# $q$-DIFFERENCE EQUATIONS FOR HOMOGENEOUS $q$-DIFFERENCE OPERATORS AND THEIR APPLICATIONS 

SAMA ARJIKA<br>Department of Mathematics and Informatics, University of Agadez, Post Box 199, Agadez, Niger

#### Abstract

. In this short paper, we show how to deduce several types of generating functions from Srivastava et al [Appl. Set-Valued Anal. Optim. 1 (2019), pp. 187-201.] by the method of $q$-difference equations. Moreover, we build relations between transformation formulas and homogeneous $q$-difference equations.

Keywords. Basic ( $q$-) hypergeometric series; $q$-difference equation; Homogeneous $q$-difference operator; Cauchy polynomials ; Hahn polynomials; Generating functions.

2010 Mathematics Subject Classification. Primary 05A30, 33D15; 33D45; Secondary 05A40, 11B65.

## 1. Introduction and basics properties

In this paper, we adopt the common conventions and notations on $q$-series. For the convenience of the reader, we provide a summary of the mathematical notations, basics properties and definitions to be used in the sequel. We refer to the general references (see [16]) for the definitions and notations. Throughout this paper, we assume that $|q|<1$.

For complex numbers $a$, the $q$-shifted factorials are defined by:

$$
(a ; q)_{n}= \begin{cases}1 & \text { if } n=0  \tag{1.1}\\ (1-a)(1-a q) \cdots\left(1-a q^{n-1}\right), & \text { if } n=1,2,3, \ldots\end{cases}
$$

and for tends to infinity, we have

$$
(a ; q)_{\infty}:=\prod_{k=0}^{\infty}\left(1-a q^{k}\right)
$$

The following easily verified identities will be frequently used in this paper:

$$
\begin{equation*}
(a ; q)_{n}=\frac{(a ; q)_{\infty}}{\left(a q^{n} ; q\right)_{\infty}} \quad(a ; q)_{n+k}=(a ; q)_{n}\left(a q^{n} ; q\right)_{k} \tag{1.2}
\end{equation*}
$$

and $\left(a_{1}, a_{2}, \ldots, a_{r} ; q\right)_{m}=\left(a_{1} ; q\right)_{m}\left(a_{2} ; q\right)_{m} \cdots\left(a_{r} ; q\right)_{m}, m \in\{0,1,2 \cdots\}$.
The $q$-binomial coefficients are given by

$$
\left[\begin{array}{l}
n \\
k
\end{array}\right]_{q}:= \begin{cases}\frac{(q ; q)_{n}}{(q ; q)_{k}(q ; q)_{n-k}} & \text { if } 0 \leq k \leq n \\
0 & \text { otherwise }\end{cases}
$$

The basic (or $q$-) hypergeometric function of the variable $z$ and with $\mathfrak{r}$ numerator and $\mathfrak{s}$ denominator parameters (see, for details, the monographs by Slater [25, Chapter 3] and by Srivastava and Karlsson

[^0][26, p. 347, Eq. (272)]; see also [16]) is defined as follows:
\[

\left.{ }_{\mathfrak{r}} \Phi_{\mathfrak{s}}\left[$$
\begin{array}{l}
a_{1}, a_{2}, \ldots, a_{\mathfrak{r}} ; \\
b_{1}, b_{2}, \ldots, b_{\mathfrak{s}} ;
\end{array}
$$\right] ; z\right]=\sum_{n=0}^{\infty}\left[(-1)^{n} q^{(n)}\right]^{1+\mathfrak{s}-\mathfrak{r}} \frac{\left(a_{1}, a_{2}, ···, a_{\mathfrak{r}} ; q\right)_{n}}{\left(b_{1}, b_{2}, ···, b_{\mathfrak{s}} ; q\right)_{n}} \frac{z^{n}}{(q ; q)_{n}}
\]

where $q \neq 0$ when $\mathfrak{r}>\mathfrak{s}+1$. Note that:

$$
{ }_{\mathfrak{r}+1} \Phi_{\mathfrak{r}}\left[\begin{array}{c}
a_{1}, a_{2}, \ldots, a_{\mathfrak{r}+1} \\
\\
b_{1}, b_{2}, \ldots, b_{\mathfrak{r}} ;
\end{array}\right]=\sum_{n=0}^{\infty} \frac{\left(a_{1}, a_{2}, \ldots, a_{\mathfrak{r}+1} ; q\right)_{n}}{\left(b_{1}, b_{2}, \ldots, b_{\mathfrak{r}} ; q\right)_{n}} \frac{z^{n}}{(q ; q)_{n}} .
$$

