ON GRADED S-PRIME SUBMODULES

HICHAM SABER, TARIQ ALRAQAD, AND RASHID ABU-DAWWAS

Abstract. In this article, we introduce the concepts of graded S-prime submodules and graded S-torsion free modules, which are generalizations of graded prime submodules and graded torsion free modules. Suppose that $S \subseteq h(R)$ is a multiplicatively closed subset of a graded commutative ring $R$, and let $M$ be a graded unital $R$-module. A graded $R$-submodule $N$ of $M$ with $(N :_R M) \cap S = \emptyset$ is said to be a graded $S$-prime $R$-submodule if there exists $s \in S$ and whenever $rm \in N$ then either $sr \in (N :_R M)$ or $sm \in N$ for each $r \in h(R)$ and $m \in h(M)$. Also, a graded $R$-module $M$ is called graded $S$-torsion free if $\text{Ann}_R(M) \cap S = \emptyset$ and there exists $s \in S$ such that $rm = 0$ implies $sr = 0$ or $sm = 0$ for each $r \in h(R)$ and $m \in h(M)$.

1. Introduction

Throughout this article, $G$ will be a group with identity $e$, $R$ a commutative ring with a nonzero unity $1$ and $M$ an unital $R$-module. $R$ is said to be $G$-graded if $R = \bigoplus_{g \in G} R_g$ with $R_gR_h \subseteq R_{gh}$ for all $g, h \in G$ where $R_g$ is an additive subgroup of $R$ for all $g \in G$. The elements of $R_g$ are called homogeneous of degree $g$. If $x \in R$, then $x$ can be written as $\sum_{g \in G} x_g$, where $x_g$ is the component of $x$ in $R_g$. Also, we set $h(R) = \bigcup_{g \in G} R_g$. Moreover, it has been proved in [3] that $R_e$ is a subring of $R$ and $1 \in R_e$. Let $I$ be an ideal of a graded ring $R$. Then $I$ is said to be graded ideal if $I = \bigoplus_{g \in G} (I \cap R_g)$, i.e., for $x \in I$, $x = \sum_{g \in G} x_g$ where $x_g \in I$ for all $g \in G$. An ideal of a graded ring need not be graded. Let $R$ be a $G$-graded ring and $I$ is a graded ideal of $R$. Then $R/I$ is $G$-graded by $(R/I)_g = (R_g + I)/I$ for all $g \in G$.

Assume that $M$ is an unital $R$-module. Then $M$ is said to be $G$-graded if $M = \bigoplus_{g \in G} M_g$ with $R_gM_h \subseteq M_{gh}$ for all $g, h \in G$ where $M_g$ is an additive subgroup of $M$ for all $g \in G$. The elements of $M_g$ are called homogeneous of degree $g$. It is clear that $M_g$ is an $R_e$-submodule of $M$ for all $g \in G$. Moreover, we set $h(M) = \bigcup_{g \in G} M_g$.

Let $N$ be an $R$-submodule of a graded $R$-module $M$. Then $N$ is said to be graded $R$-submodule if $N = \bigoplus_{g \in G} (N \cap M_g)$, i.e., for $x \in N$, $x = \sum_{g \in G} x_g$ where $x_g \in N$ for all $g \in G$. An $R$-submodule of a graded $R$-module need not be graded. Let $M$ be a $G$-graded $R$-module and $N$ be a graded $R$-submodule of $M$. Then $M/N$ is a graded $R$-module by $(M/N)_g = (M_g + N)/N$ for all $g \in G$.

Key words and phrases. Graded prime submodules; graded torsion free modules, graded $S$-prime submodules, graded $S$-torsion free modules.
Lemma 1.1. ([6], Lemma 2.1) Let $R$ be a $G$-graded ring and $M$ be a $G$-graded $R$-module.

(1) If $I$ and $J$ are graded ideals of $R$, then $I + J$ and $I \cap J$ are graded ideals of $R$.
(2) If $N$ and $K$ are graded $R$-submodules of $M$, then $N + K$ and $N \cap K$ are graded $R$-submodules of $M$.
(3) If $N$ is a graded $R$-submodule of $M$, $r \in h(R)$, $x \in h(M)$ and $I$ is a graded ideal of $R$, then $Rx$, $IN$ and $rN$ are graded $R$-submodules of $M$.

If $N$ is a graded $R$-submodule of $M$, then $Ann_R(N) = \{r \in R : rN = \{0\}\}$ is a graded ideal of $R$ (see [2]), and $(N :_R M) = \{r \in R : rM \subseteq N\}$ is a graded ideal of $R$ (see [2]).

The aim of this article is following [10] to introduce graded $S$-prime submodules and graded $S$-torsion free modules. The concept of graded prime submodule has a meaningful location in the theory of graded modules, and it is used to distinguish certain classes of graded modules. For years, there have been many studies and generalizations on this argument. See, for example, [1], [2], [3] and [9]. The sets of graded prime ideals and graded maximal ideals are denoted by $GSpec(R)$ and $GMax(R)$, respectively. A graded ring $R$ is called graded quasiisofal if $|GMax(R)| = 1$. Recall from [2] that a graded prime $R$-submodule is a proper graded $R$-submodule $N$ of $M$ having the property that $rm \in N$ implies $r \in (N :_R M)$ or $m \in N$ for each $r \in h(R)$ and $m \in h(M)$. In this case, $(N :_R M) \in GSpec(R)$. A graded $R$-module $M$ is called a graded multiplication $R$-module if $N = (N :_R M)M$ for every graded $R$-submodule $N$ of $M$ (see [5]). If the only graded $R$-submodules of $M$ are $\{0\}$ and $M$ itself, then we call $M$ a graded simple $R$-module (see [3]).

Consider a nonempty subset $S$ of $R$. We call $S$ a multiplicatively closed subset (briefly, m.c.s.) of $R$ if (i) $0 \notin S$, (ii) $1 \in S$, and (iii) $ss' \in S$ for all $s, s' \in S$ (see [12]). Note that $S_1 = h(R) - I$ is a m.c.s. of $R$ for every $I \in GSpec(R)$. Let $S \subseteq h(R)$ be a m.c.s. of $R$ and $N$ a graded $R$-submodule of $M$ with $(N :_R M) \cap S = \emptyset$. Then the graded $R$-submodule $N$ is called a graded $S$-prime $R$-submodule if there exists $s \in S$ and whenever $rm \in N$ then either $sr \in (N :_R M)$ or $sm \in N$ for each $r \in h(R)$ and $m \in h(M)$. In particular, a graded ideal $I$ of $R$ is called a graded $S$-prime ideal if $I$ is a graded $S$-prime $R$-submodule of the $R$-module $R$. Note that as $1 \in S$, every graded prime $R$-submodule of $M$ whose residual by $M$ is disjoint from $S$ is graded $S$-prime, however, the converse is not true in general (Example 2.3). Also, if $S \subseteq HU(R)$, where $HU(R)$ denotes the set of homogeneous units in $R$, the notions of graded $S$-prime submodules and graded prime submodules are equal.

Here, we denote the sets of all graded prime $R$-submodules and all graded $S$-prime $R$-submodules by $GSpec(M)$ and $GSpec_{S}(M)$, respectively. In particular, we write $GSpec_{S}(R)$ to express the set of all graded $S$-prime ideals of $R$.

