Abstract
In this paper we extend results obtained in [3] and [5]. By considering a semi linear conservation
law with velocity in $L^\infty$, we prove by fixed point arguments existence and uniqueness result and
even in a penalized situation.

Keywords: transport equations, semi linear PDE, fixed point methods, STILS method, conservation
laws, advection-reaction, finite element method, Newton’s method, Picard’s iteration.

1 Introduction
This paper deals about semi linear conservations laws with velocity field in $L^\infty$. Our goal is twofold.
On the one hand, the focus is to propose a generalization of space time integrated least square(STILS)
The STILS method has been widely studied in numerous linear cases. Our aim is to introduce a
non linearity in the source term and look for theoretical methods to prove existence and uniqueness
results. For this, we shall propose methods combining variational and topological methods.
To reach this aim, we shall use two fixed point theorems. The first one is the Banach’s fixed point
theorem and the second is due to Schauder. In this latter case, we shall need a penalization argu-
ment.
On the other hand, we endeavor to propose numerical methods to analyse semi linear boundary

value problems. We shall use finite element methods combined with Picard’s iteration and Newton’s methods.

Finite element method is known to produce spurious oscillations and add diffusions in the orthogonal directions of integral curve when convection-dominated problem is solved see [12] and references therein. To remedy it, the space time integrated least square method has been introduced in finite element context by H. Nguyen and J. Reynen in [9] for solving advection-diffusion equation. And a time marching approach of STILS has been proposed by O. Besson and G. De Montmollin in [2] for solving numerically linear transport equation using the finite element method with $\text{div}(u) = 0$.

To get discrete maximum principle and remove the oscillations produced by the STILS method, J. Pousin, K. Bennamsour, E. Bretin and L. Piffet in [5], added to the formulation a constraint of positivity and a penalization of the total variation.

Before presenting the organization of our work, let us point out that interesting works on the SILS method have been already realized. We quote some among them closely related to our theoretical works. In fact, it been has been used by P.Azerad and O. Besson in [1] to give a coercive variational formulation to the transport equation with a free divergence $C^1$ regular velocity vector field. Existence and uniqueness of Space Time Least Square solution of linear conservation law with velocity field in $L^\infty$ is proved in [7] by O. Besson and J. Pousin. And in the same paper, these latter deduce a maximum principle result from Stampacchias theorem and have established the comparison between the least squares solution and the renormalized solution of these equations.

The paper is organized as follows. In the next section we shall do the presentation of the problem with some useful mathematical tools for our study. The third section is devoted to the existence and uniqueness results. The main used arguments are fixed point theorems (Banach-Picard’s theorem, Schauder’s Theorem). And in the last section, we propose two news numerical methods for computing the solution by using fixed point algorithm.

2 Position of the problem

2.1 Statement of the aim and functional setting

Let $\Omega \subset \mathbb{R}^d$, $(d \in \mathbb{N}^*)$ be a domain with a Lipschitz boundary $\partial \Omega$ satisfying the cone property. Let us take $T > 0$, a set $Q = \Omega \times ]0, T[$ and consider an advection velocity $u : Q \rightarrow \mathbb{R}^d$ with the following regularity property

$$u \in L^\infty(Q)^d \text{ with } \text{div}(u) \in L^\infty(Q).$$

Let $f : \mathbb{R} \rightarrow \mathbb{R}$ be a function such that $f \in W^{1,\infty}(\mathbb{R})$. In some situations we can consider $f$ as a $k-$Lipschitz, for $k$ small enough.

The first question we will look is to find a space time least square solution for the following boundary value problem

$$\begin{cases}
\frac{\partial c}{\partial t} + \text{div}(uc) = f(c) \text{ in } Q \\
c(x, 0) = c_0(x) \text{ in } \Omega \\
c(x, t) = c_1(x, t) \text{ on } \Gamma_-
\end{cases} \quad (1)$$

where

$$\Gamma_- = \{ x \in \partial \Omega : (n(x), u(x,t)) < 0; \forall t \in (0, T) \}.$$
and $(\cdot, \cdot)$ is the inner product in $\mathbb{R}^d$, $n(x)$ is the outer normal to $\partial \Omega$ at point $x$. For the sake of simplicity one assume that $\Gamma_-$ does not depend on the time $t$. Let us consider $u \in L^\infty(Q)^d$ such that $\text{div}(u) \in L^\infty(Q)$, set $\bar{u} = (1,u_1,u_2,\ldots,u_d)$ and $\bar{n}(x,t)$ the outer normal to $\partial Q$ at $(x,t)$.

We shall use the notation $|E|$ to mean the Lebesgue measure of a set $E$ throughout this paper. Let us recall that, the space-time incoming flow boundary is given by

$$\partial Q_\neg = \{(x,t) \in \partial Q, (\bar{u}(x,t),\bar{n}(x,t)) < 0 \} = \Omega \times \{0\} \cup \Gamma_- \times [0,T].$$

The incoming flow boundary condition in space-time is defined as follows

$$c_b(x,t) = \begin{cases} c_0(x) & \text{if } t = 0 \\ c_1(x,t) & \text{on } \Gamma_- \end{cases}$$

We introduce the following norm defined by:

1. $\|\phi\|^2 = \|\phi\|^2_{L^2(Q)} + \|\tilde{\text{div}}(\bar{u}\phi)\|^2_{L^2(Q)} - \int_{\partial Q_\neg} \phi^2(\bar{u},\bar{n})ds$ for all $\phi \in D(\overline{Q})$.

Where

2. $\tilde{\nabla} \phi = (\frac{\partial \phi}{\partial t}, \frac{\partial \phi}{\partial x_1}, \frac{\partial \phi}{\partial x_1}, \ldots, \frac{\partial \phi}{\partial x_d})$;

3. $\tilde{\text{div}}(\bar{u}\phi) = \frac{\partial \phi}{\partial t} + \sum_{i=1}^{d} \frac{\partial (\phi u_i)}{\partial x_i}$;

4. And the Sobolev space $H(u,Q) = \overline{D(Q)}$;

5. Note that if $u$ is regular enough for instance $u \in L^\infty(Q)^d$ with $\text{div}(u) \in L^\infty(Q)$, then $H(u,Q) \cap L^\infty = \{\phi \in L^2(Q) ; \tilde{\text{div}}(\bar{u}\phi) \in L^2(Q), \phi|_{\partial Q_-} \in L^2(\partial Q_-; (\bar{u},\bar{n}) | ) \} \cap L^\infty$ for more details see [3].

Before proceeding further, let us remind the following theorems that will be useful for our work and for their proofs, we invite the reader to see [3].

**Theorem 2.1** Let us consider $u \in L^\infty(Q)^d$ with $\text{div}(u) \in L^\infty(Q)$. Then the normal trace of $u$ $(\bar{u},\bar{n}) \in L^\infty(\partial Q)$.

**Theorem 2.2** Let $u \in L^\infty(Q)^d$ with $\text{div}(u) \in L^\infty(Q)$. Then there exists a linear continuous trace operator

$$\gamma_{\bar{n}} : H(u,Q) \longrightarrow \text{L}^2(\partial Q;(\bar{u},\bar{n}))$$

$$\phi \longmapsto \phi|_{\partial Q}$$

which can be localized as

$$\gamma_{\bar{n} \pm} : H(u,Q) \longrightarrow \text{L}^2(\partial Q_{\pm};(\bar{u},\bar{n}))$$

$$\phi \longmapsto \phi|_{\partial Q_{\pm}}.$$
Finally, let us define the spaces

\[ H_0(u, Q, \partial Q_-) = \{ \phi \in H(u, Q), \phi = 0 \text{ on } \partial Q_- \} = H(u, Q) \cap \text{Ker} \gamma_{\tilde{n} -} \]

and

\[ G_{\pm} = \gamma_{\tilde{n}_{\pm}} (H(u, Q)). \]

Let us give the curved inequality still called curved Poincaré inequality, below that is fundamental and even is the precursor of existence of STILS solution. It has been introduced and proved in [1] for free-divergence and extended in [3]. There exists \( c_p > 0 \) such that for any \( \phi \in H(u, Q) \):

\[ \| \phi \|_{L^2(Q)}^2 \leq c_p^2 (\| \tilde{\text{div}}(\tilde{u}\phi) \|_{L^2(Q)}^2 - \int_{\partial Q_-} \phi^2 (\tilde{u}, \tilde{n}) ds) \]  \hspace{1cm} (2)

From the curved inequality one deduces the following theorem.

**Theorem 2.3** Let \( u \in L^\infty(Q)^d \) with \( \text{div}(u) \in L^\infty(Q) \). Then the semi norm on \( H(u, Q) \) defined by

\[ | \phi |_{1,u}^2 = \| \tilde{\text{div}}(\tilde{u}\phi) \|_{L^2(Q)}^2 - \int_{\partial Q_-} \phi^2 (\tilde{u}, \tilde{n}) ds \]

is a square of norm, equivalent to the norm defined on \( H(u, Q) \).

Thus \( H(u, Q) \) can be equipped by the norm \( | \cdot |_{1,u} \).

**Remark 2.1** In the free-divergence case, one gets that \( c_p \leq 2T \) (see for instance [1] for additional information).

### 2.2 Space time least square and the linear problem

In this section, we are going to recall the design and some properties of STILS method for solving the following linear conservation laws problem.

\[
\begin{cases}
\frac{\partial c}{\partial t} + \text{div}(uc) = f \text{ in } Q \\
c(x, 0) = c_0(x) \text{ in } \Omega \\
c(x, t) = c_1(x, t) \text{ on } \Gamma_-.
\end{cases}
\]  \hspace{1cm} (3)

The space time least square solution of (3) corresponds to a minimizer in

\[ \{ \phi \in H(u, Q); \gamma_{\tilde{n}_{\pm}} (\phi) = c_b \} \]

of the following convex, \( H(u, Q) \)-coercive functional defined by

\[ J(c) = \frac{1}{2} \left( \int_Q (\tilde{\text{div}}(\tilde{u}c) - f)^2 dx dt - \int_{\partial Q_-} c^2 (\tilde{u}, \tilde{n}) ds \right) \]  \hspace{1cm} (4)

The Gâteaux-differential of \( J \) yields

\[ D|J(c)|.\phi = \int_Q (\tilde{\text{div}}(\tilde{u}c) - f) \tilde{\text{div}}(\tilde{u}\phi) dx dt - \int_{\partial Q_-} c\phi (\tilde{u}, \tilde{n}) ds. \]  \hspace{1cm} (5)
Thus, if \( c_b \in G_\cdot \), the space time last square formulation of (3) is expressed as follows

\[
\int_Q \tilde{\text{div}}(\tilde{u}c)\tilde{\text{div}}(\tilde{u}\phi)dxdt = \int_Q f\tilde{\text{div}}(\tilde{u}\phi)dxdt \quad \forall \phi \in H_0(u, Q)
\]  

(6)

and

\[
\gamma_{\tilde{\text{n}}}(c) = c_b.
\]

For more details see [3], [5].

