Abstract

In the paper, we propose a new accelerated zeroth-order momentum (Acc-ZOM) method to solve the non-convex stochastic mini-optimization problems. We prove that the Acc-ZOM method achieves a lower query complexity of $O(d^{3/4}\epsilon^{-3})$ for finding an $\epsilon$-stationary point, which improves the best known result by a factor of $O(d^{1/4})$ where $d$ denotes the parameter dimension. The Acc-ZOM does not require any batches compared to the large batches required in the existing zeroth-order stochastic algorithms. Further, we extend the Acc-ZOM method to solve the non-convex stochastic minimax-optimization problems and propose an accelerated zeroth-order momentum descent ascent (Acc-ZOMDA) method. We prove that the Acc-ZOMDA method reaches the best known query complexity of $\tilde{O}(\kappa_y^3(d_1 + d_2)^{3/2}\epsilon^{-3})$ for finding an $\epsilon$-stationary point, where $d_1$ and $d_2$ denote dimensions of the mini and max optimization parameters respectively and $\kappa_y$ is condition number. In particular, our theoretical result does not rely on large batches required in the existing methods. Moreover, we propose a momentum-based accelerated framework for the minimax-optimization problems. At the same time, we present an accelerated momentum descent ascent (Acc-MDA) method for solving the white-box minimax problems, and prove that it achieves the best known gradient complexity of $\tilde{O}(\kappa_y^3\epsilon^{-3})$ without large batches. Extensive experimental results on the black-box adversarial attack to deep neural networks (DNNs) and poisoning attack demonstrate the efficiency of our algorithms.

Keywords: Zeroth-Order, Momentum, Minmax, Nonconvex-(Strongly)Concave

1. Introduction

In the paper, we consider solving the following stochastic mini-optimization problem:

$$\min_{x \in \mathcal{X}} f(x) = \mathbb{E}_{\xi \sim \mathcal{D}}[f(x; \xi)], \quad (1)$$
where \( f(x) \) is a differentiable and possibly non-convex function, and \( X \subseteq \mathbb{R}^d \) is a convex closed set, and \( \xi \) is a random variable that following an unknown distribution \( D \). In machine learning, the expectation loss minimization is generally expressed as the problem (1). Stochastic gradient descent (SGD) is standard algorithm for solving the problem (1). However, it suffers from large variance resulting in a high gradient complexity of \( O(\epsilon^{-4}) \) (Ghadimi and Lan, 2013) for finding an \( \epsilon \)-stationary point, i.e., \( \mathbb{E}\|\nabla f(x)\| \leq \epsilon \). Thus, many variance-reduced algorithms (Allen-Zhu and Hazan, 2016; Reddi et al., 2016; Zhou et al., 2018; Fang et al., 2018; Wang et al., 2019) have been developed to improve the gradient complexity of the SGD. Specifically, Allen-Zhu and Hazan (2016); Reddi et al. (2016) proposed the non-convex SVRG algorithm, which reaches an improved gradient complexity of \( O(\epsilon^{-10/3}) \). Further, Zhou et al. (2018); Fang et al. (2018); Wang et al. (2019) proposed the SNVRG, SPIDER, and SpiderBoost algorithms respectively, which obtain a near-optimal gradient complexity of \( O(\epsilon^{-3}) \). More recently, the momentum-based variance reduced methods (Cutkosky and Orabona, 2019; Tran-Dinh et al., 2019) were recently proposed with the best known complexity of \( O(\epsilon^{-3}) \). At the same time, Arjevani et al. (2019) established a lower bound of complexity \( O(\epsilon^{-3}) \) for some variance reduction algorithms.

The above algorithms need to use the gradients of objective function to update the parameters. In many machine learning problems, however, the explicit gradients of their objective functions are difficult or infeasible to access. For example, in the reinforcement learning (Malik et al., 2020; Kumar et al., 2020; Huang et al., 2020a), it is difficult to calculate the explicit gradients of their objective functions. Even worse, in the adversarial attack to black-box deep neural networks (DNNs) (Chen et al., 2018), only prediction labels can be obtained. To solve such back-box problem (1), the zeroth-order methods (Ghadimi and Lan, 2013; Duchi et al., 2015) have been widely used with only querying the function value of \( f(x) \) and not accessing to its explicit formation. Recently, some zeroth-order stochastic algorithms (Ghadimi and Lan, 2013; Duchi et al., 2015; Nesterov and Spokoiny, 2017; Chen et al., 2019) have been presented by using the smoothing techniques such as Gaussian-distribution and Uniform-distribution smoothing. Similarly, these zeroth-order stochastic algorithms also suffer from the large variances resulting in a high query complexity of \( O(d\epsilon^{-4}) \) (Ghadimi and Lan, 2013) for finding an \( \epsilon \)-stationary point. To improve the query complexity, Fang et al. (2018); Ji et al. (2019) recently proposed accelerated zeroth-order stochastic gradient algorithms (i.e., SPIDER-SZO and ZO-SPIDER-Coord) based on the variance reduced technique of SPIDER (Fang et al., 2018). Although these two methods obtain a lower query complexity of \( O(d\epsilon^{-3}) \), these methods require large batches in both inner and outer loops of algorithms. At the same time, the practical performances of the methods are not consistent with their low query complexity, because these methods require large batches and strict learning rates to achieve this low complexity.

In this paper, thus, we propose a new accelerated zeroth-order momentum (Acc-ZOM) method to solve the black-box problem (1), which builds on the momentum-based variance reduction technique of STORM/ Hybrid-SGD (Cutkosky and Orabona, 2019; Tran-Dinh et al., 2019). Specifically, our Acc-ZOM method only need one sample to update the stochastic gradient at each iteration and uses the monotonically decreased learning rates. We prove that the Acc-ZOM method achieves a lower function query complexity of \( O(d^{3/4}\epsilon^{-3}) \) without large batches for finding an \( \epsilon \)-stationary point, which improves the
Table 1: **Query complexity** comparison of the representative non-convex zeroth-order methods for obtaining an $\epsilon$-stationary point of the black-box problems (1) and (2), respectively. GauGE, UniGE and CooGE are abbreviations of Gaussian, Uniform and Coordinate-Wise smoothing gradient estimators, respectively. Here $\kappa_y$ denotes the condition number for function $f(\cdot, y)$.

The best known complexity by a factor of $O(d^{1/4})$ (please see Table 1 for query complexity comparison of different non-convex zeroth-order methods).

Besides the problem (1) widely used in machine learning, there also exist many machine learning applications (Shapiro and Kleywegt, 2002; Nouiehed et al., 2019; Zhao, 2020) such as adversarial training (Goodfellow et al., 2014), reinforcement learning (Wai et al., 2019, 2018), distribution learning (Qi et al., 2020) and AUC maximization (Ying et al., 2016), which can be modeled as the minimax problems. In the paper, we focus on solving the following stochastic minimax-optimization problem:

$$
\min_{x \in \mathcal{X}} \max_{y \in \mathcal{Y}} f(x, y) = \mathbb{E}_{\xi \sim \mathcal{D}'}[f(x, y; \xi)],
$$

where the function $f(x, y)$ is $\tau$-strongly concave in $y$ but possibly nonconvex in $x$, and $\xi$ is a random variable that following an unknown distribution $\mathcal{D}'$. Here the constraint sets $\mathcal{X} \subseteq \mathbb{R}^{d_1}$ and $\mathcal{Y} \subseteq \mathbb{R}^{d_2}$ are compact and convex. In fact, the problem (2) can be seen as a zero-sum game between two players. The goal of the first player is to minimize $f(x, y)$ by varying $x$, while the other player’s aim is to maximize $f(x, y)$ by varying $y$. For solving the black-box minimax-optimization problem (2), we propose an accelerated zeroth-order momentum descent ascent (Acc-ZOMDA) method. When the minimax problem (2) is one-sided black-box (black-box w.r.t. $x$ and white box w.r.t. $y$), we propose an accelerated semi-zeroth-order momentum descent ascent (Acc-Semi-ZOMDA) method. When the minimax problem (2) is white-box, we present an accelerated momentum descent ascent (Acc-MDA) method.

**Contributions:** Our main contributions are summarized as follows:

1) We propose a new accelerated zeroth-order momentum (Acc-ZOM) method to solve the black-box problem (1). The Acc-ZOM method can achieve a lower query complexity of $O(d^{3/4}\epsilon^{-3})$ without large batches, which improves the best known result by a factor of $O(d^{1/4})$.
Table 2: **Gradient complexity** comparison of the representative gradient descent ascent methods for obtaining an $\epsilon$-stationary point of the **white-box** problem (2). Here $Y$ denote the fact that there exists a convex constraint on variable, otherwise is $N$. Note that our theoretical results do not rely on more assumptions on the convex constrain sets, so it can be easily extend to the non-constrain setting.

2) We extend the Acc-ZOM method to solve the black-box problem (2), and present an accelerated zeroth-order momentum descent ascent (Acc-ZOMDA) method. The Acc-ZOMDA obtains the best known query complexity of $\tilde{O}(\kappa_0^3(d_1 + d_2)^{3/2} \epsilon^{-3})$ without large batches.

3) We propose an accelerated momentum framework for solving the stochastic minimax-optimization problems. Specifically, we propose an accelerated semi-zeroth-order momentum descent ascent (Acc-Semi-ZOMDA) method to solve one-sided black-box problem (2) (a black-box w.r.t. $x$ and a white box w.r.t. $y$). We prove that the Acc-Semi-ZOMDA method reaches a lower function query complexity of $\tilde{O}(\kappa_0^3 d_1^3/2 \epsilon^{-3})$.

4) In particular, we present an accelerated momentum descent ascent (Acc-MDA) method to solve the white-box problem (2). We prove that the Acc-MDA achieves the best known gradient complexity of $\tilde{O}(\kappa_0^3 \epsilon^{-3})$ without large batches (please see Table 2).

2. Related Works

In this section, we overview the recent zeroth-order methods for solving the mini-optimization problems and minimax-optimization problems, respectively.

2.1 Zeroth-Order Min-Optimization

Zeroth-order (gradient-free) methods are a class of powerful optimization tools to solve many machine learning problems, whose the explicit gradients are difficult or even infeasible to access. Recently, the zeroth-order methods have been widely proposed and studied. For example, Ghadimi and Lan (2013); Duchi et al. (2015); Nesterov and Spokoiny (2017) proposed several zeroth-order algorithms based on the Gaussian smoothing technique. Subsequently, some accelerated zeroth-order stochastic methods (Liu et al., 2018b; Ji et al., 2019) have been proposed by using the variance reduced techniques. To solve the constrained optimization, the zeroth-order projected method (Liu et al., 2018c) and the zeroth-order Frank-Wolfe methods (Balasubramanian and Ghadimi, 2018; Chen et al., 2018; Sahu et al., 2019; Huang et al., 2020b) have been recently proposed. More recently, Chen et al. (2019) has proposed a zeroth-order adaptive momentum method to solve the constrained problems. To solve the nonsmooth optimization, several zeroth-order proximal algorithms (Ghadimi
et al., 2016; Huang et al., 2019c; Ji et al. 2019) and zeroth-order ADMM-based algorithms (Gao et al., 2018; Liu et al., 2018a; Huang et al., 2019a b) have been proposed.

2.2 Zeroth-Order and First-Order Minimax-Optimization

The above zeroth-order methods only focus on the mini-optimization problems. In fact, many machine learning problems such as reinforcement learning (Wai et al., 2019, 2018), black-box adversarial attack (Liu et al., 2019b), and adversarial training (Goodfellow et al., 2014 Liu et al. 2019a). can be expressed as the minimax-optimization problems.

For the white-box minimax problems, more recently, some gradient-based descent ascent (GDA) methods (Rafique et al., 2018; Jin et al., 2019; Nouiehed et al., 2019; Thekumparampil et al., 2019; Lin et al., 2019; Yang et al., 2020 Ostrovskii et al., 2020; Yan et al. 2020; Lin et al. 2020; Xu et al., 2020a; Luo et al., 2020; Xu et al., 2020b; Bot  and Böhm, 2020) have been proposed for solving the minimax-optimization problems. For example, Xu et al. (2020b) proposed a unified single-loop alternating gradient projection algorithm for non( convex)-non( concave) minimax problems. Xu et al. (2020a); Luo et al. (2020) proposed a class of fast stochastic GDA algorithms based on the SARAH/SPIDER (Nguyen et al., 2017; Fang et al., 2018) to solve the stochastic minimax problems. Yang et al. (2020) proposed an alternating gradient descent ascent (AGDA) algorithm to solve a subclass of nonconvex nonconcave minimax problems, whose objective satisfies a so-called two-sided Polyak-Lojasiewicz inequality. Ostrovskii et al. (2020) proposed an efficient algorithm for finding first-order Nash equilibria in nonconvex concave minimax problems In addition, Tran-Dinh et al. (2020) presented hybrid variance-reduced SGD Algorithms for a special case of nonconvex-concave stochastic minimax problems, which are equivalent to a class of stochastic compositional problems. In fact, Tran-Dinh et al. (2020)) only focus on solving stochastic compositional problems by using hybrid variance-reduced SGD methods, as in Qi et al. (2020).

For the black-box minimax problems, more recently, some zeroth-order descent ascent methods (Liu et al., 2019b; Wang et al., 2020; Xu et al., 2020a) have been presented to solve the minimax-optimization problem (2). In addition, some online zeroth-order extra-gradient algorithms (Roy et al., 2019) have been proposed to solve the strongly convex and concave minimax problems.

Notations: \(\langle x, y \rangle\) denotes the inner product of two vectors x and y. \(\| \cdot \| \) denotes the \(\ell_2\) norm for vectors and spectral norm for matrices. Given function \(f(x, y)\), \(f(x, \cdot)\) denotes function w.r.t. the second variable with fixing x, and \(f(\cdot, y)\) denotes function w.r.t. the first variable with fixing y. Let \(\nabla f(x, y) = (\nabla_x f(x, y), \nabla_y f(x, y))\), where \(\nabla_x f(x, y)\) and \(\nabla_y f(x, y)\) denote the partial gradients w.r.t. variables x and y, respectively. Define two increasing \(\sigma\)-algebras \(\mathcal{F}_t^1 := \{\xi_1, \xi_2, \cdots, \xi_{t-1}\}\) and \(\mathcal{F}_t^2 := \{u^1, u^2, \cdots, u^{t-1}\}\) for all \(t \geq 2\), where \(\{u_t\}_{t=1}^{\infty}\) is a vector generated from the uniform distribution over the unit sphere, then let \(\mathbb{E}[\cdot] = \mathbb{E}[\cdot|\mathcal{F}_t^1, \mathcal{F}_t^2]\). We denote \(a = O(b)\) if \(a \leq \nu b\) for some constant \(\nu > 0\). The notation \(\tilde{O}\) hides logarithmic terms. Given a convex closed set \(\mathcal{X}\), we define a projection operation to \(\mathcal{X}\) as \(\mathcal{P}_\mathcal{X}(x_0) = \arg \max_{x \in \mathcal{X}} \frac{1}{2} \| x - x_0 \|^2\).
3. Preliminaries

In this section, we review the Uniform smoothing Gradient Estimator (UniGE) (Gao et al., 2018; Ji et al., 2019). Given any function $f(x) : \mathbb{R}^d \rightarrow \mathbb{R}$, the UniGE can generate an approximated gradient according to:

$$\hat{\nabla} f(x) = \frac{f(x + \mu u) - f(x)}{\mu/d} u,$$

where $u \in \mathbb{R}^d$ is a vector generated from the uniform distribution over the unit sphere, and $\mu$ is a smoothing parameter. Let $f_\mu(x) = \mathbb{E}_{u \sim U_B}[f(x + \mu u)]$ be a smooth approximation of $f(x)$, where $U_B$ is the uniform distribution over the $d$-dimensional unit Euclidean ball $B$.

Following Gao et al. (2018); Ji et al. (2019), we have $\mathbb{E}_{(u,\xi)}[\hat{\nabla} f(x;\xi)] = \nabla f_\mu(x)$.

**Assumption 1** The variance of stochastic zeroth-order gradient is bounded, i.e., there exists a constant $\sigma > 0$ such that for all $x$, it follows $\mathbb{E} \| \hat{\nabla} f(x;\xi) - \nabla f_\mu(x) \|^2 \leq \sigma^2$.

Since $\mathbb{E}_{(u,\xi)}[\hat{\nabla} f(x;\xi)] = \nabla f_\mu(x)$, Assumption 1 is similar to the upper bound of variance of stochastic gradient in (Ghadimi and Lan, 2013; Cutkosky and Orabona, 2019). Similarly, for any function $f(x,y) : \mathbb{R}^{d_1} \times \mathbb{R}^{d_2} \rightarrow \mathbb{R}$, the UniGE can generate an approximated partial gradients according to:

$$\hat{\nabla}_x f(x,y) = \frac{f(x + \mu_1 u_1,y) - f(x,y)}{\mu_1/d_1} u_1, \quad \hat{\nabla}_y f(x,y) = \frac{f(x,y + \mu_2 u_2) - f(x,y)}{\mu_2/d_2} u_2,$$

where $u_1 \in \mathbb{R}^{d_1}$ and $u_2 \in \mathbb{R}^{d_2}$ are the vector generated from the uniform distribution over the unit sphere $U_{B_1}$ and $U_{B_2}$, respectively, and $\mu_1$ and $\mu_2$ are the smoothing parameters. Here $U_{B_1}$ and $U_{B_2}$ denote the uniform distributions over the $d_1$-dimensional unit Euclidean ball $B_1$ and $d_2$-dimensional unit Euclidean ball $B_2$, respectively. The smoothed functions can be defined as:

$$f_{\mu_1}(x,y) = \mathbb{E}_{u_1} f(x + \mu_1 u_1,y), \quad f_{\mu_2}(x,y) = \mathbb{E}_{u_2} f(x,y + \mu_2 u_2).$$

Following Gao et al. (2018); Liu et al. (2019b), we have $\mathbb{E}_{(u_1,\xi)}[\hat{\nabla}_x f(x,y;\xi)] = \nabla_x f_{\mu_1}(x,y)$ and $\mathbb{E}_{(u_2,\xi)}[\hat{\nabla}_y f(x,y;\xi)] = \nabla_y f_{\mu_2}(x,y)$. The following Assumption 2 is similar to the upper bound of variance of stochastic partial gradients in (Luo et al., 2020; Wang et al., 2020).

**Assumption 2** The variance of stochastic zeroth-order gradient is bounded, i.e., there exists a constant $\delta_1 > 0$ such that for all $x$, it follows $\mathbb{E} \| \hat{\nabla}_x f(x,y;\xi) - \nabla_x f_{\mu_1}(x,y) \|^2 \leq \delta_1^2$; there exists a constant $\delta_2 > 0$ such that for all $y$, it follows $\mathbb{E} \| \hat{\nabla}_y f(x,y;\xi) - \nabla_y f_{\mu_2}(x,y) \|^2 \leq \delta_2^2$. We also define $\delta = \max\{\delta_1, \delta_2\}$.

4. Acc-ZOM Algorithm

In this section, we propose a new accelerated zeroth-order momentum (Acc-ZOM) method to solve the black-box problem (1), where only the objective function values can be obtained. Specifically, the Acc-ZOM method builds on the momentum-based variance reduction technique of STORM (Cutkosky and Orabona, 2019). We begin with providing some mild conditions about the problem (1) as follows:
Algorithm 1 Acc-ZOM algorithm for black-box mini-optimization

1: Input: $T$, parameters $\{\gamma, k, m, c\}$ and initial input $x_1 \in \mathcal{X}$
2: for $t = 1, 2, \ldots, T$ do
3:  if $t = 1$ then
4:    Draw a sample $\xi_1$, and sample a vector $u \in \mathbb{R}^d$ from uniform distribution over unit sphere, then compute $v_1 = \hat{\nabla} f(x_1; \xi_1)$, where the zeroth-order gradient is estimated from (3);
5:  else
6:    Draw a sample $\xi_t$, and sample a vector $u \in \mathbb{R}^d$ from uniform distribution over unit sphere, then compute $v_t = \hat{\nabla} f(x_t; \xi_t) + (1 - \alpha_t)[v_{t-1} - \hat{\nabla} f(x_{t-1}; \xi_t)]$, where the zeroth-order gradients are estimated from (3);
7:  end if
8:  Compute $\eta_t = \frac{k}{(m+1)^{1/3}}$;
9:  Update $\hat{x}_{t+1} = \mathcal{P}_\mathcal{X}(x_t - \gamma v_t)$, and $x_{t+1} = x_t + \eta_t(\hat{x}_{t+1} - x_t)$;
10: Compute $\alpha_{t+1} = c\eta_t^2$;
11: end for
12: Output (in theory): $x_\zeta$ chosen uniformly random from $\{x_t\}_{t=1}^T$.

Assumption 3 The component function $f(x; \xi)$ is $L$-smooth such that
\[ \|\nabla f(x; \xi) - \nabla f(x'; \xi)\| \leq L\|x - x'\|, \forall x, x' \in \mathcal{X}. \]

Assumption 4 The function $f(x)$ is bounded from below in $\mathcal{X}$, i.e., $f^* = \inf_{x \in \mathcal{X}} f(x)$.

Assumption 3 imposes smoothness on each component loss function, which is a standard assumption in the nonconvex algorithms. Assumptions 4 guarantees the feasibility of the problem (2).

Algorithm 1 summarizes the algorithmic framework of the Acc-ZOM method for solving the black-box problem (1). In the problem (1), when the constrain $\mathcal{X} = \mathbb{R}^d$, i.e., it reduces to an unconstrained problem, the step 9 of algorithm 1 becomes $x_{t+1} = x_t - \gamma \eta_t v_t$. In Algorithm 1, we use the zeroth-order variance-reduced stochastic gradients as follows:
\[ v_t = \alpha_t \hat{\nabla} f(x_t; \xi_t) + (1 - \alpha_t)(\hat{\nabla} f(x_t; \xi_t) - \hat{\nabla} f(x_{t-1}; \xi_t) + v_{t-1}) \]
\[ = \nabla f(x_t; \xi_t) + (1 - \alpha_t)(v_{t-1} - \hat{\nabla} f(x_{t-1}; \xi_t)), \tag{6} \]
where $\rho_t \in (0, 1]$. When $\alpha_t = 1$, $v_t$ will degenerate a vanilla zeroth-order stochastic gradient; When $\alpha_t = 0$, $v_t$ will degenerate a zeroth-order stochastic gradient based on variance-reduced technique of SPIDER Fang et al. (2018).

Next, we define a reasonable metric to measure the convergence of Algorithm 1:
\[ G_t = \frac{1}{\gamma} \|\hat{x}_{t+1} - x_t\| + \|\nabla f(x_t) - v_t\|. \tag{7} \]

Following Ghadimi et al. (2016), if $\bar{x} \in \mathcal{X}$ is a stationary point or local minimum of the problem (1), we have $\bar{x} = \mathcal{P}_\mathcal{X}(\bar{x} - \gamma \nabla f(\bar{x}))$. When $G_t = \frac{1}{\gamma} \|\hat{x}_{t+1} - x_t\| + \|\nabla f(x_t) - v_t\| \to 0,$
we have \( v_t = \nabla f(x_t) \) and \( x_t = x_{t+1} = P_X(x_t - \gamma v_t) = P_X(x_t - \gamma \nabla f(x_t)) \). In particular, when \( \mathcal{X} = \mathbb{R}^d \), we have

\[
\mathcal{G}_t = \|v_t\| + \|\nabla f(x_t) - v_t\| \geq \|\nabla f(x_t)\|. \tag{8}
\]

Therefore, if \( \mathcal{G}_t \to 0 \), we have \( \|\nabla f(x_t)\| \to 0 \).

5. Acc-ZOMDA algorithm

In this section, we propose a novel accelerate zeroth-order momentum descent ascent (Acc-ZOMDA) method to solve the black-box problem (2), where only the objective function values can be obtained. We first introduce some mild conditions about problem (2):

**Assumption 5** The component function \( f(x, y; \xi) \) has an average \( L_f \)-Lipschitz gradient, i.e., for all \( x, x' \in \mathcal{X} \) and \( y, y' \in \mathcal{Y} \)

\[
\|\nabla f(x, y; \xi) - \nabla f(x', y'; \xi)\| \leq L_f \|(x, y) - (x', y')\|, \tag{9}
\]

where \( \nabla f(x, y; \xi) = (\nabla_x f(x, y; \xi), \nabla_y f(x, y; \xi)) \).

**Assumption 6** The objective function \( f(x, y) \) is \( \tau \)-strongly concave w.r.t \( y \), i.e., for any \( x \in \mathcal{X} \)

\[
\|\nabla_y f(x, y) - \nabla_y f(x, y')\| \geq \tau \|y - y'\|, \quad \forall y, y' \in \mathcal{Y}. \tag{10}
\]

Then the following inequality holds

\[
f(x, y) \leq f(x, y') + \langle \nabla_y f(x, y'), y - y' \rangle - \frac{\tau}{2} \|y - y'\|^2. \tag{11}
\]

Assumption 5 implies the partial gradients \( \nabla_x f(x, y) \) and \( \nabla_y f(x, y) \) are \( L_f \)-Lipschitz continuous. Since \( f(x, y) \) is strongly concave in \( y \in \mathcal{Y} \), there exists a unique solution to the problem \( \max_{y \in \mathcal{Y}} f(x, y) \) for any \( x \), and we define the solution as \( y^*(x) = \arg \max_{y \in \mathcal{Y}} f(x, y) \). Furthermore, we define the function \( g(x) \) as follows:

\[
g(x) = \max_{y \in \mathcal{Y}} f(x, y) = f(x, y^*(x)). \tag{12}
\]

**Assumption 7** The function \( g(x) \) is bounded from below in \( \mathcal{X} \), i.e., \( g^* = \inf_{x \in \mathcal{X}} g(x) \).

