Quantum information theory and Fourier multipliers on quantum groups

Cédric Arhancet

Abstract

In this paper, we compute the exact value of the minimum output entropy of all quantum channels induced by Fourier multipliers acting on an arbitrary finite quantum group $\mathbb{G}$. Moreover, we show that this quantity is equal to the completely bounded minimal entropy. We also determine the values of the classical capacity and of the quantum capacity. Our results rely on a new and precise description of bounded Fourier multipliers from $L^1(\mathbb{G})$ into $L^p(\mathbb{G})$ for $1 < p \leq \infty$ where $\mathbb{G}$ is a co-amenable compact quantum group of Kac type and on the automatic completely boundedness of these multipliers that this description entails. This result is new even in the case of a group von Neumann algebra associated to an amenable discrete group.

1 Introduction

Fundamental characteristics of a quantum channel $T$ are the minimum output entropy and the different capacities. Determine these quantities is central to characterizing the fundamental limits of the quantum channel’s ability to transmit information reliably.

In the Schödinger picture, a quantum channel is a trace preserving completely positive map $T: S^1_n \rightarrow S^1_n$ acting on a Schatten class $S^1_n$. The minimum output entropy of a quantum channel is defined by

\begin{equation}
H_{\text{min}}(T) \overset{\text{def}}{=} \min_{x \geq 0, \text{Tr} x = 1} H(T(x))
\end{equation}

Mathematics subject classification: 20G42, 43A22, 46L07, 46L52, 81P45.
Key words and phrases: noncommutative $L^p$-spaces, quantum entropy, quantum capacities, compact quantum groups.
where $H(\rho) \overset{\text{def}}{=} -\operatorname{Tr}(\rho \log \rho)$ denotes the von Neumann entropy. Recall that $H$ is the quantum analogue of the Shannon entropy $H$ and can be seen as a uncertainty measure of $\rho$. See for example [Pet2] for a short survey of this notion. Note that $H(\rho)$ is always positive, takes its maximum values when $\rho$ is maximally mixed and its minimum value zero if $\rho$ is pure. So the minimum output entropy can be seen as a measure of the deterioration of the purity of states. The minimum output entropy of a specific channel is difficult to calculate in general.

In this work, we investigate more generally quantum channels acting on a finite-dimensional noncommutative $L^1$-space $L^1(M)$ associated with a von Neumann algebra $M$ equipped with a normalized faithful trace $\tau$. The first aim of this paper is to compute the (negative) quantity

$$
S_{\min}(T) \overset{\text{def}}{=} \min_{x \geq 0, \tau(x) = 1} -\tau(T(x) \log T(x)).
$$

for any $T : L^1(M) \to L^1(M)$ belonging to a large class of explicit quantum channels. If $L^1(M) = S_n$, this quantity differs from (1.1) by a constant depending on $n$. Note that if $\rho$ is a positive element of $L^1(M)$ with $\tau(\rho) = 1$ then $\tau(\rho \log \rho) \geq 0$. We refer [LuP1], [LPS1], [Rus1] and [Seg1] for more information on the Segal entropy $S(\rho) \overset{\text{def}}{=} \tau(\rho \log \rho)$ in the context of von Neumann algebras.

The considered channels are the (trace preserving completely positive) Fourier multipliers on finite quantum groups, see e.g. [Daw1] and [Daw3] for more information. Such a channel $T : L^1(G) \to L^1(G)$ acts on a finite-dimensional noncommutative $L^1$-space $L^1(G)$ and is a noncommutative variant of a classical Fourier multiplier $M_{\varphi} : L^1(T) \to L^1(T)$, $\sum_h a_h e^{2\pi ihk} \mapsto \sum_k \varphi_k a_k e^{2\pi ik}$ where $\varphi = (\varphi_k)$ is a suitable sequence of $\ell^\infty$. Here $T \overset{\text{def}}{=} \{|z| = 1\}$ is the one-dimensional torus and we refer to [Gra1] for the classical theory of multipliers on $T$.

Loosely speaking, a finite quantum group is a finite-dimensional $C^*$-algebra $A$ equipped with a suitable "coproduct" map $\Delta : A \to A \otimes A$ that is a noncommutative variant of the commutative $C^*$-algebra $C(G)$ of continuous functions on a compact group $G$ equipped with the map $\Delta : C(G) \to C(G) \otimes C(G)$ where $\Delta(f)(s, t) = f(st)$ for $f \in C(G)$ and $s, t \in G$. It is possible to do harmonic analysis and representation theory in this setting. See [Maj1], [MaD1] and [FSS1] for short presentations.

Our approach relies on an observation of the authors of [ACN1]. They observed that we can express the minimum output entropy as a derivative of suitable operators norms:

$$
S_{\min}(T) = -\frac{d}{dp} \|T\|_{L^1(M) \to L^p(M)}|_{p=1}.
$$

See Section 1.7 for a proof of this formula. So it suffices to compute the operator norm $\|T\|_{L^1(M) \to L^p(M)}$ in order to compute the minimum output entropy. Unfortunately, in general, the calculation of these operator norms is not much easier than the direct computation of the minimum output entropy. However, the purpose of this paper is to show that the computation of $\|T\|_{L^1(G) \to L^p(G)}$ is possible in the case of an arbitrary Fourier multiplier $T$ on a finite quantum group $G$.

Moreover, we prove that for these channels the minimum output entropy is equal to the completely bounded minimal entropy (reverse coherent information). This notion was introduced for $M = M_n$ in [DJRKB] and rediscovered in [GPLS], see also [YHW1]. We can use the following definition which will be justified in Theorem 1.44

$$
S_{cb, \min}(T) \overset{\text{def}}{=} -\frac{d}{dp} \|T\|_{cb,L^1(M) \to L^p(M)}|_{p=1}.
$$

1. We could introduce the positive quantity $S_{\max}(T) \overset{\text{def}}{=} \max_{x \geq 0, \tau(x) = 1} \tau(T(x) \log T(x))$ but we prefer keep a notation in the spirit of (1.1).
where the subscript cb completely bounded and is natural in operator space theory, see the books [BLM], [ER], [Pis1] and [Pis2].

We refer to Theorem 1.44 for proof of the existence of $S_{cb,\min}(T)$ and a concrete expression. Indeed, we will show that $\|T\|_{cb,L^1(G)\to L^p(G)} = \|T\|_{L^1(G)\to L^p(G)}$ for any bounded Fourier multiplier $T$ on a co-amenable compact quantum group of Kac type $\mathbb{G}$ (hence in particular on finite quantum groups) and any $1 \leq p \leq \infty$ (see Theorem 1.13) and we will immediately deduce the equality $S_{\min}(T) = S_{cb,\min}(T)$. Note that if $\mathcal{M}$ is a non-abelian (at least semifinite) von Neumann algebra, we will prove in Section 1.4 that the completely bounded norm $\|\cdot\|_{cb,L^1(M)\to L^p(M)}$ and the classical operator norm $\|\cdot\|_{L^1(M)\to L^p(M)}$ are not equal. So the above equality is specific to the Fourier multipliers on co-amenable compact quantum groups of Kac type. Finally, we refer to [GuW1] for another application of these completely bounded norms.

Note that the completely bounded minimal entropy $S_{cb,\min}$ is additive since the norms (see section 1.9 for a correct proof of this last assertion.) in sharp contrast with the minimum output entropy [Has1], we deduce that each Fourier multiplier has the additivity property.

One of the most fundamental questions in quantum information concerns with the amount of information that can be transmitted reliably through a quantum channel. For that, many capacities was introduced for describing the capability of the channel for delivering information from the sender to the receiver. We refer to the survey [GIN1] for more information on the large diversity of quantum channel capacities. Despite of the significant progress in recent years, the computation of most capacities remains largely open. The Holevo capacity of a quantum channel $T$: $L^1(\mathcal{M}) \to L^1(\mathcal{M})$ can be defined by the formula

$$\chi(T) \overset{\text{def}}{=} \sup \left\{ S \left( \sum_{i=1}^{N} \lambda_i T(\rho_i) \right) - \sum_{i=1}^{N} \lambda_i S(T(\rho_i)) \right\}$$

where the supremum is taken over all $N \in \mathbb{N}$, all probability distributions $(\lambda_1, \ldots, \lambda_N)$ and all states $\rho_1, \ldots, \rho_N$ of $L^1(\mathcal{M})$, see [GIN1, page 21] [Key1, page 82] for the case $\mathcal{M} = M_n$. It is known that the classical capacity $C(T)$ can be expressed by the asymptotic formula

$$C(T) = \lim_{n \to +\infty} \frac{\chi(T^\otimes n)}{n}$$

This quantity is the rate at which one can reliably send classical information through $T$. Using the remarkable connection described in the paper [JuP1] of Holevo capacity $\chi(T)$ with the $p$-summing maps and some noncommutative variants, the $\ell^p(S^p_\alpha)$-summing operators, we are able to determine the value of $C(T)$ for any Fourier multiplier $T$ acting on a finite quantum group $\mathbb{G}$. It is the second aim of this paper. For that, we obtain some results on the $\ell^p(S^p_\alpha)$-summing Fourier multipliers in Section 1.5. We deduce equally the same value for the coherent information

$$Q^{(1)}(T) = \sup_{\rho \in L^1(\mathcal{M}) \otimes L^1(\mathcal{M})} \left\{ S((\text{Id} \otimes T)(\rho)) - S((\tau \otimes T)(\rho)) \right\}$$

where the supremum is taken over all states $\rho$, and the quantum capacity

$$Q(T) = \lim_{n \to +\infty} \frac{Q^{(1)}(T^\otimes n)}{n}$$

which the the rate at which one can reliably send quantum information through $T$.

We refer to [GJL1], [GJL2], [JuP1] and [JuP2] for papers using operator space theory for estimating quantum capacities and to the books [GMS1], [Hol1], [NiC1], [Pet1], [Wal1] and [Wil1] for more information on quantum information theory.
To conclude, we also hope that this connection between quantum information theory and the well-established theory of Fourier multipliers on operator algebras will be the starting point of other progress on the problems of quantum information theory but also in noncommutative harmonic analysis. We leave open an important number of implicit questions. We equally refer to [BCLY], [CrN1] and [LeY1] for papers on quantum information theory in link with noncommutative harmonic analysis.

The paper is organized as follows. Section 1.1 gives background on noncommutative $L^p$-spaces, compact quantum groups, and operator space theory. These notions are fundamental for us. In Section 1.2, we prove that the convolution induces a completely bounded map on some noncommutative $L^p$-spaces associated to some suitable compact quantum groups. In Section 1.3, we describe bounded Fourier multipliers from $L^1(G)$ into $L^p(G)$ where $G$ is a co-amenable compact quantum group of Kac type. We deduce from Section 1.2 that these multipliers are necessarily completely bounded with the same completely bounded norm. We also describe by duality the (completely) bounded Fourier multiplier $L^p(G) \rightarrow L^\infty(G)$ which will be useful for obtaining the result on the different capacities. In Section 1.4, we compare the spaces of bounded maps and of completely bounded maps from $L^1(M)$ into $L^\infty(M)$. We show that in the case of a nonabelian von Neumann algebra $M$, these norms are different. In Section 1.5, we describe partially the $\ell^p(S^d)$-summing (left or right) Fourier multipliers acting from $L^\infty(G)$ into $L^\infty(G)$ where $G$ is a co-amenable compact quantum group of Kac type. In Section 1.6, we compute the minimal output entropy and we obtain the equality with the completely bounded minimal entropy. Finally, we obtain the values of the classical capacity and the quantum capacity. We equally observe that there exist some bounded Schur multipliers but not completely bounded from $S^1$ into the space $B(\ell^2)$ of bounded operators acting on the Hilbert space $\ell^2$. In Section 1.7, we give a proof of the formula (1.3) which describes the minimum output entropy $S_{\min}(T)$ as a derivative of operator norms for the sake of completeness. In Section 1.9, we give a correct proof of the multiplicativity of the completely bounded norms $\|\cdot\|_{cb,L^q \rightarrow L^p}$ if $1 \leq q \leq p \leq \infty$. For the sake of completeness, we show the additivity of $S_{cb,\min}(T)$. In Section 1.9, we prove two results needed for the concrete description of $S_{cb,\min}(T)$ obtained in Theorem 1.44.

1.1 Preliminaries

**Multiplier and bimodules** Let $A$ be a Banach algebra and let $X$ be a Banach space equipped with a structure of $A$-bimodule. We say that a pair of maps $(L, R)$ from $A$ into $X$ is a multiplier if

$$ aL(b) = R(a)b, \quad a, b \in A. $$

We say that $(L, R)$ is a bounded multiplier if $L$ and $R$ are bounded. In this case, we let

$$ \|(L, R)\| \overset{\text{def}}{=} \max \{ \|L\|_{A \rightarrow X}, \|R\|_{A \rightarrow X} \}. $$

If $X$ is $A$-right module, a left multiplier is a map $L: A \rightarrow X$ such that

$$ L(ab) = L(a)b, \quad a, b \in A. $$

Similarly, if $X$ is $A$-left module, a right multiplier is a map $R: A \rightarrow X$ such that

$$ R(ab) = aR(b), \quad a, b \in A. $$

We refer to [Daw1] for more information.
Matrix normed modules Let $A$ be a Banach algebra equipped with an operator space structure. We need to consider the left $A$-modules $X$ that correspond to completely contractive homomorphisms $A \to CB(X)$ for an operator space $X$. Following [BLM, (3.1.4)], we call these matrix normed left $A$-modules. It is easy to see that these are exactly the left $A$-modules $X$ satisfying for all $m, n \in \mathbb{N}$, any $[a_{ij}] \in M_n(A)$ and any $[x_{kl}] \in M_m(X)$

\begin{equation}
\| [a_{ij} x_{kl}] \|_{M_{mn}(X)} \leq \| [a_{ij}] \|_{M_n(A)} \| [x_{kl}] \|_{M_m(X)}.
\end{equation}

A reformulation of (1.13) is that the module action on $X$ extends to a complete contraction $A \hat{\otimes} X \to X$ where $\hat{\otimes}$ denotes the operator space projective tensor product. Similar results hold for matrix normed right modules.

If $X$ is a matrix normed left $A$-module, then by [BLM, 3.1.5 (2)] the dual $X^*$ is a matrix normed right $A$-module for the dual action defined by

\begin{equation}
\langle \varphi a, x \rangle_{X^*, X} \overset{\text{def}}{=} \langle \varphi, ax \rangle_{X^*, X}, \quad a \in A, x \in X, \varphi \in X^*.
\end{equation}

There exists a similar result for matrix normed right $A$-modules.

Noncommutative $L^p$-spaces Here we recall some basics of noncommutative $L^p$-spaces on semifinite von Neumann algebras. We refer to [Tak1] for the theory of von Neumann algebras and to [PiX] for more information on noncommutative $L^p$-spaces. Let $\mathcal{M}$ be a semifinite von Neumann algebra equipped with a normal semifinite faithful trace $\tau$. We let $\mathcal{M}_+$ denote the positive part of $\mathcal{M}$. Let $\mathcal{S}_+$ be the set of all $x \in \mathcal{M}_+$ whose support projection have a finite trace. Then any $x \in \mathcal{S}_+$ has a finite trace. Let $\mathcal{S} \subset \mathcal{M}$ be the linear span of $\mathcal{S}_+$, then $\mathcal{S}$ is a weak*-dense $*$-subalgebra of $\mathcal{M}$.

Let $1 < p < \infty$. For any $x \in \mathcal{S}$, the operator $|x|^p$ belongs to $\mathcal{S}_+$ and we set

\[ \|x\|_{L^p(\mathcal{M})} \overset{\text{def}}{=} (\tau(|x|^p))^\frac{1}{p}, \quad x \in \mathcal{S}. \]

Here $|x| \overset{\text{def}}{=} (x^* x)^{\frac{1}{2}}$ denotes the modulus of $x$. It turns out that $\| \cdot \|_p$ is a norm on $\mathcal{S}$. By definition, the noncommutative $L^p$-space associated with $(\mathcal{M}, \tau)$ is the completion of $(\mathcal{S}, \| \cdot \|_p)$. It is denoted by $L^p(\mathcal{M})$. For convenience, we also set $L^\infty(\mathcal{M}) \overset{\text{def}}{=} \mathcal{M}$ equipped with its operator norm. Note that by definition, $L^p(\mathcal{M}) \cap \mathcal{M}$ is dense in $L^p(\mathcal{M})$ for any $1 \leq p < \infty$.

Furthermore, $\tau$ uniquely extends to a bounded linear functional on $L^1(\mathcal{M})$, still denoted by $\tau$. Indeed we have $|\tau(x)| \leq \tau(\|x\|_1) = \|x\|_1$ for any $x \in L^1(\mathcal{M})$.

We recall the noncommutative Hölder inequality. If $1 \leq p, q, r \leq \infty$ satisfy $\frac{1}{p} = \frac{1}{q} + \frac{1}{r}$ then

\begin{equation}
\|xy\|_r \leq \|x\|_p \|y\|_q, \quad x \in L^p(\mathcal{M}), y \in L^q(\mathcal{M}).
\end{equation}

Conversely for any $z \in L^r(\mathcal{M})$, by using the same ideas than the proof of [Ray2, Theorem 4.20] there exist $x \in L^p(\mathcal{M})$ and $y \in L^q(\mathcal{M})$ such that

\begin{equation}
z = xy \quad \text{and} \quad \|z\|_r = \|x\|_p \|y\|_q
\end{equation}

For any $1 \leq p < \infty$, let $p^* = \frac{p}{p-1}$ be the conjugate number of $p$. Applying (1.15) with $q = p^*$ and $r = 1$, we may define a duality pairing between $L^p(\mathcal{M})$ and $L^{p^*}(\mathcal{M})$ by

\begin{equation}
\langle x, y \rangle = \tau(xy), \quad x \in L^p(\mathcal{M}), y \in L^{p^*}(\mathcal{M}).
\end{equation}
Moreover, we have
\[(1.21) \quad \Sigma : L^\infty(G) \rightarrow L^\infty(G), \quad x \mapsto x^\ast.\]

Compact quantum groups Let us first recall some well-known definitions and properties concerning compact quantum groups. We refer to [Cas1], [FSS1], [Kus1], [MaD1], [NeT1], [VDa] and references therein for more details.