Thanks to Theorem 2.2 we can reduce the problem (6) in a homogeneous one in \( \partial Q_\cdot \). For \( c_b \in G_\cdot \), let \( C_b \in H(u, Q) \) such that \( \gamma_{\tilde{\text{n}}}(C_b) = c_b \) then \( \rho = c - C_b \) is the unique solution of

\[
\int_Q \tilde{\text{div}}(u\rho)\tilde{\text{div}}(\tilde{u}\phi)dxdt = \int_Q (f - \tilde{\text{div}}(\tilde{u}C_b))\tilde{\text{div}}(\tilde{u}\phi)dxdt \quad \forall \phi \in H_0(u, Q).
\]  

(7)

Finally let us recall the following theorem proved in [3].

**Theorem 2.4** For \( u \in L^\infty(Q)^d \) with \( \text{div}(u) \in L^\infty(Q) \), \( c_b \in G_\cdot \), and \( f \in L^2(Q) \), the problem (7) has a unique solution. Moreover

\[
| \rho |_{1,u} \leq \Vert f \Vert_{L^2(Q)} + \Vert \tilde{\text{div}}(\tilde{u}C_b) \Vert_{L^2(Q)}
\]

and the function \( c = \rho + C_b \) is the space-time least squares solution of (3).

### 2.3 Space time least square and semi linear problem

This last subsection is devoted to introduce a variational formulation (1). Otherwise our aim is to find \( c \in H(u, Q) \) such that

\[
\int_Q \tilde{\text{div}}(\tilde{u}c)\tilde{\text{div}}(\tilde{u}\phi)dxdt = \int_Q f(c)\tilde{\text{div}}(\tilde{u}\phi)dxdt \quad \forall \phi \in H_0(u, Q, \partial Q_\cdot)
\]  

(8)

and

\[
\gamma_{\tilde{\text{n}}}(c) = c_b
\]  

(9)

It is important to stress that the above formulation is nonlinear. And we shall propose fixed point methods to study it. Let us recall that there are at least three distinct classes of such abstract theorems that are useful for proving existence results in a wide family of partial differential equations. These classes are

- fixed point theorems for strict contractions,
- fixed point theorems for compact mappings and
- fixed point theorems for order preserving operators.

We shall use in the following the two first types.
3 Existence and qualitative results

3.1 Existence and uniqueness

In this section we shall study the problem (8) by establishing and proving existence and uniqueness theorems for the STILS solution. These results are deduced thanks to the fixed point theory namely the Banach-Picard and Schauder theorems.

At first, in the case where \( f \) is \( k-Lipschitz \) with \( k \) is small enough that will be precised and by using the Banach-Picard fixed point theorem \([15]\), we have the following existence and uniqueness theorem of STILS solution.

**Theorem 3.1** Let \( u \in L^\infty(Q) \) with \( \text{div}(u) \in L^\infty(Q) \), and \( c_b \in G_- \), \( f \) be \( k-Lipschitz \) in \( \mathbb{R} \) with \( k < \frac{1}{c_p} \). Then the problem (8)-(9) has a unique solution.

**Proof**

Let us consider \( \mathbb{H} = \{ \phi \in H(u,Q), \gamma_{n_-}(\phi) = c_b \} \)

For all \( \rho \in \mathbb{H} \), \( f(\rho) \in L^2(Q) \) then, by \([2.4]\) there exists a unique element \( c \in \mathbb{H} \) satisfying :

\[
\int_Q \tilde{\text{div}}(\tilde{u}c)\tilde{\text{div}}(\tilde{u}\phi)dxdt = \int_Q f(\rho)\tilde{\text{div}}(\tilde{u}\phi)dxdt
\]

for all \( \phi \in H_0(u,Q,\partial Q_-) \)

Let us define, \( T : \mathbb{H} \rightarrow \mathbb{H} \)

such that

\[
T(\rho) = c
\]

thus a solution of the non linear problem \([8.9]\) is a fixed point of \( T \).

Let \( \rho_1, \rho_2 \in \mathbb{H} \) and \( c_1 = T(\rho_1), c_2 = T(\rho_2) \).

Since \( c_1 - c_2 = 0 \) on \( \partial Q_- \)

\[
\| c_1 - c_2 \|_{L^2(Q)} = \| \text{div}(\tilde{u}(c_1 - c_2)) \|_{L^2(Q)} = \int_Q \tilde{\text{div}}(\tilde{u}(c_1 - c_2))\tilde{\text{div}}(\tilde{u}(c_1))dxdt - \int_Q \tilde{\text{div}}(\tilde{u}(c_1 - c_2))\tilde{\text{div}}(\tilde{u}(c_2))dxdt.
\]

For \( c_1 = T(\rho_1) \) and \( c_2 = T(\rho_2) \) we have

\[
\int_Q \tilde{\text{div}}(\tilde{uc}_1)\tilde{\text{div}}(\tilde{u}(c_1 - c_2))dxdt = \int_Q f(\rho_1)\tilde{\text{div}}(\tilde{u}(c_1 - c_2))dxdt
\]

and

\[
\int_Q \tilde{\text{div}}(\tilde{uc}_2)\tilde{\text{div}}(\tilde{u}(c_1 - c_2))dxdt = \int_Q f(\rho_2)\tilde{\text{div}}(\tilde{u}(c_1 - c_2))dxdt.
\]

Then a computation yields

\[
\| c_1 - c_2 \|_{L^2(Q)} = \int_Q f(\rho_1)\tilde{\text{div}}(\tilde{u}(c_1 - c_2))dxdt - \int_Q f(\rho_2)\tilde{\text{div}}(\tilde{u}(c_1 - c_2))dxdt.
\]
Lemma 3.2

There is a positive constant such that we have

\[|c_1 - c_2|^2_{1,u} = \int_Q (f(\rho_1) - f(\rho_2)) \text{div} (\tilde{u}(c_1 - c_2)) \, dx \, dt\]

By Young’s inequality, we get:

\[|c_1 - c_2|^2_{1,u} \leq \|f(\rho_1) - f(\rho_2)\|_{L^2(Q)} \|\text{div} (\tilde{u}(c_1 - c_2))\|_{L^2(Q)}\]

Since \(f\) is \(k\)-Lipschitz in \(\mathbb{R}\) and \(|c_1 - c_2|_{1,u} = \|\text{div} (\tilde{u}(c_1 - c_2))\|_{L^2(Q)}\) we have:

\[|c_1 - c_2|^2_{1,u} \leq k \|\rho_1 - \rho_2\|^2_{L^2(Q)} |c_1 - c_2|_{1,u}\]

and hence

\[|c_1 - c_2|^2_{1,u} \leq kc_p |\rho_1 - \rho_2|_{1,u} |c_1 - c_2|_{1,u} .\]

Finally we get

\[|T(\rho_1) - T(\rho_2)|_{1,u} \leq kc_p |\rho_1 - \rho_2|_{1,u} .\]

Thus \(T\) is a strict contraction, provided that \(kc_p < 1\). The Banach’s fixed point theorem ensures the existence and uniqueness of \(c \in \mathbb{H}\) with \(T(c) = c\) which solves \(\tilde{u} = 0\). □

 Remark 3.1 In the free-divergence case, the previous assumption gives \(k < \frac{1}{kT}\) thus we get a solution for small times. But it can not be extended because of the lost of continuity.

The constant \(c_p\) is not optimal (see [3] for more details). And so, the condition \(kc_p < 1\) could be improved.

Now, let us state and prove the following technical lemmas that will be key steps in the building of the next existence theorem.

Lemma 3.2 There is a positive constant \(C > 0\) such that for any \(\phi \in D(\overline{Q})\) verifying \(\phi = 0\) on \(\partial Q_−\), we have \(\|\nabla \phi\|_{L^2(Q)^{d+1}} \leq C\|\text{div} (\tilde{u}\phi)\|_{L^2(Q)}\)

Proof Let us suppose that the inequality is false. Then for any integer \(n \in \mathbb{N}\), there is \(\phi_n \in D(\overline{Q})\) such that :

\[\|\nabla \phi_n\|_{L^2(Q)^{d+1}} > n\|\text{div} (\tilde{u}\phi_n)\|_{L^2(Q)}\]  \hspace{1cm} (13)

If \(n\) is such that \(\|\nabla \phi_n\|_{L^2(Q)^{d+1}} = 0\) then \(\|\nabla \phi_n\|_{L^2(Q)^{d+1}} = n\|\text{div}(\tilde{u}\phi_n)\|_{L^2(Q)} = 0\) which is a contradiction with (13).

Now dividing (13) by \(\|\nabla \phi_n\|_{L^2(Q)^{d+1}}\), we have :

\[\|\nabla \frac{\phi_n}{\nabla \phi_n}\|_{L^2(Q)^{d+1}} > n\|\text{div}(\tilde{u}\frac{\phi_n}{\nabla \phi_n})\|_{L^2(Q)}\]  \hspace{1cm} (14)

Setting \(\theta_n = \frac{\phi_n}{\nabla \phi_n}\|_{L^2(Q)^{d+1}}\), we obtain :

\[\|\nabla \theta_n\|_{L^2(Q)^{d+1}} = 1\]  \hspace{1cm} (15)

and

\[\|\text{div}(\tilde{u}\theta_n)\|_{L^2(Q)} = \|\text{div}(\tilde{u}\frac{\phi_n}{\nabla \phi_n})\|_{L^2(Q)}\].  \hspace{1cm} (16)
3 Existence and qualitative results

Thanks to (15) and (16), the inequality (14) can be written as follows

\[
\|\widetilde{\text{div}}(\tilde{u}\theta_n)\|_{L^2(Q)} < \frac{1}{n}. \tag{17}
\]

By curved inequality (also named curved Poincaré inequality) we get existence of a positive constant \(A > 0\) such that:

\[
\|\theta_n\|_{L^2(Q)} \leq \sqrt{A}\|\widetilde{\text{div}}(\tilde{u}\theta_n)\|_{L^2(Q)},
\]

then

\[
\|\theta_n\|_{L^2(Q)} \leq \frac{\sqrt{A}}{n}. \tag{18}
\]

This implies that:

\[
\theta_n \rightarrow 0 \text{ in } L^2(Q). \tag{19}
\]

From (15) and (18) one deduces that \((\theta_n)\) is bounded in \(H^1(Q)\). Then there is a convex combination of the sequence \((\theta_n)\) that converges to \(\theta^* \in H^1(Q)\) weakly, and so in \(L^2(Q)\) too. Using (19), this convex combination converges to 0 in \(L^2(Q)\). Thanks to the uniqueness of the limit we have \(\theta^* = 0\). As a sum up, one sees that (13) yields existence of a sequence \((\theta_n) \subset D(Q) \subset H^1(Q)\) satisfying:

\[
\begin{aligned}
&\left\{ \begin{array}{ll}
\theta_n \rightarrow 0 \text{ weakly in } H^1(Q) & (i) \\
\|\nabla \theta_n\|_{L^2(Q)^{d+1}} = 1 \text{ for any } n \in \mathbb{N} & (ii)
\end{array} \right.
\end{aligned} \tag{20}
\]

(i) implies that \(\nabla \theta_n \rightarrow 0\) weakly in \(L^2(Q)\).

Let \(\psi \in L^2(Q)^{d+1}\) such that \(\|\psi\|_{L^2(Q)^{d+1}} = 1\).

