows from theorem [42] and theorem [43]

**Remark 13.** For $X \in \text{Var}(\mathbb{C})$, the quasi-isomorphisms

\[
\mathbb{Z} \text{Hom}(\mathbb{D}_*^n, X) \xrightarrow{\text{An}_*} \mathbb{Z} \text{Hom}(\mathbb{D}^n(0, 1), X^{an}) \xrightarrow{\text{Hom}(i, X^{cw})} \mathbb{Z} \text{Hom}([0, 1]^n, X^{cw})
\]

where,

\[
\tilde{\mathbb{D}}_*^{an} := (e : U \to \mathbb{A}^n, \mathbb{D}^n(0, 1) \subset e(U)) \in \text{Fun}(\mathbb{V}_{\mathbb{A}_n}^e (\tilde{\mathbb{D}}_*^n(0, 1)), \text{Var}(\mathbb{C}))
\]
is the system of etale neighborhood of the closed ball \( \bar{D}^n(0,1) \subset \mathbb{A}^n \), and \( i : [0,1]^n \to \bar{D}^n(0,1) \) is the closed embedding, shows that a closed singular chain \( \alpha \in Z\text{Hom}^n([0,1]^n,X^{cw}) \), is homologue to a closed singular chain

\[
\beta = \alpha + \partial \gamma = \bar{\beta}|_{[0,1]^n} \in Z\text{Hom}^n(\Delta^n,X^{cw})
\]

which is the restriction by the closed embedding \([0,1]^n \to U^{cw} \hookrightarrow \mathbb{A}^n\), where \( e : U \to \mathbb{A}^n \) an etale morphism with \( U \in \text{Var}(\mathbb{C}) \), of a complex algebraic morphism \( \bar{\beta} : U \to X \). Hence \( \beta([0,1]^n) = \bar{\beta}([0,1]^n) \subset X \) is the restriction of a real algebraic subset of dimension \( n \) in \( \text{Res}_\mathbb{R}(X) \) (after restriction a scalar that is under the identification \( \mathbb{C} \simeq \mathbb{R}^2 \)).

**Definition 155.** Let \( S \in \text{Var}(\mathbb{C}) \) The cohomological Betti realization functor is

\[
\text{Bti}_S^\vee : DA(S) \to D(S^{cw}), \quad M \mapsto \text{Bti}_S^\vee(M) := R\text{Hom}(\text{Bti}_S^* M, Z_{S^{cw}}) = R\text{Hom}(M, \text{Bti}_S^* Z_{S^{cw}})
\]

where for \( \text{Bti}_S^* : K \in D(S^{cw}) \to R \text{An} S^* e(S^{an})^* K \in DA(S) \) is the right adjoint to \( \text{Bti}_S^\vee \).

### 7.2 The Hodge realization functor for relative motives

Recall (see section 2) that for \( S \in \text{Var}(\mathbb{C}) \), we consider the dual functor

\[
\mathbb{D}_S : C(\text{Var}(\mathbb{C})^{sm}/S) \to C(\text{Var}(\mathbb{C})^{sm}/S), F \mapsto \mathbb{D}_S F := \mathcal{H}om(F, E_{et}(\mathbb{Z}_S)).
\]

Similarly, for \( S \in \text{AnSp}(\mathbb{C}) \), we consider the dual functor

\[
\mathbb{D}_S : C(\text{AnSp}(\mathbb{C})^{sm}/S) \to C(\text{AnSp}(\mathbb{C})^{sm}/S), F \mapsto \mathbb{D}_S F := \mathcal{H}om(F, E_{usu}(\mathbb{Z}_S))
\]

The filtered De Rham algebraic realization functor constructed in section 6 and on the other hand the Betti realization functor (see section 7.1) give the Hodge realization functor:

