(Dated: December 9, 2021)

Mixing single and triple fermions an exact killing operator of the Coupled Cluster Doubles (CCD) wave function with good symmetry was found in [1]. Using these operators with the equation of motion (EOM) method the so-called self-consistent odd particle number random phase approximation (odd-RPA) was set up. Together with the stationarity condition of the two body density matrix it is shown that the killing conditions allow to reduce the order of correlation functions contained in the matrix elements of the odd-RPA equations to a fully self consistent equation for the single particle occupation numbers. Excellent results for the latter and the ground state energies are obtained in an exactly solvable model from weak to strong couplings.

PACS numbers: Random phase approximation, Coupled cluster double wave function, restoration of broken symmetry, Lipkin model.

I. INTRODUCTION

It is well known that the coupled cluster doubles (CCD) wave function is a powerful many-body ansatz. However, it is not easy nor straightforward to perform calculations with the CCD wave function. The technique most in use [2–4] is to project the equations for the ground state energy onto successively more complicated mp - mh configurations with $m = 1, 2, \dots$ and p, h single particle (s.p.) states above and below the Fermi level, respectively. Often excellent results have been obtained with these methods in various fields of physics (nuclear physics, chemistry, condensed matter, ...) [3, 4]. However, the method runs into difficulties when the system under consideration undergoes a transition to a spontaneously broken symmetry. A typical example is the transition to superconductivity of electronic systems or to super-fluidity of other Fermi systems like there are nuclear physics or cold atoms in traps. This is particularly relevant for finite systems where considering a definite number of particles can become mandatory. Very recently there have, thus, been attempts to formulate symmetry projected CDD approaches: i) using BCS quasi-particle basis with projection to good particle number [5] ii) an effort has also been undertaken for parity projection in the Lipkin model [6]. Evidently such techniques lead to quite complex equations and to the best of our knowledge particle number projected CCD has not been applied to any realistic system so far.

In this paper we will go a different route leading certainly also to a theory of quite some complexity but which presents in our opinion rather interesting aspects. In the recent past it was shown in [1] that the CCD wave function is the vacuum to exact killing operators mixing single and triple numbers of fermion operators. Taking those operators within an equation of motion (EOM) approach leads to the so-called self-consistent odd particle number RPA (odd-RPA) approach [1]. The problem is how to evaluate the matrix elements which contain up to three-body correlation functions appearing in this odd-RPA in a consistent way, since those operators which consist in a non-linear transformation of fermions cannot be inverted as it is the case with quasi particle operators obtained, e.g., from a Bogoliubov transformation among fermions. However, as we will show in this paper, there exists a way around. One namely can use the killing condition which mixes, as mentioned, single and triple fermion operators to reduce the order of correlation functions [7]. In applying this method successively, we will achieve that the matrix elements in odd-RPA only contain correlated s.p. occupation numbers. To achieve this, one also has to take advantage in a last step of the stationarity of the two particle density matrix. We demonstrate the excellent performance of this approach in applying it to the Lipkin model. This model is exactly solvable and frequently used to test many body techniques mostly in nuclear physics where it was invented but not only [8–16]. This model contains for instance a phase with a spontaneously broken symmetry mixing even and odd numbers of ph excitations. It is, therefore, a discrete symmetry (parity), in ph space which is broken in strong coupling. We will see that the results from odd-RPA for

†Electronic address: schuck@ipno.in2p3.fr

s.p. occupation numbers and ground state energies are excellent in the weak and strong coupling limits and still being of very acceptable accuracy in the transition region.

The paper is organised as follows. In Sect.II we present the general theory and in Sect.III we apply it to the Lipkin model. In Sect.IV we give our conclusions and outline some perspectives. Finally in the Appendix we give some detailed formulas.

II. GENERAL THEORY

In this paper we will consider the following CCD wave function

$$|Z\rangle = \exp(Z) |HF\rangle \quad (1)$$

with

$$\begin{aligned} Z &= \frac{1}{2} \sum_{pp'hh'} z_{pp'hh'} K_{ph}^\dagger K_{p'h'}^\dagger \\ &= \frac{1}{2} \sum_{pp'hh'} z_{pp'hh'} P_{pp'}^\dagger P_{hh'}, \end{aligned} \quad (2)$$

where $|HF\rangle$ is the Hartree-Fock (HF) Slater determinant and

$$K_{ph}^\dagger = \beta_p^\dagger \beta_h^\dagger \quad K_{hp} = \beta_h \beta_p \quad (3)$$

with $\beta_h |HF\rangle = a_h^\dagger |HF\rangle = 0$ and $\beta_p |HF\rangle = a_p |HF\rangle = 0$ (a_k^\dagger, a_k the fermion operators in the HF basis). The indices " p, p', \dots " refer to single particle states 'above' and " h, h', \dots " refer to single hole states 'below' the Fermi surface, respectively.

The pairing operators are given by

$$P_{pp'}^\dagger = \beta_p^\dagger \beta_{p'}^\dagger \quad P_{hh'}^\dagger = \beta_h^\dagger \beta_{h'}^\dagger \quad (4)$$

The amplitudes $z_{pp'hh'}$ must full-fill the condition of the killer operators of the state (1).

For an odd particle excitation operator, the killers can be defined as retrieval (ρ) mode or addition (α) mode, respectively

$$\begin{aligned} q_\rho &= \sum_h x_h^\rho \beta_h + \sum_{pp'h'} U_{pp'h'}^\rho \beta_p^\dagger K_{p'h'}^\dagger \\ q_\alpha &= \sum_p x_p^\alpha \beta_p + \sum_{p'hh'} U_{p'hh'}^\alpha K_{p'h'}^\dagger \beta_h^\dagger. \end{aligned} \quad (5)$$

The killing conditions $q_\rho |Z\rangle = q_\alpha |Z\rangle = 0$ give

$$\sum_{h'} z_{pp'hh'} x_{h'}^\rho = U_{pp'h'}^\rho, \quad \sum_{p'} x_{p'}^\alpha z_{p'phh'} = U_{phh'}^\alpha. \quad (6)$$

