HOMOLOGICAL THEORY OF $k$-IDEMPOTENT IDEALS IN DUALIZING VARIETIES

LUIS GABRIEL RODRÍGUEZ-VALDÉS\textsuperscript{1}, MARTHA LIZBETH SHAID SANDOVAL-MIRANDA\textsuperscript{2}, VALENTE SANTIAGO-VARGAS\textsuperscript{3}

Abstract. In this work, we develop the theory of $k$-idempotent ideals in the setting of dualizing varieties. Several results given previously in [4] by M. Auslander, M. I. Platzeck, and G. Todorov are extended to this context. Given an ideal $I$ (which is the trace of a projective module), we construct a canonical recollement which is the analog to a well-known recollement in categories of modules over artin algebras. Moreover, we study the homological properties of the categories involved in such a recollement. Consequently, we find conditions on the ideal $I$ to obtain quasi-hereditary algebras in such a recollement. Applications to bounded derived categories are also given.

1. Introduction

Dualizing $R$-varieties have appeared in the theory of locally bounded $k$-categories over a field $k$, as well as in the study of categories of graded modules over artin algebras. What is more, they are in connection with covering theory. One of the advantages of the notion of dualizing $R$-variety defined in [5] is that it provides a common setting for the category $	ext{proj}(\Lambda)$ of finitely generated projective $\Lambda$-modules, $\text{mod}(\Lambda)$ and $\text{mod}(\text{mod}(\Lambda))$, which play an important role in the study of an artin algebra $\Lambda$.

Recently, in [16], C. Parra, M. Saorin, and S. Virili, have studied modules over a small preadditive category $C$, and have shown various interesting results on torsion theories, idempotent ideals, as well as recollements, in that context. Particularly, they have generalized a result given by J. P. Jans, which states that there is a bijective correspondence between idempotent ideals in the preadditive category $C$ and TTF’s in the category of modules $\text{Mod}(C)$.

In [4], M. Auslander, M. I. Platzeck and G. Todorov studied homological ideals in the case of the category $\text{mod}(\Lambda)$, where $\Lambda$ is an artin algebra. They proved several fundamental results related to homological ideals, and they connected such a notion with the context of quasi-hereditary algebras.

Following all of these ideas, it seems natural to extend this study to the setting of rings with several objects (see [13]). This extension is best expressed in the language of dualizing $R$-varieties. Our main purpose in this paper is to show generalizations of results given in [4], in the context of dualizing varieties. In the following, we describe our results in more detail.

After the introduction (section 1), in section 2 we consider a preadditive category $C$, and we recall basic definitions and results about $\text{Mod}(C)$ and dualizing varieties.

In section 3, we consider the notion of ideal in a preadditive category $C$. We begin our work by generalizing the classical adjunction for artin algebras given by

$$\text{Hom}_{\Lambda/I}(Y, \text{Tr}_{\Lambda/I}(X)) \simeq \text{Hom}_{\Lambda}(Y, X)$$

and $\text{Tor}$. We study certain derived functors, and with the help of these derived functors, we give homological characterizations of when the functor $\text{Tr}_I : \text{Mod}(C) \to \text{Mod}(C/I)$ preserves injective coresolutions of length $k$ (see 3.11 and 3.17).

In section 4, we study conditions on the ideal $I$ under which we can restrict our previous results to the subcategory $\text{mod}(C)$ of finitely presented $C$-modules. We introduce the property (A) in the ideal $I$ (see definition 4.5), and we prove that if an ideal satisfies property A then we can restrict our attention to the case of finitely presented modules (see 4.7). In particular, we prove that if $C$ is a dualizing variety and $I$ is an ideal satisfying property A, then $C/I$ is also dualizing (see 4.6).

In section 5, we introduce the notion of $k$-idempotent ideal in preadditive categories (see 5.1). We describe the idempotent ideals in terms of the vanishing of certain derived functors (see 5.2 and 5.3). Moreover, if the ideal $I$ satisfies property $A$ and $C$ is a dualizing $R$-variety, by using Auslander-Reiten duality, we give characterizations of when $I$ is $k$-idempotent in terms of the functors $\text{Ext}^i_{\text{mod}(C)}(\_, \_)$ and $\text{Tor}^i_{\_,\_}$ (see 5.9).

In section 6, we prove the dual basis lemma for the category $\text{Mod}(C)$ (see 6.1), and given a projective module $P$, we introduce the trace ideal $I := \text{Tr}_P C$ (see 6.3). We also show that if $C$ is a dualizing $R$-variety, then $\text{Tr}_P C$ satisfies property $A$ (see 6.10). We study projective resolutions of $k$-idempotent ideals and introduce specials subcategories, $P_k$ and $I_k$ (see 6.14). Here we prove that $I = \text{Tr}_P C$ is $k + 1$-idempotent if and only if $I(C', \_)$ $\in P_k$ for all $C' \in C$ (see 6.17), which is a generalization of the result [4, Theorem 2.1].

In section 7, we consider $P := \text{Hom}_C(C, \_)$ $\in \text{mod}(C)$ and $R_P := \text{End}_{\text{mod}(C)}(P)^{op}$ and we study the functor $\text{Hom}_{\text{mod}(C)}(P, \_)$. We obtain a generalization of a well known recollement (see for example [17, example 3.4]) to the setting of dualizing $R$-varieties (see 7.4). Finally in this section, we prove that $\text{mod}(R_P)$ is equivalent to certain subcategories of $\text{mod}(C)$ (see 7.8).

In section 8, we study some homological properties of the functor

$$\text{Hom}_{\text{mod}(C)}(P, \_) : \text{mod}(C) \to \text{mod}(R_P),$$

and how the homological properties of $\text{mod}(C)$ and $\text{mod}(R_P)$ are related. We explore the relationship between injective coresolutions in $\text{mod}(C)$ and $\text{mod}(R_P)$. We give necessary and sufficient conditions for $I_1$ to be equal to $I_{\infty}$. Finally, we study the property of an ideal to be projective. This notion is important because the condition that $I(C', \_)$ being projective is part of the definition of heredity ideal given in [15]. We show that under certain conditions we are able to produce quasi-hereditary algebras (see 8.13). In addition, we have an application to derived categories (see 8.14), which is a generalization of a well-known result for the category $\text{Mod}(R)$, where $R$ is an associative ring.
Finally, in section 9, some examples of $k$-homological ideals are explored.

2. Preliminaries

In this section we recall the basic notions of rings with several objects and the notion of dualizing $R$-variety introduced by Auslander and Reiten in [5].

2.1. Categorical Foundations. Recall that a category $C$ together with an abelian group structure in each of the sets of morphisms $C(C_1, C_2)$ is said to be a preadditive category whenever all the composition mappings $C(C', C'') \times C(C, C') \to C(C, C'')$ in $C$ are bilinear mappings of abelian groups. A covariant functor $F : C_1 \to C_2$ between preadditive categories $C_1$ and $C_2$ is said to be additive if for each pair of objects $C$ and $C'$ in $C_1$, the mapping $F : C_1(C, C') \to C_2(F(C), F(C'))$ is a morphism of abelian groups. If $C$ is a preadditive category, we always consider its opposite category $C^{op}$ as a preadditive category by letting $C^{op}(C', C) = C(C', C')$. We follow the usual convention of identifying each contravariant functor $F$ from a category $C$ to $D$ with a covariant functor $F$ from $C^{op}$ to $D$.

An arbitrary category $C$ is small if the class of objects of $C$ is a set. An additive category is a preadditive category $C$ such that every finite family of objects in $C$ has a coproduct. Given a small preadditive category $C$ and $D$ an arbitrary preadditive category, we denote by $(C, D)$ the category of all the covariant additive functors.

2.2. The category $\text{Mod}(C)$. Throughout this section $C$ will denote an arbitrary small preadditive category, and $\text{Mod}(C)$ will denote the category of additive covariant functors from $C$ to the category of abelian groups $\text{Ab}$. This is also referred as the category of $C$-modules. As usual, $\text{Mod}(C^{op})$ will be identified with the category of additive contravariant functors from $C$ to $\text{Ab}$.

Now, we recall some properties of the category $\text{Mod}(C)$, and for more details, the reader may refer to [2].

As it is well-know, the category $\text{Mod}(C)$ is an abelian category with enough injectives and projectives. For each $C$ in $C$, the $C$-module $(C, -)$ given by $(C, -)(X) = C(C, X)$ for each $X$ in $C$, has the property that for each $C$-module $M$, the mapping $((C, -), M) \to M(C)$ given by $f \mapsto f_C(1_C)$ for each $C$-morphism $f : (C, -) \to M$ is an isomorphism of abelian groups (Yoneda’s Lemma).

1. The functor $\mathbb{Y} : C \to \text{Mod}(C)$ given by $\mathbb{Y}(C) = (C, -)$ is fully faithful.
2. For each family $\{C_i\}_{i \in I}$ of objects in $C$, the $C$-module $\coprod_{i \in I} \mathbb{Y}(C_i)$ is projective.
3. For each $M \in \text{Mod}(C)$, there exists an epimorphism $\coprod_{i \in I} \mathbb{Y}(C_i) \to M$ for some family $\{C_i\}_{i \in I}$ in $C$. We say that $M$ is finitely generated if such family is finite.
4. A finitely generated projective $C$-module is a direct summand of $\coprod_{i \in I} \mathbb{Y}(C_i)$ for some finite family of objects $\{C_i\}_{i \in I}$ in $C$.

2.3. Change of Categories. The results in this subsection are taken directly from [2]. Let $C$ be a small preadditive category. There is a unique (up to isomorphism) functor $\otimes_C : \text{Mod}(C^{op}) \times \text{Mod}(C) \to \text{Ab}$ called the tensor product. The abelian group $\otimes_C(A, B)$ is denoted by $A \otimes_C B$ for all $C^{op}$-modules $A$ and all $C$-modules $B$.

Proposition 2.1. The tensor product has the following properties:

1. (a) For each $C$-module $B$, the functor $\otimes_C B : \text{Mod}(C^{op}) \to \text{Ab}$ given by $(\otimes_C B)(A) = A \otimes_C B$ for all $C^{op}$-modules $A$ is right exact.
(b) For each $\mathcal{C}^{op}$-module $A$, the functor $A \otimes_{\mathcal{C}} : \text{Mod}(\mathcal{C}) \rightarrow \text{Ab}$ given by $(A \otimes_{\mathcal{C}})(B) = A \otimes_{\mathcal{C}} B$ for all $\mathcal{C}$-modules $B$ is right exact.

(2) For each $\mathcal{C}^{op}$-module $A$ and each $\mathcal{C}$-module $B$, the functors $A \otimes_{\mathcal{C}}$ and $\otimes_{\mathcal{C}} B$ preserve arbitrary coproducts.

(3) For each object $C$ in $\mathcal{C}$ we have $A \otimes_{\mathcal{C}} (C, -) = A(C)$ and $(-, C) \otimes_{\mathcal{C}} B = B(C)$ for all $\mathcal{C}^{op}$-modules $A$ and all $\mathcal{C}$-modules $B$.

Suppose now that $\mathcal{C}'$ is a preadditive subcategory of the small category $\mathcal{C}$. We use the tensor product of $\mathcal{C}'$-modules to describe the left adjoint $C \otimes_{\mathcal{C}'}$ of the restriction functor $\text{res}_{\mathcal{C}'} : \text{Mod}(\mathcal{C}) \rightarrow \text{Mod}(\mathcal{C}')$ given by $M \mapsto M|_{\mathcal{C}'}$.

Define the functor $C \otimes_{\mathcal{C}'} : \text{Mod}(\mathcal{C}') \rightarrow \text{Mod}(\mathcal{C})$ by $(C \otimes_{\mathcal{C}'} M)(C') = C(-, C)|_{\mathcal{C}'} \otimes_{\mathcal{C}'} M$ for all $M \in \text{Mod}(\mathcal{C}')$ and $C \in \mathcal{C}$.

Proposition 2.2. [2, Proposition 3.1] Let $\mathcal{C}'$ be a subcategory of the small category $\mathcal{C}$. Then the functor $C \otimes_{\mathcal{C}'} : \text{Mod}(\mathcal{C}') \rightarrow \text{Mod}(\mathcal{C})$ satisfies:

1. $C \otimes_{\mathcal{C}'}$ is right exact and preserves coproducts;

2. The composition $\text{Mod}(\mathcal{C}')^{\mathcal{C} \otimes_{\mathcal{C}'} \otimes_{\mathcal{C}'} \text{Mod}(\mathcal{C}')}$ is the identity;

3. For each object $C' \in \mathcal{C}'$, we have $C \otimes_{\mathcal{C}'} C'(C', -) = C(C', -)$;

4. The restriction mapping $C(C \otimes_{\mathcal{C}'} M, N) \rightarrow C'(M, N|_{\mathcal{C}'})$ is an isomorphism for each $\mathcal{C}'$-module $M$ and each $\mathcal{C}$-module $N$;

5. $C \otimes_{\mathcal{C}'}$ is a fully faithful functor.

Having described the left adjoint $C \otimes_{\mathcal{C}'}$ of the restriction functor $\text{res}_{\mathcal{C}'} : \text{Mod}(\mathcal{C}) \rightarrow \text{Mod}(\mathcal{C}')$, we now describe its right adjoint. Define the functor $C'(C, -) : \text{Mod}(\mathcal{C}) \rightarrow \text{Mod}(\mathcal{C}')$ by $C'(C, M)(X) = C'(C(X, -)|_{\mathcal{C}'}, M)$ for all $\mathcal{C}'$-modules $M$ and all objects $X$ in $\mathcal{C}$. We have the following proposition.

Proposition 2.3. [2, Proposition 3.4] Let $\mathcal{C}'$ be a subcategory of the small category $\mathcal{C}$. Then the functor $C'(C, -) : \text{Mod}(\mathcal{C}') \rightarrow \text{Mod}(\mathcal{C})$ has the following properties:

1. $C'(C, -)$ is left exact and preserves inverse limits;

2. The composition $\text{Mod}(\mathcal{C}')^{C'(C, -) \otimes_{\mathcal{C}'} \otimes_{\mathcal{C}'} \text{Mod}(\mathcal{C}')}$ is the identity;

3. The restriction mapping $C(N, C'(C, M)) \rightarrow C'(N|_{\mathcal{C}'}, M)$ is an isomorphism for each $\mathcal{C}'$-module $M$ and each $\mathcal{C}$-module $N$;

4. $C'(C, -)$ is a fully faithful functor.

2.4. Dualizing varieties and Krull-Schmidt Categories. Let $\mathcal{C}$ be an additive category. It is said that $\mathcal{C}$ is a category in which idempotents split if given $e : C \rightarrow C$ an idempotent endomorphism of an object $C \in \mathcal{C}$, then $e$ has a kernel in $\mathcal{C}$. Let us denote by $\text{proj}(\mathcal{C})$ the full subcategory of $\text{Mod}(\mathcal{C})$ consisting of all finitely generated projective $\mathcal{C}$-modules. It is well known that $\text{proj}(\mathcal{C})$ is a small additive category in which idempotents split, the functor $\mathcal{Y} : \mathcal{C} \rightarrow \text{proj}(\mathcal{C})$ given by $\mathcal{Y}(C) = C(C, -)$, is fully faithful, and induces by restriction $\text{res} : \text{Mod}(\text{proj}(\mathcal{C})^{op}) \rightarrow \text{Mod}(\mathcal{C})$ an equivalence of categories. Also, recall the following notion given by Auslander in [2], a variety is a small additive category in which idempotents split.

Given a ring $R$, we denote by $\text{Mod}(R)$ the category of left $R$-modules and by $\text{mod}(R)$ the full subcategory of $\text{Mod}(R)$ consisting of the finitely generated left $R$-modules.

Now, we recall some notions from [5].

Definition 2.4. Let $R$ be a commutative artin ring. An $R$-category $\mathcal{C}$, is an additive category such that $\mathcal{C}(C_1, C_2)$ is an $R$-module, and the composition is $R$-bilinear. An $R$-variety $\mathcal{C}$ is a variety which is an $R$-category. An $R$-variety $\mathcal{C}$ is Hom-finite, if for each pair of objects $C_1, C_2$ in $\mathcal{C}$, the $R$-module $\mathcal{C}(C_1, C_2)$ is finitely generated. We denote by $(\mathcal{C}, \text{mod}(R))$, the full subcategory of $(\mathcal{C}, \text{Mod}(R))$ consisting of the $\mathcal{C}$-modules such that for every $C$ in $\mathcal{C}$ the $R$-module $M(C)$ is finitely generated.
Suppose $C$ is a Hom-finite $R$-variety. If $M : C \to \text{Ab}$ is a $C$-module, for each $C \in C$ the abelian group $M(C)$ has a structure of $\text{End}_C(C)$-module, and hence as an $R$-module since $\text{End}_C(C)$ is an $R$-algebra. Then, $\text{Mod}(C)$ is an $R$-variety, which we identify with the category of covariant functors $(C, \text{Mod}(R))$. Moreover, $(C, \text{mod}(R))$ is abelian and the inclusion $(C, \text{mod}(R)) \to (C, \text{Mod}(R))$ is exact.

**Definition 2.5.** Let $C$ be a Hom-finite $R$-variety. We denote by $\text{mod}(C)$ the full subcategory of $\text{Mod}(C)$ whose objects are the **finitely presented functors**. That is, $M \in \text{mod}(C)$ if and only if there exists an exact sequence in $\text{Mod}(C)$

$$\xymatrix{ \text{Hom}_C(C_0, -) \ar[r] & \text{Hom}_C(C_1, -) \ar[r] & M \ar[r] & 0.}$$

Consider the functor $\mathbb{D}_C : (C, \text{mod}(R)) \to (C^{\text{op}}, \text{mod}(R))$, which is defined as follows: for any object $C$ in $C$, $\mathbb{D}_C(M)(C) = \text{Hom}_R(M(C), E)$ where $E$ is the **injective envelope** of $R/\text{rad}(R) \in \text{mod}(R)$. The functor $\mathbb{D}_C$ defines a duality between $(C, \text{mod}(R))$ and $(C^{\text{op}}, \text{mod}(R))$. We have the following definition due to Auslander and Reiten (see [5]).

**Definition 2.6.** An Hom-finite $R$-variety $C$ is **dualizing**, if the functor $\mathbb{D}_C : (C, \text{mod}(R)) \to (C^{\text{op}}, \text{mod}(R))$ induces a duality between the categories $\text{mod}(C)$ and $\text{mod}(C^{\text{op}})$.

It is clear from the definition that for dualizing varieties $C$ the category $\text{mod}(C)$ has enough injectives and projectives. To finish, we recall the following definition:

**Definition 2.7.** An additive category $C$ is **Krull-Schmidt**, if every object in $C$ decomposes in a finite sum of objects whose endomorphism ring are local.

We recall the following result.

**Theorem 2.8.** Let $C$ a dualizing $R$-variety. Then $\text{mod}(C)$ is a dualizing $R$-variety.

## 3. An Adjunction and Some Derived Functors

In the article [4], Auslander-Platzeck-Todorov studied homological ideals in the case of $\text{mod}(\Lambda)$ where $\Lambda$ is an artin algebra. Given a two sided ideal $I$ of $\Lambda$ they considered $\Lambda/I$ and they studied the trace $\text{Tr}_{\Lambda/I}(M)$ of a $\Lambda$-module $M$ defined as

$$\text{Tr}_{\Lambda/I}(M) = \sum_{f \in \text{Hom}_{\Lambda}(\Lambda/I, M)} \text{Im}(f).$$

In order to define the analogous of $\text{Tr}_{\Lambda/I}(M)$ in the category $\text{Mod}(C)$ we introduced the following notions.

