

Moduli Spaces of Fundamental Groups of Curves in Positive Characteristic I

YU YANG

Abstract

In this series of papers, we investigate a new anabelian phenomenon of curves over algebraically closed fields of positive characteristic which shows that the topological structures of moduli spaces of curves can be understood from open continuous homomorphisms of fundamental groups of curves. Let p be a prime number, and let $\overline{M}_{g,n}$ be the coarse moduli space of the moduli stack over an algebraic closure of the finite field \mathbb{F}_p classifying pointed stable curves of type (g, n) . We introduce a topological space $\overline{\Pi}_{g,n}$ which we call *the moduli space of admissible fundamental groups of pointed stable curves of type (g, n) in characteristic p* , whose underlying set consists of the set of isomorphism classes of the admissible fundamental groups of pointed stable curves of type (g, n) , and whose topology is determined by the sets of finite quotients of the admissible fundamental groups. By introducing a certain equivalence relation \sim_{fe} on the underlying topological space $|\overline{M}_{g,n}|$ of $\overline{M}_{g,n}$ determined by Frobenius actions, we obtain a topological space $\overline{\mathfrak{M}}_{g,n} \stackrel{\text{def}}{=} |\overline{M}_{g,n}| / \sim_{fe}$ whose topology is induced by the Zariski topology of $\overline{M}_{g,n}$. Moreover, there is a natural continuous map

$$\pi_{g,n}^{\text{adm}} : \overline{\mathfrak{M}}_{g,n} \rightarrow \overline{\Pi}_{g,n}.$$

The topological space $\overline{\Pi}_{g,n}$ gives us a new insight into the theory of the anabelian geometry of curves over algebraically closed fields of characteristic p based on the following anabelian philosophy: Every topological property concerning $\overline{\Pi}_{g,n}$ is equivalent to an anabelian property concerning pointed stable curves over algebraically closed fields of characteristic p . Furthermore, *the Homeomorphism Conjecture* says that $\pi_{g,n}^{\text{adm}}$ is a homeomorphism, which is the main conjecture of the theory developed in the present series of papers. The Homeomorphism Conjecture generalizes all the conjectures in the theory of anabelian geometry of curves over algebraically closed fields of characteristic p , and means that moduli spaces of curves *can be reconstructed group-theoretically as topological spaces* from the admissible fundamental groups of curves. One of main results of the present series of papers says that the Homeomorphism Conjecture holds when $\dim(\overline{M}_{g,n}) = 1$ (i.e., $(g, n) = (0, 4)$ or $(g, n) = (1, 1)$). In the present paper, we establish two fundamental tools to analyze the geometric behavior of curves from open continuous homomorphisms of admissible fundamental groups, which play central roles in the theory developed in the series of papers. Moreover, we prove that $\pi_{0,n}^{\text{adm}}([q])$ is a closed point of $\overline{\Pi}_{0,n}$ when $[q]$ is a closed point of $\overline{\mathfrak{M}}_{0,n}$. In particular, we obtain that the Homeomorphism Conjecture holds when $(g, n) = (0, 4)$.

Keywords: pointed stable curve, admissible fundamental group, moduli space, anabelian geometry; positive characteristic.

Introduction

In the present paper, we study the anabelian geometry of curves over algebraically closed fields of positive characteristic. Let p be a prime number, and let

$$X^\bullet = (X, D_X)$$

be a pointed stable curve of type (g_X, n_X) over a field k of characteristic $\text{char}(k)$, where X denotes the underlying curve, D_X denotes the set of marked points, g_X denotes the genus of X , and n_X denotes the cardinality $\#D_X$ of D_X . First, we explain some background of the anabelian geometry of curves. Suppose that X^\bullet is smooth over k . When k is

an *arithmetic field* (e.g. number field, p -adic field, finite field, etc.), A. Grothendieck suggested a theory of arithmetic geometry called *anabelian geometry* (cf. [3], [4]), roughly speaking, in the case of curves, whose ultimate goal is the following question.

Can we recover the geometric information of X^\bullet group-theoretically from various versions of its fundamental group?

The various formulations of this question are called *Grothendieck's anabelian conjecture for curves* or the Grothendieck conjecture, for short. The Grothendieck conjecture has been proven in many cases. For example, the conjecture was proved by H. Nakamura, A. Tamagawa, and S. Mochizuki in the case of number fields (cf. [14], [15], [26], [11]), and was proved by Tamagawa, J. Stix, and M. Saïdi-Tamagawa in the case of finitely generated fields over the finite field \mathbb{F}_p (cf. [26], [24], [25], [22], [23]). All the proofs of the Grothendieck conjecture for curves over arithmetic fields mentioned above require the use of the *highly non-trivial outer Galois representations* induced by the fundamental exact sequences of fundamental groups.

Next, let us return to the case where X^\bullet is an arbitrary pointed stable curve, and suppose that k is an *algebraically closed field*. By choosing a suitable base point of X^\bullet , we have the admissible fundamental group

$$\pi_1^{\text{adm}}(X^\bullet)$$

of X^\bullet (cf. Definition 1.2). In particular, if X^\bullet is smooth over k , then $\pi_1^{\text{adm}}(X^\bullet)$ is naturally isomorphic to the tame fundamental group $\pi_1^t(X^\bullet)$. Write $\pi_1^{\text{adm}}(X^\bullet)^{p'}$ for the maximal prime-to- p quotient of $\pi_1^{\text{adm}}(X^\bullet)$ if $\text{char}(k) = p$. The profinite group $\pi_1^{\text{adm}}(X^\bullet)$ (resp. $\pi_1^{\text{adm}}(X^\bullet)^{p'}$) is isomorphic to the profinite completion (resp. pro-prime-to- p completion) of the following group (cf. [33, Théorème 2.2 (c)])

$$\langle a_1, \dots, a_{g_X}, b_1, \dots, b_{g_X}, c_1, \dots, c_{n_X} \mid \prod_{i=1}^{g_X} [a_i, b_i] \prod_{j=1}^{n_X} c_j = 1 \rangle$$

when $\text{char}(k) = 0$ (resp. $\text{char}(k) = p$). In the case of algebraically closed fields of characteristic 0, since the admissible fundamental groups of curves depend only on the types of curves, the anabelian geometry of curves does not exist in this situation. On the other hand, if $\text{char}(k) = p$, the situation is quite different from that in characteristic 0. The admissible fundamental group $\pi_1^{\text{adm}}(X^\bullet)$ is very mysterious and its structure is no longer known. In the remainder of the introduction, we assume that k is an algebraically closed field of characteristic p .

Since the late 1990s, some developments of F. Pop, M. Raynaud, Saïdi, Tamagawa, J. Tong, and the author (cf. [16], [19], [27], [28], [29], [30], [31], [35], [36], [37]) showed evidence for very strong *anabelian phenomena* for curves over *algebraically closed fields of positive characteristic*. In this situation, the Galois group of the base field is trivial, and the *arithmetic* fundamental group coincides with the *geometric* fundamental group, thus there is a total absence of a Galois action of the base field. This kind of anabelian phenomenon goes beyond Grothendieck's anabelian geometry (because no Galois actions exist), and this is the reason that we do not have an explicit description of the geometric fundamental group of any pointed stable curve in positive characteristic. Moreover, we may

think that the anabelian geometry of curves over algebraically closed fields of characteristic p is a theory based on the following rough consideration: The admissible fundamental group of a pointed stable curve over an algebraically closed field of characteristic p must encode “*moduli*” of the curve.

Let us explain the anabelian geometry of curves over algebraically closed fields of positive characteristic from the point of view of moduli spaces. Let $\overline{\mathbb{F}}_p$ be an algebraically closed field of \mathbb{F}_p , and let $\overline{\mathcal{M}}_{g,n}$ be the moduli stack over $\overline{\mathbb{F}}_p$ classifying pointed stable curves of type (g, n) , $\mathcal{M}_{g,n} \subseteq \overline{\mathcal{M}}_{g,n}$ the open substack classifying smooth pointed stable curves, $\overline{M}_{g,n}$ the coarse moduli space of $\overline{\mathcal{M}}_{g,n}$, and $M_{g,n}$ the coarse moduli space of $\mathcal{M}_{g,n}$. Let $q \in \overline{M}_{g,n}$ be an arbitrary point, $k(q)$ the residue field of $\overline{M}_{g,n}$, and k_q an algebraically closed field which contains $k(q)$. Then the composition of natural morphisms

$$\mathrm{Spec} k_q \rightarrow \mathrm{Spec} k(q) \rightarrow \overline{M}_{g,n}$$

determines a pointed stable curve $X_{k_q}^\bullet$ of type (g, n) over k_q . In particular, if k_q is an algebraic closure of $k(q)$, we shall write X_q^\bullet for $X_{k_q}^\bullet$. Write $\pi_1^{\mathrm{adm}}(X_{k_q}^\bullet)$ for the admissible fundamental group $X_{k_q}^\bullet$ and $\Gamma_{X_{k_q}^\bullet}$ for the dual semi-graph of $X_{k_q}^\bullet$. Since the isomorphism classes of $\pi_1^{\mathrm{adm}}(X_{k_q}^\bullet)$ and $\Gamma_{X_{k_q}^\bullet}$ do not depend on the choice of k_q , we shall denote by

$$\pi_1^{\mathrm{adm}}(q), \Gamma_q$$

the admissible fundamental group $\pi_1^{\mathrm{adm}}(X_{k_q}^\bullet)$ and the dual semi-graph $\Gamma_{X_{k_q}^\bullet}$, respectively. Moreover, we write $v(\Gamma_q)$, $e^{\mathrm{op}}(\Gamma_q)$, and $e^{\mathrm{cl}}(\Gamma_q)$ for the set of vertices of Γ_q , the set of open edges of Γ_q , and the set of closed edges of Γ_q , respectively.

Let $\overline{\Pi}_{g,n}$ be the set of isomorphism classes (as profinite groups) of admissible fundamental groups of pointed stable curves of type (g, n) over algebraically closed fields of characteristic p . Then the fundamental group functor π_1^{adm} induces a natural surjective map from the underlying topological space $|\overline{M}_{g,n}|$ of $\overline{M}_{g,n}$ to $\overline{\Pi}_{g,n}$ as follows:

$$[\pi_1^{\mathrm{adm}}] : |\overline{M}_{g,n}| \twoheadrightarrow \overline{\Pi}_{g,n}, \quad q \mapsto [\pi_1^{\mathrm{adm}}(q)],$$

where $[\pi_1^{\mathrm{adm}}(q)]$ denotes the isomorphism class of $\pi_1^{\mathrm{adm}}(q)$. Note that the map $[\pi_1^{\mathrm{adm}}]$ is not a bijection in general. For example, let $q, q' \in \overline{M}_{g,n}$ be arbitrary points such that $X_q \setminus D_{X_q}$ is isomorphic to $X_{q'} \setminus D_{X_{q'}}$ as schemes (e.g. X_q^\bullet is a Frobenius twist of $X_{q'}^\bullet$). Then we have that $[\pi_1^{\mathrm{adm}}(q)] = [\pi_1^{\mathrm{adm}}(q')]$. On the other hand, we introduce an equivalence relation \sim_{fe} on $|\overline{M}_{g,n}|$ which we call *Frobenius equivalence* (cf. [40, Definition 3.4] or Definition 3.1 of the present paper). Roughly speaking, $q_1 \sim_{fe} q_2$ for any points $q_1, q_2 \in \overline{M}_{g,n}$ if there exists an isomorphism $\rho : \Gamma_{q_1} \xrightarrow{\sim} \Gamma_{q_2}$ of dual semi-graphs of $X_{q_1}^\bullet$ of $X_{q_2}^\bullet$ such that the pointed stable curves $\tilde{X}_{q_1, v_1}^\bullet$ and $\tilde{X}_{q_2, v_2}^\bullet$ associated to v_1 and $v_2 \stackrel{\mathrm{def}}{=} \rho(v_1)$ (cf. Section 1), respectively, are isomorphic as schemes for every $v_1 \in v(\Gamma_{q_1})$. In particular, when $q_1 \in M_{g,n}$ (i.e., $X_{q_1}^\bullet$ is a non-singular curve), then $q_1 \sim_{fe} q_2$ if and only if $X_{q_1} \setminus D_{X_{q_1}}$ is isomorphic to $X_{q_2} \setminus D_{X_{q_2}}$ as schemes. Moreover, [40, Proposition 3.7] shows that $[\pi_1^{\mathrm{adm}}]$ factors through the following quotient set

$$\overline{\mathfrak{M}}_{g,n} \stackrel{\mathrm{def}}{=} |\overline{M}_{g,n}| / \sim_{fe}.$$

Then we obtain a natural surjective map

$$\pi_{g,n}^{\text{adm}} : \overline{\mathfrak{M}}_{g,n} \twoheadrightarrow \overline{\Pi}_{g,n}$$

induced by $[\pi_1^{\text{adm}}]$.

One of the main conjectures in the theory of anabelian geometry of curves is the following weak Isom-version of the Grothendieck conjecture of curves over algebraically closed fields of characteristic p (=the Weak Isom-version Conjecture):

Weak Isom-version Conjecture . *We maintain the notation introduced above. Then the surjective map*

$$\pi_{g,n}^{\text{adm}} : \overline{\mathfrak{M}}_{g,n} \twoheadrightarrow \overline{\Pi}_{g,n}, [q] \mapsto [\pi_1^{\text{adm}}(q)],$$

is a bijection, where $[q]$ denotes the image of q of the natural quotient map $|\overline{M}_{g,n}| \rightarrow \overline{\mathfrak{M}}_{g,n}$.

The Weak Isom-version Conjecture was essentially formulated by Tamagawa in the case of smooth pointed stable curves, and by the author in the case of arbitrary pointed stable curves (cf. [28], [40]), which means that the moduli spaces of curves in positive characteristic *can be reconstructed group-theoretically as sets* from admissible fundamental groups of pointed stable curves in positive characteristic. The Weak Isom-version Conjecture is very difficult, which was proved completely only in the case where $(g, n) = (0, 4)$. More precisely, we have the following result obtained by Tamagawa and the author (cf. [28, Theorem 0.2], [40, Theorem 3.8]):

Theorem 0.1. *We maintain the notation introduced above. Write $\overline{\mathfrak{M}}_{g,n}^{\text{cl}}$ for the images of the set of closed points of $|\overline{M}_{g,n}|$. Then we have that $\pi_{0,n}^{\text{adm}}(\overline{\mathfrak{M}}_{0,n}^{\text{cl}}) \cap \pi_{0,n}^{\text{adm}}(\overline{\mathfrak{M}}_{0,n} \setminus \overline{\mathfrak{M}}_{0,n}^{\text{cl}}) = \emptyset$, and that*

$$\pi_{0,n}^{\text{adm}}|_{\overline{\mathfrak{M}}_{0,n}^{\text{cl}}} : \overline{\mathfrak{M}}_{0,n}^{\text{cl}} \rightarrow \overline{\Pi}_{0,n}$$

is an injection. In particular, the Weak Isom-version Conjecture holds when $(g, n) = (0, 4)$.

Remark 0.1.1. In other words, Theorem 0.1 is equivalent to the following anabelian result:

Let $q_1, q_2 \in \overline{M}_{0,n}$ be arbitrary points. Suppose that q_1 is closed, and that $\pi_1^{\text{adm}}(q_1)$ is isomorphic to $\pi_1^{\text{adm}}(q_2)$ as profinite groups. Then we have $q_1 \sim_{fe} q_2$.

Suppose that g is an arbitrary non-negative integer number. We also want to mention the following *finiteness theorem* (cf. [16], [19], [30], [31], [35]):

Let $[q] \in \overline{\mathfrak{M}}_{g,n}^{\text{cl}}$. Then we have $\#((\pi_{g,n}^{\text{adm}})^{-1}([\pi_1^{\text{adm}}(q)]) \cap \overline{\mathfrak{M}}_{g,n}^{\text{cl}}) < \infty$.

At the time of writing, almost all of the researches concerning the anabelian geometry of curves over algebraically closed fields of characteristic p focus on the Weak Isom-version Conjecture, and the conjecture cannot give us any new insight into the anabelian phenomena of curves over algebraically closed fields of characteristic p . On the other hand, the results proved by the author in [36] show that

it is possible that the *topological structures* of moduli spaces of curves in positive characteristic can be reconstructed group-theoretically from the geometric fundamental groups of curves in positive characteristic.

This is the main observation that motivated the theory developed in the present series of papers.

From now on, we shall regard $\overline{\mathfrak{M}}_{g,n}$ as a topological space whose topology is induced naturally by the Zariski topology of $|\overline{M}_{g,n}|$. Let \mathcal{G} be the category of finite groups and $G \in \mathcal{G}$ a finite group. We put

$$U_{\overline{\Pi}_{g,n}, G} \stackrel{\text{def}}{=} \{[\pi_1^{\text{adm}}(q)] \in \overline{\Pi}_{g,n} \mid \text{Hom}_{\text{surj}}(\pi_1^{\text{adm}}(q), G) \neq \emptyset\},$$

where $\text{Hom}_{\text{surj}}(-, -)$ denotes the set of surjective homomorphisms of profinite groups. We define a topological space

$$(\overline{\Pi}_{g,n}, O_{\overline{\Pi}_{g,n}})$$

group-theoretically from the set of isomorphism classes of admissible fundamental groups of pointed stable curves $\overline{\Pi}_{g,n}$, whose underlying set is $\overline{\Pi}_{g,n}$, and whose topology $O_{\overline{\Pi}_{g,n}}$ is generated by $\{U_{\overline{\Pi}_{g,n}, G}\}_{G \in \mathcal{G}}$ as open subsets. For simplicity, we still use the notation $\overline{\Pi}_{g,n}$ to denote the topological space $(\overline{\Pi}_{g,n}, O_{\overline{\Pi}_{g,n}})$, and shall say

$$\overline{\Pi}_{g,n}$$

the moduli space of admissible fundamental groups of pointed stable curves of type (g, n) over algebraically closed fields of characteristic p or the moduli space of admissible fundamental groups of type (g, n) in characteristic p , for short. Theorem 3.5 (or Theorem 7.14) of the present paper implies that the surjective map

$$\pi_{g,n}^{\text{adm}} : \overline{\mathfrak{M}}_{g,n} \twoheadrightarrow \overline{\Pi}_{g,n}$$

is also a continuous map. Moreover, we pose the following conjecture, which is the main conjecture of the theory developed in the present series of papers:

Homeomorphism Conjecture . *We maintain the notation introduced above. Then we have that*

$$\pi_{g,n}^{\text{adm}} : \overline{\mathfrak{M}}_{g,n} \twoheadrightarrow \overline{\Pi}_{g,n}$$

is a homeomorphism.

The Homeomorphism Conjecture means that the moduli spaces of curves in positive characteristic *can be reconstructed group-theoretically as topological spaces* from admissible fundamental groups of pointed stable curves in positive characteristic. This conjecture gives us a new insight into the theory of the anabelian geometry of curves over algebraically closed fields of characteristic p based on the following philosophy:

The anabelian properties of pointed stable curves over algebraically closed fields of characteristic p are equivalent to the topological properties of the topological space $\overline{\Pi}_{g,n}$.

This new anabelian philosophy has raised a host of questions which cannot be seen if we only consider the Weak Isom-version Conjecture (e.g. Problem 3.9 of the present paper).

Next, let us explain the difference between the Weak Isom-version Conjecture and the Homeomorphism Conjecture from the aspect of group theory. The mean of *anabelian geometry* around the Weak Isom-version Conjecture (i.e., the theory developed in [16], [19], [27], [28], [29], [30], [31], [35], [36], [37]) is the following:

Let \mathcal{F}_i , $i \in \{1, 2\}$, be a geometric object in a certain category and $\Pi_{\mathcal{F}_i}$ the fundamental group associated to \mathcal{F}_i . Then the set of isomorphisms of geometric objects $\text{Isom}(\mathcal{F}_1, \mathcal{F}_2)$ can be understood from the set of isomorphisms of group-theoretical objects $\text{Isom}(\Pi_{\mathcal{F}_1}, \Pi_{\mathcal{F}_2})$. The term “*anabelian*” means that the geometric properties can be determined by the isomorphism classes of the fundamental groups. On the other hand, we do not know the relation of \mathcal{F}_1 and \mathcal{F}_2 if $\Pi_{\mathcal{F}_1}$ is not isomorphic to $\Pi_{\mathcal{F}_2}$.

In the theory developed in the present series of papers, we consider anabelian geometry in a completely different way. The mean of *anabelian geometry* around the Homeomorphism Conjecture is the following:

The relation of \mathcal{F}_1 and \mathcal{F}_2 in a certain moduli space can be understood from the set of open continuous homomorphisms $\text{Hom}(\Pi_{\mathcal{F}_1}, \Pi_{\mathcal{F}_2})$. Moreover, $\text{Hom}(\Pi_{\mathcal{F}_1}, \Pi_{\mathcal{F}_2})$ contains the geometric information of the moduli space. The term “*anabelian*” means the geometric properties of a certain *moduli space* (i.e., not only a single geometric object but also the moduli space of geometric objects), where the moduli space can be reconstructed group-theoretically from fundamental groups.

Note that we cannot consider the set of morphisms of geometric objects $\text{Hom}(\mathcal{F}_1, \mathcal{F}_2)$, since $\text{Hom}(\mathcal{F}_1, \mathcal{F}_2) = \emptyset$ and $\text{Hom}(\Pi_{\mathcal{F}_1}, \Pi_{\mathcal{F}_2}) \neq \emptyset$ in general (e.g. the specialization homomorphisms). In fact, the existence of specialization homomorphisms is the reason that Tamagawa cannot formulate a “Hom-type” conjecture for tame fundamental groups of smooth pointed stable curves in general (cf. [28, Remark 1.34]). Thus, roughly speaking, the Weak Isom-version Conjecture is an “*Isom-type*” problem, and the Homeomorphism Conjecture is a “*Hom-type*” problem. In fact, in [36], the author formulated the so-called *Weak Hom-version Conjecture* for smooth pointed stable curves which is equivalent to Homeomorphism Conjecture when $q \in M_{g,n}$. Similar to other theory in anabelian geometry, Hom-type problems are so much harder than the Isom-type problems.

Now, our main result of the present paper is as follows (see also Theorem 6.7):

Theorem 0.2. *We maintain the notation introduced above. Let $[q] \in \overline{\mathfrak{M}}_{0,n}^{\text{cl}}$ be an arbitrary closed point. Then $\pi_{0,n}^{\text{adm}}([q])$ is a closed point of $\overline{\Pi}_{0,n}$. In particular, the Homeomorphism Conjecture holds when $(g, n) = (0, 4)$.*

Remark 0.2.1. In [41], we will prove that the Homeomorphism Conjecture also holds when $(g, n) = (1, 1)$. Then the Homeomorphism Conjecture holds when the dimension of $\overline{M}_{g,n}$ is 1. In [42], we will prove a generalized version of Tamagawa’s essential dimension conjecture for closed points of $\overline{M}_{1,n}$. In [43], by equipping the sets of inertia subgroups

with certain orders, we define clutching morphisms and forgetting morphisms for moduli spaces of admissible fundamental groups, and prove the clutching morphisms and the forgetting morphisms are continuous maps.

Denote by $\text{Hom}_{\text{pro-gps}}^{\text{open}}(-, -)$ and $\text{Isom}_{\text{pro-gps}}(-, -)$ the set of open continuous homomorphisms of profinite groups and the set of isomorphisms of profinite groups, respectively. Then Theorem 0.2 follows immediately from the following strong (Hom-type) anabelian result, which is a ultimate generalization of [28, Theorem 0.2] when $g = 0$ and q_1 is closed (see also Theorem 6.6).

Theorem 0.3. *Let $q_1, q_2 \in \overline{M}_{0,n}$ be arbitrary points. Suppose that q_1 is closed. Then we have that*

$$\text{Hom}_{\text{pro-gps}}^{\text{open}}(\pi_1^{\text{adm}}(q_1), \pi_1^{\text{adm}}(q_2)) \neq \emptyset$$

if and only if $q_1 \sim_{f_e} q_2$. In particular, if this is the case, we have that q_2 is a closed point, and that

$$\text{Hom}_{\text{pro-gps}}^{\text{open}}(\pi_1^{\text{adm}}(q_1), \pi_1^{\text{adm}}(q_2)) = \text{Isom}_{\text{pro-gps}}(\pi_1^{\text{adm}}(q_1), \pi_1^{\text{adm}}(q_2)).$$

Remark 0.3.1. In fact, in the present paper, we will prove a slightly stronger version of Theorem 0.3 by replacing $\pi_1^{\text{adm}}(q_1)$ and $\pi_1^{\text{adm}}(q_2)$ by the maximal pro-solvable quotients $\pi_1^{\text{adm}}(q_1)^{\text{sol}}$ and $\pi_1^{\text{adm}}(q_2)^{\text{sol}}$ of $\pi_1^{\text{adm}}(q_1)$ and $\pi_1^{\text{adm}}(q_2)$, respectively. Then we obtain a solvable version of Theorem 0.2 which is slightly stronger than Theorem 0.2. In particular, we obtain that *the Solvable Homeomorphism Conjecture* (cf. Section 3.2) holds when $(g, n) = (0, 4)$.

Remark 0.3.1. Note that Theorem 0.3 is essentially different from Theorem 0.1. The reason is as follows: Let $q_1, q_2 \in |\overline{M}_{g,n}|$ be arbitrary points such that q_1 is not closed, and that q_2 is a closed point contained in the topological closure of q_1 in $|\overline{M}_{g,n}|$. Then every open continuous homomorphism $\pi_1^{\text{adm}}(q_1) \rightarrow \pi_1^{\text{adm}}(q_2)$ is not an isomorphism (cf. [30, Theorem 0.3]).

Next, we explain the method of proving Theorem 0.3 (or Theorem 0.2). We establish two fundamental tools to analyze the geometric behavior of curves from open continuous homomorphisms of admissible fundamental groups, which play central roles in the theory of moduli spaces of admissible fundamental groups in positive characteristic. The first tool is the following result, which says that the inertia subgroups and field structures associated to inertia subgroups of marked points can be reconstructed group-theoretically from arbitrary surjective open continuous homomorphisms of admissible fundamental groups (cf. Theorem 4.11 and Theorem 4.13 for more precise statements):

Theorem 0.4. *Let X_i^\bullet , $i \in \{1, 2\}$, be a pointed stable curve of type (g_{X_i}, n_{X_i}) over an algebraically closed field k_i of characteristic $p > 0$, and $\Gamma_{X_i^\bullet}$ the dual semi-graph of X_i^\bullet . Let $\Pi_{X_i^\bullet}$ be either the admissible fundamental group $\pi_1^{\text{adm}}(X_i^\bullet)$ of X_i^\bullet or the maximal pro-solvable quotient $\pi_1^{\text{adm}}(X_i^\bullet)^{\text{sol}}$ of $\pi_1^{\text{adm}}(X_i^\bullet)$, and $I_i \subseteq \Pi_{X_i^\bullet}$ an closed subgroup associated to an open edge of $\Gamma_{X_i^\bullet}$ (i.e., a closed subgroup which is (outer) isomorphic to the inertia subgroup of the marked point corresponding to an open edge of $\Gamma_{X_i^\bullet}$). Suppose that $(g_{X_1}, n_{X_1}) = (g_{X_2}, n_{X_2})$. Let*

$$\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$$

be an arbitrary surjective open continuous homomorphism of profinite groups. Then the following statements hold:

- (i) $\phi(I_1) \subseteq \Pi_{X_2^\bullet}$ is a closed subgroup associated to an open edge of $\Gamma_{X_2^\bullet}$, and that there exists a closed subgroup $I' \subseteq \Pi_{X_1^\bullet}$ associated to an open edge of $\Gamma_{X_1^\bullet}$ such that $\phi(I') = I_2$.
- (ii) The field structures associated to inertia subgroups of marked points can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$, and that ϕ induces a field isomorphism between the fields associated to I_1 and $\phi(I_1)$ group-theoretically.

The main ingredient in the proof of Theorem 0.4 is a formula for the maximum generalized Hasse-Witt invariant $\gamma^{\max}(\Pi_{X_i^\bullet})$ of prime-to- p cyclic admissible coverings of X_i^\bullet , which was proved by the author in [39].

The second tool is the following result, which we call combinatorial Grothendieck conjecture for surjections, and which says that the geometry (i.e., topological and combinatorial structures) of pointed stable curves can be completely reconstructed group-theoretically from open continuous homomorphisms of admissible fundamental groups (cf. Theorem 5.30 for a more precise statement, and Theorem 5.26 for a more general form under certain assumptions):

Theorem 0.5. *Let X_i^\bullet , $i \in \{1, 2\}$, be a pointed stable curve of type $(0, n)$ over an algebraically closed field k_i of characteristic $p > 0$, and $\Gamma_{X_i^\bullet}$ the dual semi-graph of X_i^\bullet . Let $\Pi_{X_i^\bullet}$ be the maximal pro-solvable quotient of the admissible fundamental group of X_i^\bullet and $\Pi_i \subseteq \Pi_{X_i^\bullet}$ a closed subgroup associated to a vertex (i.e., a closed subgroup which is (outer) isomorphic to the admissible fundamental group of the smooth pointed stable curve associated to a vertex of $\Gamma_{X_i^\bullet}$), and $I_i \subseteq \Pi_{X_i^\bullet}$ an closed subgroup associated to a closed edge (i.e., a closed subgroup which is (outer) isomorphic to the inertia subgroup of the node corresponding to a closed edge of $\Gamma_{X_i^\bullet}$). Suppose that $\#v(\Gamma_{X_1^\bullet}) = \#v(\Gamma_{X_2^\bullet})$ and $\#e^{\text{cl}}(\Gamma_{X_1^\bullet}) = \#e^{\text{cl}}(\Gamma_{X_2^\bullet})$, where $\#(-)$ denotes the cardinality of $(-)$. Let*

$$\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$$

be an arbitrary surjective open continuous homomorphism of profinite groups. Then the following statements hold:

- (i) $\phi(\Pi_1) \subseteq \Pi_{X_2^\bullet}$ is a closed subgroup associated to a vertex of $\Gamma_{X_2^\bullet}$, and that there exists a closed subgroup $\Pi' \subseteq \Pi_{X_1^\bullet}$ associated to a vertex of $\Gamma_{X_1^\bullet}$ such that $\phi(\Pi') = \Pi_2$.
- (ii) $\phi(I_1) \subseteq \Pi_{X_2^\bullet}$ is a closed subgroup associated to a closed edge of $\Gamma_{X_2^\bullet}$, and that there exists a closed subgroup $I' \subseteq \Pi_{X_1^\bullet}$ associated to a closed edge of $\Gamma_{X_1^\bullet}$ such that $\phi(I') = I_2$.
- (iii) ϕ induces an isomorphism

$$\phi^{\text{sg}} : \Gamma_{X_1^\bullet} \xrightarrow{\sim} \Gamma_{X_2^\bullet}$$

of dual semi-graphs group-theoretically.

The main ingredient in the proof of Theorem 0.5 is a formula for the limit of p -averages $\text{Avr}_p(\Pi_{X_i^\bullet})$ of the admissible fundamental group of X_i^\bullet , which was proved by Tamagawa and the author (cf. [28], [38]). The key observations of the proofs of Theorem 0.4 and Theorem 0.5 are the following:

The inequalities of $\gamma^{\max}(\Pi_{X_i^\bullet})$ and $\text{Avr}_p(\Pi_{X_i^\bullet})$ induced by ϕ play roles of the comparability of (outer) Galois representations in the theory of the anabelian geometry of curves over algebraically closed fields of characteristic $p > 0$.