Here, in our present investigation, we are mainly concerned with the Cauchy polynomials $p_{n}(x, y)$ as given below (see [6, (9]):

$$
\begin{equation*}
p_{n}(x, y):=(x-y)(x-q y) \cdots\left(x-q^{n-1} y\right)=(y / x ; q)_{n} x^{n} \tag{1.3}
\end{equation*}
$$

with the generating function [6]

$$
\begin{equation*}
\sum_{n=0}^{\infty} p_{n}(x, y) \frac{t^{n}}{(q ; q)_{n}}=\frac{(y t ; q)_{\infty}}{(x t ; q)_{\infty}} \tag{1.4}
\end{equation*}
$$

where [6]

$$
p_{n}(x, y)=(-1)^{n} q^{\left(\frac{n}{2}\right)} p_{n}\left(y, q^{1-n} x\right),
$$

and

$$
p_{n-k}\left(x, q^{1-n} y\right)=(-1)^{n-k} q^{\left(\frac{k}{2}\right)-\binom{n}{2}} p_{n-k}\left(y, q^{k} x\right)
$$

which naturally arise in the $q$-umbral calculus [2], Goldman and Rota [10], Ihrig and Ismail [14], Johnson [15] and Roman [22]. The generating function (1.4) is also the homogeneous version of the Cauchy identity or the $q$-binomial theorem [9]

$$
\sum_{k=0}^{\infty} \frac{(a ; q)_{k}}{(q ; q)_{k}} z^{k}={ }_{1} \Phi_{0}\left[\begin{array}{c}
a  \tag{1.5}\\
-; q, z
\end{array}\right]=\frac{(a z ; q)_{\infty}}{(z ; q)_{\infty}} \quad|z|<1
$$

Putting $a=0$, the relation (1.5) becomes Euler's identity [9]

$$
\begin{equation*}
\sum_{k=0}^{\infty} \frac{z^{k}}{(q ; q)_{k}}=\frac{1}{(z ; q)_{\infty}} \quad|z|<1 \tag{1.6}
\end{equation*}
$$

and its inverse relation [9]

$$
\begin{equation*}
\sum_{k=0}^{\infty} \frac{(-1)^{k} q^{k} \frac{(2)}{2} z^{k}}{(q ; q)_{k}}=(z ; q)_{\infty} \tag{1.7}
\end{equation*}
$$

The following two $q$-difference operators are defined by [7, 27, 23]

$$
\begin{equation*}
D_{q}\{f(x)\}=\frac{f(x)-f(q x)}{x}, \quad \theta_{x}=\theta_{x y \mid y=0}, \quad \theta_{x y}\{f(x, y)\}:=\frac{f\left(q^{-1} x, y\right)-f(x, q y)}{q^{-1} x-y} . \tag{1.8}
\end{equation*}
$$

The Leibniz rule for the $D_{q}$ is the following identity [22]

$$
D_{q}^{n}\{f(x) g(x)\}=\sum_{k=0}^{n}\left[\begin{array}{l}
n  \tag{1.9}\\
k
\end{array}\right]_{q} q^{k(k-n)} D_{q}^{k}\{f(x)\} D_{q}^{n-k}\left\{g\left(q^{k} x\right)\right\}
$$

where $D_{q}^{0}$ is understood as the identity. For $f(x)=x^{k}$ and $g(x)=1 /(x t ; q)_{\infty}$, we have

$$
D_{q}^{n}\left\{\frac{x^{k}}{(x t ; q)_{\infty}}\right\}=\frac{(q ; q)_{k}}{(x t ; q)_{\infty}} \sum_{j=0}^{n}\left[\begin{array}{c}
n  \tag{1.10}\\
j
\end{array}\right]_{q} \frac{(x t ; q)_{j}}{(q ; q)_{k-j}} t^{n-j} x^{k-j}
$$

Saad and Sukhi [23, 24] and Chen and Liu [7, [8] employed the technique of parameter augmentation by constructing the following $q$-exponential operators

$$
\begin{equation*}
R\left(b D_{q}\right)=\sum_{k=0}^{\infty} \frac{(-1)^{k} q^{\left(\frac{k}{2}\right)}}{(q ; q)_{k}}\left(b D_{q}\right)^{k}, \quad \mathbb{E}\left(b \theta_{a}\right)=\sum_{k=0}^{\infty} \frac{q^{\left(\frac{k}{2}\right)}}{(q ; q)_{k}}\left(b \theta_{a}\right)^{k} . \tag{1.11}
\end{equation*}
$$