A compact quantum group $\mathbb{G}$ is a von Neumann algebra $L^\infty(\mathbb{G})$ equipped with a faithful unital normal $*$-homomorphism $\Delta : L^\infty(\mathbb{G}) \rightarrow L^\infty(\mathbb{G}) \otimes L^\infty(\mathbb{G})$ (called the coproduct) such that $(\Delta \otimes \text{Id}) \Delta = (\text{Id} \otimes \Delta) \Delta$ and a normal faithful state $h : L^\infty(\mathbb{G}) \rightarrow \mathbb{C}$ (called the Haar state) such that
\[(h \otimes \text{Id}) \circ \Delta(x) = h(x)1 = (\text{Id} \otimes h) \circ \Delta(x), \ x \in L^\infty(\mathbb{G}).\]

The quantum group $\mathbb{G}$ is said to be of Kac type $h$ is a trace. We say that $\mathbb{G}$ is finite if $L^\infty(\mathbb{G})$ is finite-dimensional. Such a compact quantum group is of Kac type by [VDa2].

Representations A unitary matrix $u = (u_{ij})_{1 \leq i,j \leq n}$ with entries $u_{ij} \in L^\infty(\mathbb{G})$ is called a $n$-dimensional unitary representation of $\mathbb{G}$ if for any $i,j = 1, \ldots, n$ we have
\[\Delta(u_{ij}) = \sum_{k=1}^n u_{ik} \otimes u_{kj}.\]

We say that $u$ is irreducible if there is no non-trivial projection $p \in M_n$ such that $(p \otimes 1)u = u(p \otimes 1)$. We denote by $\text{Irr}(\mathbb{G})$ the set of unitary equivalence classes of irreducible finite-dimensional unitary representations of $\mathbb{G}$. For each $\pi \in \text{Irr}(\mathbb{G})$, we fix a representative $u^{(\pi)} \in L^\infty(\mathbb{G}) \otimes M_{n_\pi}$ of the class $\pi$.

We let
\[(1.20) \quad \text{Pol}(\mathbb{G}) \overset{\text{def}}{=} \text{span} \{ u^{(\pi)}_{ij} : u^{(\pi)} = [u^{(\pi)}_{ij}]_{1 \leq j \leq n_\pi}, \pi \in \text{Irr}(\mathbb{G}) \}.\]

This is a weak* dense subalgebra of $L^\infty(\mathbb{G})$.

Antipodes on compact quantum groups of Kac type If $\mathbb{G}$ is a compact quantum group of Kac type, it is known that there exists an anti-$*$-automorphism $S : L^\infty(\mathbb{G}) \rightarrow L^\infty(\mathbb{G})$, called the antipode of $\mathbb{G}$, determined by
\[S(u^{(\pi)}_{ij}) = (u^{(\pi)}_{ji})^* , \ \pi \in \text{Irr}(\mathbb{G}), 1 \leq i,j \leq n_\pi.\]

Moreover, $S$ preserves the finite trace $h$, i.e., $h \circ S = h$. For any $x, z \in L^\infty(\mathbb{G})$, we have
\[(1.21) \quad S((\text{Id} \otimes \tau)(\Delta(z)(1 \otimes y))) = (\text{Id} \otimes \tau)((1 \otimes z)\Delta(y)).\]

Moreover, we have
\[(1.22) \quad \Delta \circ S = \Sigma \circ (S \otimes S) \circ \Delta,\]

where $\Sigma : L^\infty(\mathbb{G}) \otimes L^\infty(\mathbb{G}) \rightarrow L^\infty(\mathbb{G}) \otimes L^\infty(\mathbb{G})$, $x \otimes y \rightarrow y \otimes x$ is the flip.
Fourier transforms. For a linear functional $\varphi$ on $\text{Pol}(G)$, we define the Fourier transform

$$\hat{\varphi}(\pi) \overset{\text{def}}{=} (\varphi \otimes \text{Id})(\hat{(u(\pi))}^*), \quad \pi \in \text{Irr}(G).$$

In particular, any $x \in L^\infty(G)$ induces a linear functional $h(\cdot,x) : \text{Pol}(G) \to \mathbb{C}, \ y \mapsto h(yx)$ on $\text{Pol}(G)$ and the Fourier transform $\hat{x}(\pi) \overset{\text{def}}{=} \hat{\varphi}(1) = 1$ and $\hat{x}(\pi) = 0$ for $s \in G \setminus \{e\}$. For any $f \in \text{Irr}(G)$, we have

$$\hat{f}(\pi) = \int_G \pi(s)^* f(s) \, d\mu_G(s), \quad \pi \in \text{Irr}(G).$$

Example 1.2 Let $G$ be a compact group and define

$$\Delta(f)(s,t) \overset{\text{def}}{=} f(st), \quad f \in C(G), \quad s,t \in G.$$ 

Then $\Delta$ admits a weak* continuous extension $\Delta : L^\infty(G) \to L^\infty(G) \otimes L^\infty(G)$. In this situation $L^\infty(G)$ equipped with $\Delta$ and a Haar measure is a compact quantum group. For any $f \in L^\infty(G)$, we can show that

$$\hat{f}(\pi) = \int_G \pi(s)^* f(s) \, d\mu_G(s), \quad \pi \in \text{Irr}(G).$$

Example 1.3 Let $G$ be a discrete group with its neutral element $e$ and $\text{VN}(G)$ its von Neumann algebra. The “dual” $\hat{G}$ of $G$ is a compact quantum group defined by $\text{VN}(G)$ equipped with the coproduct $\Delta : \text{VN}(G) \to \text{VN}(G) \otimes \text{VN}(G)$ defined by

$$\Delta(\lambda_s) = \lambda_s \otimes \lambda_s$$

and the Haar state defined as the unique trace $\tau$ on $\text{VN}(G)$ such that $\tau(1) = 1$ and $\tau(\lambda_s) = 0$ for $s \in G \setminus \{e\}$. For any $f \in \text{VN}(G)$, we have

$$\hat{f}(s) = \tau(f\lambda(s)^*), \quad s \in G.$$ 

Operator spaces. We refer to [Pis1] for more information on vector valued noncommutative $L^p$-spaces. Let $M$ be a hyperfinite von Neumann algebra. Let $E$ and $F$ be operator spaces. If a map $T : E \to F$ is completely bounded then $\text{Id}_{L^p(M)} \otimes T : L^p(M,E) \to L^p(M,F)$ is bounded and we have

$$\|\text{Id}_{L^p(M)} \otimes T\|_{L^p(M,E) \to L^p(M,F)} \leq \|T\|_{cb,E \to F}.$$ 

and if $M \neq 0$

$$\|\text{Id}_{L^p(M)} \otimes T\|_{L^p(M,E) \to L^p(M,F)} \leq \|T\|_{cb,E \to F}.$$
Let $M, N$ be von Neumann algebras. Recall that by [Pis2, Theorem 2.5.2] the map

\[ (1.27) \quad \Psi : M \overline{\otimes} N \longrightarrow \text{CB}(M^*, N) \]

\[ z \quad \mapsto \quad x \mapsto (x \otimes \text{Id})(z) \]

is a completely isometric isomorphism. Let $X$ be a Banach space and $E$ be an operator space. For any bounded linear map $T : X \rightarrow E$, we have by [BLM, (1.12)]

\[ (1.28) \quad \|T\|_{\text{cb}, \max(X) \rightarrow E} = \|T\|_{X \rightarrow E}. \]

For any bounded linear map $T : E \rightarrow X$, we have by [BLM, (1.10)]

\[ (1.29) \quad \|T\|_{\text{cb}, E \rightarrow \min(X) \rightarrow E} = \|T\|_{E \rightarrow X}. \]

For any bounded linear map $T : L^q \otimes L^p \rightarrow L^p \otimes L^q, x \otimes y \mapsto y \otimes x$ induces a bounded map

\[ (1.30) \quad \|T\|_{\text{cb}, L^q(M) \otimes L^p(N) \rightarrow L^p(N) \otimes L^q(M)} \leq 1. \]

If $E$ and $F$ are operator spaces, we have an isometry

\[ (1.31) \quad E \otimes_{\min} F \subset \text{CB}(F^*, E) \]

and each element of $x \otimes y$ of $E \otimes_{\min} F$ identifies to a weak*-weak continuous map (see [DeF, page 48].

We will use the following notation of [Pis1, Definition 3.1]:

\[ (1.32) \quad L^\infty_0(\mathcal{M}, E) \equiv \mathcal{M} \otimes_{\min} E. \]

It is well-known that

\[ (1.33) \quad \|x\|_{L^p(L^1)} = \|\text{(Id} \otimes \tau)(x)\|_{L^p}. \]

For any positive element $x \in M_d \otimes \mathcal{M}$ with a finite number of non-null entries we have by an obvious generalization of [KiK1]

\[ \|x\|_{S^1(L^p(M))} \leq \left\| \text{(Id} \otimes \tau)(x^p) \right\|_{S^1}. \]

**Entropy** Let $g : \mathbb{R}^+ \rightarrow \mathbb{R}$ be the function defined by $g(0) \equiv 0$ and $g(t) \equiv t \ln(t)$ if $t > 0$. If $\rho$ is positive element of $L^1(\mathcal{M})$, by a slight abuse, we use the notation $\rho \log \rho \equiv g(\rho)$.

Let $\mathcal{M}$ be a finite von Neumann algebra with a normal faithful finite trace $\tau$, and let $T : \mathcal{M} \rightarrow \mathcal{M}$ be a normal positive linear unital map such that $\tau \circ T = T$. For any $h \in L^1(\mathcal{M})$ with finite entropy we have by [LuP2, Theorem 11]

\[ (1.34) \quad S(T(h)) \leq S(h), \quad \text{i.e.} \quad \tau(T(h) \log(T(h))) \leq \tau(h \log(h)). \]

Recall that for any $t > 0$ and any state $\rho \in L^1(\mathcal{M}, \tau)$, we have

\[ (1.35) \quad S_r(\rho) = S_{\tau\tau}\left(\frac{1}{t} \rho\right) + \log t. \]

where $S_r$ is the Segal’s entropy relatively to the trace $\tau$.  

8
1.2 Convolutions by elements of $L^p(G)$ and completely bounded maps from $L^1(G)$ into $L^p(G)$

Let $G$ be a compact quantum group. Recall that the associated coproduct is a weak* continuous map $\Delta: L^\infty(G) \to L^\infty(G) \overline{\otimes} L^\infty(G)$. So there is a completely contractive preadjoint map $\Delta_*: L^\infty(G) \overline{\otimes} L^\infty(G)^* \to L^\infty(G)^*$, where $\overline{\otimes}$ denotes the operator space projective tensor product. This gives us a completely contractive Banach algebra structure on $L^\infty(G)^*$. We will use the following folklore observation.

In this section, we prove a completely bounded version of this inequality. We will use the following classical notation

\[
f \ast g \overset{\text{def}}{=} \Delta_* (f \otimes g) = (f \otimes g) \Delta, \quad f, g \in L^\infty(G)^*.
\]

For any $x, y \in L^\infty(G)$, we define the convolution $x \ast y$ as an element of $L^\infty(G)^*$ by

\[
x \ast y \overset{\text{def}}{=} \tau(x) \ast \tau(y).
\]

Let $G$ be a compact quantum group of Kac type. Suppose $1 \leq p \leq \infty$. For any $x \in L^1(G)$ and any $y \in L^p(G)$, we have by [LWW1, Corollary 3.10] the inequality

\[
\|x \ast y\|_{L^p} \leq \|x\|_{L^1} \|y\|_{L^p}.
\]

In this section, we prove a completely bounded version of this inequality. We will use the following folklore observation.

**Lemma 1.4** Let $G$ be a compact quantum group of Kac type. If $x, y \in L^\infty(G)$, $x \ast y$ is equal to the element $\langle (\tau(x) \circ \sigma) \otimes \id \rangle (\Delta(y)) \cdot \langle \rangle_{L^1(G), L^\infty(G)}$.

**Proof:** For any $x, y, z \in L^\infty(G)$, we have

\[
\langle x \ast y, z \rangle_{L^1(G), L^\infty(G)} \overset{\text{(1.37)}}{=} \langle (\tau(x) \ast \tau(y)), z \rangle_{L^1(G), L^\infty(G)} \overset{\text{(1.36)}}{=} \langle \tau(x) \otimes \tau(y), \Delta(z) \rangle = \tau(x) \ast \tau(y) \Delta(z).
\]

\[
\tau(x) \ast \tau(y) \Delta(z) = \tau(x) \ast \tau(y) \Delta(z) = \tau(x) \ast \tau(y) \Delta(z) = \tau(x) \ast \tau(y) \Delta(z).
\]

Recall that we have a contractive inclusion $L^\infty(G) \subset L^1(G)$, $x \mapsto \tau(x)$. If $x, y \in L^\infty(G)$, we are led to define the element

\[
x \ast_{\infty} y \overset{\text{def}}{=} \langle \tau(x) \circ \sigma \rangle (\Delta(y)).
\]

By Lemma 1.4, we have

\[
x \ast y = \tau((x \ast_{\infty} y).\cdot).
\]

Note that (1.36), induces a left action of $L^1(G)$ on $L^1(G)$ (by left convolutions). We define the right dual action $\cdot$ of $L^1(G)$ on $L^\infty(G)$ by

\[
\langle z \cdot a, x \rangle_{L^\infty(G), L^1(G)} \overset{\text{(1.14)}}{=} \langle z, a \ast x \rangle_{L^\infty(G), L^1(G)}, \quad a \in L^1(G), x \in L^1(G), z \in L^\infty(G).
\]

Since $S$ is an anti-*-automorphism, note that $S$ is weak* continuous. For any $y \in L^1(G)$ and any $z \in L^\infty(G)$, we define the element $y \ast_{1,\infty} z$ of $L^\infty(G)$ by

\[
y \ast_{1,\infty} z \overset{\text{def}}{=} z \cdot S_\ast(y).
\]

\[\text{2. The result remains true for a locally compact quantum group } G \text{ whose scaling automorphism group is trivial.}\]
Proposition 1.5 Let $G$ be a compact quantum group of Kac type. For any $y \in L^1(G)$ and any $z \in L^\infty(G)$, we have

$$y *_{1,\infty} z = ((y \circ S) \otimes \text{Id}) \circ \Delta(z).$$

Proof: If $y \in L^1(G)$ and $z \in L^\infty(G)$, we have

$$\langle y *_{1,\infty} z, \psi \rangle_{L^\infty(G),L^1(G)} = \langle z \cdot S_*(y), \psi \rangle_{L^\infty(G),L^1(G)}$$

$$= \langle z, (y \circ S) \ast \psi \rangle_{L^\infty(G),L^1(G)}$$

$$= \langle ((y \circ S) \otimes \psi) \circ \Delta(z) \rangle_{L^\infty(G),L^1(G)}$$

We deduce (1.43).

Proposition 1.6 Let $G$ be a compact quantum group of Kac type. We have the following commutative diagram.

\[
\begin{array}{ccc}
L^1(G) \otimes L^1(G) & \overset{\ast}{\longrightarrow} & L^1(G) \\
\downarrow & & \downarrow \\
L^1(G) \otimes L^\infty(G) & \overset{\ast_{1,\infty}}{\longrightarrow} & L^\infty(G) \\
\downarrow & & \downarrow \\
L^\infty(G) \otimes L^\infty(G) & \overset{\ast_\infty}{\longrightarrow} & L^\infty(G)
\end{array}
\]

Proof: For any $x, z \in L^\infty(G)$, we have

$$\tau(x \cdot) *_{1,\infty} z = (1.43) \quad ((\tau(x \cdot) \circ S) \otimes \text{Id}) \circ \Delta(z) = (1.39) \quad x *_{\infty} z.$$ 

Moreover, for any $x, z \in L^\infty(G)$ and any $f \in L^1(G)$, we have

$$\langle f * \tau(x \cdot), z \rangle_{L^1(G),L^\infty(G)} = \langle f \otimes \tau(x \cdot), \Delta(z) \rangle = f \left[ (\text{Id} \otimes \tau)(1 \otimes x) \Delta(z) \right]$$

$$= (1.21) \quad f \circ S \left[ (\text{Id} \otimes \tau)(\Delta(x)(1 \otimes z)) \right] = \left[ (f \circ S) \otimes \tau(z \cdot) \right] \circ \Delta(x)$$

$$= \tau \left[ ((f \circ S) \otimes \text{Id}) \circ \Delta(x) \right] = (1.43) \quad \tau((f \ast_{1,\infty} x)).$$

In the following theorem, $L^1(G)$ is implicitly equipped with opposed operator space structure.

Theorem 1.7 Let $G$ be a compact quantum group of Kac type. Suppose $1 \leq p \leq \infty$. We have well-defined map completely contractive maps $L^1(G) \otimes L^p(G) \to L^p(G)$, $f \otimes g \mapsto f * g$ and $L^p(G) \otimes L^1(G) \to L^p(G)$, $g \otimes f \mapsto g * f$.

Proof: Since the convolution $*$ of (1.36) induces a structure of matrix normed left $L^\infty(G)_*$-module on $L^\infty(G)_*$, the right dual action $\cdot$ of (1.41) induces a structure of matrix normed right $L^\infty(G)_*$-module on $L^\infty(G)$. Moreover, $S : L^\infty(G) \to L^\infty(G)$ is an anti-$*$-automorphism.
Its preadjoint $S_* : L^\infty(G) \to L^\infty(G)$ is an anti-completely isometric map. For any $[a_{ij}] \in M_n(L^1(G))$ and any $[x_{kl}] \in M_m(L^\infty(G))$, we deduce that
\[
\left\| [a_{ij} *_{1,\infty} x_{kl}] \right\|_{M_{nm}(L^\infty(G))} \leq \left\| [x_{kl}] \right\|_{M_{nm}(L^\infty(G))} \left\| S_*(a_{ij}) \right\|_{M_{nm}(L^\infty(G))} \\
\leq \left\| [x_{kl}] \right\|_{M_{nm}(L^\infty(G))} \left\| [S_*(a_{ij})] \right\|_{M_{nm}(L^1(G))} \leq \left\| [x_{kl}] \right\|_{M_{nm}(L^\infty(G))} \left\| [a_{ij}] \right\|_{M_{nm}(L^1(G))}
\]
So, we have a well-defined map completely contractive map $L^1(G)^{op} \otimes L^\infty(G) \to L^\infty(G)$, $x \otimes y \mapsto x * y$. Recall that we also have a completely contractive map $L^1(G) \otimes L^1(G) \to L^1(G)$, $x \otimes y \mapsto x * y$. So we obtain the conclusion by bilinear interpolation.