In fact, under certain assumptions, Theorem 0.5 also holds for arbitrary types (cf. Theorem 5.26 and Remark 5.26.1). Moreover, the author believes that Theorem 0.4, Theorem 0.5, and Theorem 5.26 will play important roles in the proof of the Homeomorphism Conjecture for arbitrary types.

We observe that the scheme structure of a smooth pointed stable curve of type $(0, n)$ over $\overline{\mathbb{F}}_p$ is determined (via generalized Hasse-Witt invariants of admissible coverings) completely by its inertia subgroups of marked points and the field structures associated to the inertia subgroups. Then Theorem 0.4 implies that, if $X_{q_1}^\bullet$ is non-singular, the scheme structure of $X_{q_2}^\bullet$ can be determined by the scheme structure of $X_{q_1}^\bullet$ via an open continuous homomorphism between their admissible fundamental groups. Moreover, by applying Theorem 0.4, the geometric operation (=removing a subset of marked points of a pointed stable curve and contracting the (-1) -curves and the (-2) -curves of a pointed semi-stable curve) can be translated to the group-theoretical operation (=quotient of a closed subgroup of the admissible fundamental group of a pointed stable curve, where the closed subgroup is generated by the inertia subgroups corresponding to a subset of marked points of the pointed stable curve). Then we can reduce Theorem 0.3 to the case where $\#v(\Gamma_{q_1}) = \#v(\Gamma_{q_2})$ and $\#e^{\text{cl}}(\Gamma_{q_1}) = \#e^{\text{cl}}(\Gamma_{q_2})$. Moreover, by applying Theorem 0.5, we can reduce Theorem 0.3 further to the case where q_1 and q_2 are contained in $M_{0,n}$ (i.e., $X_{q_1}^\bullet$ and $X_{q_2}^\bullet$ are non-singular). Then Theorem 0.3 follows from [36, Theorem 1.2] proved by the author. This completes the proof of our main theorem.

The present paper is organized as follows. In Section 1, we fix some notation concerning admissible coverings and admissible fundamental groups. In Section 2, we recall the definition of generalized Hasse-Witt invariants, a formula for maximum generalized Hasse-Witt invariants of prime-to- p admissible coverings, and a formula for limits of p -averages of admissible fundamental groups. In Section 3, we introduce the moduli spaces of admissible fundamental groups and formulate the Homeomorphism Conjecture. In Section 4, we prove Theorem 0.4. In Section 5, we prove Theorem 0.5. In Section 6, we prove our main theorem. In Section 7, we prove the continuity of $\pi_{g,n}^{\text{adm}}$.

ACKNOWLEDGEMENTS

The main result of the present paper was obtained in July 2019, the author would like to thank Zhi Hu, Yuji Odaka, Akio Tamagawa, and Kazuhiko Yamaki for comments. 1 Admissible coverings and admissible fundamental groups

In this section, we recall some notation and definitions concerning admissible coverings and admissible fundamental groups.

Definition 1.1. Let \mathbb{G} be a semi-graph (cf. [39, Definition 2.1]).

(a) We shall denote by $v(\mathbb{G})$, $e^{\text{op}}(\mathbb{G})$, and $e^{\text{cl}}(\mathbb{G})$ the set of vertices of \mathbb{G} , the set of open edges of \mathbb{G} , and the set of closed edges of \mathbb{G} , respectively.

(b) The semi-graph \mathbb{G} can be regarded as a topological space with natural topology induced by \mathbb{R}^2 . We define an *one-point compactification* \mathbb{G}^{cpt} of \mathbb{G} as follows: if $e^{\text{op}}(\mathbb{G}) = \emptyset$, we put $\mathbb{G}^{\text{cpt}} = \mathbb{G}$; otherwise, the set of vertices of \mathbb{G}^{cpt} is the disjoint union $v(\mathbb{G}^{\text{cpt}}) \stackrel{\text{def}}{=} v(\mathbb{G}) \sqcup \{v_\infty\}$, the set of closed edges of \mathbb{G}^{cpt} is $e^{\text{cl}}(\mathbb{G}^{\text{cpt}}) \stackrel{\text{def}}{=} e^{\text{cl}}(\mathbb{G}) \cup e^{\text{op}}(\mathbb{G})$, the set of open edges of \mathbb{G} is empty, and every edge $e \in e^{\text{op}}(\mathbb{G}) \subseteq e^{\text{cl}}(\mathbb{G}^{\text{cpt}})$ connects v_∞ with the vertex that is abutted by e .

(c) Let $v \in v(\mathbb{G})$. We shall say that \mathbb{G} is *2-connected* at v if $\mathbb{G} \setminus \{v\}$ is either empty or connected. Moreover, we shall say that \mathbb{G} is *2-connected* if \mathbb{G} is 2-connected at each $v \in v(\mathbb{G})$. Note that, if \mathbb{G} is connected, then \mathbb{G}^{cpt} is 2-connected at each $v \in v(\mathbb{G}) \subseteq v(\mathbb{G}^{\text{cpt}})$ if and only if \mathbb{G}^{cpt} is 2-connected. We put

$$b(v) \stackrel{\text{def}}{=} \sum_{e \in e^{\text{op}}(\mathbb{G}) \cup e^{\text{cl}}(\mathbb{G})} b_e(v),$$

where $b_e(v) \in \{0, 1, 2\}$ denotes the number of times that e meets v . We put

$$v(\mathbb{G})^{b \leq 1} \stackrel{\text{def}}{=} \{v \in v(\mathbb{G}) \mid b(v) \leq 1\},$$

and denote by $e^{\text{cl}}(\mathbb{G})^{b \leq 1}$ the set of closed edges of \mathbb{G} which meet a vertex of $v(\mathbb{G})^{b \leq 1}$.

Let p be a prime number, and let

$$X^\bullet = (X, D_X)$$

be a pointed *semi-stable* curve of type (g_X, n_X) over an algebraically closed field k of characteristic p , where X denotes the underlying curve, D_X denotes the set of marked points, g_X denotes the genus of X , and n_X denotes the cardinality $\#D_X$ of D_X . Write Γ_{X^\bullet} for the dual semi-graph of X^\bullet (cf. [34, Definition 3.1] for the definition of the dual semi-graph of a pointed semi-stable curve) and $r_X \stackrel{\text{def}}{=} \dim_{\mathbb{Q}}(H^1(\Gamma_{X^\bullet}, \mathbb{Q}))$ for the Betti number of the semi-graph Γ_{X^\bullet} .

Let $v \in v(\Gamma_{X^\bullet})$ and $e \in e^{\text{op}}(\Gamma_{X^\bullet}) \cup e^{\text{cl}}(\Gamma_{X^\bullet})$. We write X_v for the irreducible component of X corresponding to v , write x_e for the node of X corresponding to e if $e \in e^{\text{cl}}(\Gamma_{X^\bullet})$, and write x_e for the marked point of X corresponding to e if $e \in e^{\text{op}}(\Gamma_{X^\bullet})$. Moreover, write \tilde{X}_v for the *smooth* compactification of $U_{X_v} \stackrel{\text{def}}{=} X_v \setminus X_v^{\text{sing}}$, where $(-)^{\text{sing}}$ denotes the singular locus of $(-)$. We define a smooth pointed semi-stable curve of type (g_v, n_v) over k to be

$$\tilde{X}_v^\bullet = (\tilde{X}_v, D_{\tilde{X}_v} \stackrel{\text{def}}{=} (\tilde{X}_v \setminus U_{X_v}) \cup (D_X \cap X_v)).$$

We shall say that \tilde{X}_v^\bullet is the smooth pointed semi-stable curve of type (g_v, n_v) associated to v , or the smooth pointed semi-stable curve associated to v for short. In particular, we shall say that \tilde{X}_v^\bullet is the smooth pointed stable curve associated to v if \tilde{X}_v^\bullet is a pointed stable curve over k .

Definition 1.2. Let $Y^\bullet = (Y, D_Y)$ be a pointed semi-stable curve over k , $f^\bullet : Y^\bullet \rightarrow X^\bullet$ a finite morphism of pointed semi-stable curves over k , and $f : Y \rightarrow X$ the morphism of underlying curves induced by f^\bullet .

We shall say f^\bullet a *Galois admissible covering* over k (or Galois admissible covering for short) if the following conditions are satisfied:

(i) There exists a finite group $G \subseteq \text{Aut}_k(Y^\bullet)$ such that $Y^\bullet/G = X^\bullet$, and f^\bullet is equal to the quotient morphism $Y^\bullet \rightarrow Y^\bullet/G$.

(ii) For each $y \in Y^{\text{sm}} \setminus D_Y$, f is étale at y , where $(-)^{\text{sm}}$ denotes the smooth locus of $(-)$.

(iii) For any $y \in Y^{\text{sing}}$, the image $f(y)$ is contained in X^{sing} .

(iv) For each $y \in Y^{\text{sing}}$, we write $D_y \subseteq G$ for the decomposition group of y and $\#D_y$ for the cardinality of D_y . Then we have that $(\#D_y, p) = 1$, and that the local morphism between two nodes induced by f may be described as follows:

$$\begin{array}{ccc} \widehat{\mathcal{O}}_{X, f(y)} \cong k[[u, v]]/uv & \rightarrow & \widehat{\mathcal{O}}_{Y, y} \cong k[[s, t]]/st \\ u & \mapsto & s^{\#D_y} \\ v & \mapsto & t^{\#D_y}, \end{array}$$

where $\#(-)$ denotes the cardinality of $(-)$. Moreover, we have that $\tau(s) = \zeta_{\#D_y} s$ and $\tau(t) = \zeta_{\#D_y}^{-1} t$ for each $\tau \in D_y$, where $\zeta_{\#D_y}$ is a primitive $\#D_y$ th root of unit.

(v) The local morphism between two marked points induced by f may be described as follows:

$$\begin{array}{ccc} \widehat{\mathcal{O}}_{X, f(y)} \cong k[[a]] & \rightarrow & \widehat{\mathcal{O}}_{Y, y} \cong k[[b]] \\ a & \mapsto & b^m, \end{array}$$

where $(m, p) = 1$ (i.e., a tamely ramified extension).

Moreover, we shall say f^\bullet an *admissible covering* if there exists a morphism of pointed semi-stable curves $h^\bullet : W^\bullet \rightarrow Y^\bullet$ over k such that the composite morphism $f^\bullet \circ h^\bullet : W^\bullet \rightarrow X^\bullet$ is a Galois admissible covering over k . We shall say an admissible covering f^\bullet *étale* if f is an étale morphism.

Let Z^\bullet be a disjoint union of finitely many pointed semi-stable curves over k . We shall say that a morphism $f_Z^\bullet : Z^\bullet \rightarrow X^\bullet$ over k is a *multi-admissible covering* if the restriction of f_Z^\bullet to each connected component of Z^\bullet is admissible.

Definition 1.3. Let $f^\bullet : Y^\bullet \rightarrow X^\bullet$ be an admissible covering over k of degree m . Let $e \in e^{\text{op}}(\Gamma_{X^\bullet}) \cup e^{\text{cl}}(\Gamma_{X^\bullet})$ and x_e the closed point of X corresponding to e . We put

$$\begin{aligned} e_f^{\text{cl, ra}} &\stackrel{\text{def}}{=} \{e \in e^{\text{cl}}(\Gamma_{X^\bullet}) \mid \#f^{-1}(x_e) = 1\}, \\ e_f^{\text{cl, ét}} &\stackrel{\text{def}}{=} \{e \in e^{\text{cl}}(\Gamma_{X^\bullet}) \mid \#f^{-1}(x_e) = m\}, \\ e_f^{\text{op, ra}} &\stackrel{\text{def}}{=} \{e \in e^{\text{op}}(\Gamma_{X^\bullet}) \mid \#f^{-1}(x_e) = 1\}, \end{aligned}$$

$$\begin{aligned}
e_f^{\text{op}, \text{ét}} &\stackrel{\text{def}}{=} \{e \in e^{\text{op}}(\Gamma_{X^\bullet}) \mid \#f^{-1}(x_e) = m\}, \\
v_f^{\text{ra}} &\stackrel{\text{def}}{=} \{v \in v(\Gamma_{X^\bullet}) \mid \#\text{Irr}(f^{-1}(X_v)) = 1\}, \\
v_f^{\text{sp}} &\stackrel{\text{def}}{=} \{v \in v(\Gamma_{X^\bullet}) \mid \#\text{Irr}(f^{-1}(X_v)) = m\},
\end{aligned}$$

where $\text{Irr}(-)$ denotes the set of irreducible components of $(-)$, “ra” means “ramification”, and “sp” means “split”. Note that if the Galois closure of f^\bullet is a Galois admissible covering whose Galois group is a p -group, then the definition of admissible coverings implies that $\#e_f^{\text{cl}, \text{ra}} = \#e_f^{\text{op}, \text{ra}} = 0$.

Let \mathcal{C} be a category. We shall write $\text{Ob}(\mathcal{C})$ for the class of objects of \mathcal{C} , and write $\text{Hom}(\mathcal{C})$ for the class of morphisms of \mathcal{C} . We denote by

$$\text{Cov}^{\text{adm}}(X^\bullet) \stackrel{\text{def}}{=} (\text{Ob}(\text{Cov}^{\text{adm}}(X^\bullet)), \text{Hom}(\text{Cov}^{\text{adm}}(X^\bullet)))$$

the category which consists of the following data: (i) $\text{Ob}(\text{Cov}^{\text{adm}}(X^\bullet))$ consists of an empty object and all the pairs $(Z^\bullet, f_Z^\bullet : Z^\bullet \rightarrow X^\bullet)$, where Z^\bullet is a disjoint union of finitely many pointed semi-stable curves over k , and f_Z^\bullet is a multi-admissible covering over k ; (ii) for any $(Z^\bullet, f_Z^\bullet), (Y^\bullet, f_Y^\bullet) \in \text{Ob}(\text{Cov}^{\text{adm}}(X^\bullet))$, we define

$$\text{Hom}((Z^\bullet, f_Z^\bullet), (Y^\bullet, f_Y^\bullet)) \stackrel{\text{def}}{=} \{g^\bullet \in \text{Hom}_k(Z^\bullet, Y^\bullet) \mid f_Y^\bullet \circ g^\bullet = f_Z^\bullet\},$$

where $\text{Hom}_k(Z^\bullet, Y^\bullet)$ denotes the set of k -morphisms of pointed semi-stable curves. It is well known that $\text{Cov}^{\text{adm}}(X^\bullet)$ is a Galois category. Thus, by choosing a base point $x \in X^{\text{sm}} \setminus D_X$, we obtain a fundamental group $\pi_1^{\text{adm}}(X^\bullet, x)$ which is called the *admissible fundamental group* of X^\bullet . For simplicity of notation, we omit the base point and denote the admissible fundamental group by

$$\pi_1^{\text{adm}}(X^\bullet).$$

Note that, by the definition of admissible coverings, the admissible fundamental group of X^\bullet is naturally isomorphic to the tame fundamental group of X^\bullet when X^\bullet is smooth over k . Let $v \in v(\Gamma_{X^\bullet})$. Write $\pi_1^{\text{adm}}(\tilde{X}_v^\bullet)$ for the admissible fundamental group of the smooth pointed semi-stable curve \tilde{X}_v^\bullet associated to v . Then we have a natural (outer) injection

$$\pi_1^{\text{adm}}(\tilde{X}_v^\bullet) \hookrightarrow \pi_1^{\text{adm}}(X^\bullet).$$

On the other hand, the structure of maximal pro-prime-to- p quotient $\pi_1^{\text{adm}}(X^\bullet)^{p'}$ of $\pi_1^{\text{adm}}(X^\bullet)$ is well-known, which is isomorphic to the pro-prime-to- p completion of the following group (cf. [V, Théorème 2.2 (c)])

$$\langle a_1, \dots, a_{g_X}, b_1, \dots, b_{g_X}, c_1, \dots, c_{n_X} \mid \prod_{i=1}^{g_X} [a_i, b_i] \prod_{j=1}^{n_X} c_j = 1 \rangle.$$

We shall denote by $\pi_1^{\text{adm}}(X)$, $\pi_1^{\text{ét}}(X)$, $\pi_1^{\text{top}}(\Gamma_{X^\bullet})$ the admissible fundamental group of the pointed semi-stable curve (X, \emptyset) , the étale fundamental group of the underlying curve X

of X^\bullet , and the profinite completion of the topological fundamental group of Γ_{X^\bullet} , respectively. Then we have the following natural surjective open continuous homomorphisms (for suitable choices of base points):

$$\pi_1^{\text{adm}}(X^\bullet) \twoheadrightarrow \pi_1^{\text{adm}}(X) \twoheadrightarrow \pi_1^{\text{ét}}(X) \twoheadrightarrow \pi_1^{\text{top}}(\Gamma_{X^\bullet}).$$

Note that the isomorphism classes of $\pi_1^{\text{adm}}(X^\bullet)$, $\pi_1^{\text{adm}}(X)$, $\pi_1^{\text{ét}}(X)$, and $\pi_1^{\text{top}}(\Gamma_{X^\bullet})$ depend only on the pointed *stable* curve associated to X^\bullet (i.e., the pointed stable curve obtained by contracting the (-1) -curves and (-2) -curves of X^\bullet).

The admissible fundamental groups of pointed stable curves can be also described by using logarithmic geometry. Let $\overline{\mathcal{M}}_{g_X, n_X, \mathbb{Z}}$ be the moduli stack over $\text{Spec } \mathbb{Z}$ parameterizing pointed stable curves of type (g_X, n_X) and $\mathcal{M}_{g_X, n_X, \mathbb{Z}}$ the open substack of $\overline{\mathcal{M}}_{g_X, n_X, \mathbb{Z}}$ parameterizing smooth pointed stable curves. Write $\overline{\mathcal{M}}_{g_X, n_X, \mathbb{Z}}^{\log}$ for the log stack obtained by equipping $\overline{\mathcal{M}}_{g_X, n_X, \mathbb{Z}}$ with the natural log structure associated to the divisor with normal crossings $\overline{\mathcal{M}}_{g_X, n_X, \mathbb{Z}} \setminus \mathcal{M}_{g_X, n_X, \mathbb{Z}} \subset \overline{\mathcal{M}}_{g_X, n_X, \mathbb{Z}}$ relative to $\text{Spec } \mathbb{Z}$. The pointed stable curve X^\bullet over k induces a morphism $\text{Spec } k \rightarrow \overline{\mathcal{M}}_{g_X, n_X, \mathbb{Z}}$. Write s_X^{\log} for the log scheme whose underlying scheme is $\text{Spec } k$, and whose log structure is the pulling-back log structure induced by the morphism $\text{Spec } k \rightarrow \overline{\mathcal{M}}_{g_X, n_X, \mathbb{Z}}$. We obtain a natural morphism $s_X^{\log} \rightarrow \overline{\mathcal{M}}_{g_X, n_X, \mathbb{Z}}^{\log}$ induced by the morphism $\text{Spec } k \rightarrow \overline{\mathcal{M}}_{g_X, n_X, \mathbb{Z}}$ and a stable log curve

$$X^{\log} \stackrel{\text{def}}{=} s_X^{\log} \times_{\overline{\mathcal{M}}_{g_X, n_X, \mathbb{Z}}^{\log}} \overline{\mathcal{M}}_{g_X, n_X+1, \mathbb{Z}}^{\log}$$

over s_X^{\log} whose underlying scheme is X . Let $Y^{\log} \rightarrow X^{\log}$ be an arbitrary Kummer log étale covering. One can prove that there exists a Kummer log étale covering $t_X^{\log} \rightarrow s_X^{\log}$ such that $Y^{\log} \times_{s_X^{\log}} t_X^{\log} \rightarrow X^{\log} \times_{s_X^{\log}} t_X^{\log}$ is a log admissible covering (cf. [9, §3.5 Definition]) over t_X^{\log} . Then the admissible fundamental group of X^\bullet does not depend on the log structure of X^{\log} , and [9, §3.11 Proposition] implies that the admissible fundamental group $\pi_1^{\text{adm}}(X^\bullet)$ of X^\bullet is naturally isomorphic to the geometric log étale fundamental group of X^{\log} (i.e., $\ker(\pi_1(X^{\log}) \rightarrow \pi_1(s_X^{\log}))$).

Let

$$\pi_1^{\text{adm}}(X^\bullet)^{\text{sol}}, \pi_1^{\text{adm}}(X)^{\text{sol}}, \pi_1^{\text{ét}}(X)^{\text{sol}}, \pi_1^{\text{top}}(\Gamma_{X^\bullet})^{\text{sol}}$$

be the maximal pro-solvable quotients of $\pi_1^{\text{adm}}(X^\bullet)$, $\pi_1^{\text{adm}}(X)$, $\pi_1^{\text{ét}}(X)$, $\pi_1^{\text{top}}(\Gamma_{X^\bullet})$, respectively. Then we obtain the following natural surjective open continuous homomorphisms

$$\pi_1^{\text{adm}}(X^\bullet)^{\text{sol}} \twoheadrightarrow \pi_1^{\text{adm}}(X)^{\text{sol}} \twoheadrightarrow \pi_1^{\text{ét}}(X)^{\text{sol}} \twoheadrightarrow \pi_1^{\text{top}}(\Gamma_{X^\bullet})^{\text{sol}}.$$

We shall say

$$\pi_1^{\text{adm}}(X^\bullet)^{\text{sol}}$$

the *solvable admissible fundamental group* of X^\bullet . Let $v \in v(\Gamma_{X^\bullet})$. Write $\pi_1^{\text{adm}}(\tilde{X}_v^\bullet)^{\text{sol}}$ for the solvable admissible fundamental group of the smooth pointed semi-stable curve \tilde{X}_v^\bullet associated to v . Then the natural (outer) injection $\pi_1^{\text{adm}}(\tilde{X}_v^\bullet) \hookrightarrow \pi_1^{\text{adm}}(X^\bullet)$ induces a homomorphism

$$\pi_1^{\text{adm}}(\tilde{X}_v^\bullet)^{\text{sol}} \rightarrow \pi_1^{\text{adm}}(X^\bullet)^{\text{sol}}.$$

We see that this homomorphism is an *injection*. Indeed, let $\tilde{f}_v^\bullet : \tilde{Y}_v^\bullet \rightarrow \tilde{X}_v^\bullet$ be a Galois admissible covering over k whose Galois group is an abelian group. Then we see immediately that there exists a Galois admissible covering $g^\bullet : Z^\bullet \rightarrow X^\bullet$ over k whose Galois group is a solvable group such that the following is satisfied: let Z_v be an irreducible component of Z^\bullet such that $g(Z_v) = X_v$; then the Galois admissible covering $\tilde{Z}_v^\bullet \rightarrow \tilde{X}_v^\bullet$ over k induced by g^\bullet factors through \tilde{f}_v^\bullet . This means that the homomorphism $\pi_1^{\text{adm}}(\tilde{X}_v^\bullet)^{\text{sol}} \rightarrow \pi_1^{\text{adm}}(X^\bullet)^{\text{sol}}$ mentioned above is an injection.

In the remainder of the present paper, *we shall denote by*

$$\Pi_{X^\bullet}$$

either $\pi_1^{\text{adm}}(X^\bullet)$ or $\pi_1^{\text{adm}}(X^\bullet)^{\text{sol}}$ unless indicated otherwise. If $\Pi_{X^\bullet} = \pi_1^{\text{adm}}(X^\bullet)$, we denote by

$$\Pi_{X^\bullet}^{\text{cpt}} \stackrel{\text{def}}{=} \pi_1^{\text{adm}}(X), \quad \Pi_{X^\bullet}^{\text{ét}} \stackrel{\text{def}}{=} \pi_1^{\text{ét}}(X), \quad \Pi_{X^\bullet}^{\text{top}} \stackrel{\text{def}}{=} \pi_1^{\text{top}}(\Gamma_{X^\bullet}).$$

If $\Pi_{X^\bullet} = \pi_1^{\text{adm}}(X^\bullet)^{\text{sol}}$, we denote by

$$\Pi_{X^\bullet}^{\text{cpt}} \stackrel{\text{def}}{=} \pi_1^{\text{adm}}(X)^{\text{sol}}, \quad \Pi_{X^\bullet}^{\text{ét}} \stackrel{\text{def}}{=} \pi_1^{\text{ét}}(X)^{\text{sol}}, \quad \Pi_{X^\bullet}^{\text{top}} \stackrel{\text{def}}{=} \pi_1^{\text{top}}(\Gamma_{X^\bullet})^{\text{sol}}.$$

Let $H \subseteq \Pi_{X^\bullet}$ be an arbitrary open subgroup. We write X_H^\bullet for the pointed semi-stable curve of type (g_{X_H}, n_{X_H}) over k corresponding to H , $\Gamma_{X_H^\bullet}$ for the dual semi-graph of X_H^\bullet , and r_{X_H} for the Betti number of $\Gamma_{X_H^\bullet}$. Then we obtain an admissible covering

$$f_H^\bullet : X_H^\bullet \rightarrow X^\bullet$$

over k induced by the natural injection $H \hookrightarrow \Pi_{X^\bullet}$, and obtain a natural map of dual semi-graphs

$$f_H^{\text{sg}} : \Gamma_{X_H^\bullet} \rightarrow \Gamma_{X^\bullet}$$

induced by f_H^\bullet , where “sg” means “semi-graph”. Moreover, if H is an open *normal* subgroup, then $\Gamma_{X_H^\bullet}$ admits an action of Π_{X^\bullet}/H induced by the natural action of Π_{X^\bullet}/H on X_H^\bullet . Note that the quotient of $\Gamma_{X_H^\bullet}$ by Π_{X^\bullet}/H coincides with Γ_{X^\bullet} , and that H is isomorphic to the admissible fundamental group (resp. solvable admissible fundamental group) $\Pi_{X_H^\bullet}$ of X_H^\bullet if $\Pi_{X^\bullet} = \pi_1^{\text{adm}}(X^\bullet)$ (resp. $\Pi_{X^\bullet} = \pi_1^{\text{adm}}(X^\bullet)^{\text{sol}}$). We also use the notation

$$H^{\text{cpt}}, H^{\text{ét}}, H^{\text{top}}$$

to denote $\Pi_{X_H^\bullet}^{\text{cpt}}$, $\Pi_{X_H^\bullet}^{\text{ét}}$, and $\Pi_{X_H^\bullet}^{\text{top}}$, respectively.

We put

$$\hat{X} \stackrel{\text{def}}{=} \varprojlim_{H \subseteq \Pi_{X^\bullet} \text{ open}} X_H, \quad D_{\hat{X}} \stackrel{\text{def}}{=} \varprojlim_{H \subseteq \Pi_{X^\bullet} \text{ open}} D_{X_H}, \quad \Gamma_{\hat{X}^\bullet} \stackrel{\text{def}}{=} \varprojlim_{H \subseteq \Pi_{X^\bullet} \text{ open}} \Gamma_{X_H^\bullet}.$$

We shall say that

$$\hat{X}^\bullet = (\hat{X}, D_{\hat{X}})$$

is the universal admissible covering (resp. universal solvable admissible covering) of X^\bullet corresponding to Π_{X^\bullet} if $\Pi_{X^\bullet} = \pi_1^{\text{adm}}(X^\bullet)$ (resp. $\Pi_{X^\bullet} = \pi_1^{\text{adm}}(X^\bullet)^{\text{sol}}$), and that $\Gamma_{\hat{X}^\bullet}$ is

the dual semi-graph of \widehat{X}^\bullet . Note that we have that $\text{Aut}(\widehat{X}^\bullet/X^\bullet) = \Pi_{X^\bullet}$, and that $\Gamma_{\widehat{X}^\bullet}$ admits a natural action of Π_{X^\bullet} .

Let $v \in v(\Gamma_{X^\bullet})$, $e \in e^{\text{op}}(\Gamma_{X^\bullet}) \cup e^{\text{cl}}(\Gamma_{X^\bullet})$, $\widehat{v} \in v(\Gamma_{\widehat{X}^\bullet})$ a vertex over v , and $\widehat{e} \in e^{\text{op}}(\Gamma_{\widehat{X}^\bullet}) \cup e^{\text{cl}}(\Gamma_{\widehat{X}^\bullet})$ an edge over e . We denote by

$$\Pi_{\widehat{v}} \subseteq \Pi_{X^\bullet}, \quad I_{\widehat{e}} \subseteq \Pi_{X^\bullet}$$

the stabilizer subgroups of \widehat{v} and \widehat{e} , respectively. We see immediately that $\Pi_{\widehat{v}}$ is (outer) isomorphic to $\Pi_{\widetilde{X}_v^\bullet}$ of \widetilde{X}_v^\bullet , and that $I_{\widehat{e}}$ is (outer) isomorphic to an inertia subgroup associated to the closed point of X corresponding to e . Then we have that $I_{\widehat{e}} \cong \widehat{\mathbb{Z}}(1)^{p'}$, where $(-)^{p'}$ denotes the maximal pro-prime-to- p quotient of $(-)$. We put

$$\text{Ver}(\Pi_{X^\bullet}) \stackrel{\text{def}}{=} \{\Pi_{\widehat{v}}\}_{\widehat{v} \in v(\Gamma_{\widehat{X}^\bullet})},$$

$$\text{Edg}^{\text{op}}(\Pi_{X^\bullet}) \stackrel{\text{def}}{=} \{I_{\widehat{e}}\}_{\widehat{e} \in e^{\text{op}}(\Gamma_{\widehat{X}^\bullet})},$$

$$\text{Edg}^{\text{cl}}(\Pi_{X^\bullet}) \stackrel{\text{def}}{=} \{I_{\widehat{e}}\}_{\widehat{e} \in e^{\text{cl}}(\Gamma_{\widehat{X}^\bullet})}.$$

Moreover, if \widehat{e} abuts on \widehat{v} , then we have the following injections

$$I_{\widehat{e}} \hookrightarrow \Pi_{\widehat{v}} \hookrightarrow \Pi_{X^\bullet}.$$

Note that $\text{Ver}(\Pi_{X^\bullet})$, $\text{Edg}^{\text{op}}(\Pi_{X^\bullet})$, and $\text{Edg}^{\text{cl}}(\Pi_{X^\bullet})$ admit natural actions of Π_{X^\bullet} (i.e., the conjugacy actions), and that we have the following natural bijections

$$\text{Ver}(\Pi_{X^\bullet})/\Pi_{X^\bullet} \xrightarrow{\sim} v(\Gamma_{X^\bullet}),$$

$$\text{Edg}^{\text{op}}(\Pi_{X^\bullet})/\Pi_{X^\bullet} \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X^\bullet}),$$

$$\text{Edg}^{\text{cl}}(\Pi_{X^\bullet})/\Pi_{X^\bullet} \xrightarrow{\sim} e^{\text{cl}}(\Gamma_{X^\bullet}).$$

2 Maximum and averages of generalized Hasse-Witt invariants

In this section, we recall some results concerning Hasse-Witt invariants (or p -rank) and generalized Hasse-Witt invariants.

Definition 2.1. Let Z^\bullet be a disjoint union of finitely many pointed semi-stable curves over k . We define the p -rank (or *Hasse-Witt invariant*) of Z^\bullet to be

$$\sigma_Z \stackrel{\text{def}}{=} \dim_{\mathbb{F}_p}(H_{\text{ét}}^1(Z, \mathbb{F}_p)).$$

In particular, if Z^\bullet is a pointed semi-stable curve, then

$$\sigma_Z = \dim_{\mathbb{F}_p}(\Pi_{Z^\bullet}^{\text{ab}} \otimes \mathbb{F}_p),$$

where Π_{Z^\bullet} is either the admissible fundamental group or the solvable admissible fundamental group of Z^\bullet , and $(-)^{\text{ab}}$ denotes the abelianization of $(-)$.

