$$
A_{2 l}^{(2)} \text { AT LEVEL }-l-\frac{1}{2}
$$

SHASHANK KANADE

#### Abstract

Let $L_{l}=L\left(\mathfrak{s l}_{2 l+1},-l-\frac{1}{2}\right)$ be the simple vertex operator algebra based on the affine Lie algebra $\widehat{\mathfrak{s l}}_{2 l+1}$ at boundary admissible level $-l-\frac{1}{2}$.

We consider a lift $\nu$ of the Dynkin diagram involution of $A_{2 l}=\mathfrak{s l}_{2 l+1}$ to an involution of $L_{l}$. The $\nu$-twisted $L_{l}$-modules are $A_{2 l}^{(2)}$-modules of level $-l-\frac{1}{2}$ with an anti-homogeneous realization. We classify simple $\nu$-twisted highest-weight (weak) $L_{l}$-modules using twisted Zhu algebras and singular vectors for $\widehat{\mathfrak{s l}}_{2 l+1}$ at level $-l-\frac{1}{2}$ obtained by Perše.

We find that there are finitely many such modules up to isomorphism, and the $\nu$-twisted (weak) $L_{l}$-modules that are in category $\mathcal{O}$ for $A_{2 l}^{(2)}$ are semi-simple.

## 1. Introduction

In [16], while studying the modular invariant representations of affine Lie algebras, Kac and Wakimoto introduced the notion of admissible highest-weight representations and classified these in [17]. Let $\mathfrak{g}$ be a finite dimensional simple Lie algebra of type $X_{N}$, and let $\widehat{\mathfrak{g}}$ be the corresponding untwisted affine Lie algebra of type $X_{N}^{(1)}$ (see [15, Table Aff 1]). Since [16], vertex operator algebras (say $L(\mathfrak{g}, k)$ ) based on the untwisted affine Lie algebra $\widehat{\mathfrak{g}}$ at admissible levels $k$ have received a tremendous amount of attention.

In [2], Adamović and Milas analysed the case of $\mathfrak{g}=\mathfrak{s l}_{2}$ for all admissible levels $k$, classified the weak modules of $L\left(\mathfrak{s l}_{2}, k\right)$ that belong to category $\mathcal{O}$ as $\widehat{\mathfrak{s l}}_{2}$-modules and showed that this category is semi-simple with finitely many equivalence classes of irreducibles. They conjectured that this holds for all untwisted affine Lie algebras. The $\mathfrak{g}=\mathfrak{s l}_{2}$ case was also studied in [10, 12]. In a celebrated achievement, Arakawa proved this conjecture [4]. Before [4], several other specific cases of this conjecture were known to be true, notably in type $C$ [1], in type $A$ [25], in type $B$ [24] and for $G_{2}[5]$. In $[2,1,25,24,5]$, the technique of Zhu algebras [29, 14] and an explicit knowledge of the singular vectors at the prescribed levels was used.

It is also important to consider categories larger than $\mathcal{O}$, namely, the categories generated by relaxed highest weight modules. For $\mathfrak{g}=\mathfrak{s l}_{2}$, simple relaxed highest-weight modules at admissible levels were classified using the Zhu technology in [2]. Recently, a classification for arbitrary rank based on Mathieu's coherent famililes [23] is presented in [20]. We will not pursue this direction here.

Kac-Wakimoto's work [16] also included a discussion of affine Lie super-algebras, and indeed models related to $\mathfrak{o s p}(1 \mid 2)$ at admissible levels have been analysed in [26, 9, 27]. However, it is not clear if semi-simplicity holds beyond $\mathfrak{o s p}(1 \mid 2 n)^{1}$, and [4] does not encompass affine super-algebras.

Despite all these stellar advances, the case of twisted affine Lie algebras (see [15, Table Aff 2, Aff 3]) has received little to no attention. The most natural way to access modules for $X_{N}^{(r)}$ where $r=2,3$ is by considering $\nu$-twisted modules for the VOAs based on the corresponding untwisted

[^0]affine Lie algebras $X_{N}^{(1)}[13,22]$. Here, $\nu$ is a lift of the non-trivial Dynkin diagram automorphism to $\mathfrak{g}$ and $\nu$ fixes the chosen Cartan sub-algebra. $\nu$ is then extended to act on the whole VOA. We may modify $\nu$ by composing it with $\exp (2 \pi \mathrm{i} \cdot \operatorname{ad} h)$ for certain Cartan elements $h$ with $\nu(h)=h$ [15, Eq. 8.1.2]. This way, we get different realizations of $X_{N}^{(r)}$ differing primarily in their gradings.

In this paper, we consider the case of $A_{2 l}^{(2)}$ at level $-l-\frac{1}{2}$ for $l \in \mathbb{Z}_{>0}$. We use the anti-homogeneous realization of $A_{2 l}^{(2)}$ obtained from an involutive lift $\nu$ of the Dynkin diagram automorphism of $\mathfrak{g}=\mathfrak{s l}_{2 l+1}=A_{2 l}$. Here, anti-homogeneous refers to the fact that our picture is exactly the opposite of the traditional one - our affine, i.e., 0 th node for $A_{2 l}^{(2)}$ is what is usually the last, i.e., $l$ th node in the affine Dynkin diagram, and our horizontal subalgebra is thus $\mathfrak{s o}_{2 l+1}=B_{l}$ and not $\mathfrak{s p}_{2 l}=C_{l}$.

We use twisted Zhu algebras [11] (see also [28]) and the singular vectors for $\widehat{\mathfrak{s}}_{2 l+1}$ at level $-l-\frac{1}{2}$ obtained by Perše in [25]. Somewhat surprisingly, we find that the top spaces of the $A_{2 l}^{(2)}$ modules (which are naturally modules for our horizontal subalgebra, $B_{l}$ ) are exactly the same as the top spaces for the highest-weight $L\left(B_{l},-l+\frac{3}{2}\right)$-modules found in [24]. Letting $h^{\vee}$ denote the dual Coxeter number [15, Ch. 6], the relation between these levels for $l>1$ is that

$$
\begin{equation*}
-l-\frac{1}{2}+h_{A_{2 l}(2)}^{\vee}=l+\frac{1}{2}=-l+\frac{3}{2}+h_{B_{l}{ }^{(1)}}^{\vee} . \tag{1.1}
\end{equation*}
$$

Our proof of admissibility of the $A_{2 l}^{(2)}$ highest weights thus obtained also uses a large portion of the corresponding proof in [24]. The proof of semi-simplicity then proceeds as in $[2,1,25,24,5]$, etc., with appropriate changes to accommodate twisted modules.

We find that there are two inequivalent $\nu$-twisted irreducible modules for $L\left(\mathfrak{s l}_{2 l+1},-l-\frac{1}{2}\right)$ with finite dimensional top spaces (Remark 4.8). Recall that $-l-\frac{1}{2}$ is a boundary admissible level [19] for $A_{2 l}^{(1)}$ and correspondingly, there is exactly one (up to equivalence) irreducible with finite dimensional top space in the untwisted sector [25].

This naturally leads to the following speculations and considerations that we are currently investigating.
(1) Perhaps the most important speculation we have is that the Adamović-Milas conjecture / Arakawa's theorem is true for twisted affine Lie algebras as well. To be precise, we speculate that given a twisted affine Lie algebra $X_{N}^{(r)}$, and an admissible level $k$ for (the untwisted) $X_{N}^{(1)}$, there exists an appropriate realization of $X_{N}^{(r)}$ and a corresponding lift $\nu$ of the (non-trivial) diagram automorphism of $X_{N}$, such that $\nu$-twisted (weak) $L\left(X_{N}, k\right)$ modules which are in category $\mathcal{O}$ as $X_{N}^{(r)}$-modules form a semi-simple category with finitely many irreducibles.
(2) In [8], it was proved that the ordinary modules for $L\left(X_{N}, k\right)$ ( $k$ is admissible level for the untwisted affine Lie algebra $X_{N}^{(1)}$ ), form a vertex tensor category; the rigidity of this category for the simply-laced cases was proved in [7]. Our results imply that in general, the category consisting of untwisted and $g$-twisted ordinary modules for $g \in\langle\nu\rangle$ will not be closed under twisted fusion.

In our present case, the untwisted and $\nu$-twisted ordinary modules form semi-simple categories, but the untwisted sector has one simple (up to equivalences) and the $\nu$-twisted one has two inequivalent simples. The aforementioned closure under twisted fusion is now forbidden by elementary considerations of tensor categories.

In general, such ordinary $g$-twisted modules are integrable in the direction of $\mathfrak{g}^{0}$ (the fixed point subalgebra of $\mathfrak{g}=X_{N}$ under $\nu$ ), thus it is natural to expect their (twisted) fusion to be integrable with respect to $\mathfrak{g}^{0}$, but it need not be $\mathfrak{g}$-integrable.

It will be difficult but interesting to work out the twisted fusion for our $\nu$-twisted modules, and perhaps also the fusion for the untwisted modules for the corresponding orbifold. Here, the structure of this orbifold [3] will be important to first classify its modules.
(3) It will be very interesting to also analyse twisted quantum Drinfeld-Sokolov reductions [18] of the $\nu$-twisted modules we have found for appropriate nilpotents $f \in \mathfrak{s l}_{2 l+1}$ fixed by $\nu$, and compare these to twisted representations of the corresponding $\mathcal{W}$-algebras. Here again, one may take a slightly different route and investigate the relation of the structure and representation theory of the affine orbifold with that of the $\mathcal{W}$-algebra orbifold.

## 2. Twisted affine Lie algebra $A_{2 l}^{(2)}$

2.1. Twisted affine Lie algebra $A_{2 l}^{(2)}$, basics. We will consider what we call the anti-homogeneous realization of $A_{2 l}^{(2)}$ and recall basic facts from [15, 6]. Consider the generalized Cartan matrices:

$$
\begin{align*}
& \tilde{A}=\begin{array}{c}
0 \\
0 \\
1
\end{array}\left(\begin{array}{cc}
2 & -1 \\
-4 & 2
\end{array}\right),(l=1),  \tag{2.1}\\
& \tilde{A}=\begin{array}{c} 
\\
0 \\
1 \\
2 \\
\vdots \\
l-2 \\
l-1 \\
l \\
l
\end{array}\left(\begin{array}{ccccccc}
0 & 1 & 2 & \cdots & l-2 & l-1 & l \\
2 & -1 & & & & & \\
-2 & 2 & -1 & & & & \\
& -1 & 2 & \ddots & & & \\
& & \ddots & \ddots & \ddots & & \\
& & & \ddots & 2 & -1 & \\
& & & & -1 & 2 & -1 \\
& & & & & -2 & 2
\end{array}\right),(l>1) . \tag{2.2}
\end{align*}
$$

We have the corresponding (affine) Dynkin diagrams:

Here, the $0^{\text {th }}$ node is considered to be the affine node and the horizontal subalgebra of $A_{2 l}^{(2)}$ is of type $B_{l}=\mathfrak{s o}_{2 l+1}$ (unlike the usual convention where it turns out to be $C_{l}=\mathfrak{s p}_{2 l}$ ):

$$
\begin{gather*}
\stackrel{\circ}{\alpha_{1}}  \tag{2.4}\\
l=1
\end{gather*} \quad \stackrel{\circ}{\alpha_{1}}-\stackrel{\circ}{\alpha_{2}}-\alpha_{3}^{\circ}-\cdots \cdots \alpha_{\alpha_{l-2}}^{\circ} \alpha_{l-1}^{\circ} \Longrightarrow \underset{\alpha_{l}}{\circ}
$$

We have:

$$
\begin{array}{cl}
a=\left(a_{0}, \ldots, a_{l}\right)^{t}=(1,2, \ldots, 2)^{t}, & \tilde{A} a=0 \\
a^{\vee}=\left(a_{0}^{\vee}, \ldots, a_{l}^{\vee}\right)=(2,2, \ldots, 2,1), & a^{\vee} \tilde{A}=0 . \tag{2.6}
\end{array}
$$

We will often use the following indexing sets:

$$
\begin{equation*}
I=\{1, \ldots, l\}, \widehat{I}=\{0, \ldots, l\} . \tag{2.7}
\end{equation*}
$$

The twisted affine Lie algebra $A_{2 l}^{(2)}$ has Kac-Moody generators $h_{i}, e_{i}, f_{i}(i \in \widehat{I})$ and $d$ satisfying the usual relations [15]. We let the Cartan subalgebra $\mathfrak{H}$ be spanned by $h_{0}, h_{1}, \ldots, h_{l}, d$, The simple
roots $\alpha_{i}(i \in \widehat{I})$ are elements of $\mathfrak{H}^{*}$. We will sometimes denote the pairing between $\mathfrak{H}^{*}$ and $\mathfrak{H}$ by $(\cdot, \cdot)$. This notation will be overloaded below. For $i, j \in \widehat{I}, k \in I$ we have:

$$
\begin{equation*}
\alpha_{i}\left(h_{j}\right)=\left(\alpha_{i}, h_{j}\right)=\widetilde{A}_{j i}, \quad \alpha_{0}(d)=\left(\alpha_{0}, d\right)=1, \quad \alpha_{k}(d)=\left(\alpha_{k}, d\right)=0 . \tag{2.8}
\end{equation*}
$$