Algorithm 2 describes the algorithmic framework of Acc-ZOMDA method for solving the minimax-optimization problem (2). In Algorithm 2, we also use the variance reduced technique of STORM to estimate the zeroth-order gradient \( v_t \) and \( w_t \). For Algorithm 2, we define a reasonable metric to measure its convergence:

\[
\mathcal{H}_t = \frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\| + \|\nabla_x f(x_t, y_t) - v_t\| + \tilde{d}^2 L_f \|y_t - y^*(x_t)\|, \tag{13}
\]

where \( \tilde{d} = d_1 + d_2 \), the first two terms of \( \mathcal{H}_t \) measure the convergence of the iteration solutions \( \{x_t\}_{t=1}^T \), and the last term measures the convergence of the iteration solutions
Algorithm 2 Acc-ZOMDA algorithm for black-box minimax-optimization

1: **Input:** $T$, parameters $\{\gamma, \lambda, k, m, c_1, c_2\}$ and initial input $x_1 \in X$ and $y_1 \in Y$;
2: **for** $t = 1, 2, \ldots, T$ **do**
3:   **if** $t = 1$ **then**
4:     Draw a sample $\xi_1$, and sample two vectors $u_1 \in \mathbb{R}^{d_1}$ and $u_2 \in \mathbb{R}^{d_2}$ from uniform distribution over unit sphere, then compute $v_1 = \nabla_x f(x_1, y_1; \xi_1)$ and $w_1 = \nabla_y f(x_1, y_1; \xi_1)$, where the zeroth-order gradients are estimated from (4);
5:   **else**
6:     Draw a sample $\xi_t$, and sample two vectors $u_1 \in \mathbb{R}^{d_1}$ and $u_2 \in \mathbb{R}^{d_2}$ from uniform distribution over unit sphere, then compute $v_t = \nabla_x f(x_t, y_t; \xi_t) + (1 - \alpha_t)[v_{t-1} - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t)]$ and $w_t = \nabla_y f(x_t, y_t; \xi_t) + (1 - \beta_t)[w_{t-1} - \nabla_y f(x_{t-1}, y_{t-1}; \xi_t)]$, where the zeroth-order gradients are estimated from (4);
7:   **end if**
8:   Compute $\eta_t = \frac{k}{(m+t)^{1/3}}$;
9:   Update primal variable: $\bar{x}_{t+1} = \mathcal{P}_X(x_t - \gamma v_t)$ and $x_{t+1} = x_t + \eta_t(\bar{x}_{t+1} - x_t)$;
10:  Update dual variable: $\bar{y}_{t+1} = \mathcal{P}_Y(y_t + \lambda w_t)$ and $y_{t+1} = y_t + \eta_t(\bar{y}_{t+1} - y_t)$;
11:  Compute $\alpha_{t+1} = c_1 \eta_t^2$ and $\beta_{t+1} = c_2 \eta_t^2$;
12: **end for**
13: **Output (in theory):** $x_\zeta$ and $y_\zeta$ chosen uniformly random from $\{x_t, y_t\}_{t=1}^T$.
14: **Output (in practice):** $x_T, y_T$.

$\{y_t\}_{t=1}^T$. Following Ghadimi et al. (2016), if $\bar{x} \in X$ is a stationary point or local minimum of the subproblem $\min_{x \in X} f(x, y)$ given any $y \in Y$, we have $\bar{x} = \mathcal{P}_X(\bar{x} - \gamma \nabla_x f(\bar{x}, y))$. When $\frac{1}{\gamma} \|\bar{x}_{t+1} - x_t\| + \|\nabla_x f(x_t, y_t) - v_t\| \to 0$, we have $v_t = \nabla_x f(x_t, y_t)$ and $x_t = \bar{x}_{t+1} = \mathcal{P}_X(x_t - \gamma v_t) = \mathcal{P}_X(x_t - \gamma \nabla_x f(x_t, y_t))$. Since the function $f(x, y)$ is strongly concave in $y \in Y$, there exists a unique solution $y^*(x)$ to the problem $\max_{y \in Y} f(x, y)$ for any $x \in X$. Thus, we apply the common metric $\|y_t - y^*(x_t)\|$ to measure to the convergence of parameter $y$. Here we use the coefficient $\tilde{d}^2 L_f$ to balance the scale of metrics of the primal variable $x$ and the dual variable $y$. In particular, when $X = \mathbb{R}^{d_1}$ and $Y = \mathbb{R}^{d_2}$, i.e., the problem (2) is unconstrained, we have:

$$
\mathcal{H}_t = \|v_t\| + \|\nabla_x f(x_t, y_t) - v_t\| + \tilde{d}^2 L_f \|y_t - y^*(x_t)\| \geq \|\nabla_x f(x_t, y_t) - \nabla_x f(x_t, y^*(x_t))\| \geq \|\nabla_x f(x_t, y_t)\| + \|\nabla_y f(x_t, y_t)\|,
$$

where the first inequality is due to Assumption 5, and the last inequality holds by $\nabla_y f(x_t, y^*(x_t)) = 0$ and $\tilde{d} \geq 2$. It implies that if $\mathcal{H}_t \to 0$, we have $\|\nabla_x f(x_t, y_t)\| \to 0$ and $\|\nabla_y f(x_t, y_t)\| \to 0$.

6. Acc-Semi-ZOMDA Algorithm

In this subsection, we propose the Acc-Semi-ZOMDA algorithm to solve one-sided black-box problem (2), where is a black-box w.r.t. $x$ and a white box w.r.t. $y$. Algorithm 3 provides the algorithmic framework of the Acc-Semi-ZOMDA.

Like as Algorithm 2, we define a metric to measure convergence of Algorithm 3:

$$
\mathcal{H}_t' = \frac{1}{\gamma} \|ar{x}_{t+1} - x_t\| + \|\nabla_x f(x_t, y_t) - v_t\| + d_1^{1/2} L_f \|y_t - y^*(x_t)\|,
$$

where $d_1 = \max\{d_1, \tilde{d} \}$. In addition, we also choose $\alpha_t = c_1 \eta_t^2$ and $\beta_t = c_2 \eta_t^2$, where $\eta_t = \frac{k}{(m+t)^{1/3}}$. As a result, Algorithm 3 also converge linearly in the strong convex-concave region, i.e., $\mathcal{H}_t' \to 0$ as $t \to \infty$.
Algorithm 3 Acc-Semi-ZOMDA algorithm for one-side black-box minimax-optimization

1: **Input:** $T$, parameters $\{\gamma, \lambda, k, m, c_1, c_2\}$ and initial input $x_1 \in \mathcal{X}$ and $y_1 \in \mathcal{Y}$;
2: for $t = 1, 2, \ldots, T$ do
3:   if $t = 1$ then
4:     Draw a sample $\xi_1$, and sample a vector $u_1 \in \mathbb{R}^d$ from uniform distribution over unit
5:       sphere, then estimate the zeroth-order stochastic gradient $v_1 = \nabla_x f(x_1, y_1; \xi_1)$, and compute stochastic gradient $w_1 = \nabla_y f(x_1, y_1; \xi_1)$;
6:   else
7:     Draw a sample $\xi_t$, and sample a vector $u_t \in \mathbb{R}^d$ from uniform distribution over unit
8:       sphere, then estimate the zeroth-order stochastic gradient $v_t = \nabla_x f(x_t, y_t; \xi_t) + (1 - \alpha_t)[v_{t-1} - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t)]$, and compute stochastic gradient $w_t = \nabla_y f(x_t, y_t; \xi_t) + (1 - \beta_t)[w_{t-1} - \nabla_y f(x_{t-1}, y_{t-1}; \xi_t)]$;
9:   end if
10:  Compute $\eta_t = \frac{k}{(m+1)^{1/3}}$;
11:  Update primal variable: $\tilde{x}_{t+1} = \mathcal{P}_Y(x_t - \gamma v_t)$ and $x_{t+1} = x_t + \eta_t(\tilde{x}_{t+1} - x_t)$;
12:  Update dual variable: $\tilde{y}_{t+1} = \mathcal{P}_Y(y_t + \lambda w_t)$ and $y_{t+1} = y_t + \eta_t(\tilde{y}_{t+1} - y_t)$;
13:  Compute $\alpha_{t+1} = c_1 \eta_t^2$ and $\beta_{t+1} = c_2 \eta_t^2$;
14: end for
15: **Output (in theory):** $x_\zeta$ and $y_\zeta$ chosen uniformly random from $\{x_t, y_t\}_{t=1}^T$.
16: **Output (in practice):** $x_T, y_T$.

where the first two terms of $\mathcal{H}_t'$ measure the convergence of the iteration solutions $\{x_t\}_{t=1}^T$, and the last term measures the convergence of the iteration solutions $\{y_t\}_{t=1}^T$. Following Ghadimi et al. (2016), if $\bar{x} \in \mathcal{X}$ is a stationary point or local minimum of the subproblem $\min_{x \in \mathcal{X}} f(x, y)$ given any $y \in \mathcal{Y}$, we have $\bar{x} = \mathcal{P}_X(\bar{x} - \gamma \nabla_x f(\bar{x}, y))$. When $\frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\| + \|\nabla_x f(x_t, y_t) - v_t\| \to 0$, we have $v_t = \nabla_x f(x_t, y_t)$ and $x_t = \tilde{x}_{t+1} = \mathcal{P}_X(x_t - \gamma v_t) = \mathcal{P}_X(x_t - \gamma \nabla_x f(x_t, y_t))$ Since the function $f(x, y)$ is strongly concave in $y \in \mathcal{Y}$, there exists an unique solution $y^*(x)$ to the problem $\max_{y \in \mathcal{Y}} f(x, y)$ for any $x \in \mathcal{X}$. Thus, we apply the common metric $\|y_t - y^*(x_t)\|$ to measure to the convergence of parameter $y$. Here we use the coefficient $d_1^{1/2} L_f$ to balance the scale of metrics of the primal variable $x$ and the dual variable $y$. In particular, when $\mathcal{X} = \mathbb{R}^d$ and $\mathcal{Y} = \mathbb{R}^d$, i.e., the problem (2) is unconstrained, we have

\[
\mathcal{H}_t' = \|v_t\| + \|\nabla_x f(x_t, y_t) - v_t\| + d_1^{1/2} L_f \|y_t - y^*(x_t)\|
\geq \|\nabla_x f(x_t, y_t)\| + d_1^{1/2} \|\nabla_y f(x_t, y_t) - \nabla_y f(x_t, y^*(x_t))\|
\geq \|\nabla_x f(x_t, y_t)\| + \|\nabla_y f(x_t, y_t)\|,
\]

where the first inequality is due to Assumption 5, and the last inequality holds by $\nabla_y f(x_t, y^*(x_t)) = 0$ and $d_1 \geq 1$. It implies that if $\mathcal{H}_t' \to 0$, we have $\|\nabla_x f(x_t, y_t)\| \to 0$ and $\|\nabla_y f(x_t, y_t)\| \to 0$.

7. Acc-MDA Algorithm

In this subsection, we propose the Acc-MDA algorithm to solve white-box problem (2). Algorithm 4 provides the algorithmic framework of the Acc-MDA.
and the last term measures the convergence of the iteration solutions
where the first two terms of

Algorithm 4 Accelerated Zeroth-Order Momentum Methods from Mini to Minimax Optimization

\[
\text{Algorithm 4} \quad \text{Acc-MDA algorithm for white-box minimax-optimization}
\]

1. Input: \( T \), parameters \( \{ \gamma, \lambda, k, m, c_1, c_2 \} \) and initial input \( x_1 \in \mathcal{X} \) and \( y_1 \in \mathcal{Y} \);
2. for \( t = 1, 2, \ldots, T \) do
3. \( \text{if } t = 1 \) then
4. Draw a sample \( \xi_1 \), and then compute stochastic gradients \( v_1 = \nabla_x f(x_1, y_1; \xi_1) \) and \( w_1 = \nabla_y f(x_1, y_1; \xi_1) \);
5. else
6. Draw a sample \( \xi_t \), and then compute stochastic gradients \( v_t = \nabla_x f(x_t, y_t; \xi_t) + (1 - \alpha_t)[v_{t-1} - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t)] \) and \( w_t = \nabla_y f(x_t, y_t; \xi_t) + (1 - \beta_t)[w_{t-1} - \nabla_y f(x_{t-1}, y_{t-1}; \xi_t)] \);
7. end if
8. Compute \( \eta_t = \frac{\kappa}{(m+t)^{\frac{1}{3}}} \);
9. Update primal variable: \( \tilde{x}_{t+1} = \mathcal{P}_\mathcal{X}(x_t - \gamma v_t) \) and \( x_{t+1} = x_t + \eta_t(\tilde{x}_{t+1} - x_t) \);
10. Update dual variable: \( \tilde{y}_{t+1} = \mathcal{P}_\mathcal{Y}(y_t + \lambda w_t) \) and \( y_{t+1} = y_t + \eta_t(\tilde{y}_{t+1} - y_t) \);
11. Compute \( \alpha_{t+1} = c_1 \eta_t^2 \) and \( \beta_{t+1} = c_2 \eta_t^2 \);
12. end for
13. Output (in theory): \( x_\zeta \) and \( y_\zeta \) chosen uniformly random from \( \{x_t, y_t\}_{t=1}^T \).
14. Output (in practice): \( x_T, y_T \).

Similar as Algorithm 2, we define a metric to measure convergence of Algorithm 4:

\[
\mathcal{H}''_t = \frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\| + \|\nabla_x f(x_t, y_t) - v_t\| + L_f \|y_t - y^*(x_t)\|, \tag{17}
\]

where the first two terms of \( \mathcal{H}''_t \) measure the convergence of the iteration solutions \( \{x_t\}_{t=1}^T \), and the last term measures the convergence of the iteration solutions \( \{y_t\}_{t=1}^T \). Following Ghadimi et al. (2016), if \( \tilde{x} \in \mathcal{X} \) is a stationary point or local minimum of the subproblem \( \min_{x \in \mathcal{X}} f(x, y) \) given any \( y \in \mathcal{Y} \), we have \( \tilde{x} = \mathcal{P}_\mathcal{X}(\tilde{x} - \gamma \nabla_x f(\tilde{x}, y)) \). When \( \frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\| + \|\nabla_x f(x_t, y_t) - v_t\| \to 0 \), we have \( v_t = \nabla_x f(x_t, y_t) \) and \( x_t = \tilde{x}_{t+1} = \mathcal{P}_\mathcal{X}(x_t - \gamma v_t) = \mathcal{P}_\mathcal{X}(x_t - \gamma \nabla_x f(x_t, y_t)) \). Since the function \( f(x, y) \) is strongly concave in \( y \in \mathcal{Y} \), there exists an unique solution \( y^*(x) \) to the problem \( \max_{y \in \mathcal{Y}} f(x, y) \) for any \( x \in \mathcal{X} \). Thus, we apply the common metric \( \|y_t - y^*(x_t)\| \) to measure to the convergence of parameter \( y \). Here we use the coefficient \( L_f \) to balance the scale of metrics of the primal variable \( x \) and the dual variable \( y \). In particular, when \( \mathcal{X} = \mathbb{R}^d_1 \) and \( \mathcal{Y} = \mathbb{R}^d_2 \), i.e., the problem \( (2) \) is unconstrained, we have

\[
\mathcal{H}''_t = \|v_t\| + \|\nabla_x f(x_t, y_t) - v_t\| + L_f \|y_t - y^*(x_t)\| \\
\geq \|\nabla_x f(x_t, y_t)\| + \|\nabla_y f(x_t, y_t) - \nabla_y f(x_t, y^*(x_t))\| \\
= \|\nabla_x f(x_t, y_t)\| + \|\nabla_y f(x_t, y_t)\|, \tag{18}
\]

where the first inequality is due to Assumption 5, and the last equality holds by \( \nabla_y f(x_t, y^*(x_t)) = 0 \). It implies that if \( \mathcal{H}''_t \to 0 \), we have \( \|\nabla_x f(x_t, y_t)\| \to 0 \) and \( \|\nabla_y f(x_t, y_t)\| \to 0 \).

In the paper, we main focus on solving the non-convex and strongly concave minimax problems. In fact, our algorithms also can solve the general non-convex and concave minimax problems. Like the alternating gradient projection method Xu et al. (2020b), we can use a regularized version of the original function \( f(x, y) - \frac{b}{2} \|y\|^2 \), where \( b > 0 \).
8. Convergence Analysis

In this section, we study the convergence properties of our algorithms (Acc-ZOM and Acc-ZOMDA) under some mild conditions. The related proofs of Acc-ZOM, Acc-ZOMDA, Acc-Semi-ZOMDA and Acc-MDA are provided in Appendix A.1, Appendix A.2, Appendix A.3 and Appendix A.4, respectively.

8.1 Convergence Analysis of the Acc-ZOM Algorithm

In this subsection, we provide the convergence properties of the Acc-ZOM algorithm. First, we define a function \( f_\mu(x) = \mathbb{E}_{u \sim U_B}[f(x + \mu u)] \), which is a smooth approximation of function \( f(x) \), where \( U_B \) is the uniform distribution over the \( d \)-dimensional unit Euclidean ball \( B \). The Acc-ZOM method builds on the momentum-based variance reduced technique of STORM. However, this technique strictly relies on the unbiased stochastic gradient, while our algorithm uses the biased zeroth-order stochastic gradient. To deal with this challenge, we skillfully borrow the approximate function \( f_\mu(x) \) to analyze the convergence properties of our algorithm.

**Theorem 1** Suppose the sequence \( \{x_t\}_{t=1}^T \) be generated from Algorithm 1. Let \( \eta_t = \frac{k}{(m + t)^{1/3}} \) for any \( t \geq 0 \), \( 0 < \gamma \leq \min \left( \frac{m^{1/3}}{2Lk}, \frac{1}{2\sqrt{6dL}} \right) \), \( c \geq \frac{2}{3} \), \( k > 0 \), \( m \geq \max(2,(ck)^3,k^3) \) and \( 0 < \mu \leq \frac{1}{d(m + T)^{2/3}} \), we have

\[
\mathbb{E}[G] = \frac{1}{T} \sum_{t=1}^{T} \mathbb{E}[\|\nabla f(x_t) - v_t\| + \frac{1}{\gamma}\|\tilde{x}_{t+1} - x_t\|] \leq \frac{\sqrt{2Mm^{1/6}}}{T^{1/2}} + \frac{\sqrt{2M}}{T^{1/3}} + \frac{L}{2(m + T)^{2/3}},
\]

where \( M = \frac{f_\mu(x_1) - f^*}{k\gamma} + \frac{m^{1/3}c^2}{k^2} + \frac{9L^2}{4k^2} + 2k^2e^2\sigma^2\ln(m + T) \).

**Remark 2** Let \( m \geq \max \left( (ck)^3,k^3,\frac{(k\sqrt{6dL})^3}{d} \right) \), we have \( \frac{m^{1/3}}{2Lk} \geq \frac{1}{2\sqrt{6dL}} \). It is easy verified that \( \gamma = O\left(\frac{1}{\sqrt{d}}\right) \) and \( M = O\left(\sqrt{d} + \ln(T)\right) \). Without loss of generality, let \( \sqrt{d} \geq \ln(T) \), so \( M = O\left(\sqrt{d}\right) \). Thus, the Acc-ZOM algorithm has \( O\left(\frac{d^{1/4}}{T^{1/4}}\right) \) convergence rate. By \( \frac{d^{1/4}}{T^{1/4}} \leq \epsilon \), i.e., \( \mathbb{E}[G] \leq \epsilon \), we choose \( T \geq d^{3/4}\epsilon^{-3} \). In Algorithm 1, we require to query four function values for estimating the zeroth-order gradients \( v_t \) at each iteration, and need \( T \) iterations. Thus, the Acc-ZOM algorithm has a query complexity of \( 4T = O(d^{3/4}\epsilon^{-3}) \) for finding an \( \epsilon \)-stationary point. In fact, our method apply the momentum-based variance reduced technique of STORM without relying on the large batches to estimate zeroth-order stochastic gradients, so it achieves a lower query complexity of \( O(d^{3/4}\epsilon^{-3}) \) than the existing methods relying on the large batches.

8.2 Convergence Analysis of the Acc-ZOMDA Algorithm

In this subsection, we provide the convergence properties of the Acc-ZOMDA algorithm. We first define a function \( g_\mu(x) = \mathbb{E}_{u_1 \sim U_{B_1}}[g(x + \mu u_1)] \), which is a smoothing approximation of the function \( g(x) = \max_{y \in Y} f(x,y) = f(x,y^*(x)) \). For notational simplicity, let \( d = d_1 + d_2 \), \( L_g = L_f + \frac{L_2^2}{\tau} \) and \( \kappa_y = L_f/\tau \) denotes the condition number for function \( f(\cdot,y) \).
Theorem 3 Suppose the sequence \( \{x_t, y_t\}_{t=1}^T \) be generated from Algorithm 2. Let \( y_1 = y^*(x_1) \), \( c_1 \geq \frac{2}{d^3} + \frac{9}{4d^2} \) and \( c_2 \geq \frac{2}{d^2} + \frac{625d_2^2}{3\tau} \), \( k > 0 \), \( m \geq \max(2, k^3, (c_1k)^3, (c_2k)^3) \), \( 0 < \lambda \leq \min \left( \frac{1}{d\tau}, \frac{1}{d^2} \right) \), \( 0 < \gamma \leq \min \left( \frac{1}{2d\tau}, \frac{1}{2d^2 \lambda \tau + 105d_2 \lambda \tau} \right) \), \( 0 < \mu_1 \leq \frac{1}{d_1(m+T)^{3/2}} \) and \( 0 < \mu_2 \leq \frac{1}{d_2^3/2(m+T)^{3/2}} \), we have

\[
\mathbb{E}[\mathcal{H}_t] = \frac{1}{T} \sum_{t=1}^T \mathbb{E}(d^{1/2}L_f || y^*(x_t) - y_t || + || \nabla f(x_t, y_t) - v_t || + \frac{1}{\gamma} \Vert \tilde{x}_{t+1} - x_t \Vert)
\leq \frac{2\sqrt{3M^*}m^{1/6}}{T^{1/2}} + \frac{\sqrt{3}M^*}{T^{1/3}} + \frac{L_f}{2(m+T)^{2/3}},
\]

(20)

where \( M^* = \frac{c_1^3 - c_2^3}{\gamma^2} \) \( + \frac{28\tau^2 L^4_2}{\lambda^2 \tau} \) \( + \frac{36\tau^2 L^2_1 + 625d_2^2}{8\tau^2} (m+T)^{-2/3} \) \( + \frac{9L^2_2}{4\tau^2 \lambda^2} + \frac{2(c_2^3 + c_2^3)\delta^2 \lambda^2}{2\mu_1} \ln(m+T). \)

Remark 4 Without loss of generality, let \( m \geq \max((c_1k)^3, (c_2k)^3, k^3, \frac{L_{oT}^2 \lambda \mu}{3\tau^2 (d_1 + d_2)^3/2}) \), \( \tilde{d} > L_f \) and \( \lambda = \min \left( \frac{1}{d\tau}, \frac{1}{d^2} \right) \). It is easy verified that \( \gamma = O \left( \frac{1}{\gamma^2 \sqrt{d}} \right) \), \( \lambda = O \left( \frac{1}{d} \right) \), \( c_1 = O(1) \) and \( c_2 = O(\kappa_{d_1}) \). So we have \( M^* = O \left( \frac{\kappa_{d_1}^3}{T^{1/3}} \right) \) convergence rate. By \( \frac{\kappa_{d_1}^3}{T^{1/3}} \leq \epsilon \), i.e., \( \mathbb{E}[\mathcal{H}_t] \leq \epsilon \), we choose \( T \geq \frac{\kappa_{d_1}^3}{T^{1/3}} \epsilon^{-3} \). In Algorithm 2, we need to query eight function values for estimating the zeroth-order gradients \( v_t \) and \( w_t \) at each iteration, and need \( T \) iterations. Thus, the Acc-ZOMDA algorithm has a query complexity of \( 8T = O \left( \frac{\kappa_{d_1}^3 \tilde{d}^3/2}{T^{1/3}} \right) = O \left( \frac{\kappa_{d_1}^3 (d_1 + d_2)^3/2 \epsilon^{-3}}{T^{1/3}} \right) \) for finding an \( \epsilon \)-stationary point. Note that though the query complexity of our method is only match that of the ZOSR-EDA-Boost (Xu et al., 2020a), the ZOSR-EDA-Boost method relies on large batches and expensive gradient estimator, i.e., CooGE.

8.3 Convergence Analysis of the Acc-Semi-ZOMDA Algorithm

In the subsection, we provide the convergence properties of the Acc-Semi-ZOMDA algorithm. We first define some function as the Acc-ZOMDA. Let \( f_{\mu_1}(x, y) = \mathbb{E}_{u_1 \sim U_{B_1}} f(x + \mu_1 u_1, y) \) denote the smoothing version of \( f(x, y) \) w.r.t. \( x \) with parameter \( \mu_1 \), where \( U_{B_1} \) denotes the uniform distributions over the \( d_1 \)-dimensional unit Euclidean ball \( B_1 \). At the same time, let \( g_{\mu_1}(x) = \max_{y \in \mathbb{Y}} \mathbb{E}_{u_1 \sim U_{B_1}} f(x + \mu_1 u_1, y) = \mathbb{E}_{u_1 \sim U_{B_1}} \max_{y \in \mathbb{Y}} f(x + \mu_1 u_1, y) = \mathbb{E}_{u_1 \sim U_{B_1}} [g(x + \mu_1 u_1)] \) denote the smoothing approximation of the function \( g(x) = \max_{y \in \mathbb{Y}} f(x, y) = f(x, y^*(x)) \). Next, we give a mild assumption instead of the above Assumption 2.

Assumption 8 The variance of stochastic (zeroth-order) gradient is bounded, i.e., there exists a constant \( \delta_1 > 0 \) such that for all \( x \), it follows \( \mathbb{E} \left| \tilde{\nabla}_x f(x, y; \xi) - \nabla_x f_{\mu_1}(x, y) \right|^2 \leq \delta_1^2 \); there exists a constant \( \delta_2 > 0 \) such that for all \( y \), it follows \( \mathbb{E} \left| \tilde{\nabla}_y f(x, y; \xi) - \nabla_y f(x, y) \right|^2 \leq \delta_2^2 \). We also define \( \delta = \max \{ \delta_1, \delta_2 \} \).

Theorem 5 Suppose the sequence \( \{x_t, y_t\}_{t=1}^T \) be generated from Algorithm 3. Let \( y_1 = y^*(x_1) \), \( c_1 \geq \frac{2}{d_3} + \frac{9\tau}{4d^2} \) and \( c_2 \geq \frac{2}{d_2} + \frac{625d_2^2}{3\tau} \), \( k > 0 \), \( m \geq \max(2, k^3, (c_1k)^3, (c_2k)^3) \),
The variance of stochastic gradient is bounded, in the subsection, we provide the convergence properties of the Acc-MDA algorithm. We have
\[
\mathbb{E}[\mathcal{H}_t^\gamma] = \frac{1}{T} \sum_{t=1}^{T} \mathbb{E}(d_t^{1/2}L_f\|y^*(x_t) - y_t\| + \|\nabla_x f(x_t, y_t) - v_t\| + \frac{1}{\gamma} \|\bar{x}_{t+1} - x_t\|)
\leq \frac{2\sqrt{3M''}m^{1/6}}{T^{1/2}} + \frac{2\sqrt{3M''}m}{T^{1/3}} + \frac{L_f}{2(m + T)^{2/3}},
\]
(21)
where \(M'' = \frac{g(x_1) - g^*}{\gamma_k} + \frac{2\delta^2}{\lambda x^k\kappa_0} + \frac{9L_f^2}{2(m + T)^{-2/3}} + \frac{9L_f^2}{4x^k\kappa_0} + \frac{2(c_1^2 + c_2^2)\delta^2k^2}{\lambda_x^3}\ln(m + T).