In this section $C$ will be a small preadditive category. Let $\mathcal{M} = \{M_i\}_{i \in I}$ be a family of $C$-modules and set $M := \bigoplus_{i \in I} M_i$. For $F \in \text{Mod}(C)$ we define $\Lambda_{F} := \text{Hom}_{\text{Mod}(C)}(M, F)$, and for $\lambda \in \Lambda_{F}$ we set $u_{\lambda} : M \to M^{(\lambda_F)}$ as the $\lambda$-th inclusion of $M$ into $M^{(\lambda_F)} := \bigoplus_{\lambda \in \Lambda_{F}} M$. For $\lambda \in \Lambda_{F}$ we have the morphism $\lambda : M \to F$, then by the universal property of the coproduct, there exists a unique morphism $\Theta_{F} : M^{(\lambda_F)} \to F$ such that $\lambda = \Theta_{F} \circ u_{\lambda}$ for every $\lambda \in \Lambda_{F}$.

**Definition 3.1.** The **trace** of $F$ respect to the family $\mathcal{M} = \{M_i\}_{i \in I}$, denoted by $\text{Tr}_{\Lambda_{F}}(F)$, is the image of $\Theta_{F}$. That is, we have the following factorization

$$
\xymatrix{ M^{(\lambda_{F})} \ar[r]^{\Delta_{F}} & \text{Tr}_{\Lambda_{F}}(F) \ar[r]^{\Psi_{F}} & F }
$$

where $\Theta_{F} = \Psi_{F} \Delta_{F}$ with $\Delta_{F}$ an epimorphism and $\Psi_{F}$ a monomorphism.

**Proposition 3.2.** For each family $\mathcal{M} = \{M_i\}_{i \in I}$, we have a functor $\text{Tr}_{\mathcal{M}} : \text{Mod}(C) \to \text{Mod}(\mathcal{C})$.

**Proof.** Straightforward. \qed

Now, we recall the following definitions that will be essential throughout this work.
Definition 3.3. Let $\mathcal{C}$ be a preadditive category. An ideal $I$ of $\mathcal{C}$ is an additive subfunctor of $\text{Hom}_\mathcal{C}(-,-)$. That is, $I$ is a class of the morphisms in $\mathcal{C}$ such that:

(a) $I(A,B) = \text{Hom}_\mathcal{C}(A,B) \cap I$ is an abelian subgroup of $\text{Hom}_\mathcal{C}(A,B)$ for each $A,B \in \mathcal{C}$;
(b) If $f \in I(A,B)$, $g \in \text{Hom}_\mathcal{C}(C,A)$ and $h \in \text{Hom}_\mathcal{C}(B,D)$, then $hfg \in I(C,D)$.
(c) Let $I$ and $J$ be ideals in $\mathcal{C}$. The product of ideals $I,J$ is defined as follows: for each $A,B \in \mathcal{C}$ we set

$$I,J(A,B) := \left\{ \sum_{i=1}^{n} f_{i}g_{i} \mid g_{i} \in C(C_{i},C), f_{i} \in C(C_{i},B) \text{ for some } C_{i} \in \mathcal{C} \right\}.$$ 

We say that an ideal $I$ of $\mathcal{C}$ is idempotent if $I^2 = I$.
(d) Let $I$ be an ideal of $\mathcal{C}$, we set $\text{Ann}(I) := \{ F \in \text{Mod}(\mathcal{C}) \mid F(f) = 0 \forall f \in I(A,B) \forall A,B \in \mathcal{C} \}$.

Now, we recall the construction of the quotient category. Let $I$ be an ideal in a preadditive category $\mathcal{C}$. The quotient category $\mathcal{C}/I$ is defined as follows: it has the same objects as $\mathcal{C}$ and $\text{Hom}_{\mathcal{C}/I}(A,B) := \text{Hom}_\mathcal{C}(A,B) / I(A,B)$ for each $A,B \in \mathcal{C}/I$.

For $f + I(A,B) \in \text{Hom}_{\mathcal{C}/I}(A,B)$ and $g + I(B,C) \in \text{Hom}_{\mathcal{C}/I}(B,C)$, we set

$$g \circ f := g + I(A,C) \in \text{Hom}_{\mathcal{C}/I}(A,C).$$

Let $I$ be an ideal of $\mathcal{C}$, we have the canonical functor $\pi : \mathcal{C} \rightarrow \mathcal{C}/I$ defined as: $\pi(A) = A \forall A \in \mathcal{C}$ and $\pi(f) := f + I(A,B) \in \text{Hom}_{\mathcal{C}/I}(A,B) \forall f \in \text{Hom}_\mathcal{C}(A,B)$.

Definition 3.4. Let $I$ be an ideal in a preadditive category $\mathcal{C}$ and consider the functor $\pi : \mathcal{C} \rightarrow \mathcal{C}/I$. We have the functor $\pi_* : \text{Mod}(\mathcal{C}/I) \rightarrow \text{Mod}(\mathcal{C})$ defined as follows: $\pi_*(F) := F \circ \pi$ for $F \in \text{Mod}(\mathcal{C}/I)$ and $\pi_*(\eta) = \eta \circ \pi : F \rightarrow G$ in $\text{Mod}(\mathcal{C}/I)$.

Now, we construct the analogous of the functor $\text{Tr}_{\mathcal{M}/I}(-)$.

Definition 3.5. Let $I$ be an ideal in $\mathcal{C}$, for $C \in \mathcal{C}$ we set $M_C := \frac{\text{Hom}_\mathcal{C}(C,-)}{I(C,-)} \in \text{Mod}(\mathcal{C})$. We consider the family $\mathcal{M} = \{ M_C \}_{C \in \mathcal{C}}$ and we define $\text{Tr}_\mathcal{M} := \text{Tr}_\mathcal{M} : \text{Mod}(\mathcal{C}) \rightarrow \text{Mod}(\mathcal{C})$.

Remark 3.6. (a) For every $F \in \text{Mod}(\mathcal{C})$ we have that $\text{Tr}_\mathcal{M}(F) \in \text{Ann}(I)$.
(b) It is well known that there exists a functor $\Omega : \text{Ann}(I) \rightarrow \text{Mod}(\mathcal{C}/I)$ satisfying that $\pi_* \circ \Omega = 1_{\text{Ann}(I)}$ and $\Omega \circ \pi_* = 1_{\text{Mod}(\mathcal{C}/I)}$ (see for example [16, Lemma 2.1]).

We have the following properties and the proof is left to the reader.

Lemma 3.7. Let $I$ be an ideal in $\mathcal{C}$.

(a) Let $F \in \text{Mod}(\mathcal{C}/I)$. Then $\text{Tr}_\mathcal{M}(F \circ \pi) = F \circ \pi$.
(b) Let $F \in \text{Mod}(\mathcal{C})$. Then $\text{Tr}_\mathcal{M}(F) = F$ if and only if $F \in \text{Ann}(I)$.
(c) Let $M_C := \frac{\text{Hom}_\mathcal{C}(C,-)}{I(C,-)} \in \text{Mod}(C)$, then $\Omega(M_C) = M_C = \frac{\text{Hom}_\mathcal{C}(C,-)}{I(C,-)} \circ \pi = \pi_* (\text{Hom}_{\mathcal{C}/I}(C,-))$.

Proof. Straightforward. \qed

Now, let $\frac{\text{Tr}_\mathcal{M}}{\pi} := \Omega \circ \text{Tr}_\mathcal{M} : \text{Mod}(\mathcal{C}) \rightarrow \text{Mod}(\mathcal{C}/I)$. Let us see that $\pi_*$ is left adjoint to $\frac{\text{Tr}_\mathcal{M}}{\pi}$.\/
Proposition 3.8. The functor $\pi_* : \text{Mod}(C/I) \rightarrow \text{Mod}(C)$ is left adjoint to $\Omega \circ \text{Tr}_C := \Omega \circ \text{Tr}_C : \text{Mod}(C) \rightarrow \text{Mod}(C/I)$. That is, there exists a natural isomorphism

$$\theta_{F,G} : \text{Hom}_{\text{Mod}(C)}(\pi_*(F), G) \rightarrow \text{Hom}_{\text{Mod}(C/I)}(F, \text{Tr}_C(G))$$

for $F \in \text{Mod}(C/I)$ and $G \in \text{Mod}(C)$.

Proof. First, we construct the unit $\eta : 1_{\text{Mod}(C/I)} \rightarrow \text{Tr}_C \circ \pi_*$ of the adjunction. Indeed, we have that $(\text{Tr}_C \circ \pi_*)(F) = (\Omega \circ \text{Tr}_C)(F \circ \pi) = \Omega(F \circ \pi) = (\Omega \circ \pi_*)(F) = F$ (see 3.7(a) and 3.6(b)). Then, for each $F \in \text{Mod}(C/I)$ we define $\eta_F := 1_F : F \rightarrow (\text{Tr}_C \circ \pi_*)(F)$.

Now, we define the counit $\epsilon : \pi_* \circ \text{Tr}_C \rightarrow 1_{\text{Mod}(C)}$ of the adjunction. We note that for $G \in \text{Mod}(C)$ we have $(\pi_\ast \circ \text{Tr}_C)(G) = (\pi_\ast \circ \Omega \circ \text{Tr}_C)(G) = (\pi_\ast \circ \Omega)(\text{Tr}_C(G)) = \text{Tr}_C(G)$ (see 3.6(b)). Then, for $G \in \text{Mod}(C)$ we define $\epsilon_G := \Psi_G$ where $\Psi_G : \text{Tr}_C(G) \rightarrow G$ is the canonical inclusion given in 3.1. Now, it is straightforward to check the triangular identities.

□

For the following results of this section we are going to use the functor $\otimes_C : \text{Mod}(C^{op}) \times \text{Mod}(C) \rightarrow \text{Ab}$ which we introduced in section 2.3. Let $I$ be an ideal in a preadditive category $C$. We recall the following functor (for more details see [11]).

Definition 3.9. We define the functor $\hat{\otimes}_C : \text{Mod}(C) \rightarrow \text{Mod}(C/I)$ as follows: for $M \in \text{Mod}(C)$ we set $(\hat{\otimes}_C M)(C) := \frac{C}{C+I} \otimes_C M$ for all $C \in C/I$ and $(\hat{\otimes}_C M)(\overline{f}) = \overline{\otimes}(f, M)$ for all $\overline{f} = f + I(C, C') \in \text{Hom}_{C/I}(C, C')$.

We also recall the following functor which will be fundamental in this work.

Definition 3.10. We define the functor $\mathcal{C}(\hat{\otimes}_C, -) : \text{Mod}(C) \rightarrow \text{Mod}(C/I)$ as follows: for $M \in \text{Mod}(C)$ we set $\mathcal{C}(\hat{\otimes}_C, M)(C) = \mathcal{C}(\frac{C}{C+I}, M)$ for all $C \in C/I$ and $\mathcal{C}(\hat{\otimes}_C, M)(\overline{f}) = \frac{C}{C+I}(f, -), M$ for all $\overline{f} = f + I(C, C') \in \text{Hom}_{C/I}(C, C')$.

It is well known that $\mathcal{C}(\hat{\otimes}_C, -) : \text{Mod}(C) \rightarrow \text{Mod}(C/I)$ is right adjoint to $\pi_*$ and $\hat{\otimes}_C$ is left adjoint to $\pi_*$ (see for example, [11, Proposition 3.9]), and hence by 3.8, we have that $\mathcal{C}(\hat{\otimes}_C, -) \cong \text{Tr}_C$ since adjoint functors are unique up to isomorphisms. Thus, we have the following result.

Proposition 3.11. Let $I$ be an ideal in $C$ and $\pi : C \rightarrow C/I$ the canonical functor. Then we have the following diagram

$$\text{Mod}(C/I) \xrightarrow{\pi} \pi^* \rightarrow \text{Mod}(C)$$

where $(\pi^*, \pi_*)$ and $(\pi_*^!, \pi^*_!)$ are adjoint pairs, $\pi^! := \mathcal{C}(\hat{\otimes}_C, -) \cong \text{Tr}_C$ and $\pi^* := \hat{\otimes}_C$.

We recall that for every small preadditive category $C$ it is well known that $\text{Mod}(C)$ is an abelian category with enough projectives and enough injectives. So, we can define derived functors in $\text{Mod}(C)$.

Let $M \in \text{Mod}(C)$, we denote by $\text{Ext}^i_{\text{Mod}(C)}(M, -) : \text{Mod}(C) \rightarrow \text{Ab}$ the $i$-th derived functor of $\text{Hom}_{\text{Mod}(C)}(M, -) : \text{Mod}(C) \rightarrow \text{Ab}$. Similarly we have $\text{Ext}^i_{\text{Mod}(C)}(-, M) : \text{Mod}(C)^{op} \rightarrow \text{Ab}$.

Now, we can construct canonical morphisms.
Proposition 3.12. Let $G \in \text{Mod}(C)$ and $F \in \text{Mod}(C/I)$. Then, there exists a morphism of abelian groups $\varphi_{F,G} : \text{Ext}^i_{\text{Mod}(C/I)}(F, \underline{\text{Tr}}_G(G)) \to \text{Ext}^i_{\text{Mod}(C)}(\pi_*(F), G)$ for each $i \geq 0$.

Proof. Since $\pi_*$ is exact, it induces a morphism
\[
\text{Ext}^i_{\text{Mod}(C/I)}(F, \underline{\text{Tr}}_G(G)) \to \text{Ext}^i_{\text{Mod}(C)}(\pi_*(F), \pi_*(\underline{\text{Tr}}_G(G))).
\]
Moreover, the counit $\epsilon : \pi_*(\underline{\text{Tr}}_G(G)) \to G$ induces a morphism
\[
\text{Ext}^i_{\text{Mod}(C)}(\pi_*(F), \pi_*(\underline{\text{Tr}}_G(G))) \to \text{Ext}^i_{\text{Mod}(C)}(\pi_*(F), G).
\]
Hence, we have the required morphism. $\square$

Now, we give the following definition which is the analogous to the multiplication of an ideal and a module in the classical sense.

Definition 3.13. Let $G \in \text{Mod}(C)$ and $I$ an ideal in $C$. We define $IG$ as the subfunctor of $G$ defined as follows: for $X \in C$ we set $IG(X) := \sum_{f \in \mathcal{U} \in \text{Ext}(C,X)} \text{Im}(G(f))$.

Let $N \in \text{Mod}(C^{op})$ and consider the functor $N \otimes - : \text{Mod}(C) \to \text{Ab}$. We denote by $\text{Tor}_i^C(N, -) : \text{Mod}(C) \to \text{Ab}$ the $i$-th left derived functor of $N \otimes -$.

Proposition 3.14. Let $F \in \text{Mod}((C/I)^{op})$ and $G \in \text{Mod}(C)$, and consider a projective resolution $(P^*, \epsilon_G)$ of $G$. Then for each $i \geq 0$, there exists a canonical morphism of abelian groups $\psi_{F,G}^i : \text{Tor}_i^C(F \circ \pi, G) \to \text{Tor}_i^{C/I}(F, G/IG)$.

Proof. Similar to 3.12. $\square$

Now, we give the following definition.

Definition 3.15. Consider the functors $C(\underline{\text{Tr}}, -), \underline{\text{Tr}} \otimes - : \text{Mod}(C) \to \text{Mod}(C/I)$ given in the definitions 3.9 and 3.10. We denote by $\text{EXT}^i_C(C/I, -) : \text{Mod}(C) \to \text{Mod}(C/I)$ the $i$-th right derived functor of $C(\underline{\text{Tr}}, -)$ and $\text{TOR}_i^C(C/I, -) : \text{Mod}(C) \to \text{Mod}(C/I)$ the $i$-th left derived functor of $\underline{\text{Tr}} \otimes -$.

Remark 3.16. Consider the functor $\text{EXT}^i_C(C/I, -) : \text{Mod}(C) \to \text{Mod}(C/I)$. For $C \in C/I$ we have that: $\text{EXT}^i_C(C/I, M)(C) = \text{Ext}^i_{\text{Mod}(C)}\left(\frac{\text{Hom}(C(-), -)}{\text{Tor}_i^C(C/I, -)}, M\right)$.

Now, we have the following proposition which will help us to characterize $k$-idempotent ideals in the forthcoming sections.

Proposition 3.17. Let $I$ an ideal in $C$, $\pi : C \to C/I$ the canonical functor and consider the diagram given in 3.11. Let $G \in \text{Mod}(C)$, and $0 \to G \to I_0 \to I_1 \to \cdots \to I_k$ is an injective coresolution of $G$. For $1 \leq k \leq \infty$, the following conditions are equivalent.

(a) $0 \to \underline{\text{Tr}}_G(G) \to \underline{\text{Tr}}_G(I_0) \to \underline{\text{Tr}}_G(I_1) \to \cdots \to \underline{\text{Tr}}_G(I_k)$ is the beginning of an injective coresolution of $\underline{\text{Tr}}_G(G) \in \text{Mod}(C/I)$.

(b) $\text{EXT}^i_C(C/I, G) = 0$ for all $1 \leq i \leq k$.

(c) For $F \in \text{Mod}(C/I)$ the morphisms given in 3.12,
\[
\varphi_{F,G}^i : \text{Ext}^i_{\text{Mod}(C/I)}(F, \underline{\text{Tr}}_G(G)) \to \text{Ext}^i_{\text{Mod}(C)}(\pi_*(F), G),
\]
are isomorphisms for $1 \leq i \leq k$.

Proof. (b) $\Leftrightarrow$ (a). By definition of the derived functor, we have that $\text{EXT}^i_C(C/I, G)$ is the $i$-th homology of the complex of $C/I$-modules
\[
C(C/I, I_0) \to C(C/I, I_1) \to \cdots \to C(C/I, I_k) \to \cdots
\]
But $\overline{\text{Tr}}_x = \mathcal{C}(\mathcal{C}/I, -)$, then we have that $\text{EXT}^i_\mathcal{C}(\mathcal{C}/\mathcal{I}, G) = 0$ for all $1 \leq i \leq k$ if and only if the following complex is exact

$$0 \to \overline{\text{Tr}}_x(G) \to \overline{\text{Tr}}_x(I_0) \to \overline{\text{Tr}}_x(I_1) \to \cdots \to \overline{\text{Tr}}_x(I_k)$$

where each $\overline{\text{Tr}}_x(I_j)$ is an injective $\mathcal{C}/\mathcal{I}$-module.