The canonical central element $c \in \mathfrak{H}$ of $A_{2 l}^{(2)}$ and the basic imaginary root $\delta$ are expressed as:

$$
\begin{equation*}
c=\sum_{0 \leq i \leq l} a_{i}^{\vee} h_{i}=2 h_{0}+\cdots+2 h_{l-1}+h_{l}, \quad \delta=\sum_{0 \leq i \leq l} a_{i} \alpha_{i}=\alpha_{0}+2 \alpha_{1} \cdots+2 \alpha_{l} . \tag{2.9}
\end{equation*}
$$

We choose $h_{1}, \ldots, h_{l}, c, d$ as a standard basis for $\mathfrak{H}$. We have:

$$
\begin{equation*}
\delta(c)=0, \delta\left(h_{1}\right)=0, \ldots, \delta\left(h_{l}\right)=0, \delta(d)=1 . \tag{2.10}
\end{equation*}
$$

We also consider $\Lambda_{0}^{c} \in \mathfrak{H}^{*}$ such that:

$$
\begin{equation*}
\Lambda_{0}^{c}(c)=1, \Lambda_{0}^{c}\left(h_{1}\right)=0, \ldots, \Lambda_{0}^{c}\left(h_{l}\right)=0, \Lambda_{0}^{c}(d)=0 \tag{2.11}
\end{equation*}
$$

Note that $\Lambda_{0}^{c}$ is $\frac{1}{2} \Lambda_{0}$, where $\Lambda_{0}$ is the fundamental weight corresponding to the 0th node. It is easy to see that $\alpha_{1}, \ldots, \alpha_{l}, \delta, \Lambda_{0}^{c}$ form a basis of $\mathfrak{H}^{*}$. The standard symmetric (non-degenerate) bilinear form on $\mathfrak{H}$ is given by:

$$
\begin{equation*}
\left(h_{i}, h\right)=\left(\alpha_{i}, h\right) \cdot \frac{a_{i}}{a_{i}^{\mathrm{V}}}, \quad i \in \widehat{I}, h \in \mathfrak{H}, \quad(d, d)=0 . \tag{2.12}
\end{equation*}
$$

The non-degenerate map $(\cdot, \cdot)$ leads to a (linear) isomorphism $\iota: \mathfrak{H} \rightarrow \mathfrak{H}^{*}$ with $(i \in \widehat{I})$ :

$$
\begin{align*}
& \left(\iota(h), h_{1}\right)=\left(h, h_{1}\right), \text { for all } h, h_{1} \in \mathfrak{H},  \tag{2.13}\\
& \iota\left(h_{i}\right)=\frac{a_{i}}{a_{i}^{\vee}} \cdot \alpha_{i}, \iota(c)=\delta, \iota(d)=\Lambda_{0}^{c} . \tag{2.14}
\end{align*}
$$

We may thus get a (non-degenerate) symmetric bilinear form on $\mathfrak{H}^{*}$ by transport of structure. It satisfies $(i, j \in \widehat{I}$ and $k \in I)$ :

$$
\begin{equation*}
\left(\alpha_{i}, \alpha_{j}\right)=\widetilde{A}_{i j} \cdot \frac{a_{i}^{\vee}}{a_{i}}, \quad\left(\delta, \alpha_{k}\right)=(\delta, \delta)=\left(\Lambda_{0}^{c}, \alpha_{k}\right)=\left(\Lambda_{0}^{c}, \Lambda_{0}^{c}\right)=0, \quad\left(\delta, \Lambda_{0}^{c}\right)=1 . \tag{2.15}
\end{equation*}
$$

The squared root lengths are therefore $(k=1, \ldots, l-1)$ :

$$
\begin{equation*}
\left(\alpha_{0}, \alpha_{0}\right)=4,\left(\alpha_{k}, \alpha_{k}\right)=2,\left(\alpha_{l}, \alpha_{l}\right)=1 \tag{2.16}
\end{equation*}
$$

The root system of $A_{2 l}^{(2)}$ depends on $l$. Let $l>1$. The root system of the horizontal subalgebra $B_{l}$ can be realized as (with $k=1, \ldots, l-1$ and $i, j \in I$ ):

$$
\begin{equation*}
\alpha_{k}=\epsilon_{k}-\epsilon_{k+1}, \alpha_{l}=\epsilon_{l}, \quad \text { where }\left(\epsilon_{i}, \epsilon_{j}\right)=\delta_{i j} \tag{2.17}
\end{equation*}
$$

We have:

$$
\begin{equation*}
\Phi^{\text {long }}=\left\{ \pm \epsilon_{i} \pm \epsilon_{j} \mid 1 \leq i<j \leq l\right\}, \quad \Phi^{\text {short }}=\left\{ \pm \epsilon_{i} \mid i=1, \ldots, l\right\} \tag{2.18}
\end{equation*}
$$

and the real roots for $A_{2 l}^{(2)}$ are [6]:

$$
\begin{align*}
\widehat{\Delta}^{\text {re }} & =\widehat{\Phi}^{\text {long }} \cup \widehat{\Phi}^{\text {intermediate }} \cup \widehat{\Phi}^{\text {short }} \\
& =\left\{2 \alpha_{s}+(2 m+1) \delta \mid \alpha \in \Phi_{s}, m \in \mathbb{Z}\right\} \cup\left\{\alpha+m \delta \mid \alpha \in \Phi_{l}, m \in \mathbb{Z}\right\} \cup\left\{\alpha+m \delta \mid \alpha \in \Phi_{s}, m \in \mathbb{Z}\right\} \tag{2.19}
\end{align*}
$$

where the squared norms of roots in the respective sets are 4,2 and 1 . With $k=1, \ldots, l-1$, the fundamental weights of the horizontal subalgebra are:

$$
\begin{equation*}
\omega_{k}=\epsilon_{1}+\cdots+\epsilon_{k}, \quad \omega_{l}=\frac{1}{2}\left(\omega_{1}+\cdots+\omega_{l}\right) . \tag{2.20}
\end{equation*}
$$

For $l=1$, the horizontal subalgebra is $\mathfrak{s l}_{2}$ with simple positive root $\alpha_{1}$, and we have:

$$
\begin{equation*}
\widehat{\Delta}^{\mathrm{re}}=\widehat{\Phi}^{\mathrm{long}} \cup \widehat{\Phi}^{\text {short }}=\left\{ \pm 2 \alpha_{1}+(2 m+1) \delta \mid m \in \mathbb{Z}\right\} \cup\left\{ \pm \alpha_{1}+m \delta \mid m \in \mathbb{Z}\right\} . \tag{2.21}
\end{equation*}
$$

Here, note that $\left(\alpha_{1}, \alpha_{1}\right)=1$, and thus squared norms of the roots in these sets are 4 and 1 , respectively. The fundamental weight for the horizontal algebra is $\omega_{1}=\frac{1}{2} \alpha_{1}$.

Let $\rho$ be any element of $\mathfrak{H}^{*}$ satisfying $\rho\left(h_{i}\right)=1$ for all $i \in \widehat{I}$. We may take it to be: $\rho=h^{\vee} \Lambda_{0}^{c}+\bar{\rho}$ where $\bar{\rho}$ is half the sum of positive roots of the horizontal sub-algebra and $h^{\vee}=a_{0}^{\vee}+\cdots+a_{l}^{\vee}=2 l+1$ is the dual Coxeter number of $A_{2 l}^{(2)}$. For $l=1, \bar{\rho}=\frac{1}{2} \alpha_{1}$. If $l>1$, we have:

$$
\begin{equation*}
\bar{\rho}=\left(l-\frac{1}{2}\right) \epsilon_{1}+\left(l-\frac{3}{2}\right) \epsilon_{2}+\cdots+\frac{1}{2} \epsilon_{l} . \tag{2.22}
\end{equation*}
$$

Finally, recall the notion of Weyl group $W$ generated by reflections $r_{i}(i \in \widehat{I})$ satisfying $r_{i}(h)=$ $h-\left(\alpha_{i}, h\right) h_{i}$ for $h \in \mathfrak{H}$ and we transfer the action to $\mathfrak{H}^{*}$ by $\iota$. We have $W \cdot\left\{\alpha_{0}, \ldots, \alpha_{l}\right\}=\widehat{\Delta}^{\text {re }}$ and we define $\widehat{\Delta}^{\vee}$,re $=W \cdot\left\{h_{0}, \ldots, h_{l}\right\}$, which is the set of real coroots. There is thus a bijection from real roots to real coroots denoted by ${ }^{\vee}$ such that $\alpha_{i} \mapsto \alpha_{i}^{\vee}=h_{i}$, and it is not hard to prove, using the invariance of $(\cdot, \cdot)$ under the Weyl group that for $\lambda \in \mathfrak{H}^{*}, \alpha \in \widehat{\Delta}^{\text {re }}$ that

$$
\begin{equation*}
\left(\lambda, \alpha^{\vee}\right)=\frac{2}{(\alpha, \alpha)}(\lambda, \alpha) \tag{2.23}
\end{equation*}
$$

Given $\lambda \in \mathfrak{H}^{*}$, define

$$
\begin{equation*}
\widehat{\Delta}_{\lambda}^{\vee, \mathrm{re}}=\left\{\alpha^{\vee} \in \widehat{\Delta}^{\vee, \mathrm{re}} \mid\left(\lambda, \alpha^{\vee}\right) \in \mathbb{Z}\right\}, \quad \widehat{\Delta}_{\lambda}^{\mathrm{re}}=\left\{\alpha \in \widehat{\Delta}^{\mathrm{re}} \mid \alpha^{\vee} \in \widehat{\Delta}_{\lambda}^{\vee, \mathrm{re}}\right\} . \tag{2.24}
\end{equation*}
$$

Definition 2.1. [16] We say an element $\lambda \in \mathfrak{H}^{*}$ is an admissible weight if:
(1) $\left(\lambda+\rho, \alpha^{\vee}\right) \notin\{0,-1,-2, \cdots\}$ for all $\alpha^{\vee} \in \widehat{\Delta}_{+}^{\vee, \text { re }}$ and
(2) $\mathbb{Q} \widehat{\Delta}_{\lambda}^{\vee, \text { re }}=\mathbb{Q}\left\{h_{0}, \ldots, h_{l}\right\}$.

Remark 2.2. The second condition can be equivalently replaced with $\mathbb{Q} \widehat{\Delta}_{\lambda}^{\text {re }}=\mathbb{Q}\left\{\alpha_{0}, \ldots, \alpha_{l}\right\}$.
2.2. Twisted affinizations of Lie algebras. Suppose we are given a finite dimensional (simple) Lie algebra $\mathfrak{g}$ with a symmetric invariant bilinear form $\langle\cdot, \cdot\rangle$. Let $\nu$ be an automorphism of $(\mathfrak{g},\langle\cdot, \cdot\rangle)$ of a finite order, say $T$. Corresponding to $\nu$, we have the eigen-decomposition

$$
\begin{equation*}
\mathfrak{g}=\bigoplus_{j \in \mathbb{Z} / T \mathbb{Z}} \mathfrak{g}^{j}, \quad x \in \mathfrak{g}^{j} \Leftrightarrow \nu(x)=e^{2 \pi \mathrm{i} j / T} x . \tag{2.25}
\end{equation*}
$$

Consider the affinization:

$$
\begin{equation*}
\widehat{\mathfrak{g}}^{\frac{1}{\mathbb{T}}}=\mathfrak{g} \otimes \mathbb{C}\left[t^{1 / T}, t^{-1 / T}\right] \oplus \mathbb{C} c \tag{2.26}
\end{equation*}
$$

We will often drop the superscript $\frac{1}{T} \mathbb{Z}$ since it will be clear from the context. The element $c$ is central and the other brackets are $\left(a, b \in \mathfrak{g}, m, n \in \frac{1}{T} \mathbb{Z}\right)$ :

$$
\begin{equation*}
\left[a \otimes t^{m}, b \otimes t^{n}\right]=[a, b] \otimes t^{m+n}+m \delta_{m+n, 0}\langle a, b\rangle c . \tag{2.27}
\end{equation*}
$$

Define $\nu\left(t^{j / T}\right)=e^{-2 \pi \mathrm{i} j / T} t^{j / T}$ and extend linearly to $\mathbb{C}\left[t^{1 / T}, t^{-1 / T}\right]$. Also let $\nu(c)=c$. We are interested in the fixed point sub-algebra

$$
\begin{equation*}
\widehat{\mathfrak{g}}[\nu]=\bigoplus_{j \in \mathbb{Z} / T \mathbb{Z}}\left(\mathfrak{g}^{j} \otimes t^{j / T} \mathbb{C}\left[t, t^{-1}\right]\right) \oplus \mathbb{C} c . \tag{2.28}
\end{equation*}
$$

We shall obtain $A_{2 l}^{(2)}$ via such twisted affinization of $\mathfrak{g}=A_{2 l}=\mathfrak{s l}_{2 l+1}$.
2.3. Anti-homogeneous realization of $A_{2 l}^{(2)}$. We start by fixing some notation. Fix $l \in \mathbb{Z}_{>0}$. Consider $\mathfrak{g l}_{2 l+1}$ spanned by elementary matrices $E_{i, j}$ (or simply $E_{i j}$ ) with 1 in row $i$ and column $j$, zeros everywhere else. Let $E_{i}=E_{i, i+1}, F_{i}=E_{i+1, i}, H_{i}=E_{i, i}-E_{i+1, i+1}$ be the standard choices of simple root vectors and simple coroots for $\mathfrak{g}=\mathfrak{s l}_{2 l+1} \subset \mathfrak{g l}_{2 l+1}$. Let $\mathfrak{g}=\mathfrak{n}_{-} \oplus \mathfrak{h} \oplus \mathfrak{n}_{+}$be the triangular decomposition of $\mathfrak{g}$. Let $E_{\theta}=E_{1,2 l+1}=\left[\cdots\left[\left[E_{1}, E_{2}\right], E_{3}\right], \cdots, E_{2 l}\right]$.