**Definition 156.** Let \( S \in \text{SmVar}(\mathbb{C}) \). We define the Hodge realization functor as

\[
\mathcal{F}_S^{Hdg} := (\mathcal{F}_S^{FDR}, \text{Bti}_S^\vee) : DA_c(S) \to D_{D(1,0)fil,\infty}(S) \times_I D_{fil}(S^{an}),
\]

\[
M \mapsto \mathcal{F}_S^{Hdg}(M) := (\mathcal{F}_S^{FDR}(M), \text{Bti}_S^\vee M, \alpha(M))
\]

where α(M ) is the map in DCf il (S an )
α(M ) : (Bti∗S M ) ⊗ CS := (e(S)∗ singD∗ An∗S L(F, W )) ⊗ CS
s(e(S)∗ sing

∗

An∗
S L(F,W ))

Proposition 136. Let \( g : T \to S \) a morphism with \( T, S \in \text{Var}(\mathbb{C}) \). Assume there exists a factorization \( g : T \xrightarrow{p} Y \xrightarrow{i} S \), with \( Y \in \text{SmVar}(\mathbb{C}) \), \( l \) a closed embedding and \( p \) the projection. Let \( S = \bigcup_{i \in I} S_i \) an open cover and \( i : S_i \hookrightarrow S \) closed embeddings with \( S_i \in \text{SmVar}(\mathbb{C}) \). Then, \( g_i : Y \times S \to S_i \) is a lift of \( g \), \( g_i = g_{\mid T_i} : T_i \to S_i \). Then, for \( M \in D_{\mathcal{A}}(S) \), the following diagram

\[
\begin{array}{ccc}
DR(S)^{-1}(\text{Hom}(L \otimes S, L(i_1 \cdot j_1^* e(S), \text{sing}_S, \text{An}_S^* L(F,W))), E_{\text{usu}}(O_{S_i})) & \xrightarrow{u_{ij}} & DR(S)^{-1}(\text{Hom}(L \otimes S, L(i_1 \cdot j_1^* e(S), \text{sing}_S, \text{An}_S^* L(F,W))), E_{\text{usu}}(O_{S_i}))
\end{array}
\]

where \( \alpha(M) \) is the map in \( D_{\text{fil}}(S_{an}/(\hat{S}_i^{an})) \)

\[
\alpha(M) : T(S/(\hat{S}_i))(B^{\text{fil}}(M,W)) \otimes \mathbb{C}_S := (i_1 \cdot j_1^* e(S), \text{sing}_S, \text{An}_S^* L(F,W)) \otimes \mathbb{C}_S, T^q(D_{T_i})(-)
\]

\[
\xrightarrow{s(e(S), \text{sing}_S, \text{An}_S^* L(F,W))} DR(S)^{-1}(\text{Hom}(L \otimes S, L(i_1 \cdot j_1^* e(S), \text{sing}_S, \text{An}_S^* L(F,W))), E_{\text{usu}}(O_{S_i})) \xrightarrow{u_{ij}} DR(S)^{-1}(\text{Hom}(L \otimes S, L(i_1 \cdot j_1^* e(S), \text{sing}_S, \text{An}_S^* L(F,W))), E_{\text{usu}}(O_{S_i}))
\]

where \( (F, W) \in C_{\text{fil}}(\text{Var}(\mathbb{C})_{an}/S) \) is such that \( (M, W) = (\mathbb{A}^1, \text{et}) (F, W) \)

- the map \( T(e, \text{hom})(-,-) \) is the isomorphism of theorem 29
- the map \( T(e, \text{hom})(-,-) \) is a filtered equivalence usual by proposition 33 and proposition 121

\[ F^D_{S} (M) := a_{fil} F^D_{S} (M) \in D_{D_{fil}}(S), F^D_{S_{an}} (M) := a_{fil} F^D_{S} (M) \in D_{D_{fil}}(S_{an}) \]

- \( T(An, F^D_{S} (M)) : (F^D_{S} (M))^{an} \xrightarrow{\sim} F^D_{S_{an}} (M) \) is an isomorphism by theorem 44