(a) $\Rightarrow$ (c). Suppose that $0 \to \overline{\text{Tr}}_x(G) \to \overline{\text{Tr}}_x(I_0) \to \overline{\text{Tr}}_x(I_1) \to \cdots \to \overline{\text{Tr}}_x(I_k)$ is the beginning of an injective coreolution of $\overline{\text{Tr}}_x(G)$. We can complete to an injective coreolution: $0 \to \overline{\text{Tr}}_x(G) \to \overline{\text{Tr}}_x(I_0) \to \cdots \to \overline{\text{Tr}}_x(I_k) \to I'_{k+1} \to I'_{k+2} \to \cdots$. By using the construction in 3.12, we get isomorphisms for $1 \leq i \leq k$

$$\varphi^i_{F,G} : \text{Ext}^i_{\text{Mod}(\mathcal{C}/\mathcal{I})}(F, \overline{\text{Tr}}_x(G)) \to \text{Ext}^i_{\text{Mod}(\mathcal{C})}(\pi_*(F), G).$$

(c) $\Rightarrow$ (b). By 3.7(c), we have that $M_C := \frac{\text{Hom}_{\mathcal{C}/\mathcal{I}}(C, -)}{\mathcal{I}(C, -)} \in \text{Mod}(\mathcal{C})$ satisfies that $M_C = \text{Hom}_{\mathcal{C}/\mathcal{I}}(C, -) \circ \pi = \pi_*\left(\text{Hom}_{\mathcal{C}/\mathcal{I}}(C, -)\right)$. Let us fix $i$ such that $1 \leq i \leq k$. We have that $\text{EXT}^i_\mathcal{C}(\mathcal{C}/\mathcal{I}, G) \in \text{Mod}(\mathcal{C}/\mathcal{I})$ is defined for $C \in \mathcal{C}/\mathcal{I}$ as follows. By 3.16, we have that

$$\text{EXT}^i_\mathcal{C}(\mathcal{C}/\mathcal{I}, G)(C) := \text{Ext}^i_{\text{Mod}(\mathcal{C})}\left(\frac{\text{Hom}_{\mathcal{C}/\mathcal{I}}(C, -)}{\mathcal{I}(C, -)}, G\right)$$

$$= \text{Ext}^i_{\text{Mod}(\mathcal{C})}\left(\pi_*\left(\text{Hom}_{\mathcal{C}/\mathcal{I}}(C, -)\right), G\right)$$

$$\simeq \text{Ext}^i_{\text{Mod}(\mathcal{C}/\mathcal{I})}\left(\text{Hom}_{\mathcal{C}/\mathcal{I}}(C, -), \overline{\text{Tr}}_x(G)\right) \quad \text{[hypothesis]}$$

$$= 0 \quad \text{[Hom}_{\mathcal{C}/\mathcal{I}}(C, -) \text{ es projective in } \text{Mod}(\mathcal{C}/\mathcal{I})]$$

Now, we have the following result that is analogous to the previous result.

**Proposition 3.18.** Let $\mathcal{I}$ be an ideal in $\mathcal{C}$, $\pi : C \to \mathcal{C}/\mathcal{I}$ the canonical functor and consider the diagram given in 3.11. Let $G \in \text{Mod}(\mathcal{C})$, and $\cdots \to P_k \to \cdots \to P_1 \to P_0 \to G \to 0$ a projective resolution of $G$. For $1 \leq k \leq \infty$, the following conditions are equivalent.

(a) $P_k/IP_k \to \cdots \to P_1/IP_1 \to P_0/IP_0 \to G/IPG \to 0$ is the beginning of a projective resolution of $G/IPG \in \text{Mod}(\mathcal{C}/\mathcal{I})$.

(b) $\overline{\text{Tor}}^i_\mathcal{C}(\mathcal{C}/\mathcal{I}, G) = 0$ for $1 \leq i \leq k$.

(c) For $F \in \text{Mod}(\mathcal{C}/\mathcal{I})$ the morphisms given in 3.14,

$$\psi^i_{F,G} : \text{Tor}^j_\mathcal{C}(\mathcal{C}/\mathcal{I}, F), G) \to \text{Tor}^j_\mathcal{C}(\mathcal{C}/\mathcal{I}, F, G/IPG),$$

are isomorphisms for $1 \leq i \leq k$.

4. **Property A and restriction of adjunctions**

In this section we will use some of the notions given in 2.4. First we recall the following well-known result (see [2]).

**Proposition 4.1.** Let $\mathcal{C}$ be a variety and $\text{proj}(\mathcal{C})$ the category of finitely generated projective $\mathcal{C}$-modules. Consider the Yoneda functor $\mathcal{Y} : \mathcal{C} \to \text{ proj}(\mathcal{C})$ defined as $\mathcal{Y}(C) := \text{Hom}_{\mathcal{C}}(C, -)$. Then $\mathcal{Y}$ is a contravariant functor which is full, faithful and dense.

Let $\mathcal{C}$ be a Hom-finite $R$-variety, we recall that $\text{mod}(\mathcal{C})$ denotes the full subcategory of $\text{Mod}(\mathcal{C})$ whose objects are the finitely presented functors (see definition 2.5). The aim of this section is to restrict the functors obtained in the last section.
Proposition 4.2. Let $C$ be a Hom-finite $R$-variety, $I$ an ideal in $C$ and $\pi : C \rightarrow C/I$ the canonical functor. Consider the upper part of the diagram given in 3.11.

(a) We can restrict $\pi^*$ to a functor $\pi^* : \text{mod}(C) \rightarrow \text{mod}(C/I)$.
(b) If for every $C \in C$ there exists an epimorphism $\text{Hom}_C(C', -) \rightarrow I(C, -)$, we can restrict the functor $\pi_*$ to a functor $\pi_* : \text{mod}(C/I) \rightarrow \text{mod}(C)$.
(c) If for every $C \in C$ there exists an epimorphism $\text{Hom}_C(C', -) \rightarrow I(C, -)$, we have the adjoint pair

\[
\begin{array}{c}
\text{mod}(C/I) \xrightarrow{\pi^*} \text{mod}(C).
\end{array}
\]

Proof. (a) Let us see that we have $\pi^* : \text{mod}(C) \rightarrow \text{mod}(C/I)$. Indeed, we know that $\pi^* : \text{Mod}(C) \rightarrow \text{Mod}(C/I)$ is right exact. Moreover, by the construction of $\pi^*$ it follows that $\pi^*(\text{Hom}_C(C, -)(C')) = C(-, C') \otimes \text{Hom}_C(C, -) = \text{Hom}_{C/I}(C/C', C'C)$, and thus $\pi^*(\text{Hom}_C(C, -)) = \text{Hom}_{C/I}(C, -)$ (see 2.1). From this we have the restriction $\pi^* : \text{mod}(C) \rightarrow \text{mod}(C/I)$.
(b) Let us see that if $M \in \text{mod}(C/I)$, then $\pi_*(M) \in \text{mod}(C)$. Indeed, let $M \in \text{mod}(C/I)$, then there exists an exact sequence $\text{Hom}_{C/I}(X, -) \rightarrow \text{Hom}_{C/I}(Y, -) \rightarrow M \rightarrow 0$ with $X, Y \in C/I$. Applying $\pi_*$, by 3.7 we have the following exact sequence $\text{Hom}_{C/I}(X, -) \rightarrow \text{Hom}_{C/I}(Y, -) \rightarrow \pi_* (M) \rightarrow 0$. We assert that $\text{Hom}_{C/I}(X, -)$ is finitely presented for each $X \in C$. To prove this we consider

\[
\begin{array}{ccc}
0 & \rightarrow & \text{mod}(C/I) \\
\downarrow & & \downarrow \\
\text{mod}(C) & \xrightarrow{\pi_*} & \text{mod}(C/I)
\end{array}
\]

By hypothesis we have that $\text{mod}(C/I)$ is finitely generated, then by theorem [2, proposition 4.2(c)], we have that $\text{Hom}_{C/I}(X, -)$ is finitely presented. Then by [2, proposition 4.2(b)], we conclude that $\pi_*(M)$ is finitely presented.
(c) Follows from (a) and (b).

\[\square\]

Remark 4.3. Let $C$ be a Hom-finite $R$-variety. We get following commutative diagram

\[
\begin{array}{ccc}
(C/I, \text{mod}(R)) & \xrightarrow{(\pi_1)_*} & (C, \text{mod}(R)) \\
\downarrow \Phi_{C/I} & & \downarrow \Phi_C \\
((C/I)^{op}, \text{mod}(R)) & \xrightarrow{(\pi_2)_*} & (C^{op}, \text{mod}(R))
\end{array}
\]

Consider the functor $\Omega : \text{Ann}(I) \rightarrow \text{Mod}(C/I)$ defined in 3.6, we know that $\Omega$ is an equivalence of categories with inverse $\pi_* : \text{Mod}(C/I) \rightarrow \text{Ann}(I)$. Then we have the following proposition which tells us that we can restrict the functor $\pi_*$.

Proposition 4.4. Let $C$ be a Hom-finite $R$-variety and $I$ an ideal in $C$ such that for each $C \in C$ there exists an epimorphism $\text{Hom}_C(C', -) \rightarrow I(C, -)$. Then, there exists an equivalence $\pi_* |_{\text{mod}(C/I)} : \text{mod}(C/I) \rightarrow \text{mod}(C) \cap \text{Ann}(I)$.

Proof. It is straightforward. \[\square\]

Because of the last proposition we are now interested in ideals that satisfy the hypothesis of 4.4. So we have the following definition.

Definition 4.5. Let $C$ be a preadditive category. We say that an ideal $I$ satisfies the property (A) if for every $C \in C$ there exists epimorphisms $\text{Hom}_C(X, -) \rightarrow I(C, -) \rightarrow 0$ and $\text{Hom}_C(-, Y) \rightarrow I(-, C) \rightarrow 0$. 
The following result tells us that if the ideal $\mathcal{I}$ satisfies property $A$, then the category $\mathcal{C}/\mathcal{I}$ is dualizing provided $\mathcal{C}$ is also dualizing.

**Proposition 4.6.** Let $\mathcal{C}$ be a dualizing $R$-variety and $\mathcal{I}$ an ideal which satisfies property $A$. Then $\mathcal{C}/\mathcal{I}$ is a dualizing $R$-variety and the following diagram

$$\begin{array}{ccc}
\text{mod}(\mathcal{C}/\mathcal{I}) & \xrightarrow{(\pi_1)_*} & \text{mod}(\mathcal{C}) \\
\text{mod}(\text{mod}(\mathcal{C}/\mathcal{I})^{\text{op}}) & \xrightarrow{(\pi_2)_*} & \text{mod}(\mathcal{C}^{\text{op}})
\end{array}$$

is commutative.

*Proof.* Let $\mathbb{D}_C : \text{mod}(\mathcal{C}) \longrightarrow \text{mod}(\mathcal{C}^{\text{op}})$ be the duality. It is enough to see that we have a functor $\mathbb{D}_C : \text{mod}(\mathcal{C}) \cap \text{Ann}(\mathcal{I}) \longrightarrow \text{mod}(\mathcal{C}^{\text{op}}) \cap \text{Ann}(\mathcal{I}^{\text{op}})$. Indeed, let $M \in \text{mod}(\mathcal{C}) \cap \text{Ann}(\mathcal{I})$ and consider $\mathbb{D}_C(M) \in \text{mod}(\mathcal{C}^{\text{op}})$. Let $f^{\text{op}} \in \mathcal{I}^{\text{op}}(B^{\text{op}}, A^{\text{op}})$ then $f \in \mathcal{I}(A, B)$. Therefore, $\mathbb{D}_C(M)(f^{\text{op}}) := \text{Hom}_R(M(f), I(R/r)) = 0$ since $M(f) = 0$. Then $\mathcal{C}/\mathcal{I}$ is dualizing and $\mathbb{D}_{\mathcal{C}/\mathcal{I}} \simeq (\mathbb{D}_C)_{\text{mod}(\mathcal{C}) \cap \text{Ann}(\mathcal{I})}$. This way we have proved that the required diagram is commutative. \hfill $\Box$

The proof of the following result is similar to the one given in [14, Proposition 2.7].

**Proposition 4.7.** Let $\mathcal{C}$ be a dualizing $R$-variety and $\mathcal{I}$ an ideal which satisfies property $A$. Let $\pi_1 : \mathcal{C} \longrightarrow \mathcal{C}/\mathcal{I}$ be the canonical functor, then we can restrict the diagram given in 3.11 to the finitely presented modules

$$\begin{array}{ccc}
\text{mod}(\mathcal{C}/\mathcal{I}) & \xrightarrow{\pi_1} & \text{mod}(\mathcal{C})
\end{array}$$

*Proof.* The proof given in [14, Proposition 2.7] works in this setting. \hfill $\Box$

Now, we give some examples where the property $A$ holds. We recall that the (Jacobson) *radical* of an additive category $\mathcal{C}$ is the two-sided ideal $\text{rad}_C$ in $\mathcal{C}$ defined by the formula $\text{rad}_C(X, Y) = \{ h \in \mathcal{C}(X, Y) \mid 1_X - gh \text{ is invertible for any } g \in \mathcal{C}(Y, X) \}$ for all objects $X$ and $Y$ of $\mathcal{C}$.

**Proposition 4.8.** Let $\mathcal{C}$ be a dualizing $R$-variety and $\mathcal{I} = \text{rad}(\mathcal{C})(-,-)$ the radical ideal. Then $\mathcal{I}$ satisfies the property $A$.

*Proof.* See [9, Prop. 2.10 (2)] in p. 128. \hfill $\Box$

In order to give more examples of ideals satisfying the property $A$ we recall the following definition.

**Definition 4.9.** Let $\mathcal{C}$ be small abelian $R$-category with the following properties.

(a) There is only a finite number of nonisomorphic simple objects in $\mathcal{C}$.

(b) Every object in $\mathcal{C}$ is of finite length.

(It is well known that under this hypothesis $\mathcal{C}$ is a Krull-Schmidt category). It is said that $\mathcal{C}$ is of *finite representation type* if $\mathcal{C}$ has only a finite number of non-isomorphic indecomposable objects (see [3, p. 12]).

Following the notation in [3, p. 3], an object $M \in \text{Mod}(\mathcal{C})$ is *finite* if it is both noetherian an artinian. That is, if $M$ satisfies the ascending and descending chain condition on submodules.

**Proposition 4.10.** Let $\mathcal{C}$ be of finite representation type as in Definition 4.9. Then every ideal $\mathcal{I}(-,-)$ in $\mathcal{C}$ satisfies property $A$. 

---

**HOMOLOGICAL THEORY OF $K$-IDEMPOTENT IDEALS IN DUALIZING VARIETIES**

11

...
Proof. By [3, 3.6 (a) and (b)], we have that $\text{Mod}(\mathcal{C})$ and $\text{Mod}(\mathcal{C}^{op})$ are locally finite. By [3, 3.1], we have that each $\text{Hom}_\mathcal{C}(\cdot, -)$ and $\text{Hom}_\mathcal{C}(-, \cdot)$ are finite for each $\mathcal{C} \in \mathcal{C}$. Since the subcategory of finite modules is a Serre subcategory, we have that the submodules of $\text{Hom}_\mathcal{C}(\cdot, -)$ and $\text{Hom}_\mathcal{C}(-, \cdot)$ are finite. In particular, each $\mathcal{I}(\cdot, -)$ and $\mathcal{I}(-, \cdot)$ are finite. By [3, Corollary 1.7], we have that $\mathcal{I}(\cdot, -)$ and $\mathcal{I}(-, \cdot)$ are finitely generated. Then $\mathcal{I}$ satisfies property $A$. □

Corollary 4.11. If $\Lambda$ is an artin algebra of finite representation type, then every ideal in $\mathcal{C} = \text{mod}(\Lambda)$ satisfies property $A$.

We recall the following notions. Let $\mathcal{A}$ be an arbitrary category and $\mathcal{B}$ a full subcategory in $\mathcal{A}$. The full subcategory $\mathcal{B}$ is contravariantly finite if for every $A \in \mathcal{A}$ there exists a morphism $f_A : B \to A$ with $B \in \mathcal{B}$ such that if $f' : B' \to A$ is other morphism with $B' \in \mathcal{B}$, then there exist a morphism $g : B' \to B$ such that $f' = f_A \circ g$. Dually, is defined the notion of covariantly finite. We say that $\mathcal{B}$ is functorially finite if $\mathcal{B}$ is contravariantly finite and covariantly finite.

**Proposition 4.12.** Let $\mathcal{C}$ be an additive category and $\mathcal{X}$ an additive full subcategory of $\mathcal{C}$. Let $\mathcal{I} = \mathcal{I}_\mathcal{X}$ be the ideal of morphisms in $\mathcal{C}$ which factor through some object in $\mathcal{X}$. Then $\mathcal{I}$ satisfies property $A$ if and only if $\mathcal{X}$ is functorially finite in $\mathcal{C}$.

Proof. (⇐). Suppose that $\mathcal{X}$ is contravariantly finite. Then for each $\mathcal{C} \in \mathcal{C}$, there exists a right $\mathcal{X}$-approximation $f_C : X \to C$. Thus, we have a morphism $\text{Hom}_\mathcal{C}(-, f_C) : \text{Hom}_\mathcal{C}(-, X) \to \text{Hom}_\mathcal{C}(-, C)$.

We assert that $\text{Im}(\text{Hom}_\mathcal{C}(-, f_C)) = \mathcal{I}(-, C)$. Indeed, let $C' \in \mathcal{C}$ and $\alpha \in \mathcal{I}(C', C)$. Since $\mathcal{I} = \mathcal{I}_\mathcal{X}$, there exists $X' \in \mathcal{X}$ and morphisms $\alpha' : C' \to X'$ and $\alpha'' : X' \to C$ such that $\alpha = \alpha'' \alpha'$. Since $f_C$ is an $\mathcal{X}$-approximation, there exists $\beta : X' \to X$ such that $\alpha'' = f_C \beta$. Then $\alpha = \alpha'' \alpha' = f_C \beta \alpha'$. We then have that $\alpha \in \text{Im}(\text{Hom}_\mathcal{C}(-, f_C))$. Now, for $\gamma : C' \to X$ we have that $(\text{Hom}_\mathcal{C}(-, f_C))_{\mathcal{C}}(\gamma) = f_C \gamma \in \mathcal{I}(C', C)$ since $f_C \gamma$ factors through $X \in \mathcal{X}$ and $\mathcal{I} = \mathcal{I}_\mathcal{X}$, proving that $\text{Im}(\text{Hom}_\mathcal{C}(-, f_C)) = \mathcal{I}(-, C)$. Thus, there exists an epimorphism $\text{Hom}_\mathcal{C}(-, f_C) : \text{Hom}_\mathcal{C}(-, X) \to \mathcal{I}(-, C)$. Similarly, we can prove that if $\mathcal{X}$ is covariantly finite, then there exists and epimorphism $\text{Hom}_\mathcal{C}(\cdot, -) \to \mathcal{I}(\cdot, -) \to 0$ for each $\mathcal{C} \in \mathcal{C}$. Therefore, we have that if $\mathcal{X}$ is functorially finite, then $\mathcal{I}$ satisfies property $A$.

The other implication is similar and the details are left to the reader. □

Now let us consider the transfinite radical of $\mathcal{C}$ denoted by $\text{rad}_\mathcal{C}^\infty(-, -)$ (see [20] for details).

**Proposition 4.13.** Let $\mathcal{C}$ be $\text{Hom}$-finite $R$-variety and suppose that $\text{rad}_\mathcal{C}^\infty(-, -) = 0$. Let $\mathcal{I}$ be an idempotent ideal in $\mathcal{C}$ and let $\mathcal{X} = \{ X \in \mathcal{C} \mid 1_X \in \mathcal{I}(X, X) \}$. If $\mathcal{X}$ is functorially finite, then $\mathcal{I}$ satisfies property $A$.