Theorem 1.1. ([17, Theorem 2]) Let $f(a, b)$ be a two-variable analytic function in a neighbourhood of $(a, b)=(0,0) \in \mathbb{C}^{2}$. If $f(a, b)$ satisfies the $q$-difference equation

$$
\begin{equation*}
a f(a q, b)-b f(a, b q)=(a-b) f(a q, b q) \tag{1.12}
\end{equation*}
$$

then we have:

$$
\begin{equation*}
f(a, b)=\mathbb{E}\left(b \theta_{a}\right)\{f(a, 0)\} . \tag{1.13}
\end{equation*}
$$

Liu [17, 18] initiated the method of $q$-difference equations and deduced several results involving Baileys ${ }_{6} \psi_{6}, q$-Mehler formulas for Rogers-Szegö polynomials and $q$-integral of Sears transformation.

Recently, Srivastava, Arjika and Kelil [29], introduced two homogeneous $q$-difference operators $\widetilde{E}\left(a, b ; D_{q}\right)$ and $\widetilde{L}\left(a, b ; \theta_{x y}\right)$

$$
\begin{equation*}
\widetilde{E}\left(a, b ; D_{q}\right)=\sum_{k=0}^{\infty} \frac{(-1)^{k} q^{\left(\frac{k}{2}\right)}(a ; q)_{k}}{(q ; q)_{k}}\left(b D_{q}\right)^{k}, \quad \widetilde{L}\left(a, b ; \theta_{x y}\right)=\sum_{k=0}^{\infty} \frac{q^{\left(\frac{k}{2}\right)}(a ; q)_{k}}{(q ; q)_{k}}\left(b \theta_{x y}\right)^{k} . \tag{1.14}
\end{equation*}
$$

which turn out to be suitable for dealing with a generalized Cauchy polynomials $p_{n}(x, y, a)$ [29]

$$
\begin{equation*}
p_{n}(x, y, a)=\widetilde{E}\left(a, y ; D_{q}\right)\left\{x^{n}\right\} . \tag{1.15}
\end{equation*}
$$

The method of $q$-exponential operator is a rich and powerful tool for $q$-series, especially it makes many famous results easily fall into this framework. In this paper, we use this method to derive some results such as: generating functions, Srivastava-Agarwal type generating functions and transformational identity involving the generalized Cauchy polynomials.

The paper is organized as follows: In Section 2, we state and prove two theorems on $q$-difference equations. We give generating functions for generalized Cauchy polynomials $p_{n}(x, y, a)$ by using the perspective of $q$-difference equations, in Section 3. In Section 4, we derive Srivastava-Agarwal type generating functions involving the generalized Cauchy polynomials. Finally, we obtain a transformational identity involving generating functions for generalized Cauchy polynomials by the method of homogeneous $q$-difference equations in Section 5 .

## 2. $q$-DIFFERENCE EQUATIONS

In this section, we give and prove two theorems to be used in the sequel.
Theorem 2.1. Let $f(a, x, y)$ be a three-variable analytic function in a neighborhood of $(a, x, y)=(0,0,0) \in$ $\mathbb{C}^{3}$. If $f(a, x, y)$ can be expanded in terms of $p_{n}(x, y, a)$ if and only if

$$
\begin{equation*}
x[f(a, x, y)-f(a, x, q y)]=y[f(a, q x, q y)-f(a, x, q y)]-a y\left[f\left(a, q x, q^{2} y\right)-f\left(a, x, q^{2} y\right)\right] . \tag{2.1}
\end{equation*}
$$

To determine if a given function is an analytic function in several complex variables, we often use the following Hartogs's Theorem. For more information, please refer to Taylor [30, p. 28] and Liu [19, Theorem 1.8].

Lemma 2.1. [Hartogs's Theorem [11, p.15]] If a complex-valued function is holomorphic (analytic) in each variable separately in an open domain $D \subset \mathbb{C}^{n}$, then it is holomorphic (analytic) in $D$.

Lemma 2.2. [20] p. 5 Proposition 1] If $f\left(x_{1}, x_{2}, \ldots, x_{k}\right)$ is analytic at the origin $(0,0, \ldots, 0) \in \mathbb{C}^{k}$, then, $f$ can be expanded in an absolutely convergent power series

$$
\begin{equation*}
f\left(x_{1}, x_{2}, \ldots, x_{k}\right)=\sum_{n_{1}, n_{2}, \cdots, n_{k}=0}^{\infty} \alpha_{n_{1}, n_{2}, \cdots, n_{k}} x_{1}^{n_{1}} x_{2}^{n_{2}} \cdots x_{k}^{n_{k}} . \tag{2.2}
\end{equation*}
$$