For the case of pairing we can consider the following killers

$$\begin{aligned} q_\rho &= \sum_h y_h^\rho \beta_h + \sum_{pp'h'} V_{pp'h'}^\rho P_{pp'}^\dagger \beta_{h'}^\dagger \\ q_\alpha &= \sum_p y_p^\alpha \beta_p + \sum_{p'hh'} V_{p'hh'}^\alpha \beta_{p'}^\dagger P_{hh'}^\dagger \end{aligned} \quad (7)$$

and the killing conditions give the relations

$$\sum_{h'} z_{pp'hh'} y_{h'}^\rho = V_{pp'h'}^\rho, \quad \sum_{p'} y_{p'}^\alpha z_{p'phh'} = V_{phh'}^\alpha. \quad (8)$$

In this paper we will, however, not consider the pairing case any further. It will be treated separately in a forthcoming paper. The coefficients x^ρ, U^ρ will be determined from the minimisation of a sum rule for the average single particle energy

$$\lambda_\rho = \frac{\langle \{q_\rho, [H, q_\rho^\dagger]\} \rangle}{\langle \{q_\rho, q_\rho^\dagger\} \rangle} \quad (9)$$

and equivalently for x^α, U^α with q_α^\dagger . From the minimisation of equation (9), we obtain two coupled equations

$$\sum_{h'} e_{hh'} x_{h'}^\rho + \sum_{pp'h'} \mathcal{C}_{h,pp'h'} U_{pp'h'}^\rho = \lambda_\rho x_h^\rho \quad (10)$$

$$\sum_{h'} \mathcal{C}_{pp'h,h'}^* x_{h'}^\rho + \sum_{p_1 p_2 h'} \mathcal{D}_{pp'h,p_1 p_2 h'} U_{p_1 p_2 h'}^\rho = \lambda_\rho U_{pp'h}^\rho$$

or written as a matrix eigenvalue equation

$$\begin{pmatrix} e & \mathcal{C} \\ \mathcal{C}^\dagger & \mathcal{D} \end{pmatrix} \begin{pmatrix} x^\rho \\ U^\rho \end{pmatrix} = \lambda_\rho \begin{pmatrix} x^\rho \\ U^\rho \end{pmatrix} \quad (11)$$

with

$$\begin{aligned} e_{hh'} &= \langle \{ \beta_h, [H, \beta_{h'}^\dagger] \} \rangle \\ \mathcal{C}_{pp'h,h'}^* &= \frac{\langle \{ K_{h'p'} \beta_p, [H, \beta_h^\dagger] \} \rangle}{\sqrt{\mathcal{N}_{pp'h'}}} \\ \mathcal{D}_{pp'h,p_1 p_2 h'} &= \frac{\langle \{ K_{h'p'} \beta_p, [H, \beta_{p_1}^\dagger K_{p_2 h'}^\dagger] \} \rangle}{\sqrt{\mathcal{N}_{pp'h'}} \sqrt{\mathcal{N}_{p_1 p_2 h'}}} \\ \mathcal{N}_{pp'h'} &= \langle \{ K_{h'p'} \beta_p, \beta_p^\dagger K_{p'h'}^\dagger \} \rangle \end{aligned} \quad (12)$$

where $\langle \dots \rangle = \frac{\langle Z | \dots | Z \rangle}{\langle Z | Z \rangle}$ will be used throughout the paper. The Hamiltonian of two-particles in interaction is given by

$$H = \sum_{kl} \epsilon_{kl} c_k^\dagger c_l + \frac{1}{4} \sum_{klmn} \bar{v}_{klmn} c_k^\dagger c_l^\dagger c_n c_m. \quad (13)$$

with ϵ_{kl} represents the matrix of the kinetic energy. The anti-symmetrised matrix elements of the two-body force are given by $\bar{v}_{klk'l'} = \langle kl | v | k'l' \rangle - \langle kl | v | l'k' \rangle$. A general two-body Hamiltonian in the HF-quasi-particle basis is given by [17]

$$H = E_{HF} + H^{11} + H^{20} + H^{40} + H^{31} + H^{22} \quad (14)$$

The different terms in (14) are defined as

$$\begin{aligned}
E_{HF} &= \sum_h \epsilon_{hh} + \frac{1}{2} \sum_{hh'} \bar{v}_{hh'hh'}, \\
H^{20} &= \sum_{ph} \left(\epsilon_{ph} + \sum_{h'} \bar{v}_{ph'hh'} \right) K_{ph}^\dagger + \text{h.c.}, \\
H^{40} &= \frac{1}{4} \sum_{pp',hh'} \bar{v}_{pp'h'h'} K_{ph}^\dagger K_{p'h'}^\dagger + \text{h.c.}, \\
H^{11} &= \sum_{pp'} \left(\epsilon_{pp'} + \sum_h \bar{v}_{php'h} \right) S_{pp'} \\
&\quad - \sum_{hh'} \left(\epsilon_{h'h} + \sum_{h_1} \bar{v}_{h'h_1hh_1} \right) S_{hh'} \\
H^{31} &= \frac{1}{2} \sum_{ph} K_{ph}^\dagger \left(\sum_{p'p_1} \bar{v}_{pp'h'p_1} S_{p'p_1} \right. \\
&\quad \left. - \sum_{h'h_1} \bar{v}_{ph_1hh'} S_{h'h_1} \right) + \text{h.c.}, \\
H^{22} &= \sum_{php'h'} \bar{v}_{ph'h'p'} K_{ph}^\dagger K_{h'p'} \\
&\quad + \frac{1}{4} \sum_{pp'p_1} \bar{v}_{pp'p'p_1} S_{pp'} + \frac{1}{4} \sum_{hh'h_1} \bar{v}_{hh_1h'h_1} S_{hh'} \\
&\quad - \frac{1}{4} \sum_{pp'p_1p_2} \bar{v}_{pp'p_1p_2} S_{pp_2} S_{p'p_1} \\
&\quad - \frac{1}{4} \sum_{hh'h_1h_2} \bar{v}_{hh'h_1h_2} S_{h_1h'} S_{h_2h}, \tag{15}
\end{aligned}$$

The density operators S_{ij} are given by

$$S_{hh'} = \beta_h^\dagger \beta_{h'} \quad S_{pp'} = \beta_p^\dagger \beta_{p'} \tag{16}$$