**Remark 6** Without loss of generality, let \(m \geq \max ((c_1k)^3, (c_2k)^3, (\frac{L_f}{\lambda_f\lambda^2 + 10\lambda_0\kappa_0})^3), d_1 > L_f \) and \(\lambda = \min (\frac{1}{6L_f}, \frac{1}{d_1})\). It is easy verified that \(\gamma = O(\frac{1}{\kappa_y^2}), \lambda = O(\frac{1}{\kappa_y^2}), c_1 = O(1)\) and \(c_2 = O(\kappa_y)\). So we have \(M'' = O(\kappa_y^3d_1^3\ln(T))\). Thus, the Acc-Semi-ZOMDA algorithm has \(O(\kappa_y^3d_1^3\ln(T))\) convergence rate. By \(\frac{\kappa_y^3d_1^3}{\gamma^2} \leq \epsilon\), i.e., \(\mathbb{E}[\mathcal{H}_t^\gamma] \leq \epsilon\), we choose \(T \geq \kappa_y^3d_1^3\epsilon^{-3}\). In Algorithm 3, we need to query four function values for estimating the zeroth-order gradient \(v_t\) and query two gradient oracle to estimate the stochastic gradient \(w_t\) at each iteration, and need \(T\) iterations. Thus, the Acc-Semi-ZOMDA algorithm has a lower query complexity of \(6T = O(\kappa_y^3d_1^3\epsilon^{-3})\) for finding an \(\epsilon\)-stationary point.

### 8.4 Convergence Analysis of the Acc-MDA Algorithm

In the subsection, we provide the convergence properties of the Acc-MDA algorithm. We first give a mild assumption instead of the above Assumption 2.

**Assumption 9** The variance of stochastic gradient is bounded, i.e., there exists a constant \(\delta_1 > 0\) such that for all \(x\), it follows \(\mathbb{E}\|\nabla_x f(x, y; \xi) - \nabla_x f(x, y)\|^2 \leq \delta_1^2\); There exists a constant \(\delta_2 > 0\) such that for all \(y\), it follows \(\mathbb{E}\|\nabla_y f(x, y; \xi) - \nabla_y f(x, y)\|^2 \leq \delta_2^2\). We also define \(\delta = \max\{\delta_1, \delta_2\}\).

**Theorem 7** Suppose the sequence \((x_t, y_t)_{t=1}^{T}\) be generated from Algorithm 4. Let \(y_t = y^*(x_1), c_1 \geq \frac{2}{3\kappa^2} + \frac{9\lambda}{4k^3}\) and \(c_2 \geq \frac{2}{3\kappa^2} + \frac{75L_f^2}{2k^2}, k > 0, m \geq \max (2, k^3, (c_1k)^3, (c_2k^3)^2), 0 < \lambda \leq \frac{1}{6L_f}\) and \(0 \leq \gamma \leq \min (\frac{\lambda^2}{2L_f\sqrt{\lambda + 38\kappa_0}}, \frac{m^{1/3}}{2L_x k^3})\), we have
\[
\mathbb{E}[\mathcal{H}_t^\gamma] = \frac{1}{T} \sum_{t=1}^{T} \mathbb{E}(L_f\|y^*(x_t) - y_t\| + \|\nabla_x f(x_t, y_t) - v_t\| + \frac{1}{\gamma} \|\bar{x}_{t+1} - x_t\|)
\leq \frac{2\sqrt{3M''}m^{1/6}}{T^{1/2}} + \frac{2\sqrt{3M''}m}{T^{1/3}} + \frac{L_f}{2(m + T)^{2/3}},
\]
(22)
where \(M'' = \frac{g(x_1) - g^*}{\gamma_k} + \frac{2\delta^2}{\lambda x^k\kappa_0} + \frac{2(c_1^2 + c_2^2)\delta^2k^2}{\lambda_x^3}\ln(m + T).

**Remark 8** Without loss of generality, let \(m \geq \max ((c_1k)^3, (c_2k)^3, (\frac{L_f}{\lambda_f\lambda^2 + 10\lambda_0\kappa_0})^3), \lambda = \frac{1}{6L_f}\). It is easy verified that \(\gamma = O(\frac{1}{\kappa_y^2}), \lambda = O(1), c_1 = O(1)\) and \(c_2 = O(\kappa_y)\). So
we have $M''' = O(\kappa_y^2 \ln(T))$. The Acc-MDA algorithm has $\tilde{O}(\frac{\kappa_y}{\sqrt{T}})$ convergence rate. By $\frac{\kappa_y}{T^{3/4}} \leq \epsilon$, i.e., $E[H^0] \leq \epsilon$, we choose $T \geq \kappa_y \epsilon^{-3}$. In Algorithm 4, we need to query four gradient oracle for estimating stochastic gradients $v_t$ and $w_t$ at each iteration, and need $T$ iterations. Thus, the Acc-MDA algorithm reaches the best known gradient complexity of $4T = \tilde{O}(\kappa_y^3 \epsilon^{-3})$ without large batches.

9. Experiments

In this section, we evaluate the performance of our algorithms on two applications: 1) black-box adversarial attack to deep neural networks (DNNs) and 2) poisoning attack to logistic regression. In the first application, we compare our Acc-ZOM algorithm with the ZO-AdaMM (Chen et al., 2019), ZO-SPIDER-Coord (Ji et al., 2019), SPIDER-SZO (Fang et al., 2018) and ZO-SFW (Sahu et al., 2019). In the second application, for two-sides black-box attack, we compare our Acc-ZOMDA algorithm with ZO-Min-Max (Liu et al., 2019b) and ZO-SGDA (Wang et al., 2020). For one-side black-box attack, we choose ZO-Min-Max (Liu et al., 2019b) as a baseline. For white-box attack, we choose SGDA (Lin et al. 2019) and SREDA (Luo et al., 2020) as baselines.

9.1 Black-Box Adversarial Attack to DNNs

In this subsection, we use our Acc-ZOM algorithm to generate adversarial perturbations to attack the pre-trained black-box DNNs, whose parameters are hidden and only its outputs are accessible. Let $(a, b)$ denote an image $a$ with its true label $b \in \{1, 2, \cdots, K\}$, where $K$ is the total number of image classes. Given multiple images $\{a_i, b_i\}_{i=1}^n$, we design a universal perturbation $x$ to a pre-trained black-box DNN. Following Guo et al. (2019), we consider the following untargeted attack problem:

$$
\min_{x \in \mathcal{X}} \frac{1}{n} \sum_{i=1}^n \max \left( f_{b_i}(x + a_i) - \max_{j \neq b_i} f_j(x + a_i), 0 \right), \quad \text{s.t. } \mathcal{X} = \{\|x\|_\infty \leq \epsilon\} \quad (23)
$$

where $f_j(x + a_i)$ represents the output with $j$-th class, that is, the final output before softmax of DNN. In the problem (23), we normalize the pixel values to $[0, 1]^d$.

In the experiment, we use the pre-trained DNNs on four benchmark datasets: MNIST, FashionMNIST, CIFAR-10, and SVHN, which attain 99.4%, 91.8%, 93.2%, and 80.8% test accuracy, respectively. Here, $n$ in problem (23) is set to 40 for all datasets. The batchsize of all algorithms is 10. Different datasets require different $\epsilon$. Specifically, $\epsilon$ is set to 0.4, 0.3, 0.1, 0.2 for MNIST, FashionMNIST, CIFAR-10, and SVHN, respectively. The hyper-parameters $\gamma, k, m, c$ of the Acc-ZOM are 0.1, 1, 3, 3. For the other algorithms, we follow the hyper-parameters in their original paper for a fair comparison. In Fig. 1, we plot attack loss vs. the number of function queries for each algorithm. Fig. 1 shows that our Acc-ZOM algorithm can largely outperform other algorithms in terms of function queries. The selection of hyper-parameters comply with theoretic analysis. $k$ is first chosen as 1. Given $k, c$ have to be larger than $\frac{2}{3k^3} + \frac{5}{3}$, we then choose $c$ as 3, which is the smallest integer larger than the threshold. Similarly, $m$ is chosen as 3 to satisfy the condition $m \leq \max((ck)^3, k^3)$. To study the impact of batch-size, we use three different batch-size settings: 5, 10, 20.
9.2 Poisoning Attack to Logistic Regression

In this subsection, we apply the task of poisoning attack to logistic regression to demonstrate the efficiency of our Acc-ZOMDA, Acc-Semi-ZOMDA and Acc-MDA. Let \(\{a_i, b_i\}_{i=1}^n\) denote the training dataset, in which \(n_0 \ll n\) samples are corrupted by a perturbation vector \(x\). Following Liu et al. (2019b), this poisoning attack problem is formulated as

\[
\max_{x \in \mathcal{X}} \min_{y \in \mathcal{Y}} f(x, y) = h(x, y; \mathcal{D}_p) + h(0, y; \mathcal{D}_t), \quad \text{s.t.} \quad \mathcal{X} = \{\|x\|_\infty \leq \varepsilon\}, \quad \mathcal{Y} = \{\|y\|_2^2 \leq \lambda_{\text{reg}}\}
\]

where \(\mathcal{D}_p\) and \(\mathcal{D}_t\) are corrupted set and clean set respectively, \(y\) is the model parameter, the corrupted rate \(\frac{|\mathcal{D}_p|}{|\mathcal{D}_t|+|\mathcal{D}_p|}\) is set to 0.15. Here \(h(x, y; \mathcal{D}) = -\frac{1}{|\mathcal{D}|} \sum_{(a_i, b_i) \in \mathcal{D}} \left[ b_i \log(g(x, y; a_i)) + (1 - b_i) \log(1 - g(x, y; a_i)) \right] \) with \(g(x, y; a_i) = \frac{1}{1+e^{-(x^{T} a_i + \nu_i)}}\). Since the adversary has no knowledge on the training procedure and data, \(f(x, y)\) is black-box. In the experiment, we generate \(n = 1000\) samples. Specifically, we randomly draw the feature vector \(a_i \in \mathbb{R}^{100}\) from normal distribution \(\mathcal{N}(0, 1)\), and label \(b_i = 1\) if \(\frac{1}{1+e^{-(x_i^{T} \theta + \nu_i)}} > \frac{1}{2}\), otherwise \(b_i = 0\). Here we choose \(\theta = (1, 1, \cdots, 1)\) as the ground-truth model parameters, and \(\nu_i \in \mathcal{N}(0, 10^{-3})\). For this experiment, we set \(\varepsilon\) and \(\lambda_{\text{reg}}\) to 2 and 0.001. We also chose the hyper-parameters \(\gamma, \lambda, k, m, c_1, c_2\) of our Acc-ZOMDA as 0.2, 0.08, 1, 3, 3, 3.

From Fig. 3, we can see that our Acc-ZOMDA algorithm converges fastest and achieves lowest stationary gap. The Acc-ZOMDA is also robust to different learning rate pairs of \((\gamma, \lambda)\). In Fig. 4, we show the comparison results for one-side black-box (black-box w.r.t
Accelerated Zeroth-Order Momentum Methods from Mini to Minimax Optimization

Figure 3: (a): Stationary gap of our method and comparison methods. (b): Stationary gap given different $(\gamma, \lambda)$ combinations.

Figure 4: Stationary gap of our method and comparison methods given one-side black-box scenario and white-box scenario.

attacker) poison attack and white-box poison attack. All hyper-parameter settings are the same as two sided black-box attack. These results demonstrate that our Acc-Semi-ZOMDA and Acc-MDA algorithms compare favorably with other algorithms.

10. Conclusion

In the paper, we proposed a novel accelerated zeroth-order momentum (Acc-ZOM) method for stochastic mini-optimization, and proved that the Acc-ZOM achieves a lower query complexity of $O(d^{3/4}\epsilon^{-3})$, which improves the best known complexity by a factor of $O(d^{1/4})$. At the same time, we proposed an accelerated zeroth-order momentum descent ascent (Acc-ZOMDA) method for stochastic minimax-optimization, and proved that the Acc-ZOMDA reaches the best known query complexity of $\tilde{O}(\kappa^3_d d^{3/2} \epsilon^{-3})$ without large batches. Moreover, we presented an accelerated momentum framework for the stochastic minimax-optimization. In particular, we present an accelerated momentum descent ascent (Acc-MDA) method for the white-box minimax problems, and proved it reaches the best known gradient complexity of $\tilde{O}(\kappa^3_d \epsilon^{-3})$ without large batches.

A. Supplementary Materials

In this section, we provide the detailed convergence analysis of our algorithms. We first review some useful lemmas.

**Lemma 9** (Lin et al., 2019) Under the above Assumptions 5 and 6, the function \( g(x) = \min_{y \in Y} f(x, y) = f(x, y^*(x)) \) has \( L_g \)-Lipschitz continuous gradient, such as

\[
\| \nabla g(x) - \nabla g(x') \| \leq L_g \| x - x' \|, \quad \forall x, x' \in \mathcal{X}
\]

(24)

where \( L_g = L_f + \frac{L^2}{\tau} \).

**Lemma 10** (Lin et al., 2019) Under the above Assumptions 5 and 6, the mapping \( y^*(x) = \arg \max_{y \in Y} f(x, y) \) is \( \kappa_y \)-Lipschitz continuous, such as

\[
\| y^*(x) - y^*(x') \| \leq \kappa_y \| x - x' \|, \quad \forall x, x' \in \mathcal{X}
\]

(25)

where \( \kappa_y = \frac{L_f}{\tau} \) denotes the condition number for function \( f(\cdot, y) \).

**Lemma 11** (Nesterov, 2018) Assume that \( f(x) \) is a differentiable convex function and \( \mathcal{X} \) is a convex set. \( x^* \in \mathcal{X} \) is the solution of the constrained problem \( \min_{x \in \mathcal{X}} f(x) \), if

\[
\langle \nabla f(x^*), x - x^* \rangle \geq 0, \quad x \in \mathcal{X}.
\]

(26)

**Lemma 12** (Nesterov, 2018) Assume the function \( f(x) \) is \( L \)-smooth, i.e., \( \| \nabla f(x) - \nabla f(y) \| \leq L \| x - y \| \). Then the following inequality holds

\[
| f(y) - f(x) - \nabla f(x)^T (y - x) | \leq \frac{L}{2} \| x - y \|^2.
\]

(27)

**Lemma 13** (Gao et al., 2018; Ji et al., 2019) Let \( f_\mu(x) = \mathbb{E}_{u \sim U_B}[f(x + \mu u)] \) be a smooth approximation of function \( f(x) \), where \( U_B \) is the uniform distribution over the \( d \)-dimensional unit Euclidean ball \( B \). Given zeroth-order gradient \( \hat{\nabla} f(x) = \frac{f(x + \mu u) - f(x)}{\mu/d} u \), we have

1. If \( f(x) \) has \( L \)-Lipschitz continuous gradient (i.e., \( L \)-smooth), then \( f_\mu(x) \) has \( L \)-Lipschitz continuous gradient.

2. \( |f_\mu(x) - f(x)| \leq \frac{\mu^2 L}{2} \) and \( \| \nabla f_\mu(x) - \nabla f(x) \| \leq \frac{\mu L d}{2} \) for any \( x \in \mathbb{R}^d \);

3. \( \mathbb{E} \left[ \frac{1}{|S|} \sum_{i \in S} \hat{\nabla} f(x; \xi_i) \right] = \nabla f_\mu(x) \) for any \( x \in \mathbb{R}^d \);

4. \( \mathbb{E} \| \hat{\nabla} f(x; \xi) - \hat{\nabla} f(x'; \xi) \|^2 \leq 3dL^2 \| x - x' \|^2 + \frac{3L^2 d^2 \mu}{2} \) for any \( x, x' \in \mathbb{R}^d \).

Note that the above results (1)-(2) of Lemma 13 come from Lemma 4.1 in (Gao et al., 2018), and the above results (3)-(4) come from Lemma 5 in (Ji et al., 2019). In addition, the result (4) of Lemma 13 is an extended result from Lemma 5 in Ji et al. (2019).
A.1 Convergence Analysis of Acc-ZOM Algorithm

In this subsection, we study the convergence of the Acc-ZOM algorithm. Let $f_\mu(x) = \mathbb{E}_{u \sim U_B}[f(x + \mu u)]$ be a smooth approximation of function $f(x)$, where $U_B$ is the uniform distribution over the $d$-dimensional unit Euclidean ball $B$. We first give some useful lemmas.

Lemma 14 Suppose that the sequence $\{x_t\}_{t=1}^T$ be generated from Algorithm 1. Let $0 < \eta_t \leq 1$ and $0 < \gamma \leq \frac{1}{2L\eta}$, then we have

$$f_\mu(x_{t+1}) - f_\mu(x_t) \leq \eta_t \gamma \|\nabla f_\mu(x_t) - v_t\|^2 - \frac{\eta_t}{2\gamma} \|\tilde{x}_{t+1} - x_t\|^2. \quad (28)$$

Proof According to Assumption 3 and Lemma 13, the approximated function $f_\mu(x)$ is $L$-smooth. Then we have

$$f_\mu(x_{t+1}) \leq f_\mu(x_t) + \langle \nabla f_\mu(x_t), x_{t+1} - x_t \rangle + \frac{L}{2} \|x_{t+1} - x_t\|^2$$

$$= f_\mu(x_t) + \eta_t \langle \nabla f_\mu(x_t), \tilde{x}_{t+1} - x_t \rangle + \frac{L\eta_t^2}{2} \|\tilde{x}_{t+1} - x_t\|^2$$

$$= f_\mu(x_t) + \eta_t \langle \nabla f_\mu(x_t) - v_t, \tilde{x}_{t+1} - x_t \rangle + \eta_t \langle v_t, \tilde{x}_{t+1} - x_t \rangle + \frac{L\eta_t^2}{2} \|\tilde{x}_{t+1} - x_t\|^2,$$ \quad (29)

where the second equality is due to $x_{t+1} = x_t + \eta_t (\tilde{x}_{t+1} - x_t)$. By the step 9 of Algorithm 1, we have $\tilde{x}_{t+1} = \mathcal{P}_\mathcal{X}(x_t - \gamma v_t) = \arg \min_{x \in \mathcal{X}} \frac{1}{2} \|x - x_t + \gamma v_t\|^2$. Since $\mathcal{X}$ is a convex set and the function $\frac{1}{2} \|x - x_t + \gamma v_t\|^2$ is convex, by using Lemma 11, we have

$$\langle \tilde{x}_{t+1} - x_t + \gamma v_t, x - \tilde{x}_{t+1} \rangle \geq 0, \ x \in \mathcal{X}. \quad (30)$$

In Algorithm 1, let the initialize solution $x_1 \in \mathcal{X}$, and the sequence $\{x_t\}_{t \geq 1}$ generates as follows:

$$x_{t+1} = x_t + \eta_t (\tilde{x}_{t+1} - x_t) = \eta_t \tilde{x}_{t+1} + (1 - \eta_t)x_t, \quad (31)$$

where $0 < \eta_t \leq 1$. Since $\mathcal{X}$ is convex set and $x_t$, $\tilde{x}_{t+1} \in \mathcal{X}$, we have $x_{t+1} \in \mathcal{X}$ for any $t \geq 1$. Set $x = x_t$ in the inequality (30), we have

$$\langle v_t, \tilde{x}_{t+1} - x_t \rangle \leq -\frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\|^2. \quad (32)$$

According to the Cauchy-Schwarz inequality and Young’s inequality, we have

$$\langle \nabla f_\mu(x_t) - v_t, \tilde{x}_{t+1} - x_t \rangle \leq \|\nabla f_\mu(x_t) - v_t\| \cdot \|\tilde{x}_{t+1} - x_t\|$$

$$\leq \gamma \|\nabla f_\mu(x_t) - v_t\|^2 + \frac{1}{4\gamma} \|\tilde{x}_{t+1} - x_t\|^2. \quad (33)$$
Combining the inequalities (29), (32) with (33), we obtain
\[
f_\mu(x_{t+1}) \leq f_\mu(x_t) + \eta_t \langle \nabla f_\mu(x_t) - v_t, \tilde{x}_{t+1} - x_t \rangle + \eta_t \langle v_t, \tilde{x}_{t+1} - x_t \rangle + \frac{L\eta_t^2}{2} \|\tilde{x}_{t+1} - x_t\|^2 \\
\leq f_\mu(x_t) + \eta_t \|\nabla f_\mu(x_t) - v_t\|^2 + \eta_t \frac{\|\tilde{x}_{t+1} - x_t\|^2}{4\gamma} - \frac{\eta_t}{\gamma} \|\tilde{x}_{t+1} - x_t\|^2 + \frac{L\eta_t^2}{2} \|\tilde{x}_{t+1} - x_t\|^2 \\
= f_\mu(x_t) + \eta_t \|\nabla f_\mu(x_t) - v_t\|^2 - \frac{\eta_t}{2\gamma} \|\tilde{x}_{t+1} - x_t\|^2 - \left( \frac{\eta_t}{4\gamma} - \frac{L\eta_t^2}{2} \right) \|\tilde{x}_{t+1} - x_t\|^2 \\
\leq f_\mu(x_t) + \eta_t \|\nabla f_\mu(x_t) - v_t\|^2 - \frac{\eta_t}{2\gamma} \|\tilde{x}_{t+1} - x_t\|^2, \tag{34}
\]
where the last inequality is due to \(0 < \gamma \leq \frac{1}{2L\eta_t}\).

**Lemma 15** Suppose the zeroth-order stochastic gradient \(v_t\) be generated from Algorithm 1, we have
\[
\mathbb{E}\|\nabla f_\mu(x_t) - v_t\|^2 \leq (1 - \alpha_t)^2 \mathbb{E}\|\nabla f_\mu(x_{t-1}) - v_{t-1}\|^2 + 6(1 - \alpha_t)^2 L^2 \eta_{t-1}^2 \mathbb{E}\|\tilde{x}_t - x_{t-1}\|^2 \\
+ 3(1 - \alpha_t)^2 L^2 d^2 \mu^2 + 2\alpha_t^2 \sigma^2. \tag{35}
\]

**Proof** According to the definition of \(v_t\) in Algorithm 1, we have
\[
v_t - v_{t-1} = -\alpha_t v_{t-1} + (1 - \alpha_t)(\hat{\nabla} f(x_t; \xi_t) - \hat{\nabla} f(x_{t-1}; \xi_t)) + \alpha_t \hat{\nabla} f(x_t; \xi_t). \tag{36}
\]
Then we have
\[
\mathbb{E}\|\nabla f_\mu(x_t) - v_t\|^2 \\
= \mathbb{E}\|\nabla f_\mu(x_t) - v_{t-1} - (v_t - v_{t-1})\|^2 \\
= \mathbb{E}\|\nabla f_\mu(x_t) - v_{t-1} + \alpha_t v_{t-1} - \alpha_t \hat{\nabla} f(x_t; \xi_t) - (1 - \alpha_t)(\hat{\nabla} f(x_t; \xi_t) - \hat{\nabla} f(x_{t-1}; \xi_t))\|^2 \\
= \mathbb{E}\|(-\alpha_t)\langle \nabla f_\mu(x_{t-1}) - v_{t-1} \rangle + (1 - \alpha_t)(\nabla f_\mu(x_t) - f_\mu(x_{t-1}) - \hat{\nabla} f(x_t; \xi_t) + \hat{\nabla} f(x_{t-1}; \xi_t)) \\
+ \alpha_t \langle \nabla f_\mu(x_t) - \hat{\nabla} f(x_t; \xi_t) \rangle\|^2 \\
= (1 - \alpha_t)^2 \mathbb{E}\|\nabla f_\mu(x_{t-1}) - v_{t-1}\|^2 + (1 - \alpha_t)^2 \mathbb{E}\|\nabla f_\mu(x_t) - f_\mu(x_{t-1}) - \hat{\nabla} f(x_t; \xi_t) + \hat{\nabla} f(x_{t-1}; \xi_t)\|^2 \\
+ 2\alpha_t(1 - \alpha_t) \langle \nabla f_\mu(x_t) - \nabla f_\mu(x_{t-1}) - \hat{\nabla} f(x_t; \xi_t) + \hat{\nabla} f(x_{t-1}; \xi_t), \nabla f_\mu(x_t) - \hat{\nabla} f(x_t; \xi_t) \rangle \\
+ \alpha_t^2 \mathbb{E}\|\nabla f_\mu(x_t) - \hat{\nabla} f(x_t; \xi_t)\|^2 \\
\leq (1 - \alpha_t)^2 \mathbb{E}\|\nabla f_\mu(x_{t-1}) - v_{t-1}\|^2 + 2(1 - \alpha_t)^2 \mathbb{E}\|\nabla f_\mu(x_t) - f_\mu(x_{t-1}) - \hat{\nabla} f(x_t; \xi_t) + \hat{\nabla} f(x_{t-1}; \xi_t)\|^2 \\
+ 2\alpha_t^2 \mathbb{E}\|\nabla f_\mu(x_t) - \hat{\nabla} f(x_t; \xi_t)\|^2 \\
\leq (1 - \alpha_t)^2 \mathbb{E}\|\nabla f_\mu(x_{t-1}) - v_{t-1}\|^2 + (1 - \alpha_t)^2 \mathbb{E}\|\hat{\nabla} f(x_t; \xi_t) - \hat{\nabla} f(x_{t-1}; \xi_t)\|^2 + 2\alpha_t^2 \sigma^2 \\
\leq (1 - \alpha_t)^2 \mathbb{E}\|\nabla f_\mu(x_{t-1}) - v_{t-1}\|^2 + 6(1 - \alpha_t)^2 L^2 \eta_{t-1}^2 \mathbb{E}\|\tilde{x}_t - x_{t-1}\|^2 + 3(1 - \alpha_t)^2 L^2 d^2 \mu^2 + 2\alpha_t^2 \sigma^2 \\
= (1 - \alpha_t)^2 \mathbb{E}\|\nabla f_\mu(x_{t-1}) - v_{t-1}\|^2 + 6(1 - \alpha_t)^2 L^2 \eta_{t-1}^2 \mathbb{E}\|\tilde{x}_t - x_{t-1}\|^2 + 3(1 - \alpha_t)^2 L^2 d^2 \mu^2 + 2\alpha_t^2 \sigma^2, \tag{37}
\]
Theorem 16 Suppose the sequence \( \{x_t\}_{t=1}^T \) be generated from Algorithm 1. Let \( \eta_t = \frac{k}{(m+\ell)^{1/3}} \) for any \( t \geq 0 \), \( 0 < \gamma \leq \min \left( \frac{m^{1/3}}{2k}, \frac{1}{2 \sqrt{60L}} \right) \), \( c \geq \frac{2}{3k^3} + \frac{5}{4} \), \( k > 0 \), \( m \geq \max \left( 2, (ck)^3, k^3 \right) \) and \( 0 < \mu \leq \frac{1}{d(m+T)^{2/3}} \), we have
\[
\frac{1}{T} \sum_{t=1}^{T} \mathbb{E}[\|\nabla f(x_t) - v_t\| + \frac{1}{\gamma} \|\bar{x}_{t+1} - x_t\|] \leq \frac{\sqrt{2M}m^{1/6}}{T^{1/2}} + \frac{\sqrt{2M}}{T^{1/3}} + \frac{L}{2(m+T)^{2/3}},
\]
where \( M = \frac{f(\bar{x}_T) - f^*}{K} + \frac{m^{1/3} \sigma^2}{K^2} + \frac{2L^2}{K} + 2k^3 \sigma^2 \ln(m+T) \).