Among several results, we prove that if $N \in GSpec_{S}(R)$, then $S^{-1}N$ is a graded prime $S^{-1}R$-submodule of $S^{-1}M$ (Proposition 2.2(4)), however, the converse is not true in general (Example 2.7). We show that $N \in GSpec_{S}(R)$ if and only if there is an $s \in S$, and $sK \subseteq N$ implies $sI \subseteq (N : R M)$ or $sK \subseteq N$ for each graded ideal $I$ of $R$ and graded $R$-submodule $K$ of $M$ (Proposition 2.8). In Proposition 2.10, we study graded $S$-prime submodules over graded $R$-homomorphisms. We prove that if $N \in GSpec_{S}(R)$, then $(N :_R M) \in GSpec_{S}(R)$, and the converse is true if $M$ is a graded multiplication $R$-module (Proposition 2.13). We show that $N \in GSpec_{S}(R)$ if and only if $(N :_M s) \in GSpec_{S}(R)$ for some $s \in S$. 
It is known that by (2), Proposition 2.7, if $N \subseteq GSpec(R)$, then $(N :_R M) \subseteq GSpec(R)$, however, the converse is not true in general (Example 2.25). We prove that if $(R, X)$ is a graded quasilocal ring, then $N \subseteq GSpec(R)$ if and only if $(N :_R M) \subseteq GSpec(R)$ and $N \subseteq GSpec_{he(R)-X}(R)$ (Proposition 2.26). In Proposition 2.28, we study graded S-prime submodules over idealizations. Finally, we show that if $M$ is a finitely generated graded $R$-module and every proper graded $R$-submodule of $M$ is graded S-prime, then $Ann_R(M) \cap h(R) = HZ(M) = \{ r \in h(R) : rm = 0 \text{ for some nonzero } m \in h(M) \}$ (Proposition 2.31).

A graded $R$-module $M$ is graded torsion free if the homogeneous torsion subset $HT(M) = \{ m \in M : rm = 0 \text{ for some nonzero } r \in h(R) \}$ is zero (see [2]). Let $M$ be a graded $R$-module and $S \subseteq h(R)$ be a m.c.s. of $R$ with $Ann_R(M) \cap S = \emptyset$. We call $M$ a graded $S$-torsion free $R$-module with $rm = 0$ implying either $sr = 0$ or $sm = 0$ for some fixed $s \in S$ and for each $r \in h(R)$, $m \in h(M)$. It can be easily seen that being a graded torsion free module is a sufficient condition for being a graded $S$-torsion free module. We prove that $N \in GSpec_{S}(R)$ if and only if $N/M$ is a graded $f(S)$-torsion free $R/(N :_R M)$-module, where $f : R \to R/(N :_R M)$ is the graded $R$-homomorphism defined by $f(r) = r + (N :_R M)$ for all $r \in R$ (Proposition 2.30).

2. Graded $S$-Prime Submodules

In this section, we introduce and study the concept of graded $S$-prime submodules.

Definition 2.1. Suppose that $S \subseteq h(R)$ is a m.c.s. of a graded commutative ring $R$, and let $M$ be a graded unital $R$-module. A graded $R$-submodule $N$ of $M$ with $(N :_R M) \cap S = \emptyset$ is said to be a graded $S$-prime $R$-submodule if there exists $s \in S$ and whenever $rm \in N$ then either $sr \in (N :_R M)$ or $sm \in N$ for each $r \in h(R)$ and $m \in h(M)$.

Let $S \subseteq h(R)$ be a m.c.s. and $M$ be a graded $R$-module. Then $S^{-1}M$ is a graded $S^{-1}R$-module with $(S^{-1}M)_g = \{ \frac{m}{s} \in M_h, s \in S \cap R_{hg^{-1}} \}$ and $(S^{-1}R)_g = \{ \frac{a}{s} : a \in R_h, s \in S \cap R_{hg^{-1}} \}$ for all $g \in G$. It is obvious that $S^* = \{ x \in h(R) : \frac{1}{x} \text{ is a homogeneous unit of } S^{-1}R \}$ is a m.c.s of $R$ containing $S$.

Proposition 2.2. Assume that $R$ is a graded ring, $S \subseteq h(R)$ is a m.c.s. and $M$ is a graded $R$-module. Then

(1) If $N \in GSpec(R)$ provided that $(N :_R M)$ and $S$ are disjoint, then $N \subseteq GSpec_{S}(R)$.

(2) If $S_1 \subseteq S_2$ are m.c.s. of $h(R)$ and $N \in GSpec_{S_1}(R)$, then $N \in GSpec_{S_2}(R)$ where $(N :_R M) \cap S_2 = \emptyset$.

(3) $N \in GSpec_{S}(R)$ if and only if $N \in GSpec_{S^*}(R)$.

(4) If $N \in GSpec_{S}(R)$, then $S^{-1}N$ is a graded prime $S^{-1}R$-submodule of $S^{-1}M$.

Proof. (1) Straightforward.

(2) Straightforward.

(3) Let $N \in GSpec_{S}(R)$. As $S \subseteq S^*$, by (2), it is enough to prove that $(N :_R M) \cap S^* = \emptyset$. Let $x \in (N :_R M) \cap S^* \neq \emptyset$. Then $xM \subseteq N$ and $\frac{1}{x}$ is a homogeneous unit of $S^{-1}R$, and then $\frac{1}{x} \cdot \frac{1}{s} = 1$ for some $r \in h(R)$ and $s \in S$, which implies that $us = uxt$ for some $u \in S$. Suppose that $us = t \in S$. Then $t = uxt \in (N :_R M) \cap S$, which is a contradiction. So,
If $m \in R(M)$ such that $rm \in N$. As $N \in GSpec_{S}(R_M)$, there exists $t \in S^*$ such that $tr \in (N : R_M)$ or $tm \in N$. Since $\frac{1}{t}$ is a homogeneous unit of $S^{-1}R$, there exist $u, s \in S$ and $a \in h(R)$ such that $us = u\alpha$. Assume that $us = \alpha \in S$. Then $\alpha \in (N : R_M)$ or $\alpha m \in N$. Hence, $N \in GSpec_{S}(R_M)$.

(4) Suppose that $N \in GSpec_{S}(R_M)$. Let $\frac{z}{s} \in h(S^{-1}R)$ and $\frac{m}{r} \in h(S^{-1}M)$ such that $\frac{z}{s} \frac{m}{r} \in S^{-1}N$. Then $arm \in N$ for some $u \in S$. Since $N \in GSpec_{S}(R_M)$, there exists $\alpha \in S$ such that $\alpha ur \in (N : R_M)$ or $\alpha rm \in N$, which implies that $\frac{z}{s} = \frac{\alpha ur}{\alpha rm} \in S^{-1}(N : R_M) \subseteq (S^{-1}N : S^{-1}R S^{-1}M)$ or $\frac{m}{r} = \frac{\alpha rm}{\alpha ur} \in S^{-1}N$. Hence, $S^{-1}N$ is a graded prime $S^{-1}R$-submodule of $S^{-1}M$.

The next example shows that the converse of Proposition 2.2 (1) is not true in general.