Let X^\bullet be a pointed stable curve over of type (g_X, n_X) over an algebraically closed field k of characteristic $p > 0$, Γ_{X^\bullet} the dual semi-graph of X^\bullet , and Π_{X^\bullet} either the admissible fundamental group or the solvable admissible fundamental group of X^\bullet . Let n be an arbitrary positive natural number prime to p and $\mu_n \subseteq k^\times$ the group of n th roots of unity. Fix a primitive n th root ζ_n , we may identify μ_n with $\mathbb{Z}/n\mathbb{Z}$ via the map $\zeta_n^i \mapsto i$. Let $\alpha \in \text{Hom}(\Pi_{X^\bullet}^{\text{ab}}, \mathbb{Z}/n\mathbb{Z})$. We denote by $X_\alpha^\bullet = (X_\alpha, D_{X_\alpha})$ the Galois multi-admissible covering with Galois group $\mathbb{Z}/n\mathbb{Z}$ corresponding to α . Write F_{X_α} for the absolute Frobenius morphism on X_α . Then there exists a decomposition (cf. [21, Section 9])

$$H^1(X_\alpha, \mathcal{O}_{X_\alpha}) = H^1(X_\alpha, \mathcal{O}_{X_\alpha})^{\text{st}} \oplus H^1(X_\alpha, \mathcal{O}_{X_\alpha})^{\text{ni}},$$

where F_{X_α} is a bijection on $H^1(X_\alpha, \mathcal{O}_{X_\alpha})^{\text{st}}$ and is nilpotent on $H^1(X_\alpha, \mathcal{O}_{X_\alpha})^{\text{ni}}$. Moreover, we have

$$H^1(X_\alpha, \mathcal{O}_{X_\alpha})^{\text{st}} = H^1(X_\alpha, \mathcal{O}_{X_\alpha})^{F_{X_\alpha}} \otimes_{\mathbb{F}_p} k,$$

where $(-)^{F_{X_\alpha}}$ denotes the subspace of $(-)$ on which F_{X_α} acts trivially. Then Artin-Schreier theory implies that we may identify

$$H_\alpha \stackrel{\text{def}}{=} H_{\text{ét}}^1(X_\alpha, \mathbb{F}_p) \otimes_{\mathbb{F}_p} k$$

with the largest subspace of $H^1(X_\alpha, \mathcal{O}_{X_\alpha})$ on which F_{X_α} is a bijection.

The finite dimensional k -vector spaces H_α is a finitely generated $k[\mu_n]$ -module induced by the natural action of μ_n on X_α . We have the following canonical decomposition

$$H_\alpha = \bigoplus_{i \in \mathbb{Z}/n\mathbb{Z}} H_{\alpha, i},$$

where $\zeta_n \in \mu_n$ acts on $H_{\alpha, i}$ as the ζ_n^i -multiplication. We define

$$\gamma_{\alpha, i} \stackrel{\text{def}}{=} \dim_k(H_{\alpha, i}), \quad i \in \mathbb{Z}/n\mathbb{Z}.$$

We shall say that $\gamma_{\alpha, i}$, $i \in \mathbb{Z}/n\mathbb{Z}$, is a *generalized Hasse-Witt invariant* (cf. [13]) of the cyclic multi-admissible covering $X_\alpha^\bullet \rightarrow X^\bullet$. Note that the decomposition above implies that

$$\sigma_{X_\alpha} = \dim_k(H_\alpha) = \sum_{i \in \mathbb{Z}/n\mathbb{Z}} \gamma_{\alpha, i}.$$

Let $t \in \mathbb{N}$ be an arbitrary positive natural number, K_{p^t-1} the kernel of the natural surjection

$$\Pi_{X^\bullet} \twoheadrightarrow \Pi_{X^\bullet}^{\text{ab}} \otimes \mathbb{Z}/(p^t - 1)\mathbb{Z},$$

and $X_{K_{p^t-1}}^\bullet$ the pointed stable curve over k determined by K_{p^t-1} . Next, we define two important invariants associated to X^\bullet . We put

$$\gamma^{\max}(X^\bullet) \stackrel{\text{def}}{=}$$

$$\max_{n \in \mathbb{N} \text{ s.t. } (n, p) = 1} \{\gamma_{\alpha, i} \mid \alpha \in \text{Hom}(\Pi_{X^\bullet}^{\text{ab}}, \mathbb{Z}/n\mathbb{Z}), \alpha \neq 0, i \in (\mathbb{Z}/n\mathbb{Z}) \setminus \{0\}\},$$

and shall say that $\gamma^{\max}(X^\bullet)$ is the maximum generalized Hasse-Witt invariant of prime-to- p cyclic admissible coverings of X^\bullet . We put

$$\text{Avr}_p(X^\bullet) \stackrel{\text{def}}{=} \lim_{t \rightarrow \infty} \frac{\sigma_{X_{K_{p^t-1}}}}{\#(\Pi_{X^\bullet}^{\text{ab}} \otimes \mathbb{Z}/(p^t-1)\mathbb{Z})},$$

and shall say that $\text{Avr}_p(X^\bullet)$ is the limit of p -averages of X^\bullet .

On the other hand, let $\overline{\mathbb{F}}_p$ be an arbitrary algebraic closure of the finite field \mathbb{F}_p , $\chi \in \text{Hom}(\Pi_{X^\bullet}, \overline{\mathbb{F}}_p^\times)$ such that $\chi \neq 1$, and $\Pi_\chi \subseteq \Pi_{X^\bullet}$ the kernel of χ . The profinite group Π_χ admits a natural action of Π_{X^\bullet} via conjugation. We put

$$\begin{aligned} \text{Hom}(\Pi_\chi, \mathbb{Z}/p\mathbb{Z})[\chi] &\stackrel{\text{def}}{=} \{a \in \text{Hom}(\Pi_\chi, \mathbb{Z}/p\mathbb{Z}) \otimes_{\mathbb{F}_p} \overline{\mathbb{F}}_p \mid \tau(a) = \chi(\tau)a \\ &\quad \text{for all } \tau \in \Pi_{X^\bullet}\}, \end{aligned}$$

$$\gamma_\chi(\text{Hom}(\Pi_\chi, \mathbb{Z}/p\mathbb{Z})) \stackrel{\text{def}}{=} \dim_{\overline{\mathbb{F}}_p}(\text{Hom}(\Pi_\chi, \mathbb{Z}/p\mathbb{Z})[\chi]).$$

We define the following two *group-theoretical* invariants associated to Π_{X^\bullet} :

$$\gamma^{\max}(\Pi_{X^\bullet}) \stackrel{\text{def}}{=} \max\{\gamma_\chi(\text{Hom}(\Pi_\chi, \mathbb{Z}/p\mathbb{Z})) \mid \chi \in \text{Hom}(\Pi_{X^\bullet}, \overline{\mathbb{F}}_p^\times) \text{ such that } \chi \neq 1\},$$

$$\text{Avr}_p(\Pi_{X^\bullet}) \stackrel{\text{def}}{=} \lim_{t \rightarrow \infty} \frac{\dim_{\mathbb{F}_p}(K_{p^t-1}^{\text{ab}} \otimes \mathbb{F}_p)}{\#(\Pi_{X^\bullet}^{\text{ab}} \otimes \mathbb{Z}/(p^t-1)\mathbb{Z})}.$$

We see immediately that

$$\begin{aligned} \gamma^{\max}(\Pi_{X^\bullet}) &= \gamma^{\max}(X^\bullet), \\ \text{Avr}_p(\Pi_{X^\bullet}) &= \text{Avr}_p(X^\bullet). \end{aligned}$$

Moreover, we have the following important formulas for $\gamma^{\max}(\Pi_{X^\bullet})$ and $\text{Avr}_p(\Pi_{X^\bullet})$ which were proved by Tamagawa and the author by using the theory of Raynaud-Tamagawa theta divisors (cf. [39, Theorem 1.4] for $\gamma^{\max}(\Pi_{X^\bullet})$, [29, Theorem 0.5] and [38, Theorem 5.2, Remark 5.2.1, and Remark 5.2.2] for $\text{Avr}_p(\Pi_{X^\bullet})$).

Theorem 2.2. *We maintain the notation introduced above.*

(a) *We have*

$$\gamma^{\max}(\Pi_{X^\bullet}) = \begin{cases} g_X - 1, & \text{if } n_X = 0, \\ g_X + n_X - 2, & \text{if } n_X \neq 0. \end{cases}$$

(b) *Suppose that $\Gamma_{X^\bullet}^{\text{cpt}}$ is 2-connected. Then we have*

$$\text{Avr}_p(\Pi_{X^\bullet}) = g_X - r_X - \#v(\Gamma_{X^\bullet})^{b \leq 1} + \#e^{\text{cl}}(\Gamma_{X^\bullet})^{b \leq 1}.$$

Remark 2.2.1. Suppose that $\Gamma_{X^\bullet}^{\text{cpt}}$ is 2-connected. Note that $\#v(\Gamma_{X^\bullet})^{b \leq 1} \neq 0$ if one of the following conditions holds: (i) X^\bullet is smooth over k and $\#e^{\text{op}}(\Gamma_{X^\bullet}) \leq 1$; (ii) $\#v(\Gamma_{X^\bullet}) = 2$, $\#e^{\text{op}}(\Gamma_{X^\bullet}) = 0$, $\#e^{\text{cl}}(\Gamma_{X^\bullet}) = 1$, and $r_X = 0$. In the case (i), we have

$$\text{Avr}_p(\Pi_{X^\bullet}) = g_X - 1.$$

In the case (ii), we have

$$\text{Avr}_p(\Pi_{X^\bullet}) = g_X - 2 + 1 = g_X - 1.$$

Lemma 2.3. *Let X_i^\bullet , $i \in \{1, 2\}$, be a pointed stable curve of type (g_{X_i}, n_{X_i}) over an algebraically closed field k_i of characteristic $p > 0$ and $\Pi_{X_i^\bullet}$ either the admissible fundamental group of X_i^\bullet or the solvable admissible fundamental group of X_i^\bullet . Let*

$$\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$$

be an arbitrary surjective open continuous homomorphism of profinit groups, $H_2 \subseteq \Pi_{X_2^\bullet}$ an arbitrary open normal subgroup, and $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2)$. Then the following statements hold:

(a) *We have*

$$\gamma^{\max}(H_1) \geq \gamma^{\max}(H_2).$$

(b) *Suppose that $(g_X, n_X) = (g_{X_1}, n_{X_1}) = (g_{X_2}, n_{X_2})$. Moreover, suppose either that $G \stackrel{\text{def}}{=} \Pi_{X_2^\bullet}/H_2$ is a p -group, that $(\#G, p) = 1$, or that G is a solvable group. Then we have*

$$\text{Avr}_p(H_1) \geq \text{Avr}_p(H_2).$$

Proof. (a) Let $n \in \mathbb{Z}_{>0}$ be a positive natural number prime to p , and $\alpha_2 \in \text{Hom}(H_2^{\text{ab}}, \mathbb{Z}/n\mathbb{Z})$ such that $\alpha_2 \neq 0$. Let $j \in \mathbb{Z}/n\mathbb{Z}$ such that $\gamma_{\alpha_2, j} = \gamma^{\max}(H_2)$. Write Q_2 for the kernel of the composition of the following homomorphisms

$$H_2 \twoheadrightarrow H_2^{\text{ab}} \xrightarrow{\alpha_2} \mathbb{Z}/n\mathbb{Z},$$

$Q_1 \stackrel{\text{def}}{=} \phi^{-1}(Q_2)$, and $\alpha_1 \in \text{Hom}(H_1^{\text{ab}}, \mathbb{Z}/n\mathbb{Z})$ for the homomorphism induced by $\phi|_{H_1}$ and α_2 . Let $\overline{\mathbb{F}}_p$ be an algebraic closure of \mathbb{F}_p . Then $Q_i^{p, \text{ab}} \otimes_{\mathbb{F}_p} \overline{\mathbb{F}}_p$ admits a natural $\overline{\mathbb{F}}_p[\mathbb{Z}/n\mathbb{Z}]$ -module structure. Moreover, we see immediately that $\phi|_{H_1}$ induces a surjective homomorphism of $\overline{\mathbb{F}}_p[\mathbb{Z}/n\mathbb{Z}]$ -modules

$$Q_1^{p, \text{ab}} \otimes_{\mathbb{F}_p} \overline{\mathbb{F}}_p \twoheadrightarrow Q_2^{p, \text{ab}} \otimes_{\mathbb{F}_p} \overline{\mathbb{F}}_p.$$

Then we obtain that $\gamma_{\alpha_1, j} \geq \gamma_{\alpha_2, j}$. Thus, we have

$$\gamma^{\max}(H_1) \geq \gamma^{\max}(H_2).$$

(b) Let $t \in \mathbb{N}$ be an arbitrary positive natural number, K_{H_i, p^t-1} the kernel of the natural surjection

$$H_i \twoheadrightarrow H_i^{\text{ab}} \otimes \mathbb{Z}/(p^t - 1)\mathbb{Z}.$$

Suppose that G is a p -group. We have that Galois admissible covering $X_{H_i}^\bullet \rightarrow X_i^\bullet$ corresponding to H_i is étale. This implies that $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ are equal types. We obtain that

$$\#(H_1^{\text{ab}} \otimes \mathbb{Z}/(p^t - 1)\mathbb{Z}) = \#(H_2^{\text{ab}} \otimes \mathbb{Z}/(p^t - 1)\mathbb{Z}).$$

Suppose that $(\#G, p) = 1$. Since X_1^\bullet and X_2^\bullet are equal types, we have that

$$\#(H_1^{\text{ab}} \otimes \mathbb{Z}/(p^t - 1)\mathbb{Z}) = \#(H_2^{\text{ab}} \otimes \mathbb{Z}/(p^t - 1)\mathbb{Z}).$$

Then $\phi|_{H_1}$ implies that

$$\text{Avr}_p(H_1) \stackrel{\text{def}}{=} \lim_{t \rightarrow \infty} \frac{\dim_{\mathbb{F}_p}(K_{H_1, p^t-1}^{\text{ab}} \otimes \mathbb{F}_p)}{\#(H_1^{\text{ab}} \otimes \mathbb{Z}/(p^t - 1)\mathbb{Z})}$$

$$\geq \text{Avr}_p(H_2) \stackrel{\text{def}}{=} \lim_{t \rightarrow \infty} \frac{\dim_{\mathbb{F}_p}(K_{H_2, p^t-1}^{\text{ab}} \otimes \mathbb{F}_p)}{\#(H_2^{\text{ab}} \otimes \mathbb{Z}/(p^t-1)\mathbb{Z})}.$$

Suppose that G is solvable. Then the lemma follows immediately from the lemma if either G is a p -group, or $(\#G, p) = 1$. This completes the proof of the lemma. \square

3 Moduli spaces of admissible fundamental groups and the Homeomorphism Conjecture

In this section, we define the moduli spaces of fundamental groups and formulate the Homeomorphism Conjecture, which are main research objects of the present paper.

3.1 The Weak Isom-version Conjecture

Let p be a prime number, \mathbb{F}_p the prime field of characteristic p , and $\overline{\mathbb{F}}_p$ an algebraically closed field of \mathbb{F}_p . Let $\overline{\mathcal{M}}_{g,n}$ be the moduli stack over $\overline{\mathbb{F}}_p$ classifying pointed stable curves of type (g, n) and $\mathcal{M}_{g,n} \subseteq \overline{\mathcal{M}}_{g,n}$ the open substack classifying smooth pointed stable curves. Let $\overline{M}_{g,n}$ and $M_{g,n}$ be the coarse moduli spaces of $\overline{\mathcal{M}}_{g,n}$ and $\mathcal{M}_{g,n}$, respectively.

Let $q \in \overline{M}_{g,n}$ be an arbitrary point, $k(q)$ the residue field of $\overline{M}_{g,n}$, and k_q an algebraically closed field which contains $k(q)$. Then the composition of natural morphisms

$$\text{Spec } k_q \rightarrow \text{Spec } k(q) \rightarrow \overline{M}_{g,n}$$

determines a pointed stable curve $X_{k_q}^\bullet$ of type (g, n) over k_q . Write $\pi_1^{\text{adm}}(X_{k_q}^\bullet)$ for the admissible fundamental group $X_{k_q}^\bullet$ and $\pi_1^{\text{adm}}(X_{k_q}^\bullet)^{\text{sol}}$ for the solvable admissible fundamental group of $X_{k_q}^\bullet$. Since the isomorphism classes of $\pi_1^{\text{adm}}(X_{k_q}^\bullet)$ and $\pi_1^{\text{adm}}(X_{k_q}^\bullet)^{\text{sol}}$ do not depend on the choice of k_q , we shall denote by

$$\pi_1^{\text{adm}}(q), \pi_1^{\text{sol}}(q)$$

the admissible fundamental groups $\pi_1^{\text{adm}}(X_{k_q}^\bullet)$ and the solvable admissible fundamental group $\pi_1^{\text{adm}}(X_{k_q}^\bullet)^{\text{sol}}$, respectively. Moreover, we shall denote by

$$X_q^\bullet$$

the pointed stable curve $X_{\overline{k(q)}}^\bullet$ and Γ_q the dual semi-graph of X_q^\bullet , where $\overline{k(q)}$ is an algebraic closure of $k(q)$. Let $v \in v(\Gamma_q)$. Then the smooth pointed stable curve $\tilde{X}_{q,v}^\bullet$ of type (g_v, n_v) associated to v determines a morphism

$$\text{Spec } \overline{k(q)} \rightarrow M_{g_v, n_v}.$$

We shall write $q_v \in M_{g_v, n_v}$ for the image of the morphism and say q_v the point of type (g_v, n_v) associated to v .

Definition 3.1. (a) Let $q_i \in M_{g,n}$, $i \in \{1, 2\}$, be an arbitrary point. We shall say that q_1 is *Frobenius equivalent* to q_2 if $X_{q_1} \setminus D_{X_{q_1}}$ is isomorphic to $X_{q_2} \setminus D_{X_{q_2}}$ as schemes.

(b) Let $q_i \in \overline{M}_{g,n}$, $i \in \{1, 2\}$, be an arbitrary point. We shall say that q_1 is *Frobenius equivalent* to q_2 if the following conditions are satisfied:

(i) There exists an isomorphism $\rho : \Gamma_{q_1} \xrightarrow{\sim} \Gamma_{q_2}$ of dual semi-graphs.

(ii) Let $v_1 \in v(\Gamma_{q_1})$, $v_2 \stackrel{\text{def}}{=} \rho(v_1) \in v(\Gamma_{q_2})$, q_{1,v_1} the point of type (g_{v_1}, n_{v_1}) associated to v_1 , and q_{2,v_2} the point of type (g_{v_2}, n_{v_2}) associated to v_2 . We have that q_{1,v_1} is Frobenius equivalent to q_{2,v_2} .

(iii) Let $\rho_{v_1,v_2} : \Gamma_{q_{1,v_1}} \xrightarrow{\sim} \Gamma_{q_{2,v_2}}$ be the isomorphism of dual semi-graphs induced by ρ . There exists a morphism $f_{v_1,v_2}^\bullet : X_{q_{1,v_1}}^\bullet \xrightarrow{\sim} X_{q_{2,v_2}}^\bullet$ such that the morphism $X_{q_{1,v_1}} \setminus D_{X_{q_{1,v_1}}} \rightarrow X_{q_{2,v_2}} \setminus D_{X_{q_{2,v_2}}}$ induced by f_{v_1,v_2}^\bullet is an isomorphism as schemes, and that the isomorphism of dual semi-graphs $f_{v_1,v_2}^{\text{sg}} : \Gamma_{q_{1,v_1}} \xrightarrow{\sim} \Gamma_{q_{2,v_2}}$ induced by f_{v_1,v_2}^\bullet coincides with ρ_{v_1,v_2} .

We shall denote by

$$q_1 \sim_{fe} q_2$$

if q_1 is Frobenius equivalent to q_2 . Note that \sim_{fe} is an equivalence relation on the underlying topological space $|\overline{M}_{g,n}|$ of $\overline{M}_{g,n}$.

(c) Let $q_i \in \overline{M}_{g,n}$, $i \in \{1, 2\}$, be an arbitrary point, k_{q_i} an algebraically closed field which contains $k(q_i)$, and $X_{k_{q_i}}^\bullet$ the pointed stable curve of type (g, n) over k_{q_i} . We shall say that $X_{k_{q_1}}^\bullet$ is *Frobenius equivalent* to $X_{k_{q_2}}^\bullet$ if q_1 is Frobenius equivalent to q_2 .

The following result was proved by the author.

Proposition 3.2. *Let $q_i \in \overline{M}_{g,n}$, $i \in \{1, 2\}$, be an arbitrary point. Suppose that $q_1 \sim_{fe} q_2$. Then we have that $\pi_1^{\text{adm}}(q_1)$ is isomorphic to $\pi_1^{\text{adm}}(q_2)$ as profinite groups. In particular, we have that $\pi_1^{\text{sol}}(q_1)$ is isomorphic to $\pi_1^{\text{sol}}(q_2)$ as profinite groups.*

Proof. See [40, Proposition 3.7]. □

We put

$$\begin{aligned} \mathfrak{M}_{g,n} &\stackrel{\text{def}}{=} |M_{g,n}| / \sim_{fe} \subseteq \overline{\mathfrak{M}}_{g,n} \stackrel{\text{def}}{=} |\overline{M}_{g,n}| / \sim_{fe}, \\ \Pi_{g,n} &\stackrel{\text{def}}{=} \{[\pi_1^{\text{adm}}(q)] \mid q \in M_{g,n}\} \subseteq \overline{\Pi}_{g,n} \stackrel{\text{def}}{=} \{[\pi_1^{\text{adm}}(q)] \mid q \in \overline{M}_{g,n}\}, \\ \Pi_{g,n}^{\text{sol}} &\stackrel{\text{def}}{=} \{[\pi_1^{\text{sol}}(q)] \mid q \in M_{g,n}\} \subseteq \overline{\Pi}_{g,n}^{\text{sol}} \stackrel{\text{def}}{=} \{[\pi_1^{\text{sol}}(q)] \mid q \in \overline{M}_{g,n}\}, \end{aligned}$$

where $[\pi_1^{\text{adm}}(q)]$ and $[\pi_1^{\text{sol}}(q)]$ denote the isomorphism classes (as profinite groups) of $\pi_1^{\text{adm}}(q)$ and $\pi_1^{\text{sol}}(q)$, respectively. Let $q \in \overline{M}_{g,n}$. We shall write $[q]$ for the image of q in $\overline{\mathfrak{M}}_{g,n}$. Then there are natural surjective maps of *sets* as follows:

$$\begin{aligned} \text{sol} : \overline{\Pi}_{g,n} &\twoheadrightarrow \overline{\Pi}_{g,n}^{\text{sol}}, \quad [\pi_1^{\text{adm}}(q)] \mapsto [\pi_1^{\text{sol}}(q)], \\ \pi_{g,n}^{\text{adm}} : \overline{\mathfrak{M}}_{g,n} &\twoheadrightarrow \overline{\Pi}_{g,n}, \quad [q] \mapsto [\pi_1^{\text{adm}}(q)], \\ \pi_{g,n}^{\text{sol}} &\stackrel{\text{def}}{=} \text{sol} \circ \pi_{g,n}^{\text{adm}} : \overline{\mathfrak{M}}_{g,n} \twoheadrightarrow \overline{\Pi}_{g,n}^{\text{sol}}, \\ \pi_{g,n}^{\text{t}} &\stackrel{\text{def}}{=} \pi_{g,n}^{\text{adm}}|_{\mathfrak{M}_{g,n}} : \mathfrak{M}_{g,n} \twoheadrightarrow \Pi_{g,n}, \end{aligned}$$

$$\pi_{g,n}^{\text{t},\text{sol}} \stackrel{\text{def}}{=} \pi_{g,n}^{\text{sol}}|_{\mathfrak{M}_{g,n}} : \mathfrak{M}_{g,n} \twoheadrightarrow \Pi_{g,n}^{\text{sol}},$$

where “t” means “tame”. Moreover, we have the following commutative diagrams:

$$\begin{array}{ccc} \mathfrak{M}_{g,n} & \xrightarrow{\pi_{g,n}^{\text{t}}} & \Pi_{g,n} \\ \downarrow & & \downarrow \\ \overline{\mathfrak{M}}_{g,n} & \xrightarrow{\pi_{g,n}^{\text{adm}}} & \overline{\Pi}_{g,n} \end{array}$$

and

$$\begin{array}{ccc} \mathfrak{M}_{g,n} & \xrightarrow{\pi_{g,n}^{\text{t},\text{sol}}} & \Pi_{g,n}^{\text{sol}} \\ \downarrow & & \downarrow \\ \overline{\mathfrak{M}}_{g,n} & \xrightarrow{\pi_{g,n}^{\text{sol}}} & \overline{\Pi}_{g,n}^{\text{sol}}, \end{array}$$

where all vertical arrows are natural injections.

Proposition 3.3. *We maintain the notation introduced above. Then we have*

$$\pi_{g,n}^{\text{adm}}(\overline{\mathfrak{M}}_{g,n} \setminus \mathfrak{M}_{g,n}) = \overline{\Pi}_{g,n} \setminus \Pi_{g,n},$$

$$\pi_{g,n}^{\text{sol}}(\overline{\mathfrak{M}}_{g,n} \setminus \mathfrak{M}_{g,n}) = \overline{\Pi}_{g,n}^{\text{sol}} \setminus \Pi_{g,n}^{\text{sol}}.$$

Proof. The proposition follows immediately from [35, Theorem 1.2, Remark 1.2.1, Remark 1.2.2, and Proposition 6.1] (see also Theorem 4.2 of the present paper). \square

We may formulate the weak Isom-version of the Grothendieck conjecture for pointed stable curves over algebraically closed fields of characteristic $p > 0$ (=the Weak Isom-version Conjecture) as follows:

Weak Isom-version Conjecture . *We maintain the notation introduced above. Then we have that*

$$\pi_{g,n}^{\text{adm}} : \overline{\mathfrak{M}}_{g,n} \twoheadrightarrow \overline{\Pi}_{g,n}$$

is a bijection as sets.

The Weak Isom-version Conjecture was formulated by Tamagawa in the case of $q \in M_{g,n}$, and by the author in the general case (cf. [28], [40]), which is the ultimate goal of [16], [19], [27], [28], [29], [30], [31], and [35]. The Weak Isom-version Conjecture shows that moduli spaces of curves over algebraically closed fields of characteristic $p > 0$ can be reconstructed group-theoretically as “sets” from admissible fundamental groups of curves.

Moreover, we have the following solvable version of the Weak Isom-version Conjecture which is slightly stronger than the original version.

Solvable Weak Isom-version Conjecture . *We maintain the notation introduced above. Then we have that*

$$\pi_{g,n}^{\text{sol}} : \overline{\mathfrak{M}}_{g,n} \twoheadrightarrow \overline{\Pi}_{g,n}^{\text{sol}}$$

is a bijection as sets.

Write $\overline{\mathfrak{M}}_{g,n}^{\text{cl}}$ for the image of the set of closed points $\overline{M}_{g,n}^{\text{cl}}$ of the natural map $|\overline{M}_{g,n}| \rightarrow \overline{\mathfrak{M}}_{g,n}$. Then we have the following result.

Theorem 3.4. *We maintain the notation introduced above. Then the following statements hold:*

(a) *We have that*

$$\pi_{g,n}^{\text{sol}}|_{\overline{\mathfrak{M}}_{g,n}^{\text{cl}}} : \overline{\mathfrak{M}}_{g,n}^{\text{cl}} \rightarrow \overline{\Pi}_{g,n}^{\text{sol}}$$

is quasi-finite (i.e., $\#(\pi_{g,n}^{\text{sol}}|_{\overline{\mathfrak{M}}_{g,n}^{\text{cl}}})^{-1}([\pi_1^{\text{sol}}(q)]) < \infty$ for every $[\pi_1^{\text{sol}}(q)] \in \overline{\Pi}_{g,n}^{\text{sol}}$).

(b) *Suppose that $g = 0$. Then we have that*

$$\pi_{g,n}^{\text{sol}}|_{\overline{\mathfrak{M}}_{g,n}^{\text{cl}}} : \overline{\mathfrak{M}}_{g,n}^{\text{cl}} \rightarrow \overline{\Pi}_{g,n}^{\text{sol}}$$

is an injection, and that

$$\pi_{g,n}^{\text{sol}}(\overline{\mathfrak{M}}_{g,n} \setminus \overline{\mathfrak{M}}_{g,n}^{\text{cl}}) \subseteq \overline{\Pi}_{g,n}^{\text{sol}} \setminus \pi_{g,n}^{\text{sol}}(\overline{\mathfrak{M}}_{g,n}^{\text{cl}}).$$

In particular, the Solvable Weak Isom-version Conjecture holds if $(g, n) = (0, 4)$.

Proof. Since [29, Theorem 0.2] and [30, Theorem 0.1] also hold for the maximal pro-solvable quotients of tame fundamental groups, the theorem follows immediately from [29, Theorem 0.2], [30, Theorem 0.1], [35, Theorem 1.2, Remark 1.2.1, Remark 1.2.2, and Proposition 6.1], and Proposition 3.3. \square

3.2 Moduli spaces of admissible fundamental groups and the Homeomorphism Conjecture

We maintain the notation introduced in Section 3.1. Moreover, in the reminder of the present section, we regard $\overline{\mathfrak{M}}_{g,n}$ and $\mathfrak{M}_{g,n}$ as topological spaces whose topologies are induced by the Zariski topologies of $|\overline{M}_{g,n}|$ and $|M_{g,n}|$, respectively.

Let \mathcal{G} be the category of finite groups, $G \in \mathcal{G}$ an arbitrary finite group, Π an arbitrary profinite group, and $\text{Hom}_{\text{surj}}(-, -)$ the set of surjective homomorphisms. We put

$$U_{\overline{\Pi}_{g,n}, G} \stackrel{\text{def}}{=} \{[\pi_1^{\text{adm}}(q)] \in \overline{\Pi}_{g,n} \mid \text{Hom}_{\text{surj}}(\pi_1^{\text{adm}}(q), G) \neq \emptyset\},$$

$$U_{\Pi_{g,n}, G} \stackrel{\text{def}}{=} \{[\pi_1^{\text{adm}}(q)] \in \Pi_{g,n} \mid \text{Hom}_{\text{surj}}(\pi_1^{\text{adm}}(q), G) \neq \emptyset\},$$

$$U_{\overline{\Pi}_{g,n}^{\text{sol}}, G} \stackrel{\text{def}}{=} \{[\pi_1^{\text{sol}}(q)] \in \overline{\Pi}_{g,n}^{\text{sol}} \mid \text{Hom}_{\text{surj}}(\pi_1^{\text{sol}}(q), G) \neq \emptyset\},$$

$$U_{\Pi_{g,n}^{\text{sol}}, G} \stackrel{\text{def}}{=} \{[\pi_1^{\text{sol}}(q)] \in \Pi_{g,n}^{\text{sol}} \mid \text{Hom}_{\text{surj}}(\pi_1^{\text{sol}}(q), G) \neq \emptyset\}.$$

Then we obtain the following topological spaces

$$(\overline{\Pi}_{g,n}, O_{\overline{\Pi}_{g,n}}), (\Pi_{g,n}, O_{\Pi_{g,n}}),$$

$$(\overline{\Pi}_{g,n}^{\text{sol}}, O_{\overline{\Pi}_{g,n}^{\text{sol}}}), (\Pi_{g,n}^{\text{sol}}, O_{\Pi_{g,n}^{\text{sol}}})$$

whose topologies $O_{\overline{\Pi}_{g,n}}$, $O_{\Pi_{g,n}}$, $O_{\overline{\Pi}_{g,n}^{\text{sol}}}$, and $O_{\Pi_{g,n}^{\text{sol}}}$ are generated by $\{U_{\overline{\Pi}_{g,n},G}\}_{G \in \mathcal{G}}$, $\{U_{\Pi_{g,n},G}\}_{G \in \mathcal{G}}$, $\{U_{\overline{\Pi}_{g,n}^{\text{sol}},G}\}_{G \in \mathcal{G}}$, and $\{U_{\Pi_{g,n}^{\text{sol}},G}\}_{G \in \mathcal{G}}$ as open subsets, respectively. For simplicity, we still use the notation

$$\overline{\Pi}_{g,n}, \Pi_{g,n}, \overline{\Pi}_{g,n}^{\text{sol}}, \Pi_{g,n}^{\text{sol}}$$

to denote the topological spaces $(\overline{\Pi}_{g,n}, O_{\overline{\Pi}_{g,n}})$, $(\Pi_{g,n}, O_{\Pi_{g,n}})$, $(\overline{\Pi}_{g,n}^{\text{sol}}, O_{\overline{\Pi}_{g,n}^{\text{sol}}})$, and $(\Pi_{g,n}^{\text{sol}}, O_{\Pi_{g,n}^{\text{sol}}})$, respectively.