Proof According to Lemma 15, we have
\[
\mathbb{E}[\|\nabla f_\mu(x_{t+1}) - v_{t+1}\|^2] \leq (1 - \alpha_{t+1})^2 \mathbb{E}[\|\nabla f_\mu(x_t) - v_t\|^2] + 6(1 - \alpha_{t+1})dL^2 \eta_t^2 \mathbb{E}[\|\bar{x}_{t+1} - x_t\|^2] + 3(1 - \alpha_{t+1})^2 L^2 \mu^2 + 2\alpha_{t+1}^2 \sigma^2, \quad (39)
\]
Since \( \eta_t \) is decreasing and \( m \geq k^3 \), we have \( \eta_t \leq \eta_0 = \frac{k}{m^{1/3}} \leq 1 \) and \( \gamma \leq \frac{m^{1/3}}{2k} = \frac{1}{2 \sqrt{60L}} \leq \frac{1}{2L^2} \) for any \( t \geq 0 \). Due to \( 0 < \eta_t \leq 1 \) and \( m \geq (ck)^3 \), we have \( \alpha_t = \eta_t^2 \leq \alpha_t \leq \frac{ck}{m^{1/3}} \leq 1 \). Then we consider the upper bound of the following term:
\[
\frac{1}{\eta_t} \mathbb{E}[\|\nabla f_\mu(x_{t+1}) - v_{t+1}\|^2] - \frac{1}{\eta_{t-1}} \mathbb{E}[\|\nabla f_\mu(x_t) - v_t\|^2] \leq (1 - \alpha_{t+1})^2 \frac{1}{\eta_t} - \frac{1}{\eta_{t-1}} \mathbb{E}[\|\nabla f_\mu(x_t) - v_t\|^2] + 6(1 - \alpha_{t+1})dL^2 \eta_t^2 \mathbb{E}[\|\bar{x}_{t+1} - x_t\|^2] + 3(1 - \alpha_{t+1})^2 L^2 \mu^2 \eta_t \\
+ \frac{2\alpha_{t+1}^2 \sigma^2}{\eta_t} \leq (1 - \alpha_{t+1}) \frac{1}{\eta_t} - \frac{1}{\eta_{t-1}} \mathbb{E}[\|\nabla f_\mu(x_t) - v_t\|^2] + 6dL^2 \eta_t \mathbb{E}[\|\bar{x}_{t+1} - x_t\|^2] + \frac{3L^2 \mu^2}{\eta_t} + \frac{2\alpha_{t+1}^2 \sigma^2}{\eta_t} \\
= \left( \frac{1}{\eta_t} - \frac{1}{\eta_{t-1}} \right) \mathbb{E}[\|\nabla f_\mu(x_t) - v_t\|^2] + \frac{3L^2 \mu^2}{\eta_t} + \frac{2\alpha_{t+1}^2 \sigma^2}{\eta_t}, \quad (40)
\]
where the second inequality is due to \( 0 < \alpha_{t+1} \leq 1 \). By \( \eta_t = \frac{k}{(m+\ell)^{1/3}} \), we have
\[
\frac{1}{\eta_t} - \frac{1}{\eta_{t-1}} = \frac{1}{k} \left( (m + t)^{1/3} - (m + t - 1)^{1/3} \right) \leq \frac{1}{3k(m+\ell)^{2/3}} \leq \frac{1}{3k(m+\ell)^{2/3}} \leq \frac{2^{2/3}}{3k^2(m+\ell)^{2/3}} = \frac{2^{2/3}}{3k^2(m+\ell)^{2/3}} \leq \frac{2}{3k^2} \eta_t, \quad (41)
\]
where the first inequality holds by the concavity of function \( f(x) = x^{1/3} \), \( i.e., (x+y)^{1/3} \leq x^{1/3} + \frac{y}{3x^{2/3}} \); the second inequality is due to \( m \geq 2 \), and the last inequality is due to
0 < \eta_t \leq 1. Let c \geq \frac{2}{3L^2} + \frac{5}{4}, we have

\begin{align*}
\frac{1}{\eta_t} \mathbb{E} \left\| \nabla f_{\mu}(x_{t+1}) - v_{t+1} \right\|^2 - \frac{1}{\eta_{t-1}} \mathbb{E} \left\| \nabla f_{\mu}(x_t) - v_t \right\|^2 \\
\leq -\frac{5\eta}{4} \mathbb{E} \left\| \nabla f_{\mu}(x_t) - v_t \right\|^2 + 6dL^2 \eta_t \mathbb{E} \left\| \tilde{x}_{t+1} - x_t \right\|^2 + \frac{3L^2d^2\mu^2}{\eta_t} + \frac{2\alpha^2_{t+1}\sigma^2}{\eta_t}.
\end{align*}

Next, we define a Lyapunov function $R_t = f_{\mu}(x_t) + \frac{\gamma}{\eta_{t-1}} \left\| \nabla f_{\mu}(x_t) - v_t \right\|^2$ for any $t \geq 1$. According to Lemma 14, we have

\begin{align*}
R_{t+1} - R_t &= f_{\mu}(x_{t+1}) + \frac{1}{\eta_t} \mathbb{E} \left\| \nabla f_{\mu}(x_{t+1}) - v_{t+1} \right\|^2 - f_{\mu}(x_t) - \frac{1}{\eta_{t-1}} \mathbb{E} \left\| \nabla f_{\mu}(x_t) - v_t \right\|^2 \\
&\leq \eta_t \gamma \mathbb{E} \left\| \nabla f_{\mu}(x_t) - v_t \right\|^2 - \frac{\eta}{2\gamma} \mathbb{E} \left\| \tilde{x}_{t+1} - x_t \right\|^2 - \frac{5\gamma\eta}{4} \mathbb{E} \left\| \nabla f_{\mu}(x_t) - v_t \right\|^2 \\
&\quad + 6dL^2 \eta_t \gamma \mathbb{E} \left\| \tilde{x}_{t+1} - x_t \right\|^2 + \frac{3L^2d^2\mu^2\gamma}{\eta_t} + \frac{2\alpha^2_{t+1}\sigma^2\gamma}{\eta_t} \\
&\leq -\frac{\gamma\eta}{4} \mathbb{E} \left\| \nabla f_{\mu}(x_t) - v_t \right\|^2 - \frac{\eta}{4\gamma} \mathbb{E} \left\| \tilde{x}_{t+1} - x_t \right\|^2 + \frac{3L^2d^2\mu^2\gamma}{\eta_t} + \frac{2\alpha^2_{t+1}\sigma^2\gamma}{\eta_t},
\end{align*}

where the last inequality is due to $\gamma \leq \frac{1}{2\sqrt{6dL}}$. Thus, we obtain

\begin{align*}
\frac{\gamma\eta}{4} \mathbb{E} \left\| \nabla f_{\mu}(x_t) - v_t \right\|^2 + \frac{\eta}{4\gamma} \mathbb{E} \left\| \tilde{x}_{t+1} - x_t \right\|^2 \leq R_t - R_{t+1} + \frac{3L^2d^2\mu^2\gamma}{\eta_t} + \frac{2\alpha^2_{t+1}\sigma^2\gamma}{\eta_t}.
\end{align*}

Since $\inf_{x \in \mathcal{X}} f(x) = f^*$, we have $\inf_{x \in \mathcal{X}} f_{\mu}(x) = \inf_{x \in \mathcal{X}} \mathbb{E}_{u \sim U_B} [f(x + \mu u)] = \inf_{x \in \mathcal{X}} \frac{1}{V} \int_B f(x + \mu u) du \geq \frac{1}{V} \int_B f_{\mu} f(x + \mu u) du = f^*$, where $V$ denotes the volume of the unit ball $B$.

Taking average over $t = 1, 2, \cdots, T$ on both sides of (44), we have

\begin{align*}
\frac{1}{T} \sum_{t=1}^{T} \mathbb{E} \left[ \frac{\gamma\eta}{4} \mathbb{E} \left\| \nabla f_{\mu}(x_t) - v_t \right\|^2 + \frac{\eta}{4\gamma} \mathbb{E} \left\| \tilde{x}_{t+1} - x_t \right\|^2 \right] \\
\leq \frac{f_{\mu}(x_1) - f^*}{T} + \frac{\gamma}{T\eta_0} \sum_{t=1}^{T} \frac{3L^2d^2\mu^2\gamma}{T\eta_t} + \frac{T}{\eta_t} \sum_{t=1}^{T} \frac{2\alpha^2_{t+1}\sigma^2\gamma}{T\eta_t} \\
\leq \frac{f_{\mu}(x_1) - f^*}{T} + \frac{\gamma\sigma^2}{T\eta_0} + \frac{T}{\eta_t} \sum_{t=1}^{T} \frac{3L^2d^2\mu^2\gamma}{T\eta_t} + \frac{T}{\eta_t} \sum_{t=1}^{T} \frac{2\alpha^2_{t+1}\sigma^2\gamma}{T\eta_t} \\
= \frac{f_{\mu}(x_1) - f^*}{T} + \frac{\gamma m^{1/2}\sigma^2}{kT} + \frac{T}{\eta_t} \sum_{t=1}^{T} \frac{3L^2d^2\mu^2\gamma}{T}\frac{T}{\eta_t} + \frac{T}{\eta_t} \sum_{t=1}^{T} \frac{2\sigma^2_{t+1}\eta_t\sigma^2\gamma}{T},
\end{align*}

(45)
where the second inequality is due to \( v_1 = \hat{\psi} f(x_1, \xi) \) and Assumption 1. Since \( \eta_t \) is decreasing, i.e., \( \eta_t^{-1} \geq \eta_t^{-1} \) for any \( 0 < t < T \), we have

\[
\frac{1}{T} \sum_{t=1}^{T} \mathbb{E} \left[ \frac{1}{4} \mathbb{E} \| \nabla f_\mu(x_t) - v_t \|^2 + \frac{1}{4\gamma^2} \mathbb{E} \| \bar{x}_{t+1} - x_t \|^2 \right] 
\leq \frac{f_\mu(x_1) - f^*}{T\eta_T^{-\gamma}} \frac{T T}{\eta_T^\gamma} + \frac{m^{1/3} \sigma^2}{kT\eta_T} + \sum_{t=1}^{T} \frac{3L^2 d^2 \mu^2}{T\eta_T} + \sum_{t=1}^{T} \frac{2c^2 \eta_T^2 \sigma^2}{T\eta_T} 
\leq \frac{f_\mu(x_1) - f^*}{T\eta_T^{-\gamma}} \frac{T T}{\eta_T^\gamma} + \frac{m^{1/3} \sigma^2}{kT\eta_T} + \frac{3L^2 d^2 \mu^2}{4k T\eta_T} \int_1^T (m + t)^{\gamma/3} dt + \frac{2c^2 \sigma^2}{T\eta_T} \int_1^T k^3 (m + t)^{-1} dt 
\leq \frac{f_\mu(x_1) - f^*}{T\gamma k} (m + T)^{\gamma/3} + \frac{m^{1/3} \sigma^2}{k^2 T} (m + T)^{\gamma/3} + \frac{9L^2 d^2 \mu^2}{4k^2 T} (m + T)^{\gamma/3} 
+ \frac{2k^2 c^2 \sigma^2}{T} \ln(m + T)(m + T)^{\gamma/3},
\]

(46)

where the second inequality holds by \( \sum_{t=1}^{T} \frac{1}{\eta_t} dt \leq \int_1^T \frac{1}{\eta_t} dt = \int_1^T \frac{(m + t)^{\gamma/3}}{k} dt \) and the last inequality is due to \( 0 < \mu \leq \frac{1}{d(m + T)^{\gamma/4}} \). Let 

\[
M = \frac{f_\mu(x_1) - f^*}{k_\gamma} + \frac{m^{1/3} \sigma^2}{k^2} + \frac{9L^2 d^2 \mu^2}{4k^2} + 2k^2 c^2 \sigma^2 \ln(m + T),
\]

we have

\[
\frac{1}{T} \sum_{t=1}^{T} \mathbb{E} \left[ \frac{1}{4} \mathbb{E} \| \nabla f_\mu(x_t) - v_t \|^2 + \frac{1}{4\gamma^2} \mathbb{E} \| \bar{x}_{t+1} - x_t \|^2 \right] \leq \frac{M}{T} (m + T)^{\gamma/3}.
\]

(47)

According to Jensen’s inequality, we have

\[
\frac{1}{T} \sum_{t=1}^{T} \mathbb{E} \left[ \frac{1}{2} \| \nabla f_\mu(x_t) - v_t \| + \frac{1}{2\gamma} \| \bar{x}_{t+1} - x_t \| \right] 
\leq \left( \frac{2}{T} \sum_{t=1}^{T} \mathbb{E} \left[ \frac{1}{4} \mathbb{E} \| \nabla f_\mu(x_t) - v_t \|^2 + \frac{1}{4\gamma^2} \mathbb{E} \| \bar{x}_{t+1} - x_t \|^2 \right] \right)^{1/2} 
\leq \sqrt{2M} \frac{T^{1/2}}{T^{1/2}} (m + T)^{1/6} \leq \frac{\sqrt{2M} m^{1/6}}{T^{1/2}} + \frac{\sqrt{2M} m^{1/6}}{T^{1/3}},
\]

(48)

where the last inequality is due to \( (a + b)^{1/6} \leq a^{1/6} + b^{1/6} \). Then we have

\[
\frac{1}{T} \sum_{t=1}^{T} \mathbb{E} \| \nabla f_\mu(x_t) - v_t \| + \frac{1}{\gamma} \| \bar{x}_{t+1} - x_t \| \leq \frac{2\sqrt{2M} m^{1/6}}{T^{1/2}} + \frac{2\sqrt{2M} m^{1/6}}{T^{1/3}}.
\]

(49)
By Lemma 13, we have \( \|\nabla f_\mu(x_t) - v_t\| = \|\nabla f_\mu(x_t) - \nabla f(x_t) + \nabla f(x_t) - v_t\| \geq \|\nabla f(x_t) - v_t\| - \|\nabla f_\mu(x_t) - \nabla f(x_t)\| \geq \|\nabla f(x_t) - v_t\| - \frac{\mu L d}{2} \). Thus, we have

\[
\frac{1}{T} \sum_{t=1}^{T} \mathbb{E}[\|\nabla f(x_t) - v_t\| + \frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\|] \\
\leq \frac{1}{T} \sum_{t=1}^{T} \mathbb{E}[\|\nabla f_\mu(x_t) - v_t\| + \frac{\mu L d}{2} + \frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\|] \\
\leq \frac{\sqrt{2} M m^{1/6}}{T^{1/2}} + \frac{\sqrt{2} M}{T^{1/3}} + \frac{\mu L d}{2} \\
\leq \frac{\sqrt{2} M m^{1/6}}{T^{1/2}} + \frac{\sqrt{2} M}{T^{1/3}} + \frac{L}{2(m + T)^{2/3}},
\]

(50)

where the last inequality is due to \( 0 < \mu \leq \frac{1}{d(m + T)^{2/3}} \).

\[ \blacksquare \]

A.2 Convergence Analysis of the Acc-ZOMDA Algorithm

In the subsection, we study the convergence properties of the Acc-ZOMDA algorithm for solving the problem (2). Let \( f_\mu(x, y) = \mathbb{E}_{x_1 \sim U_{B_1}} f(x + \mu_1 u_1, y) \) and \( f_{\mu_2}(x, y) = \mathbb{E}_{x_2 \sim U_{B_2}} f(x, y + \mu_2 u_2) \) denote the smoothing version of \( f(x, y) \) w.r.t. \( x \) with parameter \( \mu_1 \) and the smoothing version of \( f(x, y) \) w.r.t. \( y \) with parameter \( \mu_2 \), respectively. Here \( U_{B_1} \) and \( U_{B_2} \) denote the uniform distributions over the \( d_1 \)-dimensional unit Euclidean ball \( B_1 \) and \( d_2 \)-dimensional unit Euclidean ball \( B_2 \), respectively. At the same time, let \( g_\mu(x) = \mathbb{E}_{x \sim U_{B_1}}[g(x + \mu_1 u_1)] \) denote the smoothing approximation of the function \( g(x) = \max_{y \in Y} f(x, y) = f(x, y^*(x)) \).

**Lemma 17** Suppose the sequence \( \{x_t, y_t\}_{t=1}^{T} \) be generated from Algorithm 2. Let \( 0 < \eta_t \leq 1 \) and \( 0 < \gamma \leq \frac{1}{2L_\eta}, \) we have

\[
g_\mu(x_t) - g_\mu(x_{t+1}) \leq -\frac{\eta_t}{2\gamma} \|\tilde{x}_{t+1} - x_t\|^2 + 6\eta_t \gamma L^2 f \|x^*(x_t) - y_t\|^2 + 2\eta_t \gamma L \|x f_\mu(x_t, y_t) - v_t\|^2 + 3\eta_t \gamma \mu_1^2 d_1^2 L^2 \]

(51)

where \( L_\eta = L_f + L^2_f / \tau \).

**Proof** According to Lemma 9 and Lemma 13, the approximated function \( g_\mu(x) \) has \( L_\eta \)-Lipschitz continuous gradient. Then we have

\[
g_\mu(x_{t+1}) \leq g_\mu(x_t) + \langle \nabla g_\mu(x_t), x_{t+1} - x_t \rangle + \frac{L_\eta}{2} \|x_{t+1} - x_t\|^2 \\
= g_\mu(x_t) + \eta_t \langle \nabla g_\mu(x_t), \tilde{x}_{t+1} - x_t \rangle + \frac{L_\eta \eta_t^2}{2} \|\tilde{x}_{t+1} - x_t\|^2 \\
= g_\mu(x_t) + \eta_t \langle \nabla g_\mu(x_t) - v_t, \tilde{x}_{t+1} - x_t \rangle + \eta_t \langle v_t, \tilde{x}_{t+1} - x_t \rangle + \frac{L_\eta \eta_t^2}{2} \|\tilde{x}_{t+1} - x_t\|^2.
\]

(52)
By the step 9 of Algorithm 2, we have \( \tilde{x}_{t+1} = P_\chi(x_t - \gamma v_t) = \arg \min_{x \in \chi} \frac{1}{2} \|x - x_t + \gamma v_t\|^2 \).

Since \( \chi \) is a convex set and the function \( \frac{1}{2} \|x - x_t + \gamma v_t\|^2 \) is convex, according to Lemma 11, we have

\[
\langle \tilde{x}_{t+1} - x_t + \gamma v_t, x - \tilde{x}_{t+1} \rangle \geq 0, \quad x \in \chi. \tag{53}
\]

In Algorithm 2, let the initialize solution \( x_1 \in \chi \), and the sequence \( \{x_t\}_{t \geq 1} \) generates as follows:

\[
x_{t+1} = x_t + \eta_t(\tilde{x}_{t+1} - x_t) = \eta_t \tilde{x}_{t+1} + (1 - \eta_t)x_t, \tag{54}
\]

where \( 0 < \eta_t \leq 1 \). Since \( \chi \) is a convex set and \( x_t, \tilde{x}_{t+1} \in \chi \), we have \( x_{t+1} \in \chi \) for any \( t \geq 1 \). Set \( x = x_t \) in the inequality (53), we have

\[
\langle v_t, \tilde{x}_{t+1} - x_t \rangle \leq -\frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\|^2. \tag{55}
\]

Next, we decompose the term \( \langle \nabla g_{\mu_1}(x_t) - v_t, \tilde{x}_{t+1} - x_t \rangle \) as follows:

\[
\langle \nabla g_{\mu_1}(x_t) - v_t, \tilde{x}_{t+1} - x_t \rangle = \langle \nabla g_{\mu_1}(x_t) - \nabla f_{\mu_1}(x_t, y_t), \tilde{x}_{t+1} - x_t \rangle + \langle \nabla f_{\mu_1}(x_t, y_t) - v_t, \tilde{x}_{t+1} - x_t \rangle. \tag{56}
\]

For the term \( T_1 \), by the Cauchy-Schwarz inequality and Young’s inequality, we have

\[
T_1 = \langle \nabla g_{\mu_1}(x_t) - \nabla f_{\mu_1}(x_t, y_t), \tilde{x}_{t+1} - x_t \rangle
\leq \|\nabla g_{\mu_1}(x_t) - \nabla f_{\mu_1}(x_t, y_t)\| \cdot \|\tilde{x}_{t+1} - x_t\|
\leq 2\gamma \|\nabla g_{\mu_1}(x_t) - \nabla f_{\mu_1}(x_t, y_t)\|^2 + \frac{1}{8\gamma} \|\tilde{x}_{t+1} - x_t\|^2
= 2\gamma \|\nabla f_{\mu_1}(x_t, y^*(x_t)) - \nabla f_{\mu_1}(x_t, y^*(x_t))\|^2 + \frac{1}{8\gamma} \|\tilde{x}_{t+1} - x_t\|^2
= 2\gamma \|\nabla f_{\mu_1}(x_t, y^*(x_t)) - \nabla f(x_t, y^*(x_t)) + \nabla f(x_t, y^*(x_t)) - \nabla f(x_t, y_t) + \nabla f(x_t, y_t) - \nabla f_{\mu_1}(x_t, y_t)\|\|\tilde{x}_{t+1} - x_t\|^2 + \frac{1}{8\gamma} \|\tilde{x}_{t+1} - x_t\|^2
\leq 6\gamma \|\nabla f_{\mu_1}(x_t, y^*(x_t)) - \nabla f(x_t, y^*(x_t))\|^2 + 6\gamma \|\nabla f(x_t, y^*(x_t)) - \nabla f(x_t, y_t)\|^2 + 6\gamma \|\nabla f(x_t, y_t) - \nabla f_{\mu_1}(x_t, y_t)\|^2 + \frac{1}{8\gamma} \|\tilde{x}_{t+1} - x_t\|^2
\leq 3\gamma \mu_1^2 d_L^2 L_f^2 + 6\gamma L_f^2 \|y^*(x_t) - y_t\|^2 + \frac{1}{8\gamma} \|\tilde{x}_{t+1} - x_t\|^2, \tag{57}
\]

where the last inequality holds by Assumption 5, i.e., implies that the partial gradient \( \nabla f(x, y) \) is \( L_f \)-Lipschitz continuous and Lemma 13, we have

\[
\|\nabla f_{\mu_1}(x_t, y^*(x_t)) - \nabla f(x_t, y^*(x_t))\| \leq \frac{L_f d_{\mu_1} t}{2}, \quad \|\nabla f(x_t, y_t) - \nabla f_{\mu_1}(x_t, y_t)\| \leq \frac{L_f d_{\mu_1} t}{2}; \tag{58}
\]
by Assumption 5, we have
\[
\|\nabla_x f(x_t, y^*(x_t)) - \nabla_x f(x_t, y_t)\| \leq \|\nabla f(x_t, y^*(x_t)) - \nabla f(x_t, y_t)\| \leq L_f \|y_t - y^*(x_t)\|. \quad (59)
\]

For the term \(T_2\), by the Cauchy-Schwarz inequality and Young’s inequality, we have
\[
T_2 = \langle \nabla_x f_{\mu_1}(x_t, y_t) - v_t, \tilde{x}_{t+1} - x_t \rangle \\
\leq \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\| \cdot \|\tilde{x}_{t+1} - x_t\| \\
\leq 2\gamma \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{1}{8\gamma} \|\tilde{x}_{t+1} - x_t\|^2, \quad (60)
\]
where the last inequality holds by \(\langle a, b \rangle \leq \frac{\lambda}{2} \|a\|^2 + \frac{1}{2\lambda} \|b\|^2\) with \(\lambda = 4\gamma\). Thus, we have
\[
\langle \nabla g_{\mu_1}(x_t) - v_t, \tilde{x}_{t+1} - x_t \rangle = 3\gamma \mu_1^2 d_1^2 L_f^2 + 6\gamma L_f^2 \|y^*(x_t) - y_t\|^2 + 2\gamma \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{1}{4\gamma} \|\tilde{x}_{t+1} - x_t\|^2. \quad (61)
\]
Finally, combining the inequalities (52), (55) with (61), we have
\[
g_{\mu_1}(x_{t+1}) \leq g_{\mu_1}(x_t) + 3\eta \gamma \mu_1^2 d_1^2 L_f^2 + 6\eta \gamma L_f^2 \|y^*(x_t) - y_t\|^2 + 2\eta \gamma \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 \\
+ \frac{\eta}{4\gamma} \|\tilde{x}_{t+1} - x_t\|^2 - \frac{\eta}{\gamma} \|\tilde{x}_{t+1} - x_t\|^2 + \frac{L_g \eta^2}{2} \|\tilde{x}_{t+1} - x_t\|^2 \\
\leq g_{\mu_1}(x_t) + 3\eta \gamma \mu_1^2 d_1^2 L_f^2 + 6\eta \gamma L_f^2 \|y^*(x_t) - y_t\|^2 + 2\eta \gamma \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 \\
- \frac{\eta}{2\gamma} \|\tilde{x}_{t+1} - x_t\|^2, \quad (62)
\]
where the last inequality is due to \(0 < \gamma \leq \frac{1}{2L_f \eta \mu}\).

**Lemma 18** Suppose the sequence \(\{x_t, y_t\}_{t=1}^T\) be generated from Algorithm 2. Under the above assumptions, and set \(0 < \eta \leq 1\) and \(\lambda \leq \frac{1}{6L_f}\), we have
\[
\|y_{t+1} - y^*(x_{t+1})\|^2 \leq \left(1 - \frac{\eta \tau \lambda}{4}\right) \|y_t - y^*(x_t)\|^2 \leq \frac{3\eta}{4} \|\tilde{y}_{t+1} - y_t\|^2 \\
+ \frac{25\eta \lambda}{6\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2 + \frac{25\kappa_y^2 \eta \lambda}{6\tau} \|x_t - \tilde{x}_{t+1}\|^2, \quad (63)
\]
where \(\kappa_y = L_f / \tau\).