**Example 2.3.** Consider $R = \mathbb{Z}$ and $G = \mathbb{Z}_2$. Then $R$ is trivially $G$-graded by $R_0 = \mathbb{Z}$ and $R_1 = \{0\}$. Consider the $R$-modules $T = \mathbb{Z}[i]$ and $L = \mathbb{Z}[i]$. Then $T$ and $L$ are $G$-graded by $T_0 = \mathbb{Z}, T_1 = i\mathbb{Z}, L_0 = \mathbb{Z}_2$ and $L_1 = i\mathbb{Z}_2$. So, $M = T \times L$ is a $G$-graded $R$-module where $M_0 = T_0 \times L_0$ and $M_1 = T_1 \times L_1$. Now, $N = \{0\} \times \{0\}$ is a graded $R$-submodule of $M$ with $(N : R_M) = \{0\}$. Consider $S = \mathbb{Z} - \{0\}$ is a $G$-module of $h(R)$ and put $s = 2 \in S$. We show that $N \in GSpec_{S}(R_M)$. Note that $(N : R_M) \cap S = \emptyset$. Let $r \in h(R)$ and $m \in h(M)$ such that $rm \in N$.

**Case 1:** If $m \in M_0$, then $m = (t_0, l_0)$ for some $t_0 \in \mathbb{Z}$ and $l_0 \in \mathbb{Z}_2$, and then $rm = (rt_0, rl_0) \in N$, which implies that $rt_0 = 0$ and $rl_0 = 0$. If $r = 0$, then we are done. Assume that $t_0 = 0$. Then $sm = 2(t_0, l_0) \in N$. Hence, $N \in GSpec_{S}(R_M)$.

**Case 2:** If $m \in M_1$, then $m = (t_1, l_1)$ for some $t_1 \in i\mathbb{Z}$ and $l_1 \in i\mathbb{Z}_2$, and then $t_1 = ia$ and $l_1 = ib$ for some $a \in \mathbb{Z}$ and $b \in \mathbb{Z}_2$. So, $rm = (ira, ib) \in N$, which implies that $ra = 0$ and $ib = 0$. Hence, by Case (1), $N \in GSpec_{S}(R_M)$.

On the other hand, $2 \notin h(R)$ and $(0, 1) \notin h(M)$ such that $2(0, 1) \notin N$, but $2 \notin (N : R_M)$ and $(0, 1) \notin N$. Hence, $N$ is not graded prime $R$-submodule of $M$.

Now, we are going to prove that the converse of Proposition 2.2 (4) is not true in general. Firstly, we need the following:

**Definition 2.4.** A graded commutative ring $R$ with unity is said to be a graded field if every nonzero homogeneous element of $R$ is unit.

The next example shows that a graded field need not be a field.

**Example 2.5.** Let $R$ be a field and suppose that $F = \{x + uy : x, y \in R, u^2 = 1\}$. If $G = \mathbb{Z}_2$, then $F$ is $G$-graded by $F_0 = R$ and $F_1 = uR$. Let $a \in h(F)$ such that $a \neq 0$. If $a \in F_0$, then $a \in R$ and since $R$ is a field, we have $a$ is a unit element. Suppose that $a \in F_1$. Then $a = uy$ for some $y \in R$. Since $a \neq 0$, we have $y \neq 0$, and since $R$ is a field, we have $y$ is a unit element, that is $zy = 1$ for some $z \in R$. Thus, $uz \in F_1$ such that $(uz)a = uz(uy) = u^2(zy) = 1.1 = 1$, which implies that $a$ is a unit element. Hence, $F$ is a graded field. On the other hand, $F$ is not a field since $1 + u \in F - \{0\}$ is not a unit element since $(1 + u)(1 - u) = 0$.

**Lemma 2.6.** Let $R$ be a graded field and $M$ be a graded $R$-module. Then every proper graded $R$-submodule of $M$ is graded prime.

**Proof.** Let $N$ be a proper graded $R$-submodule of $M$. Suppose that $r \in h(R)$ and $m \in h(M)$ such that $rm \in N$. If $r = 0$, then $r = 0 \in (N : R_M)$. If $r \neq 0$, then $r$ is
unit as \( R \) is graded field, and then \( r^{-1} \in R \) with \( r^{-1}(rm) = m \in N \). Hence, \( N \) is a graded prime \( R \)-submodule of \( M \).

The next example shows that the converse of Proposition 2.2 (4) is not true in general.

**Example 2.7.** Consider \( R = \mathbb{Z} \) and \( G = \mathbb{Z}_2 \). Then \( R \) is trivially \( G \)-graded by \( R_0 = \mathbb{Z} \) and \( R_1 = \{0\} \). Consider the \( R \)-module \( T = \mathbb{Q}[i] \). Then \( T \) is \( G \)-graded by \( T_0 = \mathbb{Q} \) and \( T_1 = i\mathbb{Q} \). So, \( M = T \times T \) is a \( G \)-graded \( R \)-module where \( M_0 = T_0 \times T_0 \) and \( M_1 = T_1 \times T_1 \). Now, \( N = \mathbb{Z} \times \{0\} \) is a graded \( R \)-submodule of \( M \) with \( (N :_R M) = \{0\} \). Consider \( S = \mathbb{Z} - \{0\} \) is a m.c.s of \( h(R) \). Then \( S^{-1}R = Q \) is a graded field, and then by Lemma 2.6, \( S^{-1}N \) is a graded prime \( S^{-1}R \)-submodule of \( S^{-1}M \). On the other hand, assume that \( s \in S \), and choose a prime number \( p \) with \( \gcd(s, p) = 1 \). Then \( p \in h(R) \) and \( (\frac{1}{p}, 0) \in h(M) \) such that \( p(\frac{1}{p}, 0) = (1, 0) \in N \), but \( sp \notin (N :_R M) \) and \( s(\frac{1}{p}, 0) = (\frac{s}{p}, 0) \notin N \). Hence, \( N \) is not graded \( S \)-prime \( R \)-submodule of \( M \).

**Proposition 2.8.** Let \( M \) be a \( G \)-graded \( R \)-module, \( N \) be a graded \( R \)-submodule of \( M \) and \( S \) be a m.c.s of \( h(R) \). Then \( N \in \text{GSpec}_S(RM) \) if and only if there is an \( s \in S \), and \( 1K \subseteq N \) implies \( sI \subseteq (N :_R M) \) or \( sK \subseteq N \) for each graded ideal \( I \) of \( R \) and graded \( R \)-submodule \( K \) of \( M \).