The anti-homogeneous realization is achieved via an involutive lift of the diagram automorphism of $\mathfrak{s l}_{2 l+1}$ which we now describe.

Define $\nu\left(E_{i, j}\right)=-(-1)^{i-j} E_{2 l+2-j, 2 l+2-i}$. It is straightforward to prove that $\nu$ is an involution of $\mathfrak{g l}_{2 l+1}$ and also of the Lie subalgebra $\mathfrak{g}=\mathfrak{s l}_{2 l+1}$. Corresponding to $\nu$ we have the decomposition $\mathfrak{g}=\mathfrak{g}^{0} \oplus \mathfrak{g}^{1}$ (where the superscripts are understood as elements of $\mathbb{Z}_{2}$ ). It is clear that $\nu\left(H_{i}\right)=$ $H_{2 l+1-i}$, for $i=1, \ldots, 2 l$, and thus $\nu$ is an involutive lift of the Dynkin diagram automorphism of $\mathfrak{g}$. Observe that $E_{\theta} \in \mathfrak{g}^{1}$.

The fixed points $\mathfrak{g}^{0}$ form a simple Lie algebra of type $B_{l}=\mathfrak{s o}_{2 l+1}$ with the following Chevalley generators [6].

$$
\begin{array}{ll}
e_{i}=E_{i}+E_{2 l+1-i}, \quad f_{i}=F_{i}+F_{2 l+1-i}, & h_{i}=H_{i}+H_{2 l+1-i}, \quad(i=1, \ldots l-1), \\
\overline{e_{l}}=\sqrt{2}\left(E_{l}+E_{l+1}\right), \overline{f_{l}}=\sqrt{2}\left(F_{l}+F_{l+1}\right), \quad \overline{h_{l}}=2\left(H_{l}+H_{l+1}\right) . \tag{2.29}
\end{array}
$$

For convenience, we denote:

$$
\begin{equation*}
e_{l}=E_{l}+E_{l+1}, \quad f_{l}=F_{l}+F_{l+1}, \quad h_{l}=H_{l}+H_{l+1} . \tag{2.30}
\end{equation*}
$$

Note again that the actual generators for $B_{l}$ (which will also get promoted to a subset of generators for $A_{2 l}^{(2)}$ below) are indeed $e_{1}, \ldots, e_{l-1}, \overline{e_{l}}, h_{1}, \ldots, h_{l-1}, \overline{h_{l}}, f_{1}, \ldots, f_{l-1}, \overline{f_{l}}$. We have introduced $e_{l}, f_{l}, h_{l}$ only to save ourselves from keeping track of the various scalars.

Given any $a \in \mathfrak{g}$, we let

$$
\begin{equation*}
a=a^{+}+a^{-}, \quad a^{+}=\frac{1}{2}(a+\nu a) \in \mathfrak{g}^{0}, a^{-}=\frac{1}{2}(a-\nu a) \in \mathfrak{g}^{1} . \tag{2.31}
\end{equation*}
$$

We let $\mathfrak{g}^{0}=\mathfrak{n}_{-}^{0} \oplus \mathfrak{h}^{0} \oplus \mathfrak{n}_{+}^{0}$ be the triangular decompositions with respect to our choices of root vectors. Note that $\mathfrak{n}_{+}^{0}$ is spanned by $E_{i, j}^{+}$for $1 \leq i<j \leq 2 l+1$ and that $\operatorname{dim}\left(\mathfrak{h}^{0}\right)=l$.

Later, we shall require the dimension of weight 0 space of $\mathfrak{g}^{1}$ as a $\mathfrak{g}^{0}$-module. One may calculate this directly by decomposing $\mathfrak{g}$ with respect to $\mathfrak{g}^{0}$. Here we present one more approach. Temporarily, let $L(\omega)$ denote irreducible $\mathfrak{g}^{0} \cong \mathfrak{s o}_{2 l+1}$ module with highest weight $\omega$. As a $\mathfrak{g}^{0}$-module, $\mathfrak{g}^{1} \cong L\left(2 \omega_{1}\right)$ and is generated by the highest weight vector $E_{\theta}$. Further, $\operatorname{Sym}^{2} L\left(\omega_{1}\right) \cong L\left(2 \omega_{1}\right) \oplus \mathbb{C}$ and $L\left(\omega_{1}\right)$ is the defining representation of dimension $2 l+1$. It can be seen that if $\omega$ is a weight of $L\left(\omega_{1}\right)$ then so is $-\omega, 0$ is a weight, and every weight space is one dimensional. Thus, the 0 weight space of $\operatorname{Sym}^{2} L\left(\omega_{1}\right)$ has dimension $l+1$, and the 0 weight space of $\mathfrak{g}^{1} \cong L\left(2 \omega_{1}\right)$ has dimension $l$.

Now, $\widehat{\mathfrak{s l}}_{2 l+1}[\nu]$ gives us an anti-homogeneous realization of $A_{2 l}^{(2)}$. Considering the numbering from (2.3), we let the Kac-Moody generators to be the ones given in (2.29) for $i=1, \ldots, l$. As for $h_{0}, e_{0}, f_{0}$, we take them to be:

$$
\begin{equation*}
h_{0}=-H_{\theta}+\frac{1}{2} c=-\left(H_{1}+\cdots+H_{2 l}\right)+\frac{1}{2} c, e_{0}=E_{2 l+1,1} \otimes t^{1 / 2}, f_{0}=E_{1,2 l+1} \otimes t^{-1 / 2} . \tag{2.32}
\end{equation*}
$$

The involution $\nu$ extends to the universal enveloping algebra $\mathfrak{U}(\mathfrak{g})$ and we have $\mathfrak{U}\left(\mathfrak{g}^{0}\right) \subsetneq \mathfrak{U}(\mathfrak{g})^{0} \subsetneq$ $\mathfrak{U}(\mathfrak{g})$. Later, we will be interested in certain two-sided ideals $I \subset \mathfrak{U}\left(\mathfrak{g}^{0}\right)$.

Remark 2.3. It is possible to achieve this realization of $A_{2 l}^{(2)}$ by using the Chevalley involution [15, Eq. 1.3.4] of $A_{2 l}$. However, it is convenient to use an automorphism that respects the triangular decomposition of $\mathfrak{g}$.

## 3. Twisted Zhu algebra: Preliminaries

Let $(V, Y, \mathbf{1}, \omega)$ be a vertex operator algebra [21] and let $g$ be an automorphism of finite order $T$ of $V$. Let $V^{j}(j=0, \ldots, T-1)$ be the subspace of eigenvalue $e^{2 \pi \mathrm{i} j / T}$ for $g$. Following [11], we now define the twisted Zhu algebra $A_{g}(V)$ as follows. Let $u \in V^{j}(0 \leq j<T)$ be $L(0)$ - and $g$ homogeneous element and let $v \in V$. Define

$$
\begin{align*}
& u \circ_{g} v=\operatorname{Res}_{x}\left(\frac{(1+x)^{\mathrm{wt} u-1+\delta_{j}+\frac{j}{T}}}{x^{1+\delta_{j}}} Y(u, x) v\right)  \tag{3.1}\\
& u *_{g} v= \begin{cases}\operatorname{Res}_{x}\left(\frac{(1+x)^{\mathrm{wt} u}}{x} Y(u, x) v\right) & \text { if } j=0 \\
0 & \text { if otherwise. }\end{cases} \tag{3.2}
\end{align*}
$$

where we take $\delta_{j}=1$ when $j=0$ and $\delta_{j}=0$ if $j \neq 0$. Extend $\circ_{g}, *_{g}$ to $V$ linearly. Further define

$$
\begin{equation*}
O_{g}(V)=\operatorname{Span}\left\{u \circ_{g} v \mid u, v \in V\right\}, \quad A_{g}(V)=V / O_{g}(V) . \tag{3.3}
\end{equation*}
$$

Taking $v=\mathbf{1}$ in (3.1) immediately gives us:

$$
\begin{equation*}
V^{i} \subset O_{g}(V) \text { if } i \not \equiv 0 \quad(\bmod T) . \tag{3.4}
\end{equation*}
$$

We will denote the image in $A_{g}(V)$ of $v \in V$ by $\llbracket v \rrbracket_{g}$. It was shown in [11] that $O_{g}(V)$ is a two-sided ideal with respect to $*_{g}$ and that $A_{g}(V)$ is an associative algebra under product $*_{g}$ with $\llbracket 1 \rrbracket$ as the unit and $\llbracket \omega \rrbracket$ belonging to the center. When $g=1, \circ_{g}, *_{g}, O_{g}(V), A_{g}(V)$ are simply denoted as $\circ, *, O(V), A(V)$, respectively. We recall the following basic theorems (and their twisted analogues) from [29, 14, 11, 28].

Theorem 3.1. We have:
(1) [14, 28] Let $I$ be a $g$-stable ideal of $V$, and suppose $\mathbf{1} \notin I, \omega \notin I$. Then, the image of $I$ in $A_{g}(V)$, denoted as $A_{g}(I)$ is a two-sided ideal. Moreover, $A_{g}(V / I) \cong A_{g}(V) / A_{g}(I)$.
(2) [11, Thm. 7.2] There is a bijective correspondance between the set of equivalence classes of simple $A_{g}(V)$ modules and weak, $\frac{1}{T} \mathbb{Z}$-gradable $g$-twisted $V$-modules (see [11, Def. 3.3], where these modules are called admissible, not to be confused with [16]).
Remark 3.2. The first part of the theorem above is proved for $g=1$ (the untwisted case) in [14]. It is not hard to extend the proof to general $g$ [28].

Now, for the rest of the section, let $V=V(\mathfrak{g}, k)$ be the (universal) Verma module vertex operator algebra based on $(\mathfrak{g},\langle\cdot, \cdot\rangle)$ with level $k \neq-h^{\vee}[21]$. Let $g$ be an automorphism of $V$ order $T \neq 1$ lifted from an automorphism $g$ of $(\mathfrak{g},\langle\cdot, \cdot\rangle)$ of the same order $T$.

Theorem 3.3. We have:
(1) [28] There exists an (explicit) isomorphism of associative algebras $F: A_{g}(V(\mathfrak{g}, k)) \xrightarrow{\cong} \mathfrak{U}\left(\mathfrak{g}^{0}\right)$.
(2) [14] Let $x \in \mathfrak{g}^{0}$ and $v \in V$. Then,

$$
\begin{equation*}
F\left(\llbracket x(0) v \rrbracket_{g}\right)=\left[x, \llbracket v \rrbracket_{g}\right] \tag{3.5}
\end{equation*}
$$

where both sides are zero if $v \in V^{1} \oplus \cdots \oplus V^{T-1}$.
(3) [14] Let $x_{1}, x_{2}, \ldots, x_{m} \in \mathfrak{g}^{0}, n_{1}, n_{2}, \ldots, n_{m} \in \mathbb{Z}_{\geq 0}$. Then under the isomorphism above,

$$
\begin{equation*}
F\left(\llbracket x_{1}\left(-n_{1}-1\right) x_{2}\left(-n_{2}-1\right) \cdots x_{m}\left(-n_{m}-1\right) \mathbf{1} \rrbracket_{g}\right)=(-1)^{n_{1}+n_{2}+\cdots+n_{m}} x_{m} x_{m-1} \cdots x_{1} \tag{3.6}
\end{equation*}
$$

(4) The previous part immediately implies that for $x \in \mathfrak{g}^{0}, n \in \mathbb{Z}_{\geq 0}$ and $v \in V$, we have:

$$
\begin{equation*}
F\left(\llbracket x(-n-1) v \rrbracket_{g}\right)=(-1)^{n} F\left(\llbracket v \rrbracket_{g}\right) x . \tag{3.7}
\end{equation*}
$$

Henceforth, we will suppress $F(\cdots)$ and simply identify $A_{g}(V(\mathfrak{g}, k))$ with $\mathfrak{U}\left(\mathfrak{g}^{0}\right)$.

Definition 3.4. We have an action ${ }_{L}$ of $\mathfrak{g}^{0}$ on $\mathfrak{U}\left(\mathfrak{g}^{0}\right)$ given by $x_{L} u=[x, u]$ where $x \in \mathfrak{g}^{0}, u \in \mathfrak{U}\left(\mathfrak{g}^{0}\right)$. We may and do extend the action $L_{L}$ of $\mathfrak{g}^{0}$ to an action of $\mathfrak{U}\left(\mathfrak{g}^{0}\right)$.