We now will proceed to the reduction of the order of correlation functions contained in the matrix elements of (12). We start with the following relations

$$\beta_k |Z\rangle = e^Z \tilde{\beta}_k |HF\rangle \tag{17}$$

whith $\tilde{\beta}_k = e^{-Z} \beta_k e^Z$. Then

$$\begin{aligned}
\tilde{\beta}_p &= \beta_p + [\beta_p, Z] + \text{zero} \\
&= \beta_p + \sum_{p'hh'} z_{pp'h'h'} K_{p'h}^\dagger \beta_{h'}^\dagger \\
\tilde{\beta}_h &= \beta_h + [\beta_h, Z] + \text{zero} \\
&= \beta_h + \sum_{pp'h'} z_{pp'h'h'} K_{ph'}^\dagger \beta_{p'}^\dagger. \tag{18}
\end{aligned}$$

This yields the following relations

$$\beta_p |Z\rangle = \sum_{p'hh'} z_{pp'h'h'} K_{p'h}^\dagger \beta_{h'}^\dagger |Z\rangle \tag{19a}$$

$$\beta_h |Z\rangle = \sum_{pp'h'} z_{pp'h'h'} K_{ph'}^\dagger \beta_{p'}^\dagger |Z\rangle \tag{19b}$$

which are just variants of the killing conditions. Now multiplying these relations from the left with $\beta_h(\beta_p)$ and using (6), we arrive at a reduction of higher powers in K^\dagger to lower powers ones

$$\begin{aligned}
&\sum_{p'p_1h_1h'} U_{pp'h}^\rho z_{p_1p_2h_1h'} K_{ph}^\dagger K_{p_2h_1}^\dagger K_{p'h'}^\dagger |Z\rangle = \\
&\delta_{pp_1} x_h^\rho K_{hp_1} |Z\rangle - (U_{p_1ph}^\rho - U_{pp_1h}^\rho) K_{ph}^\dagger |Z\rangle \tag{20a}
\end{aligned}$$

$$\begin{aligned}
&\sum_{p_1p'h_1h_2} U_{ph_1h'}^\alpha z_{p_1p'h'h_2} K_{ph_1}^\dagger K_{p_1h_2}^\dagger K_{p'h'}^\dagger |Z\rangle = \\
&-\delta_{hh'} x_p^\alpha K_{hp} |Z\rangle - (U_{phh'}^\alpha - U_{ph'h}^\alpha) K_{ph'}^\dagger |Z\rangle \tag{20b}
\end{aligned}$$

Similarly, we can reduce the even powers of K^\dagger

$$\sum_{pp'} U_{pp'h}^\rho K_{ph}^\dagger K_{p'h}^\dagger |Z\rangle = x_h^\rho S_{h'h} |Z\rangle \tag{21a}$$

$$\sum_{hh'} U_{phh'}^\alpha K_{ph}^\dagger K_{p'h'}^\dagger |Z\rangle = -x_p^\alpha S_{p'p} |Z\rangle \tag{21b}$$

From the mean value in the ground state (1), we find the s.p. occupation numbers

$$\begin{aligned}
n_h &= \langle \beta_h^\dagger \beta_h \rangle = \sum_\rho |\langle \{ \beta_h^\dagger, q_\rho \} \rangle|^2 = |x_h^\rho|^2 \\
n_p &= \langle \beta_p^\dagger \beta_p \rangle = \sum_\alpha |\langle \{ \beta_p^\dagger, q_\alpha \} \rangle|^2 = |x_p^\alpha|^2 \tag{22}
\end{aligned}$$

and

$$\begin{aligned}
\langle S_{hh'} \rangle &= \langle \beta_h^\dagger \beta_{h'} \rangle \\
&= \sum_\rho \langle \{ \beta_h^\dagger, q_\rho \} \rangle \langle \{ q_\rho^\dagger, \beta_{h'} \} \rangle = x_h^\rho (x_{h'}^\rho)^* \\
\langle S_{pp'} \rangle &= \langle \beta_p^\dagger \beta_{p'} \rangle \\
&= \sum_\alpha \langle \{ \beta_p^\dagger, q_\alpha \} \rangle \langle \{ q_\alpha^\dagger, \beta_{p'} \} \rangle = x_p^\alpha (x_{p'}^\alpha)^* \tag{23}
\end{aligned}$$

We note that the mean values in the ground state (1) of odd powers of K^\dagger vanish. But from the eqs. (21a, 21b) and (23), we can calculate all mean values of even powers of K^\dagger . Let us add the two eqs (20a, 20b), we then can express any correlation functions appearing in the elements of the matrix (11) as functions of $\langle S_{pp'} \rangle$, $\langle S_{hh'} \rangle$ and the mean value of the square of these operators in (23). In order to close the system of equations, we need one further relation. It very naturally is given by demanding that the time derivative of the two body correlation function be zero. It is this stationary condition of the two-body density matrix which gives us a relation between the $\langle S_{kk'} S_{ll'} \rangle$ and $\langle S_{nn'} \rangle$,

$$\langle [H, K_{ph}^\dagger K_{p'h'}^\dagger] \rangle = \langle [H, K_{hp} K_{h'p'}] \rangle = 0. \tag{24}$$

For the explicit form of this commutator, see appendix (A). In order to test our theory, we choose the Lipkin model for an application.

III. APPLICATION TO THE LIPKIN MODEL

The single-particle space of the Lipkin model consists of two fermion levels, each of which has a N -fold degeneracy see [8, 17]. The upper (lower) level has the energy of $\frac{\epsilon}{2}$ ($-\frac{\epsilon}{2}$). The Hamiltonian of the Lipkin model is given by

$$H = eJ_0 - \frac{V}{2} (J_+^2 + J_-^2) \quad (25)$$

with e the inter-shell spacing, V is the coupling constant, and

$$\begin{aligned} J_0 &= \frac{1}{2} \sum_{m=1}^N (c_{1m}^\dagger c_{1m} - c_{0m}^\dagger c_{0m}), \\ J_+ &= \sum_{m=1}^N c_{1m}^\dagger c_{0m}, \quad J_- = (J_+)^\dagger \end{aligned} \quad (26)$$

with $2J_0 = \hat{n}_1 - \hat{n}_0$, $\hat{n}_i = \sum c_{im}^\dagger c_{im}$ and N the number of particles equivalent to the degeneracies of the shells. The Lipkin model has been derived in nuclear physics and is, as mentioned in the Introduction, exactly solvable and frequently used to test many body approaches. The model is non-trivial and has a spontaneously discrete (parity) broken symmetry phase. Besides in nuclear physics, it is also considered in other fields of physics, see [9–16].