**Proof.** Suppose that \( N \in \text{GSpec}_S(RM) \). Suppose that \( 1K \subseteq N \) for some graded ideal \( I \) of \( R \) and graded \( R \)-submodule \( K \) of \( M \). As \( N \in \text{GSpec}_S(RM) \), there is an \( s \in S \) so that \( rm \in N \) implies \( sr \in (N :_R M) \) or \( sm \in N \) for each \( r \in h(R) \) and \( m \in h(M) \). Assume that \( sK \nsubseteq N \). Then there exists \( k \in K \) such that \( sk \notin N \). Then there exists \( g \in G \) such that \( sk_g \notin N \). Note that, \( k_g \in K \) as \( K \) is graded submodule. Let \( r \in I \). Then \( rh \in I \) for all \( h \in G \) as \( I \) is graded ideal. Now, \( r_h k_g \in IK \subseteq N \). For all \( h \in G \). Since \( N \in \text{GSpec}_S(RM) \) and \( sk_g \notin N \), we have \( srh \in (N :_R M) \) for all \( h \in G \), and then \( sr \in (N :_R M) \). Hence, \( sI \subseteq (N :_R M) \). Conversely, let \( r \in h(R) \) and \( m \in h(M) \) with \( rm \in N \). Now, \( I = Rr \) is a graded ideal of \( R \) and \( K = Rm \) is a graded \( R \)-submodule of \( M \) such that \( 1K \subseteq N \). Then by assumption, there is an \( s \in S \) so that \( sI \subseteq (N :_R M) \) or \( sK \subseteq N \), and so either \( sr \in (N :_R M) \) or \( sm \in N \). Therefore, \( N \in \text{GSpec}_S(RM) \). □

**Corollary 2.9.** Let \( R \) be a graded ring, \( P \) be a graded ideal of \( R \) and \( S \) be a m.c.s of \( h(R) \). Then \( P \in \text{GSpec}_S(R) \) if and only if there is an \( s \in S \), and \( IJ \subseteq P \) implies \( sI \subseteq P \) or \( sJ \subseteq P \) for each graded ideals \( I \) and \( J \) of \( R \).

Let \( M \) and \( T \) be \( G \)-graded \( R \)-modules. Then an \( R \)-homomorphism \( f : M \to T \) is said to be a graded \( R \)-homomorphism if \( f(M_g) \subseteq T_g \) for all \( g \in G \) (see [8]).

**Proposition 2.10.** Let \( M \) and \( T \) be \( G \)-graded \( R \)-modules. Assume that \( f : M \to T \) is a graded \( R \)-homomorphism.

1. If \( K \in \text{GSpec}_S(RT) \) provided that \( (f^{-1}(K) :_R M) \cap S = \emptyset \), then \( f^{-1}(K) \in \text{GSpec}_S(RM) \).
2. If \( f \) is a graded \( R \)-epimorphism and \( N \in \text{GSpec}_S(RM) \) with \( \text{Ker}(f) \subseteq N \), then \( f(N) \in \text{GSpec}_S(RT) \).

**Proof.**

1. Clearly, \( f^{-1}(K) \) is a graded \( R \)-submodule of \( M \). Let \( rm \in f^{-1}(K) \) for some \( r \in h(R) \), \( m \in h(M) \). Then \( f(rm) = rf(m) \in K \). Since \( K \in \text{GSpec}_S(RT) \), there is an \( s \in S \) so that \( sr \in (K :_R T) \) or \( sf(m) = f(sm) \in K \). Now we show that \( (K :_R T) \subseteq (f^{-1}(K) :_R M) \). Let \( x \in (K :_R T) \). Then
Proposition 2.12. Let $x \in K$. Since $f(M) \subseteq T$, we have that $f(xM) = xf(M) \subseteq xT \subseteq K$, which implies that $xM \subseteq xM + \text{Ker}(f) = f^{-1}(f(xM)) \subseteq f^{-1}(K)$ and hence $x \in (f^{-1}(K) : R M)$. As $(K : R T) \subseteq (f^{-1}(K) : R M)$, we have either $sr \in (f^{-1}(K) : R M)$ or $sm \in f^{-1}(K)$. Hence, $f^{-1}(K) \in G\text{Spec}_{S(RM)}$.

(2) Clearly, $f(N)$ is a graded $R$-submodule of $T$. Firstly, we show that $(f(N) : R T) \cap S = \emptyset$. If not, there would be an $s \in (f(N) : R T) \cap S$. Since $s \in (f(N) : R T)$, $sT \subseteq f(N)$, and then $f(sm) = sf(M) \subseteq st \subseteq f(N)$. So, we have $sM \subseteq sM + \text{Ker}(f) \subseteq N + \text{Ker}(f) = N$, which implies that $sM \subseteq N$. Thus $s \in (N : R M)$, which contradicts that $N \in G\text{Spec}_{S(RM)}$. Let $r \in h(R)$, $t \in h(T)$ with $rt \in f(N)$. Since $f$ is an $R$-epimorphism, there is an $m \in h(M)$ such that $t = f(m)$. Then $rt = rf(m) = f(rm) \in f(N)$. Since $\text{Ker}(f) \subseteq N$, we have $rm \in N$. Since $N \in G\text{Spec}_{S(RM)}$, there is an $s \in S$ such that $sr \in (N : R M) or sm \in N$. Since $(N : R M) \subseteq (f(N) : R T)$, we have $sr \in (f(N) : R T)$ or $f(sm) = sf(m) = st \in f(N)$. Correspondingly, $f(N) \in G\text{Spec}_{S(RT)}$.

\[ \square \]

Lemma 2.11. Let $M$ be a graded $R$-module, $L$ be a graded $R$-submodule of $M$, and $N$ be an $R$-submodules of $M$ such that $L \subseteq N$. Then $N$ is a graded $R$-submodule of $M$ if and only if $N/L$ is a graded $R$-submodule of $M/L$.

Proof. Suppose that $N$ is a graded $R$-submodule of $M$. Clearly, $N/L$ is an $R$-submodule of $M/L$. Let $x + L \in N/L$. Then $x \in N$ and since $N$ is graded, $x = \sum_{g \in G} x_g$ where $x_g \in N$ for all $g \in G$ and then $(x + L)_g = x_g + L \in N/L$ for all $g \in G$. Hence, $N/L$ is a graded $R$-submodule of $M/L$. Conversely, let $x \in N$. Then $x = \sum_{g \in G} x_g$ where $x_g \in M_g$ for all $g \in G$ and then $(x_g + L) \in (M_g + L)/L = (M/L)_g$ for all $g \in G$ such that $\sum_{g \in G} (x_g + L)_g = \sum_{g \in G} x_g + L = \sum_{g \in G} x_g + L = x + L \in N/L$.

Since $N/L$ is graded, $x_g + L \in N/L$ for all $g \in G$ which implies that $x_g \in N$ for all $g \in G$. Hence, $N$ is a graded $R$-submodule of $M$.

\[ \square \]

Proposition 2.12. Let $M$ be a graded $R$-module, $L$ be a graded $R$-submodule of $M$ and $S$ be a m.e.s of $h(R)$.

(1) If $K \in G\text{Spec}_{S(RM)}$ with $(K : R L) \cap S = \emptyset$, then $L \cap K \in G\text{Spec}_{S(RL)}$.

(2) Suppose that $N$ is an $R$-submodule of $M$ with $L \subseteq N$. Then $N \in G\text{Spec}_{S(RM)}$ if and only if $N/L \in G\text{Spec}_{S(RM/L)}$.

Proof. (1) Clearly, $L \cap K$ is a graded $R$-submodule of $L$. Consider the graded $R$-homomorphism $f : L \to M$ defined by $f(m) = m$ for all $m \in L$. Then note that $f^{-1}(K) = L \cap K$. Now we show that $(f^{-1}(K) : R L) \cap S = \emptyset$. Assume that $s \in (f^{-1}(K) : R L) \cap S$. Then we have that $sL \subseteq f^{-1}(K) = L \cap K \subseteq K$ and thus $s \in (K : R L) \cap S$, which is a contradiction. The result holds by Proposition 2.10 (1).