**Proof** According to the assumption 6, i.e., the function \(f(x, y)\) is \(\tau\)-strongly concave w.r.t \(y\), we have
\[
f(x_t, y_t) \leq f(x_t, y_t) + \langle \nabla_y f(x_t, y_t), y - y_t \rangle - \frac{\tau}{2} \|y - y_t\|^2 \\
= f(x_t, y_t) + \langle w_t, y - \tilde{y}_{t+1} \rangle + \langle \nabla_y f(x_t, y_t) - w_t, y - \tilde{y}_{t+1} \rangle \\
+ \langle \nabla_y f(x_t, y_t), \tilde{y}_{t+1} - y_t \rangle - \frac{\tau}{2} \|y - y_t\|^2. \quad (64)
\]
According to the assumption 5, i.e., the function $f(x, y)$ is $L_f$-smooth, we have

\[-\frac{L_f}{2} \|\tilde{y}_{t+1} - y_t\|^2 \leq f(x_t, \tilde{y}_{t+1}) - f(x_t, y_t) - \langle \nabla_y f(x_t, y_t), \tilde{y}_{t+1} - y_t \rangle. \tag{65}\]

Combining the inequalities (64) with (65), we have

\[f(x_t, y) \leq f(x_t, \tilde{y}_{t+1}) + \langle w_t, y - \tilde{y}_{t+1} \rangle + \langle \nabla_y f(x_t, y_t) - w_t, y - \tilde{y}_{t+1} \rangle - \frac{\tau}{2} \|y - y_t\|^2 + \frac{L_f}{2} \|\tilde{y}_{t+1} - y_t\|^2. \tag{66}\]

Next, by the step 10 of Algorithm 2, we have $\tilde{y}_{t+1} = \mathcal{P}_\mathcal{Y}(y_t + \lambda w_t) = \arg\min_{y \in \mathcal{Y}} \frac{1}{2} \|y - y_t - \lambda w_t\|^2$. Since $\mathcal{Y}$ is a convex set and the function $\frac{1}{2} \|y - y_t - \lambda w_t\|^2$ is convex, according to Lemma 11, we have

\[\langle \tilde{y}_{t+1} - y_t - \lambda w_t, y - \tilde{y}_{t+1} \rangle \geq 0, \ y \in \mathcal{Y}. \tag{67}\]

Then we obtain

\[\langle w_t, y - \tilde{y}_{t+1} \rangle \leq \frac{1}{\lambda} \langle \tilde{y}_{t+1} - y_t, y - \tilde{y}_{t+1} \rangle = \frac{1}{\lambda} \langle \tilde{y}_{t+1} - y_t, y - \tilde{y}_{t+1} \rangle + \frac{1}{\lambda} \langle \tilde{y}_{t+1} - y_t, y_t \rangle = -\frac{1}{\lambda} \| \tilde{y}_{t+1} - y_t \|^2 + \frac{1}{\lambda} \langle \tilde{y}_{t+1} - y_t, y_t \rangle. \tag{68}\]

Combining the inequalities (66) with (68), we have

\[f(x_t, y) \leq f(x_t, \tilde{y}_{t+1}) + \frac{1}{\lambda} \langle \tilde{y}_{t+1} - y_t, y - y_t \rangle + \langle \nabla_y f(x_t, y_t) - w_t, y - \tilde{y}_{t+1} \rangle - \frac{1}{\lambda} \| \tilde{y}_{t+1} - y_t \|^2 - \frac{\tau}{2} \|y - y_t\|^2 + \frac{L_f}{2} \|\tilde{y}_{t+1} - y_t\|^2. \tag{69}\]

Let $y = y^*(x_t)$ and we obtain

\[f(x_t, y^*(x_t)) \leq f(x_t, \tilde{y}_{t+1}) + \frac{1}{\lambda} \langle \tilde{y}_{t+1} - y_t, y^*(x_t) - y_t \rangle + \langle \nabla_y f(x_t, y_t) - w_t, y^*(x_t) - \tilde{y}_{t+1} \rangle - \frac{1}{\lambda} \| \tilde{y}_{t+1} - y_t \|^2 - \frac{\tau}{2} \|y^*(x_t) - y_t\|^2 + \frac{L_f}{2} \|\tilde{y}_{t+1} - y_t\|^2. \tag{70}\]

Due to the concavity of $f(\cdot, y)$ and $y^*(x_t) = \arg\max_{y \in \mathcal{Y}} f(x_t, y)$, we have $f(x_t, y^*(x_t)) \geq f(x_t, \tilde{y}_{t+1})$. Thus, we obtain

\[0 \leq \frac{1}{\lambda} \langle \tilde{y}_{t+1} - y_t, y^*(x_t) - y_t \rangle + \langle \nabla_y f(x_t, y_t) - w_t, y^*(x_t) - \tilde{y}_{t+1} \rangle - \left(\frac{1}{\lambda} - \frac{L_f}{2}\right) \| \tilde{y}_{t+1} - y_t \|^2 - \frac{\tau}{2} \|y^*(x_t) - y_t\|^2. \tag{71}\]

By $y_{t+1} = y_t + \eta_t (\tilde{y}_{t+1} - y_t)$, we have

\[\|y_{t+1} - y^*(x_t)\|^2 = \|y_t + \eta_t (\tilde{y}_{t+1} - y_t) - y^*(x_t)\|^2 = \|y_t - y^*(x_t)\|^2 + 2\eta_t \langle \tilde{y}_{t+1} - y_t, y_t - y^*(x_t) \rangle + \eta_t^2 \| \tilde{y}_{t+1} - y_t \|^2. \tag{72}\]
Then we obtain
\[
\langle \tilde{y}_{t+1} - y_t, y^*(x_t) - y_t \rangle \leq \frac{1}{2\eta_t} \|y_t - y^*(x_t)\|^2 + \frac{\eta_t}{2} \|\tilde{y}_{t+1} - y_t\|^2 - \frac{1}{2\eta_t} \|y_{t+1} - y^*(x_t)\|^2. \tag{73}
\]

Considering the upper bound of the term \( \langle \nabla_y f(x_t, y_t) - w_t, y^*(x_t) - \tilde{y}_{t+1} \rangle \), we have
\[
\begin{align*}
\langle \nabla_y f(x_t, y_t) - w_t, y^*(x_t) - \tilde{y}_{t+1} \rangle &= \langle \nabla_y f(x_t, y_t) - w_t, y^*(x_t) - y_t \rangle + \langle \nabla_y f(x_t, y_t) - w_t, y_t - \tilde{y}_{t+1} \rangle \\
&\leq \frac{1}{\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2 + \frac{\tau}{4} \|y^*(x_t) - y_t\|^2 + \frac{1}{\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2 + \frac{\tau}{4} \|y_t - \tilde{y}_{t+1}\|^2 \\
&= \frac{2}{\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2 + \frac{\tau}{4} \|y^*(x_t) - y_t\|^2 + \frac{\tau}{4} \|y_t - \tilde{y}_{t+1}\|^2. \tag{74}
\end{align*}
\]
Next, combining the inequalities (71), (73) with (74), we have
\[
\frac{1}{2\eta_t \lambda} \|y_{t+1} - y^*(x_t)\|^2 \leq \left( \frac{1}{2\eta_t \lambda} - \frac{\eta_t}{4}\right) \|y_t - y^*(x_t)\|^2 + \left( \frac{\eta_t}{2\lambda} + \frac{\tau}{4} + \frac{L_f}{2} - \frac{1}{\lambda}\right) \|\tilde{y}_{t+1} - y_t\|^2 \\
+ \frac{2}{\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2 \\
\leq \left( \frac{1}{2\eta_t \lambda} - \frac{\eta_t}{4}\right) \|y_t - y^*(x_t)\|^2 + \left( \frac{3L_f}{4} - \frac{1}{2\lambda}\right) \|\tilde{y}_{t+1} - y_t\|^2 + \frac{2}{\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2 \\
= \left( \frac{1}{2\eta_t \lambda} - \frac{\eta_t}{4}\right) \|y_t - y^*(x_t)\|^2 - \left( \frac{3L_f}{8\lambda} - \frac{1}{8\lambda}\right) \|\tilde{y}_{t+1} - y_t\|^2 \\
+ \frac{2}{\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2 \\
\leq \left( \frac{1}{2\eta_t \lambda} - \frac{\eta_t}{4}\right) \|y_t - y^*(x_t)\|^2 - \frac{3}{8\lambda} \|\tilde{y}_{t+1} - y_t\|^2 \\
+ \frac{2}{\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2, \tag{75}
\]
where the second inequality holds by \( L_f \geq \tau \) and \( 0 < \eta_t \leq 1 \), and the last inequality is due to \( 0 < \lambda \leq \frac{1}{8L_f} \). It implies that
\[
\|y_{t+1} - y^*(x_t)\|^2 \leq \left( 1 - \frac{\eta_t \lambda}{2}\right) \|y_t - y^*(x_t)\|^2 - \frac{3\eta_t}{4} \|\tilde{y}_{t+1} - y_t\|^2 + \frac{4\eta_t \lambda}{\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2. \tag{76}
\]

Next, we decompose the term \( \|y_{t+1} - y^*(x_{t+1})\|^2 \) as follows:
\[
\begin{align*}
\|y_{t+1} - y^*(x_{t+1})\|^2 &= \|y_{t+1} - y^*(x_t) + y^*(x_t) - y^*(x_{t+1})\|^2 \\
&= \|y_{t+1} - y^*(x_t)\|^2 + 2 \langle y_{t+1} - y^*(x_t), y^*(x_t) - y^*(x_{t+1}) \rangle + \|y^*(x_t) - y^*(x_{t+1})\|^2 \\
&\leq \left( 1 + \frac{\eta_t \lambda}{4}\right) \|y_{t+1} - y^*(x_t)\|^2 + \left( 1 + \frac{4}{\eta_t \lambda}\right) \|y^*(x_t) - y^*(x_{t+1})\|^2 \\
&\leq \left( 1 + \frac{\eta_t \lambda}{4}\right) \|y_{t+1} - y^*(x_t)\|^2 + \left( 1 + \frac{4}{\eta_t \lambda}\right) \|y^*(x_t) - y^*(x_{t+1})\|^2 \\
&= \left( 1 + \frac{\eta_t \lambda}{4}\right) \|y_{t+1} - y^*(x_t)\|^2 + \left( 1 + \frac{4}{\eta_t \lambda}\right) \|y^*(x_t) - y^*(x_{t+1})\|^2.
\end{align*}
\]
where the first inequality holds by the Cauchy-Schwarz inequality and Young’s inequality, and the second inequality is due to Lemma 10, and the last equality holds by $x_{t+1} = x_t + \eta_t(\bar{x}_{t+1} - x_t)$.

Combining the above inequalities (76) and (77), we have

$$
\|y_{t+1} - y^*(x_{t+1})\|^2 \leq (1 + \frac{\eta_t \tau \lambda}{4})(1 - \frac{\eta_t \tau \lambda}{2})\|y_t - y^*(x_t)\|^2 - \frac{3\eta_t}{4}\|\tilde{y}_{t+1} - y_t\|^2 \\
+ (1 + \frac{\eta_t \tau \lambda}{4})\|\nabla_y f(x_t, y_t) - w_t\|^2 + (1 + \frac{4}{\eta_t \tau \lambda})\kappa_y^2 \eta_t^2 \|x_t - \bar{x}_{t+1}\|^2.
$$

(78)

Since $0 < \eta_t \leq 1$, $0 < \lambda \leq \frac{1}{6L_f}$ and $L_f \geq \tau$, we have $\lambda \leq \frac{1}{6L_f} \leq \frac{1}{6\tau}$ and $\lambda \eta_t \leq \frac{1}{6\tau}$. Then we obtain

$$
\left(1 + \frac{\eta_t \tau \lambda}{4}\right)(1 - \frac{\eta_t \tau \lambda}{2}) = 1 - \frac{\eta_t \tau \lambda}{2} + \frac{\eta_t \tau \lambda}{4} - \frac{\eta_t \tau \lambda^2}{8} \leq 1 - \frac{\eta_t \tau \lambda}{4},
$$

$$
-(1 + \frac{\eta_t \tau \lambda}{4}) \frac{3\eta_t}{4} \leq -\frac{3\eta_t}{4},
$$

$$
(1 + \frac{\eta_t \tau \lambda}{4})\kappa_y^2 \eta_t^2 = \kappa_y^2 \eta_t^2 + \frac{4\kappa_y^2 \eta_t}{\tau \lambda} \leq \frac{\kappa_y^2 \eta_t}{6\tau \lambda} + \frac{4\kappa_y^2 \eta_t}{\tau \lambda} = \frac{25\kappa_y^2 \eta_t}{6\tau \lambda}.
$$

(79)

Thus, we have

$$
\|y_{t+1} - y^*(x_{t+1})\|^2 \leq (1 - \frac{\eta_t \tau \lambda}{4})\|y_t - y^*(x_t)\|^2 - \frac{3\eta_t}{4}\|\tilde{y}_{t+1} - y_t\|^2 \\
+ \frac{25\eta_t \lambda}{6\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2 + \frac{25\kappa_y^2 \eta_t}{6\tau \lambda} \|x_t - \bar{x}_{t+1}\|^2.
$$

(80)

\[\square\]

**Lemma 19** Suppose the zeroth-order stochastic gradients $v_t$ and $w_t$ be generated from Algorithm 2, we have

$$
\mathbb{E}\|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 \leq (1 - \alpha_t)^2\mathbb{E}\|\nabla_x f_{\mu_1}(x_{t-1}, y_{t-1}) - v_{t-1}\|^2 + 3(1 - \alpha_t)^2 L_f^2 \mu_1^2 d_1^2 \\
+ 6d_1 L_f^2 (1 - \alpha_t)^2 \eta_{t-1}^2 (\|x_t - x_{t-1}\|^2 + \|y_t - y_{t-1}\|^2) + 2\alpha_t^2 \delta^2.
$$

(81)

$$
\mathbb{E}\|\nabla_y f_{\mu_2}(x_t, y_t) - w_t\|^2 \leq (1 - \beta_t)^2\mathbb{E}\|\nabla_y f_{\mu_2}(x_{t-1}, y_{t-1}) - w_{t-1}\|^2 + 3(1 - \beta_t)^2 L_f^2 \mu_2^2 d_2^2 \\
+ 6d_2 L_f^2 (1 - \beta_t)^2 \eta_{t-1}^2 (\|x_t - x_{t-1}\|^2 + \|y_t - y_{t-1}\|^2) + 2\beta_t^2 \delta^2.
$$

(82)

**Proof** We first prove the inequality (81). According to the definition of $v_t$ in Algorithm 2, we have

$$
v_t - v_{t-1} = -\alpha_t v_{t-1} + (1 - \alpha_t)(\bar{\nabla}_x f(x_t, y_t; \xi_t) - \bar{\nabla}_x f(x_{t-1}, y_{t-1}; \xi_t)) + \alpha_t \bar{\nabla}_x f(x_t, y_t; \xi_t).
$$

(83)
Then we have

\begin{align}
\mathbb{E}\|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 \\
= \mathbb{E}\|\nabla_x f_{\mu_1}(x_t, y_t) - v_{t-1} - (v_t - v_{t-1})\|^2 \\
= \mathbb{E}\|\nabla_x f_{\mu_1}(x_t, y_t) - v_{t-1} + \alpha_t v_{t-1} - \alpha_t \nabla_x f(x_t, y_t; \xi_t) - (1 - \alpha_t)(\nabla_x f(x_t, y_t; \xi_t) - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t))\|^2 \\
= \mathbb{E}\|(1 - \alpha_t)\nabla_x f_{\mu_1}(x_{t-1}, y_{t-1}) - v_{t-1} + (1 - \alpha_t)(\nabla_x f_{\mu_1}(x_t, y_t) - \nabla_x f_{\mu_1}(x_{t-1}, y_{t-1})) - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t) + \alpha_t (\nabla_x f_{\mu_1}(x_t, y_t) - \nabla_x f(x_t, y_t; \xi_t))\|^2 \\
= (1 - \alpha_t)^2 \mathbb{E}\|\nabla_x f_{\mu_1}(x_{t-1}, y_{t-1}) - v_{t-1}\|^2 + \alpha_t^2 \mathbb{E}\|\nabla_x f_{\mu_1}(x_t, y_t) - \nabla_x f(x_t, y_t; \xi_t)\|^2 \\
+ 2\alpha_t(1 - \alpha_t)\mathbb{E}\|\nabla_x f_{\mu_1}(x_{t-1}, y_{t-1}) - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t)\|^2 \\
\leq (1 - \alpha_t^2) \mathbb{E}\|\nabla_x f_{\mu_1}(x_{t-1}, y_{t-1}) - v_{t-1}\|^2 \\
+ 2\alpha_t^2 \mathbb{E}\|\nabla_x f_{\mu_1}(x_t, y_t) - \nabla_x f(x_t, y_t; \xi_t)\|^2 \\
\leq (1 - \alpha_t^2) \mathbb{E}\|\nabla_x f_{\mu_1}(x_{t-1}, y_{t-1}) - v_{t-1}\|^2 + 2(1 - \alpha_t^2) \mathbb{E}\|\nabla_x f_{\mu_1}(x_{t-1}, y_{t-1}) - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t)\|^2 \\
+ 2\alpha_t^2 \delta^2,
\end{align}

where the fourth equality follows by \(\mathbb{E}_{(u_1, \xi)}[\nabla_x f(x_t, y_t; \xi_t)] = \nabla_x f_{\mu_1}(x_t, y_t)\) and \(\mathbb{E}_{(u_1, \xi)}[\nabla_x f(x_t, y_t; \xi_t) - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t)] = \nabla_x f_{\mu_1}(x_t, y_t) - \nabla_x f_{\mu_1}(x_{t-1}, y_{t-1})\); the first inequality holds by Young’s inequality; the last inequality is due to the equality \(\mathbb{E}\|\xi - \mathbb{E}[\xi]\|^2 = \mathbb{E}\|\xi\|^2 - \|\mathbb{E}[\xi]\|^2\) and Assumption 2.

Next, we consider the upper bound of the above term \(T_1\) as follows:

\begin{align}
T_1 &= \mathbb{E}\|\nabla_x f(x_t, y_t; \xi_t) - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t)\|^2 \\
&= \mathbb{E}\| d_1(f(x_t + \mu_1 u_1, y_t; \xi_t) - f(x_t, y_t; \xi_t)) - d_1(f(x_{t-1} + \mu_1 u_1, y_{t-1}; \xi_t)) - f(x_{t-1}, y_{t-1}; \xi_t)\|_{\mu_1}^2 \\
&= d_1^2 \mathbb{E}\| \mu_1 (f(x_t + \mu_1 u_1, y_t; \xi_t) - f(x_t, y_t; \xi_t)) - \mu_1 (f(x_{t-1} + \mu_1 u_1, y_{t-1}; \xi_t) - f(x_{t-1}, y_{t-1}; \xi_t)) \|_{\mu_1}^2 \\
&+ \|\langle \nabla_x f(x_t, y_t; \xi_t), u_1 \rangle - \langle \nabla_x f(x_{t-1}, y_{t-1}; \xi_t), u_1 \rangle\|_{\mu_1}^2 \\
&\leq \frac{3L_f^2 \mu_1^2 d_1^2}{2} + 3d_1^2 \mathbb{E}\|\langle \nabla_x f(x_t, y_t; \xi_t) - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t), u_1 \rangle\|_{\mu_1}^2 \\
&= \frac{3L_f^2 \mu_1^2 d_1^2}{2} + 3d_1^2 \mathbb{E}\|\nabla_x f(x_t, y_t; \xi_t) - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t)\|^2 \\
&= \frac{3L_f^2 \mu_1^2 d_1^2}{2} + 3d_1^2 \mathbb{E}\|\nabla_x f(x_t, y_t; \xi_t) - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t)\|^2 + 3d_1^2 \mathbb{E}\|\nabla_x f(x_{t-1}, y_{t-1}; \xi_t)\|^2 + 3d_1^2 \mathbb{E}\|\nabla_x f(x_{t-1}, y_{t-1}; \xi_t)\|^2 \\
&\leq \frac{3L_f^2 \mu_1^2 d_1^2}{2} + 3d_1^2 \mathbb{E}\|\nabla_x f(x_t, y_t; \xi_t) - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t)\|^2 + 3d_1^2 \mathbb{E}\|\nabla_x f(x_{t-1}, y_{t-1}; \xi_t)\|^2.
Following the proof of Lemma 5 in Ji et al. (2019), we have $u_1^T u_1 = \frac{1}{d_1} I_{d_1}$, where $I_{d_1}$ denotes a $d_1$-dimensional identity matrix. Thus, we have

$$T_1 \leq \frac{3L_f^2 \mu_1^2 d_1^2}{2} + 3d_1 E \| \nabla_x f(x_t, y_t; \xi_t) - \nabla_x f(x_{t-1}, y_{t-1}; \xi_t) \|^2$$

$$\leq \frac{3L_f^2 \mu_1^2 d_1^2}{2} + 3d_1 E \| \nabla f(x_t, y_t; \xi_t) - \nabla f(x_{t-1}, y_{t-1}; \xi_t) \|^2$$

$$\leq \frac{3L_f^2 \mu_1^2 d_1^2}{2} + 3d_1 L_f^2 (\|x_t - x_{t-1}\|^2 + \|y_t - y_{t-1}\|^2)$$

$$= \frac{3L_f^2 \mu_1^2 d_1^2}{2} + 3d_1 L_f^2 (\|\tilde{x}_t - x_{t-1}\|^2 + \|\tilde{y}_t - y_{t-1}\|^2),$$

(86)

where the last inequality holds by Assumption 5. Plugging the above inequality (86) into (84), we obtain

$$E \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \|^2 \leq (1 - \alpha_t)^2 E \| \nabla_x f_{\mu_1}(x_{t-1}, y_{t-1}) - v_{t-1} \|^2 + (1 - \alpha_t)^2 L_f \mu_1 d_1^2$$

$$+ 6d_1 L_f^2 (1 - \alpha_t)^2 \eta_{t-1}^2 (\|\tilde{x}_{t-1}\|^2 + \|\tilde{y}_{t-1}\|^2) + 2\alpha_t^2 \delta^2.$$

We apply a similar analysis to prove the above inequality (82). We obtain

$$E \| \nabla_y f_{\mu_2}(x_t, y_t) - w_t \|^2 \leq (1 - \beta_t)^2 E \| \nabla_y f_{\mu_2}(x_{t-1}, y_{t-1}) - w_{t-1} \|^2 + (1 - \beta_t)^2 L_f \mu_2 d_1^2$$

$$+ 6d_2 L_f^2 (1 - \beta_t)^2 \eta_{t-1}^2 (\|\tilde{x}_{t-1}\|^2 + \|\tilde{y}_{t-1}\|^2) + 2\beta_t^2 \delta^2.$$

Theorem 20 Suppose the sequence $\{x_t, y_t\}_{t=1}^T$ be generated from Algorithm 2. Let $y_1 = y^*(x_1), c_1 \geq \frac{2}{3\epsilon_m} + \frac{9\sqrt{\tau}}{4} $ and $c_2 \geq \frac{2}{3\epsilon_m} + \frac{625L_f^2 \lambda}{3}, \ k > 0, \ m \leq \max(2, k^3, (c_1 k^3), (c_2 k^3))$, $0 < \lambda \leq \min \left( \frac{1}{6\lambda_T}, \frac{1}{d_1} \right), \ 0 < \gamma \leq \min \left( \frac{\lambda_T}{2L_f \sqrt{6d_1 + 105d_1 k}}, \frac{m^{1/3}}{2L_f k} \right), \ 0 < \mu_1 \leq \frac{1}{d_1 (m + T)^{2/3}}$ and $0 < \mu_2 \leq \frac{1}{d_1 (m + T)^{2/3}}$, we have

$$\frac{1}{T} \sum_{t=1}^T E \left( d^{1/2} L_f \|y^*(x_t) - y_t\| + \|\nabla_x f(x_t, y_t) - v_t\| + \frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\| \right)$$

$$\leq \frac{2 \sqrt{3M' \lambda^{1/6}}}{T^{1/2}} + \frac{2 \sqrt{3M' \lambda^{1/3}}}{T^{1/3}} + \frac{L_f}{2 (m + T)^{2/3}}.$$

(87)

where $M' = \frac{2\eta_1 (x_1) - g^*}{\gamma k} + \frac{2c^2}{\lambda_T k^3} + \frac{36\tau^2 L_f^2 + 625L_f^2}{8\tau^2} (m + T)^{-2/3} + \frac{9L_f^2}{12\tau \lambda_T} + \frac{2(c^2 + c^2 \delta^2 \tau k^2)}{\lambda_T \epsilon_m} \ln(m + T)$.