Theorem 3.5. *We maintain the notation introduced above. Then we have that*

$$\pi_{g,n}^{\text{adm}} : \overline{\mathfrak{M}}_{g,n} \rightarrow \overline{\Pi}_{g,n},$$

$$\pi_{g,n}^{\text{sol}} : \overline{\mathfrak{M}}_{g,n} \rightarrow \overline{\Pi}_{g,n}^{\text{sol}}$$

are continuous maps.

Proof. The theorem will be proved in Section 7, see Theorem 7.14. \square

Proposition 3.6. *We maintain the notation introduced above. Then the following statements hold.*

(a) *Let $[\pi_1^{\text{adm}}(q)] \in \overline{\Pi}_{g,n}$ and $[\pi_1^{\text{sol}}(q)] \in \overline{\Pi}_{g,n}^{\text{sol}}$ be arbitrary points. Then we have*

$$V([\pi_1^{\text{adm}}(q)]) = \{[\pi_1^{\text{adm}}(q')] \in \overline{\Pi}_{g,n} \mid \text{Hom}_{\text{surj}}(\pi_1^{\text{adm}}(q), \pi_1^{\text{adm}}(q')) \neq \emptyset\},$$

$$V([\pi_1^{\text{sol}}(q)]) = \{[\pi_1^{\text{sol}}(q')] \in \overline{\Pi}_{g,n}^{\text{sol}} \mid \text{Hom}_{\text{surj}}(\pi_1^{\text{sol}}(q), \pi_1^{\text{sol}}(q')) \neq \emptyset\},$$

where $V([\pi_1^{\text{adm}}(q)])$ and $V([\pi_1^{\text{sol}}(q)])$ denote the topological closures of $[\pi_1^{\text{adm}}(q)]$ and $[\pi_1^{\text{sol}}(q)]$ in $\overline{\Pi}_{g,n}$ and $\overline{\Pi}_{g,n}^{\text{sol}}$, respectively.

(b) *We have that*

$$\Pi_{g,n} \subseteq \overline{\Pi}_{g,n}, \quad \Pi_{g,n}^{\text{sol}} \subseteq \overline{\Pi}_{g,n}^{\text{sol}}$$

are open subsets.

(c) *Let Z be an arbitrary irreducible closed subset of $\overline{\mathfrak{M}}_{g,n}$. Then $V(\pi_{g,n}^{\text{adm}}(Z))$ and $V(\pi_{g,n}^{\text{sol}}(Z))$ are irreducible closed subsets of $\overline{\Pi}_{g,n}$ and $\overline{\Pi}_{g,n}^{\text{sol}}$, respectively, where $V(\pi_{g,n}^{\text{adm}}(Z))$ and $V(\pi_{g,n}^{\text{sol}}(Z))$ denote the topological closures of $\pi_{g,n}^{\text{adm}}(Z)$ and $\pi_{g,n}^{\text{sol}}(Z)$ in $\overline{\Pi}_{g,n}$ and $\overline{\Pi}_{g,n}^{\text{sol}}$, respectively. In particular, the topological spaces $\overline{\Pi}_{g,n}$ and $\overline{\Pi}_{g,n}^{\text{sol}}$ are irreducible.*

(d) *Let V be either an irreducible closed subset of $\overline{\Pi}_{g,n}$ or an irreducible closed subset of $\overline{\Pi}_{g,n}^{\text{sol}}$. Then V has a unique generic point.*

Proof. (a) follows immediately from the definitions of $O_{\overline{\Pi}_{g,n}}$ and $O_{\overline{\Pi}_{g,n}^{\text{sol}}}$, respectively.

(b) Let $[\pi_1^{\text{adm}}(q)] \in \Pi_{g,n}$ be an arbitrary point and $\pi_A^{\text{adm}}(q)$ the set of finite quotients of $\pi_1^{\text{adm}}(q)$. Moreover, since $\pi_1^{\text{adm}}(q)$ is topologically finitely generated, we have a subset of open normal subgroups $\{H_j\}_{j \in \mathbb{N}}$ of $\pi_1^{\text{adm}}(q)$ such that $H_{j_1} \subseteq H_{j_2}$ for any $j_1 \geq j_2$, and that

$$\pi_1^{\text{adm}}(q) \cong \varprojlim_{j \in \mathbb{N}} \pi_1^{\text{adm}}(q)/H_j.$$

We put

$$S(q) \stackrel{\text{def}}{=} \{\pi_1^{\text{adm}}(q)/H_j, j \in \mathbb{N}\} \subseteq \pi_A^{\text{adm}}(q).$$

We see that, in order to prove that $\Pi_{g,n}$ is an open subset of $\overline{\Pi}_{g,n}$, it is sufficient to prove that, for every point $[q_2] \in \mathfrak{M}_{g,n}$, there exists a finite group $G \in S(q_2)$ such that $U_{\overline{\Pi}_{g,n},G}$ is contained in $\Pi_{g,n}$.

Suppose that $U_{\overline{\Pi}_{g,n},G} \cap (\overline{\Pi}_{g,n} \setminus \Pi_{g,n}) \neq \emptyset$ for every $G \in S(q_2)$. Since $\pi_{g,n}^{\text{adm}}$ is continuous (cf. Theorem 3.5) and the set of generic points of $\overline{\mathfrak{M}}_{g,n} \setminus \mathfrak{M}_{g,n}$ is finite, there exists a generic point $[q_1]$ of $\overline{\mathfrak{M}}_{g,n} \setminus \mathfrak{M}_{g,n}$ such that

$$[\pi_1^{\text{adm}}(q_1)] \in \bigcap_{G \in S(q_2)} U_{\overline{\Pi}_{g,n},G}.$$

Then the set

$$\text{Hom}_{\text{surj}}(\pi_1^{\text{adm}}(q_1), \pi_1^{\text{adm}}(q_2)) = \varprojlim_{G \in S(q_2)} \text{Hom}_{\text{surj}}(\pi_1^{\text{adm}}(q_1), G)$$

is not empty. Thus, there is a surjective open continuous homomorphism $\phi : \pi_1^{\text{adm}}(q_1) \rightarrow \pi_1^{\text{adm}}(q_2)$. Note that ϕ induces an isomorphism of maximal prime-to- p quotients

$$\phi^{p'} : \pi_1^{\text{adm}}(q_1)^{p'} \xrightarrow{\sim} \pi_1^{\text{adm}}(q_2)^{p'}.$$

By applying [35, Lemma 6.3], there exists an open characteristic subgroup $H_1 \subseteq \pi_1^{\text{adm}}(q_1)^{p'}$ such that the pointed stable curve $X_{H_1}^\bullet$ of type $(g_{X_{H_1}}, n_{X_{H_1}})$ over k_{q_1} corresponding to H_1 satisfying the following conditions: (1) $\Gamma_{X_{H_1}^\bullet}^{\text{cpt}}$ is 2-connected; (2) $\#(v(\Gamma_{X_{H_1}^\bullet})^{b \leq 1}) = 0$; (3) the Betti number $r_{X_{H_1}}$ of the dual semi-graph of $X_{H_1}^\bullet$ is positive. Let $H_2 \stackrel{\text{def}}{=} \phi^{p'}(H_1) \subseteq \pi_1^{\text{adm}}(q_2)^{p'}$. Then we obtain a smooth pointed stable curve $X_{H_2}^\bullet$ of type $(g_{X_{H_2}}, n_{X_{H_2}})$ over k_{q_2} corresponding to H_2 . Since H_i is an open characteristic subgroup, we obtain that $(g_{X_{H_1}}, n_{X_{H_1}}) = (g_{X_{H_2}}, n_{X_{H_2}})$. Then Theorem 2.2 (b) and Lemma 2.3 (b) imply that

$$r_{X_{H_1}} \leq 0.$$

This contradicts $r_{X_{H_1}} > 0$.

Similar arguments to the arguments given in the proof above imply that $\Pi_{g,n}^{\text{sol}}$ is an open subset of $\overline{\Pi}_{g,n}^{\text{sol}}$. This completes the proof of (b).

(c) is trivial.

(d) We only treat the case where V is an irreducible closed subset of $\overline{\Pi}_{g,n}$. Let $\text{Gen}(V)$ be the set of generic points of V . Since every closed subset of $\overline{\mathfrak{M}}_{g,n}$ has a non-empty set of generic points, we have that $\text{Gen}(V) \neq \emptyset$. Let $[\pi_1^{\text{adm}}(q_1)], [\pi_1^{\text{adm}}(q_2)] \in \text{Gen}(V)$ be arbitrary generic points. Let $G \in \pi_A^{\text{adm}}(q_1)$ be an arbitrary finite group. Then $U_{\overline{\Pi}_{g,n},G} \cap V \neq \emptyset$. Thus, $[\pi_1^{\text{adm}}(q_2)] \in U_{\overline{\Pi}_{g,n},G} \cap V$. This means that $\pi_A^{\text{adm}}(q_1) \subseteq \pi_A^{\text{adm}}(q_2)$. Similar arguments to the arguments given in the proof above imply $\pi_A^{\text{adm}}(q_1) \supseteq \pi_A^{\text{adm}}(q_2)$. Then we have

$$\pi_A^{\text{adm}}(q_1) = \pi_A^{\text{adm}}(q_2).$$

Since admissible fundamental groups of pointed stable curves are topologically finitely generated, [2, Proposition 16.10.6] implies that $[\pi_1^{\text{adm}}(q_1)] = [\pi_1^{\text{adm}}(q_2)]$. This completes the proof of the proposition. \square

Definition 3.7. We shall say that

$$\overline{\Pi}_{g,n}$$

is the moduli space of admissible fundamental groups of pointed stable curves of type (g, n) over algebraically closed fields of characteristic p (or the moduli space of admissible fundamental groups of type (g, n) in characteristic p for short), and that

$$\overline{\Pi}_{g,n}^{\text{sol}}$$

is the moduli space of solvable admissible fundamental groups of pointed stable curves of type (g, n) over algebraically closed fields of characteristic $p > 0$ (or the moduli space of solvable admissible fundamental groups of type (g, n) in characteristic p for short). Moreover, we shall say that $O_{\overline{\Pi}_{g,n}}$ and $O_{\overline{\Pi}_{g,n}^{\text{sol}}}$ are the *anabelian topologies* of $\overline{\Pi}_{g,n}$ and $\overline{\Pi}_{g,n}^{\text{sol}}$, respectively.

Next, we formulate the main conjectures of the theory developing in the present paper.

Homeomorphism Conjecture . *We maintain the notation introduced above. Then we have that*

$$\pi_{g,n}^{\text{adm}} : \overline{\mathfrak{M}}_{g,n} \twoheadrightarrow \overline{\Pi}_{g,n}$$

is a homeomorphism.

Moreover, we have a solvable version of the Homeomorphism Conjecture as follows, which is slightly stronger than the original version.

Solvable Homeomorphism Conjecture . *We maintain the notation introduced above. Then we have that*

$$\pi_{g,n}^{\text{sol}} : \overline{\mathfrak{M}}_{g,n} \twoheadrightarrow \overline{\Pi}_{g,n}^{\text{sol}}$$

is a homeomorphism.

The Homeomorphism Conjecture (or the Solvable Homeomorphism Conjecture) shows that moduli spaces of curves over algebraically closed fields of characteristic $p > 0$ can be reconstructed group-theoretically as “*topological spaces*” from admissible fundamental groups (or solvable admissible fundamental groups) of curves. Moreover, the conjectures give a new insight into the theory of anabelian geometry of curves over algebraically closed fields of characteristic $p > 0$ based on the following anabelian philosophy:

The topological space $\overline{\Pi}_{g,n}$ (or $\overline{\Pi}_{g,n}^{\text{sol}}$) contains all anabelian informations of pointed stable curves of type (g, n) over algebraically closed fields of characteristic $p > 0$, and every topological property concerning the topological space $\overline{\Pi}_{g,n}$ (or $\overline{\Pi}_{g,n}^{\text{sol}}$) can be regarded as an anabelian property of pointed stable curves of type (g, n) over algebraically closed fields of characteristic $p > 0$.

The main theorem of the present paper is the following, which will be proved in Section 6 (cf. Theorem 6.7).

Theorem 3.8. *We maintain the notation introduced above. Let $[q] \in \overline{\mathfrak{M}}_{0,n}^{\text{cl}}$ be an arbitrary closed point. Then $\pi_{0,n}^{\text{adm}}([q])$ and $\pi_{0,n}^{\text{sol}}([q])$ are closed points of $\overline{\Pi}_{0,n}$ and $\overline{\Pi}_{0,n}^{\text{sol}}$, respectively. In particular, the Homeomorphism Conjecture and the Solvable Homeomorphism Conjecture hold when $(g, n) = (0, 4)$.*

On the other hand, some major problems concerning $\overline{\Pi}_{g,n}$ are as follows:

Problem 3.9. *We maintain the notation introduced above.*

1. *Is $\overline{\Pi}_{g,n}$ a noetherian topological space?*
2. *Let $[q] \in \overline{\mathfrak{M}}_{g,n}^{\text{cl}}$. Is $V(\pi_{g,n}^{\text{adm}}([q]))$ a finite set?*
3. *Let Z be an irreducible closed subset of $\overline{\mathfrak{M}}_{g,n}$. Is $\pi_{g,n}^{\text{adm}}(Z)$ an irreducible closed subset of $\overline{\Pi}_{g,n}$?*
4. *Let $i \in \{1, 2\}$, and let $V_{i,m_i} \subseteq \cdots \subseteq V_{i,1} \subseteq V_{i,0} \stackrel{\text{def}}{=} \overline{\Pi}_{g,n}$ be an arbitrary maximal chain of irreducible closed subsets of $\overline{\Pi}_{g,n}$. Does $m_1 = m_2$ hold?*
5. *Let Z be an irreducible closed subset of $\overline{\mathfrak{M}}_{g,n}$. Does $\dim(Z) = \dim(V(\pi_{g,n}^{\text{adm}}(Z)))$ hold? Here, $\dim(V(\pi_{g,n}^{\text{adm}}(Z)))$ denotes the Krull dimension of $V(\pi_{g,n}^{\text{adm}}(Z))$. In particular, does $\dim(\overline{\mathfrak{M}}_{g,n}) = \dim(\overline{\Pi}_{g,n})$ and $\dim(V(\pi_{g,n}^{\text{adm}}([q]))) = 0$ for every $[q] \in \overline{\mathfrak{M}}_{g,n}^{\text{cl}}$ hold? Moreover, Is $\pi_{g,n}^{\text{adm}}([q])$ a closed point of $\overline{\Pi}_{g,n}$ for every $[q] \in \overline{\mathfrak{M}}_{g,n}^{\text{cl}}$?*
6. *Prove the Homeomorphism Conjecture. In particular, prove the Homeomorphism Conjecture for $(0, n)$.*

Remark 3.9.1. We may also ask the problems mentioned above for $\overline{\Pi}_{g,n}^{\text{sol}}$.

Remark 3.9.2. Problem 3.9 (2) is equivalent to the following anabelian property of pointed stable curves:

Let $[q] \in \overline{\mathfrak{M}}_{g,n}^{\text{cl}}$. Then we have that the set

$$\{q' \in \overline{\mathfrak{M}}_{g,n}^{\text{cl}} \mid \text{Hom}_{\text{surj}}(\pi_1^{\text{adm}}(q), \pi_1^{\text{adm}}(q')) \neq \emptyset\}$$

is a finite set.

This property is a generalized version of Theorem 3.4 (a).

Remark 3.9.3. We maintain the notation introduced above. Tamagawa posed a conjecture as follows (cf. [28, Conjecture 5.3 (ii)]), which is called *Essential Dimension Conjecture*:

Let $i \in \{1, 2\}$, and let $q_i \in \mathfrak{M}_{g,n}$ and $V(q_i)$ the topological closure of q_i in $\overline{\mathfrak{M}}_{g,n}$. Then we have that $\dim(V(q_1)) = \dim(V(q_2))$ if $[\pi_1^{\text{adm}}(q_1)] = [\pi_1^{\text{adm}}(q_2)]$.

We see immediately that Problem 3.9 (5) is a generalized version of Tamagawa's Essential Dimension Conjecture.

Proposition 3.10. *Let $[q] \in \overline{\mathfrak{M}}_{g,n}^{\text{cl}}$. Then we have that $\dim(V(\pi_{g,n}^{\text{adm}}([q]))) = 0$ if and only if $\pi_{g,n}^{\text{adm}}([q])$ is a closed point of $\overline{\Pi}_{g,n}$.*

Proof. The “if” part of the proposition is trivial. We only need to prove the “only if” part of the proposition.

Let $[\pi_1^{\text{adm}}(q')] \in V(\pi_{g,n}^{\text{adm}}([q]))$ be an arbitrary point and $V([\pi_1^{\text{adm}}(q')])$ the topological closure of $[\pi_1^{\text{adm}}(q')]$ in $\overline{\Pi}_{g,n}$. Then we have that $V([\pi_1^{\text{adm}}(q')])$ is an irreducible closed subset which is contained in $V(\pi_{g,n}^{\text{adm}}([q]))$. Since $V(\pi_{g,n}^{\text{adm}}([q]))$ is an irreducible closed subset of dimension 0, we obtain that

$$V(\pi_{g,n}^{\text{adm}}([q])) = V([\pi_1^{\text{adm}}(q')]).$$

This means that there exist surjective open continuous homomorphisms

$$\pi_1^{\text{adm}}(q) \twoheadrightarrow \pi_1^{\text{adm}}(q'),$$

$$\pi_1^{\text{adm}}(q') \twoheadrightarrow \pi_1^{\text{adm}}(q).$$

Then we obtain $\pi_A^{\text{adm}}(q) = \pi_A^{\text{adm}}(q')$. Since admissible fundamental groups of pointed stable curves are topologically finitely generated, [2, Proposition 16.10.6] implies that $[\pi_1^{\text{adm}}(q)] = [\pi_1^{\text{adm}}(q')]$. Thus, we obtain $V(\pi_{g,n}^{\text{adm}}([q])) = [\pi_1^{\text{adm}}(q)]$. This completes the proof of the proposition. \square

4 Reconstruction of inertia subgroups and field structures from surjections

In this section, we will prove that the inertia subgroups associated to marked points can be reconstructed group-theoretically from surjective homomorphisms of admissible fundamental groups (or solvable admissible fundamental groups).

Let \mathcal{P} be a category of profinite groups whose class of objects $\text{Ob}(\mathcal{P})$ consists of profinite groups, and whose class of morphisms $\text{Hom}_{\mathcal{P}}(\Pi, \Pi')$ is the class of open continuous homomorphisms of Π and Π' . Let $\Pi \in \mathcal{P}$, and let \mathfrak{S} be a category whose class of objects $\text{Ob}(\mathfrak{S})$ is a set of subgroups of Π , and whose class of morphisms $\text{Hom}_{\mathfrak{S}}(H, H')$ for any $H, H' \in \mathfrak{S}$ is defined as follows: the unique element of $\text{Hom}_{\mathfrak{S}}(H, H')$ is the natural inclusion when $H \subseteq H'$; otherwise, $\text{Hom}_{\mathfrak{S}}(H, H')$ is empty. We shall say that \mathfrak{S} is a category associated to Π .

Let \mathfrak{S} and \mathfrak{S}' be categories associated to profinite groups Π and Π' , respectively. We define a class of functors $\text{Hom}_{\mathcal{S}}(\mathfrak{S}, \mathfrak{S}')$ as follows: $\theta_{\mathcal{S}} \in \text{Hom}_{\mathcal{S}}(\mathfrak{S}, \mathfrak{S}')$ if there exists an open continuous homomorphism $\theta : \Pi \rightarrow \Pi'$ such that $\mathfrak{S} = \{H \stackrel{\text{def}}{=} \theta^{-1}(H')\}_{H' \in \mathfrak{S}'}$, and that $\theta_{\mathcal{S}} : \mathfrak{S} \rightarrow \mathfrak{S}'$, $H \mapsto H'$; otherwise, $\text{Hom}_{\mathcal{S}}(\mathfrak{S}, \mathfrak{S}')$ is empty. We denote by

$$\mathcal{S}$$

the category whose class of objects $\text{Ob}(\mathcal{S})$ is the class of categories associated to profinite groups, and whose class of morphisms $\text{Hom}_{\mathcal{S}}(\mathfrak{S}, \mathfrak{S}')$ consists of the classes of functors defined above. Then we have a natural functor $\pi : \mathcal{S} \rightarrow \mathcal{P}$ defined as follows: Let \mathfrak{S} ,

$\mathfrak{S}' \in \mathcal{S}$ be categories associated to profinite groups Π, Π' , respectively; we have $\pi(\mathfrak{S}) = \Pi$, $\pi(\mathfrak{S}') = \Pi'$, and $\pi(\theta_S) = \theta$. We see immediately that

$$\pi : \mathcal{S} \rightarrow \mathcal{P}$$

is a fibered category over \mathcal{P} .

Definition 4.1. Let $i \in \{1, 2\}$. Let \mathcal{F}_i be a geometric object (in a certain category), $\Pi_{\mathcal{F}_i}$ a profinite group associated to the geometric object \mathcal{F}_i , and \mathfrak{S}_i a category associated to $\Pi_{\mathcal{F}_i}$. Let $\text{Inv}_{\mathcal{F}_i}$ be an invariant depending on the isomorphism class of \mathcal{F}_i (in a certain category) and $\text{Add}_{\mathcal{F}_i}(\mathfrak{S}_i)$ an additional structure associated to \mathfrak{S}_i (e.g., $\text{Add}_{\mathcal{F}_i}(\mathfrak{S}_i) = \mathfrak{S}_i$) on the profinite group $\Pi_{\mathcal{F}_i}$ depending functorially on \mathcal{F}_i and \mathfrak{S}_i .

(a) We shall say that $\text{Inv}_{\mathcal{F}_i}$ can be *reconstructed group-theoretically* from $\Pi_{\mathcal{F}_i}$ (or $\Pi_{\mathcal{F}_i}$ induces $\text{Inv}_{\mathcal{F}_i}$ group-theoretically) if $\Pi_{\mathcal{F}_1} \cong \Pi_{\mathcal{F}_2}$ implies $\text{Inv}_{\mathcal{F}_1} = \text{Inv}_{\mathcal{F}_2}$.

(b) We shall say that $\text{Add}_{\mathcal{F}_2}(\mathfrak{S}_2)$ can be *reconstructed group-theoretically* from $\Pi_{\mathcal{F}_2}$ (or $\Pi_{\mathcal{F}_2}$ induces $\text{Add}_{\mathcal{F}_2}(\mathfrak{S}_2)$ group-theoretically) if every isomorphism $\theta : \Pi_{\mathcal{F}_1} \xrightarrow{\sim} \Pi_{\mathcal{F}_2}$ induces a bijection $\theta_{\text{ad}} : \text{Add}_{\mathcal{F}_1}(\mathfrak{S}_1) \xrightarrow{\sim} \text{Add}_{\mathcal{F}_2}(\mathfrak{S}_2)$ which preserves the structures $\text{Add}_{\mathcal{F}_1}(\mathfrak{S}_1)$ and $\text{Add}_{\mathcal{F}_2}(\mathfrak{S}_2)$, where $\mathfrak{S}_1 \stackrel{\text{def}}{=} \Pi_{\mathcal{F}_1} \times_{\theta, \Pi_{\mathcal{F}_2}} \mathfrak{S}_2$ (i.e., the fiber product in the fibered category \mathcal{S} over \mathcal{P}).

(c) Let $j_1, j_2 \in \{1, 2\}$ distinct from each other, and let $\theta : \Pi_{\mathcal{F}_1} \rightarrow \Pi_{\mathcal{F}_2}$ be an open continuous homomorphism of profinite groups and $\mathfrak{S}_1 = \Pi_{\mathcal{F}_1} \times_{\theta, \Pi_{\mathcal{F}_2}} \mathfrak{S}_2$. We shall say that a map $\theta_{\text{ad}} : \text{Add}_{\mathcal{F}_{j_1}}(\mathfrak{S}_{j_1}) \rightarrow \text{Add}_{\mathcal{F}_{j_2}}(\mathfrak{S}_{j_2})$ can be *reconstructed group-theoretically* from $\theta : \Pi_{\mathcal{F}_1} \rightarrow \Pi_{\mathcal{F}_2}$ (or $\theta : \Pi_{\mathcal{F}_1} \rightarrow \Pi_{\mathcal{F}_2}$ induces $\theta_{\text{ad}} : \text{Add}_{\mathcal{F}_{j_1}}(\mathfrak{S}_{j_1}) \rightarrow \text{Add}_{\mathcal{F}_{j_2}}(\mathfrak{S}_{j_2})$ group-theoretically) if the following condition is satisfied: Let \mathcal{F}'_i be a geometric object, $\Pi_{\mathcal{F}'_i}$ a profinite group associated to the geometric object \mathcal{F}'_i , $\theta_i : \Pi_{\mathcal{F}'_i} \xrightarrow{\sim} \Pi_{\mathcal{F}_i}$ an isomorphism of profinite groups, $\theta' : \Pi_{\mathcal{F}'_1} \rightarrow \Pi_{\mathcal{F}'_2}$, $\mathfrak{S}'_i \stackrel{\text{def}}{=} \Pi_{\mathcal{F}'_i} \times_{\theta_i, \Pi_{\mathcal{F}_i}} \mathfrak{S}_i$, $\text{Add}_{\mathcal{F}'_i}(\mathfrak{S}'_i)$ an additional structure on the profinite group $\Pi_{\mathcal{F}'_i}$. Suppose that the following commutative diagram of profinite groups holds

$$\begin{array}{ccc} \Pi_{\mathcal{F}'_1} & \xrightarrow{\theta'} & \Pi_{\mathcal{F}'_2} \\ \theta_1 \downarrow & & \theta_2 \downarrow \\ \Pi_{\mathcal{F}_1} & \xrightarrow{\theta} & \Pi_{\mathcal{F}_2}. \end{array}$$

Then the commutative diagram of profinite groups above induces the following commutative diagram of additional structures

$$\begin{array}{ccc} \text{Add}_{\mathcal{F}'_{j_1}}(\mathfrak{S}'_{j_1}) & \xrightarrow{\theta'_{\text{ad}}} & \text{Add}_{\mathcal{F}'_{j_2}}(\mathfrak{S}'_{j_2}) \\ \theta_{j_1, \text{ad}} \downarrow & & \theta_{j_2, \text{ad}} \downarrow \\ \text{Add}_{\mathcal{F}_{j_1}}(\mathfrak{S}_{j_1}) & \xrightarrow{\theta_{\text{ad}}} & \text{Add}_{\mathcal{F}_{j_2}}(\mathfrak{S}_{j_2}) \end{array}$$

which preserves the structures of additional structures.

Remark 4.1.1. Let us explain the philosophy of *mono-anabelian geometry* introduced by Mochizuki. The classical point of view of anabelian geometry (i.e., the anabelian geometry considered in [3], [4]) focuses on a comparison between two geometric objects via

their fundamental groups. Moreover, the term “group-theoretical”, in the classical point of view, means that “preserved by an arbitrary isomorphism between the fundamental groups under consideration”. We shall refer to the classical point of view as “*bi-anabelian geometry*”. Then Definition 4.1 is a definition from the point of view of bi-anabelian geometry.

On the other hand, mono-anabelian geometry focuses on the establishing a group-theoretic algorithm whose input datum is an abstract topological group which is isomorphic to the fundamental group of a given geometric object of interest (resp. a continuous homomorphism of abstract topological groups which are isomorphic to a continuous homomorphism of the fundamental groups of given geometric objects of interest), and whose output datum is a geometric object which is isomorphic to the given geometric object of interest (resp. a morphism of geometric objects which is isomorphic to a morphism of given geometric objects of interest). In the point of view of mono-anabelian geometry, the term “group-theoretic algorithm” is used to mean that “the algorithm in a discussion is phrased in language that only depends on the topological group structures of the fundamental groups under consideration”. Note that mono-anabelian results are stronger than bi-anabelian results.

We maintain the notation introduced in Definition 4.1. Then the mono-anabelian version of Definition 4.1 is as follows:

(a) We shall say that $\text{Inv}_{\mathcal{F}_i}$ can be *mono-anabelian reconstructed* from $\Pi_{\mathcal{F}_i}$ if there exists a group-theoretical algorithm whose input datum is $\Pi_{\mathcal{F}_i}$, and whose output datum is $\text{Inv}_{\mathcal{F}_i}(\mathfrak{S}_i)$.

(b) We shall say that $\text{Add}_{\mathcal{F}_i}(\mathfrak{S}_i)$ can be *mono-anabelian reconstructed* from $\Pi_{\mathcal{F}_i}$ if there exists a group-theoretical algorithm whose input datum is $\Pi_{\mathcal{F}_i}$, and whose output datum is $\text{Add}_{\mathcal{F}_i}$.

(c) Let $j_1, j_2 \in \{1, 2\}$ distinct from each other, and let $\theta : \Pi_{\mathcal{F}_1} \rightarrow \Pi_{\mathcal{F}_2}$ be an open continuous homomorphism of profinite groups and $\mathfrak{S}_1 = \Pi_{\mathcal{F}_1} \times_{\theta, \Pi_{\mathcal{F}_2}} \mathfrak{S}_2$. We shall say that a map (or a morphism) $\theta_{\text{add}} : \text{Add}_{\mathcal{F}_{j_1}}(\mathfrak{S}_{j_1}) \rightarrow \text{Add}_{\mathcal{F}_{j_2}}(\mathfrak{S}_{j_2})$ can be *mono-anabelian reconstructed* from $\theta : \Pi_{\mathcal{F}_1} \rightarrow \Pi_{\mathcal{F}_2}$ if there exists a group-theoretical algorithm whose input datum is $\theta : \Pi_{\mathcal{F}_1} \rightarrow \Pi_{\mathcal{F}_2}$, and whose output datum is $\theta_{\text{add}} : \text{Add}_{\mathcal{F}_{j_1}}(\mathfrak{S}_{j_1}) \rightarrow \text{Add}_{\mathcal{F}_{j_2}}(\mathfrak{S}_{j_2})$.

Let $i \in \{1, 2\}$, and let $X_i^\bullet = (X_i, D_{X_i})$ be a pointed stable curve of type (g_{X_i}, n_{X_i}) over an algebraically closed field k_i of characteristic $p_i > 0$, $\Gamma_{X_i^\bullet}$ the dual semi-graph of X_i^\bullet , and $\Pi_{X_i^\bullet}$ either the admissible fundamental group or the solvable admissible fundamental group of X_i^\bullet . The following result was proved by Tamagawa for smooth pointed stable curves and by the author for arbitrary pointed stable curves.