The second part is similar and left to the reader.

**Remark 1.8** The assumption “of Kac type” cannot be dropped since it is shown in [LWW1] that the inequality \( \|x * y\|_\infty \leq \|x\|_\infty \|y\|_1 \) is not true for $G = SU_q(2)$ for $q \in [-1, 1] - \{0\}$.

**Corollary 1.9** Let $G$ be a compact quantum group of Kac type. Suppose $1 < p \leq \infty$. Let $\mu \in L^p(G)$. The map $T : L^1(G) \to L^p(G)$, $x \mapsto \mu * x$ is completely bounded with
\[
\|T\|_{cb,L^1(G)\to L^p(G)} \leq \|\mu\|_{L^p(G)}.
\]

**Proof** : By [ER, Proposition 7.1.2], we have an (complete) isometry
\[
CB(L^p(G) \otimes L^1(G), L^p(G)) \to CB(L^p(G), CB(L^1(G), L^p(G))) : \mu \otimes x \mapsto \mu * x,
\]

The conclusion is obvious.

**Remark 1.10** We extend the result to the case $L^q(G) \otimes L^p(G) \to L^r(G)$ where $\frac{1}{p} + \frac{1}{q} = \frac{1}{r}$ with $1 \leq p, q, r \leq \infty$ but we have no interesting application at the present moment.

**Remark 1.11** If $G$ is an abelian locally compact group and if $1 + \frac{1}{p} + \frac{1}{q} = \frac{1}{r}$, it is not difficult to generalize the vector-valued Young’s inequality $\|f \ast g\|_{L^r(\mathbb{R}, X)} \leq \|f\|_{L^p(\mathbb{R})} \|g\|_{L^q(\mathbb{R}, X)}$ for the group $\mathbb{R}$ from [ABHN1, Proposition 1.3.2] to the case of $G$. From this, it is obvious that if $X$ is a Banach space any element $\mu \in L^p(G)$ induces a convolution operator $T : L^1(G, X) \to L^p(G, X)$, $x \mapsto \mu * x$ satisfying
\[
\|T\|_{L^1(G,X)\to L^p(G,X)} \leq \|\mu\|_{L^p(G)}.
\]

### 1.3 Bounded versus completely bounded Fourier multipliers from $L^1(G)$ into $L^p(G)$

Let $G$ be a compact quantum group of Kac type. Suppose $1 \leq p < \infty$. So, we have a structure of $L^1(G)$-bimodule on $L^p(G)$ for any $1 \leq p \leq \infty$. So we can consider the associated multipliers, see the first paragraph of Section 1.1. We denote by $\mathcal{M}^{1,p}(G)$ the space of multipliers from $L^p(G)$ into $L^p(G)$ what we call Fourier multipliers. In particular, a left Fourier multiplier is a map $T : L^1(G) \to L^p(G)$ satisfying
\[
T(x * y) = T(x) * y, \quad x, y \in L^1(G).
\]
We denote by $\mathcal{M}^{1,p}_L(G)$ the space of left bounded Fourier multipliers.
Suppose $1 \leq p < \infty$. We will use the following duality bracket

\[
\langle x, y \rangle_{L^p(G), L^{p*}(G)} \overset{\text{def}}{=} \tau(xS(y)) = \tau(yS(x)).
\]

The reader should observe that this bracket is the best duality bracket in order to do harmonic analysis on noncommutative $L^p$-spaces associated to compact quantum groups of Kac type.

We will use the following lemma which is a noncommutative analogue of [Dint2, (14.10.9)].

\textbf{Lemma 1.12} Let $G$ be a compact quantum group of Kac type. Suppose $1 \leq p < \infty$. If $x \in L^1(G)$, $y \in L^{p*}(G)$ and $z \in L^p(G)$, we have

\[
\langle z \ast x, y \rangle_{L^p(G), L^{p*}(G)} = \langle z, x \ast y \rangle_{L^p(G), L^{p*}(G)}
\]

\textbf{Proof :} For any $\xi \in \mathcal{F}$, we have

\[
\tau(\mu) = \tau(S(\mu)) = \tau(S(x)S(y)) = \tau(\xi \ast S(y)) \circ S(x).
\]

So

\[
\tau(\mu) = \tau(\cdot \ast S(y)) \circ S.
\]

Now, for any $x, y, z \in \text{Pol}(G)$, we have

\[
\langle z \ast x, y \rangle_{L^p(G), L^{p*}(G)} = \tau((z \ast x)S(y)) = (\tau(z) \otimes \tau(x)) \circ S(y)
\]

\[
(\tau(x) \otimes \tau(z) \circ (S \otimes S) \circ \Delta(y) = (\tau(x)S \otimes \tau(z)S)\Delta(y)
\]

\[
(\tau(y \ast (1 \otimes y)\Delta(S(z))) = (\tau(x) \otimes \tau(y \ast (1 \otimes y)\Delta(S(z)))
\]

\[
= \tau((x \ast y)S(z)) = \langle z, x \ast y \rangle_{L^p(G), L^{p*}(G)}.
\]

We conclude by density. \hfill \blacksquare

Now, we will show that the bounded Fourier multipliers from $L^1(G)$ into $L^p(G)$ on a co-amenable compact quantum group are convolution operators. Recall that a compact quantum group $G$ is co-amenable if and only if the Banach algebra $L^1(G)$ has a bounded approximate unit with norm not more than 1. A known class of examples of coamenable compact quantum groups is given by finite quantum groups.

\textbf{Theorem 1.13} Let $G$ be a co-amenable compact quantum group of Kac type. Suppose $1 < p \leq \infty$. Let $T: L^1(G) \rightarrow L^p(G)$ be a map.

1. The operator $T$ is a bounded left Fourier multiplier if and only if there exists $\mu \in L^p(G)$ such that

\[
T(x) = \mu \ast x, \quad x \in L^1(G).
\]

2. The operator $T$ is a bounded right Fourier multiplier if and only if there exists $\mu \in L^p(G)$ such that

\[
T(x) = x \ast \mu, \quad x \in L^1(G).
\]
3. The map $L^p(G) \to \mathfrak{M}^{1,p}(G)$, $\mu \mapsto (\mu \ast \cdot \ast \mu)$ is a surjective isometry.

In the situation of the point or the point 2, $\mu$ is unique, the map is completely bounded and we have

$$
\|\mu\|_{L^p(G)} = \|T\|_{L^1(G) \to L^p(G)} = \|T\|_{cb,L^1(G) \to L^p(G)}.
$$

Proof : 1. $\iff$: Suppose that $\mu$ belongs to $L^p(G)$. The completely boundedness of $T$ is a consequence of Corollary 1.9 which in addition says that

$$
\|T\|_{cb,L^1(G) \to L^p(G)} \leq \|\mu\|_{L^p(G)}.
$$

Moreover, for any $x, y \in L^1(G)$, we have

$$
T(x \ast y) = \mu \ast (x \ast y) = (\mu \ast x) \ast y = T(x) \ast y.
$$

Hence (1.47) is satisfied, we conclude that $T$ is a bounded left Fourier multiplier.

$\Rightarrow$: Suppose that $T : L^1(G) \to L^p(G)$ is a bounded left Fourier multiplier. Since $G$ is co-amenable, by [BeT1, Theorem 3.1] (and its proof) there exists a contractive approximative unit $(b_i)$ of the algebra $L^1(G)$. For any $x \in L^1(G)$, we have in $L^1(G)$

$$
b_i \ast x \to x.
$$

For any $i$, we have

$$
\|T(b_i)\|_{L^p(G)} \leq \|T\|_{L^1(G) \to L^p(G)} \|b_i\|_{L^1(G)} \leq \|T\|_{L^1(G) \to L^p(G)}.
$$

This implies that the net $(T(b_i))$ lies in a norm bounded subset of the Banach space $L^p(G)$. Note that if $1 < p < \infty$, the Banach space $L^p(G)$ is reflexive. By [Con1, Theorem 4.2 p. 132] if $p < \infty$ and Alaoglu’s theorem if $p = \infty$ there exist a subnet $(T(b_i))$ of $(T(b_i))$ and $\mu \in L^p(G)$ such that the net $(T(b_i))$ converges to $\mu$ for the weak topology of $L^p(G)$ if $p < \infty$ and for the weak$^*$ topology of $L^\infty(G)$ if $p = \infty$, i.e. for any $x \in L^p(G)$ we have

$$
\langle T(b_i), z \rangle_{L^p(G), L^p(G)} \to \langle \mu, z \rangle_{L^p(G), L^p(G)}.
$$

Lemma 1.14 For any $x \in L^1(G)$, we have in $L^p(G)$

$$
T(x) = \lim_i (T(b_i) \ast x).
$$

Proof : For any $x \in L^1(G)$ and any $j$, we have

$$
\|T(x) - T(b_j) \ast x\|_{L^p(G)} \leq \|T(x) - T(b_j \ast x)\|_{L^p(G)}
$$

and for the complete boundedness of $T$ we have

$$
\|T(x) - T(b_j \ast x)\|_{L^p(G)} \leq \|T\|_{L^1(G) \to L^p(G)} \|x - b_j \ast x\|_{L^1(G)} \to 0.
$$

For any $x \in L^1(G)$ any $y \in L^p(G)$, we have

$$
\langle T(x), y \rangle_{L^p(G), L^p(G)} \leq \langle \lim_j T(b_j) \ast x, y \rangle_{L^p(G), L^p(G)}
$$

and for the complete boundedness of $T$ we have

$$
\langle T(b_j), x \ast y \rangle_{L^p(G), L^p(G)} \leq \lim_j \langle T(b_j), x \ast y \rangle_{L^p(G), L^p(G)}
$$

and for the complete boundedness of $T$ we have

$$
\langle \mu, x \ast y \rangle_{L^p(G), L^p(G)} \leq \langle \mu \ast x, y \rangle_{L^p(G), L^p(G)}.
$$

13
Proof (1.60) \[ \| T \|_{L^p(G) \to L^p(G)} \leq \liminf_j \| T(b_j) \|_{L^p(G)}. \]

Combined with (1.55), we obtain (1.54). The uniqueness is a consequence of the faithfulness of the convolution, i.e., by [HNR1, Proposition 1].

2. The proof is similar to the proof of the point 1.

3. Let \((L, R)\) be a bounded multiplier. Note that by [Daw1, Lemma 2.1], the map \(R : L^1(G) \to L^p(G)\) is a bounded right Fourier multiplier. Then by the point 2, there exists \(\mu \in L^p(G)\) such that \(R(x) = x \ast \mu\). For any \(x, y \in L^1(G)\), we have

\[
(1.60) \quad x \ast L(y) = R(x) \ast y = (x \ast \mu) \ast y = x \ast (\mu \ast y).
\]

Since the convolution \(\ast\) is faithful by [HNR1, Proposition 1], we deduce that for any \(y \in L^1(G)\) we have \(L(y) = \mu \ast y\). Conversely, for any \(x, y \in L^1(G)\), we have

\[
x \ast (\mu \ast y) = (x \ast \mu) \ast y.
\]

So by (1.9), the couple \((\mu \ast \cdot, \cdot \ast \mu)\) is a Fourier multiplier. The proof is complete.

\[ \tag*{\blacksquare} \]

**Remark 1.15** We did not try to extend (with the same ideas) this result to the case of locally compact quantum group. It is likely that some parts remains true at least in the case \(1 < p \leq 2\).

**Remark 1.16** The case \(p = 1\) is [HNR2, Proposition 3.1]. In the case of the group \(\mathbb{R}\), a similar result is stated by Hörmander in the classical paper [Hor1, Theorem 1.4]3.

**Remark 1.17** By the proof of Corollary 1.9, the surjective isometric map \(L^p(G) \to M^1_{L^p}(\mathbb{G})\), \(\mu \mapsto \mu \ast \cdot\) is completely contractive. It may be possible that this map is completely isometric. No attempt was made by the author.

Now, we justify the name “Fourier multipliers” of our multipliers. Of course, we have a similar result for right multipliers which is left to the reader.

**Proposition 1.18** Let \(G\) be a co-amenable compact quantum group of Kac type. Suppose \(1 < p \leq \infty\). Let \(T : L^1(G) \to L^p(G)\) be a linear transformation. Then \(T\) is a bounded left Fourier multiplier if and only if there exists a unique \(a \in \ell^\infty(\hat{G})\) such that

\[
(1.61) \quad \widehat{T(x)(\pi)} = a_x \widehat{x(\pi)}, \quad \pi \in \text{Irr}(G), x \in L^1(G).
\]

**Proof** : \(\Rightarrow\): By the first point of Theorem 1.13, there exists a unique \(\mu \in L^p(G)\) such that (1.52) is satisfied. Since the von Neuman algebra \(L^\infty(G)\) is finite we have the contractive inclusion \(L^p(G) \subset L^1(G)\). So note that by Proposition 1.1, the element \(a \overset{\text{def}}{=} \mathcal{\widehat{\mu}}\) belongs to \(\ell^\infty(\hat{G})\). Moreover, for any \(x \in L^1(G)\) and any \(\pi \in \text{Irr}(G)\), we have

\[
\widehat{T(x)(\pi)} = \mathcal{\widehat{\mu}} \ast \mathcal{\widehat{x(\pi)}} = \mathcal{\widehat{\mu(\pi)}\widehat{x(\pi)}} = a_x \widehat{x(\pi)}.
\]

3. We reproduce the complete proof here: “follows from the fact that \(L^{p'}\) is the dual space of \(L^p\) when \(p < \infty\).
We have obtained (1.61).
\[ \text{\textit{\textless;=} For any } x, y \in L^1(\mathbb{G}) \text{ and any } \pi \in \text{Irr}(\mathbb{G}), \text{ we have} \]
\[ (1.62) \quad \widehat{T(x \ast y)}(\pi) = \widehat{T(x)(\pi)\widehat{y}}(\pi) \overset{(1.61)}{=} a_{\pi \widehat{x}}(\pi)\widehat{y}(\pi) \overset{(1.23)}{=} a_{\pi \widehat{x}}(\pi) \overset{(1.61)}{=} \widehat{T(x \ast y)}(\pi) \]

Hence \( \widehat{T(x \ast y)} = \widehat{T(x \ast y)} \). By Proposition 1.1, we infer that \( T(x \ast y) = T(x \ast y) \). By (1.47), we deduce that \( T: L^1(\mathbb{G}) \rightarrow L^p(\mathbb{G}) \) is a left Fourier multiplier. It remains to show that this map is bounded. Suppose that \( (x_n) \) is a sequence of elements \( L^1(\mathbb{G}) \) converging to some element \( x \) of \( L^1(\mathbb{G}) \) and that the sequence \( (T(x_n)) \) converges to some \( y \) in \( L^p(\mathbb{G}) \). Using Proposition 1.1 in the second inequality and the last inequality (together with the contractive inclusion \( L^p(\mathbb{G}) \subset L^1(\mathbb{G}) \)), we obtain

\[
\left\| \widehat{T(x) - \widehat{y}} \right\|_{L^\infty(\mathbb{G})} \leq \left\| \widehat{T(x) - x_n} \right\|_{L^\infty(\mathbb{G})} + \left\| \widehat{T(x_n) - y} \right\|_{L^\infty(\mathbb{G})} \overset{(1.61)}{=} \left\| a_{\hat{x} - \hat{x}_n} \right\|_{L^\infty(\mathbb{G})} + \left\| T(x_n) - y \right\|_{L^1(\mathbb{G})} \\
\leq \left\| a \right\|_{L^\infty(\mathbb{G})} \left\| \hat{x} - \hat{x}_n \right\|_{L^\infty(\mathbb{G})} + \left\| T(x_n) - y \right\|_{L^p(G)} \\
\leq \left\| a \right\|_{L^\infty(\mathbb{G})} \left\| x_n - x \right\|_{L^1(G)} + \left\| y \right\|_{L^p(G)}.
\]

Passing to the limit, we infer that \( \widehat{T(x)} = \widehat{y} \), hence \( T(x) = y \) by the injectivity of the Fourier transform given by Proposition 1.1. By the closed graph theorem, we conclude that the operator \( T: L^1(\mathbb{G}) \rightarrow L^p(\mathbb{G}) \) is bounded.

The uniqueness is left to the reader. \( \square \)

**Definition 1.19** Let \( T: L^1(\mathbb{G}) \rightarrow L^p(\mathbb{G}) \) be a bounded left Fourier multiplier. The unique \( a \in L^\infty(\mathbb{G}) \) satisfying (1.61) is called the symbol of \( T \). Moreover, we let \( M_a := T \).

Let us state the particular case of co-commutative compact quantum groups. Here, we use the classical notations, e.g. see [ArK] for background. Note that the case \( p = 1 \) is well-known by the combination of [KaL1, Corollary 5.4.11. (ii)] and [ArK, Lemma 6.4].