We now give the functoriality with respect to the five operation using the De Rahm realization case and the Betti realization case.
(iv) Let see definition 100, definition 122, definition 143 and definition 153.

\[
g^*(\alpha(M)) : g^* B_{t_i} S M \rightarrow DR(T)^{-1}(g_{Hdg}^{mod}(F_{S,an}^{DR} M)) \rightarrow DR(T)^{-1}((g_{Hdg}^{mod} F_{S}^{DR} (M)^{an}))
\]

\[T(g,bt)(M)\]

\[
\alpha(g^* M) : B_{t'_i} g^* M \rightarrow DR(T)^{-1}(F_{T,an}^{DR} (g^* M)) \rightarrow DR(T)^{-1}((F_{T}^{DR} (g^* M)^{an})
\]

see definition 100, definition 122, definition 143 and definition 153.

(ii) Let \( f : T \rightarrow S \) a morphism with \( T, S \in \text{QPVar}(\mathbb{C}) \). Then, for \( M \in DA_c(T) \), the following diagram commutes:

\[
f_*(\alpha(M)) : Rf_* B_{t_i} T M \rightarrow DR(S)^{-1}(Rf_{Hdg}^{mod} F_{T,an}^{DR} (M)) \rightarrow DR(S)^{-1}((Rf_{Hdg}^{mod} F_{T}^{DR} (M)^{an})
\]

\[T_*(f, bt)(M)\]

\[
\alpha(Rf_* M) : B_{t'_i} Rf_* M \rightarrow DR(S)^{-1}(F_{S,an}^{DR} (Rf_* M)) \rightarrow DR(S)^{-1}((F_{S}^{DR} (Rf_* M)^{an})
\]

see definition 100, definition 122, definition 143 and definition 153.

(iii) Let \( f : T \rightarrow S \) a morphism with \( T, S \in \text{QPVar}(\mathbb{C}) \). Then, for \( M \in DA_c(T) \), the following diagram commutes:

\[
f_1(\alpha(M)) : Rf_1 B_{t'_i} T M \rightarrow DR(S)^{-1}(Rf_{1,Hdg}^{mod} F_{T,an}^{DR} (M)) \rightarrow DR(S)^{-1}((Rf_{1,Hdg}^{mod} F_{T}^{DR} (M)^{an})
\]

\[T_1(f, bt)(M)\]

\[
\alpha(Rf_1 M) : B_{t''_i} f_1 M \rightarrow DR(S)^{-1}(F_{S,an}^{DR} (Rf_1 M)) \rightarrow DR(S)^{-1}((F_{S}^{DR} (Rf_1 M)^{an})
\]

see definition 100, definition 122, definition 143 and definition 153.

(iv) Let \( f : T \rightarrow S \) a morphism with \( T, S \in \text{QPVar}(\mathbb{C}) \). Then, for \( M \in DA_c(S) \), the following diagram commutes:

\[
f^!(\alpha(M)) : f^! B_{t'_i} S M \rightarrow DR(T)^{-1}(Rf^{mod}_{Hdg} F_{S,an}^{DR} (M)) \rightarrow DR(T)^{-1}((Rf^{mod}_{Hdg} F_{S}^{DR} (M)^{an})
\]

\[T'(f, bt)(M)\]

\[
\alpha(f^! M) : B_{t''_i} f^! M \rightarrow DR(T)^{-1}(F_{S,an}^{DR} (f^! M)) \rightarrow DR(T)^{-1}((F_{S}^{DR} (f^! M)^{an})
\]

see definition 100, definition 122, definition 143 and definition 153.

(v) Let \( S \in \text{Var}(\mathbb{C}) \). Then, for \( M, N \in DA_c(S) \), the following diagram commutes:

\[
\alpha(M) \otimes \alpha(N) \rightarrow DR(S)((F_{S}^{DR} (M) \otimes_{O_S} F_{S}^{DR} (N)^{an})
\]

\[T(\otimes, bt)(M,N)\]

\[
\alpha(M \otimes N) \rightarrow DR(S)((F_{S}^{DR} (M \otimes N)^{an})
\]

see definition 124 and definition 154.