Theorem 4.2. *We maintain the notation introduced above. Then the characteristic p_i of k_i and the type (g_{X_i}, n_{X_i}) can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$. Moreover, $\Pi_{X_i^\bullet}^{\text{ét}}$, $\Pi_{X_i^\bullet}^{\text{top}}$, $\text{Ver}(\Pi_{X_i^\bullet})$, $\text{Edg}^{\text{op}}(\Pi_{X_i^\bullet})$, $\text{Edg}^{\text{cl}}(\Pi_{X_i^\bullet})$, and $\Gamma_{X_i^\bullet}$ can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$.*

Proof. See [35, Theorem 1.2, Remark 1.2.1, Remark 1.2.2, and Proposition 6.1], [29, Theorem 0.1], and [39, Theorem 1.3]. \square

Remark 4.2.1. Note that [39, Theorem 1.3] gives a formula for (g_{X_i}, n_{X_i}) . Then we obtain that the characteristic p_i of k_i and the type (g_{X_i}, n_{X_i}) can be *mono-anabelian reconstructed* from $\Pi_{X_i^\bullet}$. In fact, we have that $\Pi_{X_i^\bullet}^{\text{ét}}, \Pi_{X_i^\bullet}^{\text{top}}, \text{Ver}(\Pi_{X_i^\bullet}), \text{Edg}^{\text{op}}(\Pi_{X_i^\bullet}), \text{Edg}^{\text{cl}}(\Pi_{X_i^\bullet})$, and $\Gamma_{X_i^\bullet}$ can be *mono-anabelian reconstructed* from $\Pi_{X_i^\bullet}$ (see [37, Theorem 0.2]).

Remark 4.2.2. We do not use the term “mono-anabelian reconstruction” in the present paper. On the other hand, by applying Remark 4.2.1, all of the bi-anabelian results proved in the present paper can be generalized to the case of mono-anabelian reconstructions. Moreover, mono-anabelian results will be used in [41], and play a fundamental role in [43].

Lemma 4.3. *We maintain the notation introduced above. Suppose that $p \stackrel{\text{def}}{=} p_1 = p_2$, that $(g_X, n_X) \stackrel{\text{def}}{=} (g_{X_1}, n_{X_1}) = (g_{X_2}, n_{X_2})$. Let $\phi : \Pi_{X_1^\bullet} \rightarrow \Pi_{X_2^\bullet}$ be an arbitrary open continuous homomorphism. Then we have that ϕ is a surjection.*

Proof. Let $\Pi_\phi \stackrel{\text{def}}{=} \phi(\Pi_{X_1^\bullet}) \subseteq \Pi_{X_2^\bullet}$ be the image of ϕ which is an open subgroup of $\Pi_{X_2^\bullet}$. Let $X_\phi^\bullet = (X_\phi, D_{X_\phi})$ be the pointed stable curve of type (g_{X_ϕ}, n_{X_ϕ}) over k_2 induced by Π_ϕ and

$$X_\phi^\bullet \rightarrow X_2^\bullet$$

the admissible covering over k_2 induced by the natural inclusion $\Pi_\phi \hookrightarrow \Pi_{X_2^\bullet}$. The Riemann-Hurwitz formula implies that $g_{X_\phi} + n_{X_\phi} \geq g_X + n_X$. Moreover, by applying Theorem 2.2 (a) and Lemma 2.3 (a), the natural surjection $\Pi_{X_1^\bullet} \twoheadrightarrow \Pi_\phi$ induced by ϕ imply that $g_X \geq g_{X_\phi}$ and $n_X \geq n_{X_\phi}$. Then we have

$$(g_X, n_X) = (g_{X_\phi}, n_{X_\phi}).$$

This means that the admissible covering $X_\phi^\bullet \rightarrow X_2^\bullet$ is totally ramified over every marked point of D_{X_2} . Then the Riemann-Hurwitz formula implies that $[\Pi_{X_1^\bullet} : \Pi_\phi] \neq 1$ if and only if $(g_X, n_X) = (0, 2)$. Thus, we obtain that ϕ is a surjection. \square

In the remainder of this section, we suppose that $p \stackrel{\text{def}}{=} p_1 = p_2$, that $(g_X, n_X) \stackrel{\text{def}}{=} (g_{X_1}, n_{X_1}) = (g_{X_2}, n_{X_2})$. Let

$$\phi : \Pi_{X_1^\bullet} \rightarrow \Pi_{X_2^\bullet}$$

be an arbitrary open continuous homomorphism. By Lemma 4.3, we see that ϕ is a *surjective* open continuous homomorphism. Let \mathfrak{P} be the set of prime numbers, $\Sigma \subseteq \mathfrak{P} \setminus \{p\}$ a subset, $\Pi_{X_i^\bullet}^\Sigma$ the maximal pro- Σ quotient of $\Pi_{X_i^\bullet}$, $pr_i^\Sigma : \Pi_{X_i^\bullet} \twoheadrightarrow \Pi_{X_i^\bullet}^\Sigma$ the natural surjective homomorphism, and

$$\phi^\Sigma : \Pi_{X_1^\bullet}^\Sigma \xrightarrow{\sim} \Pi_{X_2^\bullet}^\Sigma$$

the isomorphism induced by ϕ . In particular, if $\Sigma = \mathfrak{P} \setminus \{p\}$, we use the notation $\Pi_{X_i^\bullet}^{p'}$ and $\phi^{p'} : \Pi_{X_1^\bullet}^{p'} \xrightarrow{\sim} \Pi_{X_2^\bullet}^{p'}$ to denote $\Pi_{X_i^\bullet}^\Sigma$ and ϕ^Σ , respectively.

Lemma 4.4. *We maintain the notation introduced above. Then we have that $\Pi_{X_i^\bullet}^{\text{cpt}}$ can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$, and that the (surjective) open continuous homomorphism $\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$ induces a surjective homomorphism*

$$\phi^{\text{cpt}} : \Pi_{X_1^\bullet}^{\text{cpt}} \twoheadrightarrow \Pi_{X_2^\bullet}^{\text{cpt}}$$

group-theoretically. Moreover, the following commutative diagram of profinite groups

$$\begin{array}{ccc} \Pi_{X_1^\bullet} & \xrightarrow{\phi} & \Pi_{X_2^\bullet} \\ \downarrow & & \downarrow \\ \Pi_{X_1^\bullet}^{\text{cpt}} & \xrightarrow{\phi^{\text{cpt}}} & \Pi_{X_2^\bullet}^{\text{cpt}} \end{array}$$

can be reconstructed group-theoretically from ϕ .

Proof. By Theorem 4.2, we have that (g_X, n_X) can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$. If $n_X = 0$, the lemma is trivial. Then we may assume that $n_X > 0$.

Let $H_i \subseteq \Pi_{X_i^\bullet}$ be an open subgroup. Then the Riemann-Hurwitz formula implies that the admissible covering

$$X_{H_i}^\bullet \rightarrow X_i^\bullet$$

over k_i induced by $H_i \subseteq \Pi_{X_i^\bullet}$ is étale over D_{X_i} if and only if $g_{X_{H_i}} = [\Pi_{X_i^\bullet} : H_i](g_X - 1) + 1$. We put

$$\begin{aligned} \text{Et}_{D_{X_i}}^{\text{norm}}(\Pi_{X_i^\bullet}) &\stackrel{\text{def}}{=} \{H_i \subseteq \Pi_{X_i^\bullet} \text{ is an open normal subgroup} \\ &\quad | g_{X_{H_i}} = [\Pi_{X_i^\bullet} : H_i](g_X - 1) + 1\} \\ &\subseteq \text{Et}_{D_{X_i}}(\Pi_{X_i^\bullet}) \stackrel{\text{def}}{=} \{H_i \subseteq \Pi_{X_i^\bullet} \text{ is an open subgroup} \\ &\quad | g_{X_{H_i}} = [\Pi_{X_i^\bullet} : H_i](g_X - 1) + 1\}. \end{aligned}$$

By Theorem 4.2, we have that $\text{Et}_{D_{X_i}}^{\text{norm}}(\Pi_{X_i^\bullet})$ and $\text{Et}_{D_{X_i}}(\Pi_{X_i^\bullet})$ can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$. Since

$$\Pi_{X_i^\bullet}^{\text{cpt}} \stackrel{\text{def}}{=} \Pi_{X_i^\bullet} / \bigcap_{H_i \in \text{Et}_{D_{X_i}}^{\text{norm}}(\Pi_{X_i^\bullet})} H_i = \Pi_{X_i^\bullet} / \bigcap_{H_i \in \text{Et}_{D_{X_i}}(\Pi_{X_i^\bullet})} H_i,$$

we obtain that $\Pi_{X_i^\bullet}^{\text{cpt}}$ can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$.

Let $H_2 \in \text{Et}_{D_{X_2}}^{\text{norm}}(\Pi_{X_2^\bullet})$, $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2)$, and $G \stackrel{\text{def}}{=} \Pi_{X_2^\bullet}/H_2 = \Pi_{X_1^\bullet}/H_1$. We will prove that $H_1 \in \text{Et}_{D_{X_1}}^{\text{norm}}(\Pi_{X_1^\bullet})$. Let

$$f_{H_1}^\bullet : X_{H_1}^\bullet \rightarrow X_1^\bullet$$

be the Galois admissible covering over k_1 with Galois group G corresponding to H_1 , $x_1 \in D_{X_1}$ a marked point of X_1^\bullet , and $e_{f_{H_1}}(x_1)$ the ramification index of a point of $f_{H_1}^{-1}(x_1)$. Since $H_2 \in \text{Et}_{D_{X_2}}^{\text{norm}}(\Pi_{X_2^\bullet})$, we have $g_{X_{H_2}} = \#G(g_X - 1) + 1$ and $n_{X_{H_2}} = \#G n_X$. Then by applying the Riemann-Hurwitz formula, we obtain that

$$\begin{aligned} g_{X_{H_1}} &= \#G(g_X - 1) + 1 + \frac{1}{2} \cdot \sum_{x_1 \in D_{X_1}} \frac{\#G}{e_{f_{H_1}}(x_1)} (e_{f_{H_1}}(x_1) - 1) \\ &= \#G(g_X - 1) + 1 + \frac{1}{2} \cdot \sum_{x_1 \in D_{X_1}} \left(\#G - \frac{\#G}{e_{f_{H_1}}(x_1)} \right) \end{aligned}$$

and

$$n_{X_{H_1}} = \sum_{x_1 \in D_{X_1}} \frac{\#G}{e_{f_{H_1}}(x_1)}.$$

By applying Theorem 2.2 (a) and Lemma 2.3 (a), the surjective homomorphism $\phi|_{H_1} : H_1 \twoheadrightarrow H_2$ induces that

$$\gamma^{\max}(H_1) + 2 = g_{X_{H_1}} + n_{X_{H_1}} \geq \gamma^{\max}(H_2) + 2 = g_{X_{H_2}} + n_{X_{H_2}}.$$

Then we obtain that

$$\begin{aligned} g_{X_{H_1}} + n_{X_{H_1}} &= \#G(g_X - 1) + 1 + \frac{1}{2} \cdot \sum_{x_1 \in D_{X_1}} \left(\#G - \frac{\#G}{e_{f_{H_1}}(x_1)} \right) + \sum_{x_1 \in D_{X_1}} \frac{\#G}{e_{f_{H_1}}(x_1)} \\ &= \#G(g_X - 1) + 1 + \frac{1}{2} \#G n_X + \frac{1}{2} \cdot \sum_{x_1 \in D_{X_1}} \frac{\#G}{e_{f_{H_1}}(x_1)} \\ &\geq \#G(g_X - 1) + 1 + \#G n_X. \end{aligned}$$

Thus, we have

$$\sum_{x_1 \in D_{X_1}} \frac{\#G}{e_{f_{H_1}}(x_1)} \geq \#G n_X.$$

Since $\#D_{X_1} = n_X$, we see immediately that $e_{f_{H_1}}(x_1) = 1$. This means that $f_{H_1}^\bullet$ is étale, and that

$$H_1 \in \text{Et}_{D_{X_1}}^{\text{norm}}(\Pi_{X_1^\bullet}).$$

Thus we may define the following surjective homomorphism

$$\phi^{\text{cpt}} : \Pi_{X_1^\bullet}^{\text{cpt}} \stackrel{\text{def}}{=} \Pi_{X_1^\bullet} / \bigcap_{H_1 \in \text{Et}_{D_{X_1}}^{\text{norm}}(\Pi_{X_1^\bullet})} H_1 \twoheadrightarrow \Pi_{X_2^\bullet}^{\text{cpt}} \stackrel{\text{def}}{=} \Pi_{X_2^\bullet} / \bigcap_{H_2 \in \text{Et}_{D_{X_2}}^{\text{norm}}(\Pi_{X_2^\bullet})} H_2$$

which is induced by ϕ group-theoretically. Moreover, the commutative diagram

$$\begin{array}{ccc} \Pi_{X_1^\bullet} & \xrightarrow{\phi} & \Pi_{X_2^\bullet} \\ \downarrow & & \downarrow \\ \Pi_{X_1^\bullet}^{\text{cpt}} & \xrightarrow{\phi^{\text{cpt}}} & \Pi_{X_2^\bullet}^{\text{cpt}} \end{array}$$

follows immediately from the definition of ϕ^{cpt} . This completes the proof of the lemma. \square

Lemma 4.5. *Let ℓ be a prime number, and let $H_2 \subseteq \Pi_{X_2^\bullet}$ be an open normal subgroup and $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2) \subseteq \Pi_{X_1^\bullet}$. Suppose that $G \stackrel{\text{def}}{=} \Pi_{X_1^\bullet}/H_1 = \Pi_{X_2^\bullet}/H_2$ is a cyclic group which is isomorphic to $\mathbb{Z}/\ell\mathbb{Z}$. Then we have that*

$$(g_{X_{H_1}}, n_{X_{H_1}}) = (g_{X_{H_2}}, n_{X_{H_2}}).$$

Proof. Let

$$f_{H_i}^\bullet : X_{H_i}^\bullet \rightarrow X_i^\bullet$$

be the Galois admissible covering over k_i with Galois group G corresponding to H_i . Suppose that $\ell = p$. Then the definition of admissible coverings implies that $f_{H_i}^\bullet$ is étale. Thus, we have that $(g_{X_{H_1}}, n_{X_{H_1}}) = (g_{X_{H_2}}, n_{X_{H_2}})$. Then we may suppose that $\ell \neq p$.

By the Riemann-Hurwitz formula, we have

$$g_{X_{H_i}} = \ell(g_X - 1) + 1 + \frac{1}{2} \#e_{f_{H_i}}^{\text{op,ra}}(\ell - 1)$$

and

$$n_{X_{H_i}} = \#e_{f_{H_i}}^{\text{op,ra}} + \ell(n_X - \#e_{f_{H_i}}^{\text{op,ra}}).$$

By applying Theorem 2.2 (a) and Lemma 2.3 (a), the surjective homomorphism $\phi|_{H_1} : H_1 \twoheadrightarrow H_2$ implies that

$$\gamma^{\max}(H_1) + 2 = g_{X_{H_1}} + n_{X_{H_1}} \geq \gamma^{\max}(H_2) + 2 = g_{X_{H_2}} + n_{X_{H_2}}.$$

Then we have

$$\begin{aligned} & \ell(g_X - 1) + 1 + \frac{1}{2} \#e_{f_{H_1}}^{\text{op,ra}}(\ell - 1) + \#e_{f_{H_1}}^{\text{op,ra}} + \ell(n_X - \#e_{f_{H_1}}^{\text{op,ra}}) \\ &= \ell(g_X - 1) + 1 + \ell n_X + \frac{1}{2}(1 - \ell) \#e_{f_{H_1}}^{\text{op,ra}} \\ &\geq \ell(g_X - 1) + 1 + \frac{1}{2} \#e_{f_{H_2}}^{\text{op,ra}}(\ell - 1) + \#e_{f_{H_2}}^{\text{op,ra}} + \ell(n_X - \#e_{f_{H_2}}^{\text{op,ra}}) \\ &= \ell(g_X - 1) + 1 + \ell n_X + \frac{1}{2}(1 - \ell) \#e_{f_{H_2}}^{\text{op,ra}}. \end{aligned}$$

Then we obtain that

$$\#e_{f_{H_1}}^{\text{op,ra}} \leq \#e_{f_{H_2}}^{\text{op,ra}}.$$

Let $0 \leq m \leq n_X$ be a positive natural number. We put

$$\begin{aligned} \mathcal{A}_{i,m} &\stackrel{\text{def}}{=} \{N_i \subseteq \Pi_{X_i}^\bullet \text{ is an open normal subgroup} \\ &\quad | \Pi_{X_i}^\bullet / N_i \cong \mathbb{Z}/\ell\mathbb{Z} \text{ and } \#e_{f_{N_i}}^{\text{op,ra}} = m\} \end{aligned}$$

and

$$\mathcal{A}_{i,\leq m} \stackrel{\text{def}}{=} \bigcup_{0 \leq j \leq m} \mathcal{A}_{i,j},$$

where $f_{N_i}^\bullet$ denotes the Galois admissible covering over k_i corresponding to N_i . The isomorphism $\phi^{p'}$ induces a bijective map

$$\phi_\ell^* : \mathcal{A}_{2,\leq n_X} \xrightarrow{\sim} \mathcal{A}_{1,\leq n_X}.$$

To verify the lemma, it sufficient to prove that ϕ_ℓ^* induces a bijection

$$\phi_\ell^*|_{\mathcal{A}_{2,m}} : \mathcal{A}_{2,m} \xrightarrow{\sim} \mathcal{A}_{1,m}.$$

We note that since $(g_X, n_X) = (g_{X_1}, n_{X_1}) = (g_{X_2}, n_{X_2})$, the isomorphism $\phi^{p'}$ implies that $\#\mathcal{A}_{1,j} = \#\mathcal{A}_{2,j}$ for each $0 \leq j \leq n_X$. Then by Lemma 4.4, we have a bijection

$$\phi_\ell^*|_{\mathcal{A}_{2,0}} : \mathcal{A}_{2,0} \xrightarrow{\sim} \mathcal{A}_{1,0}.$$

We prove $\phi_\ell^*|_{\mathcal{A}_{2,m}} : \mathcal{A}_{2,m} \xrightarrow{\sim} \mathcal{A}_{1,m}$ by induction on m . Suppose that $m \geq 1$. The inequality $\#e_{f_{H_1}}^{\text{op,ra}} \leq \#e_{f_{H_2}}^{\text{op,ra}}$ concerning the cardinality of branch locus implies that we have a bijection $\phi_\ell^*|_{\mathcal{A}_{2,\leq m}} : \mathcal{A}_{2,\leq m} \xrightarrow{\sim} \mathcal{A}_{1,\leq m}$. By induction, $\phi_\ell^*|_{\mathcal{A}_{2,\leq m-1}} : \mathcal{A}_{2,\leq m-1} \xrightarrow{\sim} \mathcal{A}_{1,\leq m-1}$ is a bijection. Then we obtain that

$$\phi_\ell^*|_{\mathcal{A}_{2,m}} : \mathcal{A}_{2,m} \xrightarrow{\sim} \mathcal{A}_{1,m}.$$

This completes the proof of the lemma. \square

Corollary 4.6. *Let $H_2 \subseteq \Pi_{X_2^\bullet}$ be an open normal subgroup and $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2) \subseteq \Pi_{X_1^\bullet}$. Suppose that $G \stackrel{\text{def}}{=} \Pi_{X_1^\bullet}/H_1 = \Pi_{X_2^\bullet}/H_2$ is a finite solvable group. Then we have that*

$$(g_{X_{H_1}}, n_{X_{H_1}}) = (g_{X_{H_2}}, n_{X_{H_2}}).$$

Proof. The corollary follows immediately from Lemma 4.5. \square

Lemma 4.7. *Let $H_2 \subseteq \Pi_{X_2^\bullet}$ be an open normal subgroup and $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2) \subseteq \Pi_{X_1^\bullet}$. Suppose that H_2 contains the kernel of the natural homomorphism $\Pi_{X_2^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}^{\text{cpt}}$ (i.e., the admissible covering corresponding to H_2 is étale over D_{X_2}). Then we have that*

$$(g_{X_{H_1}}, n_{X_{H_1}}) = (g_{X_{H_2}}, n_{X_{H_2}}).$$

Proof. By Lemma 4.4, we have that H_1 contains the kernel of the natural homomorphism $\Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_1^\bullet}^{\text{cpt}}$ (i.e., the admissible covering corresponding to H_1 is étale over D_{X_1}). Then the lemma follows immediately from the Riemann-Hurwitz formula. \square

Definition 4.8. Let Π be an arbitrary profinite group and $m, n \in \mathbb{N}$ positive natural numbers. We define the closed normal subgroup

$$D_n(\Pi)$$

of Π to be the topological closure of $[\Pi, \Pi]\Pi^n$, where $[\Pi, \Pi]$ denotes the commutator subgroup of Π . Moreover, we define the closed normal subgroup

$$D_n^{(m)}(\Pi)$$

of Π inductively by $D_n^{(1)}(\Pi) \stackrel{\text{def}}{=} D_n(\Pi)$ and $D_n^{(j+1)}(\Pi) \stackrel{\text{def}}{=} D_n(D_n^{(j)}(\Pi))$, $j \in \{1, \dots, m-1\}$. Note that $\#(\Pi/D_n^{(m)}(\Pi)) \leq \infty$ when Π is topologically finitely generated.

Proposition 4.9. *Let $N_2 \subseteq \Pi_{X_2^\bullet}$ be an arbitrary open subgroup, $N_1 \stackrel{\text{def}}{=} \phi^{-1}(N_2) \subseteq \Pi_{X_1^\bullet}$. Then there exist open normal subgroups $H_2 \subseteq N_2 \subseteq \Pi_{X_2^\bullet}$ of $\Pi_{X_2^\bullet}$ and $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2) \subseteq N_1 \subseteq \Pi_{X_1^\bullet}$ of $\Pi_{X_1^\bullet}$ such that*

$$(g_{X_{H_1}}, n_{X_{H_1}}) = (g_{X_{H_2}}, n_{X_{H_2}}).$$

Proof. Let M_i be an open normal subgroup of $\Pi_{X_i^\bullet}$ which is contained in N_i . We put $G \stackrel{\text{def}}{=} \Pi_{X_1^\bullet}/M_1 = \Pi_{X_2^\bullet}/M_2$, and write m for $[G : G_p]$, where G_p denotes a Sylow- p subgroup of G . Then we have $(m, p) = 1$. Let

$$f_{M_i}^\bullet : X_{M_i}^\bullet \rightarrow X_i^\bullet$$

be the Galois admissible covering over k_i with Galois group G corresponding to M_i .

We put $Q_2 \stackrel{\text{def}}{=} D_m^{(4)}(\Pi_{X_2^\bullet})$ and $Q_1 \stackrel{\text{def}}{=} \phi^{-1}(Q_2)$. Note that since m is prime to p and $\phi^{p'}$ is an isomorphism, we have $Q_1 = D_m^{(4)}(\Pi_{X_1^\bullet})$. Let $H_i \stackrel{\text{def}}{=} M_i \cap Q_i \subseteq \Pi_{X_i^\bullet}$. We denote by

$$f_{Q_i}^\bullet : X_{Q_i}^\bullet \rightarrow X_i^\bullet$$

and

$$f_{H_i}^\bullet : X_{H_i}^\bullet \rightarrow X_i^\bullet$$

the Galois admissible covering over k_i with Galois group $\Pi_{X_i^\bullet}/Q_i$ corresponding to Q_i , and the Galois admissible covering over k_i with Galois group $\Pi_{X_i^\bullet}/H_i$ corresponding to H_i , respectively. Note that $f_{H_i}^\bullet$ factors through $f_{M_i}^\bullet$ and $f_{Q_i}^\bullet$.

By applying [40, Lemma 3.2 and Lemma 3.3], we have that the ramification index of every point of $D_{X_{Q_i}}$ is divided by m . Then Abhyankar's lemma implies that the Galois admissible covering

$$g_i^\bullet : X_{H_i}^\bullet \rightarrow X_{Q_i}^\bullet$$

over k_i induced by $H_i \subseteq Q_i$ is étale. Since $\Pi_{X_i^\bullet}/Q_i$ is a finite solvable group, the proposition follows immediately from Corollary 4.6 and Lemma 4.7. \square

Lemma 4.10. (a) Let $J_i \subseteq \Pi_{X_i^\bullet}$ be a closed subgroup which is isomorphic to $\widehat{\mathbb{Z}}(1)^{p'}$. Then the following conditions are equivalent:

- (i) There exists a unique closed subgroup $I_i \in \text{Edg}^{\text{op}}(\Pi_{X_i^\bullet})$ such that $J_i \subseteq I_i$.
- (ii) There exists an open subgroup $N_i \subseteq \Pi_{X_i^\bullet}$ such that there exists a cofinal system \mathcal{C}_{N_i} of N_i which consists of open normal subgroups $H_i \subseteq N_i \subseteq \Pi_{X_i^\bullet}$ of $\Pi_{X_i^\bullet}$ (i.e., $N_i \cong \varprojlim_{H_i \in \mathcal{C}_{N_i}} N_i/H_i$), the image of the composition of the natural homomorphisms

$$J_i \cap H_i \hookrightarrow H_i \rightarrow H_i^{\text{cpt, ab}}$$

is trivial for every $H_i \in \mathcal{C}_{N_i}$.

- (b) Let ℓ be a prime number distinct from p , $I_i, J_i \in \text{Edg}^{\text{op}}(\Pi_{X_i^\bullet})$ arbitrary closed subgroups, and $\Pi_{X_i^\bullet}^\ell$ the maximal pro- ℓ quotient of $\Pi_{X_i^\bullet}$. Write \overline{I}_i^ℓ and \overline{J}_i^ℓ for $\text{pr}_i^\ell(I_i)$ and $\text{pr}_i^\ell(J_i)$, respectively. Suppose that $\overline{I}_i^\ell = \overline{J}_i^\ell$. Then we have

$$I_i = J_i.$$

Proof. By applying similar arguments to the arguments given in the proof of [7, Lemma 1.6], we obtain (a).

On the other hand, [12, Proposition 1.2 (i)] implies that $I_i \cap J_i$ is trivial. Then we see that, by replacing $\Pi_{X_i^\bullet}$ by a certain open subgroup of $\Pi_{X_i^\bullet}$, there exists an open normal subgroup $N_i \subseteq \Pi_{X_i^\bullet}$ such that $\#(\Pi_{X_i^\bullet}/N_i) = \ell$, that $I_i \subseteq N_i$, and that $J_i \not\subseteq N_i$. This contradicts $\overline{I}_i^\ell = \overline{J}_i^\ell$. We complete the proof of (b). \square

Next, we prove the main result of this section.

Theorem 4.11. *We maintain the notation introduced above. Then the (surjective) open continuous homomorphism $\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$ induces a surjective map*

$$\phi^{\text{edg,op}} : \text{Edg}^{\text{op}}(\Pi_{X_1^\bullet}) \twoheadrightarrow \text{Edg}^{\text{op}}(\Pi_{X_2^\bullet}),$$

group-theoretically. Moreover, ϕ induces a bijection

$$\phi^{\text{sg,op}} : e^{\text{op}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_2^\bullet})$$

of the sets of open edges of dual semi-graphs of X_1^\bullet and X_2^\bullet group-theoretically.

Proof. If $n_X = 0$, the theorem is trivial. Then we may assume that $n_X > 0$. Let $\mathcal{C}_{\Pi_{X_2^\bullet}}$ be a cofinal system of $\Pi_{X_2^\bullet}$ which consists of open normal subgroups of $\Pi_{X_2^\bullet}$. We put

$$\mathcal{C}_{\Pi_{X_1^\bullet}} \stackrel{\text{def}}{=} \{H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2) \mid H_2 \in \mathcal{C}_{\Pi_{X_2^\bullet}}\}.$$

Note that $\mathcal{C}_{\Pi_{X_1^\bullet}}$ is not a cofinal system of $\Pi_{X_1^\bullet}$ in general. Moreover, by applying Proposition 4.9, we may assume that

$$(g_{X_{H_1}}, n_{X_{H_1}}) = (g_{X_{H_2}}, n_{X_{H_2}})$$

holds for every $H_2 \in \mathcal{C}_{\Pi_{X_2^\bullet}}$ and $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2) \in \mathcal{C}_{\Pi_{X_1^\bullet}}$.

Let $I_1 \in \text{Edg}^{\text{op}}(\Pi_{X_1^\bullet})$ and $\phi(I_1) \subseteq \Pi_{X_2^\bullet}$. We will prove that $\phi(I_1) \in \text{Edg}^{\text{op}}(\Pi_{X_2^\bullet})$. Let $H_2 \in \mathcal{C}_{\Pi_{X_2^\bullet}}$. By replacing $\Pi_{X_i^\bullet}$ and ϕ by H_i and $\phi|_{H_1}$, respectively, Lemma 4.4 implies that we have the following commutative diagram:

$$\begin{array}{ccc} I_1 \cap H_1 & \xrightarrow{\phi|_{I_1 \cap H_1}} & \phi(I_1) \cap H_2 \\ \downarrow & & \downarrow \\ H_1 & \xrightarrow{\phi|_{H_1}} & H_2 \\ \downarrow & & \downarrow \\ H_1^{\text{cpt,ab}} & \xrightarrow{\phi|_{H_1}^{\text{cpt,ab}}} & H_2^{\text{cpt,ab}}. \end{array}$$

Since $I_1 \in \text{Edg}^{\text{op}}(\Pi_{X_1^\bullet})$, we have that $I_1 \cap H_1 \hookrightarrow H_1 \rightarrow H_1^{\text{cpt,ab}}$ is trivial. Then the commutative diagram above implies that the natural morphism

$$\phi(I_1) \cap H_2 \hookrightarrow H_2 \rightarrow H_2^{\text{cpt,ab}}$$

is trivial. Thus, by Lemma 4.10 (a), there exists $I_2 \in \text{Edg}^{\text{op}}(\Pi_{X_2^\bullet})$ such that $\phi(I_1) \subseteq I_2$.

Let us prove $\phi(I_1) = I_2$. Suppose that $\phi(I_1) \neq I_2$. We put $G \stackrel{\text{def}}{=} I_2/\phi(I_1)$. Note that G is a cyclic group, and that $(m, p) = 1$, where $m \stackrel{\text{def}}{=} \#G \geq 2$.

Suppose that $g_X = 0$. Then we have $n_X \geq 3$. Let $N_2 \stackrel{\text{def}}{=} D_m(\Pi_{X_2})$, $N_1 \stackrel{\text{def}}{=} \phi^{-1}(N_2) = D_m(\Pi_{X_1})$, and

$$f_{N_i}^\bullet : X_{N_i}^\bullet \rightarrow X_i^\bullet$$

the Galois admissible covering over k_i corresponding to N_i . Since the ramification index of each point of $f_{N_i}^{-1}(D_{X_i})$ is equal to m , we have that

$$I_1 \not\subseteq N_1, \quad I_2 \not\subseteq N_2, \quad \phi(I_1) \subseteq N_2.$$

On the other hand, the isomorphism of maximal pro-prime-to- p quotients $\phi^{p'} : \Pi_{X_1}^{p'} \xrightarrow{\sim} \Pi_{X_2}^{p'}$ and $I_1 \not\subseteq N_1$ imply that $\phi(I_1) \not\subseteq N_2$. This contradicts $\phi(I_1) \subseteq N_2$. Then we obtain $\phi(I_1) = I_2$.