(2) Suppose that $P \in G\text{Spec}_{S(RM)}$. Then by Lemma 2.11, $N/L$ is a graded $R$-submodule of $M/L$. Consider the graded $R$-epimorphism $f : M \to M/L$ defined by $f(m) = m + L$ for all $m \in M$. By Proposition 2.10 (2), $N/L \in G\text{Spec}_{S(RM/L)}$. Conversely, by Lemma 2.11, $N$ is a graded $R$-submodule of $M$. Let $rm \in N$ for some $r \in h(R)$, $m \in h(M)$. Then $r(m + L) =$
Proposition 2.13. Let $M$ be a graded $R$-module and $S$ be a m.c.s of $h(R)$.

1. If $N \in GSpec_S(RM)$, then $(N :_R M) \in GSpec_S(R)$.
2. If $M$ is a graded multiplication $R$-module and $(N :_R M) \in GSpec_S(R)$, then $N \in GSpec_S(RM)$.

Proof. (1) By (2), Lemma 2.1, $(N :_R M)$ is a graded ideal of $R$. Let $ab \in (N :_R M)$ for some $a, b \in h(R)$. Since $N \in GSpec_S(RM)$, there is an $s \in S$ so that $rm \in N$ implies $sr \in (N :_R M)$ or $sm \in N$ for all $r \in h(R)$ and $m \in h(M)$. Note that $ab \in h(R)$ such that $abm \in N$ for all $m \in h(M)$. If $sa \in (N :_R M)$, there is nothing to prove. Suppose that $sa \notin (N :_R M)$. Since $N \in GSpec_S(RM)$, $sbm \in N$ for all $m \in h(M)$. Let $t \in M$. Then $t = \sum_{g \in G} t_g$ where $t_g \in M_g$ for all $g \in G$, and then $sbt_g \in N$ for all $g \in G$, which implies that $sbt = sb \left( \sum_{g \in G} t_g \right) = \sum_{g \in G} sbt_g \in N$, so that $sb \in (N :_R M)$. Therefore, $(N :_R M) \in GSpec_S(R)$.

(2) Let $I$ be a graded ideal of $R$ and $K$ be a graded $R$-submodule of $M$ with $IK \subseteq N$. Then we have that $I(K :_R M) \subseteq (IK :_R M) \subseteq (N :_R M)$. Since $(N :_R M) \in GSpec_S(R)$, by Corollary 2.8 there is an $s \in S$ so that $sI \subseteq (N :_R M)$ or $s(K :_R M) \subseteq (N :_R M)$. Thus, we have that $sI \subseteq (N :_R M)$ or $sK = s(K :_R M)M \subseteq (N :_R M)M = N$. By Proposition 2.8 $N \in GSpec_S(RM)$. □

Assume that $M$ is a graded multiplication $R$-module and $N, K$ are two graded $R$-submodules of $M$. Then the product of $N$ and $K$ is defined as $NK = (N :_R M)(K :_R M)M$ (see [3]). As an instantaneous result of Proposition 2.13 and Proposition 2.8 we have the following specific result.

Corollary 2.14. Suppose that $M$ is a graded multiplication $R$-module, $S$ is a m.c.s of $h(R)$ and $N$ is a graded $R$-submodule of $M$ with $(N :_R M) \cap S = \emptyset$. Then $N \in GSpec_S(RM)$ if and only if there is an $s \in S$, for every graded $R$-submodules $L, K$ of $M$ with $LK \subseteq N$, we have $sL \subseteq N$ or $sK \subseteq N$.

Proposition 2.15. Let $M$ be a graded multiplication $R$-module and $N \in GSpec_S(RM)$. Suppose that $K \cap L \subseteq N$ for some graded $R$-submodules $K, L$ of $M$. Then $sK \subseteq N$ or $sL \subseteq N$ for some $s \in S$.

Proof. Since $N \in GSpec_S(RM)$, there is an $s \in S$ so that $rm \in N$ implies $sr \in (N :_R M)$ or $sm \in N$ for each $r \in h(R)$ and $m \in h(M)$. Suppose that $sL \notin N$. Then $sm \notin N$ for some $m \in L$, and then there exists $g \in G$ such that $sm_g \notin N$, where $m_g \in L$ as $L$ is graded submodule. Let $r \in (K :_R M)$. Then $r_h \in (K :_R M)$ for all $h \in G$ as $(K :_R M)$ is a graded ideal, and then $r_h m_g \in (K :_R M)L \subseteq L \cap K \subseteq N$. Since $N \in GSpec_S(RM)$ and $sm_g \notin N$, we have that $sr_h \in (N :_R M)$ for all $h \in G$, and then $sr \in (N :_R M)$, so that $(K :_R M) \subseteq (N :_R M)$. Since $M$ is a graded multiplication $R$-module, $sK = s(K :_R M)M \subseteq (N :_R M)M = N$. □
Let $R_1$ and $R_2$ be $G$-graded rings. Then $R = R_1 \times R_2$ is a $G$-graded ring with $R_g = (R_1)_g \times (R_2)_g$ for all $g \in G$ (see [8]).

**Lemma 2.16.** Let $R_1$ and $R_2$ be $G$-graded rings and $R = R_1 \times R_2$. Then $P = P_1 \times P_2$ is a graded ideal of $R$ if and only if $P_1$ is a graded ideal of $R_1$ and $P_2$ is a graded ideal of $R_2$.

*Proof.* Suppose that $P$ is a graded ideal of $R$. Clearly, $P_1$ is an ideal of $R_1$ and $P_2$ is an ideal of $R_2$. Let $a \in P_1$. Then $(a,0) \in P$, and then $(a,0)_g = (a_g,0) \in P$ for all $g \in G$ as $P$ is graded ideal, which implies that $a_g \in P_1$ for all $g \in G$. Hence, $P_1$ is a graded ideal of $R_1$. Similarly, $P_2$ is a graded ideal of $R_2$. Conversely, it is clear that $P$ is an ideal of $R$. Let $(a,b) \in P$. Then $a \in P_1$ and $b \in P_2$, and then $a_g \in P_1$ and $b_g \in P_2$ for all $g \in G$ as $P_1$ and $P_2$ are graded ideals, which implies that $(a,b)_g = (a_g,b_g) \in P$ for all $g \in G$. Hence, $P$ is a graded ideal of $R$. □

**Lemma 2.17.** Let $R_1$ and $R_2$ be $G$-graded rings, $R = R_1 \times R_2$ and $S = S_1 \times S_2$, where $S_i$ is a m.c.s of $h(R_i)$. Suppose that $P = P_1 \times P_2$ is a graded ideal of $R$. Then $P \in GSpec_S(R)$ if and only if $P_1 \in GSpec_{S_1}(R_1)$ and $P_2 \cap S_2 \neq \emptyset$ or $P_1 \cap S_1 \neq \emptyset$ and $P_2 \in GSpec_{S_2}(R_2)$.