We have : \((\psi, \nabla \theta_n) \rightarrow 0\) in \(\mathbb{R}\).

The translation of the definition of the limit allows us to write:

\[
\exists n_0 \in \mathbb{N} \text{ such that for any } n \geq n_0, \text{ we have } |(\psi, \nabla \theta_n)| < 1.
\]

Thus we get \(\sup_{\|\psi\|_{L^2(Q)^{d+1}} = 1} |(\psi, \nabla \theta_n)| < 1\).

Hence, one deduces that \(\|\nabla \theta_n\|_{L^2(Q)^{d+1}} < 1\) for any \(n \geq n_0\) : what is in contradiction with (ii).

\[\blacksquare\]

**Lemma 3.3** Let \(f : \mathbb{R} \rightarrow \mathbb{R}\) be a \(k\) -Lipschitzian function.

For any \(\rho \in H(u, Q)\), we have \(f(\rho) \in H^1(Q)\). In addition there exists a positive \(C > 0\) such that

\[
\|\widetilde{\text{div}}(f(\rho))\|_{L^2(Q)^{d+1}} \leq C\|\widetilde{\text{div}}(u\rho)\|_{L^2(Q)}.
\]

**Proof** Let \(\rho \in H(u, Q)\), then there is a sequence \((\rho_n) \subset D(Q)\) that converges to \(\rho\) in \(H(u, Q)\).

Since \(f\) is \(k\) -Lipschitzian, we get:

\[
|f(\rho_n)| \leq k |\rho_n| + |f(0)| \text{ and } |f(\rho)| \leq k |\rho| + |f(0)|.
\]

Therefore \((f(\rho_n)) \subset L^2(Q)\) and \(f(\rho) \in L^2(Q)\). In addition: \(\|f(\rho_n) - f(\rho)\|_{L^2(Q)} \leq k\|\rho_n - \rho\|_{L^2(Q)}\) and \(\rho_n\) converges to \(\rho\) in \(L^2\) thus \(f(\rho_n)\) converges to \(f(\rho)\) in \(L^2\). And in particular any convex combination of \(f(\rho_n)\) converges to \(f(\rho)\) in \(L^2\).

Now let us take \(x, y \in Q\).

\[
\begin{aligned}
|f(\rho_n(x)) - f(\rho_n(y))| &\leq k |\rho_n(x) - \rho_n(y)| \\
|f(\rho_n(x)) - f(\rho_n(y))| &\leq k |\nabla \rho_n|_\infty |x - y|.
\end{aligned} \tag{21}
\]
3. Existence and qualitative results

Under Rademacher’s theorem, for any integer n, the function \( f(\rho_n) \) is differentiable almost everywhere and there is a positive constant depending on n, \( C_n \) such that \( \left| \frac{\partial f(\rho_n)}{\partial x_i} \right| \leq C_n \); and then \( \frac{\partial f(\rho_n)}{\partial x_i} \in L^2(Q) \) for any \( i = 1, \ldots, d + 1 \).

Using again the inequality (21), one sees that:

\[
\left| \frac{\partial f(\rho_n)}{\partial x_i} \right| \leq k \left| \frac{\partial \rho_n}{\partial x_i} \right| \quad \text{for any } i = 1, \ldots, d + 1
\]

and then

\[
\| \nabla f(\rho_n) \|_{L^2(Q)^{d+1}} \leq k \| \nabla \rho_n \|_{L^2(Q)^{d+1}}.
\]

By Lemma 3.2, we have \( \| \nabla \rho_n \|_{L^2(Q)^{d+1}} \leq C \| \text{div}(\tilde{u}\rho_n) \|_{L^2(Q)} \).

This yields

\[
\| \nabla f(\rho_n) \|_{L^2(Q)^{d+1}} \leq kC \| \text{div}(\tilde{u}\rho_n) \|_{L^2(Q)}. \tag{22}
\]

Since \( (\rho_n) \) converges to \( \rho \) in \( H(u, Q) \) we get \( \| \text{div}(\tilde{u}\rho_n) \|_{L^2(Q)} \) converges to \( \| \text{div}(\tilde{u}\rho) \|_{L^2(Q)} \). And we can conclude that \( (f(\rho_n)) \) is bounded in \( H^1(Q) \).

And more, we have \( (f(\rho_n)) \) is bounded in \( H^1(Q) \). Then there is \( \theta \in H^1(Q) \) such that \( (f(\rho_n)) \) converges to \( \theta \) weakly. Thanks to Mazur’s lemma, there is a convex combination of the sequence \( (f(\rho_n)) \), denoted \( \theta_n \), that strongly converges to \( \theta \) in \( H^1(Q) \) and then in \( L^2 \). And the same convex combination converges to \( f(\rho) \) in \( L^2(Q) \).

Under uniqueness in \( L^2(Q) \), we have \( f(\rho) = \theta \) but \( \theta \in H^1(Q) \). This ensures us that \( f(\rho) \in H^1(Q) \). Passing to the limit the inequality (22), yields

\[
\| \nabla f(\rho) \|_{L^2(Q)^{d+1}} \leq kC \| \text{div}(\tilde{u}\rho) \|_{L^2(Q)}.
\]

\[\square\]

**Lemma 3.4** Let \( f : \mathbb{R} \to \mathbb{R} \) be a k-Lipschitzian function, \( C \) be a bounded subset of \( H(u, Q) \) and \( (\rho_n), (c_n) \) be sequences in \( C \). Denoting by \( c \) the weak limit of \( (c_n) \) in \( H_0(u, Q) \). We have:

\[
\int_Q f(\rho_n) \text{div}(\tilde{u}(c_n - c)) dxdt \to 0.
\]

**Proof** Since \( C \subset H(u, Q) \), \( (\rho_n), (c_n) \) are sequences of \( C \), there are \( M > 0 \) and \( c \in H(u, Q) \) such that

\[
\| \text{div}(\tilde{u}\rho_n) \|_{L^2(Q)} \leq M \tag{23}
\]

and

\[
c_n \rightharpoonup c \text{ faiblement dans } H(u, Q) \tag{24}
\]

Using the curved Poincaré inequality, (23) we have

\[
\| \rho_n \|_{L^2(Q)} \leq M \sqrt{A} \tag{25}
\]

\[
\left| f(\rho_n) \right| \leq k \left| \rho_n \right| + | f(0) |. \tag{26}
\]

Thus (25, 26) yield a constant \( C_{27} \) such that:

\[
\| f(\rho_n) \|_{L^2(Q)} \leq C_{27} \tag{27}
\]
In another way, by Lemma 3.3, there exists a constant $C > 0$ such that
\[
\| \widetilde{\nabla} f(\rho_n) \|_{L^2(Q)} \leq C \| \widetilde{\text{div}}(\tilde{u} \rho_n) \|_{L^2(Q)}.
\] (28)

From (23) and (28) we have the following estimation
\[
\| \widetilde{\nabla} f(\rho_n) \|_{L^2(Q)} \leq CM.
\] (29)

Relations (27) et (29) imply that the sequence $(f(\rho_n))$ is bounded in $H^1(Q)$. Then, by Rellich’s theorem, even if it means extracting a subsequence, there is $F \in L^2(Q)$ such that
\[
f(\rho_n) \rightharpoonup F \text{ strongly in } L^2(Q).
\] (30)

From (24) and (30), we get
\[
\langle f(\rho_n), \widetilde{\text{div}}(\tilde{u}(c_n - c)) \rangle \to (F, 0) = 0.
\] (31)

Finally we have
\[
\int_Q f(\rho_n) \widetilde{\text{div}}(\tilde{u}(c_n - c)) \, dx \, dt \to 0.
\]

Having at hands these lemmas and using fixed Schauder’s theorem, we can proceed further to get existence and uniqueness results.

**Theorem 3.5** Let $u \in L^\infty(Q)$ with $\text{div}(u) \in L^\infty(Q)$, and $c_b \in G_-$, $f \in W^{1,\infty}(\mathbb{R})$. Then the problem (8)-(9) has a solution in $H_0(u,Q,\partial Q_-)$.

**Proof** Since $c_b \in G_-$ changing the source term if necessary, we shall assume that $c_b = 0$ on $\partial Q_-$. Existence.

The proof is relied mainly on the Schauder’s fixed theorem.

Step 1: we first have to choose a bounded subset $X$ of $H_0(u,Q,\partial Q_-)$ and a mapping $T : X \to X$. To achieve this aim, for all $\rho \in V$, under the Lemma 3.3 or since $f \in W^{1,\infty}(\mathbb{R})$ we have $f(\rho) \in L^2(Q)$. Then by Theorem 2.4 there exists a function $c \in H_0(u,Q,\partial Q_-)$ such that
\[
\int_Q \widetilde{\text{div}}(\tilde{u}c) \widetilde{\text{div}}(\tilde{u} \phi) \, dx \, dt = \int_Q f(\rho) \widetilde{\text{div}}(\tilde{u} \phi) \, dx \, dt \text{ for all } \phi \in H_0(u,Q,\partial Q_-).
\]

Moreover $|c|_{1,u} \leq \|f(\rho)\|_{L^2(Q)}$. Since $f \in W^{1,\infty}(\mathbb{R})$, we have $|c|_{1,u} \leq \|f\|_{L^\infty} \|Q\|^\frac{1}{2}$.

Let us define, $T : H_0(u,Q,\partial Q_-) \to H_0(u,Q,\partial Q_-)$ such that $c = T(\rho)$.

Solving (39) is equivalent to show the existence of fixed point theorem of $T$.

Let us proceed further and choose a convex set $X$ as follows :
\[
X = \{ \phi \in H_0(u,Q,\partial Q_-), |\phi|_{1,u} \leq M \}
\]

when $M$ is to be precised later.
\[
|T \rho|_{1,u} = |c|_{1,u} \leq \|f\|_{L^\infty} \|Q\|^{\frac{1}{2}}, \text{ for all } \rho \in X.
\]
Thus, choosing \( M = |f|_{L^\infty} |Q|^{\frac{2}{3}} \), the following inclusion yields
\[
T(H_0(u, Q, \partial Q_-)) \subset \mathcal{X}
\]
and then
\[
T(\mathcal{X}) \subset \mathcal{X}.
\]
So we will consider \( T : \mathcal{X} \to \mathcal{X} \).

**Step 2:** Thus \( T \) is continuous.

**Proof** of the step 2: Then a computation yields
\[
|c_1 - c_2|_{1,u}^2 = \int_Q f(\rho_1)\tilde{\Div}(\bar{u}(c_1 - c_2))dxdt - \int_Q f(\rho_2)\tilde{\Div}(\bar{u}(c_1 - c_2))dxdt
\]
and hence
\[
|c_1 - c_2|_{1,u}^2 = \int_Q (f(\rho_1) - f(\rho_2))\tilde{\Div}(\bar{u}(c_1 - c_2))dxdt.
\]
By Young's inequality, we get:
\[
|c_1 - c_2|_{1,u}^2 \leq \|f(\rho_1) - f(\rho_2)\|_{L^2(Q)}\|\tilde{\Div}(\bar{u}(c_1 - c_2))\|_{L^2(Q)}.
\]

Since \( f \in W^{1,\infty}(\mathbb{R}) \), we have:
\[
\|f(\rho_1) - f(\rho_2)\|_{L^2(Q)} \leq \|f'\|_{L^\infty} \|\rho_1 - \rho_2\|_{L^2(Q)}^2
\]
and hence
\[
|c_1 - c_2|_{1,u}^2 \leq \|f'\|_{L^\infty} \|\rho_1 - \rho_2\|_{L^2(Q)}^2 \|c_p\|_{L^\infty} \|\rho_1 - \rho_2\|_{L^2(Q)}.
\]
Finally, we get
\[
|T\rho_1 - T\rho_2|_{1,u} \leq \|f'\|_{L^\infty} \|\rho_1 - \rho_2\|_{L^2(Q)}.
\]
Thus \( T \) is Lipschitz so continuous.