Proof of Theorem [2.1 From the Hartogs's Theorem and the theory of several complex variables (see Lemmas 2.1] and 2.2], we assume that

$$
\begin{equation*}
f(a, x, y)=\sum_{k=0}^{\infty} A_{k}(a, x) y^{k} . \tag{2.3}
\end{equation*}
$$

Substituting (2.3) into (2.1) yields

$$
\begin{equation*}
x \sum_{k=0}^{\infty}\left(1-q^{k}\right) A_{k}(a, x) y^{k}=-\sum_{k=0}^{\infty}\left(1-a q^{k}\right) q^{k}\left[A_{k}(a, x)-A_{k}(a, q x)\right] y^{k+1} \tag{2.4}
\end{equation*}
$$

Comparing coefficients of $y^{k}, k \geq 1$, we readily find that

$$
\begin{equation*}
x\left(1-q^{k}\right) A_{k}(a, x)=-\left(1-a q^{k-1}\right) q^{k-1}\left[A_{k-1}(a, x)-A_{k-1}(a, q x)\right] \tag{2.5}
\end{equation*}
$$

which equals to

$$
\begin{equation*}
A_{k}(a, x)=-q^{k-1} \frac{1-a q^{k-1}}{1-q^{k}} D_{q}\left\{A_{k-1}(a, x)\right\} . \tag{2.6}
\end{equation*}
$$

By iteration, we gain

$$
\begin{equation*}
A_{k}(a, x)=(-1)^{k} q^{\left(\frac{k}{2}\right)} \frac{(a ; q)_{k}}{(q ; q)_{k}} D_{q}^{k}\left\{A_{0}(a, x)\right\} . \tag{2.7}
\end{equation*}
$$

Letting $f(a, x, 0)=A_{0}(a, x)=\sum_{n=0}^{\infty} \mu_{n} x^{n}$, we have

$$
\begin{equation*}
\left.A_{k}(a, x)=(-1)^{k} q^{\frac{k}{2}}\right) \frac{(a ; q)_{k}}{(q ; q)_{k}} \sum_{n=0}^{\infty} \mu_{n} \frac{(q ; q)_{n}}{(q ; q)_{n-k}} x^{n-k} \tag{2.8}
\end{equation*}
$$

Replacing (2.8) in (2.3), we have:

$$
\begin{align*}
f(a, x, y) & =\sum_{k=0}^{\infty}(-1)^{k} q^{\left(\frac{k}{2}\right)} \frac{(a ; q)_{k}}{(q ; q)_{k}} \sum_{n=0}^{\infty} \mu_{n} \frac{(q ; q)_{n}}{(q ; q)_{n-k}} x^{n-k} y^{k} \\
& =\sum_{n=0}^{\infty} \mu_{n} \sum_{k=0}^{n}\left[\begin{array}{l}
n \\
k
\end{array}\right]_{q}(-1)^{k} q^{\left(\frac{k}{2}\right)}(a ; q)_{k} x^{n-k} y^{k} . \tag{2.9}
\end{align*}
$$

On the other hand, if $f(a, x, y)$ can be expanded in term of $p_{n}(x, y, a)$, we can verify that $f(a, x, y)$ satisfies (2.1). The proof of the assertion (2.1) of Theorem [2.1] is now completed.

Theorem 2.2. Let $f(a, x, y, z)$ be a four-variable analytic function in a neighborhood of $(a, x, y, z)=$ $(0,0,0,0) \in \mathbb{C}^{4}$.
(1) If $f(a, x, y)$ satisfies the $q$-difference equation

$$
\begin{equation*}
x[f(a, x, y)-f(a, x, q y)]=y[f(a, q x, q y)-f(a, x, q y)]-a y\left[f\left(a, q x, q^{2} y\right)-f\left(a, x, q^{2} y\right)\right] \tag{2.10}
\end{equation*}
$$

then we have:

$$
\begin{equation*}
f(a, x, y)=\widetilde{E}\left(a, y ; D_{q}\right)\{f(a, x, 0)\} . \tag{2.11}
\end{equation*}
$$

(2) If $f(a, x, y, z)$ satisfies the $q$-difference equation

$$
\begin{align*}
& \left(q^{-1} x-y\right)[f(a, x, y, z)-f(a, x, y, q z)] \\
& \quad=z\left[f\left(a, q^{-1} x, y, q z\right)-f(a, x, q y, q z)\right]+a z\left[f\left(a, x, q y, q^{2} z\right)-f\left(a, q^{-1} x, y, q^{2} z\right)\right] \tag{2.12}
\end{align*}
$$

then we have:

$$
\begin{equation*}
f(a, x, y, z)=\widetilde{L}\left(a, z ; \theta_{x y}\right)\{f(a, x, y, 0)\} . \tag{2.13}
\end{equation*}
$$