Theorem 3.5. Suppose that the (unique) maximal $\widehat{\mathfrak{g}}$-submodule $J(\mathfrak{g}, k)$ of $V(\mathfrak{g}, k)$ is generated by a single $g$-homogeneous singular vector $v$. Let $\mathfrak{U}(\mathfrak{g}) v$ be the $\mathfrak{g}$-module generated by $v$ where $x \in \mathfrak{g}$ acts on $v$ by $x(0)$. Let

$$
\begin{equation*}
\mathscr{R}=\llbracket \mathfrak{U}(\mathfrak{g}) v \rrbracket_{g}=\llbracket(\mathfrak{U}(\mathfrak{g}) v) \cap V(\mathfrak{g}, k)^{0} \rrbracket_{g}=\llbracket(\mathfrak{U}(\mathfrak{g}) v)^{0} \rrbracket_{g} . \tag{3.8}
\end{equation*}
$$

We have the following.
(1) $\mathscr{R}$ is a finite-dimensional module for $\mathfrak{U}\left(\mathfrak{g}^{0}\right)$ under the ${ }_{L}$ action.
(2) Let $L(\mathfrak{g}, k)=V(\mathfrak{g}, k) / J(\mathfrak{g}, k)$ be the unique simple quotient of $V(\mathfrak{g}, k)$. Then,

$$
\begin{equation*}
A_{g}(L(\mathfrak{g}, k))=\frac{\mathfrak{U}\left(\mathfrak{g}^{0}\right)}{\langle\mathscr{R}\rangle} \tag{3.9}
\end{equation*}
$$

where $\langle\mathscr{R}\rangle$ denotes two sided ideal of $\mathfrak{U}\left(\mathfrak{g}^{0}\right)$ generated by $\mathscr{R}$.
(3) $\mathrm{A} \mathfrak{g}^{0}$-module $M$ is a $A_{g}(L(\mathfrak{g}, k))$-module iff $\langle\mathscr{R}\rangle \cdot M=0$.

Proof. This theorem is analogous to the corresponding theorems in the untwisted setup, and in the twisted setting, our proof is very similar to the proof of [28, Thm. 6.3].

All elements of $\mathscr{R}$ have the same conformal weight as that of $v$, and each conformal weight space of $V(\mathfrak{g}, k)$ is finite-dimensional, hence $\mathscr{R}$ is finite-dimensional. The fact that $\mathscr{R}$ is closed under ${ }_{L}$ action is immediate from (3.5).

For the second assertion, it is enough prove that $\llbracket J(\mathfrak{g}, k) \rrbracket_{g}=\langle\mathscr{R}\rangle$. Observe that if $X$ is a subspace of $\mathfrak{U}\left(\mathfrak{g}^{0}\right)$ that is closed under the ${ }_{L}$ action and also under the right multiplication by $\mathfrak{U}\left(\mathfrak{g}^{0}\right)$ then, $X$ is a two-sided ideal. Indeed, for $a \in \mathfrak{g}^{0}$ and $x \in X$, we have $a x=[a, x]-x a$, and both terms on the right-hand side belong to $X$, giving us the closure of $X$ under the left-action. In light of (3.5), $\llbracket J(\mathfrak{g}, k) \rrbracket_{g}$ is closed under $L$ and (3.7) implies that it is also closed under the right action of $\mathfrak{U}\left(\mathfrak{g}^{0}\right)$. Thus, it is a two sided ideal. Clearly, $\mathscr{R} \subset \llbracket J(\mathfrak{g}, k) \rrbracket_{g}$, and thus $\langle\mathscr{R}\rangle \subset \llbracket J(\mathfrak{g}, k) \rrbracket_{g}$.

For the reverse inclusion, note that $J(\mathfrak{g}, k)$ is spanned by terms of the sort

$$
\begin{equation*}
y=a_{1}\left(-n_{1}-1\right) a_{2}\left(-n_{2}-1\right) \cdots a_{t}\left(-n_{t}-1\right) x \tag{3.10}
\end{equation*}
$$

where $a_{i} \in \mathfrak{g}$ are $g$-homogeneous and are arranged so that all $a_{i}$ 's in $\mathfrak{g}^{0}$ are to the right, $n_{i} \in \mathbb{Z}_{\geq 0}$ and $x$ is a $g$-homogeneous element of $\mathfrak{U}(\mathfrak{g}) v$. We proceed by induction on $t$. The case for $t=0$ is clear: $\llbracket x \rrbracket_{g} \in \mathscr{R}$. Now let $t>0$. If all $a_{i}$ 's and $x$ are already fixed by $g$ then (3.7) immediately tells us that $\llbracket y \rrbracket_{g} \in\langle\mathscr{R}\rangle$. Suppose that $y$ is fixed by $g$ (otherwise its projection is 0 anyway) and that $a_{1}$ is in $\mathfrak{g}^{r}, 1 \leq r \leq T-1$. We have the following relation [11]:

$$
\begin{equation*}
\operatorname{Res}_{x} \frac{(1+x)^{r / T}}{x^{m+1}} Y\left(a_{1}(-1) \mathbf{1}, x\right) v=a_{1}(-m-1) v+\frac{r}{T} a_{1}(-m) v+\cdots \in O_{g}(V(\mathfrak{g}, k)) \tag{3.11}
\end{equation*}
$$

for all $v \in V(\mathfrak{g}, k)$ and $m \geq 0$. Repeating this relation for $m=n_{1}, n_{1}-1, \ldots$, it is clear that for some scalar $\alpha$,

$$
\begin{align*}
y & \equiv \equiv_{O_{g}(V(\mathfrak{g}, k))} \alpha \cdot a_{1}(0) a_{2}\left(-n_{2}-1\right) \cdots a_{t}\left(-n_{t}-1\right) x+\text { shorter terms }  \tag{3.12}\\
& \equiv_{O_{g}(V(\mathfrak{g}, k))} \alpha \cdot a_{2}\left(-n_{2}-1\right) \cdots a_{t}\left(-n_{t}-1\right) a_{1}(0) x+\text { shorter terms. } \tag{3.13}
\end{align*}
$$

We may similarly peel off all the elements $a_{2}, \cdots, a_{j}$ which are not in $\mathfrak{g}^{0}$ and put them near $x$. We thus see, for some scalar $\alpha^{\prime}$ :

$$
\begin{equation*}
y \equiv_{O_{g}(V(\mathfrak{g}, k))} \alpha^{\prime} \cdot a_{j+1}\left(-n_{2}-1\right) \cdots a_{t}\left(-n_{t}-1\right) \cdot a_{j}(0) \cdots a_{1}(0) x+\text { shorter terms. } \tag{3.14}
\end{equation*}
$$

Since $y$ and $a_{j+1} \cdots a_{t}$ are all fixed by $g, a_{j}(0) \cdots a_{2}(0) a_{1}(0) x \in(\mathfrak{U}(\mathfrak{g}) v)^{0}$. Now, again, (3.7) and induction hypothesis give us that $\llbracket y \rrbracket_{g} \in\langle\mathscr{R}\rangle$.

Now we recall a couple of important results that form the basis of all our calculations.
Definition 3.6. Recall that $\mathscr{R}$ is a $\mathfrak{g}^{0}$ module under the ${ }_{L}$ action. We have already chosen a Cartan subalgebra for $\mathfrak{g}^{0}$, namely $\mathfrak{h}^{0}$. Let $\mathscr{R}_{0}$ be the weight 0 subspace of $\mathscr{R}$ with respect $\mathfrak{h}^{0}$.

Theorem 3.7. ([2, Lem. 3.4.3], [24, Prop. 13]) Let $L(\lambda)$ be an irreducible highest-weight $\mathfrak{g}^{0}$-module with highest-weight $\lambda$ and a highest-weight vector $v_{\lambda}$. The following statements are equivalent.
(1) $L(\lambda)$ is an $A_{g}(L(\mathfrak{g}, k))$-module.
(2) $\mathscr{R} \cdot L(\lambda)=0$.
(3) $\mathscr{R}_{0} \cdot v_{\lambda}=0$.

Definition 3.8. In the notation of the previous theorem, for every $r \in \mathscr{R}_{0}$ there exists a (unique) polynomial $p_{r} \in \mathfrak{S}\left(\mathfrak{h}^{0}\right)$ such that $r v_{\lambda}=p_{r}(\lambda) v_{\lambda}$. Define $\mathscr{P}_{0}=\left\{p_{r} \mid r \in \mathscr{R}_{0}\right\}$.

We immediately have:
Corollary 3.9. ([25, Cor. 2.10]) There is a one-to-one correspondence between:
(1) Irreducible, highest-weight $A_{g}(L(\mathfrak{g}, k))$ modules and
(2) weights $\lambda \in\left(\mathfrak{h}^{0}\right)^{*}$ such that $p(\lambda)=0$ for all $p \in \mathscr{P}_{0}$.

We now present some calculations that will be used below. Let $a \in \mathfrak{g}^{j}, 0<j<T, b \in \mathfrak{g}$. Then,

$$
\begin{align*}
& (a(-1) \mathbf{1}) \circ_{g}(b(-1) \mathbf{1}) \\
& =\operatorname{Res}_{x}\left(\frac{(1+x)^{j / T}}{x}\left(\cdots+a(-1) b(-1) \mathbf{1} x^{0}+a(0) b(-1) \mathbf{1} x^{-1}+a(1) b(-1) \mathbf{1} x^{-2}\right)\right) \\
& =\operatorname{Res}_{x}\left(\left(\sum_{n \geq 0}\binom{j / T}{n} x^{n-1}\right)\left(\cdots+a(-1) b(-1) \mathbf{1} x^{0}+a(0) b(-1) \mathbf{1} x^{-1}+a(1) b(-1) \mathbf{1} x^{-2}\right)\right) \\
& =a(-1) b(-1) \mathbf{1}+\frac{j}{T}[a, b](-1) \mathbf{1}+\frac{j(j-T)}{2 T^{2}} k\langle a, b\rangle \mathbf{1} . \tag{3.15}
\end{align*}
$$

This implies that for $a \in \mathfrak{g}^{j},(0<j<T)$ and $b \in \mathfrak{g}$,

$$
\begin{equation*}
a(-1) b(-1) \mathbf{1} \equiv_{O_{g}(V)}-\frac{j}{T}[a, b](-1) \mathbf{1}-\frac{j(j-T)}{2 T^{2}} k\langle a, b\rangle \mathbf{1} . \tag{3.16}
\end{equation*}
$$

Or, equivalently,

$$
\begin{equation*}
\llbracket a(-1) b(-1) \mathbf{1} \rrbracket_{g}=-\frac{j}{T} \llbracket[a, b](-1) \mathbf{1} \rrbracket_{g}-\frac{j(j-T)}{2 T^{2}} k\langle a, b\rangle \llbracket \mathbf{1} \rrbracket_{g} . \tag{3.17}
\end{equation*}
$$

Since $\langle\cdot, \cdot\rangle$ is $g$-invariant, both sides are zero if $b^{(T-j)}=0$.
For general elements $a, b \in \mathfrak{g}$, we have:

$$
\begin{align*}
& a(-1) b(-1) \mathbf{1}=\left(a^{(0)}+\cdots+a^{(T-1)}\right)(-1)\left(b^{(0)}+\cdots+b^{(T-1)}\right)(-1) \mathbf{1} \\
& \quad=\left(a^{(0)}(-1) b^{(0)}(-1) \mathbf{1}+a^{(1)}(-1) b^{(T-1)}(-1) \mathbf{1}+\cdots+a^{(T-1)}(-1) b^{(1)}(-1) \mathbf{1}\right)+\ldots \tag{3.18}
\end{align*}
$$

where the last ellipses denote terms that are in $V^{(1)} \oplus \cdots \oplus V^{(T-1)}$. So, using (3.4) and (3.17)

$$
\begin{align*}
& \llbracket a(-1) b(-1) \mathbf{1} \rrbracket_{g} \\
& =\llbracket a^{(0)}(-1) b^{(0)}(-1) \mathbf{1} \rrbracket_{g}-\sum_{0<j<T} \frac{j}{T} \llbracket\left[a^{(j)}, b^{(T-j)} \rrbracket(-1) \mathbf{1} \rrbracket_{g}-\sum_{0<j<T} \frac{j(j-T)}{2 T^{2}} k\left\langle a^{(j)}, b^{(T-j)}\right\rangle \llbracket \mathbf{1} \rrbracket_{g} .\right. \tag{3.19}
\end{align*}
$$

Henceforth, we will drop the subscript $g$.

$$
\text { 4. } \nu \text {-Twisted Zhu algebra for } L\left(\mathfrak{s l}_{2 l+1},-l-\frac{1}{2}\right)
$$

Fix $l \in \mathbb{Z}_{>0}$ and let $\mathfrak{g}=\mathfrak{s l}_{2 l+1}$ as before and let $k=-l-\frac{1}{2}$. Recall that $V(\mathfrak{g}, k)$ is the (universal) generalized Verma module VOA and $J(\mathfrak{g}, k)$ is its (unique) maximal proper ideal.

Theorem 4.1. From [25] we have:
(1) The vector

$$
\begin{equation*}
v=\sum_{i=1}^{2 l} \frac{2 l-2 i+1}{2 l+1} E_{\theta}(-1) H_{i}(-1) \mathbf{1}+\sum_{i=1}^{2 l-1} E_{1, i+1}(-1) E_{i+1,2 l+1}(-1) \mathbf{1}-\frac{1}{2}(2 l-1) E_{\theta}(-2) \mathbf{1} \tag{4.1}
\end{equation*}
$$

is a singular vector in $V(\mathfrak{g}, k)$.
(2) The ideal $J(\mathfrak{g}, k)$ is generated by $v$, that is, $J(\mathfrak{g}, k)=\mathfrak{U}(\widehat{\mathfrak{g}}) v$.