**Corollary 1.20** Let \( G \) be an amenable discrete group. Suppose \( 1 \leq p \leq \infty \). Any bounded Fourier multiplier \( M_a: L^1(VN(G)) \rightarrow L^p(VN(G)) \) is completely bounded and we have

\[
\left\| M_a \right\|_{cb,L^1(VN(G)) \rightarrow L^p(VN(G))} = \left\| M_a \right\|_{L^1(VN(G)) \rightarrow \psi L_p(VN(G))}.
\]

**Remark 1.21** In the case \( p = \infty \), the description of finite supported completely bounded multipliers can be obtained on a (not necessarily amenable) discrete group \( G \) by an elementary argument using the isomorphism \( \Phi: VN(G) \otimes VN(G) \rightarrow CB(L^1(VN(G), VN(G))) \) from (1.27). Indeed let \( \varphi: G \rightarrow \mathbb{C} \) be a function with finite support. For any \( s, t \in G \) and any \( s \in G \), we have

\[
\Psi(\lambda_s \otimes \lambda_t)(\lambda_s) \overset{(1.27)}{=} \langle \lambda_s, \lambda_t \rangle_{VN(G), VN(G)} \lambda_s = \delta_{s\ast t} \lambda_s = M_{1_{\mathbb{C}}} (\lambda_t).
\]

15
Hence $\Psi(\lambda_s \otimes \lambda_s) = M_{1_{x_s}}$. So by linearity, we have $\Psi(\sum_{s \in G} \varphi_s \lambda_s \otimes \lambda_s) = M_\varphi$. Using the coproduct $\Delta : \text{VN}(G) \to \text{VN}(G) \otimes \text{VN}(G)$, $\lambda_s \mapsto \lambda_s \otimes \lambda_s$, note that

$$\left\| \sum_{s \in G} \varphi_s \lambda_s \otimes \lambda_s \right\|_{\text{VN}(G) \otimes \text{VN}(G)} \overset{(1.24)}{=} \left\| \Delta \left( \sum_{s \in G} \varphi_s \lambda_s \right) \right\|_{\text{VN}(G)} = \left\| \sum_{s \in G} \varphi_s \lambda_s \right\|_{\text{VN}(G)}.$$  

We conclude that

$$(1.63) \quad \left\| M_\varphi \right\|_{\text{cb}, L^1(\text{VN}(G) \to \text{VN}(G))} = \left\| \sum_{s \in G} \varphi_s \lambda_s \right\|_{\text{VN}(G)}.$$

In order to have an isometry $\mathfrak{M}^{1,\infty}_{\text{cb}}(G) = \text{VN}(G)$, it seems unavoidable to have a have some form of approximation on $G$. It is easy to check that the assumption “weakly amenable” suffices.

Now, we examine the case of Fourier multipliers from $L^1(\text{VN}(G))$ into $L^p(\text{VN}(G))$. We refer to [Jun2] for the definition of vector-valued noncommutative $L^p$-spaces $L^p(\mathcal{M}, E)$ in the case of a QWEP von Neumann algebra $\mathcal{M}$, which generalize the hyperfinite case of [Pis1]. Recall that

$$(1.64) \quad \| x \|_{L^\infty(\mathcal{M}, L^p(\mathcal{M}, E))} = \sup_{\| a \|_{L^p(\mathcal{M}, E)}, \| b \|_{L^p(\mathcal{M}, E)} \leq 1} \| (a \otimes 1) x (b \otimes 1) \|_{L^p(\mathcal{M}, E)}.$$

**Lemma 1.22** Suppose $2 \leq p < \infty$. Let $G$ be a discrete group. Suppose that $\text{VN}(G)$ has QWEP. The coproduct map induces an isometry $\Delta : L^p(\text{VN}(G)) \to L^\infty(\text{VN}(G), L^p(\text{VN}(G)))$.

**Proof**: Since $\Delta$ is a trace preserving normal injective $*$-homomorphism, it induces a (complete) isometry $\Delta : L^p(\text{VN}(G)) \to L^p(\text{VN}(G) \otimes \text{VN}(G))$. So for any $x \in \text{VN}(G)$, since the von Neumann algebra $\text{VN}(G)$ is finite, we have

$$\| \Delta(x) \|_{L^\infty(\text{VN}(G), L^p(\text{VN}(G)))} \geq \| \Delta(x) \|_{L^p(\text{VN}(G), L^p(\text{VN}(G)))} = \|x\|_{L^p(\text{VN}(G))}.$$

Now, we prove the reverse inequality. We start with the case $p = 2$. If $a, b$ belongs to the unit ball of $L^2(\text{VN}(G))$ and if $x = \sum_{s \in G} \alpha_s \lambda_s$ is an element of $\mathcal{P}_G$, we have

$$\| (a \otimes 1) \Delta(x) (b \otimes 1) \|_{L^2(\text{VN}(G) \otimes \text{VN}(G))} \overset{(1.24)}{=} \left\| (a \otimes 1) \left( \sum_{s \in G} \alpha_s \lambda_s \otimes \lambda_s \right) (b \otimes 1) \right\|_{L^2(\text{VN}(G) \otimes \text{VN}(G))} = \left\| \sum_{s \in G} \alpha_s a \lambda_s b \otimes \lambda_s \right\|_{L^2(\text{VN}(G) \otimes \text{VN}(G))}$$

$$\leq \left( \sum_{s \in G} \alpha_s^2 \| a \lambda_s b \|_{L^2(\text{VN}(G))}^2 \right)^{1/2} \overset{(1.15)}{\leq} \left( \sum_{s \in G} \alpha_s^2 \| a \|_{L^4(\text{VN}(G))}^2 \| \lambda_s \|_{L^4(\text{VN}(G))}^2 \| b \|_{L^4(\text{VN}(G))}^2 \right)^{1/2} \leq \left( \sum_{s \in G} \alpha_s^2 \right)^{1/2} \|a\|_{L^4(\text{VN}(G))} \|b\|_{L^4(\text{VN}(G))} \overset{\text{by (1.64)}}{\leq} \left\| \sum_{s \in G} \alpha_s \lambda_s \right\|_{L^2(\text{VN}(G))} = \|x\|_{L^2(\text{VN}(G))}.$$

Passing to the supremum on $a$ and $b$, we obtain by (1.64)

$$\| \Delta(x) \|_{L^\infty(\text{VN}(G), L^2(\text{VN}(G)))} \leq \|x\|_{L^2(\text{VN}(G))}.$$
So we have a contractive map $\Delta : L^2(\text{VN}(G)) \rightarrow L^\infty(\text{VN}(G), L^2(\text{VN}(G)))$. Recall that by [BLM, Proposition 1.2.4] the $\ast$-homomorphism $\Delta : \text{VN}(G) \rightarrow \text{VN}(G) \otimes \text{VN}(G)$ is completely contractive. We conclude by interpolation that $\Delta$ induces a contraction $\Delta : L^p(\text{VN}(G)) \rightarrow L^\infty(\text{VN}(G), L^p(\text{VN}(G)))$. 

**Remark 1.23** We can also write in the case of a positive element $x = \sum \alpha_s \lambda_s$ of $\mathcal{P}_G$, we have

$$\|\Delta(x)\|_{L^\infty(\text{VN}(G), L^1(\text{VN}(G)))} \overset{(1.33)}{=} \|(\text{Id} \otimes \tau)(\Delta(x))\|_{\text{VN}(G)} = \left\| (\text{Id} \otimes \tau)\left( \Delta\left( \sum_s \alpha_s \lambda_s \right) \right) \right\|_{\text{VN}(G)}$$

$$\overset{(1.24)}{=} \left\| \sum_s \alpha_s (\text{Id} \otimes \tau)(\lambda_s \otimes \lambda_s) \right\|_{\text{VN}(G)} = \left\| \sum_s \alpha_s \tau(\lambda_s) \lambda_s \right\|_{\text{VN}(G)} = \|\alpha \lambda_e\|_{\text{VN}(G)}.$$ 

Probably, this inequality is true for non positive elements (maybe by a factorization argument). In this case, by interpolation we could conclude that Lemma 1.22 is also true for $1 \leq p \leq 2$. But at the time of writing, we does not have a rigorous argument. So we content with an isomorphism $\Delta : L^p(\text{VN}(G)) \rightarrow L^\infty(\text{VN}(G), L^p(\text{VN}(G)))$ with a constant $4$ obtained by decomposing in a linear combination of four positive elements.

Now, we give another proof of a part of Theorem 1.13.

**Proposition 1.24** Let $G$ be an amenable discrete group. Suppose $2 \leq p \leq \infty$. For any function $\varphi : G \rightarrow \mathbb{C}$ with finite support, we have

$$\|M_{\varphi}\|_{\text{cb}, L^1(\text{VN}(G)) \rightarrow L^p(\text{VN}(G))} = \left\| \sum_{s \in G} \varphi_s \lambda_s \right\|_{L^p(\text{VN}(G))}.$$ 

Moreover, we have an isometry

$$\mathfrak{M}^{1-p}_{\text{cb}}(G) = L^p(\text{VN}(G)).$$

**Proof** : We have an isometry $L^\infty(\text{VN}(G), L^p(\text{VN}(G))) \overset{(1.32)}{=} \text{VN}(G) \otimes_{\min} L^p(\text{VN}(G)) \overset{(1.73)}{\hookrightarrow} \text{CB}(L^1(\text{VN}(G)), L^p(\text{VN}(G)))$ which maps $\Delta(\sum_s \varphi(s) \lambda_s) \overset{(1.24)}{=} \sum_s \varphi(s) \lambda_s \otimes \lambda_s$ on $M_{\varphi}$. The first part is a consequence of Lemma 1.22. For the second part, it suffices to use an obvious approximation argument using the discussion of [ArK2, page 25] concerning the property CCAP of the operator space $L^p(\text{VN}(G))$.

**Remark 1.25** If $G$ is a weakly amenable discrete group we believe that it should be possible to adapt the proof of Proposition 1.24. The difficulty is that the paper [Jun2] introducing vector-valued noncommutative $L^p$-spaces $L^p(M, E)$ in the case of a QWEP von Neumann algebra is not definitively finished, so the first isometry of the proof of Proposition 1.24 is unclear.

**Remark 1.26** In a subsequent publication, we will give an example of bounded Fourier multiplier on the free group $\mathbb{F}_n$ from $L^1(\text{VN}(\mathbb{F}_n))$ into $L^p(\text{VN}(\mathbb{F}_n))$ which is not completely bounded.

Now, we return to the general case. A simple duality argument gives the following result.

**Theorem 1.27** Let $\mathbb{G}$ be a co-amenable compact quantum group of Kac type. Suppose $1 \leq p < \infty$. 

17
1. A map $T : L^p(G) \to L^\infty(G)$ is a bounded left Fourier multiplier if and only if there exists $\mu \in L^{\infty}(G)$ such that

$$T(x) = \mu \ast x, \quad x \in L^p(G).$$

2. A map $T : L^p(G) \to L^\infty(G)$ is a bounded right Fourier multiplier if and only if there exists $\mu \in L^{\infty}(G)$ such that

$$T(x) = x \ast \mu, \quad x \in L^p(G).$$

In the situation of the point 1 or the point 2, $\mu$ is unique and we have

$$\|\mu\|_{L^{\infty}(G)} = \|T\|_{cb,L^p(G) \to L^\infty(G)} = \|T\|_{L^p(G) \to L^\infty(G)}.$$

Proof: 1. $\Rightarrow$: Suppose that there exists $\mu \in L^{\infty}(G)$ such that (1.66) is satisfied. By the point 2 of Theorem 1.13, we have a completely bounded operator $R : L^1(G) \to L^{p'}(G)$, $y \mapsto y \ast \mu$. For any $x \in L^p(G)$ and any $y \in L^1(G)$, we have

$$\langle R(y), x \rangle_{L^p(G),L^{p'}(G)} = \langle y \ast \mu, x \rangle_{L^{p'}(G),L^p(G)} \overset{\text{(1.49)}}{=} \langle y, \mu \ast x \rangle_{L^p(G),L^{p'}(G)}.$$

By [ER, Proposition 3.2.2], if $p > 1$ we infer that $T : L^p(G) \to L^\infty(G)$, $x \mapsto \mu \ast x$ is a well-defined completely bounded map satisfying (1.68). If $p = 1$, it is easy to adapt the argument.

$\Leftarrow$: Suppose that $T : L^p(G) \to L^\infty(G)$ is a bounded left Fourier multiplier. If $p > 1$, since $L^p(G)$ is reflexive, it is apparent e.g. from [Daw1, Lemma 10.1 (3)] that $T$ is weak* continuous. So we can consider the preadjoint $T_\ast : L^1(G) \to L^{p'}(G)$ on $L^1(G)$ of $T$ (if $p = 1$ consider the restriction on $L^1(G)$ of the adjoint of $T$ instead of $T_\ast$). For any $x \in L^p(G)$ and any $y, z \in L^1(G)$ we have

$$\langle x, T_\ast(z \ast y) \rangle_{L^p(G),L^{p'}(G)} = \langle T(x), z \ast y \rangle_{L^\infty(G),L^1(G)} \overset{\text{(1.11)}}{=} \langle T(x \ast z), y \rangle_{L^\infty(G),L^1(G)} = \langle x \ast z, T_\ast(y) \rangle_{L^p(G),L^{p'}(G)} \overset{\text{(1.49)}}{=} \langle x, z \ast T_\ast(y) \rangle_{L^p(G),L^{p'}(G)}.$$

Hence for any $y, z \in L^1(G)$ we deduce that

$$T_\ast(z \ast y) = z \ast T_\ast(y).$$

Consequently by (1.12) the operator $T_\ast : L^1(G) \to L^{p'}(G)$ is a bounded right multiplier. We infer by the second point of Theorem 1.13 that there exists a unique $\mu \in L^{\infty}(G)$ such that $T_\ast(y) = y \ast \mu$ for any $y \in L^1(G)$. For any $x \in L^p(G)$ and any $y \in L^1(G)$, we obtain

$$\langle T(x), y \rangle_{L^\infty(G),L^1(G)} = \langle x, T_\ast(y) \rangle_{L^p(G),L^{p'}(G)} = \langle x, y \ast \mu \rangle_{L^p(G),L^{p'}(G)} = \langle \mu \ast x, y \rangle_{L^\infty(G),L^1(G)}.$$

Therefore $T(x) = \mu \ast x$ for any $x \in L^p(G)$.

2. The proof is similar to the proof of the point 1.

The other assertions are very easy and left to the reader.

\begin{definition}
Let $T : L^p(G) \to L^\infty(G)$ be a bounded left Fourier multiplier. We say that the element $a \overset{\text{def}}{=} \hat{\mu}$ of $\ell^\infty(G)$ is the symbol of $T$. We let $M_a \overset{\text{def}}{=} T$.
\end{definition}
1.4 Bounded versus completely bounded operators from $L^1(\mathcal{M})$ into $L^p(\mathcal{M})$

In this section, we prove Theorem 1.31 that in general the bounded norm and the completely bounded norm are different for operator from $L^1(\mathcal{M})$ into $L^p(\mathcal{M})$ where $\mathcal{M}$ is a semifinite von Neumann algebra in sharp contrast with the case of Fourier multipliers on co-amenable compact quantum groups of Kac type. This result in the case $p = \infty$ can be seen as a von Neumann algebra generalization of [Los1] (see also [KaL1, pp. 118-120]). See also [HuT1], [Osa1] [Smi2] for strongly related papers.

Recall that if $T: X \to Y$ is a bounded operator between Banach spaces we have by [ER, (A.2.3) p. 333]:

\[(1.69) \quad T \text{ is a quotient mapping } \iff T^* \text{ is an isometry.}\]

Recall that a C*-algebra $A$ is $n$-subhomogeneous [BrO1, Definition 2.7.6] if all its irreducible representations have dimension at most $n$ and subhomogeneous if $A$ is $n$-subhomogeneous for some $n$. It is known, e.g. [ShU1, Lemma 2.4], that a von Neumann algebra $\mathcal{M}$ is $n$-subhomogeneous if and only if there exist some distinct integers $n_1, \ldots, n_k \leq n$, some abelian von Neumann algebras $A_i \neq \{0\}$ and a $*$-isomorphism

\[(1.70) \quad \mathcal{M} = M_{n_1}(A_1) \oplus \cdots \oplus M_{n_k}(A_k).\]

The following generalize [LeZ1, Lemma 2.3]. Note that the proof is simpler in the case where $\mathcal{M}$ is finite since in this case we have an inclusion $\mathcal{M} \subset L^1(\mathcal{M})$.

**Proposition 1.29** Let $\mathcal{M}$ be a semifinite von Neumann algebra equipped with a normal semifinite faithful trace $\tau$. Suppose that $\mathcal{M}$ is not $n$-subhomogeneous. There exists a non zero $*$-homomorphism $\gamma: M_{n+1}^+ \to \mathcal{M}$ valued in $\mathcal{M} \cap L^1(\mathcal{M})$.

**Proof**: By [Tak1, Section V], we can consider the direct sum decomposition $\mathcal{M} = \mathcal{M}_I \oplus \mathcal{M}_{II}$ of $\mathcal{M}$ into a type I summand $\mathcal{M}_I$ and a type II summand $\mathcal{M}_{II}$.

Assume that $\mathcal{M}_{II} \neq \{0\}$. According to [KaR2, Lemma 6.5.6], there exist $n+1$ equivalent mutually orthogonal projections $e_1, \ldots, e_{n+1}$ in $\mathcal{M}_{II}$ such that $e_1 + \cdots + e_{n+1} = 1$. Then by [Tak1, Proposition V.1.22] and its proof, we have a $*$-isomorphism $\mathcal{M}_{II} = M_{n+1}^+ \otimes (e_1 \mathcal{M}_{II} e_1)$. Let $f$ be a non zero projection of $e_1 \mathcal{M}_{II} e_1$ with finite trace. For any positive matrix $x \in M_{n+1}$, we have

\[\tau_{\mathcal{M}_{II}}(x \otimes f) = (\text{Tr} \otimes \tau_{e_1 \mathcal{M}_{II} e_1})(x \otimes f) = \text{Tr}(x)\tau_{e_1 \mathcal{M}_{II} e_1}(f) < \infty.\]

Hence the mapping $\gamma: M_{n+1}^+ \to \mathcal{M}_{II} \subset \mathcal{M}$, $x \mapsto x \otimes f$ is a non zero $*$-homomorphism taking values in $L^1(\mathcal{M})$.