*Proof.* Suppose that $P \in GSpec_S(R)$. By Lemma 2.16, $P_1$ is a graded ideal of $R_1$ and $P_2$ is a graded ideal of $R_2$. Now, $(1,0), (0,1) \in h(R)$ with $(1,0)(0,1) = (0,0) \in P$, so there exists $s = (s_1,s_2) \in S$ so that $s(1,0) = (s_1,0) \in P$ or $s(0,1) = (0,s_2) \in P$ and thus $P_1 \cap S_1 \neq \emptyset$ or $P_2 \cap S_2 \neq \emptyset$. We may assume that $P_1 \cap S_1 \neq \emptyset$. Since $P \cap S = \emptyset$, we have $P_2 \cap S_2 = \emptyset$. Let $ab \in P_2$ for some $a,b \in h(R_2)$. Since $(0,a)(0,b) \in P$ and $P \in GSpec_S(R)$, we have either $s(0,a) = (0,s_2a) \in P$ or $s(0,b) = (0,s_2b) \in P$ and then $s_2a \in P_2$ or $s_2b \in P_2$. Therefore, $P_2 \in GSpec_{S_2}(R_2)$. In the other case, one can easily prove that $P_1 \in GSpec_{S_1}(R_1)$. Conversely, assume that $P_1 \cap S_1 \neq \emptyset$ and $P_2 \in GSpec_{S_2}(R_2)$. Then there exists $s_1 \in P_1 \cap S_1$. Let $(a,b)(c,d) = (ac, bd) \in P$ for some $a, c \in h(R_1)$ and $b, d \in h(R_2)$. Then $bd \in P_2$ and thus there exists $s_2 \in S_2$ so that $s_2b \in P_2$ or $s_2d \in P_2$. Let $s = (s_1, s_2) \in S$. Then $s(a,b) = (s_1a, s_2b) \in P$ or $s(c, d) = (s_1c, s_2d) \in P$. Therefore, $P \in GSpec_S(R)$. In other case, one can similarly prove that $P \in GSpec_S(R)$.

Let $M_1$ be a $G$-graded $R_1$-module, $M_2$ be a $G$-graded $R_2$-module and $R = R_1 \times R_2$. Then $M = M_1 \times M_2$ is a $G$-graded $R$-module with $M_g = (M_1)_g \times (M_2)_g$ for all $g \in G$ (see [8]). Similarly to Lemma 2.16, one can prove the following:

**Lemma 2.18.** Let $M_1$ be a $G$-graded $R_1$-module, $M_2$ be a $G$-graded $R_2$-module, $R = R_1 \times R_2$ and $M = M_1 \times M_2$. Then $N = N \otimes_k M$ is a $G$-graded $R$-submodule of $M$ if and only if $N$ is a graded $R_1$-submodule of $M_1$ and $K$ is a graded $R_2$-submodule of $M_2$.

**Proposition 2.19.** Suppose that $M = M_1 \times M_2$ is a graded $R$-module and $S = S_1 \times S_2$ is a m.c.s. of $h(R)$, where $M_i$ is a $G$-graded $R_i$-module, $R = R_1 \times R_2$, and $S_i$ is a m.c.s. of $h(R_i)$. Assume that $L = N \otimes_k M$ is a graded $R$-submodule of $M$. Then $L \in GSpec_{S}(RM)$ if and only if $N \in GSpec_{S_1}(R_1M_1)$ and $(K :_{R_2} M_2) \cap S_2 \neq \emptyset$ or $(N :_{R_1} M_1) \cap S_1 \neq \emptyset$ and $K \in GSpec_{S_2}(R_2M_2)$.

*Proof.* Suppose that $L \in GSpec_{S}(RM)$. By Lemma 2.18, $N$ is a graded $R$-submodule of $M_1$ and $K$ is a graded $R$-submodule of $M_2$. Now, by Proposition 2.1 (1), $(L :_RM) = (N :_{R_1} M_1) \times (K :_{R_2} M_2) \in GSpec_S(R)$ and so by Lemma 2.17 either $(N :_{R_1} M_1) \cap S_1 \neq \emptyset$ or $(K :_{R_2} M_2) \cap S_2 \neq \emptyset$. We may assume that $(N :_{R_1} M_1) \cap S_1 \neq \emptyset$. Now, we show that $K \in GSpec_{S_2}(R_2M_2)$. Let $rm \in K$ for some $r \in h(R_2), m \in
Since \( h(M_2) \). Then \((1, r) \in h(R) \) and \((0, m) \in h(M) \) such that \((1, r)(0, m) = (0, rm) \in L\).

Therefore, \( K \in GSpecS(R_2 M_2) \). In the other case, it can be similarly proved that \( N \in GSpecS(R_1 M_1) \). Conversely, suppose that \((N :_{R_1} M_1) \cap S_1 \neq \emptyset \) and \( K \in GSpecS(R_2 M_2) \). Then there exists \( s_1 \in (N :_{R_1} M_1) \cap S_1 \).

Let \( (r_1, r_2)(m_1, m_2) = (r_1 m_1, r_2 m_2) \in L \) for some \( r_i \in h(R_i), m_i \in h(M_i) \). Then \( r_1 m_1, r_2 m_2 \in K \). Since \( K \in GSpecS(R_2 M_2) \), there is an \( s_2 \in S_2 \) so that \( s_2 r_2 \in (K :_{R_2} M_2) \) or \( s_2 m_2 \in K \).

By applying induction and Proposition 2.19, we introduce the following:

**Proposition 2.20.** Suppose that \( M = M_1 \times \ldots \times M_n \) is a graded \( R \)-module and \( S = S_1 \times \ldots \times S_n \) is a m.c.s. of \( h(R) \), where \( M_i \) is a \( G \)-graded \( R_i \)-module, \( R = R_1 \times \ldots \times R_n \), and \( S_i \) is a m.c.s of \( h(R_i) \). Assume that \( N = N_1 \times \ldots \times N_n \) is a graded \( R \)-submodule of \( M \). Then \( N \in GSpecS(RM) \) if and only if \( N_i \in GSpecS(R_i M_i) \) for some \( i \) and \((N_j :_{R_j} M_j) \cap S_j \neq \emptyset \) for all \( j \neq i \).

**Lemma 2.21.** Let \( M \) be a \( G \)-graded \( R \)-module and \( N \) be a graded \( R \)-submodule of \( M \). If \( r \in h(R) \), then \((N :_{M} r) = \{ m \in M : rm \in N \} \) is a graded \( R \)-submodule of \( M \).

**Proof.** Clearly, \((N :_{M} r) \) is an \( R \)-submodule of \( M \). Let \( m \in (N :_{M} r) \). Then \( rm \in N \). Now, \( m = \sum_{g \in G} m_g \) where \( m_g \in M_g \) for all \( g \in G \). Since \( r \in h(R), r \in R_h \) for some \( h \in G \) and then \( rm_g \in R_h M_g \subseteq M_{hg} \subseteq h(M) \) for all \( g \in G \) such that \( \sum_{g \in G} rm_g = r \left( \sum_{g \in G} m_g \right) = rm \in N \). Since \( N \) is graded, \( rm_g \in N \) for all \( g \in G \) which implies that \( m_g \in (N :_{M} r) \) for all \( g \in G \). Hence, \((N :_{M} r) \) is a graded \( R \)-submodule of \( M \).