To proceed to the odd-RPA approach, we assume as variational ground state the CCD wave function given by the following expression

$$|Z\rangle = e^{\frac{z}{2} J_+ J_-} |HF\rangle = e^Z |HF\rangle \quad (27)$$

The ground state (27) is the vacuum for the two killers of normalised retrieval and addition modes, respectively,

$$\begin{aligned} q_\rho &= \frac{1}{N} \sum_m \left[x_0^\rho c_{0m}^\dagger + U_0^\rho \frac{c_{1m}^\dagger J_+}{\sqrt{n_{11}}} \right] \\ q_\alpha &= \frac{1}{N} \sum_m \left[x_1^\alpha c_{1m} + U_1^\alpha \frac{J_- c_{0m}}{\sqrt{n_{11}}} \right] \end{aligned} \quad (28)$$

with $n_{11} = \langle \{c_{1m}^\dagger J_+, J_- c_{1m}\} \rangle = \langle \{c_{0m}^\dagger J_-, J_+ c_{0m}\} \rangle$. So we can verify the normalisation condition as

$$\begin{aligned} \langle \{q_\rho, q_\rho^\dagger\} \rangle &= |x_0^\rho|^2 + |U_0^\rho|^2 = 1 \\ \langle \{q_\alpha, q_\alpha^\dagger\} \rangle &= |x_1^\alpha|^2 + |U_1^\alpha|^2 = 1 \end{aligned} \quad (29)$$

Let us calculate the transformed single particle operators

$$\begin{aligned} \tilde{c}_{0m}^\dagger &= c_{0m}^\dagger - z c_{1m}^\dagger J_+ \\ \tilde{c}_{1m} &= c_{1m} + z J_- c_{0m}, \end{aligned} \quad (30)$$

and consider the normalised amplitudes

$$\tilde{U}_0^\rho = \frac{U_0^\rho}{\sqrt{n_{11}}}, \quad \tilde{U}_1^\alpha = \frac{U_1^\alpha}{\sqrt{n_{11}}}. \quad (31)$$

Then the condition $q_\rho |Z\rangle = 0$ and $q_\alpha |Z\rangle = 0$ yields

$$z = \frac{\tilde{U}_0^\rho}{x_0^\rho} = \frac{U_0^\rho}{x_0^\rho \sqrt{n_{11}}} = \frac{\tilde{U}_1^\alpha}{x_1^\alpha} = \frac{U_1^\alpha}{x_1^\alpha \sqrt{n_{11}}} \quad (32)$$

We can find an expression of $J_0 |Z\rangle$ via $c_{0m} q_\rho |Z\rangle = 0$,

$$J_0 |Z\rangle = \left(-\frac{N}{2} + z J_+ J_-\right) |Z\rangle \quad (33)$$

and for $J_- |Z\rangle$ via $c_{1m} q_\rho |Z\rangle = 0$,

$$J_- |Z\rangle = z \left(\frac{N}{2} - J_0\right) J_+ |Z\rangle. \quad (34)$$

We can use the two equations (33) and (34) to find an expression for the correlation functions in terms of $\langle J_0 \rangle$ and $\langle J_0^2 \rangle$ (see more details in the Appendix. B).

It remains to express $\langle J_0^2 \rangle$ as a function of $\langle J_0 \rangle$. For this, one uses the stationary condition of the two bodies density (24),

$$\begin{aligned} 0 &= \langle [H, J_-^2] \rangle \\ &= 2e \langle J_-^2 \rangle - V \langle (2J_0 + 4J_0^2 - 4J_+ J_- J_0) \rangle \end{aligned} \quad (35)$$

Then, we obtain the following expression for $\langle J_0^2 \rangle$,

$$\begin{aligned} \langle 4J_0^2 \rangle &= 2(2N-3) \langle J_0 \rangle + 2 \frac{2V - ez}{Vz} \langle J_+^2 \rangle \\ &\quad - 2(N-2) \langle J_+ J_- \rangle \\ &= 2(2N-3) \langle J_0 \rangle + \frac{2V - ez}{Vz^2} (N + 2 \langle J_0 \rangle) \\ &\quad - 2(N-2) \langle J_+ J_- \rangle \end{aligned} \quad (36)$$

with $\langle J_+ J_- \rangle$ given in Appendix B. Finally all correlation functions are well expressed as a function of z and $\langle J_0 \rangle$. Let us calculate the $\langle J_0 \rangle$ using the odd-RPA equations. We consider the conjugate of the killer of the ground state $|Z\rangle$ as odd excitation operator and we minimize the energy corresponding to these operators (28),

$$\lambda_\rho = \frac{\langle \{q_\rho, [H, q_\rho^\dagger]\} \rangle}{\langle \{q_\rho, q_\rho^\dagger\} \rangle} \quad \text{or} \quad \lambda_\alpha = \frac{\langle \{q_\alpha, [H, q_\alpha^\dagger]\} \rangle}{\langle \{q_\alpha, q_\alpha^\dagger\} \rangle}. \quad (37)$$

We obtain a matrix eigenvalue equation for the two modes with the Hamiltonian matrix

$$h_{ij} = \begin{pmatrix} h_{00} & h_{01} \\ h_{10} & h_{11} \end{pmatrix} \quad (38)$$

and the corresponding secular equation

$$\det(h - \lambda I) = 0 \quad (39)$$

The normalisation factor n_{11} is given by

$$\begin{aligned} n_{11} &= \frac{1}{N} \sum_m \langle \{c_{1m}^\dagger J_+, J_- c_{1m}\} \rangle \\ &= \frac{1}{N} \sum_m \langle \{J_+ c_{0m}, c_{0m}^\dagger J_-\} \rangle \\ &= \left(1 - \frac{2}{N}\right) (\langle J_+ J_- \rangle - \langle J_0 \rangle) + \frac{2}{N} \langle J_0^2 \rangle \end{aligned} \quad (40)$$