Suppose that $g_X > 0$. We put

$$Q_2 \stackrel{\text{def}}{=} \ker(\Pi_{X_2}^\bullet \twoheadrightarrow \Pi_{X_2}^{\text{cpt}} \twoheadrightarrow \Pi_{X_2}^{\text{cpt,ab}} \otimes \mathbb{Z}/m\mathbb{Z})$$

and $Q_1 \stackrel{\text{def}}{=} \phi^{-1}(Q_2)$. Then Lemma 4.4 implies that $Q_1 = \ker(\Pi_{X_1}^\bullet \twoheadrightarrow \Pi_{X_1}^{\text{cpt}} \twoheadrightarrow \Pi_{X_1}^{\text{cpt,ab}} \otimes \mathbb{Z}/m\mathbb{Z})$. Note that the assumption $g_X > 0$ implies that $\Pi_{X_i}^{\text{cpt}} \twoheadrightarrow \Pi_{X_i}^{\text{cpt,ab}} \otimes \mathbb{Z}/m\mathbb{Z}$ is not trivial. Then the nontrivial Galois admissible covering over k_i corresponding to Q_i is étale over D_{X_i} . Moreover, we have $I_i \subseteq Q_i$ and

$$n_{X_{Q_i}} \geq 2.$$

Let $P_2 \stackrel{\text{def}}{=} D_m(Q_2)$, $P_1 \stackrel{\text{def}}{=} \phi^{-1}(P_2) = D_m(Q_1)$, and

$$g_i^\bullet : X_{P_i}^\bullet \rightarrow X_{Q_i}^\bullet$$

the Galois admissible covering over k_i corresponding to $P_i \subseteq Q_i$. Since the ramification index of each point of $g_i^{-1}(D_{X_{Q_i}})$ is equal to m , we have that

$$I_1 \not\subseteq P_1, \quad I_2 \not\subseteq P_2, \quad \phi(I_1) \subseteq P_2.$$

On the other hand, the isomorphism of maximal pro-prime-to- p quotients $\phi|_{P_1}^{p'} : P_1^{p'} \xrightarrow{\sim} P_2^{p'}$ and $I_1 \not\subseteq P_1$ imply that $\phi(I_1) \not\subseteq P_2$. This contradicts $\phi(I_1) \subseteq P_2$. Then we obtain $\phi(I_1) = I_2$. Thus, we may define the following map

$$\phi^{\text{edg,op}} : \text{Edg}^{\text{op}}(\Pi_{X_1}^\bullet) \rightarrow \text{Edg}^{\text{op}}(\Pi_{X_2}^\bullet), \quad I_1 \mapsto I_2 \stackrel{\text{def}}{=} \phi(I_1).$$

Next, let us prove that $\phi^{\text{edg,op}}$ is a surjection. Let ℓ be a prime number distinct from p and $pr_i^\ell : \Pi_{X_i}^\bullet \twoheadrightarrow \Pi_{X_i}^\ell$. Let $J_2 \in \text{Edg}^{\text{op}}(\Pi_{X_2}^\bullet)$ be an arbitrary subgroup, $\overline{J}_2 \stackrel{\text{def}}{=} pr_2^\ell(J_2)$ the image of J_2 , and $\mathcal{C}_{\Pi_{X_i}^\bullet}^\ell \stackrel{\text{def}}{=} \{\overline{H}_i \stackrel{\text{def}}{=} pr_2^\ell(H_i)\}_{H_i \in \mathcal{C}_{\Pi_{X_i}^\bullet}}$, where $\mathcal{C}_{\Pi_{X_i}^\bullet}$ is the set of normal subgroups of $\Pi_{X_i}^\bullet$ defined above. Note that $\mathcal{C}_{\Pi_{X_i}^\bullet}^\ell$ is a cofinal system of $\Pi_{X_i}^\ell$, and that $\overline{H}_1 = (\phi^\ell)^{-1}(\overline{H}_2)$.

Let $\overline{H}_2 \in \mathcal{C}_{\Pi_{X_2}^\bullet}^\ell$, $\overline{N}_2 \stackrel{\text{def}}{=} \overline{J}_2 \overline{H}_2 \supseteq \overline{H}_2$, $\overline{N}_1 \stackrel{\text{def}}{=} (\phi^\ell)^{-1}(\overline{N}_2) \supseteq \overline{H}_1$, and $N_i \stackrel{\text{def}}{=} (pr_i^\ell)^{-1}(\overline{N}_i)$. Note that $G \stackrel{\text{def}}{=} \overline{N}_1/\overline{H}_1 = N_1/H_1 = \overline{N}_2/\overline{H}_2 = N_2/H_2$ is a cyclic ℓ -group. Write

$$g_{H_i, N_i}^\bullet : X_{H_i}^\bullet \rightarrow X_{N_i}^\bullet$$

for the Galois admissible covering over k_i with Galois group G . Since $J_2 \in \text{Edg}^{\text{op}}(\Pi_{X_2^\bullet})$, we obtain that g_{H_2, N_2}^\bullet is totally ramified at a marked point of $X_{H_2}^\bullet$. We put

$$\text{Edg}^{\text{op}, \ell, \text{ab}}(N_i) \stackrel{\text{def}}{=} \{\text{the image of } I \text{ of}$$

$$\text{the natural homomorphism } N_i \twoheadrightarrow N_i^{\ell, \text{ab}} \mid I \in \text{Edg}^{\text{op}}(N_i)\}.$$

Note that $\#\text{Edg}^{\text{op}, \ell, \text{ab}}(N_i) = n_{X_{N_i}}$. Then the composition of the following natural homomorphisms

$$\bigoplus_{I_{N_2} \in \text{Edg}^{\text{op}, \ell, \text{ab}}(N_2)} I_{N_2} \rightarrow N_2^{\ell, \text{ab}} \twoheadrightarrow G$$

is a surjection. By applying Lemma 4.4, we obtain that the isomorphism ϕ^ℓ induces an isomorphism

$$\text{Im}\left(\bigoplus_{I_{N_1} \in \text{Edg}^{\text{op}, \ell, \text{ab}}(N_1)} I_{N_1} \rightarrow N_1^{\ell, \text{ab}}\right) \xrightarrow{\sim} \text{Im}\left(\bigoplus_{I_{N_2} \in \text{Edg}^{\text{op}, \ell, \text{ab}}(N_2)} I_{N_2} \rightarrow N_2^{\ell, \text{ab}}\right).$$

Then the composition of the following natural homomorphisms

$$\bigoplus_{I_{N_1} \in \text{Edg}^{\text{op}, \ell, \text{ab}}(N_1)} I_{N_1} \rightarrow N_1^{\ell, \text{ab}} \twoheadrightarrow G$$

is also a surjection. Since G is a cyclic ℓ -group, there exists $I'_{N_1} \in \text{Edg}^{\text{op}, \ell, \text{ab}}(N_1)$ such that the composition $I'_{N_1} \hookrightarrow N_1^{\ell, \text{ab}} \twoheadrightarrow G$ is a surjection. This means that g_{H_1, N_1}^\bullet is also totally ramified at a marked point of $X_{H_1}^\bullet$.

We put

$$E_{\overline{H}_1} \stackrel{\text{def}}{=} \{x_1 \in D_{X_{H_1}} \mid g_{H_1, N_1}^\bullet \text{ is totally ramified at } x_1\}.$$

Then we have that $E_{\overline{H}_1}$ is a non-empty finite set. Thus, we obtain

$$\varprojlim_{\overline{H}_1 \in \mathcal{C}_{\Pi_{X_1}^\bullet}^\ell} E_{\overline{H}_1} \neq \emptyset.$$

This means that there exists $J_1 \in \text{Edg}^{\text{op}}(\Pi_{X_1^\bullet})$ such that the image $pr_2^\ell(\phi(J_1)) = \phi^\ell(pr_1^\ell(J_1))$ of J_1 of the composition of the natural homomorphisms

$$\begin{array}{ccc} \Pi_{X_1^\bullet} & \xrightarrow{\phi} & \Pi_{X_2^\bullet} \\ pr_1^\ell \downarrow & & pr_2^\ell \downarrow \\ \Pi_{X_1^\bullet}^\ell & \xrightarrow{\phi^\ell} & \Pi_{X_2^\bullet}^\ell \end{array}$$

is equal to \overline{J}_2^ℓ . Since $\phi(J_1) \in \text{Edg}^{\text{op}}(\Pi_{X_2^\bullet})$, by applying Lemma 4.10 (b), we have $\phi(J_1) = J_2$. Then $\phi^{\text{edg}, \text{op}}$ is a surjection. Moreover, Theorem 4.2 implies that $\text{Edg}^{\text{op}}(\Pi_{X_i^\bullet})$ can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$. This completes the proof of the first part of the theorem.

Let us prove the “moreover” part of the theorem. We see immediately that $\phi^{\text{edg,op}} : \text{Edg}^{\text{op}}(\Pi_{X_1^\bullet}) \twoheadrightarrow \text{Edg}^{\text{op}}(\Pi_{X_2^\bullet})$ is compatible with the natural actions of $\Pi_{X_1^\bullet}$ and $\Pi_{X_2^\bullet}$, respectively. By using the surjectivity of $\phi^{\text{edg,op}}$, we obtain immediately a surjection

$$\phi^{\text{sg,op}} : e^{\text{op}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} \text{Edg}^{\text{op}}(\Pi_{X_1^\bullet})/\Pi_{X_1^\bullet} \twoheadrightarrow \text{Edg}^{\text{op}}(\Pi_{X_2^\bullet})/\Pi_{X_2^\bullet} \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_2^\bullet})$$

of the sets of open edges of dual semi-graphs of X_1^\bullet and X_2^\bullet , where $(-)^{\text{sg}}$ means “semi-graph”. Moreover, since $n_X = \#e^{\text{op}}(\Gamma_{X_1^\bullet}) = \#e^{\text{op}}(\Gamma_{X_2^\bullet})$, we have that $\phi^{\text{sg,op}}$ is a bijection. On the other hand, Theorem 4.2 implies that $e^{\text{op}}(\Gamma_{X_i^\bullet})$ can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$. This completes the proof of the theorem. \square

Corollary 4.12. *We maintain the notation introduced above. Let $H_2 \subseteq \Pi_{X_1^\bullet}$ be an arbitrary open subgroup and $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2) \subseteq \Pi_{X_2^\bullet}$. Then we have that*

$$\gamma^{\text{max}}(H_1) = \gamma^{\text{max}}(H_2).$$

Proof. By Theorem 4.11, we obtain that $(g_{X_{H_1}}, n_{X_{H_1}}) = (g_{X_{H_2}}, n_{X_{H_2}})$. Then Theorem 2.2 (a) implies that $\gamma^{\text{max}}(H_1) = \gamma^{\text{max}}(H_2)$. \square

Let $\widehat{X}_i^\bullet = (\widehat{X}_i, D_{\widehat{X}_i})$, $i \in \{1, 2\}$, be the universal admissible (resp. solvable admissible) covering associated to $\Pi_{X_i^\bullet}$ if $\Pi_{X_i^\bullet}$ is the admissible (resp. solvable admissible) fundamental group of X_i^\bullet . Let $e_i \in e^{\text{op}}(\Gamma_{X_i^\bullet})$, $\widehat{e}_i \in e^{\text{op}}(\Gamma_{\widehat{X}_i^\bullet})$ over e_i , and $I_{\widehat{e}_i} \in \text{Edg}^{\text{op}}(\Pi_{X_i^\bullet})$ such that $\phi(I_{\widehat{e}_1}) = I_{\widehat{e}_2}$. Write $\overline{\mathbb{F}}_{p,i}$ for the algebraic closure of \mathbb{F}_p in k_i . We put

$$\mathbb{F}_{\widehat{e}_i} \stackrel{\text{def}}{=} (I_{\widehat{e}_i} \otimes_{\mathbb{Z}} (\mathbb{Q}/\mathbb{Z})_i^{p'}) \sqcup \{*\widehat{e}_i\},$$

where $\{*\widehat{e}_i\}$ is a one-point set, and $(\mathbb{Q}/\mathbb{Z})_i^{p'}$ denotes the prime-to- p part of \mathbb{Q}/\mathbb{Z} which can be canonically identified with

$$\bigcup_{(p,m)=1} \mu_m(\overline{\mathbb{F}}_{p,i}).$$

Moreover, $\mathbb{F}_{\widehat{e}_i}$ can be identified with $\overline{\mathbb{F}}_{p,i}$ as sets, hence, admits a structure of field, whose multiplicative group is $I_{\widehat{e}_i} \otimes_{\mathbb{Z}} (\mathbb{Q}/\mathbb{Z})_i^{p'}$, and whose zero element is $*\widehat{e}_i$. An important consequence of Theorem 4.11 is as follows.

Theorem 4.13. *We maintain the notation introduced above. Then the field structure of $\mathbb{F}_{\widehat{e}_i}$ can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$. Moreover, ϕ induces a field isomorphism*

$$\phi_{\widehat{e}_1, \widehat{e}_2}^{\text{fd}} : \mathbb{F}_{\widehat{e}_1} \xrightarrow{\sim} \mathbb{F}_{\widehat{e}_2}$$

group-theoretically, where “fd” means “field”.

Proof. We claim that we may assume that $n_X = 3$. If $g_X = 0$, then $n_X \geq 3$. Suppose that $g_X \geq 1$. Theorem 4.11 implies that $\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$ induces an open continuous surjection $\phi^{\text{cpt}} : \Pi_{X_1^\bullet}^{\text{cpt}} \twoheadrightarrow \Pi_{X_2^\bullet}^{\text{cpt}}$. Let $H'_2 \subseteq \Pi_{X_2^\bullet}^{\text{cpt}}$ be an open normal subgroup such that $\#(\Pi_{X_2^\bullet}^{\text{cpt}}/H'_2) \geq 3$ and $H'_1 \stackrel{\text{def}}{=} (\phi^{\text{cpt}})^{-1}(H'_2)$. Write $H_i \subseteq \Pi_{X_i^\bullet}^{\text{cpt}}$, $i \in \{1, 2\}$, for the inverse image of H'_i of the

natural surjection $\Pi_{X_2^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}^{\text{cpt}}$, and $X_{H_i}^\bullet$ for the pointed stable curve of type $(g_{X_{H_i}}, n_{X_{H_i}})$ over k_i corresponding to H_i . Note that $g_{X_{H_1}} = g_{X_{H_2}} \geq 1$ and $n_{X_{H_1}} = n_{X_{H_2}} \geq 3$. By replacing X_i^\bullet by $X_{H_i}^\bullet$, we may assume that $g_X \geq 1$ and $n_X \geq 3$.

By applying Theorem 4.11, ϕ induces a bijection

$$\phi^{\text{sg,op}} : e^{\text{op}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_2^\bullet}).$$

Let $E_{X_1} \stackrel{\text{def}}{=} \{e_{1,1}, e_{1,2}, e_{1,3}\} \subseteq e^{\text{op}}(\Gamma_{X_1^\bullet})$ and $E_{X_2} \stackrel{\text{def}}{=} \phi^{\text{sg,op}}(E_{X_1}) \subseteq e^{\text{op}}(\Gamma_{X_2^\bullet})$. Write $D'_{X_i} \subseteq D_{X_i}$ for the set of marked points of X_i^\bullet corresponding to E_{X_i} . Then (X_i, D'_{X_i}) , $i \in \{1, 2\}$, is a pointed stable curve of type $(g_X, 3)$ over k_i . Write I_i , $i \in \{1, 2\}$, for the closed subgroup of $\Pi_{X_i^\bullet}$ generated by the subgroups $I_{\widehat{e}} \in \text{Edg}^{\text{op}}(\Pi_{X_i^\bullet})$ such that the image of \widehat{e} in $e^{\text{op}}(\Gamma_{X_i^\bullet})$ is contained in E_{X_i} . Then we have a natural isomorphism

$$\Pi_{(X_i, D'_{X_i})} \cong \Pi_{X_i^\bullet} / I_i, \quad i \in \{1, 2\}.$$

Moreover, Theorem 4.11 implies that ϕ induces a surjective open continuous homomorphism

$$\phi' : \Pi_{(X_1, D'_{X_1})} \twoheadrightarrow \Pi_{(X_2, D'_{X_2})}.$$

Thus, by replacing X_i^\bullet , $\Pi_{X_i^\bullet}$, and ϕ by (X_i, D'_{X_i}) , $\Pi_{(X_i, D'_{X_i})}$, and ϕ' , respectively, we may assume that $n_X = 3$.

Then the theorem follows from [39, Theorem 5.5]. \square

Remark 4.13.1. Theorem 4.13 generalizes [28, Proposition 5.3] and [36, Proposition 6.1] to the case of arbitrary pointed stable curves. [28, Proposition 5.3] and [36, Proposition 6.1] play key roles in the proofs of weak Isom-version of the Grothendieck conjecture of curves over algebraically closed fields of characteristic $p > 0$ (cf. [28, Theorem 0.2]) and weak Hom-version of the Grothendieck conjecture of curves over algebraically closed fields of characteristic $p > 0$ ([36, Theorem 1.2]), respectively.

5 Combinatorial Grothendieck conjecture for surjections

In this section, we will prove a version of combinatorial Grothendieck conjecture for surjective open continuous homomorphisms under certain assumption, which is an analogue of Theorem 4.11 for topological data and combinatorial data associated to pointed stable curves. *In the present section, we shall assume that all the fundamental groups of pointed stable curves are solvable admissible fundamental groups unless indicated otherwise.*

5.1 Cohomology classes and sets of vertices

We maintain the notation introduced in Section 1. Let X^\bullet be a pointed stable curve of type (g_X, n_X) over an algebraically closed field k of characteristic $p > 0$, Γ_{X^\bullet} the dual semi-graph of X^\bullet , and Π_{X^\bullet} the solvable admissible fundamental group of X^\bullet .

Let ℓ be a prime number. We put

$$v(\Gamma_{X^\bullet})^{>0,\ell} \stackrel{\text{def}}{=} \{v \in v(\Gamma_{X^\bullet}) \mid \dim_{\mathbb{F}_\ell}(\text{Hom}(\Pi_{\tilde{X}_v}^{\text{ét}}, \mathbb{F}_\ell)) > 0\},$$

$$M_{X^\bullet}^{\text{ét}} \stackrel{\text{def}}{=} \text{Hom}(\Pi_{X^\bullet}^{\text{ét}}, \mathbb{F}_\ell),$$

$$M_{X^\bullet}^{\text{top}} \stackrel{\text{def}}{=} \text{Hom}(\Pi_{X^\bullet}^{\text{top}}, \mathbb{F}_\ell).$$

On the other hand, we have the natural isomorphisms $\text{Hom}(\Pi_{\tilde{X}_v}^{\text{ét}}, \mathbb{F}_\ell) \cong H_{\text{ét}}^1(\tilde{X}_v, \mathbb{F}_\ell)$, $M_{X^\bullet}^{\text{ét}} \cong H_{\text{ét}}^1(X, \mathbb{F}_\ell)$, and $M_{X^\bullet}^{\text{top}} \cong H^1(\Gamma_{X^\bullet}, \mathbb{F}_\ell)$. In the theory of anabelian geometry, we want to emphasize the objects under consideration are arose from various fundamental groups. Then we do not use the standard notation $H_{\text{ét}}^1(\tilde{X}_v, \mathbb{F}_\ell)$, $H_{\text{ét}}^1(X, \mathbb{F}_\ell)$, and $H^1(\Gamma_{X^\bullet}, \mathbb{F}_\ell)$. Moreover, there is an injection $M_{X^\bullet}^{\text{top}} \hookrightarrow M_{X^\bullet}^{\text{ét}}$ induced by the natural surjection $\Pi_{X^\bullet} \twoheadrightarrow \Pi_{X^\bullet}^{\text{top}}$. We put

$$M_{X^\bullet}^{\text{nt}} \stackrel{\text{def}}{=} \text{coker}(M_{X^\bullet}^{\text{top}} \hookrightarrow M_{X^\bullet}^{\text{ét}}),$$

where $(-)^{\text{nt}}$ means “non-top”. A non-zero element of $M_{X^\bullet}^{\text{ét}}$ corresponds to a Galois étale covering of the underlying curve X of X^\bullet with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ and a non-zero element of $M_{X^\bullet}^{\text{top}}$ corresponds to a Galois étale covering of X^\bullet with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ such that the map of dual semi-graphs is a topological covering.

Let $V_{X,\ell}^* \subseteq M_{X^\bullet}^{\text{ét}}$ be the subset of elements such that the image of $M_{X^\bullet}^{\text{ét}} \twoheadrightarrow M_{X^\bullet}^{\text{nt}}$ is not 0. Then an element of $V_{X,\ell}^*$ corresponds to a Galois étale covering of the underlying curve X of X^\bullet with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ such that the map of dual semi-graphs is not a topological covering. Let $\alpha \in V_{X,\ell}^*$ and

$$f_\alpha^\bullet : X_\alpha^\bullet \rightarrow X^\bullet$$

the Galois étale covering corresponding to α . Denote by $\Gamma_{X_\alpha^\bullet}$ the dual semi-graph of X_α^\bullet . Then we obtain a map

$$\iota : V_{X,\ell}^* \rightarrow \mathbb{Z}_{>0}, \quad \alpha \mapsto \#v(\Gamma_{X_\alpha^\bullet}).$$

Furthermore, we put

$$\begin{aligned} V_{X,\ell}^\star &\stackrel{\text{def}}{=} \{\alpha \in V_{X,\ell}^* \mid \iota \text{ attains its maximum}\} \\ &= \{\alpha \in V_{X,\ell}^* \mid \iota(\alpha) = \ell \#v(\Gamma_{X^\bullet}) - \ell + 1\} \\ &= \{\alpha \in V_{X,\ell}^* \mid \#v_{f_\alpha}^{\text{ra}} = 1\}. \end{aligned}$$

For each $\alpha \in V_{X,\ell}^\star$, $\iota(\alpha) = \ell \#v(\Gamma_{X^\bullet}) - \ell + 1$ implies that there exists a unique irreducible component $Z \subseteq X_\alpha$ whose decomposition group under the action of $\mathbb{Z}/\ell\mathbb{Z}$ is not trivial. Let $v_\alpha \in v(\Gamma_{X^\bullet})$ such that $X_{v_\alpha} = f_\alpha(Z)$. Then we have $v_\alpha \in v(\Gamma_{X^\bullet})^{>0,\ell}$. This means that $V_{X,\ell}^\star = \emptyset$ if and only if $v(\Gamma_{X^\bullet})^{>0,\ell} = \emptyset$.

On the other hand, let $H \subseteq \Pi_{X^\bullet}$ be an open subgroup. Write $f_H^{\text{sg}} : \Gamma_{X_H^\bullet} \rightarrow \Gamma_{X^\bullet}$ for the map of dual semi-graphs induced by the admissible covering $f_H^\bullet : X_H^\bullet \rightarrow X^\bullet$ over k corresponding to H . We define a map

$$f_H^{\text{ver},\ell} : v(\Gamma_{X_H^\bullet})^{>0,\ell} \rightarrow v(\Gamma_{X^\bullet})^{>0,\ell}$$

as follows: Let $v_H \in v(\Gamma_{X_H^\bullet})^{>0,\ell}$ and $v \stackrel{\text{def}}{=} f_H^{\text{sg}}(v_H) \in v(\Gamma_{X_H^\bullet})$. Then we have that $f_H^{\text{ver},\ell}(v_H) = v$ if $\dim_{\mathbb{F}_\ell}(\text{Hom}(\Pi_{X_v^\bullet}^{\text{ét}}, \mathbb{F}_\ell)) \neq 0$; otherwise, $f_H^{\text{ver},\ell}(v_H) = \emptyset$. Moreover, if $H \subseteq \Pi_{X^\bullet}$ is an open normal subgroup, then $v(\Gamma_{X_H^\bullet})^{>0,\ell}$ admits a natural action of Π_{X^\bullet}/H . Then we have the following proposition.

Proposition 5.1. (a) We define a pre-equivalence relation \sim on $V_{X,\ell}^*$ as follows:

Let $\alpha, \beta \in V_{X,\ell}^*$. We have that $\alpha \sim \beta$ if, for each $\lambda, \mu \in \mathbb{F}_\ell^\times$ for which $\lambda\alpha + \mu\beta \in V_{X,\ell}^*$, $\lambda\alpha + \mu\beta \in V_{X,\ell}^*$.

Then the pre-equivalence relation \sim on $V_{X,\ell}^*$ is an equivalence relation.

(b) We denote by $V_{X,\ell}$ the quotient set of $V_{X,\ell}^*$ by \sim . Then we have a natural bijection

$$\kappa_{X,\ell} : V_{X,\ell} \xrightarrow{\sim} v(\Gamma_{X^\bullet})^{>0,\ell}, \quad [\alpha] \mapsto v_\alpha,$$

where $[\alpha]$ denotes the equivalence class of α .

(c) Let ℓ, ℓ' be prime numbers distinct from each other. Suppose that $\ell \neq p$. Then we have a natural injection

$$V_{X,\ell'} \hookrightarrow V_{X,\ell},$$

which is a bijection if $\ell' \neq p$, and which fits into the following commutative diagram:

$$\begin{array}{ccc} V_{X,\ell'} & \xrightarrow{\kappa_{X,\ell'}} & v(\Gamma_{X^\bullet})^{>0,\ell'} \\ \downarrow & & \downarrow \\ V_{X,\ell} & \xrightarrow{\kappa_{X,\ell}} & v(\Gamma_{X^\bullet})^{>0,\ell}, \end{array}$$

where the vertical map of the right-hand side is the natural injection induced by the definitions of $v(\Gamma_{X^\bullet})^{>0,\ell'}$ and $v(\Gamma_{X^\bullet})^{>0,\ell}$.

(d) Let $H \subseteq \Pi_{X^\bullet}$ be an open subgroup. Suppose that $([\Pi_X^\bullet : H], \ell) = 1$. Then the natural injection $H \hookrightarrow \Pi_{X^\bullet}$ induces a map

$$\gamma_H^{\text{ver},\ell} : V_{X_H,\ell} \rightarrow V_{X,\ell}$$

which fits into the following commutative diagram:

$$\begin{array}{ccc} V_{X_H,\ell} & \xrightarrow{\kappa_{X_H,\ell}} & v(\Gamma_{X_H^\bullet})^{>0,\ell} \\ \gamma_H^{\text{ver},\ell} \downarrow & & f_H^{\text{ver},\ell} \downarrow \\ V_{X,\ell} & \xrightarrow{\kappa_{X,\ell}} & v(\Gamma_{X^\bullet})^{>0,\ell}. \end{array}$$

Moreover, suppose that $H \subseteq \Pi_{X^\bullet}$ is an open normal subgroup. Then $V_{X_H,\ell}$ admits an action of Π_{X^\bullet}/H such that $\kappa_{X_H,\ell}$ is compatible with Π_{X^\bullet}/H -actions (i.e., $\kappa_{X_H,\ell}$ is Π_{X^\bullet}/H -equivariant).

Proof. See [37, Proposition 2.1 and Remark 2.1.1] for (a), (b), and (c). Let us explain (d). Let $[\alpha_X] \in V_{X,\ell}$. Then α_X induces an element

$$\beta_{X_H} = \sum_{\beta \in L_{\alpha_X}} c_\beta \beta \in \text{Hom}(H, \mathbb{F}_\ell), \quad c_\beta \in \mathbb{F}_\ell^\times,$$

via the natural homomorphism $\text{Hom}(\Pi_{X^\bullet}, \mathbb{F}_\ell) \rightarrow \text{Hom}(H, \mathbb{F}_\ell)$, where L_{α_X} is a subset of $V_{X_H, \ell}^*$ such that, if $\beta_1, \beta_2 \in L_{\alpha_X}$ distinct from each other, then $[\beta_1] \neq [\beta_2]$.

Let $[\alpha_{X_H}] \in V_{X_H, \ell}$. Then we define

$$\gamma_H^{\text{ver}, \ell}([\alpha_{X_H}]) = [\alpha_X]$$

if there exists $[\alpha_X] \in V_{X, \ell}$ such that there exists $\beta \in L_{\alpha_X}$, and that $[\beta] = [\alpha_{X_H}]$ (i.e., $\beta \sim \alpha_{X_H}$). Otherwise, we put $\gamma_H^{\text{ver}, \ell}([\alpha_{X_H}]) = \emptyset$. It is easy to check that $\gamma_H^{\text{ver}, \ell}$ is well-defined, and that the following diagram

$$\begin{array}{ccc} V_{X_H, \ell} & \xrightarrow{\kappa_{X_H, \ell}} & v(\Gamma_{X_H^\bullet})^{>0, \ell} \\ \gamma_H^{\text{ver}, \ell} \downarrow & & f_H^{\text{ver}, \ell} \downarrow \\ V_{X, \ell} & \xrightarrow{\kappa_{X, \ell}} & v(\Gamma_{X^\bullet})^{>0, \ell} \end{array}$$

is commutative.

Moreover, suppose that H is an open normal subgroup of Π_{X^\bullet} . The natural exact sequence

$$1 \rightarrow H \rightarrow \Pi_{X^\bullet} \rightarrow \Pi_{X^\bullet}/H \rightarrow 1$$

induces an outer representation

$$\Pi_{X^\bullet}/H \rightarrow \text{Out}(H) \stackrel{\text{def}}{=} \frac{\text{Aut}(H)}{\text{Inn}(H)}.$$

Then we obtain an action of Π_{X^\bullet}/H on

$$V_{X_H, \ell}^* \subseteq \text{Hom}(H^{\text{ét}}, \mathbb{F}_\ell)$$

induced by the outer representation. Let $\sigma \in \Pi_{X^\bullet}/H$ and $\alpha_{X_H}, \alpha'_{X_H} \in V_{X_H, \ell}^*$. Then we have that $\alpha_{X_H} \sim \alpha'_{X_H}$ if and only if $\sigma(\alpha_{X_H}) \sim \sigma(\alpha'_{X_H})$. Thus, we obtain an action of Π_{X^\bullet}/H on $V_{X_H, \ell}$ induced by the natural injection $H \hookrightarrow \Pi_{X^\bullet}$. On the other hand, it is easy to check that the commutative diagram above is compatible with the Π_{X^\bullet}/H -actions. This completes the proof of the proposition. \square

Remark 5.1.1. By applying Theorem 4.2, we have that $\Pi_{X^\bullet}^{\text{ét}}$ and $\Pi_{X^\bullet}^{\text{top}}$ can be reconstructed group-theoretically from Π_{X^\bullet} . Then we obtain that $V_{X, \ell}$ (or $v(\Gamma_{X^\bullet})^{>0, \ell}$) can be reconstructed group-theoretically from Π_{X^\bullet} . Moreover, for every open subgroup $H \subseteq \Pi_{X^\bullet}$, the map

$$\gamma_H^{\text{ver}, \ell} : V_{X_H, \ell} \rightarrow V_{X, \ell}$$

constructed in Proposition 5.1 (d) can be reconstructed group-theoretically from the natural inclusion $H \hookrightarrow \Pi_{X^\bullet}$.

5.2 Cohomology classes and sets of closed edges

We maintain the notation introduced in Section 5.1. Moreover, in this subsection, we suppose that the genus of the normalization of each irreducible component of X is *positive* (i.e., $v(\Gamma_{X^\bullet}) = v(\Gamma_{X^\bullet})^{>0, \ell}$ if $\ell \neq p$), and that $\Gamma_{X^\bullet}^{\text{cpt}}$ is 2-connected.