**Lemma 2.22.** Let \( M \) be a graded \( R \)-module, \( S \) be a m.c.s of \( h(R) \) and \( N \in GSpecS(RM) \). Then there exists \( s \in S \) such that

(1) \((N :_{M} t) \subseteq (N :_{M} s) \) for all \( t \in S \).
(2) \((N :_{R} M) :_{R} t \subseteq ((N :_{R} M) :_{R} s) \) for all \( t \in S \).

**Proof.**

(1) Since \( N \in GSpecS(RM) \), there is an \( s \in S \) so that \( rm \in N \) implies \( sr \in (N :_{R} M) \) or \( sm \in N \) for all \( r \in h(R) \) and \( m \in h(M) \). Let \( t \in S \\ and \( m \in (N :_{M} t) \). Then \( m_g \in (N :_{M} t) \) for all \( g \in G \) as \((N :_{M} t) \) is graded submodule by Lemma 2.21 and then \( tm_g \in N \) for all \( g \in G \). Since \( N \in GSpecS(RM) \) and \((N :_{R} M) \cap S = \emptyset , sm_g \in N \) for all \( g \in G \), and then \( sm \in N \), that is \( m \in (N :_{M} s) \).

(2) Obvious from (1).

**Proposition 2.23.** Suppose that \( M \) is a finitely generated graded \( R \)-module, \( S \subseteq h(R) \) is a m.c.s and \( N \) is a graded \( R \)-submodule of \( M \) such that \((N :_{R} M) \cap S = \emptyset \). Then \( N \in GSpecS(RM) \) if and only if \( S^{-1}N \) is a graded prime \( R \)-submodule of \( S^{-1}M \) and there is an \( s \in S \) so that \((N :_{M} s) \subseteq (N :_{M} s) \) for all \( t \in S \).
Proof. Suppose that \( N \in GSpec_{S}(RM) \). Then the result holds by Proposition 2.22 and Lemma 2.22. Conversely, let \( r \in h(R) \) and \( m \in h(M) \) with \( rm \in N \). Then \( \frac{r}{m} \in S^{-1}N \). Since \( S^{-1}N \) is a graded prime \( R \)-submodule of \( S^{-1}M \) and \( M \) is finitely generated, we have that \( \frac{r}{m} \in (S^{-1}N :_{S^{-1}R} S^{-1}M) = S^{-1}(N :_{R} M) \) or \( \frac{r}{m} \in S^{-1}N \). Then \( ur \in (N :_{R} M) \) or \( vm \in N \) for some \( u,v \in S \). By assumption, there is an \( s \in S \) so that \((N :_{M} t) \subseteq (N :_{M} s)\) for all \( t \in S \). If \( ur \in (N :_{R} M) \), then \( rM \subseteq (N :_{M} u) \subseteq (N :_{M} s) \) and thus \( sr \in (N :_{R} M) \). If \( vm \in N \), a similar argument proves that \( sm \in N \). Therefore, \( N \in GSpec_{S}(RM) \).

Proposition 2.24. Let \( M \) be a graded \( R \)-module, \( S \) be a m.c.s of \( h(R) \) and \( N \) be a graded \( R \)-submodule of \( M \) with \( (N :_{R} M) \cap S = \emptyset \). Then \( N \in GSpec_{S}(RM) \) if and only if \( (N :_{M} s) \in GSpec(RM) \) for some \( s \in S \).

Proof. Suppose that \( N \in GSpec_{S}(RM) \). Then there is an \( s \in S \) so that \( rm \in N \) implies \( sr \in (N :_{R} M) \) or \( sm \in N \). Now we show that \( (N :_{M} s) \in GSpec(RM) \). By Lemma 2.21 \((N :_{M} s)\) is a graded \( R \)-submodule of \( M \). Let \( r \in h(R), m \in h(M) \) with \( rm \in (N :_{M} s) \). Then \((sr)m \in N \). Since \( P \in GSpec_{S}(RM) \), we have \( s^{2}r \in (N :_{R} M) \) or \( sm \in N \). If \( sm \in N \), then there is nothing to prove. Suppose that \( sm \notin N \). Then \( s^{2}r \in (N :_{R} M) \) and so \( r \in ((N :_{R} M) :_{R} s^{2}) = ((N :_{R} M) :_{R} s)) \) by Lemma 2.22. Hence, we have that \( r \in ((N :_{M} s) :_{R} M) \) and hence \((N :_{M} s) \in GSpec(RM) \). Conversely, assume that \((N :_{M} s) \in GSpec(RM) \) for some \( s \in S \). Let \( rm \in N \) for some \( r \in h(R), m \in h(M) \). Since \( rm \in (N :_{M} s) \) and \((N :_{M} s) \in GSpec(RM) \), we have \( r \in ((N :_{M} s) :_{R} M) \) or \( m \in (N :_{M} s) \), and then \( rs \in (N :_{R} M) \) or \( sm \in N \). Hence, \( N \in GSpec_{S}(RM) \). □

Consider a graded \( R \)-module \( M \) with a graded \( R \)-submodule \( N \). By (2), Proposition 2.7, if \( N \in GSpec_{(RM)} \), then \((N :_{R} M) \in GSpec(R) \). However, the next example shows that the converse is not true in general.

Example 2.25. Consider \( R = \mathbb{Z} \) and \( G = \mathbb{Z}_{4} \). Then \( R \) is trivially \( G \)-graded by \( R_{0} = \mathbb{Z} \) and \( R_{1} = R_{2} = R_{3} = \{0\} \). Consider the \( R \)-module \( T = \mathbb{Z}[i] \). Then \( T \) is \( G \)-graded by \( T_{0} = \mathbb{Z}, T_{2} = i\mathbb{Z} \) and \( T_{1} = T_{3} = \{0\} \). So, \( M = T \times T \) is a \( G \)-graded \( R \)-module where \( M_{g} = T_{g} \times T_{g} \) for all \( g \in G \). Choose \( m = (2,0) \in h(M) \), then \( N = Rm \) is a graded \( R \)-submodule of \( M \) with \((N :_{R} M) = \{0\} \in GSpec(R) \). On the other hand, \( N \notin GSpec_{S}(RM) \) since \( 2 \in h(R) \) and \((3,0) \in h(M) \) such that \( 2(3,0) \notin N \), but \( 2 \notin (N :_{R} M) \) and \((3,0) \notin N \).

Now, we investigate graded \( S \)-prime submodules to introduce a situation where the converse of (2), Proposition 2.7, is true.

Proposition 2.26. Let \((R,X) \) be a graded quasi-local ring, \( M \) be a graded \( R \)-module and \( N \) be a graded \( R \)-submodule of \( M \). Then \( N \in GSpec(RM) \) if and only if \((N :_{R} M) \in GSpec(R) \) and \( N \in GSpec_{h_{(R)-X(R)M)}(RM)} \).