Proof. Our notation is slightly different from [25]. Negative of the singular vector given in [25] is:

$$
\begin{equation*}
-\sum_{i=1}^{2 l} \frac{2 l-2 i+1}{2 l+1} H_{i}(-1) e_{\theta}(-1) \mathbf{1}+\sum_{i=1}^{2 l-1} e_{\epsilon_{1}-\epsilon_{i+1}}(-1) e_{\epsilon_{i+1}-\epsilon_{2 l+1}}(-1) \mathbf{1}+\frac{1}{2}(2 l-1) e_{\theta}(-2) \mathbf{1}, \tag{4.2}
\end{equation*}
$$

where they define for $i<j$

$$
\begin{equation*}
e_{\epsilon_{i}-\epsilon_{j}}=\left[E_{j-1},\left[E_{j-2},\left[\cdots\left[E_{i+1}, E_{i}\right] \cdots\right]\right]\right], \quad e_{\theta}=e_{\epsilon_{1}-\epsilon_{2 l+1}} \tag{4.3}
\end{equation*}
$$

It can be seen that

$$
\begin{equation*}
e_{\epsilon_{i}-\epsilon_{j}}=-(-1)^{i-j} E_{i, j}, \quad e_{\theta}=-E_{\theta} \tag{4.4}
\end{equation*}
$$

We thus get

$$
\begin{equation*}
\sum_{i=1}^{2 l} \frac{2 l-2 i+1}{2 l+1} H_{i}(-1) E_{\theta}(-1) \mathbf{1}+\sum_{i=1}^{2 l-1} E_{1, i+1}(-1) E_{i+1,2 l+1}(-1) \mathbf{1}-\frac{1}{2}(2 l-1) E_{\theta}(-2) \mathbf{1} . \tag{4.5}
\end{equation*}
$$

In the first summation, $\left[H_{i}(-1), E_{\theta}(-1)\right]=0$ if $1<i<2 l$ and $\left[H_{i}(-1), E_{\theta}(-1)\right]=E_{\theta}(-2)$ if $i=1,2 l$. We thus get the required formula.
Lemma 4.2. We have $\nu(v)=v$.
Proof. We have:

$$
\begin{align*}
& \nu(v) \\
& =\sum_{i=1}^{2 l}-\frac{2 l-2 i+1}{2 l+1} E_{\theta}(-1) H_{2 l+1-i}(-1) \mathbf{1}+\sum_{i=1}^{2 l-1} E_{2 l-i+1,2 l+1}(-1) E_{1,2 l-i+1}(-1) \mathbf{1}+\frac{2 l-1}{2} E_{\theta}(-2) \mathbf{1} \\
& =\sum_{i=1}^{2 l} \frac{2 l-2 i+1}{2 l+1} E_{\theta}(-1) H_{i}(-1) \mathbf{1}+\sum_{i=1}^{2 l-1} E_{i+1,2 l+1}(-1) E_{1, i+1}(-1) \mathbf{1}+\frac{2 l-1}{2} E_{\theta}(-2) \mathbf{1} \\
& =\sum_{i=1}^{2 l} \frac{2 l-2 i+1}{2 l+1} E_{\theta}(-1) H_{i}(-1) \mathbf{1}+\sum_{i=1}^{2 l-1}\left(E_{1, i+1}(-1) E_{i+1,2 l+1}(-1)-E_{1,2 l+1}(-2)\right) \mathbf{1}+\frac{2 l-1}{2} E_{\theta}(-2) \mathbf{1} \\
& =v \tag{4.6}
\end{align*}
$$

where the first equality follows by definition of $\nu$ and the second by re-indexing the summations.
Our next task is to calculate enough information about $\mathscr{R}=\llbracket \mathfrak{U}(\mathfrak{g}) v \rrbracket$ so that we can use Corollary 3.9. The $\mathfrak{g}$-weight of $v$ is $\theta$, and as $\mathfrak{g}$-module, $\mathfrak{U}(\mathfrak{g}) v$ is isomorphic to the adjoint module of $\mathfrak{g}$ with $v \mapsto E_{\theta}$. As $\mathfrak{g}^{0}$-modules, we then have $\mathfrak{U}(\mathfrak{g}) v \cong \mathfrak{g}^{0} \oplus \mathfrak{g}^{1}$. Note that $E_{\theta} \in \mathfrak{g}^{1}$ and so $\mathfrak{U}\left(\mathfrak{g}^{0}\right) v \cong \mathfrak{g}^{1}$ as $\mathfrak{g}^{0}$-modules. Since $v$ is $\nu$-fixed, we have $\mathscr{R}=\llbracket \mathfrak{U}(\mathfrak{g}) v \rrbracket=\llbracket \mathfrak{U}\left(\mathfrak{g}^{0}\right) v \rrbracket$. From Section 2.3 we know that $\operatorname{dim}\left(\mathscr{R}_{0}\right)=\operatorname{dim}\left(\left(\mathfrak{g}^{1}\right)_{0}\right)=l$ and thus we seek $l$ independent polynomials in $\mathscr{P}_{0}$.

Lemma 4.3. The projection of $v$ on the twisted Zhu algebra is given by the following formula:

$$
\begin{equation*}
\llbracket v \rrbracket=\sum_{i=1}^{2 l-1} E_{i+1,2 l+1}^{+} E_{1, i+1}^{+} . \tag{4.7}
\end{equation*}
$$

Proof. First, it is easy to see that:

$$
\sum_{i=1}^{2 l} \frac{2 l-2 i+1}{2 l+1} E_{\theta}(-1) H_{i}(-1) \mathbf{1}-\frac{1}{2}(2 l-1) E_{\theta}(-2) \mathbf{1} \in V\left(\mathfrak{g},-l-\frac{1}{2}\right)^{1} .
$$

Using (3.19), we get:

$$
\begin{align*}
& \sum_{i=1}^{2 l-1} \llbracket E_{1, i+1}(-1) E_{i+1,2 l+1}(-1) \mathbf{1} \rrbracket  \tag{4.8}\\
& =\sum_{i=1}^{2 l-1} \llbracket E_{1, i+1}^{+}(-1) E_{i+1,2 l+1}^{+}(-1) \mathbf{1} \rrbracket-\frac{1}{2} \llbracket\left[E_{1, i+1}^{-}, E_{i+1,2 l+1}^{-}\right](-1) \mathbf{1} \rrbracket-\frac{l+\frac{1}{2}}{8}\left\langle E_{1, i+1}^{-}, E_{i+1,2 l+1}^{-}\right\rangle \llbracket \mathbf{1} \rrbracket  \tag{4.9}\\
& =\sum_{i=1}^{2 l-1} \llbracket E_{1, i+1}^{+}(-1) E_{i+1,2 l+1}^{+}(-1) \mathbf{1} \rrbracket-\frac{1}{2} \llbracket\left[E_{1, i+1}^{-}, E_{i+1,2 l+1}^{-}\right](-1) \mathbf{1} \rrbracket \tag{4.10}
\end{align*}
$$

For $i=1, \ldots, 2 l-1$, we have:

$$
\begin{equation*}
\left[E_{1, i+1}^{-}, E_{i+1,2 l+1}^{-}\right]=\frac{1}{4}\left[E_{1, i+1}+(-1)^{i} E_{2 l+1-i, 2 l+1}, E_{i+1,2 l+1}+(-1)^{i} E_{1,2 l+1-i}\right]=0 \tag{4.11}
\end{equation*}
$$

Using (3.6) for the first term, we get the required result.
Lemma 4.4. Consider $E_{l+1,1}-(-1)^{l} E_{2 l+1, l+1} \in \mathfrak{g}^{0}$. Let

$$
\begin{equation*}
v_{1}=2\left(E_{l+1,1}-(-1)^{l} E_{2 l+1, l+1}\right)_{L} \llbracket v \rrbracket \in \mathfrak{U}\left(\mathfrak{g}^{0}\right) . \tag{4.12}
\end{equation*}
$$

Then, we have:

$$
\begin{align*}
v_{1}= & (-1)^{l} \sum_{1 \leq i<l}\left(E_{1, i+1}-(-1)^{i} E_{2 l+1-i, 2 l+1}\right)\left(E_{i+1, l+1}-(-1)^{l-i} E_{l+1,2 l+1-i}\right)  \tag{4.13}\\
& +(-1)^{l}\left(E_{1,1}-E_{2 l+1,2 l+1}\right)\left(E_{1, l+1}-(-1)^{l} E_{l+1,2 l+1}\right)  \tag{4.14}\\
& -\frac{(-1)^{l}}{2}\left(E_{1, l+1}-(-1)^{l} E_{l+1,2 l+1}\right)  \tag{4.15}\\
& +\sum_{l<i \leq 2 l-1}(-1)^{l}\left(E_{i+1, l+1}-(-1)^{l-i} E_{l+1,2 l+1-i}\right)\left(E_{1, i+1}-(-1)^{i} E_{2 l+1-i, 2 l+1}\right) . \tag{4.16}
\end{align*}
$$

Proof.

$$
\begin{aligned}
v_{1}= & 2\left(E_{l+1,1}-(-1)^{l} E_{2 l+1, l+1}\right)_{L} \llbracket v \rrbracket \\
= & 2 \sum_{i=1}^{2 l-1}\left[E_{l+1,1}-(-1)^{l} E_{2 l+1, l+1}, E_{i+1,2 l+1}^{+}\right] E_{1, i+1}^{+}+2 \sum_{i=1}^{2 l-1} E_{i+1,2 l+1}^{+}\left[E_{l+1,1}-(-1)^{l} E_{2 l+1, l+1}, E_{1, i+1}^{+}\right] \\
= & \sum_{i=1}^{2 l-1}\left[E_{l+1,1}-(-1)^{l} E_{2 l+1, l+1}, E_{i+1,2 l+1}-(-1)^{i} E_{1,2 l+1-i}\right] E_{1, i+1}^{+} \\
& +\sum_{i=1}^{2 l-1} E_{i+1,2 l+1}^{+}\left[E_{l+1,1}-(-1)^{l} E_{2 l+1, l+1}, E_{1, i+1}-(-1)^{i} E_{2 l+1-i, 2 l+1}\right]
\end{aligned}
$$

$$
\begin{align*}
= & \sum_{i=1}^{2 l-1}(-1)^{l}\left(-\delta_{i, l} E_{2 l+1,2 l+1}+\delta_{i, l} E_{1,1}+E_{i+1, l+1}-(-1)^{l-i} E_{l+1,2 l+1-i}\right) E_{1, i+1}^{+} \\
& +\sum_{i=1}^{2 l-1} E_{i+1,2 l+1}^{+}\left(E_{l+1, i+1}-(-1)^{l-i} E_{2 l+1-i, l+1}-\delta_{i, l} E_{1,1}+\delta_{i, l} E_{2 l+1,2 l+1}\right) \tag{4.17}
\end{align*}
$$

Our aim is to convert the expressions so that elements from $\mathfrak{n}_{+}^{0}$ are to the right. Note that $\mathfrak{n}_{+}^{0}$ is spanned by $E_{i, j}^{+}$for $1 \leq i<j \leq 2 l+1$. We split both summations into $i<l, i=l, i>l$ parts. In the first summation, all terms are already in this form, but we still rewrite them with a view towards future calculations. The $i<l$ component is:

$$
\begin{align*}
& \frac{1}{2} \sum_{1 \leq i<l}(-1)^{l}\left(E_{i+1, l+1}-(-1)^{l-i} E_{l+1,2 l+1-i}\right)\left(E_{1, i+1}-(-1)^{i} E_{2 l+1-i, 2 l+1}\right) \\
& =\frac{(-1)^{l}}{2} \sum_{1 \leq i<l}\left(\left(E_{1, i+1}-(-1)^{i} E_{2 l+1-i, 2 l+1}\right)\left(E_{i+1, l+1}-(-1)^{l-i} E_{l+1,2 l+1-i}\right)-E_{1, l+1}+(-1)^{l} E_{l+1,2 l+1}\right) \\
& =\frac{(-1)^{l}}{2} \sum_{1 \leq i<l}\left(E_{1, i+1}-(-1)^{i} E_{2 l+1-i, 2 l+1}\right)\left(E_{i+1, l+1}-(-1)^{l-i} E_{l+1,2 l+1-i}\right)  \tag{4.18}\\
& \quad-\frac{(-1)^{l}(l-1)}{2}\left(E_{1, l+1}-(-1)^{l} E_{l+1,2 l+1}\right) \tag{4.19}
\end{align*}
$$

The $i=l$ term is:

$$
\begin{equation*}
\frac{(-1)^{l}}{2}\left(E_{1,1}-E_{2 l+1,2 l+1}\right)\left(E_{1, l+1}-(-1)^{l} E_{l+1,2 l+1}\right) \tag{4.20}
\end{equation*}
$$

We keep the $i>l$ terms unchanged:

$$
\begin{equation*}
\frac{1}{2} \sum_{l<i \leq 2 l-1}(-1)^{l}\left(E_{i+1, l+1}-(-1)^{l-i} E_{l+1,2 l+1-i}\right)\left(E_{1, i+1}-(-1)^{i} E_{2 l+1-i, 2 l+1}\right) \tag{4.21}
\end{equation*}
$$