Corollary 2.1. Let $f(a, b)$ be a two-variable analytic function in a neighborhood of $(a, b)=(0,0) \in \mathbb{C}^{2}$. If $f(a, b)$ satisfies the $q$-difference equation

$$
\begin{equation*}
a f(a, b)-b f(q a, q b)=(a-b) f(a, q b) \tag{2.14}
\end{equation*}
$$

then we have:

$$
\begin{equation*}
f(a, b)=R\left(b D_{q}\right)\{f(a, 0)\} . \tag{2.15}
\end{equation*}
$$

Remark 2.1. For $x=a, y=b$ and $z=0$, the relation (2.10) reduces to (2.14).
For $a=0, x=a, y=0$ and $z=b$, the $q$-difference equation (2.12) reduces to (1.12).
Proof of Theorem [2.2 From the theory of several complex variables [21], we begin to solve the $q$ difference equation (2.10). First we may assume that

$$
\begin{equation*}
f(a, x, y)=\sum_{k=0}^{\infty} A_{k}(a, x) y^{k}, \tag{2.16}
\end{equation*}
$$

Substituting this equation into (2.10) and comparing coefficients of $y^{k}, k \geq 1$, we readily find that

$$
\begin{equation*}
x\left(1-q^{k}\right) A_{k}(a, x)=-\left(1-a q^{k-1}\right) q^{k-1}\left[A_{k-1}(a, x)-A_{k-1}(a, q x)\right] \tag{2.17}
\end{equation*}
$$

which equals to

$$
\begin{equation*}
A_{k}(a, x)=-q^{k-1} \frac{1-a q^{k-1}}{1-q^{k}} D_{q}\left\{A_{k-1}(a, x)\right\} . \tag{2.18}
\end{equation*}
$$

By iteration, we gain

$$
\begin{equation*}
A_{k}(a, x)=(-1)^{k} q^{\left(\frac{k}{2}\right)} \frac{(a ; q)_{k}}{(q ; q)_{k}} D_{q}^{k}\left\{A_{0}(a, x)\right\} . \tag{2.19}
\end{equation*}
$$

Now we return to calculate $A_{0}(a, x)$. Just taking $y=0$ in (2.16), we immediately obtain $A_{0}(a, x)=$ $f(a, x, 0)$. The proof of the assertion (2.11) of Theorem 2.2 is now completed by substituting (2.19) back into (2.16).
Similarly, we begin to solve the $q$-difference equation (2.12). First we may assume that

$$
\begin{equation*}
f(a, x, y, z)=\sum_{n=0}^{\infty} B_{n}(a, x, y) z^{n} . \tag{2.20}
\end{equation*}
$$

Then substituting the above equation into (2.12), we have:

$$
\begin{equation*}
\left(q^{-1} x-y\right) \sum_{n=0}^{\infty}\left(1-q^{n}\right) B_{n}(a, x, y) z^{n}=\sum_{n=0}^{\infty} q^{n}\left(1-a q^{n}\right)\left[B_{n}\left(a, q^{-1} x, y\right)-B_{n}(a, x, q y)\right] z^{n+1} \tag{2.21}
\end{equation*}
$$

Comparing coefficients of $z^{n}, n \geq 1$, we readily find that

$$
\begin{equation*}
\left(q^{-1} x-y\right)\left(1-q^{n}\right) B_{n}(a, x, y)=q^{n-1}\left(1-a q^{n-1}\right)\left[B_{n-1}\left(a, q^{-1} x, y\right)-B_{n-1}(a, x, q y)\right] . \tag{2.22}
\end{equation*}
$$

After simplification, we get

$$
\begin{equation*}
B_{n}(a, x, y)=q^{n-1} \frac{1-a q^{n-1}}{1-q^{n}} \theta_{x y}\left\{B_{n-1}(a, x, y)\right\} . \tag{2.23}
\end{equation*}
$$

By iteration, we gain

$$
\begin{equation*}
B_{n}(a, x, y)=\frac{q^{\left(\frac{n}{2}\right)}(a ; q)_{n}}{(q ; q)_{n}} \theta_{x y}^{n}\left\{B_{0}(a, x, y)\right\} . \tag{2.24}
\end{equation*}
$$

Now we return to calculate $A_{0}(a, x, y)$. Just taking $z=0$ in (2.20), we immediately obtain $A_{0}(a, x, y)$ $=f(a, x, y, 0)$. The proof of the assertion (2.13) of Theorem 2.2] is now completed by substituting (2.24) back into 2.20 .