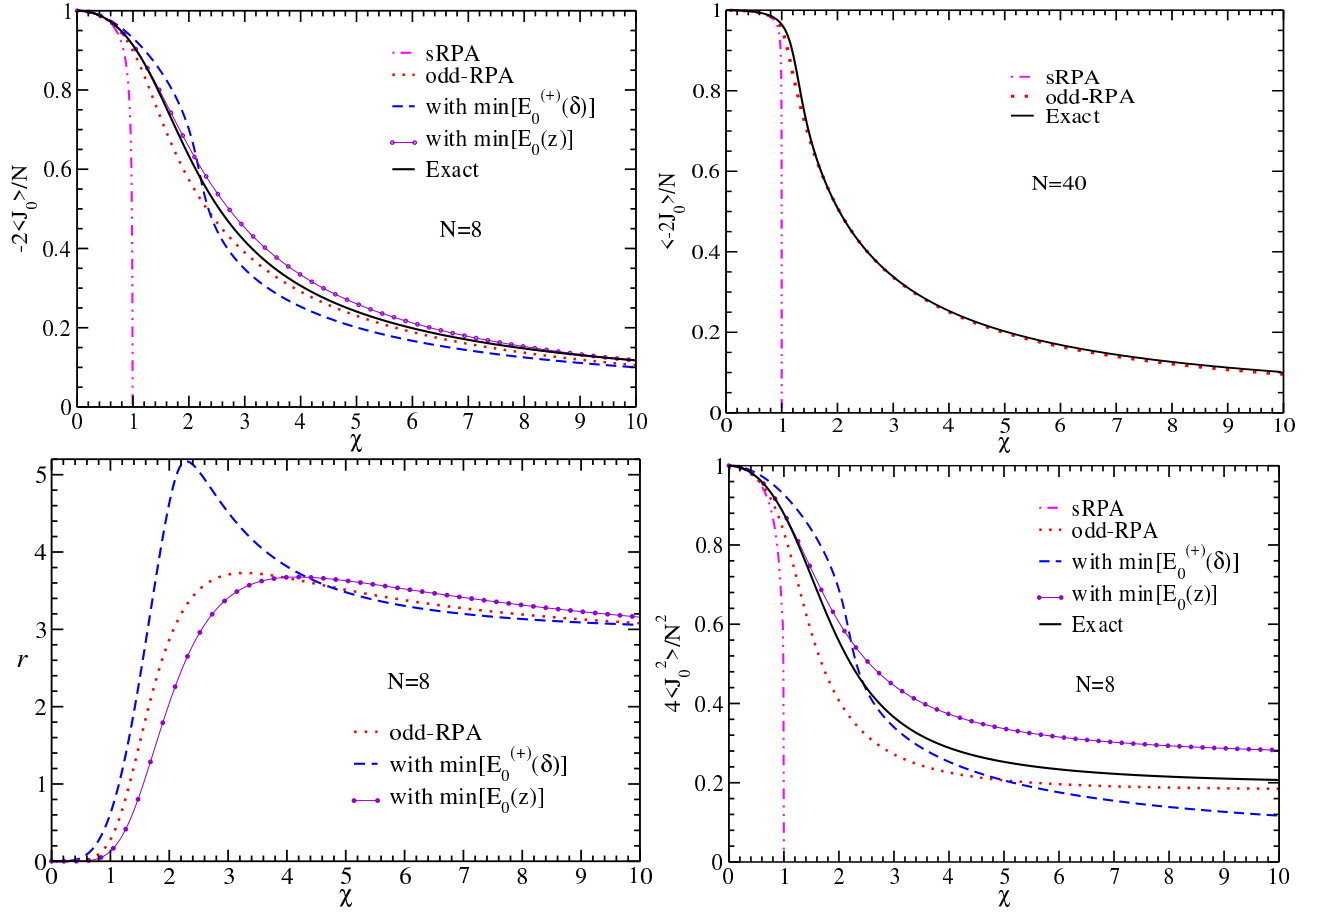

FIG. 1: Upper left panel: the occupation number difference between upper and lower levels, $\langle -2J_0 \rangle$, for $N = 8$ with standard RPA (sRPA) (double dot broken line), present odd-RPA (dotted line), projected HF $\min[E_0^{(+)}(\delta)]$ (broken line), CCD variational wave function $\min[E_0(z)]$ (continuous line with dots), and exact solution (full line) as function of the intensity of interaction $\chi = \frac{V}{e}(N-1)$. Upper right panel: $\langle -2J_0 \rangle$, for $N = 40$ with sRPA, odd-RPA, and exact solution. Lower left panel: For $N = 8$, percentage error of the correlation energy as $r = 100 \times \frac{(E_0^{\text{odd-RPA}} - E_0^{\text{Exact}})}{E_0^{\text{Exact}}}$ (dotted line), $r = 100 \times \frac{(\min[E_0(z)] - E_0^{\text{Exact}})}{E_0^{\text{Exact}}}$ (continuous line with dots) and $r = 100 \times \frac{(\min[E_0^{(+)}(\delta)] - E_0^{\text{Exact}})}{E_0^{\text{Exact}}}$ (broken line) as function of the intensity of interaction $\chi = \frac{V}{e}(N-1)$. Lower right panel: occupation fluctuation $\langle 4J_0^2 \rangle$ for $N = 8$ with same ingredients as upper left panel.

For the first Hamiltonian element, we have

$$\begin{aligned} h_{00}^{\rho} &= \frac{1}{N} \sum_m \langle \{c_{0m}^{\dagger}, [H, c_{0m}]\} \rangle = \frac{e}{2} \\ h_{00}^{\alpha} &= \frac{1}{N} \sum_m \langle \{c_{1m}, [H, c_{1m}^{\dagger}]\} \rangle = h_{00}^{\rho} \end{aligned} \quad (41)$$

and for the off diagonal elements

$$\begin{aligned} h_{10}^{\rho} &= h_{01}^{\rho} = \sum_m \frac{\langle \{c_{1m}^{\dagger} J_+, [H, c_{0m}]\} \rangle}{N \sqrt{n_{11}}} = V \sqrt{n_{11}} \\ h_{10}^{\alpha} &= h_{01}^{\alpha} = \sum_m \frac{\langle \{J_+ c_{0m}, [H, c_{1m}^{\dagger}]\} \rangle}{N \sqrt{n_{11}}} = h_{10}^{\rho} \end{aligned} \quad (42)$$