Proof. Since $R$ is artinian and $\mathcal{C}$ is a $\text{Hom}$-finite $R$-variety, we have by [20], that $\mathcal{C}$ is Krull-Schmidt with local d.c.c on ideals (see [20, Definition 5]). By [20, Corollary 10], we have that $\mathcal{I} = \mathcal{I}_\mathcal{X}$ where $\mathcal{X} = \{ X \in \mathcal{C} \mid 1_X \in \mathcal{I}(X, X) \}$. Now, if $\mathcal{X}$ is functorially finite, by 4.12, we have that $\mathcal{I}$ satisfies property $A$. □

**Example 4.14.** Let $\mathcal{C} = \text{mod}(\Lambda)$ where $\Lambda$ is a finite dimensional $K$-algebra over an algebraically closed field. If $\Lambda$ is a standard selfinjective algebra of domestic representation type or $\Lambda$ is a special biserial algebra of domestic representation type, then $\text{rad}_\mathcal{C}^\infty(-, -) = 0$ (see [19]). We recall that $\Lambda$ is of domestic representation type if there is a natural number $N$ such that for each dimension $d$, all but finitely many indecomposable modules of dimension $d$ belong to at most $N$ one-parameter families.
5. \(k\) -idempotent ideals

In this section we will work in preadditive categories as well as in dualizing \(R\)-varieties. So, we will say explicitly in which context we are working on.

We introduce the definition of \(k\)-idempotent ideal in \(\mathcal{C}\), which is the analogous to the one given by Aulander-Platzeck-Todorov in [4] for the case of artin algebras. In order to do this we consider the morphisms given in 3.12. Then for \(F,F'\in \text{Mod}(\mathcal{C}/\mathcal{I})\) we have canonical morphisms

\[
\varphi^i_{F,\pi_*(F')} : \text{Ext}^i_{\text{Mod}(\mathcal{C}/\mathcal{I})}(F,F') \longrightarrow \text{Ext}^i_{\text{Mod}(\mathcal{C})}(\pi_*(F),\pi_*(F')).
\]

**Definition 5.1.** Let \(\mathcal{C}\) be a preadditive category and \(\mathcal{I}\) an ideal in \(\mathcal{C}\).

(a) We say that \(\mathcal{I}\) is **\(k\)-idempotent** if

\[
\varphi^i_{F,\pi_*(F')} : \text{Ext}^i_{\text{Mod}(\mathcal{C}/\mathcal{I})}(F,F') \longrightarrow \text{Ext}^i_{\text{Mod}(\mathcal{C})}(\pi_*(F),\pi_*(F'))
\]

is an isomorphism for all \(F,F'\in \text{Mod}(\mathcal{C}/\mathcal{I})\) and for all \(0 \leq i \leq k\).

(b) We say that \(\mathcal{I}\) is **strongly idempotent** if

\[
\varphi^i_{F,\pi_*(F')} : \text{Ext}^i_{\text{Mod}(\mathcal{C}/\mathcal{I})}(F,F') \longrightarrow \text{Ext}^i_{\text{Mod}(\mathcal{C})}(\pi_*(F),\pi_*(F'))
\]

is an isomorphism for all \(F,F'\in \text{Mod}(\mathcal{C}/\mathcal{I})\) and for all \(0 \leq i < \infty\).

We note that we have defined \(k\)-idempotent ideal in \(\text{Mod}(\mathcal{C})\), but this concept can also be defined in the category of finitely presented \(\mathcal{C}\)-modules \(\text{mod}(\mathcal{C})\). Next, we have a characterization of \(k\)-idempotent ideals in terms of the vanishing of certain derived functors.

**Proposition 5.2.** Let \(\mathcal{C}\) be a preadditive category, \(\mathcal{I}\) an ideal in \(\mathcal{C}\) and \(1 \leq i \leq k\). The following conditions are equivalent.

(a) \(\mathcal{I}\) is \(k\)-idempotent

(b) \(\varphi^i_{F,\pi_*(F')} : \text{Ext}^i_{\text{Mod}(\mathcal{C}/\mathcal{I})}(F,F') \longrightarrow \text{Ext}^i_{\text{Mod}(\mathcal{C})}(\pi_*(F),\pi_*(F'))\) is an isomorphism for all \(F,F'\in \text{Mod}(\mathcal{C}/\mathcal{I})\) and for all \(0 \leq i \leq k\).

(c) \(\text{EXT}^i_{\mathcal{C}/\mathcal{I}}(\mathcal{C}/\mathcal{I},F' \circ \pi) = 0\) for \(1 \leq i \leq k\) and for \(F'\in \text{Mod}(\mathcal{C}/\mathcal{I})\).

(d) \(\text{EXT}^i_{\mathcal{C}/\mathcal{I}}(\mathcal{C}/\mathcal{I},\mathcal{J} \circ \pi) = 0\) for \(1 \leq i \leq k\) and for each \(\mathcal{J}\in \text{Mod}(\mathcal{C}/\mathcal{I})\) which is injective.

**Proof.** The equivalences between (a), (b) and (c) are straightforward using 3.17, and (c) \(\Rightarrow\) (d) is trivial.

(d) \(\Rightarrow\) (c). Let us see by induction on \(i\) that \(\text{EXT}^i_{\mathcal{C}/\mathcal{I}}(\mathcal{C}/\mathcal{I},F' \circ \pi) = 0\) for all \(F'\in \text{Mod}(\mathcal{C}/\mathcal{I})\). Let us suppose that \(i = 1\) and \(F'\in \text{Mod}(\mathcal{C}/\mathcal{I})\). Consider the exact sequence

\[
0 \longrightarrow F' \xrightarrow{\mu} I \xrightarrow{\delta} F' \longrightarrow 0
\]

where \(I\) is an injective \(\mathcal{C}\)-module. Since \(\text{Tr}_{\mathcal{C}/\mathcal{I}} \simeq \mathcal{C}(\mathcal{F}_\mathcal{I}^-,-)\), and by the proof of the adjunction 3.8, we have that \(\eta : 1_{\text{Mod}(\mathcal{C}/\mathcal{I})} \longrightarrow \text{Tr}_{\mathcal{C}/\mathcal{I}} \circ \pi_*\) is an isomorphism. Then we have the following commutative and exact diagram

\[
\begin{array}{ccc}
0 & \longrightarrow & \mathcal{C}(\mathcal{F}_\mathcal{I}^-,F' \circ \pi) \\
\downarrow & & \downarrow \\
0 & \longrightarrow & \mathcal{C}(\mathcal{F}_\mathcal{I}^-,\mathcal{I} \circ \pi) \\
\downarrow & & \downarrow \\
0 & \longrightarrow & \mathcal{C}(\mathcal{F}_\mathcal{I}^-,\mathcal{F}' \circ \pi) \\
\downarrow & & \downarrow \\
0 & \longrightarrow & \text{EXT}^1_{\mathcal{C}/\mathcal{I}}(\mathcal{C}/\mathcal{I},F' \circ \pi)
\end{array}
\]

where the vertical morphisms are isomorphisms. We conclude that \(\delta = 0\). Then we have the following exact sequence

\[
0 \longrightarrow \text{EXT}^1_{\mathcal{C}/\mathcal{I}}(\mathcal{C}/\mathcal{I},F' \circ \pi) \longrightarrow \text{EXT}^1_{\mathcal{C}/\mathcal{I}}(\mathcal{C}/\mathcal{I},\mathcal{I} \circ \pi) \longrightarrow \text{EXT}^1_{\mathcal{C}/\mathcal{I}}(\mathcal{C}/\mathcal{I},\mathcal{F}' \circ \pi)
\]
By hypothesis we have that $\text{EXT}^i_C(C/I, I \circ \pi) = 0$, then we get that $\text{EXT}^i_C(C/I, F' \circ \pi) = 0$, proving the case $i = 1$.

Now, let us suppose that $\text{EXT}^{i-1}_C(C/I, N \circ \pi) = 0$ for all $N \in \text{Mod}(C/I)$. Let $F' \in \text{Mod}(C/I)$. From the long exact homology sequence we have the exact sequence

$$\text{EXT}^{i-1}_C(C/I, F' \circ \pi) \rightarrow \text{EXT}^i_C(C/I, F' \circ \pi) \rightarrow \text{EXT}^i_C(C/I, I \circ \pi).$$

Since $\frac{F'}{\pi} \in \text{Mod}(C/I)$, by induction we have that $\text{EXT}^{i-1}_C(C/I, \frac{F'}{\pi} \circ \pi) = 0$ and by hypothesis we have that $\text{EXT}^i_C(C/I, I \circ \pi) = 0$, then we conclude that $\text{EXT}^i_C(C/I, F' \circ \pi) = 0$, therefore, proving the proposition. □

The following proposition tells us that we can restrict the result given in 5.2 to the category of finitely presented modules.

**Proposition 5.3.** Let $C$ be a dualizing $R$-variety, $\mathcal{I}$ an ideal which satisfies property $A$ and $1 \leq i \leq k$. The following are equivalent.

(a) $\mathcal{I}$ is $k$-idempotent.

(b) $\varphi_{F, \pi_\ast}(F') : \text{Ext}^i_{\text{Mod}(C/I)}(F, F') \rightarrow \text{Ext}^i_{\mathcal{I}}((\pi_1)_\ast(F), (\pi_1)_\ast(F'))$ is an isomorphism for all $F, F' \in \text{mod}(C/I)$ and for all $0 \leq i \leq k$.

(c) $\text{EXT}^i_C(C/I, F' \circ \pi_1) = 0$ for $1 \leq i \leq k$ and for $F' \in \text{mod}(C/I)$.

(d) $\text{EXT}^i_C(C/I, J \circ \pi_1) = 0$ for $1 \leq i \leq k$ and for each $J \in \text{mod}(C/I)$ which is injective.

**Proof.** By 4.7, we can restrict the diagram given in 3.11 to the category of finitely presented modules, then 5.2 holds for the case of finitely presented modules. □

Now, we will work in the category $\text{Mod}(C^{op})$ and we will consider the corresponding canonical morphisms analogous to $\varphi_{F, \pi_\ast}(F')$, which we will denote by

$$\delta_{F, \pi_\ast}(F') : \text{Ext}^i_{\text{Mod}(C/I)^{op}}(F, F') \rightarrow \text{Ext}^i_{\mathcal{I}}((\pi_2)_\ast(F), (\pi_2)_\ast(F'))$$

for all $F, F' \in \text{mod}(C/I)^{op}$ and for all $0 \leq i \leq k$, where $\pi_2 : C^{op} \rightarrow C^{op}/I^{op}$ is the projection. Therefore, we have that the result 5.2 holds for the category $\text{Mod}(C^{op})$.

**Proposition 5.4.** Let $C$ be a dualizing $R$-variety and $\mathcal{I}$ an ideal which satisfies property $A$. Then $\mathcal{I}$ is $k$-idempotent in $C$ if and only if $I^{op}$ is $k$-idempotent in $C^{op}$.

**Proof.** Suppose that $\mathcal{I}$ is $k$-idempotent in $C$. Let us see that

$$\delta_{F, \pi_\ast}(F') : \text{Ext}^i_{\text{Mod}(C/I)^{op}}(F, F') \rightarrow \text{Ext}^i_{\mathcal{I}}((\pi_2)_\ast(F), (\pi_2)_\ast(F'))$$

is an isomorphism for all $F, F' \in \text{mod}(C/I)^{op}$ and for all $0 \leq i \leq k$. By the proposition 5.3 it is enough to see that $\text{EXT}^i_{C^{op}}(C^{op}/I^{op}, F' \circ \pi_2) = 0$ for $1 \leq i \leq k$ and for $F' \in \text{mod}(C^{op}/I^{op})$. Indeed, for $C \in C^{op}/I^{op}$ we have that

$$\text{EXT}^i_{C^{op}}(C^{op}/I^{op}, F' \circ \pi_2)(C) =$$

$$= \text{Ext}^i_{\text{mod}(C^{op})} \left( \frac{\text{Hom}_C(-, C)}{\mathcal{I}(-, C)} \right)(F')$$

$$= \text{Ext}^i_{\text{mod}(C^{op})} \left( (\pi_2)_\ast \left( \frac{\text{Hom}_C(-, C)}{\mathcal{I}(-, C)} \right) \right)$$

$$\simeq \text{Ext}^i_{\text{mod}(C)} \left( \frac{D_C^{-1}((\pi_2)_\ast(F'))}{D_C^{-1}((\pi_2)_\ast(\text{Hom}_C(-, C)))} \right)$$

**[Diagram in 4.6]**

$$\simeq \text{Ext}^i_{\text{mod}(C/\mathcal{I})} \left( \frac{D_C^{-1}(F')}{D_C^{-1}(\text{Hom}_C/\mathcal{I}(-, C))} \right)$$

$$= 0$$

**[Diagram in 4.6]**

$D_C^{-1}(\text{Hom}_C/\mathcal{I}(-, C))$ is injective in $\text{mod}(C/\mathcal{I})$. □
In the third equality we are using $\text{Ext}^i_{\text{mod}(C)}(X,Y) \simeq \text{Ext}^i_{\text{mod}(C^{op})}(D_C(Y),D_C(X))$

for $X,Y \in \text{mod}(C)$. Hence, $\text{EXT}^i_{\text{mod}(C^{op}/I^{op}),F'}(F \circ \pi_2) = 0$ for $1 \leq i \leq k$ and for $F' \in \text{mod}(C^{op}/I^{op})$, proving by 5.2 that $I^{op}$ is $k$-idempotent. The other implication is similar.

Now, consider the morphism given in 3.14. For $G = F' \circ \pi_1$ with $F' \in \text{Mod}(C/I)$ we have that $G/I^G \simeq F'$. Then for $F \in \text{Mod}((C/I)^{op})$ and $F' \in \text{Mod}(C/I)$ we have the morphism $\psi^i_{F,(\pi_1),1}(F') : \text{Tor}^C_i(F \circ \pi_2, F' \circ \pi_1) \rightarrow \text{Tor}^{C/I}_i(F,F')$. The proof of the following two propositions are similar to 5.2 and 5.3.

**Proposition 5.5.** Let $C$ be a preadditive category, $I$ an ideal in $C$ and $1 \leq i \leq k$. The following conditions are equivalent.

(a) $\psi^i_{F,(\pi_1),1}(F') : \text{Tor}^C_i(F \circ \pi_2, F' \circ \pi_1) \rightarrow \text{Tor}^{C/I}_i(F,F')$ is an isomorphism for all $1 \leq i \leq k$, $F \in \text{Mod}((C/I)^{op})$ and $F' \in \text{Mod}(C/I)$.

(b) $\text{TOR}^C_i(C/I,F' \circ \pi_1) = 0$ for $1 \leq i \leq k$ and for all $F' \in \text{Mod}(C/I)$.

(c) $\text{TOR}^C_i(C/I,P \circ \pi_1) = 0$ for $1 \leq i \leq k$ and for all $P \in \text{Mod}(C/I)$ that is projective.

This result can be restricted to the category of finitely presented modules.

**Proposition 5.6.** Let $C$ be a dualizing $R$-variety, $I$ an ideal which satisfies property $A$ and $1 \leq i \leq k$. The following are equivalent.

(a) $\psi^i_{F,(\pi_1),1}(F') : \text{Tor}^C_i(F \circ \pi_2, F' \circ \pi_1) \rightarrow \text{Tor}^{C/I}_i(F,F')$ is an isomorphism for all $1 \leq i \leq k$, $F \in \text{mod}(C/I)^{op}$ and $F' \in \text{mod}(C/I)$.

(b) $\text{TOR}^C_i(C/I,F' \circ \pi_1) = 0$ for $1 \leq i \leq k$ and for all $F' \in \text{mod}(C/I)$.

(c) $\text{TOR}^C_i(C/I,Hom_{C/I}(C,-) \circ \pi_1) = 0$ for $1 \leq i \leq k$ and for all $Hom_{C/I}(C,-) \in \text{mod}(C/I)$.

Now, in order to relate the functors $\text{EXT}^C_i(C/I,-)$ and $\text{TOR}^C_i(C/I,-)$ we need the Auslander-Reiten duality. We have the following result due to Auslander and Reiten.

**Proposition 5.7.** Let $C$ be a dualizing $R$-variety and $M \in \text{mod}(C)$. Then there is an isomorphism of contravariant functors from $\text{mod}(C^{op})$ to $\text{mod}(R)$

$$D_{\text{mod}(C^{op})}(\text{Tor}^C_i(-,M)) \simeq \text{Ext}^i_{\text{mod}(C^{op})}(-,D_C(M)).$$

Now, we have the following result that characterizes $k$-idempotent ideals in terms of the morphisms $\psi^i_{F,(\pi_1),1}(F')$.

**Proposition 5.8.** Let $C$ be a dualizing $R$-variety and $I$ an ideal which satisfies property $A$. Then $I$ is $k$-idempotent if and only if $\psi^i_{F,(\pi_1),1}(F')$ is an isomorphism for every $F \in \text{mod}((C/I)^{op})$ and for every $F' \in \text{mod}(C/I)$.

*Proof.* ($\Rightarrow$). Let $F' \in \text{mod}(C/I)$. Let us see that $\text{TOR}^C_i(C/I,F' \circ \pi_1) = 0$ for $1 \leq i \leq k$. Indeed, by using 5.7 and the fact that $I$ is $k$-idempotent, for $C \in C/I$ we have

$$\text{TOR}^C_i(C/I,F' \circ \pi_1)(C) \simeq \text{Hom}_R\left(\text{Ext}^i_{\text{mod}(C/I)}(F',D^{-1}_{C/I}(\text{Hom}_{C/I}(-,C))),E\right) = 0,$$

where the last equality is because $\text{Ext}^i_{\text{mod}(C/I)}(F',D^{-1}_{C/I}(\text{Hom}_{C/I}(-,C))) = 0$ since the functor $D^{-1}_{C/I}(\text{Hom}_{C/I}(-,C))$ is injective in $\text{mod}(C/I)$. Therefore, by 5.6 we have that $\psi^i_{F,(\pi_1),1}(F')$ is isomorphism. The other implication is similar. □
We finish this section with the following result, which is analogous to proposition 1.3 in [4].

**Corollary 5.9.** Let $C$ be a dualizing $R$-variety, $\mathcal{I}$ an ideal which satisfies property $A$. For $1 \leq i \leq k$, the following are equivalent.

(a) $\mathcal{I}$ is $i$-idempotent.

(b) $\varphi_{i,(\pi_1)_{\ast}(F'),F'} : \text{Ext}^i_{\text{mod}(C/\mathcal{I})}(F,F') \to \text{Ext}^i_{\text{mod}(C)}((\pi_1)_{\ast}(F),(\pi_1)_{\ast}(F'))$ is an isomorphism for all $F,F' \in \text{mod}(C/\mathcal{I})$ and for all $0 \leq i \leq k$.

(c) $\text{EXT}_{i}^{\ast}(C/\mathcal{I}, F' \circ \pi_1) = 0$ for all $1 \leq i \leq k$ and for all $F' \in \text{mod}(C/\mathcal{I})$.

(d) $\text{EXT}_{i}^{\ast}(C/\mathcal{I}, J \circ \pi_1) = 0$ for all $1 \leq i \leq k$ and for all $J \in \text{mod}(C/\mathcal{I})$ which is injective.

(e) $\psi_{i,(\pi_1)_{\ast}(F'),F'} : \text{Tor}_{i}^{\ast}(F \circ \pi_1,F') \to \text{Tor}_{i}^{C/\mathcal{I}}(F,F')$ is an isomorphism for all $1 \leq i \leq k$ and $F,F' \in \text{mod}(C/\mathcal{I})$ and $F' \in \text{mod}(C/\mathcal{I})$.