Proof According to Lemma 19, we have

$$E \| \nabla_x f_{\mu_1}(x_{t+1}, y_{t+1}) - v_{t+1} \|^2 \leq (1 - \alpha_{t+1})^2 E \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \|^2 + (1 - \alpha_{t+1})^2 L_f \mu_1 d_1^2$$

$$+ 6d_1 L_f^2 (1 - \alpha_{t+1})^2 \eta_{t-1}^2 (\|\tilde{x}_{t+1} - x_t\|^2 + \|\tilde{y}_{t+1} - y_t\|^2) + 2\alpha_{t+1}^2 \delta^2.$$
Since $\eta_t$ is decreasing and $m \geq k^3$, we have $\eta_t \leq \eta_0 = \frac{k}{m^{1/3}} \leq 1$ and $\gamma \leq \frac{m^{1/3}}{2L_\alpha k} = \frac{1}{2L_\alpha \eta_0}$. For any $t \geq 0$. Due to $0 < \eta_t \leq 1$ and $m \geq \max \left( (c_1 k)^3, (c_2 k)^3 \right)$, we have $\alpha_t = c_1 \eta_t^2 \leq c_1 \eta_t \leq \frac{c_3}{m^{1/3}} \leq 1$ and $\beta_t = c_2 \eta_t^2 \leq c_2 \eta_t \leq \frac{c_4}{m^{1/3}} \leq 1$. Then we consider the upper bound of the following term:

$$
\frac{1}{\eta_t} E \| \nabla_x f_{\mu_1}(x_{t+1}, y_{t+1}) - v_{t+1} \|^2 - \frac{1}{\eta_{t-1}} E \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \|^2 \tag{88}
$$

$$
\leq \left( \frac{1 - \alpha_{t+1}}{\eta_t} - \frac{1}{\eta_{t-1}} \right) E \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \|^2 + 6d_1 L_\eta^2 (1 - \alpha_{t+1})^2 \eta_t (\| \tilde{x}_{t+1} - x_t \|^2 + \| \tilde{y}_{t+1} - y_t \|^2) \\
+ \frac{3(1 - \alpha_{t+1})^2 L_\eta^2 \mu_t^2 d_t^2}{\eta_t} + \frac{2 \alpha_{t+1}^2 \delta_2}{\eta_t}
$$

$$
\leq \left( \frac{1 - \alpha_{t+1}}{\eta_t} - \frac{1}{\eta_{t-1}} \right) E \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \|^2 + 6d_1 L_\eta^2 \eta_t (\| \tilde{x}_{t+1} - x_t \|^2 + \| \tilde{y}_{t+1} - y_t \|^2) \\
+ \frac{3L_\eta^2 \mu_t^2 d_t^2}{\eta_t} + \frac{2 \alpha_{t+1}^2 \delta_2}{\eta_t}
$$

where the second inequality is due to $0 < \alpha_{t+1} \leq 1$. By a similar way, we also obtain

$$
\frac{1}{\eta_t} E \| \nabla_y f_{\mu_2}(x_{t+1}, y_{t+1}) - w_{t+1} \|^2 - \frac{1}{\eta_{t-1}} E \| \nabla_y f_{\mu_2}(x_t, y_t) - w_t \|^2 \tag{89}
$$

$$
\leq \left( \frac{1 - \alpha_{t+1}}{\eta_t} - \frac{1}{\eta_{t-1}} - c_2 \eta_t \right) E \| \nabla_y f_{\mu_2}(x_t, y_t) - w_t \|^2 + 6d_2 L_\eta^2 \eta_t (\| \tilde{x}_{t+1} - x_t \|^2 + \| \tilde{y}_{t+1} - y_t \|^2) \\
+ \frac{3L_\eta^2 \mu_t^2 d_t^2}{\eta_t} + \frac{2 \beta_{t+1}^2 \delta_2}{\eta_t}.
$$

By $\eta_t = \frac{k}{(m+t)^{1/3}}$, we have

$$
\frac{1}{\eta_t} - \frac{1}{\eta_{t-1}} = \frac{1}{k} \left( (m+t)^{1/3} - (m+t-1)^{1/3} \right) \\
\leq \frac{1}{3k(m+t-1)^{2/3}} \leq \frac{1}{3k(m/2 + t)^{2/3}} \\
\leq \frac{2^{2/3}}{3k(m+t)^{2/3}} = \frac{2^{2/3}}{3k^3} \frac{k^2}{(m/2 + t)^{2/3}} = \frac{2^{2/3}}{3k^3} \eta_t^2 \leq \frac{2}{3k^3} \eta_t, \tag{90}
$$

where the first inequality holds by the concavity of function $f(x) = x^{1/3}$, i.e., $(x + y)^{1/3} \leq x^{1/3} + \frac{y}{3x^{2/3}}$; the second inequality is due to $m \geq 2$, and the last inequality is due to
Let $0 < \eta_t \leq 1$. Let $c_1 \geq \frac{2}{3\kappa} + \frac{9\lambda}{4}$, we have

\begin{equation}
\frac{1}{\eta_t} \mathbb{E} \| \nabla_x f_{\mu_1}(x_{t+1}, y_{t+1}) - v_{t+1}\|^2 - \frac{1}{\eta_{t-1}} \mathbb{E} \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 \leq -\frac{9\lambda}{4} \frac{\eta_t}{\eta_{t-1}} \mathbb{E} \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + 6d_1 L_f^2 \eta_t \left( \| \tilde{x}_{t+1} - x_t \|^2 + \| \tilde{y}_{t+1} - y_t \|^2 \right) + \frac{3L_f^2 \mu_1^2 d_1^2}{\eta_t} + \frac{2\alpha_{t+1} \delta^2}{\eta_t}.
\end{equation}

Let $c_2 \geq \frac{2}{3\kappa} + \frac{625dL^2\lambda}{3\tau}$ with $\tilde{d} = d_1 + d_2$, we have

\begin{equation}
\frac{1}{\eta_t} \mathbb{E} \| \nabla_y f_{\mu_2}(x_{t+1}, y_{t+1}) - w_{t+1}\|^2 - \frac{1}{\eta_{t-1}} \mathbb{E} \| \nabla_y f_{\mu_2}(x_t, y_t) - w_t\|^2 \leq -\frac{625dL^2\lambda}{3\tau} \eta_t \mathbb{E} \| \nabla_y f_{\mu_2}(x_t, y_t) - w_t\|^2 + 6d_2 L_f^2 \eta_t \left( \| \tilde{x}_{t+1} - x_t \|^2 + \| \tilde{y}_{t+1} - y_t \|^2 \right) + \frac{3L_f^2 \mu_2^2 d_2^2}{\eta_t} + \frac{2\beta_{t+1} \delta^2}{\eta_t}.
\end{equation}

According to Lemma 18, we have

\begin{equation}
\| y_{t+1} - y^*(x_{t+1}) \|^2 \leq (1 - \frac{\eta_t \tau \lambda}{4}) \| y_t - y^*(x_t) \|^2 - \frac{3\eta_t}{4} \| \tilde{y}_{t+1} - y_t \|^2 + \frac{25\kappa_y^2 \eta_t}{6\tau} \| \nabla_y f(x_t, y_t) - w_t \|^2 \right) + \frac{25\kappa_y^2 \eta_t}{6\tau} \| x_t - \tilde{x}_{t+1} \|^2 + \frac{25\kappa_y^2 \eta_t}{6\tau} \| \nabla_y f(x_t, y_t) - \nabla_y f_{\mu_2}(x_t, y_t) + \nabla_y f_{\mu_2}(x_t, y_t) - w_t \|^2 \right) \leq (1 - \frac{\eta_t \tau \lambda}{4}) \| y_t - y^*(x_t) \|^2 - \frac{3\eta_t}{4} \| \tilde{y}_{t+1} - y_t \|^2 + \frac{25\kappa_y^2 \eta_t}{6\tau} \| x_t - \tilde{x}_{t+1} \|^2 + \frac{25\kappa_y^2 \eta_t}{6\tau} \| \nabla_y f_{\mu_2}(x_t, y_t) - w_t \|^2,
\end{equation}

where the last inequality is due to Young’s inequality and Lemma 13.

Next, we define a Lyapunov function, for any $t \geq 1$

\begin{equation}
\Phi_t = g_{\mu_1}(x_t) + \frac{\gamma}{\lambda} \left( 25dL_f^2 \| y_t - y^*(x_t) \|^2 + \frac{1}{\eta_{t-1}} \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \|^2 + \frac{1}{\eta_{t-1}} \| \nabla_y f_{\mu_2}(x_t, y_t) - w_t \|^2 \right),
\end{equation}

38
where $\tilde{d} = d_1 + d_2$. Then we have

\[
\Phi_{t+1} - \Phi_t = g_{\mu_1}(x_{t+1}) - g_{\mu_1}(x_t) + \frac{25\tilde{d}L_j^2\gamma}{\lambda\tau} \left( \|y_{t+1} - y^*(x_{t+1})\|^2 - \|y_t - y^*(x_t)\|^2 \right)
+ \frac{\gamma}{\lambda\tau} \left( \frac{1}{\eta_t} \|\nabla x f_{\mu_1}(x_{t+1}, y_{t+1}) - v_{t+1}\|^2 - \frac{1}{\eta_t} \|\nabla x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{1}{\eta_t} \|\nabla y f_{\mu_2}(x_{t+1}, y_{t+1}) - w_{t+1}\|^2 \right)
- \frac{1}{\eta_t} \|\nabla y f_{\mu_2}(x_t, y_t) - w_t\|^2
\]
\[
\leq -\frac{\eta_t}{2\gamma} \|\tilde{x}_{t+1} - x_t\|^2 + 6\eta_t\gamma L_j^2 \|y^*(x_t) - y_t\|^2 + 2\eta_t\gamma \|\nabla x f_{\mu_1}(x_t, y_t) - v_t\|^2 + 3\eta_t\gamma \mu_1^2 \hat{d}_1^2 L_j^2
+ \frac{25\tilde{d}L_j^2\gamma}{\lambda\tau} \left( \frac{-\gamma}{4} \|y_{t+1} - y^*(x_{t+1})\|^2 - \frac{3\eta_t}{4} \|\tilde{y}_{t+1} - y_{t+1}\|^2 + \frac{25\eta_t\lambda}{3\tau} \|\nabla y f_{\mu_2}(x_{t+1}, y_{t+1}) - w_{t+1}\|^2 + \frac{25\lambda\mu_2^2 \hat{d}_2^2 L_2^2}{12\tau} \right)
+ \frac{25\eta_t\gamma}{6\tau\lambda} \|\tilde{x}_{t+1} - x_t\|^2 - \frac{9\gamma\eta_t}{4} E \|\nabla x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{6d_1 L_j^2 \gamma}{\tau\lambda} \left( \|\tilde{x}_{t+1} - x_t\|^2 + \|\tilde{y}_{t+1} - y_{t+1}\|^2 \right)
+ \frac{3\mu_2^2 \hat{d}_1^2 \gamma}{\lambda\tau\eta_t} + \frac{2\alpha_t^2 \tau^2}{\lambda\tau\eta_t} - \frac{12\tilde{d}_{L_j}\mu_2^2 \gamma}{\lambda\tau\eta_t} \|\nabla y f_{\mu_2}(x_t, y_t) - w_t\|^2 + \frac{6d_2 L_j \gamma}{\tau\lambda} \left( \|\tilde{x}_{t+1} - x_t\|^2 + \|\tilde{y}_{t+1} - y_{t+1}\|^2 \right)
+ \frac{3\mu_2^2 \hat{d}_2^2 \gamma}{\lambda\tau\eta_t} + \frac{2\beta_t^2 \tau^2}{\lambda\tau\eta_t},
\]
\[
\leq -\frac{\tilde{d}L_j^2\eta_t}{4} \|y^*(x_t) - y_t\|^2 - \frac{\gamma\eta_t}{4} \|\nabla x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{6\tilde{d}d_2^2 L_2^4 \mu_2^2 \gamma}{12\tau^2}
+ \frac{3\mu_2^2 \hat{d}_1^2 \gamma}{\lambda\tau\eta_t} + \frac{2\alpha_t^2 \tau^2}{\lambda\tau\eta_t} + \frac{3\mu_2^2 \hat{d}_2^2 \gamma}{\lambda\tau\eta_t} + \frac{2\beta_t^2 \tau^2}{\lambda\tau\eta_t} - \left( \frac{\eta_t}{2\gamma} - \frac{6d_1 L_j^2 \gamma}{\tau\lambda} - \frac{6d_2 L_j \gamma}{\tau\lambda} - \frac{6\tilde{d}_{L_j}\mu_2^2 \gamma}{\lambda\tau\eta_t} \right) \|\tilde{x}_{t+1} - x_t\|^2
\]
\[
\leq -\frac{\tilde{d}L_j^2\eta_t}{4} \|y^*(x_t) - y_t\|^2 - \frac{\gamma\eta_t}{4} \|\nabla x f_{\mu_1}(x_t, y_t) - v_t\|^2 - \frac{\eta_t}{4\gamma} \|\tilde{x}_{t+1} - x_t\|^2 + \frac{6\tilde{d}d_2^2 L_2^4 \mu_2^2 \gamma}{12\tau^2}
+ \frac{3\mu_2^2 \hat{d}_1^2 \gamma}{\lambda\tau\eta_t} + \frac{2\alpha_t^2 \tau^2}{\lambda\tau\eta_t} + \frac{3\mu_2^2 \hat{d}_2^2 \gamma}{\lambda\tau\eta_t} + \frac{2\beta_t^2 \tau^2}{\lambda\tau\eta_t},
\]
where the first inequality holds by Lemmas 17 and the above inequalities (91), (92) and (93); the last inequality is due to $0 < \gamma \leq \frac{\lambda\tau}{2L_j \sqrt{6\lambda\tau + 105d_2 \gamma}}$. Thus, we have

\[
\frac{\tilde{d}L_j^2\eta_t}{4} \|y^*(x_t) - y_t\|^2 + \frac{\eta_t}{4} \|\nabla x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{\eta_t}{4\gamma} \|\tilde{x}_{t+1} - x_t\|^2
\]
\[
\leq \Phi_t - \Phi_{t+1} + 3\mu_1^2 \hat{d}_1^2 L_j \eta_t + \frac{62d_2^2 L_{\mu_2}^4 \mu_2^2 \eta_t}{12\tau^2} + \frac{3\mu_2^2 \hat{d}_1^2 \gamma}{\lambda\tau\eta_t} + \frac{2\alpha_t^2 \tau^2}{\lambda\tau\eta_t} + \frac{3\mu_2^2 \hat{d}_2^2 \gamma}{\lambda\tau\eta_t} + \frac{2\beta_t^2 \tau^2}{\lambda\tau\eta_t}.
\]

Since $\inf_{x \in X} g(x) = g^*$, we have $\inf_{x \in X} g_{\mu_1}(x) = \inf_{x \in X} \mathbb{E}_{u_1 \sim U_1} [g(x + \mu_1 u_1)] = \inf_{x \in X} \frac{1}{V} \int_B g(x + \mu_1 u_1) du_1 \geq \frac{1}{V} \int_B \inf_{x \in X} g(x + \mu_1 u_1) du_1 = g^*$, where $V$ denotes the volume of the unit ball $B$. 

39
Taking average over \( t = 1, 2, \cdots, T \) on both sides of (95), we have

\[
\frac{1}{T} \sum_{t=1}^{T} \left( \frac{\bar{d}L^2_\eta}{4} \| y^*(x_t) - y_t \|^2 + \frac{\eta_t}{4} \| \nabla x f_{\mu_1}(x_t, y_t) - v_t \|^2 + \frac{\eta_t}{4\gamma^2} \| \tilde{x}_{t+1} - x_t \|^2 \right)
\]

\[
\leq \sum_{t=1}^{T} \Phi_t - \Phi_{t+1} + \frac{1}{T} \sum_{t=1}^{T} \left( 3\mu_2^3 d_1^3 L_7^2 \eta_t + \frac{625 \bar{d}d_2^2 L_4^4 \mu_2^3 \eta_t}{12\tau^2} + \frac{3L_2^2 \mu_2^2 d_1^2}{\lambda \tau \eta} ight)
\]

\[
+ \frac{2\alpha_{t+1}^2 \delta^2}{\lambda \tau \eta} + \frac{3L_2^2 \mu_2^2 d_1^2}{\lambda \tau \eta} + \frac{2\beta_{t+1}^2 \delta^2}{\lambda \tau \eta}. \tag{96}
\]

Since the initial solution satisfies \( y_1 = y^*(x_1) = \arg \max_{y \in Y} f(x_1, y) \), we have

\[
\Phi_1 = g_{\mu_1}(x_1) + \frac{\gamma}{\lambda \tau \eta_0} \| \nabla x f_{\mu_1}(x_1, y_1) - v_1 \|^2 + \frac{\gamma}{\lambda \tau \eta_0} \| \nabla y f_{\mu_2}(x_1, y_1) - w_1 \|^2
\]

\[
= g_{\mu_1}(x_1) + \frac{\gamma}{\lambda \tau \eta_0} \| \nabla x f_{\mu_1}(x_1, y_1) - \hat{\nabla} x f(x_1, y_1; \xi_1) \|^2 + \frac{\gamma}{\lambda \tau \eta_0} \| \nabla y f_{\mu_2}(x_1, y_1) - \hat{\nabla} y f(x_1, y_1; \xi_1) \|^2
\]

\[
\leq g_{\mu_1}(x_1) + \frac{2\gamma \delta^2}{\lambda \tau \eta_0}, \tag{96}
\]
where the last inequality holds by Assumption 2. Since \( \eta_t \) is decreasing, i.e., \( \eta_t^{-1} \geq \eta_t^{-1} \) for any \( 0 \leq t \leq T \), we have

\[
\frac{1}{T} \sum_{t=1}^{T} \left( \frac{\delta L_f^2}{4} \|y^*(x_t) - y_t\|^2 + \frac{1}{4} \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{1}{4\gamma^2} \|\tilde{x}_{t+1} - x_t\|^2 \right)
\leq \frac{1}{T\eta T} \sum_{t=1}^{T} (\Phi_t - \Phi_{t+1}) + \frac{1}{T\eta T} \sum_{t=1}^{T} (3\mu_1^2 d_1^2 L_f^2 \eta_t + \frac{625dd_2^2 d_1^4 \mu_2^2 \eta_t}{12\tau^2} + \frac{3L_f^2 \eta_t^4 d_1^4}{\lambda \tau^2 \eta_t} + \frac{2\beta_{t+1}^2 \delta^2}{\lambda \tau \eta_t})
\]

\[
\leq \frac{1}{T\gamma \eta T} (g_{\mu_1}(x_1) - g^* + \frac{2\delta^2 \gamma}{\lambda \tau \eta_0}) + \frac{1}{T\eta T} \sum_{t=1}^{T} (3\mu_1^2 d_1^2 L_f^2 \eta_t + \frac{625dd_2^2 d_1^4 \mu_2^2 \eta_t}{12\tau^2} + \frac{3L_f^2 \eta_t^4 d_1^4}{\lambda \tau^2 \eta_t})
\]

\[
= \frac{g_{\mu_1}(x_1) - g^*}{T\gamma \eta T} + \frac{2\delta^2}{T\lambda \tau \eta T} + \frac{36\tau^2 \mu_1^2 d_1^2 L_f^2 + 625dd_2^2 d_1^4 \mu_2^2}{12\tau^2 T\eta T} \sum_{t=1}^{T} \eta_t
\]

\[
\leq \frac{g_{\mu_1}(x_1) - g^*}{T\gamma \eta T} + \frac{2\delta^2}{T\lambda \tau \eta T} + \frac{36\tau^2 \mu_1^2 d_1^2 L_f^2 + 625dd_2^2 d_1^4 \mu_2^2}{12\tau^2 T\eta T} \int_1^T \frac{k}{(m + t)^{1/3} dt} + \frac{2(c_1^2 + c_2^2) \delta^2}{T\eta T \lambda \tau} \int_1^T \frac{k^3}{m + t} dt
\]

\[
\leq \frac{g_{\mu_1}(x_1) - g^*}{T\gamma \eta T} + \frac{2\delta^2}{T\lambda \tau \eta T} + \frac{36\tau^2 \mu_1^2 d_1^2 L_f^2 + 625dd_2^2 d_1^4 \mu_2^2}{12\tau^2 T\eta T} (m + T)^{2/3} + \frac{4T \eta T \lambda \tau k}{(m + T)^{4/3} + \frac{2(c_1^2 + c_2^2) \delta^2 k^3}{T\eta T \lambda \tau} \ln(m + T)}
\]

\[
\leq \frac{g_{\mu_1}(x_1) - g^*}{T\gamma \eta T} + \frac{2\delta^2}{T\lambda \tau \eta T} + \frac{36\tau^2 L_f^2 k + 625d_1^4 \mu_2^2 (m + T)^{-2/3}}{8\tau^2 T\eta T} (m + T) + \frac{9L_f^2}{4T \eta T \lambda \tau k} \ln(m + T) + \frac{2(c_1^2 + c_2^2) \delta^2 k^3}{T\eta T \lambda \tau} \ln(m + T) + \frac{9L_f^2}{4T \lambda \tau k^2} (m + T)^{1/3} + \frac{2(c_1^2 + c_2^2) \delta^2 k^2}{T \lambda \tau} \ln(m + T)(m + T)^{1/3},
\]

(97)

where the second inequality holds by the above inequality (96), and the last inequality is due to \( 0 < \mu_1 \leq \frac{1}{d_1(m + T)^{2/3}} \) and \( 0 < \mu_2 \leq \frac{1}{d_2^2 d_2(m + T)^{2/3}} \). Let \( M' = \frac{g_{\mu_1}(x_1) - g^*}{\gamma k} + \frac{2\delta^2}{\lambda \tau \eta_0} + \ldots \)
\[ \frac{36r^2L_2^2 + 625L_4^4}{8r^2} (m + T)^{-2/3} + \frac{9L_2^2}{4r^2} + \frac{2(c_1^2 + c_2^2)\delta^2k^2}{\lambda r^2} \ln(m + T), \]

we have

\[ \frac{1}{T} \sum_{t=1}^T \left( \frac{\delta L_2}{4} \| y^t(x_t) - y_t \|^2 + \frac{1}{4} \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \|^2 + \frac{1}{4\gamma^2} \| \tilde{x}_{t+1} - x_t \|^2 \right) \]

\[ \leq \frac{M'}{T} (m + T)^{1/3}. \] (98)

According to Jensen’s inequality, we have

\[ \frac{1}{T} \sum_{t=1}^T \left( \frac{\delta L_2}{2} \| y^t(x_t) - y_t \| + \frac{1}{2} \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \| + \frac{1}{2\gamma} \| \tilde{x}_{t+1} - x_t \| \right) \]

\[ \leq \frac{3}{T} \sum_{t=1}^T \left( \frac{\delta L_2}{4} \| y^t(x_t) - y_t \|^2 + \frac{1}{4} \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \|^2 + \frac{1}{4\gamma^2} \| \tilde{x}_{t+1} - x_t \|^2 \right)^{1/2} \]

\[ \leq \frac{\sqrt{3M'}}{T^{1/2}} (m + T)^{1/6} \]

\[ \leq \frac{\sqrt{3M'}m^{1/6}}{T^{1/2}} + \frac{\sqrt{3M'}}{T^{1/3}}, \] (99)

where the last inequality is due to \((a + b)^{1/6} \leq a^{1/6} + b^{1/6} \). Thus we obtain

\[ \frac{1}{T} \sum_{t=1}^T \mathbb{E} \left( \frac{\delta L_2}{2} \| y^t(x_t) - y_t \| + \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \| + \frac{1}{\gamma} \| \tilde{x}_{t+1} - x_t \| \right) \]

\[ \leq \frac{2\sqrt{3M'}m^{1/6}}{T^{1/2}} + \frac{2\sqrt{3M'}}{T^{1/3}}. \]

According to Lemma 13, we have

\[ \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \| = \| \nabla_x f_{\mu_1}(x_t, y_t) - \nabla_x f(x_t, y_t) + \nabla_x f(x_t, y_t) - v_t \| \geq \| \nabla_x f(x_t, y_t) - v_t \| - \| \nabla_x f_{\mu_1}(x_t, y_t) - \nabla_x f(x_t, y_t) \| \geq \| \nabla_x f(x_t, y_t) - v_t \| - \frac{\mu_1 L_f d_1}{2}. \]

Thus, we have

\[ \frac{1}{T} \sum_{t=1}^T \mathbb{E} \left( \frac{\delta L_2}{2} \| y^t(x_t) - y_t \| + \| \nabla_x f(x_t, y_t) - v_t \| + \frac{1}{\gamma} \| \tilde{x}_{t+1} - x_t \| \right) \]

\[ \leq \frac{1}{T} \sum_{t=1}^T \mathbb{E} \left( \frac{\delta L_2}{2} \| y^t(x_t) - y_t \| + \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \| + \frac{\mu_1 L_f d_1}{2} + \frac{1}{\gamma} \| \tilde{x}_{t+1} - x_t \| \right) \]

\[ \leq \frac{2\sqrt{3M'}m^{1/6}}{T^{1/2}} + \frac{2\sqrt{3M'}}{T^{1/3}} + \frac{\mu_1 L_f d_1}{2} \]

\[ \leq \frac{2\sqrt{3M'}m^{1/6}}{T^{1/2}} + \frac{2\sqrt{3M'}}{T^{1/3}} + \frac{\mu_1 L_f d_1}{2(m + T)^{2/3}}, \] (100)

where the last inequality is due to \(0 < \mu_1 \leq \frac{1}{\delta_1(m + T)^{2/3}}. \)
A.3 Convergence Analysis of Acc-Semi-ZOMDA Algorithm

In this subsection, we study the convergence properties of the Acc-Semi-ZOMDA algorithm.

**Lemma 21** Suppose the sequence \( \{x_t, y_t\}_{t=1}^T \) be generated from Algorithm 3. Let \( 0 < \eta_t \leq 1 \) and \( 0 < \gamma \leq \frac{1}{2L_y \eta_t} \), we have
\[
g_{\mu_1}(x_t) - g_{\mu_1}(x_{t+1}) \leq -\frac{\eta_t}{2\gamma} \|\tilde{x}_{t+1} - x_t\|^2 + 6\eta_t \gamma L_f^2 \|y^*(x_t) - y_t\|^2 + 2\eta_t \gamma \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + 3\eta_t \gamma \mu_1^2 d_1^2 L_f^2,
\]
where \( L_g = L_f + L_f^2 / \tau \).

**Proof** This proof is the same to the above proof of Lemma 17. \( \blacksquare \)

**Lemma 22** Suppose the sequence \( \{x_t, y_t\}_{t=1}^T \) be generated from Algorithm 3. Under the above assumptions, and set \( 0 < \eta_t \leq 1 \) and \( \lambda \leq \frac{1}{6L_f} \), we have
\[
\|y_{t+1} - y^*(x_{t+1})\|^2 \leq (1 - \frac{(\eta_t \tau \lambda)}{4}) \|y_t - y^*(x_t)\|^2 - \frac{3\eta_t}{4} \|\tilde{y}_{t+1} - y_t\|^2 + \frac{25\eta_t \lambda}{6\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2 + \frac{25\eta_t \lambda}{6\tau} \|x_t - \tilde{x}_{t+1}\|^2,
\]
where \( \kappa_y = L_f / \tau \).