## 3. Generating functions for generalized Cauchy polynomials

The generalized Cauchy polynomials $p_{n}(x, y, a)$ [29] are defined as

$$
p_{n}(x, y, a)=\sum_{k=0}^{n}\left[\begin{array}{l}
n  \tag{3.1}\\
k
\end{array}\right]_{q}(-1)^{k} q^{\binom{k}{2}}(a ; q)_{k} x^{n-k} y^{k}
$$

and their generating function
Lemma 3.1. [29, Eq. (2.21)] Suppose that $|x t|<1$, we have:

$$
\sum_{n=0}^{\infty} p_{n}(x, y, a) \frac{t^{n}}{(q ; q)_{n}}=\frac{1}{(x t ; q)_{\infty}} 1 \Phi_{1}\left[\begin{array}{l}
a ;  \tag{3.2}\\
0 ; y t \\
0 ;
\end{array}\right]
$$

For $a=0$, in Lemma 3.1 we get the following
Lemma 3.2. [6] Suppose that $|x t|<1$, we have:

$$
\begin{equation*}
\sum_{n=0}^{\infty} p_{n}(x, y) \frac{t^{n}}{(q ; q)_{n}}=\frac{(y t ; q)_{\infty}}{(x t ; q)_{\infty}} . \tag{3.3}
\end{equation*}
$$

In this section, we use the representation (3.1) to derive another generating function for generalized Cauchy polynomials by the method of homogeneous $q$-difference equations.

Theorem 3.1. Suppose that $|r x|<1$, we have:

$$
\sum_{n=0}^{\infty} p_{n}(x, y, a) \frac{(s / r ; q)_{n} r^{n}}{(q ; q)_{n}}=\frac{(s x ; q)_{\infty}}{(r x ; q)_{\infty}} 2^{2} \Phi_{2}\left[\begin{array}{l}
a, s / r ;  \tag{3.4}\\
q ; r y \\
s x, 0 ;
\end{array}\right]
$$

## Corollary 3.1.

$$
\sum_{n=0}^{\infty} p_{n}(x, y, a)(-1)^{n} q^{(n)} \frac{s^{n}}{(q ; q)_{n}}=(s x ; q)_{\infty 1} \Phi_{2}\left[\begin{array}{r}
a ;  \tag{3.5}\\
s x, 0 ; \\
q ; s y
\end{array}\right]
$$

Remark 3.1. For $s=0$ and $r=t$ in Theorem 3.1, (3.4) reduces to (3.2). For $s=0, r=t$ and $a=0$ in Theorem 3.1, (3.4) reduces to (3.3). For $r=0$ in Theorem 3.1) (3.4) reduces to (3.5).

Proof of Theorem 3.1] By denoting the right-hand side of (3.4) by $f(a, x, y)$, we can verify that $f(a, x, y)$ satisfies (2.1). So, we have

$$
\begin{equation*}
f(a, x, y)=\sum_{n=0}^{\infty} \mu_{n} p_{n}(x, y, a) \tag{3.6}
\end{equation*}
$$

and

$$
\begin{equation*}
f(a, x, 0)=\sum_{n=0}^{\infty} \mu_{n} x^{n}=\frac{(s x ; q)_{\infty}}{(r x ; q)_{\infty}}=\sum_{n=0}^{\infty} \frac{(s / r ; q)_{n}(r x)^{n}}{(q ; q)_{n}} . \tag{3.7}
\end{equation*}
$$

So, $f(a, x, y)$ is equal to the right-hand side of (3.4).
Theorem 3.2. For $k \in \mathbb{N}$ and $|x t|<1$, we have:

$$
\sum_{n=0}^{\infty} p_{n+k}(x, y, a) \frac{t^{n}}{(q ; q)_{n}}=\frac{x^{k}}{(x t ; q)_{\infty}} \sum_{n=0}^{\infty} \frac{\left(q^{-k}, x t, a ; q\right)_{n}\left(y x^{-1} q^{k}\right)^{n}}{(q ; q)_{n}}{ }_{1} \Phi_{1}\left[\begin{array}{c}
a q^{n} ;  \tag{3.8}\\
q ; y t q^{n} \\
0 ;
\end{array}\right] .
$$