Proof. (i): The commutativity of the right square is given by applying the functor \( DR(T)^{-1} \) to the commutative diagram

\[
g_{Hdg}^{mod}((F_{S}^{FR} (M)^{an}) = (g_{Hdg}^{mod} (F_{S}^{FR} (M)))^{mod_{Hdg} (T(An, F_{S}^{FR} (M)))}
\]

\[\alpha(g^* M) \rightarrow T(An, F_{S}^{FR} (g^* M)) \rightarrow F_{S}^{FR} (g^* M)
\]

306
given in proposition $133$[i]. On the other hand, the commutativity of the left square follows from the following commutative diagram:

\[ \begin{array}{ccc}
(\hat{g}^*_1 j^*_1 e(S) \times \text{An}_S^* LF, \hat{g}^*_1 u_1 j(-)) & \rightarrow & DR(T)[-1] (\Gamma^{\psi, \text{Hdg}}_T g^{\text{mod}} e(\tilde{S}_1) \cdot \text{Hom} (\text{An}_S^* L_\rho \text{Si}, \text{Gr}^{\psi}_S L^{\text{CH}} R_{\text{Hdg}}(-)/(\rho_\text{Si}^* L_i l_1 j_1 F),
E_{\text{usu}} (\Omega^{* \text{pr, an}}_S), \hat{g}^*_1 u_1 j(F)) \\
\downarrow & & \downarrow DR(T)[-1] (T(g, F_{\text{an}}^\text{DR})(M)) \\
(i'_1 j'_1 e(T) \times \text{An}_T^* g^* F, u_1 j(-)) & \rightarrow & DR(T)[-1] (e' Y \times \tilde{S}_1) \cdot \text{Hom} (\text{An}_{Y S}^* L_\rho \text{Si}, \text{Gr}^{\psi}_S L^{\text{CH}} R_{\text{Hdg}}(-)/(\rho_\text{Si}^* L_i l_1 j_1 F),
E_{\text{usu}} (\Omega^{* \text{pr, an}}_S), \hat{g}^*_1 u_1 j(F))
\end{array} \]

(ii): Follows from (i) by adjunction.

(iii): The closed embedding case is given by (ii) and the smooth projection case follows from (i) by adjunction.

(iv): Follows from (iii) by adjunction.

(v): Obvious

We can now state the following key proposition and the main theorem:

**Proposition 137.** Let \( f : X \to S \) a morphism with \( X, S \in \text{Var}(\mathbb{C}) \), \( X \) quasi-projective. Consider a factorization \( f : X \xrightarrow{\pi} Y \times S \xrightarrow{p} S \) with \( Y = \mathbb{P}^{N, o} \subset \mathbb{P}^N \) an open subset, \( l \) a closed embedding and \( p_S \) the projection. Let \( S = \bigcup_i S_i \) an open cover such that there exist closed embeddings \( i_z : S_i \to S_i \) with \( S_i \in \text{SmVar}(\mathbb{C}) \). Recall that \( S_1 := \bigcap_i S_i, X_1 = f^{-1}(S_1), \) and \( \tilde{S}_1 := \Pi_{i \in I} S_i \). Then, using proposition $136$[iii], the maps of definition $122$ and definition $153$ give an isomorphism in \( D_{\text{D}(1, 0) f_1}(S/(\tilde{S}_1)) \times_1 D(S^m) \)

\[ (T(f, F_{\text{Hdg}}^\text{DR})(\mathbb{Z}(X/X)), T(f, Bt)(\mathbb{Z}(X/X))) : \]

\[ \mathcal{F}_{Hdg}^{BM}(X/S) := (\mathcal{F}_{Hdg}(Rf_i \mathbb{Z}(X/X)), Bt_i, Rf_i \mathbb{Z}(X/X), \alpha(Rf_i \mathbb{Z}(X/X))) \]

\[ \cong (Rf_{Hdg}(\Gamma^{\psi, \text{Hdg}}_T O_{X_1} X_1 j_1 X/S, Rf_1 \mathbb{Z}_{X, an}, f_1(\alpha(X/(X \times \tilde{S}_1)))) \cdot (Rf_{Hdg}^{\psi, \text{Hdg}}_{X_1} X_1 j_1 X/S, Rf_1 \mathbb{Z}_{X, an}, f_1(\alpha(X/(X \times \tilde{S}_1)))) \]