For the second summation, the $i<l$ terms become:

$$
\begin{align*}
& \sum_{1 \leq i<l} E_{i+1,2 l+1}^{+}\left(E_{l+1, i+1}-(-1)^{l-i} E_{2 l+i-1, l+1}\right)  \tag{4.22}\\
&= \frac{1}{2} \sum_{1 \leq i<l}\left(E_{i+1,2 l+1}-(-1)^{i} E_{1,2 l+1-i}\right)\left(E_{l+1, i+1}-(-1)^{l-i} E_{2 l+1-i, l+1}\right) \\
&= \frac{1}{2} \sum_{1 \leq i<l}\left(\left(E_{l+1, i+1}-(-1)^{l-i} E_{2 l+1-i, l+1}\right)\left(E_{i+1,2 l+1}-(-1)^{i} E_{1,2 l+1-i}\right)-E_{l+1,2 l+1}+(-1)^{l} E_{1, l+1}\right) \\
&= \frac{1}{2} \sum_{l<i \leq 2 l-1}\left(E_{l+1,2 l+1-i}-(-1)^{l-i} E_{i+1, l+1}\right)\left(E_{2 l+1-i, 2 l+1}-(-1)^{i} E_{1, i+1}\right)-E_{l+1,2 l+1}+(-1)^{l} E_{1, l+1} \\
&= \frac{1}{2}\left(\sum_{l<i \leq 2 l-1}(-1)^{l}\left(E_{i+1, l+1}-(-1)^{l-i} E_{l+1,2 l+1-i}\right)\left(E_{1, i+1}-(-1)^{i} E_{2 l+1-i, 2 l+1}\right)\right) \\
&+\frac{(-1)^{l}(l-1)}{2}\left(E_{1, l+1}-(-1)^{l} E_{l+1,2 l+1}\right) . \tag{4.23}
\end{align*}
$$

The $i=l$ term is:

$$
E_{l+1,2 l+1}^{+}\left(-E_{1,1}+E_{2 l+1,2 l+1}\right)
$$

$$
\begin{aligned}
& =\frac{1}{2}\left(E_{l+1,2 l+1}-(-1)^{l} E_{1, l+1}\right)\left(-E_{1,1}+E_{2 l+1,2 l+1}\right) \\
& =\frac{1}{2}\left(-E_{1,1}+E_{2 l+1,2 l+1}\right)\left(E_{l+1,2 l+1}-(-1)^{l} E_{1, l+1}\right)+\frac{1}{2}\left(E_{l+1,2 l+1}-(-1)^{l} E_{1, l+1}\right) \\
& =\frac{(-1)^{l}}{2}\left(E_{1,1}-E_{2 l+1,2 l+1}\right)\left(E_{1, l+1}-(-1)^{l} E_{l+1,2 l+1}\right)+\frac{1}{2}\left(E_{l+1,2 l+1}-(-1)^{l} E_{1, l+1}\right) .
\end{aligned}
$$

The $i>l$ term is:

$$
\begin{align*}
\sum_{l<i \leq 2 l-1} & E_{i+1,2 l+1}^{+}\left(E_{l+1, i+1}-(-1)^{l-i} E_{2 l+1-i, l+1}\right)  \tag{4.24}\\
& =\frac{1}{2} \sum_{l<i \leq 2 l-1}\left(E_{i+1,2 l+1}-(-1)^{i} E_{1,2 l+1-i}\right)\left(E_{l+1, i+1}-(-1)^{l-i} E_{2 l+1-i, l+1}\right)  \tag{4.25}\\
& =\frac{1}{2} \sum_{1 \leq i<l}\left(E_{2 l+1-i, 2 l+1}-(-1)^{i} E_{1, i+1}\right)\left(E_{l+1,2 l+1-i}-(-1)^{l-i} E_{i+1, l+1}\right)  \tag{4.26}\\
& =\frac{(-1)^{l}}{2} \sum_{1 \leq i<l}\left(E_{1, i+1}-(-1)^{i} E_{2 l+1-i, 2 l+1}\right)\left(E_{i+1, l+1}-(-1)^{l-i} E_{l+1,2 l+1-i}\right) \tag{4.27}
\end{align*}
$$

Combining everything, we get the required formula for $v_{1}$.
Now we shall get many elements in the weight zero space $\mathscr{R}_{0}$.
Theorem 4.5. Let $1 \leq j \leq l$. Recall (2.29) and (2.30). We have:

$$
\begin{equation*}
-(-1)^{j}\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L} v_{1}=h_{j}\left(h_{j}+2 \sum_{j<i \leq l} h_{i}+(l-j)-\frac{1}{2}\right)+\mathfrak{U}\left(\mathfrak{g}^{0}\right) \mathfrak{n}_{+}^{0} . \tag{4.28}
\end{equation*}
$$

Proof. It is not hard to see that for every $1 \leq j \leq l,\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L} v_{1} \in \mathscr{R}_{0}$.
Throughout this proof, it will be often beneficial for us to do the calculations in $\mathfrak{U}(\mathfrak{g})$ or $\mathfrak{U}(\mathfrak{g})^{0}$.
Since we are sure that the final answer is to be in $\mathfrak{U}\left(\mathfrak{g}^{0}\right)$, we will carefully omit the terms not in $\mathfrak{U}\left(\mathfrak{g}^{0}\right)$ that appear in the intermediate steps. Recall that $\mathfrak{n}_{+}^{0}$ is spanned by $E_{i, j}^{+}$for $1 \leq i<j \leq 2 l+1$.

The calculation corresponding to the term (4.13) is the longest and we break it into several steps.
First, we consider the term $E_{1, i+1} E_{i+1, l+1}$. Let $1 \leq i<j \leq l$. We have:

$$
\begin{align*}
& \left(f_{j} f_{j-1} \cdots f_{i+1} f_{i} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left(E_{1, i+1} E_{i+1, l+1}\right) \\
& \quad=\left(F_{j} F_{j-1} \cdots F_{i+1} F_{i} \cdots F_{1} F_{j+1} F_{j+2} \cdots F_{l}\right)_{L}\left(E_{1, i+1} E_{i+1, l+1}\right) \\
& \quad=(-1)^{l-j}\left(F_{j} F_{j-1} \cdots F_{i+1} F_{i} \cdots F_{1}\right)_{L}\left(E_{1, i+1} E_{i+1, j+1}\right) \\
& \quad=-(-1)^{l-j}\left(F_{j} F_{j-1} \cdots F_{i+1}\right)_{L}\left(H_{i} E_{i+1, j+1}\right) \\
& \quad=(-1)^{l-j} H_{i} H_{j}+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+}+ \tag{4.29}
\end{align*}
$$

Now let $i=j$, but note that we only allow $1 \leq i<l$ in (4.13).

$$
\begin{align*}
& \left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left(E_{1, j+1} E_{j+1, l+1}\right) \\
& \quad=\left(F_{j} F_{j-1} \cdots F_{1} F_{j+1} F_{j+2} \cdots F_{l}\right)_{L}\left(E_{1, j+1} E_{j+1, l+1}\right) \\
& \quad=(-1)^{l-j}\left(F_{j} F_{j-1} \cdots F_{1}\right)_{L}\left(E_{1, j+1} H_{j+1}\right) \\
& \quad=(-1)^{l-j}\left(F_{j} F_{j-1} \cdots F_{1}\right)_{L}\left(H_{j+1} E_{1, j+1}+E_{1, j+1}\right) \\
& \quad=-(-1)^{l-j}\left(H_{j+1} H_{j}+H_{j}\right)+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+} . \tag{4.30}
\end{align*}
$$

Now let $i>j$, again noting that we only allow $1 \leq i<l$ in (4.13).

$$
\begin{align*}
& \left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} \cdots f_{i} f_{i+1} \cdots f_{l}\right)_{L}\left(E_{1, i+1} E_{i+1, l+1}\right) \\
& \quad=\left(F_{j} F_{j-1} \cdots F_{1} F_{j+1} \cdots F_{i} F_{i+1} \cdots F_{l}\right)_{L}\left(E_{1, i+1} E_{i+1, l+1}\right) \\
& \quad=(-1)^{l-i}\left(F_{j} F_{j-1} \cdots F_{1} F_{j+1} \cdots F_{i}\right)_{L}\left(E_{1, i+1} H_{i+1}\right) \\
& \quad=(-1)^{l-i}\left(F_{j} F_{j-1} \cdots F_{1} F_{j+1} \cdots F_{i}\right)_{L}\left(H_{i+1} E_{1, i+1}+E_{1, i+1}\right) \\
& \quad=-(-1)^{l-j}\left(H_{i+1} H_{j}+H_{j}\right)+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+} . \tag{4.31}
\end{align*}
$$

Note that if we place $i=j$ in (4.31), we get (4.30), thus we combine these two equations. Combining (4.29), (4.30), (4.31) for a fixed $1 \leq j \leq l$, we have:

$$
\begin{align*}
& \left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left((-1)^{l} \sum_{1 \leq i<l} E_{1, i+1} E_{i+1, l+1}+(-1)^{l} E_{2 l+1-i, 2 l+1} E_{l+1,2 l+1-i}\right) \\
& =(-1)^{l}\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left(\sum_{1 \leq i<l}(1+\nu)\left(E_{1, i+1} E_{i+1, l+1}\right)\right) \\
& =(-1)^{l}(1+\nu) \sum_{1 \leq i<l}\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left(E_{1, i+1} E_{i+1, l+1}\right) \\
& =(-1)^{j}(1+\nu)\left(\sum_{1 \leq i<j} H_{i} H_{j}-\sum_{j \leq i<l}\left(H_{i+1} H_{j}+H_{j}\right)+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+}\right) . \\
& =(-1)^{j} H_{j}\left(\sum_{1 \leq i<j} H_{i}-\sum_{j \leq i<l}\left(H_{i+1}+1\right)\right)+(-1)^{j} H_{2 l+1-j}\left(\sum_{1 \leq i<j} H_{2 l+1-i}-\sum_{j \leq i<l}\left(H_{2 l-i}+1\right)\right) \\
& \quad+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+} . \tag{4.32}
\end{align*}
$$

Now we consider the term $E_{1, i+1} E_{l+1,2 l+1-i}$. First let $1 \leq i<j \leq l$. We have:

$$
\begin{align*}
\left(f_{j}\right. & \left.\cdots f_{i+1} f_{i} \cdots f_{1} f_{j+1} \cdots f_{l-1} f_{l}\right)_{L}\left(E_{1, i+1} E_{l+1,2 l+1-i}\right) \\
& =\left(f_{j} \cdots f_{i+1} f_{i} \cdots f_{1} F_{2 l-j} \cdots F_{l+2} F_{l+1}\right)_{L}\left(E_{1, i+1} E_{l+1,2 l+1-i}\right) \\
& =\left(f_{j} \cdots f_{i+1} f_{i} \cdots f_{1}\right)_{L}\left(E_{1, i+1} E_{2 l+1-j, 2 l+1-i}\right) \\
& =\left(f_{j} f_{j-1} \cdots f_{i+1} F_{i} \cdots F_{1}\right)_{L}\left(E_{1, i+1} E_{2 l+1-j, 2 l+1-i}\right) \\
& =\left(f_{j} f_{j-1} \cdots f_{i+1}\right)_{L}\left(-H_{i} E_{2 l+1-j, 2 l+1-i}\right) \\
& =\left(F_{2 l+1-j} F_{2 l+2-j} \cdots F_{2 l-i}\right)_{L}\left(-H_{i} E_{2 l+1-j, 2 l+1-i}\right) \\
& =-(-1)^{i-j} H_{i} H_{2 l+1-j}+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+} . \tag{4.33}
\end{align*}
$$

Now let $i=j$, but note that $1 \leq i<l$.

$$
\begin{align*}
\left(f_{j}\right. & \left.\cdots f_{1} f_{j+1} \cdots f_{l}\right)_{L}\left(E_{1, j+1} E_{l+1,2 l+1-j}\right) \\
& =\left(f_{j} \cdots f_{1} F_{2 l-j} F_{2 l-j-1} \cdots F_{l+1}\right)_{L}\left(E_{1, j+1} E_{l+1,2 l+1-j}\right) \\
& =\left(f_{j} \cdots f_{1}\right)_{L}\left(-E_{1, j+1} H_{2 l-j}\right) \\
& =\left(f_{j} \cdots f_{1}\right)_{L}\left(-H_{2 l-j} E_{1, j+1}\right) \\
& =\left(F_{j} F_{j-1} \cdots F_{1}\right)_{L}\left(-H_{2 l-j} E_{1, j+1}\right) \\
& =H_{2 l-j} H_{j}+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+} . \tag{4.34}
\end{align*}
$$

Now let $j<i$, but again note that $1 \leq i<l$.

$$
\begin{align*}
\left(f_{j}\right. & \left.\cdots f_{1} f_{j+1} \cdots f_{i} f_{i+1} \cdots f_{l}\right)_{L}\left(E_{1, i+1} E_{l+1,2 l+1-i}\right) \\
& =\left(f_{j} \cdots f_{1} f_{j+1} \cdots f_{i} F_{2 l-i} F_{2 l-i-1} \cdots F_{l+1}\right)_{L}\left(E_{1, i+1} E_{l+1,2 l+1-i}\right) \\
& =\left(f_{j} \cdots f_{1} f_{j+1} \cdots f_{i}\right)_{L}\left(-E_{1, i+1} H_{2 l-i}\right) \\
& =\left(f_{j} \cdots f_{1} f_{j+1} \cdots f_{i}\right)_{L}\left(-H_{2 l-i} E_{1, i+1}\right) \\
& =(-1)^{i-j} H_{2 l-i} H_{j}+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+} . \tag{4.35}
\end{align*}
$$