We shall say that

$$\mathfrak{T}_{X^\bullet} \stackrel{\text{def}}{=} (\ell, d, f_X^\bullet : Y^\bullet \rightarrow X^\bullet)$$

is an *edge-triple* associated to X^\bullet if the following conditions are satisfied:

- (i) ℓ and d are prime numbers distinct from each other and from p .
- (ii) $\ell \equiv 1 \pmod{d}$; this means that all d th roots of unity are contained in \mathbb{F}_ℓ . Moreover, we write $\mu_d \subseteq \mathbb{F}_\ell^\times$ for the subgroup of d th roots of unity.
- (iii) $f_X^\bullet : Y^\bullet \rightarrow X^\bullet$ is a Galois admissible covering over k whose Galois group is isomorphic to μ_d such that f_X^\bullet is étale, and that $\#v_{f_X}^{\text{sp}} = 0$. Note that since $v(\Gamma_{X^\bullet}) = v(\Gamma_{X^\bullet})^{>0,d}$, f_X^\bullet exists.

On the other hand, we shall say that

$$\mathfrak{T}_{\Pi_{X^\bullet}} \stackrel{\text{def}}{=} (\ell, d, \alpha_{f_X})$$

is an *edge-triple* associated to Π_{X^\bullet} if the following conditions are satisfied:

- (i) $\alpha_{f_X} \in \text{Hom}(\Pi_{X^\bullet}^{\text{ét}}, \mathbb{F}_d)$.
- (ii) The composition of the following natural homomorphisms

$$\Pi_{X_v^\bullet}^{\text{ét}} \hookrightarrow \Pi_{X^\bullet}^{\text{ét}} \xrightarrow{\alpha_{f_X}} \mathbb{F}_d$$

is a surjection for every $v \in v(\Gamma_{X^\bullet})$.

We see immediately that an edge-triple \mathfrak{T}_{X^\bullet} associated to X^\bullet is equivalent to an edge-triple $\mathfrak{T}_{\Pi_{X^\bullet}}$ associated to Π_{X^\bullet} , where the Galois admissible covering corresponding to the kernel of the composition of the natural homomorphisms $\Pi_{X^\bullet} \rightarrow \Pi_{X^\bullet}^{\text{ét}} \xrightarrow{\alpha_{f_X}} \mathbb{F}_d$ is f_X^\bullet .

In the remainder of the present subsection, we fix an edge-triple

$$\mathfrak{T}_{\Pi_{X^\bullet}} \stackrel{\text{def}}{=} (\ell, d, \alpha_{f_X})$$

associated to Π_{X^\bullet} . Write $\mathfrak{T}_{X^\bullet} \stackrel{\text{def}}{=} (\ell, d, f_X^\bullet : Y^\bullet \rightarrow X^\bullet)$ for the edge-triple associated to X^\bullet corresponding to $\mathfrak{T}_{\Pi_{X^\bullet}}$, (g_Y, n_Y) for the type of Y^\bullet , Γ_{Y^\bullet} for the dual semi-graph of Y^\bullet , r_Y for the Betti number of Γ_{Y^\bullet} , and Π_{Y^\bullet} for the kernel of the composition of the homomorphisms $\Pi_{X^\bullet} \rightarrow \Pi_{X^\bullet}^{\text{ét}} \xrightarrow{\alpha_{f_X}} \mathbb{F}_d$.

We put

$$M_{Y^\bullet} \stackrel{\text{def}}{=} \text{Hom}(\Pi_{Y^\bullet}, \mathbb{F}_\ell).$$

Note that there is a natural injection $M_{Y^\bullet}^{\text{ét}} \stackrel{\text{def}}{=} \text{Hom}(\Pi_{Y^\bullet}^{\text{ét}}, \mathbb{F}_\ell) \hookrightarrow M_{Y^\bullet}$ induced by the natural surjection $\Pi_{Y^\bullet} \rightarrow \Pi_{Y^\bullet}^{\text{ét}}$. Then we obtain an exact sequence

$$0 \rightarrow M_{Y^\bullet}^{\text{ét}} \rightarrow M_{Y^\bullet} \rightarrow M_{Y^\bullet}^{\text{ra}} \stackrel{\text{def}}{=} \text{coker}(M_{Y^\bullet}^{\text{ét}} \hookrightarrow M_{Y^\bullet}) \rightarrow 0$$

with a natural action of μ_d , where “ra” means “ramification”. For any element of M_{Y^\bullet} , if the image of the element is not 0 in $M_{Y^\bullet}^{\text{ra}}$, then the Galois admissible covering of Y^\bullet with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ corresponding to the element is not étale.

Let $M_{Y^\bullet, \mu_d}^{\text{ra}} \subseteq M_{Y^\bullet}^{\text{ra}}$ be the subset of elements on which μ_d acts via the character $\mu_d \hookrightarrow \mathbb{F}_\ell^\times$ and $E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^* \subseteq M_{Y^\bullet}$ the subset of elements that map to nonzero elements of $M_{Y^\bullet, \mu_n}^{\text{ra}}$. Let $\alpha \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^*$. Write

$$g_\alpha^\bullet : Y_\alpha^\bullet \rightarrow Y^\bullet$$

for the Galois admissible covering over k corresponding to α . Then we obtain a map

$$\epsilon : E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^* \rightarrow \mathbb{Z}_{\geq 0}, \quad \alpha \mapsto \#(e^{\text{op}}(\Gamma_{Y_\alpha^\bullet}) \cup e^{\text{cl}}(\Gamma_{Y_\alpha^\bullet})),$$

where $\Gamma_{Y_\alpha^\bullet}$ denotes the dual semi-graph of Y_α^\bullet . We put

$$E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},*} \stackrel{\text{def}}{=} \{\alpha \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^* \mid \#e_{g_\alpha}^{\text{op,ra}} = 0, \#e_{g_\alpha}^{\text{cl,ra}} = d\}.$$

Note that $E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},*}$ is not an empty set. For each $\alpha \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},*}$, since the image of α is contained in $M_{Y_\alpha^\bullet}^{\text{ra}}, \mu_d$, we obtain that the action of μ_d on the set

$$\{y_e\}_{e \in e_{g_\alpha}^{\text{cl,ra}}} \subseteq \text{Nod}(Y^\bullet)$$

is transitive, where $\text{Nod}(-)$ denotes the set of nodes of $(-)$, and y_e denotes the node of Y^\bullet corresponding to e . Then there exists a unique node x_α of X^\bullet such that $f_X(y_e) = x_\alpha$ for every $y_e \in \{y_e\}_{e \in e_{g_\alpha}^{\text{cl,ra}}}$. We denote by $e_\alpha \in e^{\text{cl}}(\Gamma_{X^\bullet})$ the closed edge corresponding to x_α .

On the other hand, let $H \subseteq \Pi_{X^\bullet}$ be an open subgroup. Write $f_H^{\text{sg}} : \Gamma_{X_H^\bullet} \rightarrow \Gamma_{X^\bullet}$ for the map of dual semi-graphs induced by the admissible covering $f_H^\bullet : X_H^\bullet \rightarrow X^\bullet$ over k corresponding to H . We shall denote by

$$f_H^{\text{cl}} \stackrel{\text{def}}{=} f_H^{\text{sg}}|_{e^{\text{cl}}(\Gamma_{X_H^\bullet})} : e^{\text{cl}}(\Gamma_{X_H^\bullet}) \rightarrow e^{\text{cl}}(\Gamma_{X^\bullet}).$$

Moreover, if $H \subseteq \Pi_{X^\bullet}$ is an open normal subgroup, then $e^{\text{cl}}(\Gamma_{X_H^\bullet})$ admits a natural action of Π_{X^\bullet}/H . Then we have the following result.

Proposition 5.2. (a) We define a pre-equivalence relation \sim on $E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},*}$ as follows:

Let $\alpha, \beta \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},*}$. We have that $\alpha \sim \beta$ if, for each $\lambda, \mu \in \mathbb{F}_\ell^\times$ for which $\lambda\alpha + \mu\beta \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^*$, we have $\lambda\alpha + \mu\beta \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},*}$.

Then the pre-equivalence relation \sim on $E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},*}$ is an equivalence relation.

(b) We denote by $E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}}$ the quotient set of $E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},*}$ by \sim . Then we have a natural bijection

$$\vartheta_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}} : E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}} \xrightarrow{\sim} e^{\text{cl}}(\Gamma_{X^\bullet}), \quad [\alpha] \mapsto e_\alpha,$$

where $[\alpha]$ denotes the equivalence class of α .

(c) Let $\mathfrak{T}'_{\Pi_{X^\bullet}}$ be an arbitrary edge-triples associated to Π_{X^\bullet} . Then we have a natural bijection

$$E_{\mathfrak{T}'_{\Pi_{X^\bullet}}}^{\text{cl}} \xrightarrow{\sim} E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}}$$

which fits into the following commutative diagram:

$$\begin{array}{ccc} E_{\mathfrak{T}'_{\Pi_{X^\bullet}}}^{\text{cl}} & \xrightarrow{\vartheta_{\mathfrak{T}'_{\Pi_{X^\bullet}}}^{\text{cl}}} & e^{\text{cl}}(\Gamma_{X^\bullet}) \\ \downarrow & & \parallel \\ E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}} & \xrightarrow{\vartheta_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}}} & e^{\text{cl}}(\Gamma_{X^\bullet}). \end{array}$$

(d) Let $H \subseteq \Pi_{X^\bullet}$ be an open subgroup. Suppose that $([\Pi_{X^\bullet} : H], \ell) = ([\Pi_{X^\bullet} : H], d) = 1$. We have that \mathfrak{T}_{X^\bullet} associated to Π_{X^\bullet} induces an edge-triple

$$\mathfrak{T}_{X_H^\bullet} \stackrel{\text{def}}{=} (\ell, d, f_{X_H^\bullet}^\bullet : Y_{X_H^\bullet}^\bullet \stackrel{\text{def}}{=} Y^\bullet \times_{X^\bullet} X_H^\bullet \rightarrow X_H^\bullet)$$

associated to X_H^\bullet , where $Y^\bullet \times_{X^\bullet} X_H^\bullet$ denotes the fiber product in the category of pointed stable curves. Write \mathfrak{T}_H for the edge-triple associated to H corresponding to $\mathfrak{T}_{X_H^\bullet}$. Then the natural injection $H \hookrightarrow \Pi_{X^\bullet}$ induces a surjective map

$$\gamma_{\mathfrak{T}_{\Pi_{X^\bullet}}, H}^{\text{cl}} : E_{\mathfrak{T}_H}^{\text{cl}} \twoheadrightarrow E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}}$$

which fits into the following commutative diagram:

$$\begin{array}{ccc} E_{\mathfrak{T}_H}^{\text{cl}} & \xrightarrow{\vartheta_{\mathfrak{T}_H}} & e^{\text{cl}}(\Gamma_{X_H^\bullet}) \\ \gamma_{\mathfrak{T}_{\Pi_{X^\bullet}}, H}^{\text{cl}} \downarrow & & f_H^{\text{cl}} \downarrow \\ E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}} & \xrightarrow{\vartheta_{\mathfrak{T}_{\Pi_{X^\bullet}}}} & e^{\text{cl}}(\Gamma_{X^\bullet}). \end{array}$$

Moreover, suppose that $H \subseteq \Pi_{X^\bullet}$ is an open normal subgroup. Then $E_{\mathfrak{T}_H}^{\text{cl}}$ admits an action of Π_{X^\bullet}/H such that $\vartheta_{\mathfrak{T}_H}$ is compatible with Π_{X^\bullet}/H -actions (i.e., $\vartheta_{\mathfrak{T}_H}$ is Π_{X^\bullet}/H -equivariant).

Proof. See [37, Proposition 2.2 and Remark 2.2.1] for (a), (b), and (c). Let us explain (d). Let $\alpha_X \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}}$. Then α_X induces an element

$$\beta_{X_H} = \sum_{\beta \in J_{\alpha_X}} c_\beta \beta, \quad c_\beta \in \mathbb{F}_\ell^\times$$

via the natural homomorphism $\text{Hom}(\Pi_{Y_{X_H^\bullet}^\bullet}, \mathbb{F}_\ell) \rightarrow \text{Hom}(\Pi_{Y^\bullet}, \mathbb{F}_\ell)$, where $\Pi_{Y_{X_H^\bullet}^\bullet} \stackrel{\text{def}}{=} \Pi_{Y^\bullet} \cap H$, and J_{α_X} is a subset of $E_{\mathfrak{T}_H}^{\text{cl}, \star}$ such that, if $\beta_1, \beta_2 \in J_{\alpha_X}$ distinct from each other, then $[\beta_1] \neq [\beta_2]$. Let $[\alpha_{X_H}] \in E_{\mathfrak{T}_H}^{\text{cl}}$. We define

$$\gamma_{\mathfrak{T}_{\Pi_{X^\bullet}}, H}^{\text{cl}}([\alpha_{X_H}]) = [\alpha_X]$$

if there exists $\alpha_X \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}}$ such that $[\beta] = [\alpha_{X_H}]$ for some $\beta \in J_{\alpha_X}$. It is easy to check that $\gamma_{\mathfrak{T}_{\Pi_{X^\bullet}}, H}^{\text{cl}}$ is well-defined, and that the following diagram

$$\begin{array}{ccc} E_{\mathfrak{T}_H}^{\text{cl}} & \xrightarrow{\vartheta_{\mathfrak{T}_H}} & e^{\text{cl}}(\Gamma_{X_H^\bullet}) \\ \gamma_{\mathfrak{T}_{\Pi_{X^\bullet}}, H}^{\text{cl}} \downarrow & & f_H^{\text{cl}} \downarrow \\ E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}} & \xrightarrow{\vartheta_{\mathfrak{T}_{\Pi_{X^\bullet}}}} & e^{\text{cl}}(\Gamma_{X^\bullet}) \end{array}$$

is commutative.

Moreover, suppose that H is an open normal subgroup of Π_{X^\bullet} . Since $\Pi_{Y_{X_H}^\bullet}$ is an open normal subgroup of Π_{X^\bullet} , we have

$$\Pi_{X^\bullet}/\Pi_{Y_{X_H}^\bullet} \cong \Pi_{X^\bullet}/H \times \mathbb{Z}/d\mathbb{Z}.$$

Then the natural exact sequence

$$1 \rightarrow \Pi_{Y_{X_H}^\bullet} \rightarrow \Pi_{X^\bullet} \rightarrow \Pi_{X^\bullet}/\Pi_{Y_{X_H}^\bullet} \rightarrow 1$$

induces an outer representation

$$\Pi_{X^\bullet}/H \hookrightarrow \Pi_{X^\bullet}/\Pi_{Y_{X_H}^\bullet} \rightarrow \text{Out}(\Pi_{Y_{X_H}^\bullet}).$$

Thus, we obtain an action of Π_{X^\bullet}/H on

$$E_{\mathfrak{T}_{X_H}}^{\text{cl},\star} \subseteq \text{Hom}(\Pi_{Y_{X_H}^\bullet}, \mathbb{F}_\ell)$$

induced by the outer representation.

Let $\sigma \in \Pi_{X^\bullet}/H$ and $\alpha_{X_H}, \alpha'_{X_H} \in E_{\mathfrak{T}_{X_H}}^{\text{cl},\star}$. We observe that $\alpha_{X_H} \sim \alpha'_{X_H}$ if and only if $\sigma(\alpha_{X_H}) \sim \sigma(\alpha'_{X_H})$. Thus, we obtain an action of Π_{X^\bullet}/H on $E_{\mathfrak{T}_{X_H}}^{\text{cl}}$ induced by the natural injection $H \hookrightarrow \Pi_{X^\bullet}$. On the other hand, it is easy to check that the commutative diagram above is compatible with the Π_{X^\bullet}/H -actions. This completes the proof of the proposition. \square

Remark 5.2.1. By applying Theorem 4.2, we have that $\Pi_{X^\bullet}^{\text{ét}}$ can be reconstructed group-theoretically from Π_{X^\bullet} . Then $E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}}$ (or $e^{\text{cl}}(\Gamma_{X^\bullet})$) can be reconstructed group-theoretically from Π_{X^\bullet} . Moreover, for every open subgroup $H \subseteq \Pi_{X^\bullet}$, the map

$$\gamma_{\mathfrak{T}_{\Pi_{X^\bullet}}, H}^{\text{cl}} : E_{\mathfrak{T}_H}^{\text{cl}} \rightarrow E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl}}$$

constructed in Proposition 5.2 (d) can be reconstructed group-theoretically from the natural inclusion $H \hookrightarrow \Pi_{X^\bullet}$.

Next, let us calculate the cardinality $\#E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},\star}$ of $E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},\star}$. We put

$$E_{\mathfrak{T}_{\Pi_{X^\bullet}}, e}^{\text{cl},\star} \stackrel{\text{def}}{=} \{\alpha \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},\star} \mid e = e_\alpha\}, \quad e \in e^{\text{cl}}(\Gamma_{X^\bullet}).$$

Note that $e = e_\alpha$, $\alpha \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}, e}^{\text{cl},\star}$, means that the Galois admissible covering $g_\alpha^\bullet : Y_\alpha^\bullet \rightarrow Y^\bullet$ over k induced by α is (totally) ramified over $f_X^{-1}(x_e)$, where x_e denotes the node of X corresponding to e . Moreover, we have the following disjoint union

$$E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^{\text{cl},\star} = \bigsqcup_{e \in e^{\text{cl}}(\Gamma_{X^\bullet})} E_{\mathfrak{T}_{\Pi_{X^\bullet}}, e}^{\text{cl},\star}.$$

Let $m \in \mathbb{Z}_{\geq 0}$ and $e \in e^{\text{cl}}(\Gamma_{X^\bullet})$. We shall put

$$E_{\mathfrak{T}_{\Pi_{X^\bullet}}, e}^{\text{cl},\star, m} \stackrel{\text{def}}{=} \{\alpha \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}, e}^{\text{cl},\star} \mid \#v_{g_\alpha}^{\text{sp}} = m\}.$$

Let $e \in e^{\text{cl}}(\Gamma_{X^\bullet})$ be a closed edge. Write Y_e for the normalization of the underlying curve Y of Y^\bullet at $f_X^{-1}(x_e)$ and

$$\text{nor}_e : Y_e \rightarrow Y$$

for the resulting normalization morphism. Since the genus of the normalization of each irreducible component of X^\bullet is positive, we obtain that the genus of the normalization of each irreducible component of Y_e is also positive. Moreover, since Γ_{X^\bullet} is 2-connected, Y_e is connected. We have the following lemma.

Lemma 5.3. *We maintain the notation introduced above. Let $e \in e^{\text{cl}}(\Gamma_{X^\bullet})$ be a closed edge. Then we have*

$$\#E_{\mathfrak{T}_{\Pi_{X^\bullet}}, e}^{\text{cl}, \star} = \ell^{2g_Y - d - r_Y + 1} - \ell^{2g_Y - d - r_Y}.$$

Moreover, we have

$$\#E_{\mathfrak{T}_{\Pi_{X^\bullet}}^{\text{cl}, \star}} = \#e^{\text{cl}}(\Gamma_{X^\bullet})(\ell^{2g_Y - d - r_Y + 1} - \ell^{2g_Y - d - r_Y}).$$

Proof. Write $R_e \subseteq Y_e$ for the set of closed subset $(f_X \circ \text{nor}_e)^{-1}(x_e)$. Then $E_{\mathfrak{T}_{\Pi_{X^\bullet}}, e}^{\text{cl}, \star}$ can be naturally regarded as a subset of $H_{\text{ét}}^1(Y_e \setminus R_e, \mathbb{F}_\ell)$ via the natural open immersion $Y_e \setminus R_e \hookrightarrow Y_e$. Write L_e for the \mathbb{F}_ℓ -vector subspace spanned by $E_{\mathfrak{T}_{\Pi_{X^\bullet}}, e}^{\text{cl}, \star}$ in $H_{\text{ét}}^1(Y_e \setminus R_e, \mathbb{F}_\ell)$. Then we see that

$$E_{\mathfrak{T}_{\Pi_{X^\bullet}}, e}^{\text{cl}, \star} = L_e \setminus H_{\text{ét}}^1(Y_e, \mathbb{F}_\ell).$$

Write H_e^{ra} for the cokernel of the natural inclusion $H_{\text{ét}}^1(Y_e, \mathbb{F}_\ell) \hookrightarrow L_e$. We obtain an exact sequence as follows:

$$0 \rightarrow H_{\text{ét}}^1(Y_e, \mathbb{F}_\ell) \rightarrow L_e \rightarrow H_e^{\text{ra}} \rightarrow 0.$$

On the other hand, since the action of μ_d on $f^{-1}(x_e)$ is translative, the structure of the maximal pro- ℓ quotient $\Pi_{Y^\bullet}^\ell$ of Π_{Y^\bullet} implies that

$$\dim_{\mathbb{F}_\ell}(H_e^{\text{ra}}) = 1.$$

Since

$$\dim_{\mathbb{F}_\ell}(H_{\text{ét}}^1(Y_e, \mathbb{F}_\ell)) = 2(g_Y - d) - (r_Y - d) = 2g_Y - d - r_Y,$$

we obtain that

$$\#E_{\mathfrak{T}_{\Pi_{X^\bullet}}, e}^{\text{cl}, \star} = \ell^{2g_Y - d - r_Y + 1} - \ell^{2g_Y - d - r_Y}.$$

Thus, we have

$$\#E_{\mathfrak{T}_{\Pi_{X^\bullet}}^{\text{cl}, \star}} = \#e^{\text{cl}}(\Gamma_{X^\bullet})(\ell^{2g_Y - d - r_Y + 1} - \ell^{2g_Y - d - r_Y}).$$

This completes the proof of the lemma. \square

Next, we introduce some notation concerning open edges. We put

$$E_{\mathfrak{T}_{\Pi_{X^\bullet}}^{\text{op}, \star}} \stackrel{\text{def}}{=} \{\alpha \in E_{\mathfrak{T}_{\Pi_{X^\bullet}}}^* \mid \#e_{g_\alpha}^{\text{op}, \text{ra}} = d, \#e_{g_\alpha}^{\text{cl}, \text{ra}} = 0\}.$$

Note that $E_{\mathfrak{T}_{\Pi_X^\bullet}}^{\text{op},\star}$ is not an empty set if $n_X \neq 0$. For each $\alpha \in E_{\mathfrak{T}_{\Pi_X^\bullet}}^{\text{op},\star}$, since the image of α is contained in $M_{Y^\bullet, \mu_d}^{\text{ra}}$, we obtain that the action of μ_d on the set

$$\{y_e\}_{e \in e_{g_\alpha}^{\text{op}, \text{ra}}} \subseteq D_Y$$

is transitive, where y_e denotes the marked point of Y^\bullet corresponding to e . Then there exists a unique marked point $x_\alpha \in D_X$ of X^\bullet such that $f_X(y_e) = x_\alpha$ for every $y_e \in \{y_e\}_{e \in e_{g_\alpha}^{\text{op}, \text{ra}}}$. We denote by $e_\alpha \in e^{\text{op}}(\Gamma_{X^\bullet})$ the open edge corresponding to x_α . Moreover, we put

$$E_{\mathfrak{T}_{\Pi_X^\bullet}, e}^{\text{op},\star} \stackrel{\text{def}}{=} \{\alpha \in E_{\mathfrak{T}_{\Pi_X^\bullet}}^{\text{op},\star} \mid e = e_\alpha\}, \quad e \in e^{\text{op}}(\Gamma_{X^\bullet}).$$

Note that $e = e_\alpha$, $\alpha \in E_{\mathfrak{T}_{\Pi_X^\bullet}, e}^{\text{op},\star}$, means that the Galois admissible covering $g_\alpha^\bullet : Y_\alpha^\bullet \rightarrow Y^\bullet$ over k induced by α is (totally) ramified over $f_X^{-1}(x_e)$, where x_e denotes the marked point of X^\bullet corresponding to e . Moreover, we have the following disjoint union

$$E_{\mathfrak{T}_{\Pi_X^\bullet}}^{\text{op},\star} = \bigsqcup_{e \in e^{\text{op}}(\Gamma_{X^\bullet})} E_{\mathfrak{T}_{\Pi_X^\bullet}, e}^{\text{op},\star}.$$

Let $m \in \mathbb{Z}_{\geq 0}$ and $e \in e^{\text{op}}(\Gamma_{X^\bullet})$. We shall put

$$E_{\mathfrak{T}_{\Pi_X^\bullet}, e}^{\text{op},\star, m} \stackrel{\text{def}}{=} \{\alpha \in E_{\mathfrak{T}_{\Pi_X^\bullet}, e}^{\text{op},\star} \mid \#v_{g_\alpha}^{\text{sp}} = m\}.$$

Finally, we introduce the following conditions concerning pointed stable curves. Let W^\bullet be a pointed stable curve over k of type (g_W, n_W) , Γ_{W^\bullet} the dual semi-graph of W^\bullet , and Π_{W^\bullet} the solvable admissible fundamental group of W^\bullet .

Condition A . We shall say that W^\bullet satisfies Condition A if the following conditions are satisfied:

- (i) the genus of the normalization of each irreducible component of W is positive;
- (ii) every irreducible component of W is smooth over k ;
- (iii) $\Gamma_{W^\bullet}^{\text{cpt}}$ is 2-connected;
- (iv) $\#(v(\Gamma_{W^\bullet})^{b \leq 1}) = 0$.

Condition B . We shall say that W^\bullet satisfies Condition B if $\Gamma_{W_H^\bullet}^{\text{cpt}}$ is 2-connected for every open subgroup $H \subseteq \Pi_{W^\bullet}$.

Lemma 5.4. *Let m be a positive natural number prime to p and $H \stackrel{\text{def}}{=} D_m^{(3)}(\Pi_{W^\bullet}) \subseteq \Pi_{W^\bullet}$. Then W_H^\bullet satisfies Condition A, and the Betti number of the dual semi-graph of W_H^\bullet is positive.*

Proof. The lemma follows from the structure of $\Pi_{W^\bullet}^{p'}$. □

5.3 Reconstruction of sets of vertices, sets of closed edges, sets of genus, and sets of p -rank from surjections

In this subsection, we prove that sets of vertices, sets of closed edges, and sets of genus can be reconstructed group-theoretically from a surjective open continuous homomorphism of solvable admissible fundamental groups.

We fix some notation. Let $i \in \{1, 2\}$, k_i an algebraically closed field of characteristic $p > 0$, and ℓ a prime number distinct from p . Let X_i^\bullet be a pointed stable curve of type (g_{X_i}, n_{X_i}) over k_i , $\Pi_{X_i^\bullet}$ the solvable admissible fundamental group of X_i^\bullet , $\Gamma_{X_i^\bullet}$ the dual semi-graph of X_i^\bullet , and r_{X_i} the Betti number of $\Gamma_{X_i^\bullet}$. Moreover, let $v_i \in v(\Gamma_{X_i^\bullet})$, $\tilde{X}_{i,v_i}^\bullet$ the smooth pointed stable curve of type (g_{i,v_i}, n_{i,v_i}) over k_i associated to v_i , and σ_{i,v_i} the p -rank of $\tilde{X}_{i,v_i}^\bullet$. We introduce the following condition:

Condition C . We shall say that X_1^\bullet and X_2^\bullet satisfy Condition C if the following conditions are satisfied:

- (i) $(g_{X_1}, n_{X_1}) = (g_{X_2}, n_{X_2})$;
- (ii) $\#v(\Gamma_{X_1^\bullet}) = \#v(\Gamma_{X_2^\bullet})$;
- (iii) $\#e^{\text{cl}}(\Gamma_{X_1^\bullet}) = \#e^{\text{cl}}(\Gamma_{X_2^\bullet})$.

In the remainder of the present subsection, we suppose that X_1^\bullet and X_2^\bullet satisfy Condition A, Condition B, and Condition C. Moreover, let

$$\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$$

be an arbitrary open continuous homomorphism of the solvable admissible fundamental groups of X_1^\bullet and X_2^\bullet , and

$$(g_X, n_X) \stackrel{\text{def}}{=} (g_{X_1}, n_{X_1}) = (g_{X_2}, n_{X_2}).$$

Note that we have that $r_{X_1} = r_{X_2}$, and that by Lemma 4.3, ϕ is a *surjective* open continuous homomorphism. First, we have the following lemma.

Lemma 5.5. *We maintain the notation introduced above. Then we have*

$$\text{Avr}_p(\Pi_{X_i^\bullet}) = g_{X_i} - r_{X_i}.$$

Proof. The lemma follows immediately from Condition A and Theorem 2.2 (b). □

Let G be a finite group such that $(\#G, p) = 1$ and

$$f_i^\bullet : Y_i^\bullet \rightarrow X_i^\bullet$$

a Galois admissible covering over k_i with Galois group G . Let $j \in \{1, 2\}$ such that $i \neq j$. Then the isomorphism $\phi^{p'} : \Pi_{X_1^\bullet}^{p'} \xrightarrow{\sim} \Pi_{X_2^\bullet}^{p'}$ induced by ϕ implies that f_i^\bullet induces a Galois admissible covering

$$f_j^\bullet : Y_j^\bullet \rightarrow X_j^\bullet$$

over k_j with Galois group G . We write (g_{Y_i}, n_{Y_i}) for the type of Y_i^\bullet , $\Gamma_{Y_i^\bullet}$ for the dual semi-graph of Y_i^\bullet , and r_{Y_i} for the Betti number of $\Gamma_{Y_i^\bullet}$.

Lemma 5.6. *We maintain the notation introduced above. Suppose that $G \cong \mathbb{Z}/\ell\mathbb{Z}$, that $f_1^\bullet : Y_1^\bullet \rightarrow X_1^\bullet$ is étale, and that $\#v_{f_1}^{\text{sp}} = m$. Then we have*

$$\#e_{f_2}^{\text{cl,ra}} + \frac{1}{2}\#e_{f_2}^{\text{op,ra}} + \#v_{f_2}^{\text{sp}} \leq m.$$

Proof. Since f_1^\bullet is an étale covering, the Riemann-Hurwitz formula implies that

$$g_{Y_1} = \ell(g_X - 1) + 1$$

and

$$g_{Y_2} = \ell(g_X - 1) + \frac{1}{2}(\ell - 1)\#e_{f_2}^{\text{op,ra}} + 1.$$

Then we obtain

$$g_{Y_1} - g_{Y_2} = -\frac{1}{2}(\ell - 1)\#e_{f_2}^{\text{op,ra}}.$$

On the other hand, we have

$$\begin{aligned} r_{Y_1} &= \ell\#e^{\text{cl}}(\Gamma_{X_1^\bullet}) - \#v(\Gamma_{X_1^\bullet}) + \#v_{f_1}^{\text{sp}} - \ell\#v_{f_1}^{\text{sp}} + 1 \\ &= \ell\#e^{\text{cl}}(\Gamma_{X_1^\bullet}) - \#v(\Gamma_{X_1^\bullet}) - (\ell - 1)m + 1 \end{aligned}$$

and

$$r_{Y_2} = \ell\#e_{f_2}^{\text{cl,ét}} + \#e_{f_2}^{\text{cl,ra}} - \ell\#v_{f_2}^{\text{sp}} - \#v_{f_2}^{\text{ra}} + 1.$$

Since $\#e(\Gamma_{X_1^\bullet}) = \#e(\Gamma_{X_2^\bullet})$ and $\#v(\Gamma_{X_1^\bullet}) = \#v(\Gamma_{X_2^\bullet})$, we obtain that

$$r_{Y_1} - r_{Y_2} = (\ell - 1)\#e_{f_2}^{\text{cl,ra}} + (\ell - 1)(\#v_{f_2}^{\text{sp}} - m)$$

Moreover, by applying Lemma 5.5 and Lemma 2.3 (b), we have

$$g_{Y_1} - g_{Y_2} \geq r_{Y_1} - r_{Y_2}.$$

Thus, we obtain

$$\#e_{f_2}^{\text{cl,ra}} + \frac{1}{2}\#e_{f_2}^{\text{op,ra}} + \#v_{f_2}^{\text{sp}} \leq m.$$

This completes the proof of the lemma. \square

Corollary 5.7. *We maintain the notation introduced above. Suppose that $G \cong \mathbb{Z}/\ell\mathbb{Z}$, that $f_1^\bullet : Y_1^\bullet \rightarrow X_1^\bullet$ is étale, and that $\#v_{f_1}^{\text{sp}} = 0$. Then we have that $f_2^\bullet : Y_2^\bullet \rightarrow X_2^\bullet$ is étale, and that $\#v_{f_2}^{\text{sp}} = 0$.*

Proof. The corollary follows immediately from Lemma 5.6. \square

Corollary 5.8. *We maintain the notation introduced above. Suppose that $G \cong \mathbb{Z}/\ell\mathbb{Z}$, that $f_1^\bullet : Y_1^\bullet \rightarrow X_1^\bullet$ is étale, and that $\#v_{f_1}^{\text{sp}} = 1$. Then we have that $f_2^\bullet : Y_2^\bullet \rightarrow X_2^\bullet$ is étale.*

Proof. In order to verify the corollary, it is sufficient to prove that

$$\#e_{f_2}^{\text{cl,ra}} = \#e_{f_2}^{\text{op,ra}} = 0.$$

By applying Lemma 5.6, we have

$$\#e_{f_2}^{\text{cl,ra}} + \frac{1}{2}\#e_{f_2}^{\text{op,ra}} + \#v_{f_2}^{\text{sp}} \leq 1.$$

Suppose that $\#e_{f_2}^{\text{cl,ra}} \neq 0$. Since X_2^\bullet satisfies Condition A, the inequality above and the structures of the maxmial prime-to- p quotient of solvable admissible fundamental

groups imply that either $\#e_{f_2}^{\text{cl,ra}} = 1$ and $\#e_{f_2}^{\text{op,ra}} \geq 2$ or $\#e_{f_2}^{\text{cl,ra}} \geq 2$ holds. Then we have $\#e_{f_2}^{\text{cl,ra}} + \frac{1}{2}\#e_{f_2}^{\text{op,ra}} + \#v_{f_2}^{\text{sp}} > 1$. Thus, we have $\#e_{f_2}^{\text{cl,ra}} = 0$.