(f) $\text{Tor}_{i}^{\ast}(C/\mathcal{I}, F' \circ \pi_1) = 0$ for all $1 \leq i \leq k$ and all $F' \in \text{mod}(C/\mathcal{I})$.

(g) $\text{Tor}_{i}^{\ast}(C/\mathcal{I}, \text{Hom}_{C/\mathcal{I}}(C, -) \circ \pi_1) = 0$ for all $1 \leq i \leq k$ and for all $\text{Hom}_{C/\mathcal{I}}(C, -) \in \text{mod}(C/\mathcal{I})$.

**Proof.** It follows from 5.3, 5.8 and 5.6. \qed

6. Projective resolutions of $k$-idempotent ideals

In this section we will work in preadditive categories as well as in dualizing $R$-varieties. So, we will say explicitly in which context we are working on.

In the previous section we characterized $k$-idempotent ideals in terms of the projective resolutions of all $C/\mathcal{I}$-modules. We will show here that knowing the projective resolutions of $\mathcal{I}(C, -)$ for all $C \in \mathcal{C}$ is enough to determine for which $k$ the ideal $\mathcal{I}$ is $k$-idempotent.

Next, we present a generalization of the so-called dual basis lemma in classical ring theory (see [10]).

**Proposition 6.1.** (Dual basis Lemma) Let $\mathcal{C}$ be a preadditive category. An object $P \in \text{mod}(\mathcal{C})$ is projective if and only if there exists a family of morphisms $\{\beta_j : P \to \text{Hom}_C(C_j, -)\}_{j \in J}$ and a family $\{x_j\}_{j \in J}$ with $x_j \in P(C_j)$ such that for all $X \in \mathcal{C}$ and for every $a \in P(X)$ there exists a finite subset $J_{X,a} \subseteq J$ such that

$$a = \sum_{j \in J_{X,a}} P(\beta_j)(x_j).$$

**Proof.** ($\Rightarrow$) Since $\{\text{Hom}_C(C, -)\}_{C \in \mathcal{C}}$ is a generating set of projective modules, there exists an epimorphism $f : \bigoplus_{j \in J} \text{Hom}_C(C_j, -) \to P$. We get the morphisms $\eta_j := fu_j : \text{Hom}_C(C_j, -) \to P$, where $u_j : \text{Hom}_C(C_j, -) \to \bigoplus_{j \in J} \text{Hom}_C(C_j, -)$ is the $j$-th inclusion. By Yoneda lemma, $fu_j$ corresponds to one element $x_j := [\eta_j]_{p(C_j)} \in P(C_j)$; furthermore, $\eta_j : \text{Hom}_C(C_j, -) \to P$ is such that $[\eta_j]_X(a) = P(a)(x_j)$ for all $X \in \mathcal{C}$.

Now, let $\gamma_j : (\gamma_j)_{j \in J} \in \bigoplus_{j \in J} \text{Hom}_C(C_j, X)$. Then, there exists a finite subset $J_{X}$ of $J$ such that $\gamma_j = 0$ if $j \notin J_{X}$. We know that $f_X : \bigoplus_{j \in J} \text{Hom}_C(C_j, X) \to P(X)$ is defined for $\gamma = (\gamma_j)_{j \in J} \in \bigoplus_{j \in J} \text{Hom}_C(C_j, X)$ as follows: $f_X((\gamma_j)_{j \in J}) = \sum_{j \in J} [\eta_j]_X(\gamma_j) = \sum_{j \in J_{X}} P(\gamma_j)(x_j)$. Now, since $P$ is projective we have that $f_X$ is a split epimorphism, and then there exists $g : P \to \bigoplus_{j \in J} \text{Hom}_C(C_j, -)$ such that $fg = 1_P$. Let us consider the projection $\pi_j : \bigoplus_{j \in J} \text{Hom}_C(C_j, -) \to \text{Hom}_C(C_j, -)$, then we have $\beta_j := \pi_j g : P \to \text{Hom}_C(C_j, -)$. Then for $X \in \mathcal{C}$ we have that $g_X : P(X) \to \bigoplus_{j \in J} \text{Hom}_C(C_j, X)$ is defined as follows:

$$g_X(a) = (\beta_j)(x_j) a \in P(X)$$
where \([\beta_j]_X(a) : C_j \rightarrow X\). Since \(g_X(a) \in \bigoplus_{j \in J} \text{Hom}_C(C_j, X)\), there exists a finite subset \(J_{X,a} \subseteq J\) such that \([\beta_j]_X(a) = 0\) if \(j \notin J_{X,a}\). Then
\[
a = f_X(g_X(a)) = f_X\left(\sum_{j \in J_{X,a}} P([\beta_j]_X(a))(x_j)\right).
\]
The other implication is similar and is left to the reader.

We recall that given a family of objects \(\mathcal{F} = \{F_i\}_{i \in I}\) and \(M \in \text{Mod}(\mathcal{C})\), in 3.1 we defined the trace in \(M\) of the family \(\mathcal{F}\) which is denoted by \(\text{Tr}_\mathcal{F}(M)\). We have the following description of the trace.

**Remark 6.2.** Let \(\mathcal{F} = \{F_i\}_{i \in I}\) be a family in \(\text{Mod}(\mathcal{C})\). For each \(N \in \text{Mod}(\mathcal{C})\) and \(X \in \mathcal{C}\) we have that \(\text{Tr}_\mathcal{F}(N)(X) = \sum_{f \in \text{Hom}(F_i,N)} \text{Im}(f_X)\). In the case \(\mathcal{F} = \{F\}\) is just one object, we will write \(\text{Tr}_F N\).

We recall the following definition (see section 1.3 in [16]).

**Definition 6.3.** Let \(\mathcal{C}\) be a preadditive category and \(\mathcal{F} = \{F_i\}_{i \in I}\) a family of objects in \(\text{Mod}(\mathcal{C})\). For each \(C \in \mathcal{C}\) consider the \(C\)-submodule \(\text{Tr}_\mathcal{F}(\text{Hom}_C(C,-))(C)\) of \(\text{Hom}_C(C,-)\). We define the subfunctor \(\text{Tr}_\mathcal{F} C\) of \(\text{Hom}_C(-,-) : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \text{Ab}\) as follows:
\[
(\text{Tr}_\mathcal{F}C)(C,C') := \text{Tr}_\mathcal{F}(\text{Hom}_C(C,-))(C')
\]
for all \(C,C' \in \mathcal{C}\). This ideal will be called trace ideal. In the case that \(\mathcal{F} = \{P\}\) with \(P\) a projective \(\mathcal{C}\)-module, we will write \(\text{Tr}_P C\).

It is easy to see that \(\text{Tr}_\mathcal{F}C(-,-)\) is a subfunctor of \(\text{Hom}_C(-,-)\) and thus an ideal.

**Proposition 6.4.** Let \(\mathcal{C}\) be a preadditive category and let \(P\) be a projective \(\mathcal{C}\)-module. Then \(\text{Tr}_P C\) defines an idempotent ideal of \(C\).

**Proof.** By using 6.1, we can adapt the classical proof given [10, Proposition 2.40]; or see Lemma 2.5 in [16].

Since \(\text{Tr}_P C\) is an ideal, we can define \((\text{Tr}_P C \cdot F)(X) := \sum_{f \in \mathcal{U}_{C,X}(\text{Tr}_P C)(X)} \text{Im}(f_X)\) (see 3.13). Now, we have the following result which is a generalization of the basic result in modules over a ring \(R\).

**Proposition 6.5.** Let \(\mathcal{C}\) be a preadditive category, \(F \in \text{Mod}(\mathcal{C})\) and \(\text{Tr}_P C\) the trace ideal. Then \(\text{Tr}_P C \cdot F = \text{Tr}_P(F)\).

**Proof.** See Proposition 2.7 in [16].

Let \(M \in \text{Mod}(\mathcal{C})\). We recall that \(\text{add}(M)\) is the full subcategory of \(\text{Mod}(\mathcal{C})\) whose objects are direct summands of finite coproducts of the module \(M\). That is, \(X \in \text{add}(M)\) if and only if there exists a module \(Y\) such that \(X \oplus Y \cong M^n\) for some \(n \in \mathbb{N}\). The following proposition tells us when two finitely generated projective \(\mathcal{C}\)-modules produce the same ideal.

**Proposition 6.6.** Let \(P\) and \(Q\) finitely generated projective \(\mathcal{C}\)-modules. Then \(\text{Tr}_P C = \text{Tr}_Q C\) if and only if \(\text{add}(P) = \text{add}(Q)\).

**Proof.** Suppose that \(\text{Tr}_P C = \text{Tr}_Q C\). We have that \(\text{Tr}_P(P) = P\). Since \(\text{Tr}_P C = \text{Tr}_Q C\) by 6.5, we have that \(P = \text{Tr}_P P = \text{Tr}_P C \cdot P = \text{Tr}_Q C \cdot P = \text{Tr}_Q P\). Then there exists an epimorphism \(\eta : Q^J \rightarrow P\). Since \(P\) is finitely generated, we have that there exists a finite subset \(J \subseteq I\) and an epimorphism \(\eta' : Q^J \rightarrow P\) (see [2, 2.1(b)]). Since \(P\) is projective, we have that \(P\) is a direct summand of \(Q^J\). Then \(P \in \text{add}(Q)\). Similarly, \(Q \in \text{add}(P)\), and thus \(\text{add}(P) = \text{add}(Q)\). The other implication is similar.
Lemma 6.7. Let $\mathcal{C}$ be an additive category and $P = \operatorname{Hom}_\mathcal{C}(C, -) \in \operatorname{Mod}(\mathcal{C})$. Let us consider $B := \operatorname{add}(C) \subseteq \mathcal{C}$ and $F := \{\operatorname{Hom}_\mathcal{C}(C', -)\}_{C' \in B}$, then for each $\operatorname{Hom}_\mathcal{C}(X, -) \in \operatorname{Mod}(\mathcal{C})$ we have that $\operatorname{Tr}_F \left( \operatorname{Hom}_\mathcal{C}(X, -) \right) = \operatorname{Tr}_P \left( \operatorname{Hom}_\mathcal{C}(X, -) \right)$.

Proof. Straightforward.

Corollary 6.8. Let $\mathcal{C}$ be a Hom-finite $R$-variety and $P = \operatorname{Hom}_\mathcal{C}(C, -) \in \operatorname{Mod}(\mathcal{C})$. Then $\operatorname{Tr}_P \left( \operatorname{Hom}_\mathcal{C}(X, -) \right) = I_{\operatorname{add}(\mathcal{C})}(X, -)$, where $I_{\operatorname{add}(\mathcal{C})}$ is the ideal of the morphisms in $\mathcal{C}$ which factor through some object of $\operatorname{add}(\mathcal{C})$.

Proof. It follows from [12, Lemma 2.3] and 6.7.

Now, we recall the following well known result.

Proposition 6.9. Let $\mathcal{C}$ be an $R$-category which is Hom-finite, where $R$ is a commutative ring. Then for every $C \in \mathcal{C}$ we have that $\operatorname{add}(C)$ is functorially finite.

Proof. The proof given in [6, Theorem 4.2] can be adapted to this setting.

In the following results we focus in projective modules of the form $\operatorname{Hom}_\mathcal{C}(C, -)$ since in $R$-varieties all the finitely generated projectives are of such form (see 4.1).

Proposition 6.10. Let $\mathcal{C}$ be a dualizing $R$-variety, $P = \operatorname{Hom}_\mathcal{C}(C, -)$ a finitely generated projective $\mathcal{C}$-module and $I = \operatorname{Tr}_P \mathcal{C}$. Then $I$ satisfies property $A$.

Proof. By 6.8, we have that $\operatorname{Tr}_P \mathcal{C} = I_{\operatorname{add}(\mathcal{C})}$. By 6.9, we have that $\operatorname{add}(C)$ is functorially finite. By 4.12, we have that $I_{\operatorname{add}(\mathcal{C})}$ satisfies the property $A$.

Corollary 6.11. Let $\mathcal{C}$ be a dualizing $R$-variety, $P = \operatorname{Hom}_\mathcal{C}(C, -) \in \operatorname{mod}(\mathcal{C})$ and $I = \operatorname{Tr}_P \mathcal{C}$. Then we can restrict the diagram given in 3.11 to the finitely presented modules

$$\begin{array}{ccc}
\operatorname{mod}(\mathcal{C}/I) & \xrightarrow{\pi_1} & \operatorname{mod}(\mathcal{C}) \\
\pi_1 & & \\
\end{array}$$

Proof. It follows by 6.10 and 4.7.

For a preadditive category $\mathcal{C}$, we recall the construction of the functor $(-)^* : \operatorname{Mod}(\mathcal{C}) \rightarrow \operatorname{Mod}(\mathcal{C}^{\text{op}})$ which is a generalization of the functor $\operatorname{Mod}(A) \rightarrow \operatorname{Mod}(A^{\text{op}})$ given by $M \mapsto \operatorname{Hom}_A(M, A)$ for all the $A$-modules $M$, where $A$ is a ring. Indeed, for each $\mathcal{C}$-module $M$ we define $M^* : \mathcal{C} \rightarrow \textbf{Ab}$ given by $M^*(C) = \operatorname{Hom}_{\operatorname{Mod}(\mathcal{C})}(M, \operatorname{Hom}_\mathcal{C}(C, -))$. Clearly $M^*$ is a $\mathcal{C}^{\text{op}}$-module. In this way we obtain a contravariant functor $(-)^* : \operatorname{Mod}(\mathcal{C}) \rightarrow \operatorname{Mod}(\mathcal{C}^{\text{op}})$ given by $M \mapsto M^*$. If $M = \operatorname{Hom}_\mathcal{C}(C, -)$, it can be seen that $M^* \simeq \operatorname{Hom}_\mathcal{C}(\mathcal{C}, -)$; we refer the reader to section 6 in [5] for more details.

Corollary 6.12. Let $\mathcal{C}$ be a Hom-finite $R$-variety, $P = \operatorname{Hom}_\mathcal{C}(C, -) \in \operatorname{Mod}(\mathcal{C})$ and consider the ideal $I = \operatorname{Tr}_P \mathcal{C}$. Then we have that $I^{\text{op}} = \operatorname{Tr}_P \mathcal{C}^{\text{op}}$.

Proof. It follows from 6.8 and the fact that $P^* = \operatorname{Hom}_\mathcal{C}(\mathcal{C}, -)$.

For the next, we recall that if $\mathcal{C}$ is a dualizing $R$-variety by [5, Proposition 3.4] we have that $\operatorname{mod}(\mathcal{C})$ has projective covers.

Remark 6.13. Let $\mathcal{C}$ be a dualizing $R$-variety, $P$ a projective $\mathcal{C}$-module and $F \in \operatorname{mod}(\mathcal{C})$. Let $P_0(F)$ be the projective cover of $F$, then $\operatorname{Tr}_P(F) = F$ if and only if $P_0(F) \in \operatorname{add}(P)$.

We introduce the following definition that will be used along the paper.
Definition 6.14. Let $C$ be a dualizing $R$-variety and $P \in \text{mod}(C)$ be a projective module. For each $0 \leq k \leq \infty$ we define $P_k$ to be the full subcategory of $\text{mod}(C)$ consisting of the $C$-modules $X$ having a projective resolution

$$\cdots \longrightarrow P_n \longrightarrow P_{n-1} \longrightarrow \cdots \longrightarrow P_1 \longrightarrow P_0 \longrightarrow X \longrightarrow 0$$

with $P_i \in \text{add}(P)$ for $0 \leq i \leq k$.

We have the following easy lemma.

Lemma 6.15. Let $C$ be a $\text{Hom}$-finite $R$-variety, $P = \text{Hom}_C(C, -) \in \text{Mod}(C)$ and $\mathcal{I} = \text{Tr}_P C$. Consider $\pi_1 : C \longrightarrow \mathcal{I}$. Then

(a) $\text{Hom}_{\text{mod}(C)}(Q, (\pi_1)_*(Y)) = 0$ for all $Q \in \text{add}(P)$ and for all $Y \in \text{mod}(C/\mathcal{I})$.

(b) $X \in \mathcal{P}_0$ if and only if $\text{Hom}_{\text{mod}(C)}(X, (\pi_1)_*(Y)) = 0$ for all $Y \in \text{mod}(C/\mathcal{I})$.

In the following proposition we give a characterization of the modules in $P_k$ that will be used in the rest of the paper.

Proposition 6.16. Let $C$ be a dualizing $R$-variety, $P = \text{Hom}_C(C, -) \in \text{mod}(C)$ and $\mathcal{I} = \text{Tr}_P C$. For $1 \leq k \leq \infty$ and $X \in \text{mod}(C)$, the following are equivalent.

(a) $X \in \mathcal{P}_k$.

(b) $\text{Ext}^i_{\text{mod}(C)}(X, (\pi_1)_*(Y)) = 0$ for all $Y \in \text{mod}(C/\mathcal{I})$ and $i = 0, \ldots, k$.

(c) $\text{Ext}^i_{\text{mod}(C)}(X, (\pi_1)_*(Y)) = 0$ for all $J \in \text{mod}(C/\mathcal{I})$ injective and $i = 0, \ldots, k$.

Proof. (a) $\Rightarrow$ (b). When applying Hom$(-, (\pi_1)_*)$ to a projective resolution of $X$, by 6.15, we have a complex with the first $k$ terms zero.

(b) $\Rightarrow$ (a). We will proceed by induction on $k$. Suppose that $k = 1$. That is, suppose that $\text{Ext}^i_{\text{mod}(C)}(X, (\pi_1)_*(Y)) = 0$ for all $Y \in \text{mod}(C/\mathcal{I})$ and $i = 0, 1$. By 6.15, we have that the projective cover $P_0(X)$ of $X$ belongs to $\text{add}(P)$. Now, let us consider the exact sequence $0 \longrightarrow L_0 \longrightarrow P_0(X) \longrightarrow X \longrightarrow 0$. Applying Hom$(-, (\pi_1)_*(Y))$ to the last sequence we have the exact sequence

$$\text{Hom}_{\text{mod}(C)}(P_0(X), (\pi_1)_*(Y)) \longrightarrow \text{Hom}_{\text{mod}(C)}(L_0, (\pi_1)_*(Y)) \longrightarrow \text{Ext}^1_{\text{mod}(C)}(X, (\pi_1)_*(Y)).$$

Since $P_0(X) \in \text{add}(P)$, we have that $\text{Hom}_{\text{mod}(C)}(P_0(X), (\pi_1)_*(Y)) = 0$ (see 6.15) and, by hypothesis, we have that $\text{Ext}^1_{\text{mod}(C)}(X, (\pi_1)_*(Y)) = 0$. Thus, we conclude that $\text{Hom}_{\text{mod}(C)}(L_0, (\pi_1)_*(Y)) = 0$ for all $Y \in \text{mod}(C/\mathcal{I})$. Then, in the same way as we did for $X$, we get that $P_0(L) \in \text{add}(P)$. Hence, we have an exact sequence $P_0(L) \rightarrow P_0(X) \rightarrow X \rightarrow 0$, with $P_0(L), P_0(X) \in \text{add}(P)$, proving that $X \in \mathcal{P}_1$.