The anti-commutator for h_{11} is given by

$$\begin{aligned} h_{11}^{\rho} &= \sum_m \frac{\langle \{c_{1m}^{\dagger} J_+, [H, J_- c_{1m}]\} \rangle}{N n_{11}} \\ &= -\frac{3e}{2} - \frac{2V}{N n_{11}} (N-4) [\langle J_+^2 \rangle + \langle J_+^2 J_0 \rangle] \\ h_{11}^{\alpha} &= \sum_m \frac{\langle \{J_+ c_{0m}, [H, c_{0m}^{\dagger} J_-]\} \rangle}{N n_{11}} = h_{11}^{\rho} \end{aligned} \quad (43)$$

Then eq.(39) yields

$$\lambda_{\pm} = -\frac{1}{2}(e - h_v) \pm \frac{1}{2} \sqrt{(2e + h_v)^2 + 4V^2 n_{11}} \quad (44)$$

where $h_v = \frac{2V}{N n_{11}} (N-4) [\langle J_+^2 \rangle + \langle J_+^2 J_0 \rangle]$. So we can

FIG. 2: The eigenvalues λ_+ and λ_- of the odd-RPA matrix compared to the exact values as a function of χ .

calculate

$$n_0 = \sum_m |\langle c_{0m}^\dagger | \lambda_+ \rangle|^2 = \sum_m |\langle \{c_{0m}^\dagger, q_{0,\rho}\} \rangle|_{E=\lambda_+}^2 \quad (45)$$

with $\{c_{0m}^\dagger, q_\rho\} = x_0^\rho$. Then, the occupation numbers are given by

$$n_0 = N |x_0^\dagger|^2 = N \frac{\lambda_+ - h_{11}}{\lambda_+ - \lambda_-} = N \frac{1}{1 + z^2 n_{11}} \quad (46)$$

Thus (with $n_1 = N - n_0$)

$$\langle J_0 \rangle = \frac{N}{2} - n_0 = \frac{N}{2} \frac{z^2 n_{11} - 1}{z^2 n_{11} + 1} \quad (47)$$

With these relations the odd-RPA equation boils down to a non-linear relation for z which can easily be solved. As can be seen from Fig.1, the results for $\langle J_0 \rangle$, $\langle J_0 J_0 \rangle$, and the correlation energy are excellent for weak to strong coupling. At both ends, the method gives very good results whereas in the transition region the error remains below 3.75%. The relative error in the ground state energy for $\chi \rightarrow \infty$ is estimated to be $\sim 3\%$ for $N = 8$ and better for higher particle numbers. Also the single particle energies are well reproduced, see Fig.2. These are very satisfying results. We will give further comments in the next section where we also will give a comparison with two other methods: symmetry projected HF and the direct use of the CCD wave function as a variational one.

IV. DISCUSSIONS, CONCLUSIONS AND PERSPECTIVES

It was known for a certain time that the CCD wave function is killed by well chosen combinations of single

and triple fermion operators [1]. However, because of the non-linear fermion transformation, it remained an open problem how to deal with these operators. In this paper we showed that there exists a very efficient way how to manage a calculus with such operators. We showed that the more-body correlation functions appearing in the theory can be reduced to expectation values of the density operator with the help of the killing conditions and the stationarity of the two-body correlation function. The system of (odd-RPA) equations is then fully closed and calculations for s.p. occupation numbers and ground state energies can be performed. We applied the theory to the Lipkin model with very good success. Indeed occupation numbers and correlation energies become excellent in the weak and remain very good in the strong coupling limits with numbers in between, that is in the transition region, which stay below 4% error. This is very satisfying. One may ask about the reason of this success. To this end, we remark that replacing in eq.(5) the operators K_{ph}^\dagger by their expectation values, the non-linear transformation reduces to an ordinary linear HF-transformation among single fermion operators. The killing operators stand, therefore, for some sort of symmetry conserving quantum transformation of fermion operators. One may also say that the method consists of a symmetry conserving particle-vibration coupling (PVC) approach. In fact we performed calculations with parity projected HF wave functions (see (blue) broken lines in Fig.1) and also using the CCD wave function as a fully variational one (see (violet) lines with dots). We see that for the energies the latter two approaches are performing about the same as odd-RPA (with projected HF slightly worse) and also for the occupation numbers there is not a significant difference between all approaches.

In Sect.II, we also briefly sketched how to adapt odd-RPA to the pairing problem. This will be a task for the future. A still more ambitious project will be to apply

our theory to the case of broken rotational symmetry. However, before, we shall gain more experience with this novel method for simpler cases. Another open problem to be considered in the future is the fact that there exist killers of the CCD wave function which contain an even number of fermion operators [18]. Those operators consist in a slight generalisation of the standard RPA ph operators. Similar procedures as we used here can certainly also be applied for those operators. It shall be very interesting to see how well excitation energies of collective nuclear states are reproduced.

Acknowledgements

PS wants to thank Mitsuru Tohyama for past collaboration on odd-RPA. Discussions with Jorge Dukelsky are gratefully acknowledged as well as for suggestions and a carefull reading of the manuscript.

Appendix A: Stationary condition

The stationary condition implies that the expectation value of the commutator $[H, K^\dagger K^\dagger]$ must be zero. Let us then calculate this commutator with the general Hamil-

tonian (14),

$$\begin{aligned} [H^{11}, K_{ph}^\dagger K_{p'h'}^\dagger] &= 2 \sum_{p_1} \varepsilon_{pp_1} K_{p_1 h}^\dagger K_{p'h'}^\dagger \\ &\quad - 2 \sum_{h_1} \varepsilon_{hh_1} K_{ph_1}^\dagger K_{p'h'}^\dagger \end{aligned} \quad (A1)$$

$$\begin{aligned} [H^{20}, K_{ph}^\dagger K_{p'h'}^\dagger] &= \varepsilon_{ph} K_{p'h'}^\dagger + \varepsilon_{p'h'} K_{ph}^\dagger \\ &\quad - \varepsilon_{ph'} K_{p'h}^\dagger - \varepsilon_{p'h} K_{ph'}^\dagger \\ &\quad - 2 K_{ph}^\dagger \left(\sum_{h_1} \varepsilon_{p'h_1} S_{h'h_1} + \sum_{p_1} \varepsilon_{p_1 h'} S_{p'p_1} \right) \end{aligned} \quad (A2)$$