Again, note that placing $i=j$ in (4.35) gets us (4.34), thus we combine these two. Combining (4.33), (4.34), (4.35), for a fixed $1 \leq j \leq l$, we see:

$$
\begin{align*}
& \left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left((-1)^{l} \sum_{1 \leq i<l}-(-1)^{l-i} E_{1, i+1} E_{l+1,2 l+1-i}-(-1)^{i} E_{2 l+1-i, 2 l+1} E_{i+1, l+1}\right) \\
& =(-1)^{i+1}\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left(\sum_{1 \leq i<l} E_{1, i+1} E_{l+1,2 l+1-i}+(-1)^{l} E_{2 l+1-i, 2 l+1} E_{i+1, l+1}\right) \\
& =(-1)^{i+1}\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left(\sum_{1 \leq i<l}(1+\nu)\left(E_{1, i+1} E_{l+1,2 l+1-i}\right)\right) \\
& =(-1)^{i+1}(1+\nu)\left(\sum_{1 \leq i<l}\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left(E_{1, i+1} E_{l+1,2 l+1-i}\right)\right) \\
& =(-1)^{i+1}(1+\nu)\left(\sum_{1 \leq i<j}-(-1)^{i-j} H_{i} H_{2 l+1-j}+\sum_{j \leq i<l}(-1)^{i-j} H_{2 l-i} H_{j}+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+}\right) \\
& \quad=(-1)^{j}\left(\sum_{1 \leq i<j}\left(H_{i} H_{2 l+1-j}+H_{2 l+1-i} H_{j}\right)-\sum_{j \leq i<l}\left(H_{2 l-i} H_{j}+H_{i+1} H_{2 l+1-j}\right)\right)+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+} \\
& \quad=(-1)^{j} H_{j}\left(\sum_{1 \leq i<j} H_{2 l+1-i}-\sum_{j \leq i<l} H_{2 l-i}\right)+(-1)^{j} H_{2 l+1-j}\left(\sum_{1 \leq i<j} H_{i}-\sum_{j \leq i<l} H_{i+1}\right)+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+} . \tag{4.36}
\end{align*}
$$

Finally, we put together (4.32) and (4.36):

$$
\begin{aligned}
& \left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left((-1)^{l} \sum_{1 \leq i<l}\left(E_{1, i+1}-(-1)^{i} E_{2 l+1-i, 2 l+1}\right)\left(E_{i+1, l+1}-(-1)^{l-i} E_{l+1,2 l+1-i}\right)\right) \\
& =(-1)^{j} H_{j}\left(\sum_{1 \leq i<j} H_{i}-\sum_{j \leq i<l}\left(H_{i+1}+1\right)\right)+(-1)^{j} H_{2 l+1-j}\left(\sum_{1 \leq i<j} H_{2 l+1-i}-\sum_{j \leq i<l}\left(H_{2 l+1-i}+1\right)\right) \\
& +(-1)^{j} H_{j}\left(\sum_{1 \leq i<j} H_{2 l+1-i}-\sum_{j \leq i<l} H_{2 l-i}\right)+(-1)^{j} H_{2 l+1-j}\left(\sum_{1 \leq i<j} H_{i}-\sum_{j \leq i<l} H_{i+1}\right)+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+}
\end{aligned}
$$

$$
\begin{equation*}
=(-1)^{j} h_{j}\left(\sum_{1 \leq i<j} h_{i}-\sum_{j<i \leq l} h_{i}-(l-j)\right)+\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+} . \tag{4.37}
\end{equation*}
$$

In fact, in the last equality, we may now replace $\mathfrak{U}(\mathfrak{g}) \mathfrak{n}_{+}$with $\mathfrak{U}\left(\mathfrak{g}^{0}\right) \mathfrak{n}_{+}^{0}$.
For (4.14) and (4.15), note that

$$
\begin{align*}
& \left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left(E_{1, l+1}-(-1)^{l} E_{l+1,2 l+1}\right) \\
& \quad=\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left(E_{1, l+1}+\nu E_{1, l+1}\right) \\
& \quad=(1+\nu)\left(\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L} E_{1, l+1}\right) \\
& \quad=(1+\nu)\left(\left(F_{j} F_{j-1} \cdots F_{1} F_{j+1} F_{j+2} \cdots F_{l}\right)_{L} E_{1, l+1}\right) \\
& \quad=(1+\nu)\left((-1)^{l+j+1} H_{j}\right)=(-1)^{l+j+1} h_{j} . \tag{4.38}
\end{align*}
$$

The effect of applying $\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}$ on (4.14) is thus:

$$
\begin{align*}
& \left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left((-1)^{l}\left(E_{1,1}-E_{2 l+1,2 l+1}\right)\left(E_{1, l+1}-(-1)^{l} E_{l+1,2 l+1}\right)\right) \\
& \quad=(-1)^{j+1}\left(E_{1,1}-E_{2 l+1,2 l+1}\right) h_{j}+\mathfrak{U}\left(\mathfrak{g}^{0}\right) \mathfrak{n}_{+}^{0} \\
& \quad=(-1)^{j+1}\left(h_{1}+\cdots+h_{l}\right) h_{j}+\mathfrak{U}\left(\mathfrak{g}^{0}\right) \mathfrak{n}_{+}^{0} . \tag{4.39}
\end{align*}
$$

and for (4.15) we get:

$$
\begin{equation*}
\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}\left(-\frac{(-1)^{l}}{2}\left(E_{1, l+1}-(-1)^{l} E_{l+1,2 l+1}\right)\right)=\frac{(-1)^{j}}{2} h_{j}+\mathfrak{U}\left(\mathfrak{g}^{0}\right) \mathfrak{n}_{+}^{0} \tag{4.40}
\end{equation*}
$$

It is not hard to see that $\left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L}$ applied to the terms (4.16) will only yield terms in $\mathfrak{U}\left(\mathfrak{g}^{0}\right) \mathfrak{n}_{+}^{0}$.

Combining (4.37), (4.39) and (4.40) we get:

$$
\begin{align*}
& \left(f_{j} f_{j-1} \cdots f_{1} f_{j+1} f_{j+2} \cdots f_{l}\right)_{L} v_{1} \\
& =(-1)^{j} h_{j}\left(\sum_{1 \leq i<j} h_{i}-\sum_{j<i \leq l} h_{i}-(l-j)\right)-(-1)^{j}\left(h_{1}+\cdots+h_{l}\right) h_{j}+\frac{(-1)^{j}}{2} h_{j}+\mathfrak{U}\left(\mathfrak{g}^{0}\right) \mathfrak{n}_{+}^{0} \\
& =(-1)^{j} h_{j}\left(-h_{j}-2 \sum_{j<i \leq l} h_{i}+\frac{1}{2}-(l-j)\right)+\mathfrak{U}\left(\mathfrak{g}^{0}\right) \mathfrak{n}_{+}^{0} . \tag{4.41}
\end{align*}
$$

Remark 4.6. There is a very illuminating way to write the polynomials in (4.28). Let $1 \leq j<l$. Note that the coroot $h_{\epsilon_{j}+\epsilon_{j+1}}$ is $h_{j}+2 h_{j+1}+\cdots+2 h_{l-1}+\overline{h_{l}}$ which is the same as $h_{j}+2 \sum_{j<i \leq l} h_{i}$. In the case $j=l$, we write $h_{l}=\frac{1}{2} \overline{h_{l}}$. All in all, we see that we have got the following polynomials:

$$
\begin{align*}
p_{j} & =h_{j}\left(h_{\epsilon_{j}+\epsilon_{j+1}}+l-j+\frac{1}{2}\right) \quad \text { for } 1 \leq j \leq l-1,  \tag{4.42}\\
p_{l} & =\frac{1}{4} \overline{h_{l}}\left(\overline{h_{l}}-1\right) . \tag{4.43}
\end{align*}
$$

Observe that $p_{i} \in \mathscr{P}_{0}$ and they are linearly independent. Thus $\operatorname{dim}\left(\mathscr{P}_{0}\right) \geq l$. However, since $\operatorname{dim}\left(\mathscr{P}_{0}\right) \leq \operatorname{dim}\left(\mathscr{R}_{0}\right)=l$, we in fact have an equality and hence the $p_{i}$ span $\mathscr{P}_{0}$.

These are exactly the polynomials (up to a factor of 4 in $p_{l}$ ) obtained by Perše [24] in relation to the top spaces of $B_{l}$ modules at level $-l+\frac{3}{2}$. Thus, we may immediately import relevant results from [24] on zero sets of these polynomials.

Theorem 4.7. [24, Prop. 30] For every subset $S=\left\{i_{1}, i_{2}, \cdots, i_{k}\right\} \subseteq\{1,2, \cdots, l-1\}$ with $i_{1}<$ $\cdots<i_{k}$, define:

$$
\begin{align*}
& \mu_{S}=\sum_{j=1}^{k}\left(i_{j}+2 \sum_{s=j+1}^{k}(-1)^{s-j} i_{s}+(-1)^{k-j+1}\left(l-\frac{1}{2}\right)\right) \omega_{i_{j}},  \tag{4.44}\\
& \mu_{S}^{\prime}=\omega_{l}+\sum_{j=1}^{k}\left(i_{j}+2 \sum_{s=j+1}^{k}(-1)^{s-j} i_{s}+(-1)^{k-j+1}\left(l+\frac{1}{2}\right)\right) \omega_{i_{j}} . \tag{4.45}
\end{align*}
$$

Then, $\left\{\mu_{S}, \mu_{S}^{\prime} \mid S \subset\{1,2, \ldots, l-1\}\right\}$ provides the complete list of highest weights of irreducible highest-weight $A_{\nu}\left(L\left(\mathfrak{s t}_{2 l+1},-l-\frac{1}{2}\right)\right)$-modules.
Remark 4.8. In (4.44) and (4.45), notice that the coefficient of each of the $\omega_{i_{j}}(j=1, \ldots, k)$ is an element of $\frac{1}{2}+\mathbb{Z}$. This means that we have obtained exactly two weights that are dominant integral for $B_{l}$. These correspond to $S$ being the empty set: $\mu_{\phi}=0, \mu_{\phi}^{\prime}=\omega_{l}$. These are precisely the highest weights of the simple ordinary (i.e., Virasoro mode $L(0)$ acts semisimply with finite dimensional weight spaces, and weights are bounded from below) $\nu$-twisted modules.

## 5. Admissibility and complete reducibility

5.1. Admissibility. Due to the results in [22], every (weak) $\nu$-twisted $L\left(\mathfrak{s l}_{2 l+1},-l-\frac{1}{2}\right)$-module is naturally a module for the twisted affine Lie algebra $A_{2 l}^{(2)}$ of level $-l-\frac{1}{2}$. As weights for $A_{2 l}^{(2)}$, the weights obtained in Theorem 4.7 become:

$$
\begin{equation*}
\lambda_{S}=\left(-l-\frac{1}{2}\right) \Lambda_{0}^{c}+\mu_{S}, \quad \lambda_{S}^{\prime}=\left(-l-\frac{1}{2}\right) \Lambda_{0}^{c}+\mu_{S}^{\prime} . \tag{5.1}
\end{equation*}
$$

We now prove that these are admissible, see Definition 2.1.
Theorem 5.1. For every $S \subseteq\{1,2, \ldots, l-1\}$, the weights $\lambda_{S}$ and $\lambda_{S}^{\prime}$ are admissible for $A_{(2 l)}^{(2)}$.
Proof. Recall that $\rho=\bar{\rho}+h^{\vee} \Lambda_{0}^{c}$ and observe that

$$
\begin{equation*}
\lambda_{S}+\rho=\left(l+\frac{1}{2}\right) \Lambda_{0}^{c}+\bar{\rho}+\mu_{S}, \quad \lambda_{S}^{\prime}+\rho=\left(l+\frac{1}{2}\right) \Lambda_{0}^{c}+\bar{\rho}+\mu_{S}^{\prime} . \tag{5.2}
\end{equation*}
$$

First, let $l=1$. Then, the only choice for $S$ is the empty set $\phi$, and we have two weights, $\mu_{\phi}=0$, $\mu_{\phi}^{\prime}=\omega_{1}=\frac{1}{2} \alpha_{1}$. Let $\mu$ be one of these, and let $\lambda$ be $-\frac{3}{2} \Lambda_{0}^{c}+\mu$.