Suppose that is true for $k - 1$. Let $X \in \text{mod}(C)$ such that $\text{Ext}^i_{\text{mod}(C)}(X, (\pi_1)_*(Y)) = 0$ for all $Y \in \text{mod}(C/\mathcal{I})$ and $i = 0, \ldots, k - 1$. Then, by induction, there exists a resolution $0 \longrightarrow P_{k-1} \longrightarrow \cdots \longrightarrow P_1 \longrightarrow P_0 \longrightarrow X \longrightarrow 0$ with $P_i \in \text{add}(P)$ for all $i = 0, \ldots, k - 1$. Consider the exact sequence

$$0 \longrightarrow L_{k-1} = \text{Ker}(d_{k-1}) \longrightarrow P_{k-1} \longrightarrow \text{Ker}(d_{k-2}) = L_{k-2} \longrightarrow 0$$

Applying Hom$(-, (\pi_1)_*(Y))$ we have the exact sequence

$$\text{Hom}_{\text{mod}(C)}(P_{k-1}, (\pi_1)_*(Y)) \longrightarrow \text{Hom}_{\text{mod}(C)}(L_{k-1}, (\pi_1)_*(Y)) \longrightarrow \text{Ext}^1_{\text{mod}(C)}(L_{k-2}, (\pi_1)_*(Y)).$$

By shifting lemma, we get $\text{Ext}^1_{\text{mod}(C)}(L_{k-2}, (\pi_1)_*(Y)) \simeq \text{Ext}^k_{\text{mod}(C)}(X, (\pi_1)_*(Y)) = 0$. Since $P_{k-1} \in \text{add}(P)$, we conclude that $\text{Hom}_{\text{mod}(C)}(P_{k-1}, (\pi_1)_*(Y)) = 0$ (see
6.15); and hence $\text{Hom}_{\mathcal{C}}(L_{k-1}, (\pi_1)_*(Y)) = 0$ for all $Y \in \text{mod}(\mathcal{C}/\mathcal{I})$. In the same way as we did for the case $k = 1$, we get that $P_0(L_{k-1}) \in \text{add}(P)$. Then we can construct $\cdots \to P_0 = P_0(L_{k-1}) \to P_{k-1} \to \cdots \to P_1 \to P_0 \to X \to 0$, which is exact with $P_i \in \text{add}(P)$ for all $i = 0, \ldots, k$, proving that $X \in \mathbb{P}_k$.

(b) $\Rightarrow$ (c). Trivial.

(c) $\Rightarrow$ (b). Follows by induction on $i$.

\begin{proof}
First, we note that by 6.10, we have that $\mathcal{I}$ satisfies property A.

Let $\pi : \mathcal{C} \to \mathcal{C}/\mathcal{I}$ be canonical functor. By 6.11, we have that $\pi_*(\text{Hom}_{\mathcal{C}/\mathcal{I}}(C', -)) = \text{Hom}_{\mathcal{C}}(C', -) \in \text{mod}(\mathcal{C})$. Consider the following exact sequence in $\text{Mod}(\mathcal{C})$

\begin{equation}
\begin{array}{c}
0 \\
\xrightarrow{\mathcal{I}(C', -)} \text{Hom}_{\mathcal{C}}(C', -) \\
\xrightarrow{\text{Hom}_{\mathcal{C}}(C', -)} \\
\xrightarrow{\mathcal{I}(C', -)} 0.
\end{array}
\end{equation}

Since $\mathcal{C}$ is a dualizing $R$-variety, we have that $\text{mod}(\mathcal{C})$ is abelian subcategory of $\text{Mod}(\mathcal{C})$ and thus $\mathcal{I}(C', -) \in \text{mod}(\mathcal{C})$ (see [5, Theorem 2.4]). Since $\mathcal{I} = \text{Tr}_{P}C$, there exists an epimorphism $\gamma : P^n \to \mathcal{I}(C', -)$ for some $n \in \mathbb{N}$, this is because $\mathcal{I}(C', -)$ is finitely generated (see [2, 2.1(b)]). Let $Y \in \text{mod}(\mathcal{C}/\mathcal{I})$.

If there exists a non zero morphism $\alpha : \mathcal{I}(C', -) \to \pi_*(Y)$ we have that $\alpha \gamma \neq 0$, which contradicts 6.15. Therefore, we have that $\text{Hom}_{\text{mod}(\mathcal{C})}(\mathcal{I}(C', -), \pi_*(Y)) = 0$. On the other hand, applying $\text{Hom}_{\text{mod}(\mathcal{C})}(\mathcal{I}(C', -), \pi_*(Y))$ to the last exact sequence we get an isomorphism for $i \geq 1$

\begin{equation}
(\ast) : \text{Ext}_{\text{mod}(\mathcal{C})}^{i}(\mathcal{I}(C', -), \pi_*(Y)) \xrightarrow{\text{Hom}_{\text{mod}(\mathcal{C})}(\mathcal{I}(C', -), \pi_*(Y))} \text{Ext}_{\text{mod}(\mathcal{C})}^{i+1}(\mathcal{I}(C', -), \pi_*(Y)).
\end{equation}

We know that $\mathcal{I}$ is $(k + 1)$-idempotent if and only if $\text{EXT}_{\mathcal{C}}^{i}(\mathcal{C}/\mathcal{I}, \pi_*(Y)) = 0$ for $1 \leq i \leq k + 1$ and for all $Y \in \text{mod}(\mathcal{C}/\mathcal{I})$ (see 5.3). Now, the result follows from 5.3, 6.16.
\end{proof}

\begin{corollary}
Let $\mathcal{C}$ be a dualizing $R$-variety, $P = \text{Hom}_{\mathcal{C}}(C', -) \in \text{mod}(\mathcal{C})$ and $\mathcal{I} = \text{Tr}_{P}C$. Then $\mathcal{I}$ is strongly idempotent if and only if $\mathcal{I}(C', -) \in \mathbb{P}_{\infty}$ for all $C' \in \mathcal{C}$.
\end{corollary}

Let $\mathcal{C}$ be a dualizing $R$-variety. Given $M \in \text{mod}(\mathcal{C})$, we recall that $\text{rad}(M)$ denotes the radical of $M$, that is, $\text{rad}(M)$ is the intersection of the maximal submodules of $M$.

\begin{definition}
Let $\mathcal{C}$ be a dualizing $R$-variety, $P \in \text{mod}(\mathcal{C})$ a projective module and $J := I_0(\frac{P}{\text{rad}(P)}) \in \text{mod}(\mathcal{C})$ the injective envelope of $\frac{P}{\text{rad}(P)}$. For each $0 \leq k \leq \infty$ we define $\mathcal{I}_k$ to be the full subcategory of $\text{mod}(\mathcal{C})$ consisting of the $\mathcal{C}$-modules $Y$ having an injective coresolution $0 \to Y \to J_0 \to J_1 \to \cdots$ with $J_i \in \text{add}(J)$ for $0 \leq i \leq k$.

Let $\mathcal{C}$ be a dualizing $R$-variety. Since the endomorphism ring of each object in $\mathcal{C}$ is an artin algebra, it follows that $\mathcal{C}$ is a Krull-Schmidt category [5, p.337]. By 4.1, we conclude that $P \in \text{proj}(\mathcal{C})$ is indecomposable if and only if $P \cong \text{Hom}_{\mathcal{C}}(C', -)$ where $C \in \mathcal{C}$ is indecomposable (see also [12, Lemma 2.2 (b)]).

\begin{lemma}
Let $\mathcal{C}$ be a dualizing $R$-variety, $P = \text{Hom}_{\mathcal{C}}(C', -) \in \text{mod}(\mathcal{C})$ an indecomposable projective module, $J := I_0(\frac{P}{\text{rad}(P)}) \in \text{mod}(\mathcal{C})$ and $\mathcal{I} = \text{Tr}_{P}C$. Consider the projection $\pi_1 : \mathcal{C} \longrightarrow \mathcal{C}/\mathcal{I}$. Then $\text{Hom}_{\text{mod}(\mathcal{C})}((\pi_1)_*(X), J) = 0$ for all $X \in \text{mod}(\mathcal{C}/\mathcal{I})$.
\end{lemma}
Proof. It can be seen that $\text{Tr}_C(J) = 0$, and hence $\text{Tr}_C(J) = \Omega(\text{Tr}_C(J)) = 0$. Now, by adjunction (see 3.5), $\text{Hom}_{\text{mod}(C)}((\pi_1)_*(X), J) \simeq \text{Hom}_{\text{mod}(C/I)}(X, \text{Tr}_C(J)) = \text{Hom}_{\text{mod}(C/I)}(X, 0) = 0$. □

Proposition 6.21. Let $\mathcal{C}$ be a dualizing $R$-variety, $P = \text{Hom}_R(C, -) \in \text{mod}(\mathcal{C})$ an indecomposable projective module, $J := I_0(\frac{P}{\text{rad}(P)}) \in \text{mod}(\mathcal{C})$ and $\mathcal{I} = \text{Tr}_P\mathcal{C}$. Consider the projection $\pi_1 : \mathcal{C} \rightarrow \mathcal{C}/\mathcal{I}$. Then $J \simeq \mathcal{D}^{-1}_C(\text{Hom}_C(-, C))$.

Proof. Since $J$ is the injective envelope of the simple $\frac{P}{\text{rad}(P)}$, we have that $J$ is indecomposable. Then we have that $\mathcal{D}_C(J) \in \text{mod}(\mathcal{C}^{\text{op}})$ is an indecomposable projective $\mathcal{C}$-module. By 6.20 and 6.16, we get that there exists an exact sequence $Q_1 \rightarrow Q_0 \rightarrow \mathcal{D}_C(J) \rightarrow 0$ with $Q_i \in \text{add}(P^*) = \text{add}(\text{Hom}_R(-, C))$. Since $\mathcal{D}_C(J)$, is projective we conclude that $\mathcal{D}_C(J)$ is a direct summand of $Q_0$ and therefore $\mathcal{D}_C(J) \in \text{add}(\text{Hom}_R(-, C))$. Since $\text{Hom}_R(-, C)$ is indecomposable and $\text{mod}(\mathcal{C})$ is Krull-Schmidt (because $\text{mod}(\mathcal{C})$ is a dualizing $R$-variety), we conclude that $\mathcal{D}_C(J) \simeq \text{Hom}_R(-, C)$. □

The following shows that the last proposition holds for every finitely generated projective $\mathcal{C}$-module.

Proposition 6.22. Let $\mathcal{C}$ be a dualizing $R$-variety, $P = \text{Hom}_R(C, -) \in \text{mod}(\mathcal{C})$ a projective module, $J := I_0(\frac{P}{\text{rad}(P)}) \in \text{mod}(\mathcal{C})$ the injective envelope of $\frac{P}{\text{rad}(P)}$ and $\mathcal{I} = \text{Tr}_P\mathcal{C}$. Then $J \simeq \mathcal{D}^{-1}_C(\text{Hom}_C(-, C))$.

Similarly, the result given in 6.20 holds for every finitely generated projective $\mathcal{C}$-module. That is, we have the following result.

Remark 6.23. Let $\mathcal{C}$ be a dualizing $R$-variety, $P = \text{Hom}_R(C, -) \in \text{mod}(\mathcal{C})$ a projective module, $J := I_0(\frac{P}{\text{rad}(P)}) \in \text{mod}(\mathcal{C})$ and $\mathcal{I} = \text{Tr}_P\mathcal{C}$. Consider the projection $\pi_1 : \mathcal{C} \rightarrow \mathcal{C}/\mathcal{I}$. Then $\text{Hom}_{\text{mod}(\mathcal{C})}((\pi_1)_*(X), J) = 0$ for all $X \in \text{mod}(\mathcal{C}/\mathcal{I})$.

Corollary 6.24. Let $\mathcal{C}$ be a dualizing $R$-variety, $P = \text{Hom}_R(C, -) \in \text{mod}(\mathcal{C})$ a projective module, $J := I_0(\frac{P}{\text{rad}(P)}) \in \text{mod}(\mathcal{C})$ and $\mathcal{I} = \text{Tr}_P\mathcal{C}$. Consider the projection $\pi_1 : \mathcal{C} \rightarrow \mathcal{C}/\mathcal{I}$. Then $Y \subseteq \mathcal{I}_i$ if and only if $\text{Hom}_{\text{mod}(\mathcal{C})}((\pi_1)_*(X), Y) = 0$ for all $X \in \text{mod}(\mathcal{C}/\mathcal{I})$.

Proof. If follows by duality using 6.12, 6.15 and 6.22. □

Proposition 6.25. Let $P = \text{Hom}_R(C, -) \in \text{mod}(\mathcal{C})$ be a projective module, $\mathcal{I} = \text{Tr}_P\mathcal{C}$ and $1 \leq k < \infty$. Let $\pi_1 : \mathcal{C} \rightarrow \mathcal{C}/\mathcal{I}$ the canonical projection. The following conditions are equivalent for $Y \in \text{mod}(\mathcal{C})$.

(a) $Y \subseteq \mathcal{I}_k$.
(b) $\text{Ext}^i_{\text{mod}(\mathcal{C})}((\pi_1)_*(X), Y) = 0$ for all $X \in \text{mod}(\mathcal{C}/\mathcal{I})$ and $i = 0, \ldots, k$.
(c) $\text{Ext}^i_{\text{mod}(\mathcal{C})}((\pi_1)_*(Q), Y) = 0$ for all $Q \in \text{mod}(\mathcal{C}/\mathcal{I})$ projective and $i = 0, \ldots, k$.

Proof. It follows from 6.16 using the duality. □

7. A recollement

Let $\mathcal{C}$ be a preadditive category. Throught this section $P$ will be a finitely generated projective module in $\text{Mod}(\mathcal{C})$ and $R_P := \text{End}_{\text{Mod}(\mathcal{C})}(P)^{\text{op}}$. In this section we will study the functor $\text{Hom}_{\text{Mod}(\mathcal{C})}(P, -) : \text{Mod}(\mathcal{C}) \rightarrow \text{Mod}(R_P)$. The following remark is straightforward and we left the details to the reader.

Remark 7.1. Let $\mathcal{C}$ be a preadditive category and $P \in \text{proj}(\mathcal{C})$. 
(a) Consider the Yoneda embedding \( Y : C \to \text{proj}(C) \) defined as \( Y(C) := \text{Hom}_C(C, \_). \) Then \( Y_* : \text{Mod}((\text{proj}(C))^{op}) \to \text{Mod}(C) \) is an equivalence.

(b) Consider the inclusion \( \{P\}^{op} \subseteq \text{proj}(C)^{op} \) and the restriction functor \( \text{res} : \text{Mod}((\text{proj}(C))^{op}) \to \text{Mod}(\{P\}^{op}) \) given as: \( M \mapsto M|_{\{P\}^{op}}. \) Then the following diagram is commutative

\[
\begin{array}{ccc}
\text{Mod}((\text{proj}(C))^{op}) & \xrightarrow{\text{res}} & \text{Mod}(\{P\}^{op}) \\
\downarrow Y_* & & \downarrow e_P \\
\text{Mod}(C) & \xrightarrow{\text{Hom}_{\text{Mod}(C)(P, \_)}} & \text{Mod}(R_P)
\end{array}
\]

where \( R_P := \text{End}_{\text{Mod}(C)}(P)^{op} \) and \( e_P \) is the evaluation functor defined as follows: \( e_P(M) = M(P) \) for \( M \in \text{Mod}(\{P\}^{op}). \)

(c) We define a functor \( P \otimes_{R_P} - : \text{Mod}(R_P) \to \text{Mod}(C) \) as follows: \( (P \otimes_{R_P} M)(C) = P(C) \otimes_{R_P} M \) for all \( M \in \text{Mod}(R_P) \) and \( C \in C. \) Then the following diagram commutes

\[
\begin{array}{ccc}
\text{Mod}(\{P\}^{op}) & \xrightarrow{\text{proj}(C)^{op} \otimes \{P\}^{op}} & \text{Mod}(\text{proj}(C))^{op} \\
\downarrow e'_P & & \downarrow Y_* \\
\text{Mod}(R_P) & \xrightarrow{P \otimes_{R_P} -} & \text{Mod}(C)
\end{array}
\]

where \( e'_P \) is the evaluation and \( (\text{proj}(C))^{op} \otimes \{P\}^{op} - \) is the functor defined in 2.2.

(d) Recall that \( P^* \in \text{Mod}(C^{op}) \) is given by \( P^*(C) := \text{Hom}_{\text{Mod}(C)}(P, \text{Hom}_C(C, \_)). \) Now we can construct a functor \( \text{Hom}_{R_P}(P^*, -) : \text{Mod}(R_P) \to \text{Mod}(C) \) where for \( M \in \text{Mod}(R_P) \) we define \( \text{Hom}_{R_P}(P^*, M) : C \to \text{Ab} \) as follows:

\[
\left( \text{Hom}_{R_P}(P^*, M) \right)(C) := \text{Hom}_{R_P}(P^*(C), M). \]

Then the following diagram commutes

\[
\begin{array}{ccc}
\text{Mod}(\{P\}^{op}) & \xrightarrow{\{P\}^{op} \otimes (\text{proj}(C))^{op}, -} & \text{Mod}(\text{proj}(C))^{op} \\
\downarrow e'_P & & \downarrow Y_* \\
\text{Mod}(R_P) & \xrightarrow{\text{Hom}_{R_P}(P^*, -)} & \text{Mod}(C)
\end{array}
\]

where \( e'_P \) is the evaluation and \( \{P\}^{op} \otimes (\text{proj}(C))^{op}, - \) is the functor defined in 2.3.

Now, we give the following definition which encodes the information of several adjunctions.

**Definition 7.2.** Let \( A, B \) and \( C \) be abelian categories. Then the diagram

\[
\begin{array}{ccc}
B & \xleftarrow{i} & A \\
\downarrow i^* & & \downarrow j_* \\
C & \xrightarrow{j} & A \\
\end{array}
\]

is called a **recollement**, if the additive functors \( i^*, i_* = i, i^!, j_!, j^! = j^* \) and \( j_* \) satisfy the following conditions:

(R1) \((i^*, i_*) = (i, i^!), (j_!, j^!) \) are adjoint triples, i.e. \((i^*, i_*), (i, i^!) \) and \((j_!, j^!), (j_*, j^*) \) are adjoint pairs;

(R2) \( j^* i_* = 0; \)

(R3) \( i_*, j_!, j_* \) are full embedding functors.
Next, we will see that we can construct a recollement.

**Proposition 7.3.** Let $C$ be an $R$-category, $P = \text{Hom}_C(C, -) \in \text{Mod}(C)$ a finitely generated projective module, $B = \text{add}(C) \subseteq C$ and $R_P = \text{End}_{\text{Mod}(C)}(P)^{\text{op}}$. Then, there exists a recollement of the form

\[
\begin{array}{ccc}
\text{Mod}(C/I_B) & \xrightarrow{\pi} & \text{Mod}(C) \\
\text{add}(C/I_B, -) & \xrightarrow{-} & \text{Hom}_{\text{Mod}(C)}(P, -) \\
\text{Hom}_{R_P}(P^*, -) & \xrightarrow{-} & \text{Mod}(R_P)
\end{array}
\]

where $I_B$ is the ideal of morphisms in $C$ which factor through objects in $B$.

**Proof.** This follows by [11, Theorem 3.10], using the identifications 7.1. \hfill $\Box$

We can restrict the last recollement to the finitely presented modules. So, we have the following result that is an analogous to the one given in artin algebras.