with

$$\begin{aligned} \varepsilon_{pp'} &= \epsilon_{pp'} + \sum_{h_1} \bar{v}_{ph_1 p'h_1}, \\ \varepsilon_{h'h} &= \epsilon_{h'h} + \sum_{h_1} \bar{v}_{h'h_1 h h_1}, \\ \varepsilon_{ph} &= \epsilon_{ph} + \sum_{h_1} \bar{v}_{ph_1 h h_1}. \end{aligned} \quad (A3)$$

$$\begin{aligned} 4 [H^{40}, K_{ph}^\dagger K_{p'h'}^\dagger] &= - \sum_{p_1 h_1} (\bar{v}_{p_1 h_1 p'h} K_{ph', h_1 p_1}^0 + \bar{v}_{p_1 h_1 p h'} K_{p'h, h_1 p_1}^0) \\ &\quad + \sum_{p_1 p_2 h_1 h_2} \bar{v}_{p_1 h_1 p_2 h_2} \left(K_{ph, h_1 p_1}^0 K_{p'h', h_2 p_2}^0 + K_{p'h', h_1 p_1}^0 K_{ph, h_2 p_2}^0 \right) \\ &\quad + 2 \sum_{p_1 p_2 h_1 h_2} \bar{v}_{p_1 h_1 p_2 h_2} \left(K_{ph}^\dagger K_{h_1 p_1} K_{p'h', h_2 p_2}^0 + K_{p'h'}^\dagger K_{h_1 p_1} K_{ph, h_2 p_2}^0 \right) \\ &\quad + \sum_{p_1 h_1} \left(\bar{v}_{p'h_1 p_1 h'} + \bar{v}_{p_1 h' p'h_1} \right) K_{ph}^\dagger K_{h_1 p_1} + \sum_{p_1 h_1} \left(\bar{v}_{p_1 h p h_1} + \bar{v}_{p h_1 p_1 h} \right) K_{p'h'}^\dagger K_{h_1 p_1} \\ &\quad - \sum_{p_1 h_1} \left(\bar{v}_{p'h_1 p_1 h} + \bar{v}_{p_1 h_1 p'h} \right) K_{ph'}^\dagger K_{h_1 p_1} - \sum_{p_1 h_1} \left(\bar{v}_{p_1 h_1 p h'} + \bar{v}_{p h' p_1 h_1} \right) K_{p'h}^\dagger K_{h_1 p_1} \end{aligned} \quad (A4)$$

$$\begin{aligned}
\left[H^{22}, K_{ph}^\dagger K_{p'h'}^\dagger \right] = & - \sum_{p_1 h_1} \left(\bar{v}_{p_1 h h_1 p'} K_{ph'}^\dagger + \bar{v}_{p_1 h' h_1 p} K_{p'h}^\dagger \right) K_{p_1 h_1}^\dagger \\
& + \sum_{p_1 p_2 h_1 h_2} \bar{v}_{p_1 h_2 h_1 p_2} K_{p_1 h_1}^\dagger \left(K_{ph}^\dagger K_{p'h', h_2 p_2}^0 + K_{p'h'}^\dagger K_{ph, h_2 p_2}^0 \right) \\
& - \frac{1}{4} \sum_{p_1 p_2 p_3} \left[(\bar{v}_{p_2 p_3 p p_1} + \bar{v}_{p_2 p_3 p_1 p}) K_{p'h'}^\dagger K_{p_3 h}^\dagger S_{p_2 p_1} + (\bar{v}_{p_3 p_2 p' p_1} + \bar{v}_{p_2 p_3 p_1 p'}) K_{ph}^\dagger K_{p_2 h}^\dagger S_{p_3 p_1} \right] \\
& - \frac{1}{4} \sum_{p_1 p_2} \left[\left(\bar{v}_{p_1 p_2 p' p} + \bar{v}_{p_2 p_1 p p'} \right) K_{p_1 h}^\dagger K_{p_2 h'}^\dagger + \bar{v}_{p_1 p_2 p' p_2} K_{ph}^\dagger K_{p_1 h'}^\dagger + \bar{v}_{p_1 p_2 p p_2} K_{p'h'}^\dagger K_{p_1 h}^\dagger \right] \\
& - \frac{1}{4} \sum_{h_1 h_2 h_3} \left[\left(\bar{v}_{h_3 h h_1 h_2} + \bar{v}_{h h_3 h_1 h_2} \right) K_{p'h'}^\dagger K_{p h_1}^\dagger S_{h_2 h_3} + \left(\bar{v}_{h' h_3 h_2 h_1} + \bar{v}_{h_3 h' h_1 h_2} \right) K_{ph}^\dagger K_{p'h_1}^\dagger S_{h_2 h_3} \right] \\
& - \frac{1}{4} \sum_{h_1 h_2} \left[\left(\bar{v}_{h' h h_1 h_2} + \bar{v}_{h h' h_2 h_1} \right) K_{p h_1}^\dagger K_{p' h_2}^\dagger + \bar{v}_{h' h_2 h_1 h_2} K_{ph}^\dagger K_{p' h_1}^\dagger + \bar{v}_{h h_2 h_1 h_2} K_{p'h'}^\dagger K_{p h_1}^\dagger \right] \\
& + \frac{1}{2} \sum_{p_1 p_2} \bar{v}_{p_2 p_1 p p_1} K_{p_2 h}^\dagger K_{p'h'}^\dagger + \frac{1}{2} \sum_{h_1 h_2} \bar{v}_{h h_1 h_2 h_1} K_{p h_2}^\dagger K_{p'h'}^\dagger
\end{aligned} \tag{A5}$$