**Step 3:** \( \mathcal{X} \) is a subset convex, closed in \( H_0(u, Q, \partial Q_-) \) and \( T(\mathcal{X}) \) compact in \( L^2(Q) \).

**Proof** of step 3 : it is clear that \( \mathcal{X} \) is a convex and closed in \( H_0(u, Q, \partial Q_-) \).

Let \( (c_n) \) be sequences in \( T(\mathcal{X}) \), then there exists \( (\rho_n) \) sequence in \( H_0(u, Q, \partial Q_-) \) such that
\[
\int_Q \tilde{\Div}(\bar{u}(c_n))\tilde{\Div}(\bar{\phi})dxdt = \int_Q f(\rho_n)\tilde{\Div}(\bar{\phi})dxdt \forall \phi \in H_0(v, Q, \partial Q_-).
\]

(32)

Since \( (c_n) \) bounded in \( H_0(u, Q, \partial Q_-) \) then there exist \( c \in H_0(u, Q, \partial Q_-) \) such that
\[
c_n \rightharpoonup c \text{ weakly in } H_0(u, Q, \partial Q_-)
\]
then \( \tilde{\Div}(\bar{u}(c_n - c)) \rightharpoonup 0 \) weakly in \( L^2(Q) \), in particular
\[
\int_Q \tilde{\Div}(\bar{u}(c_n - c))\tilde{\Div}(\bar{c})dxdt \to 0
\]
(33)
\[
|c_n - c|_{1,u}^2 = \|\tilde{\Div}(\bar{u}(c_n - c))\|_{L^2(Q)}^2 = \int_Q \tilde{\Div}(\bar{u}(c_n - c))\tilde{\Div}(\bar{u}(c_n))dxdt - \int_Q \tilde{\Div}(\bar{u}(c_n - c))\tilde{\Div}(\bar{u}(c))dxdt.
\]
(34)
Using [32], we have
\[ |c_n - c|_{1,u}^2 = \int_Q f(\rho_n)\widetilde{\text{div}}(\widetilde{u}(c_n - c))dxdt - \int_Q \widetilde{\text{div}}(\widetilde{u}(c_n - c))\widetilde{u}(c)dxdt. \]

And by the Lemma 3.4, even if it means extracting a subsequence, we have
\[ \int_Q f(\rho_n)\widetilde{\text{div}}(\widetilde{u}(c_n - c))dxdt \rightarrow 0 \quad (35) \]
\[ (33) \text{ and } (35) \text{ imply that} \]
\[ |c_n - c|_{1,u}^2 \rightarrow 0. \]

Since \( X \) convex, closed in \( H_0(u, Q, \partial Q_-) \) and \( T : X \rightarrow X \) continuous which \( T(X) \) is relatively compact in \( H_0(u, Q, \partial Q_-) \). By Schauder’s theorem \( T \) has a fixed point.

\[ \blacksquare \]

4 Existence and uniqueness result for the penalization version

Let us consider the space \( (i) \ \mathcal{V} = H_0(u, Q, \partial Q_-) \cap H^1(Q) \)

where \( H^1(Q) \) is the usual Sobolev spaces, with the norm
\[ (ii) \|\phi\|_{\mathcal{V}}^2 = \|\phi\|_{L^2(Q)}^2 + \|\widetilde{\text{div}}(\widetilde{u}\phi)\|_{L^2(Q)}^2 + \|\nabla \phi\|_{L^2(Q)}^2. \]

From the curved inequality [2], one deduces that the following semi norm
\[ |\phi|_{\mathcal{V}} = (\|\widetilde{\text{div}}(\widetilde{u}\phi)\|_{L^2(Q)}^2 + \|\nabla \phi\|_{L^2(Q)}^2)^{\frac{1}{2}} \]
becomes a norm, equivalent to the norm given on \( \mathcal{V} \). And the space \( \mathcal{V} \) will be equipped with the norm \( |.|_{\mathcal{V}} \).

For any \( \lambda \in \mathbb{R}^+ \) and \( f \in L^2(Q) \), we are going to study the following optimization problem
\[ \rho_{\lambda} = \text{Argmin}_{c \in \mathcal{V}} J(c) + \lambda\|\nabla c\|_{L^2(Q)}^2 = \text{Argmin}_{c \in \mathcal{V}} J_\lambda(c) \quad (36) \]
where
\[ J(c) = \frac{1}{2} \left( \int_Q (\widetilde{\text{div}}(\widetilde{u}c) - f)^2dxdt. \right) \]

**Proposition 1** For any non negative real number \( \lambda \) and \( f \in L^2(Q) \), the problem (36) has a unique solution.

Moreover, for any \( \lambda \geq 1 \) there exists \( \alpha := \alpha(\lambda) \) such that \( |c|_{\mathcal{V}} \leq \alpha \|f\|_{L^2(Q)} \)
Proof. Since $J_\lambda$ is strictly convex and Gateaux-differentiable, we have to show that there is a function $c \in V$ such that $DJ_\lambda(c, \phi) = 0$ for all $\phi \in V$.

An easy computation gives
\[
DJ_\lambda(c, \phi) = \int_Q (\tilde{\text{div}}(\tilde{\text{u}}c) - f)\tilde{\text{div}}(\tilde{\text{u}}\phi)dxdt + \lambda \int_Q \tilde{\nabla}c\tilde{\nabla}\phi dxdt.
\]
(37)

And we obtain the following weak formulation:
\[
\int_Q \tilde{\text{div}}(\tilde{\text{u}}c)\tilde{\text{div}}(\tilde{\text{u}}\phi)dxdt + \lambda \int_Q \tilde{\nabla}c\tilde{\nabla}\phi dxdt = \int_Q f\tilde{\text{div}}(\tilde{\text{u}}\phi)dxdt
\]
(38)

for all $\phi \in V$.

Let us now consider the bilinear form $a_\lambda(\cdot, \cdot) : V \times V \to \mathbb{R}$ defined for all $\phi, \psi \in V$ by:
\[
a_\lambda(\phi, \psi) = \int_Q \tilde{\text{div}}(\tilde{\text{u}}\phi)\tilde{\text{div}}(\tilde{\text{u}}\psi)dxdt + \lambda \int_Q \tilde{\nabla}\phi\tilde{\nabla}\psi dxdt
\]

and the linear form $L : V \to \mathbb{R}$ defined for all $\phi \in V$ by:
\[
L(\phi) = \int_Q f\tilde{\text{div}}(\tilde{\text{u}}\phi)dxdt.
\]

Thus the expression (36) can be written as follows: find $c \in V$ such that
\[
a_\lambda(c, \phi) = L(\phi) \quad \text{for all} \quad \phi \in V.
\]

Taking $m = \min(\lambda, 1) > 0$, we have
\[
a_\lambda(\phi, \phi) = \int_Q \tilde{\text{div}}(\tilde{\text{u}}\phi)^2dxdt + \lambda \int_Q |\tilde{\nabla}\phi|^2 dxdt \geq m |\phi|^2_V.
\]

Then $a(\cdot, \cdot)_\lambda$ is $V$ elliptic on the one hand.

On the other hand, by using Holder’s inequality we have
\[
|a_\lambda(\phi, \psi)| \leq \|\tilde{\text{div}}(\tilde{\text{u}}\phi)\|_{L^2(Q)}\|\tilde{\text{div}}(\tilde{\text{u}}\psi)\|_{L^2(Q)} + \lambda\|\tilde{\nabla}\phi\|_{L^2(Q)}\|\tilde{\nabla}\psi\|_{L^2(Q)}.
\]

And the following estimate holds
\[
|a_\lambda(\phi, \psi)| \leq \max(\lambda, 1)(\|\tilde{\text{div}}(\tilde{\text{u}}\phi)\|_{L^2(Q)}\|\tilde{\text{div}}(\tilde{\text{u}}\psi)\|_{L^2(Q)} + \|\tilde{\nabla}\phi\|_{L^2(Q)}\|\tilde{\nabla}\psi\|_{L^2(Q)}).
\]

By taking $C = \max(\lambda, 1)$ and using Cauchy-Schwarz’s inequality in $\mathbb{R}^2$, we have
\[
|a_\lambda(\phi, \psi)| \leq C |\phi|_V |\psi|_V, \quad \text{for all} \quad \phi, \psi \in V.
\]

And we conclude that $a_\lambda(\cdot, \cdot)$ is continuous.

Let us now prove that $L$ is continuous.

\[
|L(\phi)| \leq \|f\|_{L^2(Q)}\|\tilde{\text{div}}(\tilde{\text{u}}\phi)\|_{L^2(Q)}
\]

so,
\[
|L(\phi)| \leq \|f\|_{L^2(Q)} |\phi|_V.
\]
Since $L$ is linear with respect to $\phi$, we get its continuity. Hence by the Lax-Milgram’s theorem there is a unique solution of (36) which satisfies

$$
\min(1, \lambda) | c_\lambda |^2 \leq a_\lambda(c_\lambda, c_\lambda) = | L(c_\lambda) | \leq \| f \|_{L^2(Q)} | c_\lambda |_V .
$$

So for $\lambda \geq 1$; we get the desired result $| c |_V \leq \| f \|_{L^2(Q)}$.

**Theorem 4.1** Let $\lambda > 1$ and $f \in W^{1,\infty}(\mathbb{R})$. Then there exists function $c_\lambda \in V$ such that

$$
\int_Q \nabla(\nabla (\phi)) \nabla (\phi) dx dt + \int_Q \nabla \nabla (\phi) dx dt = \int_Q f(c_\lambda) \nabla (\phi) dx dt \ 	ext{for all } \phi \in V \ \ (39)
$$

for all $\phi \in V$.
The solution is unique if $\lambda > 2T^2 | f' |_{L^\infty(\mathbb{R})} \ | \nabla u |^2_{L^2(Q)}$ and $\text{div}(u) = 0$.

**Proof**

**A-Existence:**
The proof is relied mainly on the Schauder’s fixed theorem.
Step 1: we first have to choose a bounded subset $X$ of $V$ and a mapping $T : X \to X$. To achieve this aims, for all $\rho \in V$, since $f \in W^{1,\infty}(Q)$, $f(\rho) \in L^2(Q)$, then by Proposition 1 there exists a function $c_\lambda \in V$ such that

$$
\int_Q \nabla(\nabla (\phi)) \nabla (\phi) dx dt + \int_Q \nabla \nabla (\phi) dx dt = \int_Q f(c_\lambda) \nabla (\phi) dx dt \ 	ext{for all } \phi \in V .
$$

Moreover $| c_\lambda |_V \leq \| f(\rho) \|_{L^2(Q)}$.