**Proposition 7.4.** Let $C$ be a dualizing $R$-variety, $P = \text{Hom}_C(C, -) \in \text{mod}(C)$, $B = \text{add}(C)$ and $R_P = \text{End}_{\text{mod}(C)}(P)^{\text{op}}$. Then, there exist a recollement

\[
\begin{array}{ccc}
\text{mod}(C/I_B) & \xrightarrow{\pi} & \text{mod}(C) \\
\text{mod}(C/I_B, -) & \xrightarrow{-} & \text{Hom}_{\text{mod}(C)}(P, -) \\
\text{Hom}_{R_P}(P^*, -) & \xrightarrow{-} & \text{mod}(R_P)
\end{array}
\]

where $I_B$ is the ideal of morphisms in $C$ which factor through objects in $B$. Moreover, we have that $I_B = \text{Tr}P_C$.

**Proof.** Let us take $C' = \text{proj}(C)^{\text{op}}$ and $B' = \text{add}(P)^{\text{op}}$. In the proof of 7.3 we have a recollement where $I_{B'} = I_{\text{add}(P)}$ is the ideal of morphisms in $C'$ which factor through objects in $\text{add}(P)$. The Yoneda’s embedding gives us an equivalence $C \simeq \text{proj}(C)^{\text{op}}$ (see 4.1), and hence $C' = \text{proj}(C)^{\text{op}}$ is a dualizing $R$-variety. Now, $B' = \text{add}(P)^{\text{op}}$ is a functorially finite subcategory of $C'$ (see 6.9). Therefore, by [14, Theorem 2.5] and 7.3, we can restrict the last recollement to the finitely presented modules where $I_B$ is the ideal of morphisms in $C$ which factor through objects in $B$, since $\text{mod}(R_P)$ coincides with the finitely presented $R$-modules (because $R_P$ is an artin $R$-algebra). Finally, by 6.8, we have that $I_B = \text{Tr}P_C$. \hfill $\Box$

We have the following definition due to Auslander [2].

**Definition 7.5.** Let $C$ a dualizing $R$-category and $P = \text{Hom}_C(C, -) \in \text{mod}(C)$. Let $M \in \text{mod}(C)$.

(a) It is said that $M$ is **projectively presented** over $P$ if $\epsilon_M$ is an isomorphism. Let us denote by $\mathcal{P}P(P)$ the full subcategory of $\text{mod}(C)$ consisting of the projectively presented modules.

(b) It is said that $M$ is **injectively copresented** over $P$ if $\eta_M$ is an isomorphism. Let us denote by $\mathcal{I}C(P)$ the full subcategory of $\text{mod}(C)$ consisting of the injectively copresented modules.

We recall that in the case of a dualizing $R$-variety every finitely generated projective $C$-module is of the form $\text{Hom}_C(C, -)$ (see 4.1).

**Proposition 7.6.** Let $C$ be a dualizing $R$-variety and $P = \text{Hom}_C(C, -) \in \text{mod}(C)$. For $M \in \text{mod}(C)$, the following are equivalent.

(a) $M \in \mathcal{I}C(P)$.

(b) There exists a module $X \in \text{mod}(R_P)$ such that $M \cong P \otimes_{R_P} X$.

(c) There exists an exact sequence $P_1 \to P_0 \to M \to 0$ with $P_1, P_0 \in \text{add}(P)$.

(d) $\text{Hom}_{\text{mod}(C)}(M, N) \to \text{Hom}_{R_P} \left( \text{Hom}_{\text{mod}(C)}(P, M), \text{Hom}_{\text{mod}(C)}(P, N) \right)$ is an isomorphism for each module $N \in \text{mod}(C)$.  

Proof. See [2, Proposition 3.2].

The next result give us a characterization of the the categories $\mathbb{F}\mathbb{P}\mathbb{P}(P)$ and $\mathbb{F}\mathbb{I}\mathbb{C}(P)$ which will help us in the forthcoming section.

Proposition 7.7. Let $C$ be a dualizing $R$-variety and $P = \text{Hom}_C(C,-) \in \text{mod}(C)$. Then the following conditions hold.

(a) $M \in \mathbb{F}\mathbb{P}\mathbb{P}(P)$ if and only if $\text{Hom}_{\text{mod}(C)}(M,N) = 0$ and $\text{Ext}^1_{\text{mod}(C)}(M,N) = 0$ for all $N \in \text{mod}(C)$ with $N \in \text{Ker}(\text{Hom}_{\text{mod}(C)}(P,-))$.

(b) $N \in \mathbb{F}\mathbb{I}\mathbb{C}(P)$ if and only if $\text{Hom}_{\text{mod}(C)}(M,N) = 0$ and $\text{Ext}^1_{\text{mod}(C)}(M,N) = 0$ for all $M \in \text{mod}(C)$ with $M \in \text{Ker}(\text{Hom}_{\text{mod}(C)}(P,-))$.

Proof. The proof given in [2, Proposition 3.7] works for the finitely presented modules, since mod$(C)$ is an abelian subcategory of Mod$(C)$ with enough injectives and projectives and we have the adjunctions in 7.4.

Proposition 7.8. Let $C$ be a dualizing $R$-variety and $P = \text{Hom}_C(C,-) \in \text{mod}(C)$. Consider the functor $\text{Hom}_{\text{mod}(C)}(P,-) : \text{mod}(C) \rightarrow \text{mod}(R_P)$. The following hold.

(a) $\text{Hom}_{\text{mod}(C)}(P,-)|_{\mathbb{P}_1} : \mathbb{P}_1 \rightarrow \text{mod}(R_P)$ and $\text{Hom}_{\text{mod}(C)}(P,-)|_{\mathbb{I}_1} : \mathbb{I}_1 \rightarrow \text{mod}(R_P)$ are equivalences, where $\mathbb{P}_1$ and $\mathbb{I}_1$ are the categories defined in 6.14 and 6.19.

(b) Let $\text{Hom}_{\text{mod}(C)}(X,Y) \xrightarrow{\rho_{X,Y}} \text{Hom}_{R_P}\left(\text{Hom}_{\text{mod}(C)}(P,X),\text{Hom}_{\text{mod}(C)}(P,Y)\right)$.

Then:

(i) $\rho_{X,Y}$ is a monomorphism if either $X \in \mathbb{P}_0$ or $Y \in \mathbb{I}_0$,

(ii) $\rho_{X,Y}$ is an isomorphism if $X \in \mathbb{P}_0$ and $Y \in \mathbb{I}_0$,

(iii) $\rho_{X,Y}$ is an isomorphism if either $X \in \mathbb{P}_1$ or $Y \in \mathbb{I}_1$.

(c) The functor $\text{Hom}_{\text{mod}(C)}(P,-)$ induces an equivalence of categories between $\text{add}(P)$ on the category of projective $R_P$-modules, and between $\text{add}(J)$ and the category of injective $R_P$-modules.

Proof. (a). The fact that $\text{Hom}_{\text{mod}(C)}(P,-)|_{\mathbb{P}_1} : \mathbb{P}_1 \rightarrow \text{mod}(R_P)$ is an equivalence follows from [2, Proposition 3.3], since $\mathbb{F}\mathbb{P}\mathbb{P}(P) = \mathbb{P}_1$.

By 7.7 and 6.25, we have that $\mathbb{F}\mathbb{I}\mathbb{C}(P) = \mathbb{I}_1$. Then, by [2, Proposition 3.6], we have that $\text{Hom}_{\text{mod}(C)}(P,-)|_{\mathbb{I}_1} : \mathbb{I}_1 \rightarrow \text{mod}(R_P)$ is an equivalence.

(b). It follows from 7.6(d) and the proof is left to the reader.

(bii). Since $X \in \mathbb{P}_0$, we have by (bi) that

$$\rho_{X,Y} : \text{Hom}_{\text{mod}(C)}(X,Y) \rightarrow \text{Hom}_{R_P}\left(\text{Hom}_{\text{mod}(C)}(P,X),\text{Hom}_{\text{mod}(C)}(P,Y)\right)$$

is a monomorphism. Since $X \in \mathbb{P}_0$ and $Y \in \mathbb{I}_0$, there exists an epimorphism $Q \xrightarrow{\pi} X \xrightarrow{\mu} 0$ and a monomorphism $0 \xrightarrow{\nu} Y \xrightarrow{\nu} I$ with $Q \in \text{add}(P)$ and $I \in \text{add}(J)$. By definition of $\mathbb{P}_1$ and $\mathbb{I}_1$, we have that $Q \in \mathbb{P}_1$ and $I \in \mathbb{I}_1$.

Let us see that $\rho_{X,Y}$ is surjective.

Let $\varphi : \text{Hom}_{\text{mod}(C)}(P,X) \rightarrow \text{Hom}_{\text{mod}(C)}(P,Y)$ be a morphism of $R_P$-modules. Consider the morphism $\text{Hom}_{\text{mod}(C)}(P,\mu) : \text{Hom}_{\text{mod}(C)}(P,Y) \rightarrow \text{Hom}_{\text{mod}(C)}(P,I)$ and then we get $\text{Hom}_{\text{mod}(C)}(P,\mu) \circ \varphi : \text{Hom}_{\text{mod}(C)}(P,X) \rightarrow \text{Hom}_{\text{mod}(C)}(P,I)$.

Since $I \in \mathbb{I}_1 = \mathbb{F}\mathbb{I}\mathbb{C}(P)$, we have that

$$\rho_{X,I} : \text{Hom}_{\text{mod}(C)}(X,I) \rightarrow \text{Hom}_{R_P}\left(\text{Hom}_{\text{mod}(C)}(P,X),\text{Hom}_{\text{mod}(C)}(P,I)\right)$$

is an isomorphism (see dual of 7.6). Then there exists a morphism $\lambda : X \rightarrow I$ such that $\text{Hom}_{\text{mod}(C)}(P,\lambda) = \text{Hom}_{\text{mod}(C)}(P,\mu) \circ \varphi$. Similarly, we have that

$$\rho_{Q,Y} : \text{Hom}_{\text{mod}(C)}(Q,Y) \rightarrow \text{Hom}_{R_P}\left(\text{Hom}_{\text{mod}(C)}(P,Q),\text{Hom}_{\text{mod}(C)}(P,Y)\right)$$
is an isomorphism (see 7.6(d)). Then there exists a morphism $\beta : Q \longrightarrow Y$ such that $\varphi \circ \Hom_{\Mod{C}}(P, \pi) = \Hom_{\Mod{C}}(P, \beta)$.

Then we have two morphisms $\lambda \pi, \mu \beta : Q \longrightarrow I$ and it is straightforward to check that $\lambda \pi = \mu \beta$. Let us consider the factorization $X \xrightarrow{\rho} K \xrightarrow{\delta} I$ of $\lambda$ through its image. Then we have that $\mu \beta = \lambda \pi = \delta p \pi$ with $p \pi$ an epimorphism and $\delta$ a monomorphism. Then we have that $\delta$ is the image of $\lambda \pi$. Since $\mu$ is a monomorphism, by the universal property of the image, there exists $\psi : K \longrightarrow Y$ such that $\delta = \mu \psi$. Now, it is easy to see that $\varphi = \Hom_{\Mod{C}}(P, \psi \circ p)$. Therefore, we conclude that $\rho_X$ is surjective, and then an isomorphism.

(biii) Follows from 7.6 and its dual since $\mathbb{F}.P.P(P) = \mathbb{P}_1$ and $\mathbb{F}.C.I(P) = \mathbb{I}_1$.

c) This follows from the fact that $\Hom_{\Mod{C}}(P, -) : \add(P) \longrightarrow \add(R_P) = \proj(R_P)$ is an equivalence.

8. Extension over the endomorphism ring of a projective module

In this section we will explore the relationship between injective coresolution in $\Mod{C}$ and $\Mod{R_P}$. For each $X, Y \in \Mod{C}$ consider the mapping

$$\rho_{X,Y} : \Hom_{\Mod{C}}(X, Y) \longrightarrow \Hom_{R_P}\left(\Hom_{\Mod{C}}(P, X), \Hom_{\Mod{C}}(P, Y)\right)$$

defined as $\rho_{X,Y}(f) = \Hom_{\Mod{C}}(P, f)$ for all $f \in \Hom_{\Mod{C}}(X, Y)$. It is easy to see that $\rho_{X,Y}$ is functorial in $X$ and $Y$, then we have the following construction.

**Proposition 8.1.** Let $C$ be a dualizing $R$-variety and $P = \Hom_{C}(C, -) \in \Mod{C}$. For each $X, Y \in \Mod{C}$ and for all $i \geq 0$ we have canonical morphisms

$$\Phi^i_{X,Y} : \Ext^i_{\Mod{C}}(X, Y) \longrightarrow \Ext^i_{R_P}\left(\Hom_{\Mod{C}}(P, X), \Hom_{\Mod{C}}(P, Y)\right)$$

where $\Phi^0_{X,Y} = p_X Y$.

**Proof.** It is straightforward, using injective coresolutions of $Y$ and $\Hom_{\Mod{C}}(P, Y)$, and the comparison lemma. □

We give conditions in order to know when the morphisms $\Phi^i_{X,Y}$ are isomorphisms.

**Proposition 8.2.** Let $C$ be a dualizing $R$-variety and $P = \Hom_{C}(C, -) \in \Mod{C}$. The mapping $\Phi^i_{X,Y} : \Ext^i_{\Mod{C}}(X, Y) \longrightarrow \Ext^i_{R_P}\left(\Hom_{\Mod{C}}(P, X), \Hom_{\Mod{C}}(P, Y)\right)$ above defined is an isomorphism for all $n \geq 0$, provided one of the three following conditions holds:

- (a) $X \in \mathbb{P}_n$, $Y \in \mathbb{I}_j$ and $n \leq i + j$,
- (b) $X \in \Mod{C}$ and $Y \in \mathbb{I}_{n+1}$,
- (c) $X \in \mathbb{P}_{n+1}$ and $Y \in \Mod{C}$.

**Proof.** The prove given in [4, Theorem 3.2] works for this setting. □

We recall that the **projective dimension** of an object $M$ in an abelian category $\mathcal{A}$ with enough projectives is the length of the shortest projective resolution of $M$, and it is denoted by $\pd(M)$.

**Corollary 8.3.** Let $C$ be a dualizing $R$-variety and $P = \Hom_{C}(C, -) \in \Mod{C}$. The following conditions hold.

- (a) If $X \in \mathbb{P}_\infty$, then $\pd(X) = \pd_{R_P}\left((P, X)\right)$.
- (b) If $X \in \mathbb{I}_\infty$, then $\id(X) = \id_{R_P}\left((P, X)\right)$.

**Proof.** It follows from 8.2. □
The global dimension of $\mathcal{A}$ is the supremum of the projective dimensions $\text{p.d}(M)$ with $M \in \mathcal{A}$; and it is denoted by $\text{gl.dim}(\mathcal{A})$.

**Proposition 8.4.** Let $\mathcal{C}$ be a dualizing $R$-variety and $P = \text{Hom}_C(C, -) \in \text{mod}(\mathcal{C})$. If $P_1 = P_\infty$ or $I_1 = I_\infty$ then $\text{gl.dim}(\text{mod}(RP)) \leq \text{gl.dim}(\text{mod}(\mathcal{C}))$.

**Proof.** We know that $\text{Hom}_{\text{mod}(\mathcal{C})}(P, -) : P_1 \to \text{mod}(RP)$ and $\text{Hom}_{\text{mod}(\mathcal{C})}(P, -) : I_1 \to \text{mod}(RP)$ are equivalences (see 7.8(a)). By 8.3, for each $M \in \text{mod}(RP)$ there exists $X \in \text{mod}(\mathcal{C})$ such that $\text{p.d}_{\text{mod}(\mathcal{C})}(X) = \text{p.d}_{\text{mod}(RP)}(M)$. This implies that $\text{gl.dim}(\text{mod}(RP)) \leq \text{gl.dim}(\text{mod}(\mathcal{C}))$. $\square$

**Proposition 8.5.** Let $\mathcal{C}$ be a dualizing $R$-variety with cokernels and consider $P = \text{Hom}_C(C, -) \in \text{mod}(\mathcal{C})$. If $P_1 = P_\infty$ or $I_1 = I_\infty$ then $\text{gl.dim}(RP) \leq 2$. In particular, $RP$ is a quasi-hereditary algebra.

**Proof.** If $\mathcal{C}$ has cokernels we know that $\text{gl.dim}(\text{mod}(\mathcal{C})) \leq 2$ (see [1, Theorem 2.2(b)]. By 8.4, we have that $\text{gl.dim}(RP) \leq 2$. By a well known result of Dlab-Ringel (see [7, Theorem 2]), we now that every artin algebra with global dimension less or equal to 2 is quasi-hereditary. $\square$

If we work in the category $\text{mod}(\mathcal{C}^{\text{op}})$, with the projective $P^{*} = \text{Hom}_C(-, C)$ and $J^{*} := I_0\left(\frac{P^{*}}{\text{rad}(P^{*})}\right)$, the injective envelope of $\frac{P^{*}}{\text{rad}(P^{*})}$ in $\text{mod}(\mathcal{C}^{\text{op}})$; we can define $P^*_k$ and $I^*_k$ in a similar way to definitions 6.14 and 6.19.

**Proposition 8.6.** Let $\mathcal{C}$ be a dualizing $R$-variety and $P = \text{Hom}_C(C, -) \in \text{mod}(\mathcal{C})$.

(a) Then we have that $X \in \mathcal{P}_k$ if and only if $D_{\mathcal{C}}(X) \in \mathcal{I}^*_k$.

(b) Then we have that $X \in \mathcal{I}_k$ if and only if $D_{\mathcal{C}}(X) \in \mathcal{P}^*_k$.

**Proof.** It follows from duality using 6.12, 6.25 and 6.16. $\square$

**Proposition 8.7.** Let $\mathcal{C}$ be a dualizing $R$-variety and $P = \text{Hom}_C(C, -) \in \text{mod}(\mathcal{C})$. Let $1 \leq k \leq \infty$. Then

(a) $Y \in \mathcal{I}_k$ if and only if $\Phi_{X,Y} : \text{Ext}^{i}_{\text{mod}(\mathcal{C})}(X,Y) \to \text{Ext}^{i}_{RP}(\mathcal{P},X)(\mathcal{P},Y)$

is an isomorphism for all $0 \leq i \leq k - 1$ and for all $X \in \text{mod}(\mathcal{C})$.

(b) $X \in \mathcal{P}_k$ if and only if $\Phi_{X,Y} : \text{Ext}^{i}_{\text{mod}(\mathcal{C})}(X,Y) \to \text{Ext}^{i}_{RP}(\mathcal{P},X)(\mathcal{P},Y)$

is an isomorphism for all $0 \leq i \leq k - 1$ and for all $Y \in \text{mod}(\mathcal{C})$.