$$\begin{aligned}
2 \left[H^{31}, K_{ph}^\dagger K_{p'h'}^\dagger \right] = & K_{ph}^\dagger \sum_{p_1 h_1} K_{p_1 h_1}^\dagger \left(\sum_{p_2} \bar{v}_{p_1 p_2 h_1 p'} K_{p_2 h'}^\dagger - \sum_{h_2} \bar{v}_{p_1 h' h_1 h_2} K_{p' h_2}^\dagger \right) \\
& + K_{p'h'}^\dagger \sum_{p_1 h_1} K_{p_1 h_1}^\dagger \left(\sum_{p_2} \bar{v}_{p_1 p_2 h_1 p} K_{p_2 h}^\dagger - \sum_{h_2} \bar{v}_{p_1 h h_1 h_2} K_{p h_2}^\dagger \right) \\
& + K_{ph}^\dagger \sum_{p_1 h_1} \left(\sum_{p_2} \bar{v}_{p_1 p' h_1 p_2} K_{p_2 h'}^\dagger - \sum_{h_2} \bar{v}_{p_1 h_2 h_1 h'} K_{p' h_2}^\dagger \right) K_{h_1 p_1} \\
& + K_{p'h'}^\dagger \sum_{p_1 h_1} \left(\sum_{p_2} \bar{v}_{p_1 p h_1 p_2} K_{p_2 h}^\dagger - \sum_{h_2} \bar{v}_{p_1 h_2 h_1 h} K_{p h_2}^\dagger \right) K_{h_1 p_1} \\
& + \left(K_{ph}^\dagger + K_{p'h'}^\dagger \right) \sum_{p_1 h_1} K_{h_1 p_1} \left(\sum_{p_2 p_3} \bar{v}_{p_1 p_2 h_1 p_3} S_{p_3 p_2} - \sum_{h_2 h_3} \bar{v}_{p_1 h_3 h_1 h_2} S_{h_3 h_2} \right) \\
& + \left(\sum_{p_2 p_3} \bar{v}_{p' p_2 h p_3} S_{p_3 p_2} - \sum_{h_2 h_3} \bar{v}_{p' h_3 h h_2} S_{h_3 h_2} \right) K_{ph'}^\dagger \\
& + \left(\sum_{p_2 p_3} \bar{v}_{p p_2 h' p_3} S_{p_3 p_2} - \sum_{h_2 h_3} \bar{v}_{p h_3 h' h_2} S_{h_3 h_2} \right) K_{p'h}^\dagger \\
& + \sum_{p_1 h_1} \left(\sum_{p_2 p_3} \bar{v}_{p_1 p_2 h_1 p_3} S_{p_3 p_2} - \sum_{h_2 h_3} \bar{v}_{p_1 h_3 h_1 h_2} S_{h_3 h_2} \right) \left(K_{p'h'}^\dagger K_{ph, h_1 p_1}^0 + K_{ph}^\dagger K_{p'h', h_1 p_1}^0 \right)
\end{aligned} \tag{A6}$$

with

$$\begin{aligned}
\left[K_{h_1 p_1}, K_{p_2 h_2}^\dagger \right] &= \delta_{p_1 p_2} \delta_{h_1 h_2} - \delta_{p_1 p_2} S_{h_1 h_2} - \delta_{h_1 h_2} S_{p_1 p_2} \\
&= K_{p_2 h_2, h_1 p_1}^0
\end{aligned} \tag{A7}$$

Summing the mean values of the different commutators in the ground state $|Z\rangle$ for $\langle [H, K_{ph}^\dagger K_{p'h'}^\dagger] \rangle = 0$ yields a relation between $\langle S_{kk'} S_{ll'} \rangle$ and $\langle S_{nn'} \rangle$.

Appendix B: Calculation of correlation functions in the Lipkin model

All correlation functions can be expressed in terms of z , $\langle J_0 \rangle$ and $\langle J_0^2 \rangle$. We also have

$$n_0 = \frac{N}{2} - \langle J_0 \rangle, \quad n_1 = \frac{N}{2} + \langle J_0 \rangle \tag{B1}$$

From the first equation (33), we find

$$z\langle J_+^2 \rangle = \frac{N}{2} + \langle J_0 \rangle \quad (\text{B2})$$

Multiplying (33) by J_+^2 , gives

$$\langle J_+^2 J_0 \rangle = -\frac{N}{2} \langle J_+^2 \rangle + z \langle J_+^4 \rangle \quad (\text{B3})$$

which yields

$$2z \langle J_+^4 \rangle = N \langle J_+^2 \rangle + 2 \langle J_+^2 J_0 \rangle \quad (\text{B4})$$

Multiplying the second equation (34) by J_+ , we can write

$$\langle J_+ J_- \rangle = z(N-1) \langle J_+^2 \rangle - z^2 \langle J_+^4 \rangle \quad (\text{B5})$$

which leads to

$$z^2 \langle J_+^4 \rangle = (N-1)z \langle J_+^2 \rangle - \langle J_+ J_- \rangle \quad (\text{B6})$$

Then, with (B4) and (B6), we find

$$z \langle J_+^2 J_0 \rangle = \left(\frac{N}{2} - 1\right) z \langle J_+^2 \rangle - \langle J_+ J_- \rangle \quad (\text{B7})$$

We multiply (33) from the left by J_0 ,

$$\begin{aligned} J_0^2 |Z\rangle &= -\frac{N}{2} J_0 |Z\rangle + z J_0 J_+^2 |Z\rangle \\ &= -\frac{N}{2} J_0 |Z\rangle + 2z J_+^2 |Z\rangle + z J_+^2 J_0 |Z\rangle \end{aligned} \quad (\text{B8})$$

Replacing the last term of (B8) by its mean value $z \langle J_+^2 J_0 \rangle$ and also $z \langle J_+^2 \rangle$ by its mean value and using (B2), we find the Casimir relation

$$J_+ J_- |Z\rangle = \left(\frac{1}{4}N(N+2) - J_0^2 + J_0\right) |Z\rangle \quad (\text{B9})$$

In summary, the correlation functions are given by

$$\begin{aligned} 2z \langle J_+^2 \rangle &= N + 2 \langle J_0 \rangle \\ \langle J_+ J_- \rangle &= \frac{1}{4}N(N+2) - \langle J_0^2 \rangle + \langle J_0 \rangle \\ z \langle J_+^2 J_0 \rangle &= \frac{1}{2}(N-2)z \langle J_+^2 \rangle - \langle J_+ J_- \rangle \\ z \langle J_+ J_- J_0 \rangle &= \frac{N}{2}(N+2)z + \frac{1}{2}(N-6)z \langle J_+ J_- \rangle \\ &\quad - (N-4)z \langle J_0 \rangle - \langle J_+^2 \rangle \end{aligned} \quad (\text{B10})$$

what allows to solve the equation for $\langle J_0 \rangle$.