**Proof.** Follows from proposition $136$[iii], theorem $33$[i] and theorem $33$[i].

We begin by stating the main theorem of this article is the following:

**Theorem 45.** (i) For \( S \in \text{Var}(\mathbb{C}) \), we have \( F_{Hdg}^S(\text{DA}(S)) \subset D(MHM(S)) \).

(ii) The Hodge realization functor \( F_{Hdg}^S(-) \) define a morphism of \( 2 \)-functor on \( \text{Var}(\mathbb{C}) \)

\[ F_{Hdg}^S : \text{Var}(\mathbb{C}) \to (\text{DA}(\mathbb{C}) \to D(MHM(\mathbb{C}))) \]

whose restriction to \( \text{QPVar}(\mathbb{C}) \) is an homotopic \( 2 \)-functor in sense of Ayoub. More precisely,

(i0) for \( f : T \to S \) a morphism, with \( T, S \in \text{QPVar}(\mathbb{C}) \), and \( M \in \text{DA}(T) \), the maps of definition $127$ and of definition $152$ induce an isomorphism in \( D(MHM(T)) \)

\[ T(f, F_{Hdg}(T)(M)) := (T(f, F_{\text{Hdg}}(T)(M)), T(f, Bti)(M)) : \]

\[ (g^* F)_{\text{Hdg}}^S (M) := (g^* \text{mod} F_{\text{Hdg}}^S (M), g^* Bti_S(M), g^*(\alpha(M))) \]

\[ \cong (F_{F_{\text{Hdg}}(T)}(g^* M), Bti^*_T(g^*(M), \alpha(g^*(M))) =: F_{\text{Hdg}}^T(g^* M), \]

(ii1) for \( f : T \to S \) a morphism, with \( T, S \in \text{QPVar}(\mathbb{C}) \), and \( M \in \text{DA}_c(T) \), the maps of definition $122$ and of definition $153$ induce an isomorphism in \( D(MHM(S)) \)

\[ T_*(f, F_{Hdg}(T)(M)) := (T_*(f, F_{\text{Hdg}}(T)(M), T_*(f, Bti)(M)) : \]

\[ Rf_{Hdg} F_{\text{Hdg}}^S (M) := (Rf_{\text{Hdg}} F_{\text{F}_{\text{Hdg}}^S (M), Rf_*(Bti_S(M), f_*(\alpha(M))) \]

\[ \cong (F_{F_{\text{Hdg}}(T)}(Rf_* M), Bti^*_T(Rf_*(M), \alpha(Rf_*(M))) =: F_{\text{Hdg}}^T(Rf_* M), \]

307
(ii) For \( f : T \to S \) a morphism, with \( T, S \in \text{QPVar}(\mathbb{C}) \), and \( M \in \text{DA}_c(T) \), the maps of definition 122 and of definition 155 induce an isomorphism in \( D(MHM(S)) \)

\[
T_i(f, \mathcal{F}^{Hdg}) (M) := (T_i(f, \mathcal{F}^{FDR})(M), T_i(f, 	ext{bti})(M)) :
\]

\[
Rf^!_i \mathcal{F}^{Hdg}_T (M) := (Rf^!_i \mathcal{F}^{FDR}_T (M), Rf^!_i \text{Bti}^*_S (M), f_!(\alpha(M)))
\]

\[
\sim \to (F^{FDR}_S(Rf^*_M, \text{Bti}^*_S(Rf^*_M, \alpha(f^*_M))) =: \mathcal{F}^{Hdg}_T(f^*_M),
\]