Since $f \in W^{1,\infty}(\mathbb{R})$, we have $| c_\lambda |_V \leq | f \|_{L^\infty} \ | Q |^{\frac{1}{2}}$.

Let us define, $T : V \to V$ such that $c_\lambda = T(\rho)$.
Solving (39) is equivalent to show the existence of fixed point theorem of $T$.
Let us proceed further and choose a convex set $X$ as follows :

$$
\phi \in V, \ | \phi |_V \leq M
$$

when $M$ is to be precised later. And

$$
| T\rho |_V = | c_\lambda |_V \leq | f \|_{L^\infty} \ | Q |^{\frac{1}{2}}, \text{ for all } \rho \in X
$$

Thus, choosing $M = | f \|_{L^\infty} \ | Q |^{\frac{1}{2}}$, the following inclusion yields

$$
T(V) \subset X
$$

and then

$$
T(X) \subset X.
$$

So we will consider $T : X \to X$.

Step 2: $T$ is continuous for all $\lambda \geq 1$. **Proof** of the step 2: $T$ can be written as composition of following application

$$
L^2(Q) \to L^2(Q) \to V \to L^2(Q)
$$
By Caratheodory theorem \( \rho \mapsto \tilde{f}(\rho) = f \circ \rho \mapsto T(\rho) \mapsto T(\rho) \).

By Caratheodory theorem \( \rho \mapsto \tilde{f}(\rho) = f \circ \rho \) is continuous from \( L^2(Q) \) into \( L^2(Q) \). And Lax-Milgram’s lemma gives the continuity of \( f \circ \rho \mapsto T(\rho) \) from \( L^2(Q) \) into \( \mathcal{V} \). Using the curved inequality (2), it is easy to see that the injection \( \rho \in \mathcal{V} \mapsto \rho \in L^2(Q) \) is also continuous.

Then \( T \) is continuous.

Steep 3: \( X \) is a subset convex and compact in \( L^2(Q) \).

**Proof** of step 3:

\[
\| \phi \|^2_{H^1(Q)} = \| \phi \|^2_{L^2(Q)} + \| \nabla \phi \|^2_{L^2(Q)} \quad \forall \phi \in H^1(Q)
\]

By the inequality (2), we have

\[
\| \phi \|^2_{H^1(Q)} \leq (1 + c^2_p)(\| \nabla (\tilde{u} \phi) \|^2_{L^2(Q)} + \| \nabla \phi \|^2_{L^2(Q)}) = (1 + c^2_p) | \phi | \mathcal{V} \quad \forall \phi \in \mathcal{V}.
\]

Then \( X \) which is bounded in \( \mathcal{V} \) is bounded in \( H^1(Q) \). And by Rellich’s theorem, we know that \( H^1(Q) \subset L^2(Q) \) with compact injection so \( X \) is relatively compact in \( L^2(Q) \).

Moreover \( X \) is closed in \( L^2(Q) \).

In fact let \( x_n \) be sequence in \( X \) with \( x_n \to x \in L^2(Q) \), then \( x_n \) is bounded in \( \mathcal{V} \) which is a reflexive Banach space then there is a subsequence \( x_{n_k} \) that converges in the weak topology \( \sigma(\mathcal{V},\mathcal{V}^*) \) to \( x^* \in \mathcal{V} \).

\( X \) is convex closed in the strong topology then \( X \) is convex closed in the weak topology (see [7], Theorem 3.2), so we have \( x^* \in X \).

And from Mazur’s theorem, there are convex combination of \( x_{n_k} \), themselves elements of \( X \) which converge strongly towards \( x^* \in X \).

But these same convex combination converge towards \( x \in X \) in \( L^2(Q) \). By uniqueness of the limit in \( L^2(Q) \), we have \( x = x^* \).

Furthermore,

\[
| v | \mathcal{V} \leq \liminf x_{n_k} | v | \mathcal{V} \leq M \text{ a.e } \in X;
\]

therefore \( X \) is closed in \( L^2(Q) \).

Since \( X \) is relatively compact and closed in \( L^2(Q) \) then it is compact in \( L^2(Q) \).

**B- Uniqueness:**

Let \( \rho_\lambda \) and \( \overline{\rho}_\lambda \) be two solutions of (39), we have

\[
\int_Q | \nabla (\tilde{u}(\rho_\lambda - \overline{\rho}_\lambda)) |^2 \, dx \, dt + \lambda \int_Q | \nabla (\rho_\lambda - \overline{\rho}_\lambda) |^2 \, dx \, dt = \int_Q (f(\rho_\lambda) - f(\overline{\rho}_\lambda)) \nabla (\tilde{u}(\rho_\lambda - \overline{\rho}_\lambda)) \, dx \, dt.
\]

By Young’s inequality, we have

\[
2\| \nabla (\tilde{u}(\rho_\lambda - \overline{\rho}_\lambda)) \|^2_{L^2(Q)} + 2\lambda \| \nabla (\rho_\lambda - \overline{\rho}_\lambda) \|^2_{L^2(Q)} \leq \| (f(\rho_\lambda) - f(\overline{\rho}_\lambda)) \|^2_{L^2(Q)} + \| \nabla (\tilde{u}(\rho_\lambda - \overline{\rho}_\lambda)) \|^2_{L^2(Q)}
\]
5 Numerical study and simulations

Since \( f \in W^{1,\infty}(\mathbb{R}) \) we have

\[
\|f(\rho_\lambda) - f(\overline{\rho}))\|_{L^2(Q)} \leq |f'|_{L^\infty(\mathbb{R})} \|\rho_\lambda - \overline{\rho})\|_{L^2(Q)}
\]

and it follows that

\[
2\|
\n\|\div(\tilde{u}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2 + 2\|\overline{\nabla}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2 \leq |f'|_{L^\infty(\mathbb{R})} \|\rho_\lambda - \overline{\rho})\|_{L^2(Q)}^2 + \|\div(\tilde{u}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2.
\]

Since \( \div(u) = 0 \), remark \[2.1\] yields

\[
\|\rho_\lambda - \overline{\rho})\|_{L^2(Q)}^2 \leq 4T^2 \|\tilde{u}, \overline{\nabla}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2.
\]

And then, we have

\[
2\|
\|\div(\tilde{u}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2 + 2\|\overline{\nabla}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2 \leq 4T^2 \|f'\|_{L^\infty(\mathbb{R})} \|\tilde{u}, \overline{\nabla}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2 + \|\div(\tilde{u}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2.
\]

By using Cauchy-Schwarz’s inequality, we have

\[
2\|
\|\div(\tilde{u}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2 + 2\|\overline{\nabla}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2 \leq 4T^2 \|f'\|_{L^\infty(\mathbb{R})} \|\tilde{u}\|_{L^2(Q)}^2 + \|\overline{\nabla}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2 + \|\div(\tilde{u}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2.
\]

\[
\|\div(\tilde{u}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2 + 2\|\overline{\nabla}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2 \leq 4T^2 \|f'\|_{L^\infty(\mathbb{R})} \|\tilde{u}\|_{L^2(Q)}^2 + \|\overline{\nabla}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2 + \|\div(\tilde{u}(\rho_\lambda - \overline{\rho}))\|_{L^2(Q)}^2.
\]

Thus \( \rho_\lambda = \overline{\rho} \) provided that \( \lambda > 2T^2 \) \( \|f'\|_{L^\infty(\mathbb{R})} \|\tilde{u}\|_{L^2(Q)}^2 \).

5 Numerical study and simulations

In this section, two numerical methods are presented for computing the solution of semi linear conservation law problem \( [10] \). The first consist in using Picard’s iteration or Newton-Adaptive for the linearization of the semi linear problem. These linearized problems are discretized by using discontinuous Galerkin’s method of the STILS formulation \( [11] \) and continuous finite element method for the penalization version \( [18] \). Moreover, a posteriori error bounds are established when Newton iteration is used.

In the sequel we shall assume that the function \( f \) is \( k- \) Lipschitz then by Rademacher’s theorem (see \( [21] \) for more details) \( f \) is differentiable almost everywhere.

5.1 A finite element method for semi linear conservations laws

Let us assume that the problem \( [8], [9] \) admits a unique solution \( c \in H^{k+1}(Q) \cap H(u, Q) \). In order to provide numerical approximation for computing the solution of \( [8], [9] \) after linearization, we shall use a simple finite element approximation which can be derived from the use of discontinuous Galerkin’s approximations of the space time least squares formulation. This method is introduced in \( [17] \) for linear hyperbolic problem and \( [18] \) for Poisson problem.

Let \( \mathcal{T}_h \) be a regular partition of the domain \( Q \) more precisely a triangulation in which each element
is a polygon (respectively a polyhedra) in two dimensions (respectively in three dimensions). For
$k \geq 1$, we consider the discontinuous finite element space (see [17])
\[ \mathcal{V}_h = \{ \phi \in L^2(Q), \phi \mid T \in Q_k(T) \ \forall T \in \mathcal{T}_h \} \] (40)
where $Q_k(T)$ is the space of linear polynomials of degree $k$ in each variable on $T$ and
\[ \mathcal{V} = \{ \phi \in L^2(Q), \phi \mid T \in H^{k+1}(T) \cap H(u,T) \ \forall T \in \mathcal{T}_h \}. \] (41)
It is easy to remark that $\mathcal{V}$ contains $\mathcal{V}_h$ and $H^{k+1}(Q) \cap H(u,Q)$. Let $\mathcal{E}_h$ be the set of all edges for $d = 1$ or flat face for $d = 2$ and $\mathcal{E}_h^0 = \mathcal{E}_h \setminus \partial Q_-$. For $T \in \mathcal{T}_h$, let us denote by $h_K$ the diameter of $K$ and $\rho_K$ the supremum of the diameters of the inscribed spheres of $K$, $h = \max h_T$ the mesh size of $\mathcal{T}_h$. Let us suppose that $\mathcal{T}_h$ is shape regular and also there exists two non negative constant $C^{(1)}_{DG}$ and $C^{(2)}_{DG}$ such that
\[ \frac{h_T}{h_K} \leq C^{(1)}_{DG} \leq C^{(2)}_{DG} \ \forall T \in \mathcal{T}_h \ \forall e \subset T. \] (42)
Moreover for $T \in \mathcal{T}_h$, we introduce the following notations
\[ \mathcal{E}_h(T) = \{ E \in \mathcal{E}_h \mid E \subset \partial T \}. \]
For $\phi \in \mathcal{V}_h$ and $e \in \mathcal{E}_h$ with $e = \partial T_1 \cap \partial T_2$, $T_1, T_2 \in \mathcal{T}_h$, let we define $[\phi]$ the jump of $\phi$ across $e \in \mathcal{E}_h^0$ as following
\[ [\phi] = \phi \mid_{\partial T_1} \tilde{n}_1 + \phi \mid_{\partial T_1} \tilde{n}_2 \]
and also
\[ [(\tilde{u}, \tilde{n})\phi] = (\tilde{u}, \tilde{n})\phi \mid_{\partial T_1} + (\tilde{u}, \tilde{n}_2)\phi \mid_{\partial T_2} \]
where $\tilde{n}_1$ and $\tilde{n}_2$ denote the unit outward vectors on $\partial T_1$ and $\partial T_2$ respectively. For $e \in \partial Q_-$, $[\phi] = \phi$ and $[(\tilde{u}, \tilde{n})\phi] = (\tilde{u}, \tilde{n})\phi$.