If $\mathcal{M}_{II} = \{0\}$, then $\mathcal{M} = \mathcal{M}_I$ is of type I. Since $\mathcal{M}$ is not subhomogeneous, it follows from the structure result (1.70) and [Tak1, Theorem V.1.27 p. 299] that there exists a Hilbert space $H$ with $\dim(H) \geq n+1$ and an abelian von Neumann algebra $A$ such that $\mathcal{M}$ contains $B(H) \otimes A$ as a summand. Let $e \in B(H)$ be a rank one projection and define $\tau_A: A_+ \to [0, \infty]$ by

\[\tau_A(z) \overset{\text{def}}{=} \tau_{\mathcal{M}}(e \otimes z).\]

Then $\tau_A$ is a normal semifinite faithful trace and $\tau_{\mathcal{M}}$ coincides with $\text{Tr} \otimes \tau_A$ on $B(H)_+ \otimes A_+$. Let $f \in A$ be a non zero projection with finite trace. For any finite rank $a \in B(H)_+$, it follows from above that

\[\tau_{\mathcal{M}}(a \otimes f) < \infty.\]
Now let \((e_1, \ldots, e_{n+1})\) be an orthonormal family in \(H\). Then the mapping \(\gamma: M_{n+1} \to M_H, \quad [a_{ij}] \mapsto \sum_{i,j=1}^{n+1} a_{ij} e_i \otimes e_j f\) is a non zero \(\ast\)-homomorphism and the restriction of \(\tau_M\) to the positive part of its range is finite. Hence \(\gamma\) is valued in \(L^1(M)\). 

Below, \(\otimes_\varepsilon\) denotes the injective tensor product of [Rya1, Chapter 3], \(\hat{\otimes}\) is the projective tensor product of [Rya1, Chapter 2], \(\otimes\) denotes the operator space projective tensor product. Moreover \(C_n\) and \(R_n\) denotes a Hilbert column space or a Hilbert row space of dimension \(n\) defined in [BLM, 1.2.23]. For any \(z \in X \otimes Y\), we recall that 

\[
\|z\|_{X \otimes_\varepsilon Y} \overset{\text{def}}{=} \sup \{ \| (z, x') \otimes y' \| : \| x' \|_{X^*} \leq 1, \| y' \|_{Y^*} \leq 1 \}.
\]

For any Banach spaces \(X\) and \(Y\) and any operator space \(E\) and \(F\), we have isometries 

\[
(X \hat{\otimes} Y)^* = B(X, Y^*) \quad \text{and} \quad (E \hat{\otimes} F)^* = CB(E, F^*).
\]

Moreover, recall the isometry 

\[
E \otimes_{\min} F \subset CB(E, F).
\]

The following lemma is stated in the case \(p = \infty\) in [Los1] with a more complicated proof.

**Lemma 1.30** Let \(n \geq 1\) be an integer. Suppose \(1 \leq p \leq \infty\). The canonical map \(\Phi_{n, p}: M_n \otimes_{\min} S_p^n \to M_n \otimes_\varepsilon S_p^n, x \otimes y \to x \otimes y\) is bijective and satisfies 

\[
\|\Phi_{n, p}^{-1}\| \geq n^{1 - \frac{1}{p}}.
\]

**Proof**: Note that using [Pis2, Corollary 2.7.7] in the second equality, we have isometrically 

\[
(1.74) \quad C_n \otimes_{\min} C_p^n = C_n \otimes_{\min} (C_n, R_n)_{\hat{\otimes}} = (C_n \otimes_{\min} C_n, C_n \otimes_{\min} R_n)_{\hat{\otimes}} = (S_n, S_n^\infty)_{\hat{\otimes}} = S_{2p}^2.
\]

We deduce that 

\[
\left\| \sum_{i=1}^{n} e_i \otimes e_i \right\|_{M_n \otimes_{\min} S_p^n} = \left\| \sum_{i=1}^{n} e_i \otimes e_i \right\|_{C_n \otimes_{\min} C_p^n} = \|I_n\|_{S_{2p}^2} \overset{(1.74)}{=} n^{1 - \frac{1}{p}}.
\]

On the other hand, using the injectivity property [DeF, Proposition 4.3] of \(\otimes_\varepsilon\) in the first equality, and the Cauchy-Schwarz inequality we have 

\[
\left\| \sum_{i=1}^{n} e_i \otimes e_i \right\|_{M_n \otimes_\varepsilon S_p^n} = \left\| \sum_{i=1}^{n} e_i \otimes e_i \right\|_{\ell_2 \otimes_\varepsilon \ell_2} \overset{(1.71)}{=} \sup \left\{ \left\| \sum_{i=1}^{n} y_i z_i \right\|_{\ell_2} : \| y_i \|_{\ell_2} \leq 1, \| z_i \|_{\ell_2} \leq 1 \right\} \leq 1.
\]

With this lemma, we can prove the following result.

**Theorem 1.31** Let \(M\) be a semifinite von Neumann algebra. Suppose \(1 \leq p \leq \infty\). The following are equivalent.

1. The canonical map \(\Theta: CB(L^1(M), L^p(M)) \to B(L^1(M), L^p(M))\) is an isomorphism.

2. \(M\) is subhomogeneous (in particular \(M\) is of type I).

In this case, if \(C\) is a positive constant such that \(\|T\|_{L^1(M) \to L^p(M)} \geq C \|T\|_{cb, L^1(M) \to L^p(M)}\) for any completely bounded map \(T: L^1(M) \to L^p(M)\) then \(M\) is \(\left(\frac{1}{C}\right)^{2p\over 1+p}\)-subhomogeneous.
Proof: Recall that we have canonical isometries
\[ \text{CB}(L^1(M), L^p(M)) \] and \[ B(L^1(M), L^p(M)) \] for any \( z \in \text{CB}(L^1(M), L^p(M)). \)

1. \( \Rightarrow \) 2: Suppose that there exists a constant \( C > 0 \) such that
\[
\| x \|_{M \otimes L^p(M)} \leq C \| x \|_{(M \otimes L^p(M))}, \quad x \in \text{CB}(L^1(M), L^p(M)).
\]

We define \( n \mid (\frac{1}{Z}) \frac{2}{Z} = + 1 \). We have \( (\frac{1}{Z}) \frac{2}{Z} < \mid (\frac{1}{Z}) \frac{2}{Z} \mid + 1 = n \). Hence
\[
\frac{1}{C} < \frac{n}{Z} = n^{1- \frac{1}{Z}}.
\]

Suppose that \( M \) is not \( \mid (\frac{1}{Z}) \frac{2}{Z} \)-subhomogeneous. By Proposition 1.29, there exists a non zero \( * \)-homomorphism \( \gamma: \mathcal{M}_n \rightarrow M \) taking values in \( M \cap L^1(M) \). Let \( \gamma' = \gamma: \mathcal{M}_n \rightarrow \mathbb{C} \). Then \( \gamma' \) is a non zero trace on the factor \( \mathcal{M}_n \) hence there exists \( k > 0 \) such that \( \gamma' = k \text{Tr} \).

We deduce a complete isometry \( J_p \triangledown \mathcal{M}_n \rightarrow M \cap L^1(M) \). Let \( \tau = \gamma: \mathcal{M}_n \rightarrow \mathbb{C} \). Then \( \tau' \) is a non zero trace on the factor \( \mathcal{M}_n \) hence there exists \( k > 0 \) such that \( \tau' = k \text{Tr} \).

We deduce a complete isometry \( J_p \triangledown \mathcal{M}_n \rightarrow M \cap L^1(M) \). Since \( \mathcal{M}_n \) is finite-dimensional, the map \( J_p \triangledown \mathcal{M}_n \) is weak* continuous in the case \( p = \infty \). The canonical embedding of \( J_p \triangledown \mathcal{M}_n \rightarrow \mathcal{M}_n \cap L^1(M) \) is an (complete) isometry. By (1.69), the predual map \( (J_p)\ast: L^p(M) \rightarrow S_p^\ast \) is a quotient map. By [Ryn1, Proposition 2.5], we deduce that the tensor product \( (J_p)\ast \otimes (J_p)\ast: \mathcal{M}_n \cap L^p(M) \rightarrow S_n^\ast \otimes S_n^\ast \) is also a quotient map. From (1.69), we obtain that the dual map
\[
((J_p)\ast \otimes (J_p)\ast)\ast: (S_n^\ast \otimes S_n^\ast )^\ast \rightarrow (\mathcal{M}_n \cap L^p(M))^\ast
\]
is an isometry.

Now, we will show that the following diagram commutes where \( j \) is defined by (1.73):

\[
\begin{array}{ccc}
M_n \otimes \text{min} S_p^n & \xrightarrow{j} & \text{CB}(L^1(M), L^p(M))^\ast \\
\downarrow J_p \otimes \Phi_n,p & & \uparrow \Theta \\
\mathcal{M} \otimes \text{min} L^p(M) & & (J_p)\ast \otimes (J_p)\ast
\end{array}
\]

For any \( x \in M_n \) and any \( y \in S_p^n \), we have
\[
\Theta \circ j \circ (J_p \otimes J_p)(x \otimes y) = \Theta \circ j(J_p \otimes J_p)(y) = \Theta \circ (J_p \otimes J_p)(x \otimes y) = \Theta \circ ((J_p)\ast \otimes (J_p)\ast)(x \otimes y)
\]
and
\[
((J_p)\ast \otimes (J_p)\ast)\ast \Phi_n,p(x \otimes y) = ((J_p)\ast \otimes (J_p)\ast)(x \otimes y) = \langle x, (J_p)\ast \otimes (J_p)\ast \rangle_{M_n,S_n^\ast}(y, (J_p)\ast \otimes (J_p)\ast)
\]
For any \( z \in M \otimes L^p(M) \), we deduce that
\[
\| \Phi_n,p(z) \|_{M_n \otimes S_p^n} = \| ((J_p)\ast \otimes (J_p)\ast)\ast \Phi_n,p(z) \|_{(M_n \otimes L^p(M))^\ast} = \| \Theta \circ j(J_p \otimes J_p)(z) \|_{(M_n \otimes L^p(M))^\ast} \\
\overset{(1.75)}{=} C \| j(J_p \otimes J_p)(z) \|_{M_n \otimes L^p(M)} = C \| z \|_{M_n \otimes L^p(M)}.
\]
So

\[ \| \Phi_{n,p}^{-1}(z) \|_{\text{min} \otimes s_n} \leq \frac{1}{C} \| z \|_{\text{min} \otimes s_n} \]

We deduce that \( \| \Phi_{n,p}^{-1} \|_{M_n \otimes s_n \to M_n \otimes s_n} \leq \frac{1}{C} \). By Lemma 1.30, we obtain \( n^{1 - \frac{1}{p}} \leq \frac{1}{C} \). It is impossible by (1.76).

2. \( \Rightarrow 1 \): It is not difficult with (1.70) and left to the reader.

**Remark 1.32** Let \( G \) be a discrete group. It is known by [Kan1] and [Smi1, Theorem 2] that the von Neumann algebra \( \text{VN}(G) \) is of type I if and only if \( G \) is virtually abelian, i.e. \( G \) has an abelian subgroup of finite index. We deduce that if the von Neumann \( \text{VN}(G) \) satisfies the equivalent properties of Theorem 1.31, then \( G \) is virtually abelian. We will show the converse somewhere and will examine the case of locally compact groups.

**Remark 1.33** We can generalize almost verbatim the result to the case of maps from \( L^q(M) \) into \( L^p(M) \) using a folklore generalization of (1.74).

**Remark 1.34** For the type III case, we can use a completely isometric version of [PiX, Theorem 3.5] combined with Theorem 1.31 in the case of the unique separable hyperfinite factor of type II$_1$.

**Corollary 1.35** Let \( M \) be a semifinite von Neumann algebra. Suppose \( 1 < p < \infty \). The following are equivalent.

1. The canonical map \( \text{CB}(L^1(M), L^p(M)) \to B(L^1(M), L^p(M)) \) is an isometry.

2. \( M \) is abelian.

**Proof** : 2. \( \Rightarrow 1 \): Suppose that the von Neumann algebra \( M \) is abelian. In this case, we have by [Pis2, page 72] a complete isometry \( L^1(M) = \max L^1(M) \). Then the point 1 is a consequence of (1.28).

1. \( \Rightarrow 2 \): This is a consequence of Theorem 1.31.

A direct consequence is the following corollary.

**Corollary 1.36** Let \( G \) be a locally compact group. The following are equivalent.

1. We have a canonical isometry \( \text{CB}(L^1(\text{VN}(G)), \text{VN}(G)) = B(L^1(\text{VN}(G)), \text{VN}(G)) \).

2. The group \( G \) is abelian.

We close this Section by investigating the Schur multipliers from the Schatten trace class \( S^1_I \) into the space \( B(\ell^2_I) \) of bounded operators on the Hilbert space \( \ell^2_I \) where \( I \) is an index set. We will observe that there exists bounded Schur multipliers which are not completely bounded in sharp contrast with the case \( p = \infty \) of Theorem 1.13 of co-amenable quantum groups. Note that it is well-known that bounded Schur multipliers \( M_A : S^1_I \to S^1_J, x \mapsto [a_{ij} x_{ij}] \) are necessarily completely bounded with the same completely bounded norm than the operator norm.

**Proposition 1.37** Let \( I \) be an infinite index set. There exists a bounded Schur multiplier from \( S^1_I \) into \( B(\ell^2_I) \) which is not completely bounded.
Suppose Lemma 1.38. We first show that a $I \times I$ matrix $A$ induces a completely bounded Schur multiplier $MA: S^1_1 \to B(\ell^2_I)$ if and only if $A \in B(\ell^2_I)$. In this case, we have
\[
\|MA\|_{cb,S^1_1 \to B(\ell^2_I)} = \|A\|_{B(\ell^2_I)}.
\]
Using the matrix $T_J(A)$ obtained from $A$ by setting each entry to zero if its row and column index are not both in a finite subset $J$ of $I$, we can suppose by approximation that $A$ has finite support. Indeed, if $A \in B(\ell^2_I)$ then by [BLM, Corollary 1.6.3] the net $(T_J(A))$ converges to the weak* topology of $B(\ell^2_I)$. We will use the isometric isomorphism $\Phi: B(\ell^2_I) \otimes B(\ell^2_I) \to CB(S^1_1, B(\ell^2_I))$ from (1.27). For any $i, j, k, l \in I$, we have
\[
\Psi(e_{ij} \otimes e_{kl})(e_{kl}) = \delta_{i=k}\delta_{j=l} = M_{e_{ij}}(e_{kl}).
\]
Hence $\Psi(e_{ij} \otimes e_{kl}) = M_{e_{ij}}$. So by linearity, we have $\Psi(\sum_{i,j} a_{ij} e_{ij} \otimes e_{ij}) = MA$. Using the map $\Delta: B(\ell^2_I) \to B(\ell^2_I) \otimes B(\ell^2_I)$, $e_{ij} \mapsto e_{ij} \otimes e_{ij}$ which is a normal injective $*$-homomorphism, note that
\[
\left\| \sum_{i,j} a_{ij} e_{ij} \otimes e_{ij} \right\|_{B(\ell^2_I) \otimes B(\ell^2_I)} = \left\| \Delta \left( \sum_{i,j} a_{ij} e_{ij} \right) \right\|_{B(\ell^2_I)} = \left\| \sum_{i,j} a_{ij} e_{ij} \right\|_{B(\ell^2_I)} = \|A\|_{B(\ell^2_I)}.
\]
So we obtain (1.77).

The matrix $A = [a_{ij}]$ defined by $a_{ij} = 1$ for any $i, j \in I$ induces a bounded Schur multiplier $MA: S^1_1 \to B(\ell^2_I)$ since we have a contractive inclusion $S^1_1 \subset B(\ell^2_I)$. It is not completely bounded since the matrix $A$ does not induces a bounded operator on $\ell^2_I$.

1.5 $\ell^p(S^p_d)$-summing Fourier multipliers on $L^\infty(G)$

Suppose $1 \leq p < \infty$ and let $d \geq 1$ be an integer. Let $E, F$ be operator spaces and let $T: E \to F$ be a linear map. We say that $T$ is $\ell^p(S^p_d)$-summing [Pis1, page 58] if $T$ induces a bounded map $\Id_{\ell^p(S^p_d)} \otimes T: \ell^p(S^p_d) \otimes \min E \to \ell^p(S^p_d(F))$. In this case, we let
\[
\|T\|_{\pi_p,d,E \to F} \overset{def}{=} \|\Id_{\ell^p(S^p_d)} \otimes T\|_{\ell^p(S^p_d) \otimes \min E \to \ell^p(S^p_d(F))}.
\]
If $d = \infty$, recall that the $\ell^p(S^p_d)$-summing maps coincide with the completely $p$-summing maps and we have
\[
\|T\|_{\pi_p,\infty,E \to F} = \|T\|_{\pi_p,d,E \to F}.
\]
If $T: E \to F$ is a $\ell^p(S^p_d)$-summing map, then by considering a tensor $e_i \otimes e_j \otimes x$, it is (really) not difficult to check that $T$ is bounded and that
\[
\|T\|_{E \to F} \leq \|T\|_{\pi_p,d,E \to F}.
\]
We need the following easy lemma.

**Lemma 1.38** Suppose $1 \leq p < \infty$ and let $d \geq 1$ be an integer. Let $E, F, G, H$ be operator spaces. Let $T: E \to F$ be a $\ell^p(S^p_d)$-summing map. If $R: F \to G$ and $S: H \to E$ are completely bounded then $RTS$ is $\ell^p(S^p_d)$-summing and we have
\[
\|RTS\|_{\pi_p,d,H \to G} \leq \|R\|_{cb,F \to G} \|T\|_{\pi_p,d,E \to F} \|S\|_{cb,H \to E}
\]
Proof: By [ER, Proposition 8.1.5], we have a well-defined (completely bounded) bounded map \( \text{Id}_{\ell^p(S^n_\ell^p)} \otimes S: \ell^p(S^n_\ell^p) \otimes_{\min} H \to \ell^p(S^n_\ell^p) \otimes_{\min} E \) with

\[
\|\text{Id}_{\ell^p(S^n_\ell^p)} \otimes S\|_{\ell^p(S^n_\ell^p) \otimes_{\min} H \to \ell^p(S^n_\ell^p) \otimes_{\min} E} \leq \|S\|_{\text{cb}, H \to E}.
\]

Since \( T: E \to F \) is a \( \ell^p(S^n_\ell^p) \)-summing map, we have by definition a well-defined bounded map \( \text{Id}_{\ell^p(S^n_\ell^p)} \otimes T: \ell^p(S^n_\ell^p) \otimes_{\min} E \to \ell^p(S^n_\ell^p(F)). \) Moreover, we have

\[
\|\text{Id}_{\ell^p(S^n_\ell^p)} \otimes R\|_{\ell^p(S^n_\ell^p(F)) \to \ell^p(S^n_\ell^p(G))} \leq \| R\|_{\text{cb}, F \to G}.
\]

We obtain the result by composition.