Remark 3.2. For $k=0$, in Theorem 3.2, (3.8) reduces to (3.2).
Proof of Theorem 3.2 Denoting the right-hand side of equation (3.8) equivalently by

$$
f(a, x, y)=x^{k} \sum_{n=0}^{\infty} \frac{\left(q^{-k}, x t, a ; q\right)_{n}\left(y x^{-1} q^{k}\right)^{n}}{(q ; q)_{n}} \frac{1}{\left(x t q^{n} ; q\right)_{\infty}}{ }^{1} \Phi_{1}\left[\begin{array}{c}
a q^{n} ;  \tag{3.9}\\
q ; y t q^{n} \\
0 ;
\end{array}\right]
$$

and it is easy to check that (3.9) satisfies (2.10), so we have:

$$
\begin{equation*}
f(a, x, y)=\sum_{n=0}^{\infty} \mu_{n} p_{n}(x, y, a) . \tag{3.10}
\end{equation*}
$$

Setting $y=0$ in (3.9), it becomes

$$
\begin{equation*}
f(a, x, 0)=\sum_{n=0}^{\infty} \mu_{n} x^{n}=\frac{x^{k}}{(x t ; q)_{\infty}}=\sum_{n=0}^{\infty} x^{n+k} \frac{t^{n}}{(q, q)_{n}}=\sum_{n=k}^{\infty} x^{n} \frac{t^{n-k}}{(q, q)_{n-k}} . \tag{3.11}
\end{equation*}
$$

Hence

$$
\begin{equation*}
f(a, x, y)=\widetilde{E}\left(a, \mu ; D_{q}\right)\left\{\sum_{n=k}^{\infty} x^{n} \frac{t^{n-k}}{(q, q)_{n-k}}\right\}=\sum_{n=k}^{\infty} p_{n}(x, y, a) \frac{t^{n-k}}{(q, q)_{n-k}}=\sum_{n=0}^{\infty} p_{n+k}(x, y, a) \frac{t^{n}}{(q, q)_{n}}, \tag{3.12}
\end{equation*}
$$

which is the left-hand side of (3.8).

## 4. SRIVAStava-Agarwal type generating functions involving generalized cauchy POLYNOMIALS

The Hahn polynomials [12, 13] (or Al-Salam and Carlitz polynomials [1]) are given by

$$
\phi_{n}^{(a)}(x \mid q)=\sum_{k=0}^{n}\left[\begin{array}{l}
n  \tag{4.1}\\
k
\end{array}\right]_{q}(a ; q)_{k} x^{k} .
$$

Srivastava and Agarwal deduced the following generating function (also called Srivastava-Agarwal type generating functions).

Lemma 4.1. [28, eq. (3.20)]

$$
\left.\sum_{n=0}^{\infty} \phi_{n}^{(\alpha)}(x \mid q)(\lambda ; q)_{n} \frac{t^{n}}{(q ; q)_{n}}=\frac{(\lambda t ; q)_{\infty}}{(t ; q)_{\infty}}{ }_{2} \Phi_{1}\left[\begin{array}{c}
\lambda, \alpha ;  \tag{4.2}\\
\\
\lambda t ;
\end{array}\right] ; x t\right], \quad \max \{|t|,|x t|\}<1 .
$$

For $\lambda=0$, we have:
Lemma 4.2. [5, eq.(1.14)]

$$
\begin{equation*}
\sum_{k=0}^{\infty} \phi_{k}^{(\alpha)}(x \mid q) \frac{t^{k}}{(q ; q)_{k}}=\frac{(\alpha x t ; q)_{\infty}}{(x t, t ; q)_{\infty}}, \quad \max \{|x t|,|t|\}<1 \tag{4.3}
\end{equation*}
$$

For more information about Srivastava-Agarwal type generating functions for Al-Salam-Carlitz polynomials, please refer to [28, 3].

In this section, we use the representation (3.1) to derive Srivastava-Agarwal type generating function for generalized Cauchy polynomials by the method of homogeneous $q$-difference equations.

Theorem 4.1. For $M \in \mathbb{N}$, if $\alpha=q^{-M}$ and $\max \{|\lambda t|,|\lambda x t|\}<1$, we have:

$$
\begin{align*}
\sum_{n=0}^{\infty} \phi_{n}^{(\alpha)}(x \mid q) p_{n}(\lambda, \mu, a) & \frac{t^{n}}{(q ; q)_{n}} \\
& =\frac{(\alpha \lambda x t ; q)_{\infty}}{(\lambda x t, \lambda t ; q)_{\infty}} \sum_{k=0}^{\infty} \frac{(-1)^{k} q^{(k)}(a, \alpha, \lambda t ; q)_{k}(\mu x t)^{k}}{(\alpha \lambda x t, q ; q)_{k}}{ }_{1} \Phi_{1}\left[\begin{array}{c}
a q^{k} ; \\
q ; \mu t q^{k} \\
0 ;
\end{array}\right] . \tag{4.4}
\end{align*}
$$

Remark 4.1. Setting $a=0, \lambda=1$ and $\mu=0$, formula (4.4) reduces to (4.3). For $a=0, \lambda=1$ and $\mu=\lambda$, formula (4.4) reduces to (4.2).