(iii) For \( f : T \to S \) a morphism, with \( T, S \in \text{QPVar}(\mathbb{C}) \), and \( M \in \text{DA}_c(S) \), the maps of definition 122 and of definition 155 induce an isomorphism in \( D(MHM(T)) \)

\[
T_i(f, \mathcal{F}^{Hdg}) (M) := (T_i(f, \mathcal{F}^{FDR})(M), T_i(f, \text{bti})(M)) :
\]

\[
f^*_i \mathcal{F}^{Hdg}_S (M) := (f^{*\text{mod}}_i \mathcal{F}^{FDR}_S (M), f^!_i \text{Bti}_S^*(M), f^!_i(\alpha(M)))
\]

\[
\sim \to (F^{FDR}_F(f^*_M, \text{Bti}^*_F(f^*_M, \alpha(f^*_M))) =: \mathcal{F}^{Hdg}_T(f^*_M),
\]

(iv) For \( S \in \text{Var}(\mathbb{C}) \), and \( M, N \in \text{DA}_c(S) \), the maps of definition 122 and of definition 155 induce an isomorphism in \( D(MHM(S)) \)

\[
T(\otimes, \mathcal{F}^{Hdg})(M, N) := (T(\otimes, \mathcal{F}^{FDR})(M, N), T(\otimes, \text{bti})(M, N)) :
\]

\[
(F^{FDR}_S(M) \otimes F^{FDR}_S(N), \text{Bti}_S(M) \otimes \text{Bti}_S(N), \alpha(M) \otimes \alpha(N))
\]

\[
\sim \to \mathcal{F}^{Hdg}_S(M \otimes N) := (F^{FDR}_S(M \otimes N), \text{Bti}_S(M \otimes N), \alpha(M \otimes N)).
\]

(iii) For \( S \in \text{Var}(\mathbb{C}) \), the following diagram commutes:

\[
\begin{array}{ccc}
\text{Var}(\mathbb{C})/S & \xrightarrow{MH(S)} & D(MHM(S)) \\
M(S) & \downarrow & \\
\text{DA}(S) & \xrightarrow{\mathcal{F}^{Hdg}_S} & D_{Df,\infty}(S/\tilde{S}_1) \times_1 D_{f\text{fil}}(S^{\text{an}})
\end{array}
\]

Proof. (i): Let \( M \in \text{DA}_c(S) \). There exist a generalized distinguish triangle in \( \text{DA}(S) \)

\[ M \to M(X_0/S)[d_0] \to \cdots \to M(X_m/S)[d_m], \]

with \( f_n : X_n \to S \) morphisms and \( X_n \in \text{QPVar}(\mathbb{C}) \). This gives the following generalized distinguish triangle in \( D_{Df,\text{fil}}(S) \times_1 D(S^{\text{an}}) \)

\[
\mathcal{F}^{Hdg}_S(M) \to \mathcal{F}^{Hdg}_S(M(X_0/S))[d_0] \to \cdots \to \mathcal{F}^{Hdg}_S(M(X_m/S))[d_m],
\]

On the other hand, by proposition 137, we have

\[
\mathcal{F}^{Hdg}_S(M(X_n/S)) \sim \to Rf^*_n \mathcal{F}^{Hdg}_{X^n} \in D(MHM(S))
\]

(ii): Follows from theorem 32 (proposition 136(i)) and theorem 42

(iii): Follows from theorem 33 (ii), proposition 136 (ii), and theorem 43 (ii).

(iii): Follows from theorem 33 (ii), proposition 136 (iii), and theorem 43 (i).

(iii): Follows from theorem 33 (ii), proposition 136 (iv), and theorem 43 (iii).

(iii): Follows from theorem 33 (proposition 136 (v) and theorem 43 (iv).