**Proof.** (a) $(\Rightarrow)$. It follows by 8.2(b).

$(\Leftrightarrow)$. Consider the ideal $\mathcal{I} := \text{Tr}_P \mathcal{C}$ and the exact sequence in $\text{mod}(\mathcal{C})$

$\begin{array}{cccccc}
\varepsilon : & 0 & \to & \mathcal{I}(C',-), & \to & \text{Hom}_C(C',-), & \to & \text{Hom}_C(C',-), & \to & 0 \\
\end{array}$

We have that $\varepsilon(P,\mathcal{I}(C',-)) \to (P,\text{Hom}_C(C',-))$ is an isomorphism. Then

$\text{Ext}^{i}_{RP}(\mathcal{P},\text{Hom}_C(C',-)),(\mathcal{P},Y) \to \text{Ext}^{i}_{RP}(\mathcal{P},\varepsilon(\mathcal{C}',-)),(\mathcal{P},Y)$

is an isomorphism for all $i \geq 0$. On the other hand, we have the commutative diagram

$$
\begin{array}{ccc}
\text{Ext}^{i}_{\text{mod}(\mathcal{C})}(\text{Hom}_C(C',-),Y) & \to & \text{Ext}^{i}_{\text{mod}(\mathcal{C})}(\mathcal{I}(C',-),Y) \\
\Phi_{\mathcal{I}(C',-),Y} & & \Phi_{\mathcal{I}(C',-),Y} \\
\text{Ext}^{i}_{RP}(\mathcal{P},\text{Hom}_C(C',-)),(\mathcal{P},Y) & \to & \text{Ext}^{i}_{RP}(\mathcal{P},\varepsilon(\mathcal{C}',-)),(\mathcal{P},Y)
\end{array}
$$
By hypothesis, the vertical mappings are isomorphisms for all $0 \leq i \leq k - 1$. Then we have the following isomorphism for all $0 \leq i \leq k - 1$

$$(**) : \text{Ext}^i_{\text{mod}(\mathcal{C})}(\text{Hom}_C(C', -), Y) \xrightarrow{\text{mod}(\mathcal{C})} \text{Ext}^i_{\text{mod}(\mathcal{C})}(\mathcal{I}(C', -), Y).$$

For $i = 0$, we get the isomorphism $\left(\text{Hom}_C(C', -), Y\right) \rightarrow \left(\mathcal{I}(C', -), Y\right)$. Applying $\text{Hom}_{\text{mod}(\mathcal{C})}(-, Y)$ to the sequence $(*)_i$ we get that $\left(\text{Hom}_C(C', -), Y\right) = 0 = \text{Ext}^1_{\text{mod}(\mathcal{C})}(\mathcal{I}(C', -), Y)$. For $1 \leq i \leq k - 1$, using the isomorphism $(**)$, we have that $\text{Ext}^i_{\text{mod}(\mathcal{C})}(\mathcal{I}(C', -), Y) = 0$. Hence, we get that $\text{Ext}^i_{\text{mod}(\mathcal{C})}(\mathcal{I}(C', -), Y) \rightarrow \text{Ext}^i_{\text{mod}(\mathcal{C})}(\mathcal{I}(C', -), Y) = 0$ for $2 \leq i \leq k$. Therefore, we have that $\text{Ext}^i_{\text{mod}(\mathcal{C})}(\mathcal{I}(C', -), Y) = 0$ for $0 \leq i \leq k$. Therefore, we have that $\text{Ext}^i_{\text{mod}(\mathcal{C})}(\mathcal{I}(C', -), Y) = 0$ for all $Q \in \text{mod}(\mathcal{C}/\mathcal{I})$ projective and $i = 0, \ldots, k$. By 6.25, we have that $Y \in \mathcal{I}_k$. The item (b) follows from (a), by using duality and 8.6.

\begin{proposition}
Let $\mathcal{C}$ be a dualizing $R$-variety and $P = \text{Hom}_C(C, -) \in \text{mod}(\mathcal{C})$. Let $X \in \mathcal{I}_1$ and $k \geq 1$. Then $X \in \mathcal{I}_k$ if and only if $\text{Ext}^i_{R_P}(P^*(C'), (P, X)) = 0$ for all $1 \leq i \leq k - 1$ and for all $C' \in \mathcal{C}$.
\end{proposition}

\begin{proof}$\Rightarrow$. Suppose that $X \in \mathcal{I}_1$. Then, we get that $\text{Ext}^i_{R_P}(P^*(C'), (P, X)) \simeq \text{Ext}^i_{\text{mod}(\mathcal{C})}(C', X) = 0$ for all $1 \leq i \leq k - 1$ and for all $C' \in \mathcal{C}$.

$\Leftarrow$. Suppose that $\text{Ext}^i_{R_P}(P^*(C'), (P, X)) = 0$ for all $1 \leq i \leq k - 1$ and for all $C' \in \mathcal{C}$. Let us see by induction on $k$ that $X \in \mathcal{I}_k$. For $k = 1$, by hypothesis, we have that $X \in \mathcal{I}_1$. So let us check the first non trivial case, then suppose that $k = 2$. Consider the ideal $\mathcal{I} = \text{Tr}_P \mathcal{C}$ and $\pi_1 : \mathcal{C} \rightarrow \mathcal{C}/\mathcal{I}$ the projection. Since $\mathcal{I}(C', -) = \text{Tr}_P(\text{Hom}_C(C', -))$, we have that $\mathcal{I}(C', -) \in \mathcal{P}_0$. By 8.2(a), we have an isomorphism $\text{Ext}^1_{\text{mod}(\mathcal{C})}(\mathcal{I}(C', -), X) \rightarrow \text{Ext}^1_{R_P}(P, \mathcal{I}(C', -))$, $(P, X))$. Since $\mathcal{I}(C', -) = \text{Tr}_P(\text{Hom}_C(C', -))$, there exists an isomorphism $(P, \mathcal{I}(C', -)) \simeq (P, \text{Hom}_C(C', -))$. Then we have that $\text{Ext}^i_{R_P}(P^*(C'), (P, X)) \simeq \text{Ext}^i_{\text{mod}(\mathcal{C})}(C', X)$.

By hypothesis we have that $\text{Ext}^1_{R_P}(P^*(C'), (P, X)) = 0$, then we conclude that $\text{Ext}^i_{\text{mod}(\mathcal{C})}(C', X) = 0$. This implies that $\text{Ext}^1_{\text{mod}(\mathcal{C})}(\pi_1)_*(Q), X) = 0$ for all projective module $Q \in \text{mod}(\mathcal{C}/\mathcal{I})$. Since $X \in \mathcal{I}_1$ (hypothesis), we have that $\text{Ext}^1_{\text{mod}(\mathcal{C})}(\pi_1)_*(Q), X) = 0$ for all projective module $Q \in \text{mod}(\mathcal{C}/\mathcal{I})$ and $i = 0, 1$ (see 6.25). By 6.25, we have that $X \in \mathcal{I}_2$.

Suppose that the theorem is true for $k - 1$ with $k - 1 \geq 2$. Let $X \in \text{mod}(\mathcal{C})$ such that $\text{Ext}^i_{R_P}(P^*(C'), (P, X)) = 0$ for all $1 \leq i \leq k - 1$ and for all $C' \in \mathcal{C}$. In particular, we have that $\text{Ext}^i_{R_P}(P^*(C'), (P, X)) = 0$ for all $C' \in \mathcal{C}$. Then, by the case $k = 2$ just proved above, we have that $X \in \mathcal{I}_2$. Then, we have an exact sequence: $(*)_i : 0 \rightarrow X \rightarrow I_0 \rightarrow L \rightarrow 0$ with $I_0 \in \text{add}(J)$ and $L \in \mathcal{I}_1$. Applying $\text{Hom}_{\text{mod}(\mathcal{C})}(P, -)$ we get an exact sequence $0 \rightarrow (P, X) \rightarrow (P, I_0) \rightarrow (P, L) \rightarrow 0$. Since $I_0 \in \text{add}(J)$, we have that $(P, I_0)$ is an injective $R_P$-module (see 7.8(c)). Then, applying $\text{Hom}_{R_P}(P^*(C'), -)$ to the last exact sequence, we have an isomorphism $\text{Ext}^i_{R_P}(P^*(C'), (P, L)) \simeq \text{Ext}^{i+1}_{R_P}(P^*(C'), (P, X))$ for all $i \geq 1$. By
Theorem 8.8. Let $C$ be a dualizing $R$-variety and $P = \text{Hom}_C(C, -) \in \text{mod}(C)$. The following holds.

(a) $I_1 = \mathbb{I}_\infty$ if and only if $P^*(C') = \text{Hom}_{\text{mod}(C)}(P, \text{Hom}_C(C', -))$ is a projective $R_P$-module for all $C' \in C$.

(b) $P_1 = \mathbb{P}_\infty$ if and only if $P(C') \cong \text{Hom}_{\text{mod}(C)}(\text{Hom}_C(C', -), P)$ is a projective $R_{P'}$-module for all $C' \in C$.

Proof. $(\Rightarrow)$. Suppose that $I_1 = \mathbb{I}_\infty$. Consider $Z \in \text{mod}(R_P)$. Since $\text{Hom}_{\text{mod}(C)}(P, -) I_1 : I_1 \to \text{mod}(R_P)$ is an equivalence (see 7.8), there exists an $X \in I_1$ such that $Z \cong (P, X)$. Then, $\text{Ext}^i_{R_P}(P^*(C'), Z) \cong \text{Ext}^i_{R_P}(P^*(C'), (P, X)) = 0$ for all $i \geq 1$ (since $X \in I_1 = \mathbb{I}_\infty$ and 8.8). This proves that $P^*(C')$ is a projective $R_P$-module. The converse is analogous and the proof of (b) is similar.

Proposition 8.9. Let $C$ be a dualizing $R$-variety and $P = \text{Hom}_C(C, -) \in \text{mod}(C)$ and $M \in \text{mod}(C)$.

(a) There exists an exact sequence

$$0 \to K_1 \xrightarrow{u} P \otimes_{R_P} \text{Hom}_{\text{mod}(C)}(P, M) \xrightarrow{\epsilon'_M} M \to K_2 \to 0$$

with $M_1 := P \otimes_{R_P} \text{Hom}_{\text{mod}(C)}(P, M) \in \mathbb{P}_1$ and $K_1, K_2 \in \text{Ker}(\text{Hom}(P, -))$.

(b) $\text{Hom}_{\text{mod}(C)}(P, \epsilon'_M) : \text{Hom}_{\text{mod}(C)}(P, M_1) \to \text{Hom}_{\text{mod}(C)}(P, M)$ is an isomorphism.

Proof. This follows by considering, the counit of the following adjoint pair of functors $(P \otimes_{R_P} -, \text{Hom}_{\text{mod}(C)}(P, -))$. 

Now, we give other necessary and sufficient conditions for $I_1$ to be equal to $\mathbb{I}_\infty$.

Proposition 8.10. Let $C$ be a dualizing $R$-variety and $P = \text{Hom}_C(C, -) \in \text{mod}(C)$.

The following are equivalent

(a) $I_1 = \mathbb{I}_\infty$.

(b) $P \otimes_{R_P} \text{Hom}_{\text{mod}(C)}(P, \text{Hom}_C(C', -))$ is a projective $C$-module for all $C' \in C$.

Proof. $(b) \Rightarrow (a)$. Let $M = \text{Hom}_C(C', -)$ and we consider the module $M_1 := P \otimes_{R_P} \text{Hom}_{\text{mod}(C)}(P, M_1) \in \text{mod}(C)$. By 8.10, there exists a morphism $\epsilon'_M : M_1 \to M$ such that $\text{Hom}_{\text{mod}(C)}(P, \epsilon'_M) : \text{Hom}_{\text{mod}(C)}(P, M_1) \to \text{Hom}_{\text{mod}(C)}(P, M)$ is an isomorphism. Suppose that $M_1$ is a projective $C$-module. Since $M_1 \in \mathbb{P}_1$, we have that there exists an epimorphism $P^n \to M_1$. Then we have that $M_1 \in \text{add}(P)$. By 7.8, we have that $\text{Hom}_{\text{mod}(C)}(P, M_1)$ is a projective $R_P$-module. But $\text{Hom}_{\text{mod}(C)}(P, M) = P^*(C')$. Then we have that $P^*(C')$ is a projective $R_P$-module for all $C' \in C$. By 8.9, we have that $I_1 = \mathbb{I}_\infty$. The other implication is similar.

Proposition 8.11. Let $C$ be a dualizing $R$-variety and $P = \text{Hom}_C(C, -) \in \text{mod}(C)$ and $I = \text{Tr}_P C$. The following are equivalent.

(a) $I$ is 2-idempotent and $I_1 = \mathbb{I}_\infty$.

(b) $I(C', -)$ is a projective $C$-module for all $C' \in C$.

Proof. $(a) \Rightarrow (b)$. Let $C' \in C$, by 6.17, we have that $I(C', -) \in \mathbb{P}_1$ for all $C' \in C$. Then, by 7.8 we have that $I(C', -) = P \otimes_{R_P} \text{Hom}_{\text{mod}(C)}(P, I(C', -))$. But, since $I(C', -) = \text{Tr}_P(\text{Hom}_C(C', -))$, we have the following isomorphism of $R_P$-modules $\text{Hom}_{\text{mod}(C)}(P, I(C', -)) = \text{Hom}_{\text{mod}(C)}(P, \text{Hom}_C(C', -))$. Then $P \otimes_{R_P}$
Then, by \( \text{Proposition 8.14.} \) Let \( C \) be a dualizing \( R \)-variety, \( P = \text{Hom}_C(C,-) \in \text{mod}(C) \) and \( I = \text{Tr}_p C \). Consider the functor \( \pi_* : \text{mod}(C/I) \to \text{mod}(C) \). If \( I(C',-) \) is projective for \( k \in C \), we have a full embedding
\[
D^b(\pi_*) : D^b(\text{mod}(C/I)) \to D^b(\text{mod}(C))
\]
between its bounded derived categories.

Proof. Since \( I = \text{Tr}_p C \), we get an epimorphism \( P^n \to I(C',-) \) for each \( C' \in C \).
Since \( I(C',-) \) is projective for all \( C' \in C \), we have that \( I(C',-) \in \text{add}(P) \subseteq \mathbb{P}_\infty \).
Then, by 6.18, we have that \( I \) is strongly idempotent. That is,
\[
\varphi^i_{F,\pi_* (F')} : \Ext^i_{\text{mod}(C/I)}(F,F') \to \Ext^i_{\text{mod}(C)}(\pi_*(F),\pi_*(F'))
\]
is an isomorphism for all \( F,F' \in \text{mod}(C/I) \) and for all \( 0 \leq i < \infty \) (see definition 5.1). By [8, Theorem 4.3], we have the required full embedding. \( \square \)

9. Some examples

Consider an algebraically closed field \( K \) and the infinite quiver
\[
Q : 1 \overset{\alpha_1}{\to} 2 \overset{\alpha_2}{\to} \cdots \overset{\alpha_k}{\to} k \overset{\alpha_{k+1}}{\to} k+1 \overset{\alpha_{k+2}}{\to} \cdots
\]
Consider \( C := KQ/\langle \rho \rangle \), the path category associated to \( Q \) where \( \rho \) is given by the relations \( \alpha_{i+1} \alpha_i = 0 \) for all \( i \geq 1 \). By construction, we have that \( C \) is a Hom-finite \( K \)-category (for more details see for example [12, Proposition 6.6]).
It is well known that the category of representations \( \text{Rep}(Q,\rho) \) is equivalent to \( \text{Mod}(C) \). In this case, the projective and simple representations associated to the vertex \( k \) are of the form
\[
P_k : k \quad \quad \quad S_k : k
\]
\[
k + 1,
\]
(1a) Consider \( P = \oplus_{j=1}^k P_j \) and \( I = \text{Tr}_p C \). In this case, we have that \( \Hom_{\text{mod}(C)}(i,-) \)
\[
\begin{cases}
0 & \text{for } 1 \leq i \leq k \text{ and } \Hom_{\text{mod}(C)}(2(i,-)) \simeq \text{tr}_p(P_i) = P_i \text{ for } i \geq k + 1 \text{. Then for all } j \geq 1 \text{ we have that } \Ext^j_{\text{mod}(C)}(\Hom_{2(i,-)}(i,-), P') \circ \pi = 0 \text{ for all } i \in C = FQ/\langle \rho \rangle \text{ and for all } P' \in \text{mod}(C/I) \text{. By 5.2, we have that } I \text{ is strongly idempotent.} \end{cases}
\]
(1b) Consider the projective \( P := \oplus_{j=1}^k P_j \) and let \( I := \text{Tr}_p C \). We assert that \( \text{Tr}_p C \) is \((k-1)\)-idempotent.
Indeed, firstly we have that \( \Hom_{2(i,-)}(1,-) \simeq \text{tr}_p(P_i) \simeq S_1, \text{ where } S_1 \text{ is the simple representation associated to the vertex } 1 \). Moreover, we have that \( \text{tr}_p(P_i) = P_i \) for \( 2 \leq i \leq k \). Then we have that \( \Hom_{2(i,-)}(1,-) \simeq \text{tr}_p(P_i) \simeq P_i \) for \( 2 \leq i \leq k \). We also have that \( \text{Tr}_p(P_i) = 0 \) for \( i \geq k + 1 \); and hence
\[
\begin{cases}
\text{tr}_p(P_i) \simeq \text{tr}_p(P_i) = P_i \text{ for } i \geq k + 1. 
\end{cases}
\]
It is enough to show that $\operatorname{Ext}^j_{\text{Mod}(C)}(S_1, F' \circ \pi) = 0$ for all $0 \leq j \leq k - 1$ and $\forall F' \in \text{Mod}(C/I)$ (see 5.2). We have a projective resolution of $S_1$

$$\cdots \rightarrow P_{k+1} \rightarrow P_k \rightarrow \cdots \rightarrow P_1 \rightarrow S_1 \rightarrow 0$$

where each $P_i$ is the projective associated to the vertex $i$. Using this resolution we can see that $\operatorname{Ext}^j_{\text{Mod}(C)}(S_1, F' \circ \pi) = 0$ for all $1 \leq j \leq k - 1$. Therefore, we have that $\mathcal{I}$ is $(k - 1)$-idempotent.

(1c) The ideal given in item (b) is not $k$-idempotent. Indeed, we have that $S_k = \Omega^{k-1}(S_1)$ (the $k - 1$ syzygy of $S_1$). By the shifting lemma, we have that $\operatorname{Ext}^k_{\text{Mod}(C)}(S_1, S_{k+1}) \simeq \operatorname{Ext}^k_{\text{Mod}(C)}(S_k, S_{k+1})$. We have the exact sequence $0 \rightarrow S_{k+1} \rightarrow P_k \rightarrow S_k \rightarrow 0$ which does not split. We conclude that $\operatorname{Ext}^k_{\text{Mod}(C)}(S_1, S_{k+1}) \neq 0$. Then, $\mathcal{I}$ is not $k$-idempotent.

(2) Let $\mathcal{I}$ be a heredity ideal in $\mathcal{C}$, according to definition 3.2 in [15]. Then we have that $\mathcal{I}(C, -)$ is a projective $\mathcal{C}$-module for all $C \in \mathcal{C}$ and $\mathcal{I}$ is idempotent. Then by 5.2, we have that $\operatorname{Ext}^k_{\text{Mod}(C)}(\mathcal{I}(C, -), F' \circ \pi) = 0$ for all $F' \in \text{Mod}(C/I)$ and for all $C \in \mathcal{C}$.

Now, since the projective dimension of each $\mathcal{I}(C, -)$ is less or equal to 1, we have that $\operatorname{Ext}^j_{\text{Mod}(C)}(\mathcal{I}(C, -), F' \circ \pi) = 0$ for all $F' \in \text{Mod}(C/I)$ and for all $C \in \mathcal{C}$. Then, by 5.2, we have that $\mathcal{I}$ is strongly idempotent.

Acknowledgements

This work presents results obtained during the first author’s doctoral studies, carried out with a CONACYT grant (see [18]). The authors are grateful to the project PAPIIT-Universidad Nacional Autónoma de México IN100520.