Proof of Theorem 4.1 Denoting the right-hand side of equation (4.4) by $H(a, \lambda, \mu, \alpha, x)$, then we have:

$$
\begin{align*}
& H(a, \lambda, \mu, \alpha, x) \\
& \quad=\frac{1}{(\lambda x t ; q)_{\infty}} \sum_{n=0}^{\infty} \frac{(-1)^{n} q^{(n)}(a ; q)_{n}(\mu t)^{n}}{(q ; q)_{n}} \sum_{k=0}^{\infty} \frac{(-1)^{k} q^{(k)}\left(\alpha, a q^{n} ; q\right)_{k}\left(\mu x t q^{n}\right)^{k}}{(q ; q)_{k}} \frac{\left(\alpha \lambda x t q^{k} ; q\right)_{\infty}}{\left(\lambda t q^{k} ; q\right)_{\infty}} . \tag{4.5}
\end{align*}
$$

We suppose that the operator $D_{q}$ acts upon the variable $\lambda$. Because equation (4.5) satisfies (2.10), we have:

$$
\begin{aligned}
H(a, \lambda, \mu, \alpha, x)=\widetilde{E}\left(a, \mu ; D_{q}\right)\{H(a, \lambda, 0, \alpha, x)\} & =\widetilde{E}\left(a, \mu ; D_{q}\right)\left\{\frac{(\alpha \lambda x t ; q)_{\infty}}{(\lambda x t, \lambda t ; q)_{\infty}}\right\} \\
& =\widetilde{E}\left(a, \mu ; D_{q}\right)\left\{\sum_{k=0}^{\infty} \Phi_{k}^{(\alpha)}(x \mid q) \frac{(\lambda t)^{k}}{(q ; q)_{k}}\right\} \\
& =\sum_{k=0}^{\infty} \Phi_{k}^{(\alpha)}(x \mid q) \frac{t^{k}}{(q ; q)_{k}} \widetilde{E}\left(a, \mu ; D_{q}\right)\left\{\lambda^{k}\right\}
\end{aligned}
$$

which is the left-hand side of 4.5). The proof is complete.

## 5. A TRANSFORMATIONAL IDENTITY INVOLVING GENERATING FUNCTIONS FOR GENERALIZED CaUChy polynomials

In this section we deduce the following transformational identity involving generating functions for generalized Cauchy polynomials by the method of homogeneous $q$-difference equation.

Theorem 5.1. Let $A(k)$ and $B(k)$ satisfy

$$
\begin{equation*}
\sum_{k=0}^{\infty} A(k) x^{k}=\sum_{k=0}^{\infty} B(k) \frac{1}{\left(x t q^{k} ; q\right)_{\infty}} \tag{5.1}
\end{equation*}
$$

and we have

$$
\sum_{k=0}^{\infty} A(k) p_{k}(x, y, a)=\sum_{k=0}^{\infty} B(k) \frac{1}{\left(x t q^{k} ; q\right)_{\infty}} 1_{1} \Phi_{1}\left[\begin{array}{l}
a ;  \tag{5.2}\\
0 ; y t q^{k} \\
0 ;
\end{array}\right]
$$

supposing that (5.1) and (5.2) are convergent.
Proof. We denote the right-hand side of (5.2) by $f(a, x, y)$ and we can check that $f(a, x, y)$ satisfies (2.10). We then obtain

$$
\begin{equation*}
f(a, x, y)=\sum_{k=0}^{\infty} \mu_{k} p_{k}(x, y, a) \tag{5.3}
\end{equation*}
$$

and

$$
\begin{align*}
f(a, x, 0)=\sum_{k=0}^{\infty} \mu_{k} x^{k} & =\sum_{k=0}^{\infty} B(k) \frac{1}{\left(x t q^{k} ; q\right)_{\infty}}(\text { by (5.1) }) \\
& =\sum_{k=0}^{\infty} A(k) x^{k} . \tag{5.4}
\end{align*}
$$

Hence

$$
\begin{equation*}
f(a, x, y)=\sum_{k=0}^{\infty} A(k) p_{k}(x, y, a), \tag{5.5}
\end{equation*}
$$

which is the left-hand side of (5.2). The proof of Theorem5.1 is thus completed.