By considering the following bilinear form in $\mathcal{V} \times \mathcal{V}$
\[ \mathcal{A}(c, \phi) = \sum_{T \in \mathcal{T}_h} \int_T \text{div}(c)\text{div}(\tilde{u}\phi)dxdt + \sum_{e \in \mathcal{E}_h^0} \int_{e} h_e^{-1}[(\tilde{u}, \tilde{n})c][((\tilde{u}, \tilde{n})\phi)ds. \] (43)
Since $c \in \mathcal{V}$ then
\[ \mathcal{A}(c, \phi) = \sum_{T \in \mathcal{T}_h} \int_T f(c)\text{div}(\tilde{u}\phi)dxdt + \sum_{e \in \partial Q_-} \int_{e} h_e^{-1}[(\tilde{u}, \tilde{n})c][((\tilde{u}, \tilde{n})\phi)ds \ \forall \phi \in \mathcal{V}_h. \] (44)
The corresponding approximation of (44) is called in [17] simple finite element methods. It is easy to see that the bilinear form
\[ \|\phi\|_{DG}^2 = \mathcal{A}(\phi, \phi) \] defines a norm in $\mathcal{V}$. Moreover, we have where
\[ \|\rho\|_{DG}^2 = \sum_{T \in \mathcal{T}_h} |\rho|_{k+1,T}^2 \] (45)
\[ \mathcal{A}(\phi, \psi) \leq \|\phi\|_{DG}\|\psi\|_{DG} \forall \psi, \phi \in \mathcal{V}. \] (46)
As in [16], we shall use the following abbreviation $x \leq y$ for signifying $x \leq Cy$ for some constant $C > 0$ independent to the mesh size $h$ and $\lambda$. Let $P_h$ be the $L^2$ projection onto $\mathcal{V}_h$, we have the
5 Numerical study and simulations

There exists a constant $C_{19} > 0$ such that for all $\rho \in \mathcal{V}$
\[ \|\nabla (\rho - P_h \rho)\|_{0,T} \leq C_{19} h^k |\rho|_{k+1,T} \]  
(47)
for all $T \in \mathcal{T}_h$ and
\[ \|\rho - P_h \rho\|_{0,T} \leq C_{19} h^{k+1} |\rho|_{k+1,T}. \]  
(48)
It is also proved in [20] that, there exists a constant $C_{19}$ independent to the mesh size $h$ such that for any $T \in \mathcal{T}_h$ and $e \subset \partial T$, we have
\[ \|\rho\|^2 \leq C_{19} (h^{-1} \|\rho\|^2 + h\|\nabla \rho\|^2_T) \]  
(49)
Finally we deduce that the following approximation lemma.

**Lemma 5.1** For all $\rho \in \mathcal{V}$
\[ \|\rho - P_h \rho\|_{DG} \leq h^k \|\rho\|_{T_h,k+1} \forall \ T \in \mathcal{T}_h \]  
(50)
**Proof**
\[ \|\rho - P_h \rho\|^2_{DG} = \sum_{T \in \mathcal{T}_h} \int_T \nabla \nabla (\rho - P_h \rho))^2 dx + \sum_{e \in \mathcal{E}_h} \int_e h_e^{-1} \|\nabla \rho\|^2_{T_h,e} \]  
(51)
By theorem (2.1), $(\tilde{\rho}, \tilde{\rho}) \in L^\infty(\partial T)$, then it follows from (49) and (42)
\[ \int_e h_e^{-1} \|\nabla \rho\|^2_{T_h,e} \leq C_{19} (h^{-2} \|\rho\|_{L^\infty(e)} \int_e \|\nabla \rho\|^2_{T_h,e}) \]  
(52)
This and (49) yield
\[ \int_e \|\nabla \rho\|^2_{T_h,e} \leq 4C_{42} (\|\nabla \rho\|_{L^\infty(e)} C_{19} (h^{-2} \|\rho\|^2_{T_h,e} + \|\nabla \rho\|^2_{T_h,e}) \]  
(53)
And from (47) and (48), it follows
\[ \int_e \|\nabla \rho\|^2_{T_h,e} \leq c_{19} h^{2k} |\rho|_{k+1,T}^2 \]  
(54)
where
\[ c_{19} = C_{19} C_{19} C_{19} (h^{-2} |\rho|_{k+1,T}^2) \]  
(55)
We have also from triangular inequality
\[ \|\nabla \rho\|_T \leq \|\nabla \rho\|_T + \|\nabla \rho\|_T \]  
(56)
Since $\tilde{\rho} \in L^\infty(T)$ and $\nabla \rho \in L^\infty(T)$, we get from (47)-(48)
\[ \|\nabla \rho\|_T \leq C_{19} \alpha_{\rho,19} (h^k |\rho|_{k+1,T}) \]  
(57)
where
\[ \alpha_{\rho,19} = \max \{ \|\nabla \rho\|_{L^\infty(T)}, |Q| \|\nabla \rho\|_{L^\infty(T)} \} \]  
(58)
From (55) and (56), we get the result. \[ \square \]
5.1.1 A finite element method and Picard’s iteration

Let $f$ be a $k-$Lipschitz function in $\mathbb{R}$ with $k < \frac{1}{c_p}$. In this case the solution $c^h$ can be computed by using the Picard iteration of some linear problem. The Picard iteration in this context is given by the following scheme:

**Algorithm 5.2**

- Start STILS-MT1 with some given $C^0$
- compute $c^h_{n+1}$ from $c^h_n$ such that

$$A(c^h_{n+1}, \phi_h) = \sum_{T \in T_h} \int_T f(c^h_n) \tilde{\text{div}}(\tilde{u} \phi_h) dx dt + \sum_{e \in \partial Q} \int_e h^{-1}_e [([\tilde{u}, \tilde{n}] c_b)([\tilde{u}, \tilde{n}] \phi_h)] ds \forall \phi_h \in V_h.$$  \hspace{1cm} (58)

5.1.2 A finite element method and Newton’s method

We suppose that the problem (8)-(9) has a unique solution $V = H^2(Q) \cap H(u, Q)$. Recalling (58), we can write (8)-(9) as follows:

$$\text{find } c \in V \text{ such that } F(c) = 0,$$  \hspace{1cm} (59)

where

$$\langle F(c), \phi \rangle_{V^*, V} = A(c, \phi) - \sum_{T \in T_h} \int_T f(c) \tilde{\text{div}}(\tilde{u} \phi) dx dt - \sum_{e \in \partial Q} \int_e h^{-1}_e [([\tilde{u}, \tilde{n}] c_b)([\tilde{u}, \tilde{n}] \phi)] ds \forall \phi \in V.$$ \hspace{1cm} (60)

Given some initial guess $c^0$, the classical Newton-Raphson’s method for solving equation (59), when $F$ is differentiable, consists in generating a sequence of approximation that converges in the quadratic sense, to the exact solution as follows.

$$\begin{cases}
  c_0 \in V \\
  c_{n+1} = c_n - F'(c_n)^{-1} . F(c_n) \forall n \in \mathbb{N}^*.
\end{cases}$$ \hspace{1cm} (61)

This method is known to produce a chaotic behavior when $c_0$ is far to the desired root see for instance (see [21]) for more details. In order to remedy the chaotic behavior the following Newton Damping method is proposed (see [14]). In that case (61) is written as

$$\begin{cases}
  C_0 \in V \\
  c_{n+1} = c_n - \delta t F'(c_n)^{-1} . F(c_n) \forall n \in \mathbb{N}^*.
\end{cases}$$ \hspace{1cm} (62)

We shall use adaptive Newton-Galerkin’s method, more precisely the damping parameter $\delta t$ in (62) may be adjusted and adapted in each iteration. For illustration of the choice of $\delta t$, let us define the Newton-Raphson’s transform as follows:

$$\rho \mapsto N_F(\rho) := -F'(\rho)^{-1} . F(\rho).$$
By (62), we have
\[ \frac{c_{n+1} - c_n}{\delta_n} = N_F(c_n). \]
And we remark that (62) may be seen as a forward Euler scheme of the following ordinary differential equation
\[ \frac{d}{ds} \rho(s) = N_F(\rho(s)) \quad \forall \rho(0) = c_0. \]
If \( c_n \in V \) for all \( n \geq 1 \) and \( F \) is enough smooth for instance \( F'(\rho)^{-1}. F(\rho) \) exists for all \( \rho \in V \) then, we obtain the solution of (63) satisfies
\[ F(\rho(t)) = F(\rho(0)) \exp(-t), \quad \forall t \geq 0. \]
It is easy to see that, \( F(\rho(t)) \to 0 \) as \( t \to 0 \).

The adaptive Newton-Raphson (see [15]) consists in choosing the damping parameter \( \delta t_n \) so that so that the discrete forward Euler’s solution for (62) stays reasonably close to the continuous solution of (63). Finally we obtain the following algorithm, see [16]

**Algorithm 5.3** Fix a tolerance \( \epsilon \)

(i) Start the Newton iteration with some initial guess \( c_0 \in V \)

(ii) In each iteration step \( n = 1, 2, \ldots \) compute
\[ \delta t_n = \min\left( \sqrt{\frac{2\epsilon}{\|N_F(c_n)\|_V}}, 1 \right) \]

(iii) Compute \( c_{n+1} \) from (62) and go (ii)

In the sequel, we suppose that \( f'(c_n) \) exists for all \( n \geq 1 \), thus the sequels in (62) is well defined and we have
\[ \beta(c, \rho, \phi) := \langle F'(c)\rho, \phi \rangle_{V^*, V} = A(\rho, \phi) - \sum_{T \in T_h} \int_T f'(c)\rho(\tilde{u}\phi)dx \] for all \( \phi \in V \).