**Proof** This proof is the same to the above proof of Lemma 18. \( \blacksquare \)

**Lemma 23** Suppose the zeroth-order stochastic gradients \( v_t \) and \( w_t \) be generated from Algorithm 3, we have
\[
\mathbb{E}\|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 \leq (1 - \alpha_t^2)\mathbb{E}\|\nabla_x f_{\mu_1}(x_{t-1}, y_{t-1}) - v_{t-1}\|^2 + 3(1 - \alpha_t^2)L_f^2 \mu_1^2 d_1^2 + 6d_1 L_f^2(1 - \alpha_t^2)\eta_t^2 (\|\tilde{x}_t - x_{t-1}\|^2 + \|\tilde{y}_t - y_{t-1}\|^2) + 2\alpha_t^2 \delta^2.
\]

\[
\mathbb{E}\|\nabla_y f(x_t, y_t) - w_t\|^2 \leq (1 - \beta_t^2)\mathbb{E}\|\nabla_y f(x_{t-1}, y_{t-1}) - w_{t-1}\|^2 + 2\beta_t^2 \delta^2 + 2(1 - \beta_t^2)L_f^2 \eta_t \tilde{d}_1^2 (\mathbb{E}\|\tilde{x}_t - x_{t-1}\|^2 + \mathbb{E}\|\tilde{y}_t - y_{t-1}\|^2).
\]

**Proof** The proof of the inequality (103) is the same to the proof of Lemma 19. Next, we prove the inequality (104). According to the definition of \( w_t \) in Algorithm 3, we have
\[
w_t - w_{t-1} = -\beta_t w_{t-1} + (1 - \beta_t)(\nabla_y f(x_t, y_t; \xi_t) - \nabla_y f(x_{t-1}, y_{t-1}; \xi_t)) + \beta_t \nabla_y f(x_t, y_t; \xi_t).
\]
Then we have

\[
\mathbb{E}[\nabla_y f(x_t, y_t) - v_t]^2 = \mathbb{E}[\nabla_y f(x_t, y_t) - v_{t-1} - (v_t - v_{t-1})]^2 \tag{105}
\]

\[
= \mathbb{E}[\nabla_y f(x_t, y_t) - v_{t-1} + \beta_t v_{t-1} - \beta_t \nabla_y f(x_t, y_t; \xi_t) - (1 - \beta_t)(\nabla_y f(x_t, y_t; \xi_t) - \nabla_y f(x_{t-1}, y_{t-1}; \xi_t))|^2
\]

\[
= \mathbb{E}[(1 - \beta_t)(\nabla_y f(x_{t-1}, y_{t-1}) - v_{t-1}) + (1 - \beta_t)(\nabla_y f(x_t, y_t) - \nabla_y f(x_{t-1}, y_{t-1}) - \nabla_y f(x_t, y_t; \xi_t)
\]

\[
+ \nabla_y f(x_{t-1}, y_{t-1}; \xi_t)) + \beta_t(\nabla_y f(x_t, y_t) - \nabla_y f(x_t, y_t; \xi_t))|^2
\]

\[
= (1 - \beta_t)^2 \mathbb{E}[\nabla_y f(x_{t-1}, y_{t-1}) - v_{t-1}]^2 + \beta_t^2 \mathbb{E}[\nabla_y f(x_t, y_t) - \nabla_y f(x_t, y_t; \xi_t)]^2
\]

\[
+ 2 \beta_t(1 - \beta_t)\langle \nabla_y f(x_t, y_t) - \nabla_y f(x_{t-1}, y_{t-1}), v_t - \nabla_y f(x_{t-1}, y_{t-1}) - \nabla_y f(x_t, y_t; \xi_t)\rangle
\]

\[
+ \nabla_y f(x_{t-1}, y_{t-1}; \xi_t), \nabla_y f(x_t, y_t) - \nabla_y f(x_t, y_t; \xi_t)\rangle \leq (1 - \beta_t)^2 \mathbb{E}[\nabla_y f(x_{t-1}, y_{t-1}) - v_{t-1}]^2 + 2 \beta_t^2 \mathbb{E}[\nabla_y f(x_t, y_t) - \nabla_y f(x_t, y_t; \xi_t)]^2
\]

\[
+ 2(1 - \beta_t)^2 \mathbb{E}[\nabla_y f(x_t, y_t) - \nabla_y f(x_{t-1}, y_{t-1}) - \nabla_y f(x_t, y_t; \xi_t)]^2 + \nabla_y f(x_{t-1}, y_{t-1}; \xi_t)
\]

\[
= (1 - \beta_t)^2 \mathbb{E}[\nabla_y f(x_{t-1}, y_{t-1}) - v_{t-1}]^2 + 2 \beta_t^2 \mathbb{E}[\nabla_y f(x_t, y_t; \xi_t)]^2 + 2 \beta_t^2 \delta^2
\]

\[
= (1 - \beta_t)^2 \mathbb{E}[\nabla_y f(x_{t-1}, y_{t-1}) - v_{t-1}]^2 + 2 \beta_t^2 \mathbb{E}[\nabla_y f(x_t, y_t; \xi_t)]^2 + 2 \beta_t^2 \delta^2
\]

where the fourth equality follows by \(\mathbb{E}[\nabla_y f(x_t, y_t; \xi_t)] = \nabla_y f(x_t, y_t; \xi_t)\) and \(\mathbb{E}[\nabla_y f(x_{t-1}, y_{t-1}) - v_{t-1}] = \nabla_y f(x_t, y_t; \xi_t)\); the first inequality holds by Young’s inequality; the second inequality is due to the equality \(\mathbb{E}[\nabla_y f(x_t, y_t; \xi_t)]^2 = \mathbb{E}[\nabla_y f(x_t, y_t; \xi_t)]^2 + \mathbb{E}[\nabla_y f(x_{t-1}, y_{t-1}) - v_{t-1}]^2 + 2 \beta_t \delta^2\), the last inequality holds by Assumption 5, \(x_t = x_{t-1} + \eta_t(\bar{x}_{t-1} - x_{t-1})\) and \(y_t = y_{t-1} + \eta_t(y_{t-1} - y_{t-1})\).

---

**Theorem 24** Suppose the sequence \(\{x_t, y_t\}_{t=1}^T\) be generated from Algorithm 3. Let \(y_1 = y^*(x_1)\), \(c_1 \geq 2 \frac{2 \lambda}{\sqrt{\lambda^2 + 4\frac{625\lambda^2}{64\tau}}}\), \(c_2 \geq 2 \frac{2 \lambda^2}{\sqrt{\lambda^2 + 4\frac{625\lambda^2}{64\tau}}}\), \(k > 0\), \(m \geq \max \left(2, k^3, (c_1 k)^3, (c_2 k)^3\right)\), \(0 < \lambda \leq \left(\frac{1}{6L_f}, \frac{1}{d_1}\right)\), \(0 < \gamma \leq \min \left(\frac{\lambda^2}{6L_f \sqrt{3d_1 + 105d_1 k^2}}, \frac{m^{1/3}}{2L_f k}\right)\) and \(0 < \mu_1 \leq \frac{1}{d_1(1 + T)^2 + \lambda^2}\), we have

\[
\mathbb{E}[\mathcal{H}_t] = \frac{1}{T} \sum_{t=1}^T \mathbb{E}\left(\frac{1}{2}L_f \|y^*(x_t) - y_t\|^2 + \|\nabla_x f(x_t, y_t) - v_t\| + \frac{1}{\gamma} \|\bar{x}_{t+1} - x_t\|\right)
\]

\[
\leq 2 \frac{\sqrt{3M''m^{1/6}}}{T^{1/2}} + 2 \frac{\sqrt{3M''}}{T^{1/3}} + \frac{L_f}{2(m + T)^{2/3}}, \tag{106}
\]

where \(M'' = \frac{g_*}{\gamma_k} + \frac{2 \delta^2}{\sqrt{\lambda^2 k_0^2}} + \frac{9L^2}{2^3} (m + T)^{-2/3} + \frac{9L^2}{\sqrt{\lambda^2 k^2}} + \frac{2(c_1^2 + c_2^2)\delta^2}{\lambda^2} \ln(m + T).

**Proof** This proof is similar to the proof of Theorem 20. According to Lemma 23, we have

\[
\mathbb{E}[\nabla_x f_{\mu_1}(x_{t+1}, y_{t+1}) - v_{t+1}]^2 \leq (1 - \alpha_{t+1})^2 \mathbb{E}[\nabla_x f_{\mu_1}(x_t, y_t) - v_t]^2 + 3(1 - \alpha_{t+1})^2 L^2_f \mu_1^2 d_1^2
\]

\[
+ 6d_1 L^2_f (1 - \alpha_{t+1})^2 \eta_t^2 (\|\bar{x}_{t+1} - x_t\|^2 + \|\bar{y}_{t+1} - y_t\|^2) + 2\alpha_{t+1}^2 \delta^2.
\]
Since $\eta_t$ is decreasing and $m \geq k^3$, we have $\eta_t \leq \eta_0 = \frac{k}{m^{1/2}} \leq 1$ and $\gamma \leq \frac{m^{1/3}}{2\eta_t k} = \frac{1}{2k^3 \eta_t}$ for any $t \geq 0$. Due to $0 < \eta_t \leq 1$ and $m \geq \max \left( (c_1k)^3, (c_2k)^3 \right)$, we have $\alpha_t = c_1 \eta_t^2 \leq c_1 \eta_t^2 \leq \frac{c_1k^2}{m^{1/2}} \leq 1$ and $\beta_t = c_2 \eta_t^2 \leq c_2 \eta_t \leq \frac{c_2k}{m^{1/2}} \leq 1$. Then we consider the upper bound of the following term:

$$
\frac{1}{\eta_t} \mathbb{E} \left\| \nabla_x f_{\mu_1}(x_{t+1}, y_{t+1}) - v_{t+1} \right\|^2 - \frac{1}{\eta_{t-1}} \mathbb{E} \left\| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \right\|^2 
\leq \left( \frac{1 - \alpha_{t+1}}{\eta_t} - \frac{1}{\eta_{t-1}} \right) \mathbb{E} \left\| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \right\|^2 + 6d_1 L_f^2 (1 - \alpha_{t+1})^2 \eta_t \left( \left\| \bar{x}_{t+1} - x_t \right\|^2 + \left\| \bar{y}_{t+1} - y_t \right\|^2 \right)
+ \frac{3(1 - \alpha_{t+1})^2 L_f^2 \mu_1^2 d_1^2}{\eta_t} + \frac{2 \alpha_{t+1}^2 \delta^2}{\eta_t}
\leq \left( \frac{1 - \alpha_{t+1}}{\eta_t} - \frac{1}{\eta_{t-1}} \right) \mathbb{E} \left\| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \right\|^2 + 6d_1 L_f^2 \eta_t \left( \left\| \bar{x}_{t+1} - x_t \right\|^2 + \left\| \bar{y}_{t+1} - y_t \right\|^2 \right)
+ \frac{3L_f^2 \mu_1^2 d_1^2}{\eta_t} + \frac{2 \alpha_{t+1}^2 \delta^2}{\eta_t}
= \left( \frac{1}{\eta_t} - \frac{c_1 \eta_t}{\eta_{t-1}} \right) \mathbb{E} \left\| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \right\|^2 + 6d_1 L_f^2 \eta_t \left( \left\| \bar{x}_{t+1} - x_t \right\|^2 + \left\| \bar{y}_{t+1} - y_t \right\|^2 \right)
+ \frac{3L_f^2 \mu_1^2 d_1^2}{\eta_t} + \frac{2 \alpha_{t+1}^2 \delta^2}{\eta_t},
$$

where the second inequality is due to $0 < \alpha_{t+1} \leq 1$. By Lemma 23, we also obtain

$$
\frac{1}{\eta_t} \mathbb{E} \left\| \nabla_y f(x_{t+1}, y_{t+1}) - w_{t+1} \right\|^2 - \frac{1}{\eta_{t-1}} \mathbb{E} \left\| \nabla_y f(x_t, y_t) - w_t \right\|^2 
\leq \left( \frac{1}{\eta_t} - \frac{1}{\eta_{t-1}} - c_2 \eta_t \right) \mathbb{E} \left\| \nabla_y f(x_t, y_t) - w_t \right\|^2 + 2L_f^2 \eta_t \left( \left\| \bar{x}_{t+1} - x_t \right\|^2 + \left\| \bar{y}_{t+1} - y_t \right\|^2 \right) + \frac{2 \beta_{t+1} \delta^2}{\eta_t}.
$$

By $\eta_t = \frac{k}{(m + t)^{1/3}}$, we have

$$
\frac{1}{\eta_t} - \frac{1}{\eta_{t-1}} = \frac{1}{k} \left( (m + t)^{1/3} - (m + t - 1)^{1/3} \right)
\leq \frac{1}{3k (m + t - 1)^{2/3}} \leq \frac{1}{3k (m/2 + t)^{2/3}}
\leq \frac{2^{2/3}}{3k (m + t)^{2/3}} = \frac{2^{2/3}}{3k (m/2 + t)^{2/3}} = \frac{2^{2/3}}{3k^3 \eta_t^2} \leq \frac{2}{3k^3 \eta_t},
$$

where the first inequality holds by the concavity of function $f(x) = x^{1/3}$, i.e., $(x + y)^{1/3} \leq x^{1/3} + \frac{y}{3x^{2/3}}$; the second inequality is due to $m \geq 2$, and the last inequality is due to $0 < \eta_t \leq 1$. Let $c_1 \geq \frac{2}{3k^3} + \frac{9\lambda\tau}{4}$, we have

$$
\frac{1}{\eta_t} \mathbb{E} \left\| \nabla_x f_{\mu_1}(x_{t+1}, y_{t+1}) - v_{t+1} \right\|^2 - \frac{1}{\eta_{t-1}} \mathbb{E} \left\| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \right\|^2 
\leq - \frac{9\lambda\tau}{4} \eta_t \mathbb{E} \left\| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \right\|^2 + 6d_1 L_f^2 \eta_t \left( \left\| \bar{x}_{t+1} - x_t \right\|^2 + \left\| \bar{y}_{t+1} - y_t \right\|^2 \right) + \frac{3L_f^2 \mu_1^2 d_1^2}{\eta_t} + \frac{2 \alpha_{t+1}^2 \delta^2}{\eta_t}.
$$
Let $c_2 \geq \frac{2}{3\tau} + \frac{625d_1L_f^2\lambda}{6\tau}$, we have

$$
\frac{1}{\eta t}E\|\nabla_y f(x_{t+1}, y_{t+1}) - w_{t+1}\|^2 - \frac{1}{\eta t-1}E\|\nabla_y f(x_t, y_t) - w_t\|^2
$$

(111)

\[ \leq - \frac{625d_1L_f^2\lambda}{6\tau} \eta t E \|\nabla_y f(x_t, y_t) - w_t\|^2 + 2L_f^2 \eta t (\|\tilde{x}_{t+1} - x_t\|^2 + \|y_{t+1} - y_t\|^2) + \frac{2\beta_t^2 \delta^2}{\eta t}. \]

Next, we define a Lyapunov function, for any $t \geq 1$

$$
\Psi_t = g_{\mu_1}(x_t) + \frac{\gamma}{\lambda \tau} (25d_1L_f^2\|y_t - y^*(x_t)\|^2 + \frac{1}{\eta t-1}E\|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{1}{\eta t-1}E\|\nabla_y f(x_t, y_t) - w_t\|^2).
$$

Then we have

$$
\Psi_{t+1} - \Psi_t
$$

\[ = g_{\mu_1}(x_{t+1}) - g_{\mu_1}(x_t) + \frac{25d_1L_f^2\gamma}{\lambda \tau} (\|y_{t+1} - y^*(x_t)\|^2 - \|y_t - y^*(x_t)\|^2)
\] 
\[ + \frac{\gamma}{\lambda \tau} \frac{1}{\eta t} E \|\nabla_x f_{\mu_1}(x_{t+1}, y_{t+1}) - v_{t+1}\|^2 - \frac{1}{\eta t-1}E\|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{1}{\eta t-1}E\|\nabla_y f(x_{t+1}, y_{t+1}) - w_{t+1}\|^2
\]
\[ - \frac{1}{\eta t-1}E\|\nabla_y f(x_t, y_t) - w_t\|^2
\]
\[ \leq - \frac{\eta t}{2\gamma} \|\tilde{x}_{t+1} - x_t\|^2 + 6\eta t \gamma L_f^2 \|y^*(x_t) - y_t\|^2 + 2\eta t \gamma E\|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + 3\eta t \gamma \mu_1^2 d_1^2 L_f^2
\]
\[ + \frac{25d_1L_f^2\gamma}{\lambda \tau} (\frac{\eta t \lambda}{4} \|y_t - y^*(x_t)\|^2 - \frac{3\mu t}{4} \|\tilde{y}_{t+1} - y_t\|^2 + \frac{25\mu t \lambda}{6\tau} \|\nabla_y f(x_t, y_t) - w_t\|^2 + \frac{25\mu t^2}{6\tau \lambda \eta t} ||x_t - \tilde{x}_{t+1}||^2)
\]
\[ - \frac{9\gamma \eta t}{4} E\|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{6d_1L_f^2\gamma}{\tau \lambda} \|\tilde{x}_{t+1} - x_t\|^2 + \|\tilde{y}_{t+1} - y_t\|^2 + \frac{3\eta t}{\lambda \tau \eta t} + \frac{2\delta_{t+1}^2}{\lambda \tau \eta t}
\]
\[ - \frac{625d_1L_f^2\gamma}{6\tau^2} \eta t E\|\nabla_y f(x_t, y_t) - w_t\|^2 + \frac{2L_f^2\eta t}{\tau \lambda} \|\tilde{y}_{t+1} - y_t\|^2 + \|\tilde{y}_{t+1} - y_t\|^2 + \frac{2\delta_{t+1}^2}{\lambda \tau \eta t}
\]
\[ \leq - \frac{d_1L_f^2\gamma}{4} \|y^*(x_t) - y_t\|^2 - \frac{\eta t}{4\gamma} \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{3\mu t^2}{4} d_1^2 L_f^2 \eta t \gamma + \frac{3\eta t}{\lambda \tau \eta t} + \frac{2\delta_{t+1}^2}{\lambda \tau \eta t}
\]
\[ + \frac{2\delta_{t+1}^2}{\lambda \tau \eta t} - (\frac{\eta t}{2\gamma} - \frac{8d_1L_f^2\eta t \gamma}{\tau \lambda} - \frac{625d_1L_f^2\gamma^2}{6\lambda^2 \tau^2} \eta t) \|\tilde{x}_{t+1} - x_t\|^2
\]
\[ \leq - \frac{d_1L_f^2\gamma}{4} \|y^*(x_t) - y_t\|^2 - \frac{\eta t}{4\gamma} \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{\eta t}{4\gamma} \|\tilde{x}_{t+1} - x_t\|^2 + \frac{3\mu t^2}{4} d_1^2 L_f^2 \eta t \gamma
\]
\[ + \frac{3\lambda^2 \mu_1^2 d_1^2 \gamma}{\lambda \tau \eta t} + \frac{2\delta_{t+1}^2}{\lambda \tau \eta t} + \frac{2\beta_{t+1}^2}{\lambda \tau \eta t},
\]
(112)

where the first inequality holds by Lemmas 21, 22 and the above inequalities (110), (111); the last inequality is due to $0 < \gamma \leq \frac{\lambda t}{2L_f \sqrt{8d_1 \lambda \tau + 105d_1^2 \gamma}}$. Thus, we have

$$
\frac{d_1L_f^2\gamma}{4} \|y^*(x_t) - y_t\|^2 + \frac{\eta t}{4\gamma} \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\|^2 + \frac{\eta t}{4\gamma} \|\tilde{x}_{t+1} - x_t\|^2
$$

\[ \leq \frac{\Psi_t - \Psi_{t+1}}{\gamma} + 3\mu t^2 d_1^2 L_f^2 \eta t + \frac{3\lambda^2 \mu_1^2 d_1^2 \gamma}{\lambda \tau \eta t} + \frac{2\delta_{t+1}^2}{\lambda \tau \eta t} + \frac{2\beta_{t+1}^2}{\lambda \tau \eta t}. \]

(113)
Since \( \inf_{x \in \mathcal{X}} g(x) = g^* \), we have \( \inf_{x \in \mathcal{X}} g_{\mu_1}(x) = \inf_{x \in \mathcal{X}} \mathbb{E}_{u_1 \sim U_B}[g(x + \mu_1 u_1)] = \inf_{x \in \mathcal{X}} \frac{1}{T} \int_B g(x + \mu_1 u_1) du_1 \geq \frac{1}{T} \int_B \inf_{x \in \mathcal{X}} g(x + \mu_1 u_1) du_1 = g^* \), where \( V \) denotes the volume of the unit ball \( B \).

Taking average over \( t = 1, 2, \ldots, T \) on both sides of (113), we have
\[
\frac{1}{T} \sum_{t=1}^{T} \left( d_1 L^2_{f} g_t \| y^*(x_t) - y_t \|^2 + \frac{\eta_t}{4} \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \|^2 + \frac{\eta_t}{4 \gamma^2} \| \tilde{x}_{t+1} - x_t \|^2 \right) \leq \frac{1}{T} \sum_{t=1}^{T} (3 \mu^2_1 d_1^2 L^2_{f \eta} + \frac{3 L^2_{f \mu_1} d_1^2}{\lambda \mu \eta} + \frac{2 a^2_{t+1} \delta^2}{\lambda \eta} + \frac{2 b^2_{t+1} \delta^2}{\lambda \eta}).
\]

Since the initial solution satisfies \( y_1 = y^*(x_1) = \arg \max_{y \in \mathcal{Y}} f(x_1, y) \), we have
\[
\Psi_1 \leq g_{\mu_1}(x_1) + \frac{\gamma}{\lambda \mu \eta_0} \| \nabla_x f_{\mu_1}(x_1, y_1) - v_1 \|^2 + \frac{\gamma}{\lambda \mu \eta_0} \| \nabla_y f(x_1, y_1) - w_1 \|^2
\]
\[
= g_{\mu_1}(x_1) + \frac{\gamma}{\lambda \mu \eta_0} \| \nabla_x f_{\mu_1}(x_1, y_1) - \nabla_y f(x_1, y_1; \xi_1) \|^2 + \frac{\gamma}{\lambda \mu \eta_0} \| \nabla_y f(x_1, y_1) - \nabla_y f(x_1, y_1; \xi_1) \|^2
\]
\[
\leq g_{\mu_1}(x_1) + \frac{2 \gamma \delta^2}{\lambda \mu \eta_0},
\]
where the last inequality holds by Assumption 8. Since \( \eta_t \) is decreasing, i.e., \( \eta_{t+1} \geq \eta_t \) for any \( 0 \leq t \leq T \), we have
\[
\frac{1}{T} \sum_{t=1}^{T} \left( d_1 L^2_{f} g_t \| y^*(x_t) - y_t \|^2 + \frac{1}{4} \| \nabla_x f_{\mu_1}(x_t, y_t) - v_t \|^2 + \frac{1}{4 \gamma^2} \| \tilde{x}_{t+1} - x_t \|^2 \right) \leq \frac{1}{T} \gamma \eta \sum_{t=1}^{T} (3 \mu^2_1 d_1^2 L^2_{f \eta} + \frac{3 L^2_{f \mu_1} d_1^2}{\lambda \mu \eta} + \frac{2 a^2_{t+1} \delta^2}{\lambda \eta} + \frac{2 b^2_{t+1} \delta^2}{\lambda \eta})
\]
\[
\leq \frac{1}{T} \gamma \eta \sum_{t=1}^{T} (g_{\mu_1}(x_1) - g^* + \frac{2 \gamma \delta^2}{\lambda \mu \eta_0}) + \frac{1}{T} \gamma \eta \sum_{t=1}^{T} \sum_{t=1}^{T} (3 \mu^2_1 d_1^2 L^2_{f \eta} + \frac{3 L^2_{f \mu_1} d_1^2}{\lambda \mu \eta} + \frac{2 a^2_{t+1} \delta^2}{\lambda \eta} + \frac{2 b^2_{t+1} \delta^2}{\lambda \eta})
\]
\[
\leq \frac{1}{T} \gamma \eta \sum_{t=1}^{T} \sum_{t=1}^{T} (g_{\mu_1}(x_1) - g^* + \frac{2 \gamma \delta^2}{\lambda \mu \eta_0}) + \frac{1}{T} \gamma \eta \sum_{t=1}^{T} \sum_{t=1}^{T} \left( \frac{3 \mu^2_1 d_1^2 L^2_{f \eta}}{\lambda \mu \eta} + \frac{3 L^2_{f \mu_1} d_1^2}{\lambda \mu \eta} + \frac{2 a^2_{t+1} \delta^2}{\lambda \eta} + \frac{2 b^2_{t+1} \delta^2}{\lambda \eta} \right)
\]
\[
\leq \frac{1}{T} \gamma \eta \sum_{t=1}^{T} \sum_{t=1}^{T} \left( \frac{g_{\mu_1}(x_1) - g^*}{\gamma \eta} + \frac{2 \gamma \delta^2}{\lambda \mu \eta_0} \right) + \frac{1}{T} \gamma \eta \sum_{t=1}^{T} \sum_{t=1}^{T} \left( \frac{g_{\mu_1}(x_1) - g^*}{\gamma \eta} + \frac{2 \gamma \delta^2}{\lambda \mu \eta_0} \right)
\]
\[
= \frac{g_{\mu_1}(x_1) - g^*}{T \gamma \eta} + \frac{2 \gamma \delta^2}{T \lambda \mu \eta_0} \sum_{t=1}^{T} \sum_{t=1}^{T} \left( \frac{g_{\mu_1}(x_1) - g^*}{\gamma \eta} + \frac{2 \gamma \delta^2}{\lambda \mu \eta_0} \right)
\]
\[
\leq \frac{g_{\mu_1}(x_1) - g^*}{T \gamma \eta} + \frac{2 \gamma \delta^2}{T \lambda \mu \eta_0} \int_{1}^{T} k \left( \frac{k^3}{m + t} dt \right)
\]
\[
= \frac{g_{\mu_1}(x_1) - g^*}{T \gamma \eta} + \frac{2 \gamma \delta^2}{T \lambda \mu \eta_0} \int_{1}^{T} \frac{k^3}{m + t} dt
\]
\[
\leq \frac{g_{\mu_1}(x_1) - g^*}{T \gamma \eta} + \frac{2 \gamma \delta^2}{T \lambda \mu \eta_0} \int_{1}^{T} \frac{k^3}{m + t} dt
\]
\[
\leq \frac{g_{\mu_1}(x_1) - g^*}{T \gamma \eta} + \frac{2 \gamma \delta^2}{T \lambda \mu \eta_0} \int_{1}^{T} \frac{2(m + T)^{2/3}}{T \gamma \eta} (m + T)^{1/3} + \frac{2 \gamma \delta^2}{T \gamma \eta} \int_{1}^{T} \frac{2(m + T)^{2/3}}{T \gamma \eta} \ln(m + T)
\]
\[
\leq \frac{g_{\mu_1}(x_1) - g^*}{T \gamma \eta} + \frac{2 \gamma \delta^2}{T \lambda \mu \eta_0} \int_{1}^{T} \frac{2(m + T)^{2/3}}{T \gamma \eta} (m + T)^{-2/3} + \frac{2 \gamma \delta^2}{T \gamma \eta} \int_{1}^{T} \frac{2(m + T)^{2/3}}{T \gamma \eta} \ln(m + T)
\]
\[
= \frac{g_{\mu_1}(x_1) - g^*}{T \gamma k} (m + T)^{1/3} + \frac{2 \gamma \delta^2}{T \lambda \mu \eta_0} (m + T)^{1/3} + \frac{2 \gamma \delta^2}{T \gamma \eta} \int_{1}^{T} \frac{2(m + T)^{2/3}}{T \gamma \eta} \ln(m + T)
\]
\[
+ \frac{2 \gamma \delta^2}{T \gamma \eta} \int_{1}^{T} \frac{2(m + T)^{2/3}}{T \gamma \eta} \ln(m + T)(m + T)^{1/3},
\]
(115)
where the second inequality holds by the above inequality (114), and the last inequality is due to $0 < \mu_1 \leq \frac{1}{d_1(m+T)^{2/3}}$. Let $M'' = \frac{g_{\mu_1}(x_1)-g^*}{\gamma k} + \frac{2\delta^2}{\lambda^2 k_{\text{no}}} + \frac{9L_f^2}{2(m+T)^{-2/3}} + \frac{9L_f^4}{4\lambda^2 k^2} + \frac{2(c_1^2+c_2^2)\delta^2 k^2}{\lambda^2}$ \ln(m+T), we have

$$ \frac{1}{T} \sum_{t=1}^{T} \left( \frac{d_1}{2} L_f \|y^*(x_t) - y_t\| + \frac{1}{4} \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\| + \frac{1}{2\gamma} \|\tilde{x}_{t+1} - x_t\| \right) $$

$$ \leq \left( \frac{3}{T} \sum_{t=1}^{T} \left( \frac{d_1}{2} L_f \|y^*(x_t) - y_t\| + \frac{1}{4} \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\| + \frac{1}{4\gamma} \|\tilde{x}_{t+1} - x_t\| \right) \right)^{1/2} $$

$$ \leq \frac{\sqrt{3} M''}{T^{1/2}} (m+T)^{1/6} \leq \frac{\sqrt{3} M'' m^{1/6}}{T^{1/2}} + \frac{\sqrt{3} M''}{T^{1/3}}, \quad (116) $$

where the last inequality is due to $(a+b)^{1/6} \leq a^{1/6} + b^{1/6}$. Thus we obtain

$$ \frac{1}{T} \sum_{t=1}^{T} \mathbb{E} \left( d_1^{1/2} L_f \|y^*(x_t) - y_t\| + \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\| + \frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\| \right) $$

$$ \leq \frac{2\sqrt{3} M'' m^{1/6}}{T^{1/2}} + \frac{2\sqrt{3} M''}{T^{1/3}}. $$

According to Lemma 13, we have $\|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\| = \|\nabla_x f_{\mu_1}(x_t, y_t) - \nabla_x f(x_t, y_t) + \nabla_x f(x_t, y_t) - v_t\| \geq \|\nabla_x f(x_t, y_t) - v_t\| - \|\nabla_x f_{\mu_1}(x_t, y_t) - \nabla_x f(x_t, y_t)\| \geq \|\nabla_x f(x_t, y_t) - v_t\| - \mu_1 L_f d_1$. Thus, we have

$$ \frac{1}{T} \sum_{t=1}^{T} \mathbb{E} \left( d_1^{1/2} L_f \|y^*(x_t) - y_t\| + \|\nabla_x f(x_t, y_t) - v_t\| + \frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\| \right) $$

$$ \leq \frac{1}{T} \sum_{t=1}^{T} \mathbb{E} \left( d_1^{1/2} L_f \|y^*(x_t) - y_t\| + \|\nabla_x f_{\mu_1}(x_t, y_t) - v_t\| + \frac{\mu_1 L_f d_1}{2} + \frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\| \right) $$

$$ \leq \frac{2\sqrt{3} M'' m^{1/6}}{T^{1/2}} + \frac{2\sqrt{3} M''}{T^{1/3}} + \frac{\mu_1 L_f d_1}{2} $$

$$ \leq \frac{2\sqrt{3} M'' m^{1/6}}{T^{1/2}} + \frac{2\sqrt{3} M''}{T^{1/3}} + \frac{L_f}{2(m+T)^{2/3}}, \quad (117) $$

where the last inequality is due to $0 < \mu_1 \leq \frac{1}{d_1(m+T)^{2/3}}$. \hfill \blacksquare
A.4 Convergence Analysis of Acc-MDA Algorithm

In this subsection, we study the convergence properties of the Acc-MDA algorithm.