(iii): By (ii), for \( g : X'/S \to X/S \) a morphism, with \( X', X, S \in \text{Var}(\mathbb{C}) \) and \( X/S = f : X \to S \), \( X'/S = f' : X' \to S \), we have by adjunction the following commutative diagram

\[
\mathcal{F}^{Hdg}_S(M(X'/S) = f'_i f^! \mathcal{Z}_S = f_! g_! f'^! \mathcal{Z}_S \xrightarrow{\sim} \mathcal{F}^{Hdg}_S(M(X/S) = f_! f'^! \mathcal{Z}_S).
\]

\[
MH(X'/S) = f'_i f^! z^Hdg_S = f_! g_! f'^! f^{ad(g,g')}_S(f'' \mathcal{Z}_S) \xrightarrow{\sim} MH(X/S) = f_! f'^! z^Hdg_S.
\]

This proves (iii).
The theorem 45 gives immediately the following:

**Corollary 10.** Let $f : X \to S$, $f' : X' \to S$ morphisms, with $X, X', S \in \text{Var}(\mathbb{C})$. Let $\bar{S} \in \text{PVar}(\mathbb{C})$ a compactification of $S$. Let $\bar{X}, \bar{X}' \in \text{PVar}(\mathbb{C})$ compactification of $X$ and $X'$ respectively, such that $f$ (resp. $f'$) extend to a morphism $\bar{f} : \bar{X} \to \bar{S}$, resp. $\bar{f}' : \bar{X}' \to \bar{S}$. Denote $D = \bar{X} \setminus X$ and $D' = \bar{X}' \setminus X'$ and $E = (D \times_S \bar{X}') \cup (\bar{X} \times_S D')$. We have the following commutative diagram

\[
\begin{array}{c}
\text{RHom}^\bullet(M(\bar{X}, D)/\bar{S}), M(\bar{X}, D')/\bar{S}) \quad & \quad \text{RHom}^\bullet(f_!\mathcal{Z}_{X}^{Hdg}, f'_!\mathcal{Z}_{X'}^{Hdg}) \\
\downarrow Rl() & \quad \downarrow Rl() \\
\text{RHom}^\bullet(M(\text{pt}), M(\bar{X} \times_S \bar{X}', E)(d)) \quad & \quad \text{RHom}^\bullet(\mathcal{Z}_{\text{pt}}^{Hdg}, a_{\bar{X} \times_S \bar{X}'}, \mathcal{Z}_{\bar{X} \times_S \bar{X}'}) \\
\downarrow l & \quad \downarrow l \\
\mathbb{Z}^d(\bar{X} \times_S \bar{X}', E, *) \quad & \quad \mathbb{C}^D_{2d - 2d + 1}(\bar{X} \times_S \bar{X}', E, Z(d))
\end{array}
\]

**Proof.** The upper square of this diagram follows from theorem 45(ii) and the following isomorphism:

- $\text{ad}(j_!j^*)(\mathcal{Z}_{\bar{X}}) : M(\bar{X}/\bar{S}) \cong \text{Cone}(M(\bar{X}/\bar{S}) \xrightarrow{\text{ad}(i^!i_*)(\mathcal{Z}_{\bar{X}})} M(D/\bar{S}))[−1] =: M((\bar{X}, D)/\bar{S})$

- $\text{ad}(j'_!j'^*)(\mathcal{Z}_{\bar{X}'}) : M(\bar{X}'/\bar{S}) \cong \text{Cone}(M(\bar{X}'/\bar{S}) \xrightarrow{\text{ad}(i'^!i'_*)(\mathcal{Z}_{\bar{X}'})} M(D'/\bar{S}))[−1] =: M((\bar{X}', D')/\bar{S})$

where $i : D \hookrightarrow \bar{X}$, $i' : D' \hookrightarrow \bar{X}'$ denote the closed embeddings and $j : X \hookrightarrow \bar{X}$, $j' : X' \hookrightarrow \bar{X}'$ the open embeddings. On the other side, the lower square follows from the absolute case.

\[
\square
\]