Proof. Suppose that \( N \in GSpec_{S}(RM) \). Since \((N :_{R} M) \subseteq X, (N :_{R} M) \cap (h(R) - X) = \emptyset \). The rest follows from Proposition 2.22 (1). Conversely, let \( rm \in N \) with \( r \notin (N :_{R} M) \) for some \( r \in h(R), m \in h(M) \). Since \( N \in GSpec_{h_{(R)-X(R)M)}(RM)} \), there exists \( s \notin X \) so that \( rs \in (N :_{R} M) \) or \( sm \in N \). Since \((N :_{R} M) \in GSpec(R) \) and \( s \notin (N :_{R} M) \), we have \( rs \notin (N :_{R} M) \) and so \( sm \in N \). Now, since \( s \notin X \) and \( X \) is graded maximal, \( 1 = x + as \) for some \( x \in X \) and \( a \in R \), and then \( m = xm + asm \in N \). Hence, \( N \in GSpec_{S}(RM) \). □

Let \( M \) be an \( R \)-module. The idealization \( R(+)M = \{(r,m) : r \in R \text{ and } m \in M \} \) of \( M \) is a commutative ring with componentwise addition and multiplication; \((x, m_{1}) +
(y, m_2) = (x + y, m_1 + m_2) and (x, m_1)(y, m_2) = (xy, xm_2 + ym_1) for each x, y \in R and m_1, m_2 \in M. Let G be an abelian group and M be a G-graded R-module. Then X = R(+)M is G-graded by X_g = R_g(+)M_g for all g \in G. Note that, X_g is an additive subgroup of X for all g \in G. Also, for g, h \in G, X_gX_h = (R_g(+)M_g)(R_h(+)M_h) = (R_gR_h, R_gM_h + R_hM_g) \subseteq (R_{gh}, M_{gh} + M_{hg}) \subseteq (R_{gh}, M_{gh}) = X_{gh} as G is abelian, (see \[\text{II}\]). If S is a m.c.s. of h(R) and N is a graded R-submodule of M, then S(+)N is a m.c.s. of h(R(+)M).

**Lemma 2.27.** Let G be an abelian group, M be a G-graded R-module, P be an ideal of R and N be an R-submodule of M such that PM \subseteq N. Then P(+)N is a graded ideal of R(+)M if and only if P is a graded ideal of R and N is a graded R-submodule of M.

**Proof.** Follows from \[\text{II}\] Proposition 3.3.

**Proposition 2.28.** Let G be an abelian group, M be a G-graded ring, S be a m.c.s of h(R) and P be a graded ideal of R with P \cap S = \emptyset. Then the following are equivalent:

1. P \in GSpec_S(R).
2. P(+)M \in GSpec_{S(+)\{0\}}(R(+)M).

**Proof.** (1) \Rightarrow (2) : Suppose that P \in GSpec_S(R). Let (x, m)(y, t) = (xy, xt + ym) \in P(+)M for some x, y \in h(R), m, t \in h(M). Then we have xy \in P. Since P \in GSpec_S(R), there exists s \in S such that sx \in P or sy \in P. Now, u = (s, 0) \in S(+)\{0\}. Then we have u(x, m) = (sx, sm) \in P(+)M or u(y, t) = (sy, st) \in P(+)M. Therefore, P(+)M \in GSpec_{S(+)\{0\}}(R(+)M).

(2) \Rightarrow (3) : The result holds by Proposition 2.22.

(3) \Rightarrow (1) : Suppose that P(+)M \in GSpec_{S(+)M}(R(+)M). Let xy \in P for some x, y \in h(R). Then (x, 0)(y, 0) \in P(+)M. Since P(+)M \in GSpec_{S(+)M}(R(+)M), there is an s = (u, t) \in S(+)M such that s(x, 0) = (ux, xt) \in P(+)M or s(y, 0) = (uy, yt) \in P(+)M, and hence we have ux \in P or uy \in P. Therefore, P \in GSpec_S(R).

**Definition 2.29.** Suppose that M is a graded R-module and S is a m.c.s. of h(R) with Ann_R(M) \cap S = \emptyset. Then M is said to be a graded S-torsion-free module in the case that we can find s \in S and whenever rm = 0, so sr = 0 or sm = 0 for each r \in h(R) and m \in h(M).

**Proposition 2.30.** Let M be a graded R-module. Assume that S is a m.c.s. of h(R) and N is a graded R-submodule of M. Then N \in GSpec_S(RM) if and only if M/N is a graded f(S)-torsion free R/(N :_R M)-module, where f : R \rightarrow R/(N :_R M) is the graded R- homomorphism defined by f(r) = r + (N :_R M) for all r \in R.

**Proof.** Suppose that N \in GSpec_S(RM). Let \(\overline{rm} = 0_{M/N}\), where \(\overline{r} = r + (N :_R M)\) and \(m = m + N\) for some \(r \in h(R)\), \(m \in h(M)\). Then \(rm \in N\). Since \(N \in GSpec_S(RM)\), there is an s \in S so that sr \in (N :_R M) or sm \in N, and then we have that \(f(s)\overline{r} = 0_{R/(N :_R M)}\) or \(f(s)\overline{m} = 0_{M/N}\). Therefore, \(M/N\) is a graded \(f(S)\)-torsion free \(R/(N :_R M)\)-module. Conversely, suppose that \(M/N\) is a graded \(f(S)\)-torsion free \(R/(N :_R M)\)-module. Let \(r \in h(R)\) and \(m \in h(M)\) with \(rm \in N\). Assume that \(\overline{r} = r + (N :_R M)\) and \(\overline{m} = m + N\). Then \(\overline{rm} = 0_{M/N}\). Since \(M/N\) is a graded \(f(S)\)-torsion free \(R/(N :_R M)\)-module, we have \(s \in S\), which satisfies \(f(s)\overline{r} = 0_{R/(N :_R M)}\) or \(f(s)\overline{m} = 0_{M/N}\), which implies that \(sr \in (N :_R M)\) or \(sm \in N\). Hence, \(N \in GSpec_S(RM)\).
Let $M$ be a graded $R$-module. Then the set of all homogeneous zero divisors of $M$ is $HZ(M) = \{ r \in h(R) : rm = 0 \text{ for some nonzero } m \in h(M) \}$.

**Proposition 2.31.** Let $M$ be a finitely generated graded $R$-module and $S$ is a m.c.s. of $h(R)$. If every proper graded $R$-submodule of $M$ is graded $S$-prime, then $HZ(M) = Ann_R(M) \cap h(R)$.

**Proof.** Let $r \in HZ(M)$. Then $r \in h(R)$ and there is a nonzero $m \in M$ with $rm = 0$. Since the graded zero submodule is graded $S$-prime and $rm = 0$, there is an $s \in S$ so that $sr \in Ann_R(M)$ or $sm = 0$. If $sm = 0$, then $s \in Ann_R(m)$. Now, let $K = Ann_R(m)M$. Then $K$ is a graded $R$-submodule of $M$ such that $S \cap (K :_R M) \neq \emptyset$. Thus, we have $K = Ann_R(m)M = M$. By ([4], Corollary 2.5), $1 - x \in Ann_R(M) \subseteq Ann_R(m)$ for some $x \in Ann_R(m)$, which implies that $Ann_R(m) = R$, and so $m = 0$, which is a contradiction. So, $sr \in Ann_R(M)$. Then we have that $s \in (Ann_M(r) :_R M)$ and hence by assumption $Ann_M(r) = M$ as $Ann_M(r) = (0 :_R M)$ is a graded $R$-submodule of $M$ by Lemma [2.21]. Thus, we have $r \in Ann_R(M)$. Therefore, $HZ(M) = Ann_R(M) \cap h(R)$. □