The following proposition gives a crucial example of \( \ell^p(S^n_\ell^p) \)-summing map.

**Proposition 1.39** Suppose \( 1 < p < \infty \) and \( d \geq 1 \) be an integer. If \( M \) is a hyperfinite finite von Neumann algebra equipped with a normal finite faithful trace then the canonical inclusion \( i_p: M \to L^p(M) \) is \( \ell^p(S^n_\ell^p) \)-summing and

\[
\|i_p\|_{\tau_p,d,M \to L^p(M)} = (\tau_M(1))^{\frac{1}{p}}.
\]

**Proof:** We can suppose that \( \tau_M(1) = 1 \). Recall that if \( E \) is an operator space, we have by [Pis1, page 37] a contractive inclusion \( M \otimes_{\min} E \hookrightarrow L^1(M, E) \). Moreover, we have \( \ell^p(M, E) = (M \otimes_{\min} E, L^1(M, E))_p \) by definition. By [Jun1, Proposition 2.4], we deduce a contractive inclusion \( M \otimes_{\min} E \hookrightarrow L^p(M, E) \). Taking \( E = \ell^p(S^n_\ell^p) \) and using [Pis1, (3.6)] in the last equality, we obtain a contractive inclusion

\[
\ell^p(S^n_\ell^p) \otimes_{\min} M \cong M \otimes_{\min} \ell^p(S^n_\ell^p) \rightarrow L^p(M, \ell^p(S^n_\ell^p)) \cong \ell^p(S^n_\ell^p(L^p(M))).
\]

We conclude by (1.78) that the map \( i_p: M \to L^p(M) \) is \( \ell^p(S^n_\ell^p) \)-summing with the estimate \( \|i_p\|_{\tau_p,d,M \to L^p(M)} \leq 1 \). Note that \( \|L^p(M)\| = 1 \). Since \( \|i_p\|_{\tau_p,d,M \to L^p(M)} \geq \|i_p\|_{M \to L^p(M)} \) by Lemma 1.38, we obtain the reverse inequality.

**Remark 1.40** If \( F_n \) is the free group with \( n \) generators where \( n \geq 2 \) is an integer then by [Jun3, Remark 3.2.2.5], the canonical contractive inclusion \( i_p: \text{VN}(F_n) \hookrightarrow L^p(\text{VN}(F_n)) \) is not completely \( p \)-summing, i.e. is not \( \ell^p(S^n_\ell^p) \)-summing. So the hyperfiniteness assumption in Proposition 1.39 cannot be removed.

**Proposition 1.41** Let \( G \) be a co-amenable compact quantum group of Kac type. Let \( a \) be a element of \( \ell^\infty(\hat{G}) \). Suppose \( \ell \leq p < \infty \). If \( a \) induces a completely bounded left Fourier multiplier \( M_a: L^p(\mathbb{G}) \to L^\infty(\mathbb{G}) \) then \( a \) induces \( \ell^p(S^n_\ell^p) \)-summing left Fourier multiplier \( M_a: L^\infty(\mathbb{G}) \to L^\infty(\mathbb{G}) \). In this case, we have

\[
\|M_a\|_{\tau_p,d,L^\infty(\hat{G}) \to L^\infty(\hat{G})} \leq \|M_a\|_{\text{cb},L^p(\hat{G}) \to L^\infty(\hat{G})}.
\]

**Proof:** Suppose that \( a \) induces a completely bounded Fourier multiplier \( M_a: L^p(\mathbb{G}) \to L^\infty(\mathbb{G}) \). Since \( G \) is co-amenable, by [BeT1, Theorem 3.1] the convolution algebra \( L^1(\mathbb{G}) \) has a bounded approximate identity. By [Run1, Theorem 4.5], we infer that the finite von Neumann algebra \( L^\infty(\mathbb{G}) \) is hyperfinite. By Proposition 1.39, the map \( i_p: L^\infty(\mathbb{G}) \hookrightarrow L^p(\mathbb{G}) \) is \( \ell^p(S^n_\ell^p) \)-summing and the norm is \( \|i_p\|_{\tau_p,d,L^\infty(\hat{G}) \to L^p(\hat{G})} = 1 \). By considering the composition

\[
L^\infty(\mathbb{G}) \overset{i_p}{\hookrightarrow} L^p(\mathbb{G}) \overset{M_a}{\to} L^\infty(\mathbb{G})
\]

we obtain

\[
\|M_a\|_{\tau_p,d,L^\infty(\hat{G}) \to L^\infty(\hat{G})} \leq \|M_a\|_{\text{cb},L^p(\hat{G}) \to L^\infty(\hat{G})}.
\]

we deduce by the ideal property (1.81) that $M_{\mu} : L^\infty(G) \to L^\infty(G)$ is $\ell^p(S^p_{\mu})$-summing and that

$$
\|M_\mu\|_{\pi_{p,d}L^\infty(G) \to L^\infty(G)} \overset{(77)}{=} \|M_\mu\|_{cb,L^p(G) \to L^\infty(G)} \|\mu\|_{\pi_{p,d}L^\infty(G) \to L^p(G)} \overset{(1.84)}{=} \|M_\mu\|_{cb,L^p(G) \to L^\infty(G)} .
$$

\[ \]

**Remark 1.42** If $G$ is an abelian compact group $G$, we have the equalities

$$
\|M_\varphi\|_{\pi_pL^\infty(G) \to L^\infty(G)} = \|M_\varphi\|_{\pi_pL^\infty(G) \to L^\infty(G)} = \|M_\varphi\|_{L^p(G) \to L^\infty(G)} = \|M_\varphi\|_{cb,L^p(G) \to L^\infty(G)}
$$

where $\|\|_{\pi_pL^\infty(G) \to L^\infty(G)}$ is the classical $p$-summing norm. Indeed, the first equality is essentially [JuP1, Remark 3.7] (see also [Pis1, Remark 5.13]). The third equality is (1.29) since $L^\infty(G) = \min L^\infty(G)$ as operator space by [Pis2, page 72]. The second equality is stated in [BeM1, Proposition 2], but the proof or the idea is not given. In respect to this beautiful tradition of not to provide proofs, we do not give the argument here. However, we (really) confirm that the proof exists. So we conjecture an equality in (1.41), at least in the group von Neumann case.

### 1.6 Entropies and capacities

Let $\mathcal{M}$ be a finite von Neumann algebra equipped with a normal finite faithful trace $\tau$. Recall that a quantum channel is a trace preserving completely positive map $T : L^1(\mathcal{M}) \to L^1(\mathcal{M})$.

Note that the numerical value $-\tau(\mu \log \mu)$ of the following result is negative and is equal to the opposite $-S(\mu)$ of Segal’s entropy of $\mu$ (since the trace is normalized).

**Theorem 1.43** Let $G$ be a finite quantum group. Let $\mu$ be a element of $L^\infty(G)$. Suppose that the convolution map $T : L^1(G) \to L^1(G)$, $x \mapsto \mu * x$ is a quantum channel. Then

$$
S_{\text{ch}, \text{min}}(T) = S_{\text{min}}(T) = -\tau(\mu \log \mu).
$$

**Proof:** Note that the compact quantum group $G$ is of Kac type by [VDa2] and it is well-known that such a quantum group is co-amenable. Hence, we can use Theorem 1.13. We obtain

$$
S_{\text{ch}, \text{min}}(T) \overset{(1.4)}{=} -\frac{d}{dp} \|T\|_{cb,L^p(\mathcal{M}) \to L^p(\mathcal{M})} \bigg|_{p=1} \overset{(1.54)}{=} -\frac{d}{dp} \|\mu\|_{L^p(\mathcal{M})} \bigg|_{p=1} \overset{(1.100)}{=} -\tau(\mu \log \mu).
$$

By (1.3), the same computation is true without the subscript “$\text{cb}$”. So we equally have $S_{\text{min}}(T) = S(\mu)$. The proof is complete.

Now, we want prove that the derivative of (1.4) exists and obtain a concrete description of the completely bounded minimal entropy $S_{\text{ch}, \text{min}}(T)$. With Proposition 1.57 and Proposition 1.59, we can use the argument of [JuP2, Theorem 3.4]. For the sake of the completeness, we provide the easy part. Recall that we use the Segal entropy $S(\rho) \overset{\text{def}}{=} \tau(\rho \log \rho)$.

**Theorem 1.44** Let $\mathcal{M}$ be a finite-dimensional von Neumann algebra of dimension $m$ equipped with a faithful trace. Let $T : L^1(\mathcal{M}) \to L^1(\mathcal{M})$ be a quantum channel. The function $p \mapsto \|T\|_{cb,1 \to p}^p$ is differentiable at $p = 1$ and the opposite of its derivative is given by

$$
S_{\text{ch}, \text{min}}(T) = \inf_{\rho \in L^1(\mathcal{M}) \otimes L^1(\mathcal{M})} \left\{ S\left( (\text{Id} \otimes \tau)(\rho) \right) - S\left( (\text{Id} \otimes T)(\rho) \right) \right\}
$$

where the infimum is taken on all states $\rho$. We can restrict the infimum to the pure states.

---

4. The mathscinet review contains useful remarks.
5. At least in the case $b = \infty$ of [BeM1, Proposition 2].
Proof : (of (1.4)) For any \( p > 1 \), we have using [Pis1, (3.1) page 39] in the first inequality
\[
\frac{\|T\|_{\text{ch}, L^{1}(M) \to L^{p}(M)}^{p} - 1}{p - 1} \geq \frac{\|\text{Id} \otimes T\|_{L^{p}(M, L^{1}(M)) \to L^{p}(M, L^{p}(M))}^{p} - 1}{p - 1} \\
= \sup_{\rho} \frac{\|\text{Id} \otimes T\|_{L^{p}(M)}^{p} - \|\rho\|_{L^{p}(M)}^{p}}{p} = \sup_{\rho} \frac{1}{p-1} \left( \|\text{Id} \otimes T\|_{L^{p}(M)}^{p} - \|\rho\|_{L^{p}(M)}^{p} \right)
\]
where the supremums are taken over the states of \( L^{1}(M) \otimes L^{1}(M) \). Taking the limit when \( p \to 1^{+} \), we obtain
\[
\frac{d}{dp} \|T\|_{\text{ch}, L^{1}(M) \to L^{p}(M)}^{p} \bigg|_{p=1} = \lim_{p \to 1^{+}} \sup_{\rho} \frac{1}{p-1} \left( \|\text{Id} \otimes T\|_{L^{p}(M)}^{p} - \|\rho\|_{L^{p}(M)}^{p} \right) = \sup_{\rho} \lim_{p \to 1^{+}} \frac{1}{p-1} \left( \|\text{Id} \otimes T\|_{L^{p}(M)}^{p} - \|\rho\|_{L^{p}(M)}^{p} \right).
\]
We conclude with (1.4).

Let \( n \geq 1 \) be an integer. Given a quantum channel \( T : S_{n}^{1} \to S_{n}^{1} \), we have by [JuP1, pages 4-5]
\[
(1.88) \quad \chi(T) = \frac{d}{dp} \|T^{\ast}\|_{\pi_{\ast}, L^{1}} \bigg|_{p=1},
\]
where we refer to (1.5) for the definition of \( \chi(T) \).

We extend the first equality to maps acting on finite-dimensional algebras by using the method of approximation of [ArK, Theorem 3.24].

Proposition 1.45 Let \( M \) be a finite-dimensional von Neumann algebra equipped with a faithful trace \( \tau \) and \( T : L^{1}(M) \to L^{1}(M) \) be a quantum channel. Then we have
\[
(1.89) \quad \chi(T) = \frac{d}{dp} \|T^{\ast}\|_{\pi_{\ast}, L^{1} \to L^{1}} \bigg|_{p=1}.
\]

Proof : By [Tak], Theorem 11.2] and [Dix2, proof of Proposition 7 p. 109, Theorem 5 p. 105, Corollary p. 103], there exist \( n_{1}, \ldots, n_{K} \in \mathbb{N} \) and \( \lambda_{1}, \ldots, \lambda_{K} > 0 \) such that
\[
(1.90) \quad (M, \tau) = (M_{n_{1}} \oplus \cdots \oplus M_{n_{K}}, \lambda_{1} \text{Tr}_{n_{1}} \oplus \cdots \oplus \lambda_{K} \text{Tr}_{n_{K}}).
\]

Case 1: All \( \lambda_{k} \) belong to \( \mathbb{N} \). Then let \( n \stackrel{\text{def}}{=} \sum_{k=1}^{K} \lambda_{k}n_{k} \). We consider the normal unital trace
preserving ∗-homomorphism $J : \mathcal{M} \to M_n$ defined by

$$J(x_1 \oplus \cdots \oplus x_K) = \begin{bmatrix} x_1 & & & & \\ & \ddots & & & \\ & & 0 & & \\ & & & \ddots & x_K \\ 0 & & & & \ddots \end{bmatrix},$$

where $x_k$ appears $\lambda_k$ times on the diagonal, $k = 1, \ldots, K$. Let $\mathbb{E} : M_n \to \mathcal{M}$ be the associated normal faithful conditional expectation. Since $\mathbb{E}J = Id_M$, we have $T^* = \mathbb{E}JT^*\mathbb{E}$. Hence

$$\|T^*\|_{\tau_{p,1},\mathcal{M} \to \mathcal{M}} = \|\mathbb{E}JT^*\mathbb{E}\|_{\tau_{p,1},\mathcal{M} \to \mathcal{M}} \leq \|\mathbb{E}\|_{cb} \|JT^*\mathbb{E}\|_{\tau_{p,1},M_n \to M_n} \|\mathbb{E}\|_{cb} \leq \|JT^*\|_{\tau_{p,1},M_n \to M_n}.$$

In a similar manner, we have

$$\|JT^*\|_{\tau_{p,1},M_n \to M_n} \leq \|J\|_{cb} \|JT^*\mathbb{E}\|_{\tau_{p,1},M_n \to M_n} \|\mathbb{E}\|_{cb} \leq \|JT^*\|_{\tau_{p,1},M_n \to M_n}.$$

Hence, we conclude that

$$\|T^*\|_{\tau_{p,1},\mathcal{M} \to \mathcal{M}} = \|JT^*\|_{\tau_{p,1},M_n \to M_n}.$$

Consequently, since we have

$$\frac{d}{dp} \|T^*\|_{\tau_{p,1},\mathcal{M} \to \mathcal{M}} |_{p=1} = \frac{d}{dp} \|JT^*\mathbb{E}\|_{\tau_{p,1},\mathcal{M} \to \mathcal{M}} |_{p=1} = \frac{d}{dp} \|(JT\mathbb{E})^*\|_{\tau_{p,1},M_n \to M_n} |_{p=1} \tag{1.88} \leq \chi(JT\mathbb{E}) \tag{1.5} \leq \sup \left\{ S\left( \sum_{i=1}^{N} \lambda_i JT\mathbb{E}(\rho_i) \right) - \sum_{i=1}^{N} \lambda_i S(JT\mathbb{E}(\rho_i)) \right\}$$

where the supremum is taken over all $N \in \mathbb{N}$, all probability distributions $(\lambda_1, \ldots, \lambda_N)$ and all states $\rho_1, \ldots, \rho_N$ of $S_n^1$. Note that for any states $(\lambda_1, \ldots, \lambda_N)$ and any $\rho_1, \ldots, \rho_N$, we have essentially by [LuP2, Theorem 12]

$$\tag{1.92} S\left( \sum_{i=1}^{N} \lambda_i JT\mathbb{E}(\rho_i) \right) = S\left( J\left( \sum_{i=1}^{N} \lambda_i T\mathbb{E}(\rho_i) \right) \right) = S\left( \sum_{i=1}^{N} \lambda_i T\mathbb{E}(\rho_i) \right).$$

and $S(JT\mathbb{E}(\rho_i)) = S(T\mathbb{E}(\rho_i))$. So we have

$$\tag{1.93} \frac{d}{dp} \|T^*\|_{\tau_{p,1},\mathcal{M} \to \mathcal{M}} |_{p=1} = \sup \left\{ S\left( \sum_{i=1}^{N} \lambda_i T\mathbb{E}(\rho_i) \right) - \sum_{i=1}^{N} \lambda_i S(T\mathbb{E}(\rho_i)) \right\}$$

where the supremum is taken as before. Note that when $\rho$ describe the states of $S_n^1$, the element $\mathbb{E}(\rho)$ describe the states of $L^1(\mathcal{M})$. Hence, we conclude that

$$\frac{d}{dp} \|T^*\|_{\tau_{p,1},\mathcal{M} \to \mathcal{M}} |_{p=1} = \sup \left\{ S\left( \sum_{i=1}^{N} \lambda_i T(\rho_i') \right) - \sum_{i=1}^{N} \lambda_i S(T(\rho_i')) \right\}$$
where the supremum is taken over all $N \in \mathbb{N}$, all probability distributions $(\lambda_1, \ldots, \lambda_N)$ and all states $\rho_1', \ldots, \rho_N'$ of $L^1(M)$.