Consider $m \in \mathbb{Z}, \widetilde{\alpha}= \pm \alpha_{1}+m \delta \in \widehat{\Phi}_{+}^{\text {short }}$. If $m>0$, then, recalling (2.23), (2.15),

$$
\begin{equation*}
\left(\lambda+\rho, \widetilde{\alpha}^{\vee}\right)=\frac{2}{1}\left(\frac{3}{2} \Lambda_{0}^{c}+\frac{1}{2} \alpha_{1}+\mu, \pm \alpha_{1}+m \delta\right)=3 m \pm 1 \pm 2\left(\mu, \alpha_{1}\right)>0 \tag{5.3}
\end{equation*}
$$

since $\left(\mu, \alpha_{1}\right)=0$ or $\frac{1}{2}$. If $m=0$, then, $\widetilde{\alpha}=\alpha_{1}$, and

$$
\begin{equation*}
\left(\lambda+\rho, \widetilde{\alpha}^{\vee}\right)=\frac{2}{1}\left(\frac{3}{2} \Lambda_{0}^{c}+\frac{1}{2} \alpha_{1}+\mu, \alpha_{1}\right)=1+2\left(\mu, \alpha_{1}\right)>0 . \tag{5.4}
\end{equation*}
$$

Now let $m \in \mathbb{Z}, \widetilde{\alpha}= \pm 2 \alpha_{1}+(2 m+1) \delta \in \widehat{\Phi}_{+}^{\text {long }}$. Necessarily, $m \geq 0$ and, recalling (2.23), (2.15),

$$
\begin{equation*}
\left(\lambda+\rho, \widetilde{\alpha}^{\vee}\right)=\frac{2}{4}\left(\frac{3}{2} \Lambda_{0}^{c}+\frac{1}{2} \alpha_{1}+\mu, \pm 2 \alpha_{1}+(2 m+1) \delta\right)=\frac{3}{4}(2 m+1) \pm \frac{1}{2} \pm\left(\mu, \alpha_{1}\right) \notin \mathbb{Z}, \tag{5.5}
\end{equation*}
$$

since $\left(\mu, \alpha_{1}\right)=0$ or $\frac{1}{2}$. Thus the first condition of admissibility is satisfied.

For the second condition, note that $\alpha_{1}, \delta-\alpha_{1} \in \widehat{\Phi}^{\text {short }}$. We have $\alpha_{1}, \delta-\alpha_{1} \in \widehat{\Delta}_{\lambda_{\phi}}^{\mathrm{re}}$ since:

$$
\left(\lambda_{\phi},\left(\alpha_{1}\right)^{\vee}\right)=2\left(-\frac{3}{2} \Lambda_{0}^{c}, \alpha_{1}\right)=0, \quad\left(\lambda_{\phi},\left(\delta-\alpha_{1}\right)^{\vee}\right)=2\left(-\frac{3}{2} \Lambda_{0}^{c}, \delta-\alpha_{1}\right)=-3 .
$$

We have $\alpha_{1}, \delta-\alpha_{1} \in \widehat{\Delta}_{\lambda_{\phi}^{\prime}}^{\text {re }}$ since:

$$
\left(\lambda_{\phi}^{\prime},\left(\alpha_{1}\right)^{\vee}\right)=2\left(-\frac{3}{2} \Lambda_{0}^{c}+\frac{1}{2} \alpha_{1}, \alpha_{1}\right)=1, \quad\left(\lambda_{\phi}^{\prime},\left(\delta-\alpha_{1}\right)^{\vee}\right)=2\left(-\frac{3}{2} \Lambda_{0}^{c}+\frac{1}{2} \alpha_{1}, \delta-\alpha_{1}\right)=-4 .
$$

Now, let $l>1$. Most of the work for this case has been already done in [24, Lem. 32]. Also, as in [24], the proof for $\lambda_{S}$ and $\lambda_{S}^{\prime}$ is similar, so we only present the former.

Suppose that $\alpha \in \Phi^{\text {short }} \cup \Phi^{\text {long }}, m \in \mathbb{Z}$ such that $\widetilde{\alpha}=\alpha+m \delta \in \widehat{\Phi}_{+}^{\text {short }} \cup \widehat{\Phi}_{+}^{\text {intermediate }}$. Then, recalling (2.23), (2.15), we get the following, exactly as in [24, Eq. 12]:

$$
\begin{equation*}
\left(\lambda_{S}+\rho, \widetilde{\alpha}^{\vee}\right)=\left(\left(l+\frac{1}{2}\right) \Lambda_{0}^{c}+\bar{\rho}+\mu_{S},(\alpha+m \delta)^{\vee}\right)=\frac{2}{(\alpha, \alpha)}\left(m\left(l+\frac{1}{2}\right)+(\bar{\rho}, \alpha)+\left(\mu_{S}, \alpha\right)\right) . \tag{5.6}
\end{equation*}
$$

In [24, Lem. 32], it was shown that the right-hand side does not belong to $\{0,-1,-2, \ldots\}$.
Now suppose $\alpha= \pm \epsilon_{i} \in \Phi^{\text {short }}(i=1, \ldots, l)$ and $m \in \mathbb{Z}$ such that $\widetilde{\alpha}=2 \alpha+(2 m+1) \delta \in \widehat{\Phi}_{+}^{\text {long }}$. We have:

$$
\begin{equation*}
\left(\lambda_{S}+\rho, \widetilde{\alpha}^{\vee}\right)=\frac{2}{4}\left((2 m+1)\left(l+\frac{1}{2}\right)+\left(\bar{\rho}+\mu_{S}, 2 \alpha\right)\right)=(2 m+1)\left(\frac{l}{2}+\frac{1}{4}\right)+\left(\bar{\rho}+\mu_{S}, \alpha\right) . \tag{5.7}
\end{equation*}
$$

Recalling (2.18), (2.20), we see that $\left(\mu_{S}, \alpha\right) \in \frac{1}{2} \mathbb{Z}$. Recalling (2.22), we see $(\bar{\rho}, \alpha) \in \frac{1}{2} \mathbb{Z}$. Hence, $\left(\lambda_{S}+\rho, \widetilde{\alpha}^{\vee}\right) \in \frac{1}{4}+\frac{1}{2} \mathbb{Z}$, and thus not in $\{0,-1,-2, \ldots\}$.

The proof for checking the second condition of Definition 2.1 (recall Remark 2.2)) is also similar to [24]. For $i=1, \ldots, k$, denote the coefficient of $\omega_{i_{j}}$ in $\mu_{S}$ by $x_{i_{j}} \in \frac{1}{2}+\mathbb{Z}$.

Using (2.18) and (2.20), it is easy to see that for $i \in\{1, \ldots, l\} \backslash S,\left(\lambda_{S}, \alpha_{i}^{\vee}\right)=\left(\mu_{S}, \alpha_{i}^{\vee}\right)=0$. If $i_{j} \in S, \delta-\alpha_{i_{j}} \in \widehat{\Phi}^{\text {intermediate }}$. We have, again using (2.18) and (2.20):

$$
\begin{equation*}
\left(\lambda_{S},\left(\delta-\alpha_{i_{j}}\right)^{\vee}\right)=\frac{2}{2}\left(\lambda_{S}, \delta-\alpha_{i_{j}}\right)=\left(\left(-l-\frac{1}{2}\right)-\left(\mu_{S}, \alpha_{i_{j}}\right)\right)=-l-\frac{1}{2}-x_{i_{j}} \in \mathbb{Z} . \tag{5.8}
\end{equation*}
$$

Now, if $S=\left\{i_{1}, \ldots, i_{k}\right\}$ has two or more elements, consider $i_{j} \in S$ with $j=1, \ldots, k-1$. Note, $\epsilon_{i_{j}}-\epsilon_{\left(i_{j+1}+1\right)}=\alpha_{i_{j}}+\alpha_{i_{j}+1}+\alpha_{i_{j}+2}+\cdots+\alpha_{i_{j+1}} \in \widehat{\Phi}^{\text {intermediate }}$.

$$
\begin{equation*}
\left(\lambda_{S},\left(\alpha_{i_{j}}+\alpha_{i_{j}+1}+\alpha_{i_{j}+2}+\cdots+\alpha_{i_{j+1}}\right)^{\vee}\right)=\left(\mu_{S}, \epsilon_{i_{j}}-\epsilon_{i_{j+1}+1}\right)=x_{i_{j}}+x_{i_{j+1}} \in \mathbb{Z} \tag{5.9}
\end{equation*}
$$

If $S$ has two or more elements, the observations above are enough to guarantee the second condition of admissibility. If $S$ has exactly one element, $S=\left\{i_{1}\right\}$, consider $\epsilon_{i}=\alpha_{i_{1}}+\alpha_{i_{1}+1} \cdots+\alpha_{l} \in \widehat{\Phi}^{\text {short }}$. We have:

$$
\begin{equation*}
\left(\lambda_{\left\{i_{1}\right\}},\left(\alpha_{i_{1}}+\alpha_{i_{1}+1} \cdots+\alpha_{l}\right)^{\vee}\right)=2\left(\mu_{\left\{i_{1}\right\}}, \epsilon_{i_{1}}\right)=2 x_{i_{1}} \in \mathbb{Z} \tag{5.10}
\end{equation*}
$$

This, combined with the other observations is enough to handle the present case. Finally, if $S$ is empty, consider $\delta-\alpha_{l}=\widehat{\Phi}^{\text {short. }}$

$$
\begin{equation*}
\left(\lambda_{\phi},\left(\delta-\alpha_{l}\right)^{\vee}\right)=2\left(\lambda_{\phi}, \delta-\alpha_{l}\right)=2\left(\left(-l-\frac{1}{2}\right)-\left(\mu_{\phi}, \alpha_{l}\right)\right)=-2 l-1 \in \mathbb{Z} \tag{5.11}
\end{equation*}
$$

5.2. Semi-simplicity. Again, our proofs are parallel to the ones in [2], [25], [24] etc., with statements modified to accommodate the twist. Recall the notion of category $\mathcal{O}$ for representations of affine Kac-Moody algebras, [15, Ch. 9].

Theorem 5.2. ([16, Thm. 4.1]) Let $\mathfrak{g}$ be any affine Lie algebra and let $M$ be a $\mathfrak{g}$-module from category $\mathcal{O}$ such that its every irreducible subquotient $L(\lambda)$ with highest weight $\lambda$ satisfies:
(1) $\left(\lambda+\rho, \alpha^{\vee}\right) \notin\{-1,-2, \ldots$,$\} for all \alpha^{\vee} \in \widehat{\Delta}_{+}^{\vee, \text { re }}$ and
(2) $\Re(\lambda+\rho, c)>0$.

Then $M$ is completely reducible.
It is clear that our weights $\lambda_{S}, \lambda_{S}^{\prime}$ for all $l \geq 1$ and $S \subseteq\{1, \ldots, l-1\}$ satisfy these conditions.
Theorem 5.3. (cf. [24, Thm. 33]) Let $M$ be a weak $\nu$-twisted $L\left(\mathfrak{s l}_{2 l+1},-l-\frac{1}{2}\right)$-module that is in category $\mathcal{O}$ as a $A_{2 l}^{(2)}$-module. Then, $M$ is completely reducible.
Proof. Any irreducible subquotient $L$ of $M$ is also a $\nu$-twisted $L\left(\mathfrak{s l}_{2 l+1},-l-\frac{1}{2}\right)$-module that is in category $\mathcal{O}$ as a $A_{2 l}^{(2)}$-module. Thus, the highest weight of $L$ is $\lambda_{S}$ or $\lambda_{S}^{\prime}$, in particular it satisfies the conditions of Theorem 5.2. So, $M$ is completely reducible as a $A_{2 l}^{(2)}$-module, and thus completely reducible as a (weak) $\nu$-twisted $L\left(\mathfrak{s l}_{2 l+1},-l-\frac{1}{2}\right)$-module.
Theorem 5.4. (cf. [24, Lem. 26]) Let $M$ be an ordinary $\nu$-twisted $L\left(\mathfrak{s l}_{2 l+1},-l-\frac{1}{2}\right)$-module. Then, $M$ is in category $\mathcal{O}$ as a $A_{2 l}^{(2)}$-module, in particular, $M$ is completely reducible.

Proof. $M$ is a level $-l-\frac{1}{2}$ module for $A_{2 l}^{(2)}$ [22], in particular, the central element $c$ of $A_{2 l}^{(2)}$ acts semi-simply on $M$. Clearly, every conformal weight space of $M$ which is finite dimensional by assumption is a module for $\mathfrak{h}^{0}$. Thus, $\mathfrak{h}^{0}$ acts semi-simply on $M$ with finite dimensional weight spaces. If $v$ is a highest weight vector in $M$ of weight $\lambda \in \mathfrak{H}^{*}$, then the irreducible $A_{2 l}^{(2)}$ module $L(\lambda)$ is an irreducible subquotient of $M$, and hence an ordinary $\nu$-twisted $L\left(\mathfrak{s l}_{2 l+1},-l-\frac{1}{2}\right)$-module. $L(\lambda)$ has a finite dimensional lowest conformal weight space, in particular, this space is finite dimensional irreducible module for $\mathfrak{g}^{0}$. Thus, $\lambda$ has only two choices, $\lambda_{\phi}$ or $\lambda_{\phi}^{\prime}$ since $\mu_{\phi}$ and $\mu_{\phi}^{\prime}$ are the only dominant integral weights for $\mathfrak{g}^{0}$ among the possible highest weights (Remark 4.8). This implies that any weight of $M$ has to be dominated by one of $\lambda_{\phi}$ or $\lambda_{\phi^{\prime}}$, i.e., $\operatorname{wt}(M) \subseteq D\left(\lambda_{\phi}\right) \cup D\left(\lambda_{\phi}^{\prime}\right)$. This proves that $M$ is in category $\mathcal{O}$ as a $A_{2 l}^{(2)}$-module. The last assertion is due to Theorem 5.3.