Let us define
\[ L(c, \phi) := \langle F(c), \phi \rangle_{V^*, V} \]
with the previous notation (62) can be written as follows: given \( c_n \in V \), find \( c_{n+1} \in V \) such that
\[ \beta(c_n, c_{n+1}, \phi) = \beta(c_n, c_n, \phi) - \delta t_n L(c_n, \phi) \quad \text{for all} \quad \phi \in V. \]

Let us now consider the following finite element approximation: find \( c_{n+1}^h \in V_h \) from \( c_n^h \in V_h \) such that
\[ \beta(c_n^h, c_{n+1}^h, \phi) = \beta(c_n^h, c_n^h, \phi) - \delta t_n L(c_n^h, \phi) \quad \text{for all} \quad \phi \in V_h. \]

By introducing the following notation
\[ c_n^{(\delta t_n, h)} := c_{n+1}^h - (1 - \delta t_n)c_n^h \]
5 Numerical study and simulations

and

\[ f^{\delta t_n}(c^h_{n+1}) := \delta t_n f(c^h_n) + f'(c^h_n)(c^h_{n+1} - c^h_n) \]  

we have, from (66)

\[
\sum_{T \in T_h} \int_T \nabla (\tilde{u} c^h_{n+1}) \cdot \nabla (\tilde{u} \phi) \, dx \, dt + \sum_{e \in E^q_h} \int_e h^{-1}_{e} [(\tilde{u}, \overline{u}) h^{\delta t_n}(c^h_{n+1})] [(\tilde{u}, \overline{u}) \phi] \, ds \\
= \sum_{T \in T_h} \int_T f^{\delta t_n}(c^h_{n+1}) \nabla (\tilde{u} \phi) \, dx \, dt + \sum_{e \in \partial Q} \int_e \delta t_n h^{-1}_{e} [(\tilde{u}, \overline{u}) c^h_{n+1}] [(\tilde{u}, \overline{u}) \phi] \, ds \quad \forall \phi \in V_h.
\]

Let us define the following quantities

\[ \alpha_T = \| \nabla (\tilde{u} c^h_{n+1}) - f(c^h_{n+1}) \|_{0,T} \quad \text{and} \quad \beta_T = \| f^{\delta t_n}(c^h_{n+1}) - f(c^h_{n+1}) \|_{0,T} \]

\[ \alpha_e = ||[(\overline{u}, \overline{u}) c^h_{n+1}]||_{0,e} \quad \text{and} \quad \beta_e = ||[(\overline{u}, \overline{u}) c^h_{n+1}]||_{0,e}. \]

We have also the following result expressed by an inequality.

**Theorem 5.4**

\[ \| F(c^{\delta t_n}) \|_{V^*} \leq h^k \max \left( \sum_{T \in T_h} \beta^2_T, \sum_{e \in E^q_h} \alpha^2_e, \sum_{e \in E^q_h} h^{-1}_e \alpha^2_e + \sum_{e \in E^q_h} h^{-1}_e \beta^2_e \right). \]

**Proof**

\[ (F(c), \phi)_{V^*, V} = (F(c), \phi - P_h \phi)_{V^*, V} + (F(c), P_h \phi)_{V^*, V} \]

Since \( P_h \in V \), From (66) it follows

\[ (F(c^{\delta t_n}), P_h \phi)_{V^*, V} = \sum_{T \in T_h} \int_T (f^{\delta t_n}(c^h_{n+1}) - f(c^h_{n+1})) \nabla (\tilde{u} P_h \phi) \, dx \, dt \]

and it follows, from Cauchy-Schwarz inequality in \( L^2(T) \) and \( R^q \) with \( q = \dim(T_h) \)

\[ (F(c^{\delta t_n}), P_h \phi)_{V^*, V} \leq \sum_{T \in T_h} \| f^{\delta t_n}(c^h_{n+1}) - f(c^h_{n+1}) \|_{0,T} \| P_h \phi \|_{0,T} \]

\[ |(F(c^{\delta t_n}), P_h \phi)_{V^*, V}| \leq \left( \sum_{T \in T_h} \| f^{\delta t_n}(c^h_{n+1}) - f(c^h_{n+1}) \|_{0,T}^2 \right)^{\frac{1}{2}} \left( \sum_{T \in T_h} \| P_h \phi \|_{0,T}^2 \right)^{\frac{1}{2}}. \]

Since \( P_h \) satisfies \( \sum_{T \in T_h} \| P_h \phi \|_{0,T}^2 \leq \sum_{T \in T_h} \| \phi \|_{0,T}^2 \), \( \forall \phi \in L^2(Q) \) (see [7]), we have

\[ |(F(c^{\delta t_n}), P_h \phi)_{V^*, V}| \leq \left( \sum_{T \in T_h} \beta^2_T \right)^{\frac{1}{2}} \left( \sum_{T \in T_h} \| \phi \|_{0,T}^2 \right)^{\frac{1}{2}} \]

And using lemma 5.1, we have

\[ |(F(c^{\delta t_n}), P_h \phi)_{V^*, V}| \leq \left( \sum_{T \in T_h} \beta^2_T \right)^{\frac{1}{2}} h^{k} \| \phi \|_{T_h,k+1}. \]
Let $K$. Thus, it follows from lemma 5.1

$\| (F(\epsilon)_{n+1}), \phi - P_h \phi )_{V, V} \| \leq \max (\sum_{T \in T_h} \alpha^2_T, \sum_{e \in E_h} h^{-1} \alpha^2_e, \sum_{e \in E_h} h^{-1} \beta^2_e) \| \phi \| _{H, k+1}. \quad (79)$

From (74) and (79) we deduce

$\| (F(\epsilon)_{n+1}), \phi - P_h \phi )_{V, V} \| \leq \max (\sum_{T \in T_h} \beta^2_T, \sum_{T \in T_h} \alpha^2_T, \sum_{e \in E_h} h^{-1} \alpha^2_e, \sum_{e \in E_h} h^{-1} \beta^2_e) h^k \| \phi \| _{H, k+1}. \quad (80)$

\[ \sum_{T \in T_h} \left( \frac{\partial (\bar{c}_{n+1}^{(\varepsilon_{n+1}^T)})}{\partial T} - f(\epsilon_{n+1}^{(\varepsilon_{n+1}^T)}) \right) \partial \bar{u}(\phi - P_h \phi) \|_{V, V} \| \leq \max (\sum_{T \in T_h} \alpha^2_T, \sum_{e \in E_h} h^{-1} \alpha^2_e, \sum_{e \in E_h} h^{-1} \beta^2_e) \| \phi \| _{H, k+1}. \quad (79) \]

Thus, it follows from lemma 5.1

$\| (F(\epsilon)_{n+1}), \phi - P_h \phi )_{V, V} \| \leq \max (\sum_{T \in T_h} \alpha^2_T, \sum_{e \in E_h} h^{-1} \alpha^2_e, \sum_{e \in E_h} h^{-1} \beta^2_e) \| \phi \| _{H, k+1}. \quad (79) \]

From (74) and (79) we deduce

$\| (F(\epsilon)_{n+1}), \phi - P_h \phi )_{V, V} \| \leq \max (\sum_{T \in T_h} \beta^2_T, \sum_{T \in T_h} \alpha^2_T, \sum_{e \in E_h} h^{-1} \alpha^2_e, \sum_{e \in E_h} h^{-1} \beta^2_e) h^k \| \phi \| _{H, k+1}. \quad (80) \]

\[ 5.2 \text{ STILS for semi linear conservations laws} \]

In the following, we assume that the problem \([39]\) admits a unique solution $c \in V := H_0(u, Q) \cap H^{k+1}(Q)$, and we will omit the dependency of the function according to the parameter $\lambda$. Our aims are to give a numerical methods for solving problem \([39]\) based on the classical finite element approximation of STILS formulation and establish posteriori estimations. For this we shall first consider first a finite element approximation based in quadrilateral mesh by starting with the following finite dimensional spaces

$V(\tilde{K}) = \{ \phi \in C^0(Q), \phi \mid \tilde{K} \in \tilde{Q}_k \} \quad (81)$

where $\tilde{K}$ is so called reference element and $\tilde{Q}_k$ is the space of polynomials of degree at most $k$ in each variable, separately defined in $\tilde{K}$. Let $S$ be a class of invertible affine mapping defined on $\tilde{K}$.
5 Numerical study and simulations

into \( \mathbb{R}^{d+1} \). For \( K = F_K(\widehat{K}) \) with \( F_K \in S \), the finite element space can be defined by composition with the inverse of \( F_K \) as follows

\[
V(K) = \{ \rho : K \to \mathbb{R} : \rho = \widehat{\rho} \circ F_K \text{ for some } \rho \in V(\widehat{K}) \}. \tag{82}
\]

Let \( T_h \) be a triangulation of \( Q \) such that each of its element is transformation of \( \widehat{K} \) with some mapping in \( S \). Thus we get the classical finite element approximation

\[
V_h = \{ \rho : Q \to \mathbb{R} : \rho |_K \in V(K) \text{ for all } K \}. \tag{83}
\]

In order to obtain the CFL condition stability of STILS-MT1 (see [2]), we shall consider a strict rectangular mesh. Let \( \Pi : V \to V_h \) such that \( \Pi q = q \) for all \( q \in Q_k \). Let \( \Pi : V \to V_h \) such that \( \Pi q = q \) for all \( q \in Q_k \). Thus we get the classical finite element approximation

\[
V_h = \{ \rho : Q \to \mathbb{R} : \rho |_K \in V(K) \text{ for all } K \}. \tag{83}
\]

Let us recall the following approximation result proved in [6], pp 103, Corollary 4.4.2.

**Lemma 5.5** Let us suppose that \( d \leq 2 \) and \( k \geq 1 \) then there exist \( C \) such that, for all \( 0 \leq m \leq k+1, c \in H^{k+1}(K) \) the following inequality holds

\[
| c - \Pi c |_{m,K} \leq \frac{h^{k+1}}{\rho^m} C_{H,Q} | c |_{k+1,K} . \tag{84}
\]

The above lemma provides us existence of \( C > 0 \) such that the following inequalities hold for any \( c \in H(u,T) \cap H^{k+1}(T), \)

\[
| c - \Pi c |_{0,T} \leq C h^{k+1} | c |_{k+1,T} \forall T \in T_h \tag{85}
\]

and

\[
| \nabla (c - \Pi c) |_{0,T} \leq C h^k | c |_{k+1,T} \forall T \in T_h . \tag{86}
\]

As in the proof of lemma 5.1, there is a non negative constant \( C_u \) such that :

\[
| \nabla (\overline{c} - \Pi c) |_{0,T} \leq C_u h^k | c |_{k+1,T} \forall T \in T_h \tag{87}
\]

**5.2.1 STILS and Picard’s iteration**

In this section, we suppose that \( f \) is \( k\)-Lipschitz with \( k < \frac{1}{\rho} \). Then the mapping \( T \) defined by \([11], [12] \) is a strict contraction and thus we shall use Picard’s iteration algorithm for the linearization of \([10], [9] \).