Case 2: All $\lambda_k$ belong to $\mathbb{Q}_+$. Then there exists a common denominator of the $\lambda_k$’s, that is, there exists $t \in \mathbb{N}$ such that $\lambda_k = \frac{\lambda_k'}{t}$ for some integers $\lambda_k'$. Note that the right-hand side of (1.89) is invariant if we multiply the trace $\tau$ by $t$. Moreover, a simple computation with (1.35) shows that the left-hand side of (1.89) is invariant if we replace the trace $\tau$ by $t\tau$. Thus, Case 1.2 follows from Case 1.1.

Case 3: $\lambda_k \in (0, \infty)$. For $\varepsilon > 0$, let $\lambda_{k,\varepsilon} \in \mathbb{Q}_+$ be $\varepsilon$-close to $\lambda_k$ in the sense that $(1 + \varepsilon)^{-1} \lambda_k \leq \lambda_{k,\varepsilon} \leq (1 + \varepsilon) \lambda_k$. We introduce the trace $\tau_\varepsilon \overset{\text{def}}{=} \lambda_{1,\varepsilon} \text{Tr}_{n_1} \oplus \cdots \oplus \lambda_{K,\varepsilon} \text{Tr}_{n_K}$ on $M \overset{\text{def}}{=} M_{n_1} \oplus \cdots \oplus M_{n_K}$. It is entirely left to the reader to conclude by a painful approximation argument in the spirit of the proof of [ArK, Theorem 3.24].

**Proposition 1.46** Let $G$ be a finite quantum group. Let $\mu$ be a element of $L^\infty(G)$. Suppose that the convolution map $T: L^1(G) \to L^1(G)$, $x \mapsto \mu * x$ is a quantum channel. Then $C_{\text{EA}}(T) \leq \tau(\mu \log \mu)$ and $C(T) \leq \tau(\mu \log \mu)$.

**Proof :** 1. Note that the proof of Theorem 1.27 contains the description of the adjoint $T^*$. Moreover, observe that for any element $d$ of $\mathbb{N} \cup \{\infty\}$, we have

$$
\lim_{q \to \infty} \|T^*\|_{\pi_{\infty, L^\infty(G)} \to L^\infty(G)} = \|\text{Id}_{M_d} \otimes T^*\|_{M_d(L^\infty(G)) \to M_d(L^\infty(G))} = 1.
$$

We let $a \overset{\text{def}}{=} \hat{\mu}$. Using [JuP1, Lemma 2.6] in the third equality and in the fifth equality, we have

$$
\chi(T) \overset{\text{def}}{=} \frac{d}{dp} \|T^*\|_{\pi_{p,1, L^\infty(G)} \to L^\infty(G)} \big|_{p=1} = \frac{d}{dp} \|\mu * \cdot\|_{\pi_{p,1, L^\infty(G)} \to L^\infty(G)} \big|_{p=1} = \lim_{q \to \infty} q \ln \|\mu * \cdot\|_{\pi_{q,1, L^\infty(G)} \to L^\infty(G)} \overset{\text{(1.85)}}{=} \lim_{q \to \infty} q \ln \|M_{a}\|_{\text{cb,}L^\infty(G) \to L^\infty(G)} \overset{\text{(1.68)}}{=} \frac{d}{dp} \|\mu\|_{L^p(G)} \big|_{p=1} = \tau(\mu \log \mu)
$$

where the last equality is essentially [JuP1, Theorem 3.4]. We deduce that

$$
C(T) \overset{\text{(1.6)}}{=} \lim_{n \to +\infty} \frac{\chi(T \otimes^n)}{n} = \lim_{n \to +\infty} \frac{\chi(\mu \otimes^n * \cdot)}{n} \overset{\text{def}}{=} \lim_{n \to +\infty} \frac{\tau(\mu \otimes^n \log \mu \otimes^n)}{n} = \lim_{n \to +\infty} \frac{n \tau(\mu \log \mu)}{n} = \tau(\mu \log \mu).
$$

**Theorem 1.47** Let $G$ be a finite quantum group. Let $\mu$ be a element of $L^\infty(G)$. Suppose that the convolution map $T: L^1(G) \to L^1(G)$, $x \mapsto \mu * x$ is a quantum channel. Then

$$
Q(T) = Q^{(1)}(T) = C(T) = \tau(\mu \log \mu).
$$

**Proof :** Note that $T$ is unital since its adjoint identifies to $T$ by the proof of Theorem 1.27. Here we use that a map is completely positive and unital if and only if its adjoint is completely positive and trace preserving.
Now, we mimic the argument of [GJL1, proof of Theorem III] with (1.34).
By using suprema on pure states (i.e. vector states; it is essential in the fourth equality) we obtain
\begin{equation}
\tau(\mu \log \mu) \overset{(1.96)}{=} -S_{\text{ch,min}}(T) \overset{(1.87)}{=} -\inf_{\rho} \left\{ S[(\text{Id} \otimes \tau)(\rho)] - S[(\text{Id} \otimes T)(\rho)] \right\} \\
= \sup_{\rho} \left\{ S[(\text{Id} \otimes T)(\rho)] - S[(\text{Id} \otimes \tau)(\rho)] \right\} = \sup_{\rho} \left\{ S[(\text{Id} \otimes T)(\rho)] - S[(\tau \otimes \text{Id})(\rho)] \right\} \\
\overset{(1.34)}{\leq} \sup_{\rho} \left\{ S((\text{Id} \otimes T)(\rho)) - S((T \otimes \tau)(\rho)) \right\} = \sup_{\rho} \left\{ S((\text{Id} \otimes T)(\rho)) - S((\tau \otimes T)(\rho)) \right\} \\
= Q^{(1)}(T).
\end{equation}
By observing that the map $\mu^\otimes n \cdot : L^1(G^n) \to L^1(G^n)$ is a convolution operator on the compact quantum group $G^n$ whose the associated von Neumann algebra is $L^\infty(G^n) \overset{\text{def}}{=} L^\infty(G) \otimes \cdots \otimes L^\infty(G)$, we obtain that
\begin{equation}
Q(T) = \lim_{n \to +\infty} \frac{Q^{(1)}(T^\otimes n)}{n} = \lim_{n \to +\infty} \frac{Q^{(1)}(\mu^\otimes n \cdot)}{n} \overset{(1.96)}{\leq} \lim_{n \to +\infty} \frac{\tau(\mu^\otimes n \log \mu^\otimes n)}{n} = \tau(\mu \log \mu).
\end{equation}
Recall that by [GIN1, (197)], we have\(^6\) the inequalities $Q^{(1)}(T) \leq Q(T) \leq C(T)$. Finally, we conclude with Proposition 1.46 which says that $C(T) \leq \tau(\mu \log \mu)$.

\section{1.7 Appendix: output minimal entropy as derivative of operator norms}

For the sake of completeness, we include a proof of (1.3) in the appendix for finite-dimensional von Neumann algebras (see Theorem 1.50). This part does not aim at originality. Indeed, the combination of [ACN1] and [DJKRB] gives a proof of this result for algebras of matrices. However, we hope that this will make this observation more accessible.

Suppose $1 \leq p, q \leq \infty$. Let $\mathcal{M}, \mathcal{N}$ be von Neumann algebras equipped with normal semifinite faithful traces. Consider a positive map $T : L^q(\mathcal{M}) \to L^p(\mathcal{N})$. By an obvious generalization of the proof of [ArK, Proposition 2.12], such a map is bounded. We define the positive real number
\begin{equation}
||T||_{+L^q(\mathcal{M}) \to L^p(\mathcal{N})} \overset{\text{def}}{=} \sup_{x \geq 0, \|x\|_q = 1} ||T(x)||_p.
\end{equation}
We always have $||T||_{+L^q(\mathcal{M}) \to L^p(\mathcal{N})} \leq ||T||_{L^q(\mathcal{M}) \to L^p(\mathcal{N})}$. We start to show that if $T$ is in addition 2-positive (e.g. completely positive) then we have an equality. See [Aud1] for a version on Schatten spaces.

\begin{proposition}
Let $\mathcal{M}, \mathcal{N}$ be von Neumann algebras equipped with normal semifinite faithful traces. Suppose $1 \leq p, q \leq \infty$. Let $T : L^q(\mathcal{M}) \to L^p(\mathcal{N})$ be a 2-positive map. We have
\begin{equation}
||T||_{L^q(\mathcal{M}) \to L^p(\mathcal{N})} = ||T||_{+L^q(\mathcal{M}) \to L^p(\mathcal{N})}.
\end{equation}
\end{proposition}
\(^6\) It is left to the reader to show that these inequalities which are true for channels acting on the algebra $M_n$ extends to channels acting on finite-dimensional algebras.
Proof: Suppose \( \|T\|_{+,q \rightarrow p} \leq 1 \). Let \( x \in L^q(M) \) with \( \|x\|_q = 1 \). By \((1.16)\) (and a suitable multiplication by a constant), there exist \( y, z \in L^2(M) \) such that

\[
(1.99) \quad x = y^* z \quad \text{with} \quad \|y\|_{2q} = \|z\|_{2q} = 1.
\]

We have

\[
\begin{bmatrix}
0 & 0 \\
y & z
\end{bmatrix}
\begin{bmatrix}
0 & 0 \\
y & z
\end{bmatrix}^* =
\begin{bmatrix}
0 & y^* \\
y & z^*
\end{bmatrix}
\begin{bmatrix}
0 & 0 \\
y & z
\end{bmatrix} =
\begin{bmatrix}
y^*y & y^*z \\
z^*y & z^*z
\end{bmatrix}.
\]

We infer that

\[
\begin{bmatrix}
y^*y & y^*z \\
z^*y & z^*z
\end{bmatrix}
\]

is a positive element of \( S_2^2(L^4(M)) \). Since \( T \) is 2-positive, the matrix \((Id_{M_2} \otimes T)\)

\[
\begin{bmatrix}
y^*y & y^*z \\
z^*y & z^*z
\end{bmatrix}
\]

is positive. Moreover, we have \( \|T(y^*y)\|_p \leq \|T\|_{+,q \rightarrow p} \|y\|_q \leq \|y\|_{2q}^2 \) \((1.99)\) 1 and similarly \( \|T(z^*z)\|_p \leq 1 \). Using \([ArK, \text{Proposition } 2.12]\) in the inequality, we deduce that \( \|T(x)\|_p \leq \|T(y^*z)\|_p \leq 1 \). Hence \( \|T\|_{q \rightarrow p} \leq 1 \). By homogeneity, we conclude that \( \|T\|_{q \rightarrow p} \leq \|T\|_{+,q \rightarrow p} \). The reverse inequality is obvious.

The following proposition relying on Dini’s theorem is elementary and left to the reader. The first part is already present in \([\text{Seg}1, \text{page } 625]\).

**Proposition 1.49** Let \( M \) be a finite-dimensional von Neumann algebra equipped with a finite faithful trace \( \tau \). For any positive element \( x \in M \) with \( \|x\|_1 = 1 \), we have

\[
(1.100) \quad \frac{d}{dp} \|x\|_{L^p(M)}|_{p=1} = \tau(x \log x).
\]

Moreover, the family of functions \( x \mapsto \frac{1-|x|_{L^p(M)}^p}{p-1} \) converge uniformly to the function \( x \mapsto -\tau(x \log x) \) when \( p \to 1^+ \) on the subset of positive element \( x \in M \) with \( \|x\|_1 = 1 \).

**Theorem 1.50** Let \( \mathcal{M}, \mathcal{N} \) be finite-dimensional von Neumann algebras. Let \( T: \mathcal{M} \to \mathcal{N} \) be a trace preserving 2-positive map. We have

\[
(1.101) \quad S_{\min}(T) = -\frac{d}{dp} \|T\|_{L^p(M) \to L^p(\mathcal{N})}^p|_{p=1}.
\]

Proof: Note that \( \|T\|_{L^1(M) \to L^1(\mathcal{N})} = 1 \) (if \( T \neq 0 \)). Using the uniform convergence of Proposition 1.49 in the fifth equality and the fact that \( T \) is trace preserving in the sixth equality, we obtain

\[
(1.100) \quad \min_{x \geq 0, \|x\|_1 = 1} -\tau(T(x) \log T(x)) = \min_{x \geq 0, \|x\|_1 = 1} \frac{d}{dp} -\|T(x)\|_{L^p(\mathcal{N})}^p|_{p=1}.
\]

\[
(1.100) \quad \min_{x \geq 0, \|x\|_1 = 1} -\tau(T(x) \log T(x)) = S_{\min}(T).
\]
1.8 Appendix: multiplicativity of some completely bounded operator norms

In this appendix, we prove in Theorem 1.54 the multiplicativity of the completely bounded norms $\|\cdot\|_{cb,L^p \to L^p}$ if $1 \leq q \leq p \leq \infty$. The result is stated in [DJKRB, Theorem 11] for Schatten spaces. Unfortunately, the first part of the proof is incorrect and the second part is loosely false and consequently is not more convincing. So we give a correct proof and we take this opportunity for generalize the result to the more general setting of hyperfinite von Neumann algebras. However, it does not remove the merit of the authors of [DJKRB] to introduce this kind of questions. See also [Jen1] for a related paper.

The new ingredient is the following result which is crucial for the proof of Theorem 1.54. Note that this result is in the same spirit of shuffles of [EKR1, Theorem 4.1 and Corollary 4.2], [EIR1, Theorem 6.1] and [EIR2] which are well-known to the experts.

Proposition 1.51 Let $\mathcal{M}_1$, $\mathcal{M}_2$, $\mathcal{M}_3$ and $\mathcal{M}_4$ be hyperfinite von Neumann algebras equipped with normal semifinite faithful trace. Suppose $1 \leq q \leq p \leq \infty$. The map

$$(1.102) \quad \text{Id} \otimes \mathcal{F} \otimes \text{Id}: L^p(\mathcal{M}_1, L^q(\mathcal{M}_2)) \times L^p(\mathcal{M}_3, L^q(\mathcal{M}_4)) \to L^p(\mathcal{M}_1 \overline{\otimes} \mathcal{M}_3, L^q(\mathcal{M}_2 \overline{\otimes} \mathcal{M}_4))$$

which maps $x \otimes y \otimes z \otimes t$ on $x \otimes z \otimes y \otimes t$ is a well-defined contraction.

Proof : Recall that by (1.31) we have an isometry $\mathcal{M}_1 \otimes_{min} L^1(\mathcal{M}_2) \hookrightarrow CB_w(\mathcal{M}_2, \mathcal{M}_1)$, $a \otimes b \mapsto (z \mapsto \langle b, za \rangle)$ where the subscript $w^*$ means weak* continuous. Similarly, we have an isometry $\mathcal{M}_3 \otimes_{min} L^1(\mathcal{M}_4) \hookrightarrow CB_w(\mathcal{M}_4, \mathcal{M}_3)$ and $(\mathcal{M}_1 \overline{\otimes} \mathcal{M}_3) \otimes_{min} L^1(\mathcal{M}_2 \overline{\otimes} \mathcal{M}_4) \hookrightarrow CB_w(\mathcal{M}_2 \overline{\otimes} \mathcal{M}_4, \mathcal{M}_1 \overline{\otimes} \mathcal{M}_3)$. If the tensors $x \in \mathcal{M}_1 \otimes L^1(\mathcal{M}_2)$ and $y \in \mathcal{M}_3 \otimes L^1(\mathcal{M}_4)$ identify to the maps $u: \mathcal{M}_2 \to \mathcal{M}_1$ and $v: \mathcal{M}_4 \to \mathcal{M}_3$ then it is easy to check that the element $(\text{Id} \otimes \mathcal{F} \otimes \text{Id})(x \otimes y)$ of $(\mathcal{M}_1 \overline{\otimes} \mathcal{M}_3) \otimes_{min} L^1(\mathcal{M}_2 \overline{\otimes} \mathcal{M}_4)$ identify to the map $u \otimes v: \mathcal{M}_2 \overline{\otimes} \mathcal{M}_4 \to \mathcal{M}_1 \overline{\otimes} \mathcal{M}_3$. By [BLM, page 40], we have

$$\|u \otimes v\|_{cb,\mathcal{M}_2 \overline{\otimes} \mathcal{M}_4 \to \mathcal{M}_1 \overline{\otimes} \mathcal{M}_3} \leq \|u\|_{cb,\mathcal{M}_2 \to \mathcal{M}_1} \|v\|_{cb,\mathcal{M}_4 \to \mathcal{M}_3}.$$

We deduce that

$$\|\text{Id} \otimes \mathcal{F} \otimes \text{Id}(x \otimes y)\|_{(\mathcal{M}_1 \overline{\otimes} \mathcal{M}_3) \otimes_{min} L^1(\mathcal{M}_2 \overline{\otimes} \mathcal{M}_4))} \leq \|x\|_{\mathcal{M}_1 \otimes L^1(\mathcal{M}_2)} \|y\|_{\mathcal{M}_3 \otimes L^1(\mathcal{M}_4)}.$$

Hence by (1.32) the map $L^\infty_0(\mathcal{M}_1, L^1(\mathcal{M}_2)) \times L^\infty_0(\mathcal{M}_3, L^1(\mathcal{M}_4)) \to L^\infty_0(\mathcal{M}_1 \overline{\otimes} \mathcal{M}_3, L^1(\mathcal{M}_2 \overline{\otimes} \mathcal{M}_4))$ is contractive. It is not difficult to prove that we have a contractive bilinear map

$$L^\infty_0(\mathcal{M}_1, \mathcal{M}_2) \times L^\infty_0(\mathcal{M}_3, \mathcal{M}_4) \to L^\infty_0(\mathcal{M}_1 \overline{\otimes} \mathcal{M}_3, \mathcal{M}_2 \overline{\otimes} \mathcal{M}_4).$$

By interpolating these two maps with [Pis1, (3.5)], we obtain a contractive bilinear map

$$L^\infty_0(\mathcal{M}_1, L^q(\mathcal{M}_2)) \times L^\infty_0(\mathcal{M}_3, L^q(\mathcal{M}_4)) \to L^\infty_0(\mathcal{M}_1 \overline{\otimes} \mathcal{M}_3, L^q(\mathcal{M}_2 \overline{\otimes} \mathcal{M}_4)).$$

Note that by [Pis1, (3.6)] we have a contractive bilinear map

$$L^q(\mathcal{M}_1, L^q(\mathcal{M}_2)) \times L^q(\mathcal{M}_3, L^q(\mathcal{M}_4)) \to L^q(\mathcal{M}_1 \overline{\otimes} \mathcal{M}_3, L^q(\mathcal{M}_2 \overline{\otimes} \mathcal{M}_4)).$$

(with the usual convention if $q = \infty$). Since $\frac{1}{p} = \frac{1}{q} \frac{1}{\infty} + \frac{q}{q}$, we conclude by interpolation that the bilinear map (1.102) is contractive.