**Lemma 25** Suppose the sequence \( \{x_t, y_t\}_{t=1}^T \) be generated from Algorithm 4. Let \( 0 < \eta_t \leq 1 \) and \( 0 < \gamma \leq \frac{1}{2L_g\eta} \), we have

\[
g(x_t) - g(x_{t+1}) \leq -\frac{\eta_t}{2\gamma} \|\tilde{x}_{t+1} - x_t\|^2 + 2\eta_t \gamma L_f^2 \|y^*(x_t) - y_t\|^2 + 2\eta_t \gamma \|\nabla_x f(x_t, y_t) - v_t\|^2,
\]

where \( L_g = L_f + L_f^2/\tau \).

**Proof** This proof is similar to the proof of Lemma 17. According to Lemma 9, the function \( g(x) \) has \( L_g \)-Lipschitz continuous gradient. Then we have

\[
g(x_{t+1}) \leq g(x_t) + \langle \nabla g(x_t), x_{t+1} - x_t \rangle + \frac{L_g}{2} \|x_{t+1} - x_t\|^2
\]

\[
= g(x_t) + \eta_t \langle \nabla g(x_t), \tilde{x}_{t+1} - x_t \rangle + \frac{L_g \eta_t^2}{2} \|\tilde{x}_{t+1} - x_t\|^2
\]

\[
= g(x_t) + \eta_t \langle \nabla g(x_t) - v_t, \tilde{x}_{t+1} - x_t \rangle + \eta_t \langle v_t, \tilde{x}_{t+1} - x_t \rangle + \frac{L_g \eta_t^2}{2} \|\tilde{x}_{t+1} - x_t\|^2.
\]

By the step 9 of Algorithm 4, we have \( \tilde{x}_{t+1} = \mathcal{P}_\mathcal{X}(x_t - \gamma v_t) = \arg \min_{x \in \mathcal{X}} \frac{1}{2} \|x - x_t + \gamma v_t\|^2 \). Since \( \mathcal{X} \) is a convex set and the function \( \frac{1}{2} \|x - x_t + \gamma v_t\|^2 \) is convex, according to Lemma 11, we have

\[
\langle \tilde{x}_{t+1} - x_t + \gamma v_t, x - \tilde{x}_{t+1} \rangle \geq 0, \ x \in \mathcal{X}.
\]

In Algorithm 4, let the initialize solution \( x_1 \in \mathcal{X} \), and the sequence \( \{x_t\}_{t \geq 1} \) generates as follows:

\[
x_{t+1} = x_t + \eta_t(\tilde{x}_{t+1} - x_t) = \eta_t \tilde{x}_{t+1} + (1 - \eta_t)x_t,
\]

where \( 0 < \eta_t \leq 1 \). Since \( \mathcal{X} \) is convex set and \( x_t, \tilde{x}_{t+1} \in \mathcal{X} \), we have \( x_{t+1} \in \mathcal{X} \) for any \( t > 0 \). Set \( x = x_t \) in the inequality (120), we have

\[
\langle v_t, \tilde{x}_{t+1} - x_t \rangle \leq -\frac{1}{\gamma} \|\tilde{x}_{t+1} - x_t\|^2.
\]

Next, we decompose the term \( \langle \nabla g(x_t) - v_t, \tilde{x}_{t+1} - x_t \rangle \) as follows:

\[
\langle \nabla g(x_t) - v_t, \tilde{x}_{t+1} - x_t \rangle = \langle \nabla g(x_t) - \nabla_x f(x_t, y_t), \tilde{x}_{t+1} - x_t \rangle + \langle \nabla_x f(x_t, y_t) - v_t, \tilde{x}_{t+1} - x_t \rangle.
\]
For the term $T_1$, by the Cauchy-Schwarz inequality and Young’s inequality, we have
\[ T_1 = \langle \nabla g(x_t) - \nabla_x f(x_t, y_t), \tilde{x}_{t+1} - x_t \rangle \]
\[ \leq \| \nabla g(x_t) - \nabla_x f(x_t, y_t) \| \cdot \| \tilde{x}_{t+1} - x_t \| \]
\[ \leq 2\gamma \| \nabla g(x_t) - \nabla_x f(x_t, y_t) \|^2 + \frac{1}{8\gamma} \| \tilde{x}_{t+1} - x_t \|^2 \]
\[ = 2\gamma \| \nabla_v f(x_t, y^*(x_t)) - \nabla_x f(x_t, y_t) \|^2 + \frac{1}{8\gamma} \| \tilde{x}_{t+1} - x_t \|^2 \]
\[ \leq 2\gamma \| \nabla f(x_t, y^*(x_t)) - \nabla f(x_t, y_t) \|^2 + \frac{1}{8\gamma} \| \tilde{x}_{t+1} - x_t \|^2 \]
\[ \leq 2\gamma L_f^2 \| y^*(x_t) - y_t \|^2 + \frac{1}{8\gamma} \| \tilde{x}_{t+1} - x_t \|^2, \] (124)
where the last inequality holds by Assumption 5.

For the term $T_2$, by the Cauchy-Schwarz inequality and Young’s inequality, we have
\[ T_2 = \langle \nabla_x f(x_t, y_t) - v_t, \tilde{x}_{t+1} - x_t \rangle \]
\[ \leq \| \nabla_x f(x_t, y_t) - v_t \| \cdot \| \tilde{x}_{t+1} - x_t \| \]
\[ \leq 2\gamma \| \nabla_x f(x_t, y_t) - v_t \|^2 + \frac{1}{8\gamma} \| \tilde{x}_{t+1} - x_t \|^2, \] (125)
where the last inequality holds by $\langle a, b \rangle \leq \frac{1}{2} \| a \|^2 + \frac{1}{2\lambda} \| b \|^2$ with $\lambda = 4\gamma$. Thus, we have
\[ \langle \nabla g(x_t) - v_t, \tilde{x}_{t+1} - x_t \rangle = 2\gamma L_f^2 \| y^*(x_t) - y_t \|^2 + 2\gamma \| \nabla_x f(x_t, y_t) - v_t \|^2 + \frac{1}{4\gamma} \| \tilde{x}_{t+1} - x_t \|^2. \] (126)

Finally, combining the inequalities (119), (122) with (126), we have
\[ g(x_{t+1}) \leq g(x_t) + 2\eta \gamma L_f^2 \| y^*(x_t) - y_t \|^2 + 2\eta \gamma \| \nabla_x f(x_t, y_t) - v_t \|^2 + \frac{\eta}{4\gamma} \| \tilde{x}_{t+1} - x_t \|^2 \]
\[ - \frac{\eta}{\gamma} \| \tilde{x}_{t+1} - x_t \|^2 + \frac{L_0 \eta^2}{2} \| \tilde{x}_{t+1} - x_t \|^2 \]
\[ \leq g(x_t) + 2\eta \gamma L_f^2 \| y^*(x_t) - y_t \|^2 + 2\eta \gamma \| \nabla_x f(x_t, y_t) - v_t \|^2 - \frac{\eta}{2\gamma} \| \tilde{x}_{t+1} - x_t \|^2, \] (127)
where the last inequality is due to $0 < \gamma \leq \frac{1}{2L_0 \eta \gamma}$.

**Lemma 26** Suppose the sequence $\{x_t, y_t\}_{t=1}^T$ be generated from Algorithm 4. Under the above assumptions, and set $0 < \eta_t \leq 1$ and $\lambda \leq \frac{1}{6L_f}$, we have
\[ \| y_{t+1} - y^*(x_{t+1}) \|^2 \leq (1 - \frac{\eta_t \gamma}{4}) \| y_t - y^*(x_t) \|^2 - \frac{3\eta_t}{4} \| y_{t+1} - y_t \|^2 \]
\[ + \frac{5\eta_t \gamma}{6\tau} \| \nabla_y f(x_t, y_t) - w_t \|^2 + \frac{25\kappa_y^2 \eta_t}{6\tau \lambda} \| x_t - \tilde{x}_{t+1} \|^2, \] (128)
where $\kappa_y = L_f / \tau$. 

50
Proof This proof is the same to the proof of Lemma 18.

Lemma 27 Suppose the stochastic gradients $v_t$ and $w_t$ be generated from Algorithm 4, we have

$$
\mathbb{E}\|\nabla_x f(x_t, y_t) - v_t\|^2 \leq (1 - \alpha_t)^2 \mathbb{E}\|\nabla_x f(x_{t-1}, y_{t-1}) - v_{t-1}\|^2 + 2\alpha_t^2 \delta^2 \\
+ 2(1 - \alpha_t)^2 L_f^2 \eta_t^2 (\mathbb{E}\|\bar{x}_t - x_{t-1}\|^2 + \mathbb{E}\|\bar{y}_t - y_{t-1}\|^2). \quad (129)
$$

$$
\mathbb{E}\|\nabla_y f(x_t, y_t) - w_t\|^2 \leq (1 - \beta_t)^2 \mathbb{E}\|\nabla_y f(x_{t-1}, y_{t-1}) - w_{t-1}\|^2 + 2\beta_t^2 \delta^2 \\
+ 2(1 - \beta_t)^2 L_f^2 \eta_t^2 (\mathbb{E}\|\bar{x}_t - x_{t-1}\|^2 + \mathbb{E}\|\bar{y}_t - y_{t-1}\|^2). \quad (130)
$$

Proof This proof is the same to the proof of Lemma 23.

Theorem 28 Suppose the sequence $\{x_t, y_t\}_{t=1}^T$ be generated from Algorithm 4. Let $y_1 = y^*(x_1)$, $c_1 \geq \frac{2}{3k^3} + \frac{9\lambda^r}{4}$ and $c_2 \geq \frac{2}{3k^3} + \frac{75L_f^2 \lambda}{2\gamma r}$, $k > 0$, $m \geq \max(2k^3, (c_1k)^3, (c_2k)^3)$, $0 < \lambda \leq \frac{1}{6L_f}$ and $0 < \gamma \leq \min(\frac{1}{2L_f}, \frac{\gamma}{L_f} \sqrt{\frac{m}{384\pi} \frac{m^{1/3}}{2L_\sigma k}})$, we have

$$
\mathbb{E}[\mathcal{H}_x^{m}] = \frac{1}{T} \sum_{t=1}^{T} \mathbb{E}(L_f \|y^*(x_t) - y_t\| + \|\nabla_x f(x_t, y_t) - v_t\| + \frac{1}{\gamma} \|\bar{x}_{t+1} - x_t\|)
$$
$$
\leq \frac{2\sqrt{3M''m^{1/6}}}{T^{1/2}} + \frac{2\sqrt{3M''}}{T^{1/3}}, \quad (131)
$$

where $M'' = \frac{g(x_1) - g^*}{\gamma_k} + \frac{2\delta^2}{k^2 \lambda^r k \sigma_0} + \frac{2(c_1 + c_2)^2 \delta^2 \lambda^r}{\gamma r} \ln(m + T)$.

Proof This proof is the similar to the proof of Theorem 24. According to Lemma 27, we have

$$
\mathbb{E}\|\nabla_x f(x_{t+1}, y_{t+1}) - v_{t+1}\|^2 \leq (1 - \alpha_{t+1})^2 \mathbb{E}\|\nabla_x f(x_t, y_t) - v_t\|^2 + 2\alpha_{t+1}^2 \delta^2 \\
+ 2L_f^2 (1 - \alpha_{t+1})^2 \eta_t^2 (\|\bar{x}_{t+1} - x_t\|^2 + \|\bar{y}_{t+1} - y_t\|^2).
$$

Since $\eta_t$ is decreasing and $m \geq k^3$, we have $\eta_t \leq \eta_0 = \frac{k}{m^{1/3}} \leq 1$ and $\gamma \leq \frac{m^{1/3}}{2L_\sigma k} = \frac{1}{2L_\sigma \eta_0} \leq \frac{1}{2L_\sigma \eta_t}$ for any $t \geq 0$. Due to $0 < \eta_t \leq 1$ and $m \geq \max((c_1k)^3, (c_2k)^3)$, we have $\alpha_t = c_1 \eta_t^2 \leq c_1 \eta_t \leq \frac{\alpha_k}{m^{1/3}} \leq 1$ and $\beta_t = c_2 \eta_t^2 \leq c_2 \eta_t \leq \frac{\alpha_k}{m^{1/3}} \leq 1$. Then we consider the upper bound of
the following term:

$$\frac{1}{\eta_t} \mathbb{E}\|\nabla_x f(x_{t+1}, y_{t+1}) - v_{t+1}\|^2 - \frac{1}{\eta_{t-1}} \mathbb{E}\|\nabla_x f(x_t, y_t) - v_t\|^2$$

$$\leq \left(\frac{1-\alpha_{t+1}}{\eta_t} - \frac{1}{\eta_{t-1}}\right) \mathbb{E}\|\nabla_x f(x_t, y_t) - v_t\|^2 + 2L_f^2(1 - \alpha_{t+1})^2\eta_t (\|\tilde{x}_{t+1} - x_t\|^2 + \|\tilde{y}_{t+1} - y_t\|^2)$$

$$+ \frac{2\alpha^2_{t+1}\delta^2}{\eta_t}$$

$$\leq \left(\frac{1-\alpha_{t+1}}{\eta_t} - \frac{1}{\eta_{t-1}}\right) \mathbb{E}\|\nabla_x f(x_t, y_t) - v_t\|^2 + 2L_f^2\eta_t (\|\tilde{x}_{t+1} - x_t\|^2 + \|\tilde{y}_{t+1} - y_t\|^2) + \frac{2\alpha^2_{t+1}\delta^2}{\eta_t}$$

$$= \left(\frac{1}{\eta_t} - \frac{1}{\eta_{t-1}} - c_1\eta_t\right) \mathbb{E}\|\nabla_x f(x_t, y_t) - v_t\|^2 + 2L_f^2\eta_t (\|\tilde{x}_{t+1} - x_t\|^2 + \|\tilde{y}_{t+1} - y_t\|^2) + \frac{2\beta_{t+1}\delta^2}{\eta_t},$$

where the second inequality is due to $0 < \alpha_{t+1} \leq 1$. By Lemma 23, we also obtain

$$\frac{1}{\eta_t} \mathbb{E}\|\nabla_y f(x_{t+1}, y_{t+1}) - w_{t+1}\|^2 - \frac{1}{\eta_{t-1}} \mathbb{E}\|\nabla_y f(x_t, y_t) - w_t\|^2$$

$$\leq \left(\frac{1}{\eta_t} - \frac{1}{\eta_{t-1}} - c_2\eta_t\right) \mathbb{E}\|\nabla_y f(x_t, y_t) - w_t\|^2 + 2L_f^2\eta_t (\|\tilde{x}_{t+1} - x_t\|^2 + \|\tilde{y}_{t+1} - y_t\|^2) + \frac{2\beta_{t+1}\delta^2}{\eta_t}.$$
Next, we define a Lyapunov function, for any $t \geq 1$

$$\Omega_t = g(x_t) + \frac{\gamma}{\lambda T} (9L_f^2 \|y_t - y^*(x_t)\|^2 + \frac{1}{\eta t} \|\nabla_x f(x_t, y_t) - v_t\|^2 + \frac{1}{\eta t-1} \|\nabla_y f(x_t, y_t) - w_t\|^2).$$

Then we have

$$\Omega_{t+1} - \Omega_t$$

$$= g(x_{t+1}) - g(x_t) + \frac{9L_f^2 \gamma}{\lambda T} (\|y_{t+1} - y^*(x_{t+1})\|^2 + \|y_t - y^*(x_t)\|^2) + \frac{1}{\eta t} \|\nabla_x f(x_{t+1}, y_{t+1}) - v_{t+1}\|^2 + \frac{1}{\eta t} \|\nabla_y f(x_{t+1}, y_{t+1}) - w_{t+1}\|^2 - \frac{1}{\eta t-1} \|\nabla_y f(x_t, y_t) - w_t\|^2$$

$$\leq -\frac{\eta}{2\gamma} \|ar{x}_{t+1} - x_t\|^2 + 2\eta \gamma L_f^2 \|y^*(x_t) - y_t\|^2 + 2\eta \gamma \|\nabla_x f(x_t, y_t) - v_t\|^2$$

$$+ \frac{9L_f^2 \gamma}{\lambda T} (1 - \frac{3\eta}{4\gamma} \|y_{t+1} - y_t\|^2) + \frac{2\eta \gamma}{\lambda T} (\frac{L_f^2 \gamma}{\lambda T} \|\bar{x}_{t+1} - x_t\|^2 + \|\bar{y}_{t+1} - y_t\|^2) + \frac{2\eta \gamma}{\lambda T} \|\nabla_y f(x_{t+1}, y_{t+1}) - w_{t+1}\|^2 + \frac{2\eta \gamma}{\lambda T} \|\nabla_y f(x_t, y_t) - w_t\|^2$$

where the first inequality holds by Lemmas 25, 26 and the above inequalities (135), (136); the last inequality is due to $0 < \gamma \leq \frac{\lambda T}{2L_f \sqrt{4\lambda T + 3\kappa^2 \alpha}}$. Thus, we have

$$\frac{L_f^2 \gamma}{4} \|y^*(x_t) - y_t\|^2 + \frac{\eta \gamma}{4} \|\nabla_x f(x_t, y_t) - v_t\|^2 + \frac{\eta \gamma}{4} \|\nabla_y f(x_{t+1}, y_{t+1}) - \bar{v}_{t+1} - x_t\|^2$$

$$\leq \frac{\Omega_t - \Omega_{t+1}}{\gamma} + \frac{2\eta \gamma}{\lambda T} \|\bar{x}_{t+1} - x_t\|^2 + \frac{2\eta \gamma}{\lambda T} \|\bar{y}_{t+1} - y_t\|^2 + \frac{2\gamma}{\lambda T} \|\nabla_y f(x_{t+1}, y_{t+1}) - w_{t+1}\|^2 + \frac{2\gamma}{\lambda T} \|\nabla_y f(x_t, y_t) - w_t\|^2$$

Taking average over $t = 1, 2, \cdots, T$ on both sides of (38), we have

$$\frac{1}{T} \sum_{t=1}^{T} \frac{L_f^2 \gamma}{4} \|y^*(x_t) - y_t\|^2 + \frac{\eta \gamma}{4} \|\nabla_x f(x_t, y_t) - v_t\|^2 + \frac{\eta \gamma}{4} \|\nabla_y f(x_{t+1}, y_{t+1}) - \bar{v}_{t+1} - x_t\|^2$$

$$\leq \sum_{t=1}^{T} \frac{\Omega_t - \Omega_{t+1}}{T \gamma} + \frac{1}{T} \sum_{t=1}^{T} \left( \frac{2\eta \gamma}{\lambda T} \|\bar{x}_{t+1} - x_t\|^2 + \frac{2\eta \gamma}{\lambda T} \|\bar{y}_{t+1} - y_t\|^2 \right).$$
Since the initial solution satisfies \( y_1 = y^*(x_1) = \arg \max_{y \in \mathcal{Y}} f(x_1, y) \), we have

\[
\Omega_1 = g(x_1) + \frac{\gamma}{\lambda \tau \eta_0} \| \nabla_x f(x_1, y_1) - v_1 \|^2 + \frac{\gamma}{\lambda \tau \eta_0} \| \nabla_y f(x_1, y_1) - w_1 \|^2
\]

\[
= g(x_1) + \frac{\gamma}{\lambda \tau \eta_0} \| \nabla_x f(x_1, y_1) - \nabla_x f(x_1, y_1; \xi_1) \|^2 + \frac{\gamma}{\lambda \tau \eta_0} \| \nabla_y f(x_1, y_1) - \nabla_y f(x_1, y_1; \xi_1) \|^2
\]

\[
\leq g(x_1) + \frac{2 \gamma \delta^2}{\lambda \tau \eta_0},
\]

(139)

where the last inequality holds by Assumption 9. Since \( \eta_t \) is decreasing, i.e., \( \eta_{t+1}^{-1} \geq \eta_t^{-1} \) for any \( 0 \leq t \leq T \), we have

\[
\frac{1}{T} \sum_{t=1}^{T} \left( \frac{L_f^2}{4} \| y^*(x_t) - y_t \|^2 + \frac{1}{4} \| \nabla_x f(x_t, y_t) - v_t \|^2 + \frac{1}{4 \gamma^2} \| \tilde{x}_{t+1} - x_t \|^2 \right)
\]

\[
\leq \frac{1}{T \gamma \eta_T} \sum_{t=1}^{T} (\Omega_t - \Omega_{t+1}) + \frac{1}{T \eta_T} \sum_{t=1}^{T} \left( \frac{2 \alpha_{t+1}^2 \delta^2}{\lambda \tau \eta_t} + \frac{2 \beta_{t+1}^2 \delta^2}{\lambda \tau \eta_t} \right)
\]

\[
\leq \frac{1}{T \gamma \eta_T} (g(x_1) - g^*) + \frac{2 \gamma \delta^2}{\lambda \tau \eta_0} + \frac{1}{T \eta_T} \sum_{t=1}^{T} \left( \frac{2 \alpha_{t+1}^2 \delta^2}{\lambda \tau \eta_t} + \frac{2 \beta_{t+1}^2 \delta^2}{\lambda \tau \eta_t} \right)
\]

\[
= \frac{g(x_1) - g^*}{T \gamma \eta_T} + \frac{2 \delta^2}{T \lambda \tau \eta_T \eta_0} + \frac{2 (c_1^2 + c_2^2) \delta^2}{T \eta_T \lambda_T} \sum_{t=1}^{T} \eta_t^3
\]

\[
\leq \frac{g(x_1) - g^*}{T \gamma \eta_T} + \frac{2 \delta^2}{T \lambda \tau \eta_T \eta_0} + \frac{2 (c_1^2 + c_2^2) \delta^2}{T \eta_T \lambda_T} \int_1^{T} \frac{k^3}{m + t} dt
\]

\[
\leq \frac{g(x_1) - g^*}{T \gamma \eta_T} + \frac{2 \delta^2}{T \lambda \tau \eta_T \eta_0} + \frac{2 (c_1^2 + c_2^2) \delta^2 k^3}{T \eta_T \lambda_T} \ln(m + T)
\]

\[
= \frac{g(x_1) - g^*}{T \gamma k} (m + T)^{1/3} + \frac{2 \delta^2}{T \lambda \tau k \eta_0} (m + T)^{1/3} + \frac{2 (c_1^2 + c_2^2) \delta^2 k^2}{T \lambda \tau} \ln(m + T)(m + T)^{1/3},
\]

(140)

where the second inequality holds by the above inequality (139). Let \( M''' = \frac{g(x_1) - g^*}{\gamma k} + \frac{2 \delta^2}{\lambda \tau k \eta_0} + \frac{2 (c_1^2 + c_2^2) \delta^2 k^2}{\lambda \tau} \ln(m + T) \), we have

\[
\frac{1}{T} \sum_{t=1}^{T} \left( \frac{L_f^2}{4} \| y^*(x_t) - y_t \|^2 + \frac{1}{4} \| \nabla_x f(x_t, y_t) - v_t \|^2 + \frac{1}{4 \gamma^2} \| \tilde{x}_{t+1} - x_t \|^2 \right) \leq \frac{M'''}{T} (m + T)^{1/3}.
\]

According to Jensen’s inequality, we have

\[
\frac{1}{T} \sum_{t=1}^{T} \left( \frac{L_f^2}{2} \| y^*(x_t) - y_t \| + \frac{1}{2} \| \nabla_x f(x_t, y_t) - v_t \| + \frac{1}{2 \gamma} \| \tilde{x}_{t+1} - x_t \| \right)
\]

\[
\leq \left( \frac{3}{T} \sum_{t=1}^{T} \left( \frac{L_f^2}{4} \| y^*(x_t) - y_t \|^2 + \frac{1}{4} \| \nabla_x f(x_t, y_t) - v_t \|^2 + \frac{1}{4 \gamma^2} \| \tilde{x}_{t+1} - x_t \|^2 \right) \right)^{1/2}
\]

\[
\leq \frac{\sqrt{3 M'''} m^{1/6}}{T^{1/2}} + \frac{\sqrt{3 M''}}{T^{1/3}},
\]

(141)
where the last inequality is due to \((a + b)^{1/6} \leq a^{1/6} + b^{1/6}\). Thus we obtain

\[
\frac{1}{T} \sum_{t=1}^{T} \mathbb{E} \left( L_f \| y^*(x_t) - y_t \| + \| \nabla_x f(x_t, y_t) - v_t \| + \frac{1}{\gamma} \| \bar{x}_{t+1} - x_t \| \right) \leq \frac{2\sqrt{3Mm}}{T^{1/2}} m^{1/6} + \frac{2\sqrt{3Mm}}{T^{1/3}}.
\]

\[\blacksquare\]