The Picard’s iteration in this context is given by following scheme:

**Algorithm 5.6**

- **Start STILS-MT1 with some given \( C^0 \)**
- **Find \( c_{n+1}^h \in V_h \) from \( c_n^h \) by the formula**

\[
\int_Q \nabla (\overline{u_c}_n^h) \nabla (\overline{u}(\phi_h)) dxdt + \lambda \int_Q \nabla (\overline{u}_n^h) \nabla \phi dxdt = \int_Q (f(\overline{u}_n^h) - \nabla (\overline{u}(\phi_h))) \nabla (\overline{u}(\phi_h)) dxdt \forall \phi_h \in V_h. \tag{88}
\]
5 Numerical study and simulations

5.3 STILS adaptive Newton method

Since the problem (39) has a unique solution $V = H^{k+1}(Q) \cap H_0(u,Q)$. Then the problem can be written as follows

$$\text{find } c \in V \text{ such that } F_\lambda(c) = 0$$

where

$$F_\lambda : V \rightarrow V^*$$

such that

$$\langle F_\lambda(c), \phi \rangle_{V^*,V} := \int_Q \text{div}(uc)\text{div}(\tilde{u}\phi)dxdt - \lambda \int_Q \nabla c \nabla \phi dxdt - \int_Q f(c)\text{div}(\tilde{u}\phi)dxdt \forall \phi \in V. \tag{90}$$

Since $f$ is differentiable, then $F_\lambda$ is differentiable and we have

$$\beta_\lambda(c, \rho, \phi) := \langle F_\lambda'(c)\rho, \phi \rangle_{V^*,V} = \int_Q \text{div}(\tilde{u}\rho)\text{div}(\tilde{u}\phi)dxdt - \int_Q \tilde{\lambda} \nabla \rho \nabla \phi dxdt - \int_Q f(c)\rho \text{div}(\tilde{u}\phi)dxdt \forall \phi, h, \tilde{\lambda} \in V. \tag{91}$$

Let us define also the following linear form in $V$

$$L_\lambda(\rho, \phi) = \langle F_\lambda(\rho), \phi \rangle_{V^*,V}. \tag{92}$$

We assume that $F$ invertible, inserting $L_\lambda$ and (92) in (62) we get

$$\beta_\lambda(c_n, c_{n+1}, \phi) = \beta_\lambda(c_n, c_n, \phi) - \delta t_n L_\lambda(c_n, \phi) \text{ for all } \phi \in V. \tag{93}$$

Let $c_n^h$ be the finite element approximation of $c_n$. We obtain the following FEM adaptive-Newton

$$\beta_\lambda(c_n^h, c_{n+1}^h, \phi) = \beta_\lambda(c_n^h, c_n^h, \phi) - \delta t_n L_\lambda(c_n^h, \phi) \text{ for all } \phi \in V_h. \tag{94}$$

By introducing the following notation

$$c_{n+1}^{(\delta t_n,h)} := c_{n+1} - \delta t_n c_n \tag{95}$$

and

$$f^{\delta t_n}(c_n^h) := \delta t_n f(c_n^h) + f'(c_n^h)(c_{n+1}^h - c_n^h) \tag{96}$$

it follows from (94) the following result

$$\int_Q \text{div}(\tilde{u}c_{n+1}^{(\delta t_n,h)})\tilde{\lambda} \text{div}(\tilde{u}\phi)dxdt + \lambda \int_Q \nabla c_{n+1}^{(\delta t_n,h)} \nabla \phi dxdt = \int_Q f^{\delta t_n}(c_n^h)\text{div}(\tilde{u}\phi)dxdt \text{ for all } \phi \in V_h. \tag{97}$$

We get also the following result.

**Theorem 5.7**

$$\|F_\lambda(c_{n+1}^{(\delta t_n,h)})\|_{V^*} \leq h^k((\sum_{T \in T_h} \alpha_T^2)^{\frac{1}{2}} + (\sum_{T \in T_h} \beta_T^2)^{\frac{1}{2}} + \lambda(\sum_{T \in T_h} \gamma_T^2)^{\frac{1}{2}}) \tag{98}$$

where

$$\alpha_T = \|(\text{div}(\tilde{u}c_{n+1}^{(\delta t_n,h)})) - f^{\delta t_n}(c_n^h)\|_{0,T}, \beta_T = \|f^{\delta t_n}(c_{n+1}^h) - f(c_n^h)\|_{0,T} \text{ and } \gamma_T = \|\nabla c_{n+1}^{(\delta t_n,h)}\|_{0,T}$$
Proof

\[
\langle F_\lambda(c_{n+1}^{(\delta t_n,h)}), \phi \rangle = \int_Q (\tilde{\text{div}}(\tilde{u}c_{n+1}^{(\delta t_n,h)}) - f(c_{n+1}^{(\delta t_n,h)}))\tilde{\text{div}}(\tilde{u}\phi)dxdt + \lambda \int_Q \nabla c_{n+1}^{(\delta t_n,h)} \nabla \phi dxdt. \quad (99)
\]

By adding and subtracting \( \phi_h = \Pi \phi \) in \(99\) and using \(97\), the following result holds

\[
\langle F_\lambda(c_{n+1}^{(\delta t_n,h)}), \phi \rangle = \int_Q (\tilde{\text{div}}(\tilde{u}c_{n+1}^{(\delta t_n,h)}) - f(c_{n+1}^{(\delta t_n,h)}))\tilde{\text{div}}(\tilde{u}(\phi - \phi_h))dxdt \\
+ \lambda \int_Q \nabla c_{n+1}^{(\delta t_n,h)} \nabla (\phi - \phi_h)dxdt + \int_Q (f^{\delta t_n}(c_{n+1}^{h}) - f(c_{n+1}^{(\delta t_n,h)}))\tilde{\text{div}}(\tilde{u}\phi_h)dxdt
\]

\[
\int_Q ((\tilde{\text{div}}(\tilde{u}c_{n+1}^{(\delta t_n,h)})) - f^{\delta t_n}(c_{n+1}^{h}))\tilde{\text{div}}(\tilde{u}(\phi - \phi_h))dxdt \leq \sum_{T \in T_h} \|(\tilde{\text{div}}(\tilde{u}c_{n+1}^{(\delta t_n,h)})) - f^{\delta t_n}(c_{n+1}^{h})\|_{0,T} \|\tilde{\text{div}}(\tilde{u}(\phi - \phi_h))\|_{0,T} 
\]

Applying Cauchy-Schwarz inequality leads to

\[
\int_Q ((\tilde{\text{div}}(\tilde{u}c_{n+1}^{(\delta t_n,h)})) - f^{\delta t_n}(c_{n+1}^{h}))\tilde{\text{div}}(\tilde{u}(\phi - \phi_h))dxdt \leq \left( \sum_{T \in T_h} \|(\tilde{\text{div}}(\tilde{u}c_{n+1}^{(\delta t_n,h)})) - f^{\delta t_n}(c_{n+1}^{h})\|_{0,T}^2 \right)^{\frac{1}{2}} \left( \sum_{T \in T_h} \|\tilde{\text{div}}(\tilde{u}(\phi - \phi_h))\|_{0,T}^2 \right)^{\frac{1}{2}} 
\]

and recalling \(87\), it follows

\[
\int_Q ((\tilde{\text{div}}(\tilde{u}c_{n+1}^{(\delta t_n,h)})) - f^{\delta t_n}(c_{n+1}^{h}))\tilde{\text{div}}(\tilde{u}(\phi - \phi_h))dxdt \leq C_u \left( \sum_{T \in T_h} \|(\tilde{\text{div}}(\tilde{u}c_{n+1}^{(\delta t_n,h)})) - f^{\delta t_n}(c_{n+1}^{h})\|_{0,T}^2 \right)^{\frac{1}{2}} h^k \|\phi\|_{k+1,Q}. 
\]

Thus

\[
\int_Q (f^{\delta t_n}(c_{n+1}^{h}) - f(c_{n+1}^{(\delta t_n,h)}))\tilde{\text{div}}(\tilde{u}\phi_h)dxdt \leq \left( \sum_{T \in T_h} \alpha_T^2 \right)^{\frac{1}{2}} h^k \|\phi\|_{k+1,Q}. 
\]

It follows also

\[
\lambda \int_Q \nabla c_{n+1}^{(\delta t_n,h)} \nabla (\phi - \phi_h)dxdt \leq \left( \sum_{T \in T_h} \|\nabla c_{n+1}^{(\delta t_n,h)}\|_{0,T} \right) \|\nabla (\phi - \phi_h)\|_{0,T}.
\]

Using inequality \(85\), the following estimation holds

\[
\lambda \int_Q \nabla c_{n+1}^{(\delta t_n,h)} \nabla (\phi - \phi_h)dxdt \leq \lambda h^k \left( \sum_{T \in T_h} \gamma_T^2 \right)^{\frac{1}{2}} \|\phi\|_{k+1,Q}. 
\]

It follows from \(102\), \(103\) and \(104\),

\[
\langle F_\lambda(c_{n+1}^{(\delta t_n,h)}), \phi \rangle \leq h^k \left( \sum_{T \in T_h} \alpha_T^2 \right)^{\frac{1}{2}} + \left( \sum_{T \in T_h} \beta_T^2 \right)^{\frac{1}{2}} + \lambda \left( \sum_{T \in T_h} \gamma_T^2 \right)^{\frac{1}{2}} \|\phi\|_{k+1,Q}.
\]

Furthermore \(\|F_\lambda(c_{n+1}^{(\delta t_n,h)})\|_V = \sup \langle F_\lambda(c_{n+1}^{(\delta t_n,h)}), \phi \rangle\) and \(\|\phi\|_{k+1,Q} \leq \|\phi\|_V\), then we get the results.

Since \(\delta t_n = 1\) if the Adaptive-Newton converges \(\|F_\lambda(c_{n+1}^{(\delta t_n,h)})\|_V\) is a reasonable approximation, moreover under certain conditions on \(f\) we can show that \(\|c - c_{n+1}^{(\delta t_n,h)}\|_V\) is equivalent to \(\|F_\lambda(c_{n+1}^{(\delta t_n,h)})\|_V\).
5.4 Numerical experiment

Let we consider the following one dimension hyperbolic conservation laws with linear convection and stiff sources terms (see [23]).

\[ f(s) = -\mu s(s - 1)(s - \frac{1}{2}) \]

and initial data

\[ c_0(x) = \begin{cases} 
1 & \text{if } x \leq 0.3 \\
0 & \text{if } x > 0.3 
\end{cases} \]

The exact solution approaches the following waves solution \( \omega(x - t) \) with

\[ \omega(x) = \begin{cases} 
0 & \text{if } c_0(x) < \frac{1}{2} \\
\frac{1}{2} & \text{if } c_0(x) = \frac{1}{2} \\
1 & \text{if } c_0(x) > \frac{1}{2} 
\end{cases} \]

Exemple 5.1 We first choose \( \mu \) such that \( T \) is a contraction for instance \( \mu = \frac{1}{7} \), and we will compute the solution of (8)-(9) by using Picard iteration and simple finite element method and (39) by Picard iteration and STILS-MT. The mesh size of the space is \( \frac{1}{60} \) and the times steep \( \frac{1}{65} \) which give \( 60 \times 65 \) element in space-time. The solution is presented at \( t = \frac{1}{4} \) in figure 1.

Exemple 5.2 Let we choose now \( \mu = 7 \) and compute the solution of by simple finite element method and STILS-MT1 with penalization \( \lambda = \frac{5}{12} \) and using Newton Raphson iteration for the semi linearity. The mesh size of the space is \( \frac{1}{20} \) and the times steep \( \frac{1}{25} \) which give \( 20 \times 25 \) element in space-time. The solution is presented at \( t = \frac{1}{4} \).
5 Numerical study and simulations

Figure 2: left Newton Adaptatif Raphson’s iteration with STILS-MT1 with penalization $\lambda = \frac{5}{12}$, right Newton adaptaif Raphson’s iteration with simple finite element method

Both numerical methods can be used to tame the spurious oscillations produced by STILS-MT and classical finite element methods when advection problem is solved. In the case of simple finite element methods, we have spurious diffusion for this semi-linear conservation, on the other hand the same fact can be obtaining when penalization version is used but it can be controlled by the parameter $\lambda$. Moreover, STILS-MT can not be used for simple finite element and that gives an important time calculation. We can clearly see that STILS-MT with penalization provides an effective methods for solving semi linear conservation law numerically.