Remark 1.52 The case $p \leq q$ is true but we does not need it. So we does not give the proof.
Lemma 1.53 Let $\mathcal{M}_1, \mathcal{M}_2, N_1, N_2$ be hyperfinite von Neumann algebras. Suppose $1 \leq p, q \leq \infty$. Let $T_1: L^q(\mathcal{M}_1) \to L^p(N_1)$ and $T_2: L^q(\mathcal{M}_2) \to L^p(N_2)$ be linear maps. Then if $T_1 \otimes T_2: L^q(\mathcal{M}_1 \otimes \mathcal{M}_2) \to L^p(N_1 \otimes N_2)$ is completely bounded then $T_1$ and $T_2$ are completely bounded and we have

$$\|T_1 \otimes T_2\|_{cb,L^p(L^q)} \leq 1 \text{ and } \|T_1\|_{cb,L^p \to L^p} \leq \|T_2\|_{cb,L^p \to L^p}.$$

Proof: Let $n, m \geq 1$ be some integers. Consider some element $x \in S_n^p(L^q(\mathcal{M}_1))$ and $y \in S_m^q(L^q(\mathcal{M}_2))$ such that

$$\|x\|_{S_n^p(L^q(\mathcal{M}_1))} \leq 1 \text{ and } \|y\|_{S_m^q(L^q(\mathcal{M}_2))} \leq 1.$$

Using the flip $F_p: L^p(\mathcal{M}_1 \otimes \mathcal{M}_2) \to L^p(\mathcal{M}_2 \otimes \mathcal{M}_1)$ and $F: L^q(\mathcal{M}_1, S_n^p) \to S_n^p(L^q(\mathcal{M}_1))$ and Proposition 1.51 in the third inequality, we have

$$\|(Id_{S_n^p} \otimes T_1)(x)|_{S_n^p(L^p(\mathcal{M}_1)))} \leq \|Id_{S_n^p} \otimes T_2\|_{S_n^p(L^p(\mathcal{M}_2)))} = \|(Id_{S_n^p} \otimes T_1)(x) \otimes (Id_{S_m^q} \otimes T_2)(y)\|_{L^p(M_1 \otimes M_2)} \\
= \|(Id_{S_n^p} \otimes T_1 \otimes Id_{S_m^q} \otimes T_2)(x \otimes y)\|_{L^p(M_1 \otimes M_2)} \\
\leq \|(Id_{S_n^p} \otimes F \otimes Id_{S_m^q} \otimes T_2)(x \otimes y)\|_{L^p(M_1 \otimes M_2)} \\
\leq \|(Id_{S_n^p} \otimes F \otimes Id_{S_m^q} \otimes T_2)(x \otimes y)\|_{L^p(M_1 \otimes M_2)}$$

Using the flip $F_p: L^p(\mathcal{M}_1 \otimes \mathcal{M}_2) \to L^p(\mathcal{M}_2 \otimes \mathcal{M}_1)$ and $F: L^q(\mathcal{M}_1, S_n^p) \to S_n^p(L^q(\mathcal{M}_1))$ and Proposition 1.51 in the third inequality, we have

$$\|T_1 \otimes T_2\|_{cb,L^q(L^q)} \leq 1 \text{ and } \|T_1\|_{cb,L^q \to L^q} \leq \|T_2\|_{cb,L^q \to L^q}.$$

Taking the supremum two times, we obtain

$$\|Id_{S_n^p} \otimes T_1\|_{S_n^p(L^q)} \leq \|Id_{S_n^p} \otimes T_2\|_{S_n^p(L^q)} \leq \|T_1 \otimes T_2\|_{cb,q \to L^p}$$

Taking again the supremum two times, we conclude that

$$\|T_1\|_{cb,L^q \to L^p} \leq \|T_2\|_{cb,L^q \to L^p} \leq \|T_1 \otimes T_2\|_{cb,L^q \to L^p}.$$

The main result of this section is the following theorem of multiplicativity.

Theorem 1.54 Let $\mathcal{M}_1, \mathcal{M}_2, N_1, N_2$ be hyperfinite von Neumann algebras. Suppose $1 \leq q \leq p \leq \infty$. Let $T_1: L^q(\mathcal{M}_1) \to L^p(N_1)$ et $T_2: L^q(\mathcal{M}_2) \to L^p(N_2)$ be completely bounded maps. Then the map $T_1 \otimes T_2: L^q(\mathcal{M}_1 \otimes \mathcal{M}_2) \to L^p(N_1 \otimes N_2)$ is completely bounded and we have

$$\|T_1 \otimes T_2\|_{cb,L^q(L^q)} \leq \|T_1\|_{cb,L^q \to L^q} \|T_2\|_{cb,L^q \to L^q}.$$
Proof : Using the flip $F : L^q(L^p) \to L^p(L^q)$, $x \otimes y \mapsto y \otimes x$, we have
\[
\|T_1 \otimes T_2\|_{cb,L^p(L^q) \to L^p(L^q)} = \|(Id_{L^p} \otimes T_2)(T_1 \otimes Id_{L^q})\|_{cb,L^q(L^p) \to L^p(L^p)} \\
\leq \|Id_{L^p} \otimes T_2\|_{cb,L^p(L^q) \to L^p(L^p)} \|T_1 \otimes Id_{L^q}\|_{cb,L^q(L^q) \to L^p(L^q)} \\
= \|Id_{L^p} \otimes T_2\|_{cb,L^p(L^q) \to L^p(L^p)} \|F(Id_{L^q} \otimes T_1)\|_{cb,L^q(L^q) \to L^p(L^q)} \\
= \|Id_{L^p} \otimes T_2\|_{cb,L^p(L^q) \to L^p(L^p)} \|F\|_{cb,L^q(L^q) \to L^p(L^q)} \|Id_{L^q} \otimes T_1\|_{cb,L^q(L^q) \to L^p(L^p)} \\
(1.30) \\
\leq \|Id_{L^p} \otimes T_2\|_{cb,L^p(L^q) \to L^p(L^p)} \|Id_{L^q} \otimes T_1\|_{cb,L^q(L^q) \to L^p(L^p)} \\
= \|T_1\|_{cb,L^q \to L^p} \|T_2\|_{cb,L^q \to L^p}. \\
\]
The reverse inequality is Lemma 1.53.

For the sake of completeness, we show how deduce the additivity of the completely bounded minimal entropy. The proof follow the one of

\[ S_{cb,min}(T_1 \otimes T_2) = S_{cb,min}(T_1) + S_{cb,min}(T_2). \]

Proof : We have
\[
\frac{1 - \|T_1 \otimes T_2\|_{cb,L^q(L^p) \to L^p(L^p)}}{p - 1} = 1 - \frac{\|T_1\|_{cb,L^q \to L^p} \|T_2\|_{cb,L^q \to L^p}}{p - 1} \\
= \frac{1 - \|T_1\|_{cb,L^q \to L^p} + \|T_1\|_{cb,L^q \to L^p} - \|T_1\|_{cb,L^q \to L^p} \|T_2\|_{cb,L^q \to L^p}}{p - 1} \\
= \frac{1 - \|T_1\|_{cb,L^q \to L^p} + \|T_1\|_{cb,L^q \to L^p}}{p - 1} \frac{1 - \|T_2\|_{cb,L^q \to L^p}}{p - 1}. \\
\]
Taking the limit when $p \to 1^+$ and using $\lim_{p \to 1^+} \|T\|_{cb,L^q \to L^p} = 1$, we obtain with (1.4) the additivity formula (1.105).

1.9 Appendix: some results on operator norms

Here we prove two results needed for the proof of Theorem 1.44.

Recall that a complex vector space $V$ is matrix ordered [ChE, page 173] if

1. $V$ is a $*$-vector space (hence so is $M_n(V)$ for any $n \geq 1$),

2. each $M_n(V)$, $n \geq 1$, is partially ordered by a cone $M_n(V)_+ \subset M_n(V)_{sa}$, and

3. if $\alpha = [\alpha_{ij}] \in M_{n,m}$, then $\alpha^* M_n(V)_+ \alpha \subset M_m(V)_+$.

An operator space $E$ is called a matrix ordered operator space [Schr1, page 143] if it is a matrix ordered vector space and if in addition

1. the $*$-operation is an isometry on $M_n(E)$ for any integer $n \geq 1$ and

2. the cones $M_n(E)_+$ are closed in the norm topology.
Suppose $E$ is a matrix ordered operator space. We say $E$ is a matrix regular operator space if for each $n \in \mathbb{N}$ and for all $v \in M_n(E)_{sa}$,

1. $u \in M_n(E)_{sa}$ and $-u \leq v \leq u$ imply that

\[ \|v\|_{M_n(E)} \leq \|u\|_{M_n(E)}. \]

2. $\|v\|_{M_n(E)} < 1$ implies that there exists $u \in M_n(E)_{sa}$ such that $\|u\|_{M_n(E)} < 1$ and $-u \leq v \leq u$.

Suppose $1 \leq p \leq \infty$. By [Schr2, Theorem 5.1.5] (or [Schr1, Theorem 5.4]), if $E$ is a matrix regular operator space and $I$ is an index set then the vector-valued Schatten class $S^q_p(I)$ is a matrix regular operator space for any $1 \leq p \leq \infty$. In particular, the Schatten class $S^q_p$ is a matrix regular operator space. By a standard approximation argument, if $\mathcal{M}$ is a hyperfinite semifinite von Neumann algebra we deduce more generally that $L^p(\mathcal{M})$ is a matrix regular operator space.

The following lemma is a variation of [ArK, Lemma 2.11].

**Lemma 1.56** Let $E$ be a matrix regular operator space. Let $a, b$ and $c$ be elements of $E$ such that the element $\begin{bmatrix} a & b \\ b^* & c \end{bmatrix}$ of $M_2(E)$ is positive. Then we have $\|b\|_E \leq \max \{ \|a\|_E, \|c\|_E \}$.

**Proof:** Since $\begin{bmatrix} a & b \\ b^* & c \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} a & b \\ b^* & c \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$ is a positive element of $M_2(E)$, we obtain the inequalities $\begin{bmatrix} a & 0 \\ 0 & c \end{bmatrix} \leq \begin{bmatrix} a & 0 \\ 0 & c \end{bmatrix} \leq \begin{bmatrix} a & 0 \\ 0 & c \end{bmatrix}$. Using [ArK, Lemma 2.10] in the first equality, we obtain

\[ \|b\|_E = \left\| \begin{bmatrix} a & 0 \\ 0 & c \end{bmatrix} \right\|_{M_2(E)} \leq \max \{ \|a\|_E, \|c\|_E \}. \]

The following proposition is a generalization of [DJKR, Theorem 12]. We remove the assumption $q \leq p$ and we extend the result to hyperfinite semifinite von Neumann algebras.

**Proposition 1.57** Let $\mathcal{M}, \mathcal{N}$ be von Neumann algebras equipped with normal semifinite faithful traces such that $\mathcal{N}$ is hyperfinite. Let $T$ be a $2n$-positive map. We have

\[ \|\text{Id}_{M_n} \otimes T\|_{S^q_2(L^q(\mathcal{M})) \to S^q_2(L^q(\mathcal{N}))} = \|\text{Id}_{M_n} \otimes T\|_{*,S^q_2(L^q(\mathcal{M})) \to S^q_2(L^q(\mathcal{N}))}. \]

If $\mathcal{M}$ is finite-dimensional and if $T^2 : L^2(\mathcal{M}) \to L^2(\mathcal{M})$ is completely positive, we also have

\[ \|\text{Id} \otimes T\|_{L^1(\mathcal{M},L^1(\mathcal{M})) \to L^1(\mathcal{M},L^1(\mathcal{M}))} = \|\text{Id} \otimes T\|_{*,L^1(\mathcal{M},L^1(\mathcal{M})) \to L^1(\mathcal{M},L^1(\mathcal{M}))}. \]

**Proof:** We prove the first part. Let $x \in S^q_2(L^q(\mathcal{M}))$. By (1.16) (and a suitable multiplication by a constant), there exist $y, z \in S^q_2(L^q(\mathcal{M}))$ such that

\[ x = y^*z \quad \text{with} \quad \|y\|^2_{2q} = \|z\|^2_{2q} = \|x\|_q. \]
We have \[
\begin{bmatrix}
0 & 0 \\
y & z
\end{bmatrix}^{*} \begin{bmatrix}
0 & 0 \\
y & z
\end{bmatrix} = \begin{bmatrix}
0 & y^{*} \\
y & z^{*}
\end{bmatrix} = \begin{bmatrix}
y^{*}y & y^{*}z \\
z^{*}y & z^{*}z
\end{bmatrix}.
\] We infer that \[
\begin{bmatrix}
y^{*}y & y^{*}z \\
z^{*}y & z^{*}z
\end{bmatrix}
\] is a positive element of \(S_{2n}^{2}(L^{2}(M))\). Since \(T\) is \(2n\)-positive, the matrix \((\text{Id}_{M_{2n}} \otimes T)\left(\begin{bmatrix}
y^{*}y & y^{*}z \\
z^{*}y & z^{*}z
\end{bmatrix}\right)\) is positive. Moreover, we have
\[
\|(\text{Id}_{M_{n}} \otimes T)(y^{*}y)\|_{S_{2n}^{2}(L^{p}(N))} \leq \|(\text{Id}_{M_{n}} \otimes T)(y^{*}z)\|_{S_{2n}^{2}(L^{p}(N))} \leq \|y^{*}y\|_{q}
\]
and similarly \(\|(\text{Id}_{M_{n}} \otimes T)(z^{*}z)\|_{S_{2n}^{2}(L^{p}(N))} \leq \|(\text{Id}_{M_{n}} \otimes T)(z^{*}y)\|_{S_{2n}^{2}(L^{p}(N))} \leq \|z^{*}z\|_{q}\). Note that by the discussion above Lemma 1.56, the vector-valued Schatten space \(S_{2n}^{2}(L^{p}(N))\) is a matrix regular operator space. By Lemma 1.56, we deduce that
\[
\|(\text{Id}_{M_{n}} \otimes T)(x)\|_{S_{2n}^{2}(L^{p}(N))} \leq \|(\text{Id}_{M_{n}} \otimes T)(y^{*}z)\|_{S_{2n}^{2}(L^{p}(N))} \leq \|\text{Id}_{M_{n}} \otimes T\|_{L_{+}(S_{2n}^{2}(L^{2}(M))) \rightarrow L_{+}(S_{2n}^{2}(L^{p}(N)))} \times \|x\|_{S_{2n}^{2}(L^{2}(M))}.
\]
We conclude that \(\|\text{Id}_{M_{n}} \otimes T\|_{L_{+}(S_{2n}^{2}(L^{2}(M))) \rightarrow L_{+}(S_{2n}^{2}(L^{p}(N)))} \leq \|\text{Id}_{M_{n}} \otimes T\|_{L_{+}(S_{2n}^{2}(L^{2}(M))) \rightarrow L_{+}(S_{2n}^{2}(L^{p}(N)))} \times \|x\|_{S_{2n}^{2}(L^{2}(M))} \). The reverse inequality is obvious.

For the second part, we use the structure of finite-dimensional C*-algebras, the universal properties of the direct sum \(\oplus 1\) and the direct sum \(\oplus \infty\), a duality argument [ER, (3.2.7)], Smith’s Lemma [ER, Proposition 2.2.2], [Pis1, (3.1) page 39] and the equality \(\|\text{Id} \otimes T\|_{L_{+}(E) \rightarrow L_{+}(F)} = \|\text{Id} \otimes T\|_{S_{2n}^{2}(L^{2}(E)) \rightarrow S_{2n}^{2}(L^{2}(F))}\). The proof is complete.

**Remark 1.58** A similar result for a map \(\text{Id} \otimes T\): \(S_{m}^{2}(L^{1}(M)) \rightarrow S_{n}^{2}(L^{p}(M))\) where \(T\): \(L^{1}(M) \rightarrow L^{p}(N)\) is completely positive is unclear and would be useful in order to give another proof of (1.87) since we have
\[
\|(\text{Id} \otimes T)(x)\|_{S_{m}^{2}(L^{1}(M))} = \sup_{y \in S_{m}^{1}(L^{1}(M))} \|y^{*}x\|_{S_{m}^{2}(L^{2}(M))}.
\]
And we could use (1.33) (for a positive \(x\)).

**Proposition 1.59** Let \(M\) be a finite-dimensional von Neumann algebra. Let \(T\): \(L^{1}(M) \rightarrow L^{p}(M)\) be a linear map. Then
\[
\|T\|_{\text{cb, } L^{1}(M) \rightarrow L^{p}(M)} = \|\text{Id}\|_{L^{1}(M) \rightarrow L^{1}(M)} \times \|\text{Id}\|_{L^{p}(M) \rightarrow L^{p}(M)}.
\]
**Proof**: The proof is a consequence of the structure of finite-dimensional C*-algebras, the universal properties of the direct sum \(\oplus 1\) and the direct sum \(\oplus \infty\), a duality argument [ER, (3.2.7)], Smith’s Lemma [ER, Proposition 2.2.2] and [Pis1, (3.1) page 39]. The proof is complete.

**Acknowledgement.** The author acknowledges support by the grant ANR-18-CE40-0021 (project HASCON) of the French National Research Agency ANR. I will thank Luis Rodríguez-Piazza for a very short discussion and Li Gao for a short but very instructive discussion on von Neumann entropy and the physical sense of capacities of a quantum channel. We also thank Adrián González Pérez for an exciting discussion on the topic of Proposition 1.24. Finally, I will thank Christian Le Merdy for some old very instructive discussions on some results of the Appendix 1.9.