Suppose that $\#e_{f_2}^{\text{op,ra}} \neq 0$. Since $\#e_{f_2}^{\text{cl,ra}} = 0$, the inequality above implies that $\#e_{f_2}^{\text{op,ra}} = 2$. Let $\ell' \neq p$ be a prime number distinct from ℓ , and let

$$g_1^\bullet : Z_1^\bullet \rightarrow X_1^\bullet$$

be a Galois étale covering of over k_1 with Galois group $\mathbb{Z}/\ell'\mathbb{Z}$ such that $\#v_{g_1}^{\text{sp}} = 0$. Then Corollary 5.7 implies that the Galois admissible covering

$$g_2^\bullet : Z_2^\bullet \rightarrow X_2^\bullet$$

over k_2 with Galois group $\mathbb{Z}/\ell'\mathbb{Z}$ induced by g_2^\bullet is étale covering, and that $\#v_{g_2}^{\text{sp}} = 0$. Write $\Gamma_{Z_i^\bullet}$ for the dual semi-graphs of Z_i^\bullet . We obtain

$$\begin{aligned} \#v(\Gamma_{X_1^\bullet}) &= \#v(\Gamma_{Z_1^\bullet}) = \#v(\Gamma_{Z_2^\bullet}) = \#v(\Gamma_{X_2^\bullet}), \\ \ell' \#e^{\text{op}}(\Gamma_{X_1^\bullet}) &= \#e^{\text{op}}(\Gamma_{Z_1^\bullet}) = \#e^{\text{op}}(\Gamma_{Z_2^\bullet}) = \ell' \#e^{\text{op}}(\Gamma_{X_2^\bullet}), \\ \ell' \#e^{\text{cl}}(\Gamma_{X_1^\bullet}) &= \#e^{\text{cl}}(\Gamma_{Z_1^\bullet}) = \#e^{\text{cl}}(\Gamma_{Z_2^\bullet}) = \ell' \#e^{\text{cl}}(\Gamma_{X_2^\bullet}). \end{aligned}$$

We have that Z_1^\bullet and Z_2^\bullet satisfy Condition A, Condition B, and Condition C.

We denote by $W_i^\bullet \stackrel{\text{def}}{=} Y_i^\bullet \times_{X_i^\bullet} Z_i^\bullet$. Note that since $\ell' \neq \ell$, we have that W_i^\bullet is connected. Then f_i^\bullet induces a Galois admissible covering

$$h_i^\bullet : W_i^\bullet \rightarrow Z_i^\bullet$$

over k_i with Galois group $\mathbb{Z}/\ell'\mathbb{Z}$. We have that h_1^\bullet is étale, that $\#v_{h_1}^{\text{sp}} = 1$, and that $\#e_{h_2}^{\text{op,ra}} = 2\ell'$. Then Lemma 5.6 implies that

$$1 < \#e_{h_2}^{\text{cl,ra}} + \frac{1}{2}\#e_{h_2}^{\text{op,ra}} + \#v_{h_2}^{\text{sp}} = \#e_{h_2}^{\text{cl,ra}} + \ell' + \#v_{h_2}^{\text{sp}} \leq 1.$$

Thus, we obtain $\#e_{f_2}^{\text{op,ra}} = 0$. This completes the proof of the corollary. \square

We put

$$\begin{aligned} M_{X_i^\bullet} &\stackrel{\text{def}}{=} \text{Hom}(\Pi_{X_i^\bullet}, \mathbb{F}_\ell), \\ M_{X_i^\bullet}^{\text{ét}} &\stackrel{\text{def}}{=} \text{Hom}(\Pi_{X_i^\bullet}^{\text{ét}}, \mathbb{F}_\ell), \\ M_{X_i^\bullet}^{\text{top}} &\stackrel{\text{def}}{=} \text{Hom}(\Pi_{X_i^\bullet}^{\text{top}}, \mathbb{F}_\ell). \end{aligned}$$

Note that we have the following injections (or weight-monodromy filtration)

$$M_{X_i^\bullet}^{\text{top}} \hookrightarrow M_{X_i^\bullet}^{\text{ét}} \hookrightarrow M_{X_i^\bullet} \quad (\text{or } M_{X_i^\bullet}^{\text{top}} \subseteq M_{X_i^\bullet}^{\text{ét}} \subseteq M_{X_i^\bullet})$$

induced by the natural surjections $\Pi_{X_i^\bullet} \twoheadrightarrow \Pi_{X_i^\bullet}^{\text{ét}} \twoheadrightarrow \Pi_{X_i^\bullet}^{\text{top}}$. Moreover, we have an isomorphism

$$\psi_\ell : M_{X_2^\bullet} \xrightarrow{\sim} M_{X_1^\bullet}$$

induced by the isomorphism $\phi^\ell : \Pi_{X_1^\bullet}^\ell \xrightarrow{\sim} \Pi_{X_2^\bullet}^\ell$. Then we have the following propositions.

Proposition 5.9. *We maintain the notation introduced above. Then the isomorphism $\psi_\ell : M_{X_2^\bullet} \xrightarrow{\sim} M_{X_1^\bullet}$ induces an isomorphism*

$$\psi_\ell^{\text{ét}} : M_{X_2^\bullet}^{\text{ét}} \xrightarrow{\sim} M_{X_1^\bullet}^{\text{ét}}$$

group-theoretically. Moreover, we have the following commutative diagram:

$$\begin{array}{ccc} M_{X_2^\bullet}^{\text{ét}} & \xrightarrow{\psi_\ell^{\text{ét}}} & M_{X_1^\bullet}^{\text{ét}} \\ \downarrow & & \downarrow \\ M_{X_2^\bullet} & \xrightarrow{\psi_\ell} & M_{X_1^\bullet}, \end{array}$$

where the vertical arrows are injections.

Proof. To verify the proposition, it is sufficient to prove that $\psi_\ell^{-1} : M_{X_1^\bullet} \xrightarrow{\sim} M_{X_2^\bullet}$ induces an isomorphism $\psi_\ell^{-1, \text{ét}} : M_{X_1^\bullet}^{\text{ét}} \xrightarrow{\sim} M_{X_2^\bullet}^{\text{ét}}$ which fits into the following commutative diagram:

$$\begin{array}{ccc} M_{X_1^\bullet}^{\text{ét}} & \xrightarrow{\psi_\ell^{-1, \text{ét}}} & M_{X_2^\bullet}^{\text{ét}} \\ \downarrow & & \downarrow \\ M_{X_1^\bullet} & \xrightarrow{\psi_\ell^{-1}} & M_{X_2^\bullet}, \end{array}$$

where the vertical arrows are injections.

Let $\alpha_1 \in M_{X_1^\bullet}^{\text{ét}}$ be a non-trivial element and $f_{1, \alpha}^\bullet : Y_{1, \alpha}^\bullet \rightarrow X_1^\bullet$ the Galois étale covering over k_1 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ corresponding to α . We put

$$L_{X_1^\bullet} \stackrel{\text{def}}{=} \{\alpha_1 \in M_{X_1^\bullet}^{\text{ét}} \mid \#v_{f_{1, \alpha_1}}^{\text{sp}} = 1\}.$$

We see that $M_{X_1^\bullet}^{\text{ét}}$ is spanned by $L_{X_1^\bullet}$ as an \mathbb{F}_ℓ -vector space.

On the other hand, Corollary 5.8 implies that f_{1, α_1}^\bullet induces a Galois étale covering of X_2^\bullet over k_2 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$. This means that ψ_ℓ^{-1} induces an injection of \mathbb{F}_ℓ -vector spaces

$$\psi_\ell^{-1, \text{ét}} : M_{X_1^\bullet}^{\text{ét}} \hookrightarrow M_{X_2^\bullet}^{\text{ét}}.$$

Moreover, since $\dim_{\mathbb{F}_\ell}(M_{X_1^\bullet}^{\text{ét}}) = 2g_{X_1} - r_{X_1} = 2g_{X_2} - r_{X_2} = \dim_{\mathbb{F}_\ell}(M_{X_2^\bullet}^{\text{ét}})$, we obtain that

$$\psi_\ell^{-1, \text{ét}} : M_{X_1^\bullet}^{\text{ét}} \xrightarrow{\sim} M_{X_2^\bullet}^{\text{ét}}$$

is an isomorphism. This completes the proof of the proposition. \square

Proposition 5.10. *We maintain the notation introduced above. Then the isomorphism $\psi_\ell : M_{X_2^\bullet} \xrightarrow{\sim} M_{X_1^\bullet}$ induces an isomorphism*

$$\psi_\ell^{\text{top}} : M_{X_2^\bullet}^{\text{top}} \xrightarrow{\sim} M_{X_1^\bullet}^{\text{top}}$$

group-theoretically. Moreover, we have the following commutative diagram:

$$\begin{array}{ccc}
M_{X_2^\bullet}^{\text{top}} & \xrightarrow{\psi_\ell^{\text{top}}} & M_{X_1^\bullet}^{\text{top}} \\
\downarrow & & \downarrow \\
M_{X_2^\bullet}^{\text{ét}} & \xrightarrow{\psi_\ell^{\text{ét}}} & M_{X_1^\bullet}^{\text{ét}} \\
\downarrow & & \downarrow \\
M_{X_2^\bullet} & \xrightarrow{\psi_\ell} & M_{X_1^\bullet},
\end{array}$$

where the vertical arrows are injections.

Proof. First, by Proposition 5.9, the isomorphism $\psi_\ell : M_{X_2^\bullet} \xrightarrow{\sim} M_{X_1^\bullet}$ induces an isomorphism $\psi_\ell^{\text{ét}} : M_{X_2^\bullet}^{\text{ét}} \xrightarrow{\sim} M_{X_1^\bullet}^{\text{ét}}$. Let $\alpha_2 \in M_{X_2^\bullet}^{\text{top}} \subseteq M_{X_2^\bullet}^{\text{ét}}$ be a non-trivial element and

$$f_{2,\alpha_2}^\bullet : Y_{2,\alpha_2}^\bullet \rightarrow X_2^\bullet$$

the Galois étale covering over k_2 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ corresponding to α_2 . Then we obtain an element $\alpha_1 \stackrel{\text{def}}{=} \psi_\ell^{\text{ét}}(\alpha_2) \in M_{X_1^\bullet}^{\text{ét}}$. Write $f_{1,\alpha_1}^\bullet : Y_{1,\alpha_1}^\bullet \rightarrow X_1^\bullet$ for the Galois étale covering over k_1 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ corresponding to α_1 . Note that the types of Y_{1,α_1}^\bullet and Y_{2,α_2}^\bullet are equal, and that Y_{1,α_1}^\bullet and Y_{2,α_2}^\bullet satisfy Condition A.

Lemma 5.5 and Lemma 2.3 (b) imply that

$$r_{Y_{1,\alpha_1}} \leq r_{Y_{2,\alpha_2}},$$

where $r_{Y_{1,\alpha_1}}$ and $r_{Y_{2,\alpha_2}}$ denote the Betti numbers of the dual semi-graphs of Y_{1,α_1}^\bullet and Y_{2,α_2}^\bullet , respectively. Since $\#v_{f_{2,\alpha_2}}^{\text{sp}} = \#v(\Gamma_{X_2^\bullet}) = \#v(\Gamma_{X_1^\bullet})$, the inequality implies $\#v_{f_{1,\alpha_1}}^{\text{sp}} = \#v(\Gamma_{X_1^\bullet})$. Thus, we have

$$\alpha_1 \in M_{X_1^\bullet}^{\text{top}}.$$

Then α_1 induces an injection

$$\psi_\ell^{\text{top}} : M_{X_2^\bullet}^{\text{top}} \hookrightarrow M_{X_1^\bullet}^{\text{top}}.$$

Moreover, since $\dim_{\mathbb{F}_\ell}(M_{X_2^\bullet}^{\text{top}}) = r_{X_2} = r_{X_1} = \dim_{\mathbb{F}_\ell}(M_{X_1^\bullet}^{\text{top}})$, we have that ψ_ℓ^{top} is an isomorphism. This completes the proof of the proposition. \square

Remark 5.10.1. Proposition 5.9 and Proposition 5.10 mean that the weight-monodromy filtrations can be reconstructed group-theoretically from ϕ .

Lemma 5.11. *We maintain the notation introduced above. Suppose that $G \cong \mathbb{Z}/\ell\mathbb{Z}$, that f_2^\bullet is étale, and that $\#v_{f_2}^{\text{ra}} = 1$. Then we have that f_1^\bullet is étale, and that $\#v_{f_1}^{\text{ra}} = 1$.*

Proof. By Proposition 5.9, we obtain that f_1^\bullet is étale. This implies that $g_{Y_1} = g_{Y_2}$, and that $\#e^{\text{cl}}(\Gamma_{Y_1^\bullet}) = \ell\#e^{\text{cl}}(\Gamma_{X_1^\bullet}) = \ell\#e^{\text{cl}}(\Gamma_{X_2^\bullet}) = \#e^{\text{cl}}(\Gamma_{Y_2^\bullet})$. On the other hand, Lemma 5.5 and Lemma 2.3 (b) imply that

$$r_{Y_1} \leq r_{Y_2}.$$

Thus, we obtain

$$\ell \# e^{\text{cl}}(\Gamma_{X_1^\bullet}) - \ell(\# v(\Gamma_{X_1^\bullet}) - \# v_{f_1}^{\text{ra}}) - \# v_{f_1}^{\text{ra}} + 1 \leq \ell \# e^{\text{cl}}(\Gamma_{X_2^\bullet}) - \ell(\# v(\Gamma_{X_2^\bullet}) - 1) - 1 + 1$$

This implies that $\# v_{f_1}^{\text{ra}} \leq 1$.

Suppose that $\# v_{f_1}^{\text{ra}} = 0$. Let $\alpha_{f_1} \in M_{X_1^\bullet}$ be an element corresponding to f_1^\bullet . Then $\alpha_{f_1} \in M_{X_1^\bullet}^{\text{top}}$. Note that $\alpha_{f_2} \stackrel{\text{def}}{=} (\psi_\ell^{\text{ét}})^{-1}(\alpha_{f_1}) \in M_{X_2^\bullet}^{\text{ét}}$ is the element corresponding to f_2^\bullet . Then Proposition 5.10 implies that α_{f_2} is contained in $M_{X_2^\bullet}^{\text{top}}$. This means that $\# v_{f_2}^{\text{ra}} = 0$. This contradicts the assumption $\# v_{f_2}^{\text{ra}} = 1$. Thus, we have $\# v_{f_1}^{\text{ra}} = 1$. We complete the proof of the lemma. \square

We reconstruct the sets of vertices and the sets of genus of irreducible components group-theoretically from ϕ as follows.

Theorem 5.12. *We maintain the notation introduced above. Then the (surjective) open continuous homomorphism $\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$ induces a bijection of the set of vertices*

$$\phi^{\text{sg,ver}} : v(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} v(\Gamma_{X_2^\bullet})$$

group-theoretically. Moreover, let $v_1 \in v(\Gamma_{X_1^\bullet})$ and $v_2 \stackrel{\text{def}}{=} \phi^{\text{sg,vex}}(v_1)$. Then we have

$$g_{1,v_1} = g_{2,v_2}.$$

Proof. We maintain the notation introduced in Section 5.1. By applying Theorem 4.2, Proposition 5.9, and Proposition 5.10, we obtain that the following homomorphisms of the natural exact sequences can be induced by ϕ group-theoretically:

$$\begin{array}{ccccccc} 0 & \longrightarrow & M_{X_2^\bullet}^{\text{top}} & \longrightarrow & M_{X_2^\bullet}^{\text{ét}} & \longrightarrow & M_{X_2^\bullet}^{\text{nt}} \longrightarrow 0 \\ & & \psi_\ell^{\text{top}} \downarrow & & \psi_\ell^{\text{ét}} \downarrow & & \downarrow \\ 0 & \longrightarrow & M_{X_1^\bullet}^{\text{top}} & \longrightarrow & M_{X_1^\bullet}^{\text{ét}} & \longrightarrow & M_{X_1^\bullet}^{\text{nt}} \longrightarrow 0. \end{array}$$

Then we obtain

$$\psi_\ell^{\text{ét}}(V_{X_2,\ell}^*) = V_{X_1,\ell}^*.$$

Moreover, Lemma 5.11 implies that

$$\psi_\ell^{\text{ét}}(V_{X_2,\ell}^\star) = V_{X_1,\ell}^\star.$$

Let $\alpha_2, \alpha'_2 \in V_{X_2,\ell}^\star$ distinct from each other such that $\alpha_2 \sim \alpha'_2$. By applying Lemma 5.11 again, for any $a, b \in \mathbb{F}_\ell^\times$, we see that $a\alpha_2 + b\alpha'_2 \in V_{X_2,\ell}^\star$ if and only if $\psi_\ell^{\text{ét}}(a\alpha_2 + b\alpha'_2) = a\psi_\ell^{\text{ét}}(\alpha_2) + b\psi_\ell^{\text{ét}}(\alpha'_2) \in V_{X_1,\ell}^\star$. Thus, we obtain a bijection

$$V_{X_2,\ell} \xrightarrow{\sim} V_{X_1,\ell}.$$

Then the first part of the theorem follows from Proposition 5.1.

Next, let us prove the “moreover” part of the theorem. Let $v_i \in v(\Gamma_{X_i^\bullet})$. We put

$$L_{X_i^\bullet}^{v_i} \stackrel{\text{def}}{=} \{\alpha_i \in M_{X_i^\bullet}^{\text{ét}} \mid v_{f_i,\alpha_i}^{\text{ra}} = \{v_i\}\},$$

where f_{i,α_i}^\bullet denotes the Galois admissible covering of X_i^\bullet over k_i corresponding to α_i . Moreover, we denote by

$$[L_{X_i^\bullet}^{v_i}]$$

the image of $L_{X_i^\bullet}^{v_i}$ in $M_{X_i^\bullet}^{\text{nt}}$. Then we have

$$\#[L_{X_i^\bullet}^{v_i}] = \ell^{g_{i,v_i}} - 1.$$

Suppose that $v_2 = \phi^{\text{sg,ver}}(v_1)$. Proposition 5.10 and Lemma 5.11 imply that $\psi_\ell^{\text{ét}}$ induces an injection

$$[L_{X_2^\bullet}^{v_2}] \hookrightarrow [L_{X_1^\bullet}^{v_1}].$$

Thus, we have

$$\ell^{g_{2,v_2}} - 1 = \#[L_{X_2^\bullet}^{v_2}] \leq \#[L_{X_1^\bullet}^{v_1}] = \ell^{g_{1,v_1}} - 1.$$

This means that

$$g_{2,v_2} \leq g_{1,v_1}.$$

On the other hand, since

$$\sum_{v_1 \in v(\Gamma_{X_1^\bullet})} g_{1,v_1} = g_X - r_{X_1} = g_X - r_{X_2} = \sum_{v_2 \in v(\Gamma_{X_2^\bullet})} g_{2,v_2},$$

we obtain

$$g_{1,v_1} = g_{2,v_2}.$$

This completes the proof of the theorem. \square

Next, let us reconstruct the sets of closed edges from ϕ . In the remainder of the present subsection, we fix an edge-triple

$$\mathfrak{T}_{\Pi_{X_1^\bullet}} \stackrel{\text{def}}{=} (\ell, d, \alpha_{f_{X_1}} : \Pi_{X_1^\bullet}^{\text{ét}} \twoheadrightarrow \mathbb{F}_d)$$

associated to $\Pi_{X_1^\bullet}$. Then Corollary 5.7 implies that ϕ and the edge-triple $\mathfrak{T}_{\Pi_{X_1^\bullet}}$ induces an edge-triple

$$\mathfrak{T}_{\Pi_{X_2^\bullet}} \stackrel{\text{def}}{=} (\ell, d, \alpha_{f_{X_2}} : \Pi_{X_2^\bullet}^{\text{ét}} \twoheadrightarrow \mathbb{F}_d)$$

associated to $\Pi_{X_2^\bullet}$ group-theoretically. Write $\Pi_{Y_i^\bullet}$ for the kernel of $\alpha_{f_{X_i}}$. The surjection $\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$ induces a surjection

$$\phi_Y : \Pi_{Y_1^\bullet} \twoheadrightarrow \Pi_{Y_2^\bullet}.$$

Moreover, the constructions of Y_1^\bullet and Y_2^\bullet imply that Y_1^\bullet and Y_2^\bullet satisfy Condition A, Condition B, and Condition C.

We put

$$M_{Y_i^\bullet} \stackrel{\text{def}}{=} \text{Hom}(\Pi_{Y_i^\bullet}, \mathbb{F}_\ell),$$

$$M_{Y_i^\bullet}^{\text{ét}} \stackrel{\text{def}}{=} \text{Hom}(\Pi_{Y_i^\bullet}^{\text{ét}}, \mathbb{F}_\ell),$$

$$M_{Y_i^\bullet}^{\text{ra}} \stackrel{\text{def}}{=} M_{Y_i^\bullet} / M_{Y_i^\bullet}^{\text{ét}}.$$

Then, by Theorem 4.2 and Proposition 5.9, the following commutative diagram can be induced by ϕ_Y group-theoretically:

$$\begin{array}{ccccccc} 0 & \longrightarrow & M_{Y_2^\bullet}^{\text{ét}} & \longrightarrow & M_{Y_2^\bullet} & \longrightarrow & M_{Y_2^\bullet}^{\text{ra}} \longrightarrow 0 \\ & & \psi_{Y,\ell}^{\text{ét}} \downarrow & & \psi_{Y,\ell} \downarrow & & \downarrow \\ 0 & \longrightarrow & M_{Y_1^\bullet}^{\text{ét}} & \longrightarrow & M_{Y_1^\bullet} & \longrightarrow & M_{Y_1^\bullet}^{\text{ra}} \longrightarrow 0, \end{array}$$

where all the vertical arrows are isomorphisms. Let $E_{\mathfrak{T}_{\Pi_{X_i}^\bullet}}^*$ be the subset of $M_{Y_i^\bullet}$ defined in Section 5.2. Since the actions of μ_d on the exact sequences are compatible with the isomorphisms appearing in the commutative diagram above, we have

$$\psi_{Y,\ell}(E_{\mathfrak{T}_{\Pi_{X_2^\bullet}}^*}) = E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}^*}.$$

Let $m \in \mathbb{Z}_{\geq 0}$ and $e_i \in e^{\text{cl}}(\Gamma_{X_i^\bullet})$. Recall that $E_{\mathfrak{T}_{\Pi_{X_i^\bullet}}^{\bullet}, e_i}^{\text{cl}, \star, m}$ is the subset of $E_{\mathfrak{T}_{\Pi_{X_i^\bullet}}^{\bullet}, e_i}^{\text{cl}, \star}$ whose element α_i satisfies $\#v_{g_i, \alpha_i}^{\text{sp}} = m$. Then we have the following lemma.

Lemma 5.13. *We maintain the notation introduced above. Then we have*

$$\psi_{Y,\ell}^{-1}\left(\bigsqcup_{e_1 \in e^{\text{op}}(\Gamma_{X_1^\bullet})} E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}^{\bullet}, e_1}^{\text{cl}, \star, 0}\right) \subseteq \bigsqcup_{e_2 \in e^{\text{op}}(\Gamma_{X_2^\bullet})} E_{\mathfrak{T}_{\Pi_{X_2^\bullet}}^{\bullet}, e_2}^{\text{cl}, \star, 0}.$$

Moreover, we have

$$\psi_{Y,\ell}^{-1}(E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}^{\bullet}}^{\text{cl}, \star}) = E_{\mathfrak{T}_{\Pi_{X_2^\bullet}}^{\bullet}}^{\text{cl}, \star}.$$

Proof. Let $e_1 \in e^{\text{cl}}(\Gamma_{X_1^\bullet})$ and $\alpha_1 \in E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}^{\bullet}, e_1}^{\text{cl}, \star, 0}$. Then the Galois admissible covering

$$g_{1, \alpha_1}^\bullet : Y_{1, \alpha}^\bullet \rightarrow Y_1^\bullet$$

over k_1 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ corresponding to α_1 induces a Galois admissible covering

$$g_{2, \alpha_2}^\bullet : Y_{2, \alpha_2}^\bullet \rightarrow Y_2^\bullet$$

over k_2 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$. Write $\alpha_2 \in M_{Y_2^\bullet}$ for the element corresponding to g_{2, α_2}^\bullet . We have

$$\alpha_2 \in E_{\mathfrak{T}_{\Pi_{Y_2^\bullet}}^{\bullet}}^*.$$

Write $g_{Y_{i, \alpha_i}}$ for the genus of Y_{i, α_i}^\bullet , and $r_{Y_{i, \alpha_i}}$ for the Betti number of the dual semi-graph $\Gamma_{Y_{i, \alpha_i}^\bullet}$. Then the Riemann-Hurwitz formula and Theorem 4.11 imply that

$$g_{Y_{1, \alpha_1}} - g_{Y_{2, \alpha_2}} = -\frac{1}{2}(\#e_{g_{2, \alpha_2}}^{\text{op}, \text{ra}})(\ell - 1) = 0.$$

On the other hand, we have

$$r_{Y_{1, \alpha_1}} = \ell(\#e^{\text{cl}}(\Gamma_{Y_1^\bullet}) - d) + d - \#v(\Gamma_{Y_1^\bullet}) + 1$$

and

$$r_{Y_2, \alpha_2} = \ell \#e_{g_2, \alpha_2}^{\text{cl}, \text{ét}} + \#e_{g_2, \alpha_2}^{\text{cl}, \text{ra}} - \ell \#v_{g_2, \alpha_2}^{\text{cl}, \text{sp}} - \#v_{g_2, \alpha_2}^{\text{cl}, \text{ra}} + 1.$$

Then Lemma 5.5 and Lemma 2.3 (b) imply that

$$0 = g_{Y_1, \alpha_1} - g_{Y_2, \alpha_2} \geq r_{Y_1, \alpha_1} - r_{Y_2, \alpha_1}.$$

Thus, we have

$$\#e_{g_2, \alpha_2}^{\text{cl}, \text{ra}} + \#v_{g_2, \alpha_2}^{\text{sp}} + \frac{1}{2} \#e_{g_2, \alpha_2}^{\text{op}, \text{ra}} = \#e_{g_2, \alpha_2}^{\text{cl}, \text{ra}} + \#v_{g_2, \alpha_2}^{\text{sp}} \leq d.$$

If $\#e_{g_2, \alpha_2}^{\text{cl}, \text{ra}} = 0$, then g_{2, α_2} is étale. By replacing X_1^\bullet and X_2^\bullet by Y_1^\bullet and Y_2^\bullet , respectively, Proposition 5.9 implies that g_{1, α_1} is also étale. This contradicts the definition of α_1 . Thus, we obtain $\#e_{g_2, \alpha_2}^{\text{cl}, \text{ra}} \neq 0$.

If $\#e_{g_2, \alpha_2}^{\text{cl}, \text{ra}} \neq 0$, then we have $\#e_{g_2, \alpha_2}^{\text{cl}, \text{ra}} = d$ and $\#v_{g_2, \alpha_2}^{\text{sp}} = \#e_{g_2, \alpha_2}^{\text{op}, \text{ra}} = 0$. This means that

$$\alpha_2 \in \bigsqcup_{e_2 \in e^{\text{cl}}(\Gamma_{Y_2^\bullet})} E_{\mathfrak{T}_{\Pi_{Y_2^\bullet}}, e_2}^{\text{cl}, \star, 0}.$$

Thus, we have

$$\psi_{Y, \ell}^{-1} \left(\bigsqcup_{e_1 \in e^{\text{cl}}(\Gamma_{Y_1^\bullet})} E_{\mathfrak{T}_{\Pi_{Y_1^\bullet}}, e_1}^{\text{cl}, \star, 0} \right) \subseteq \bigsqcup_{e_2 \in e^{\text{cl}}(\Gamma_{Y_2^\bullet})} E_{\mathfrak{T}_{\Pi_{Y_2^\bullet}}, e_2}^{\text{cl}, \star, 0}.$$

Moreover, let $\beta_i \in E_{\mathfrak{T}_{\Pi_{Y_i^\bullet}}}^{\text{cl}, \star}$. Then β_i is a linear combination of the elements of

$$\bigsqcup_{e_i \in e^{\text{cl}}(\Gamma_{Y_i^\bullet})} E_{\mathfrak{T}_{\Pi_{Y_i^\bullet}}, e_i}^{\text{cl}, \star, 0}.$$

Then we have

$$\psi_{Y, \ell}^{-1}(E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}}^{\text{cl}, \star}) \subseteq E_{\mathfrak{T}_{\Pi_{X_2^\bullet}}}^{\text{cl}, \star}.$$

On the other hand, since $g_{Y_1} = g_{Y_2}$ and $r_{Y_1} = r_{Y_2}$, Lemma 5.3 implies that $\#\psi_{Y, \ell}^{-1}(E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}}^{\text{cl}, \star}) = \#E_{\mathfrak{T}_{\Pi_{X_2^\bullet}}}^{\text{cl}, \star}$. Thus, we obtain

$$\psi_{Y, \ell}^{-1}(E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}}^{\text{cl}, \star}) = E_{\mathfrak{T}_{\Pi_{X_2^\bullet}}}^{\text{cl}, \star}.$$

This completes the proof of the lemma. \square

We reconstruct the sets of closed edges group-theoretically from ϕ as follows.

Theorem 5.14. *We maintain the notation introduced above. Then the (surjective) open continuous homomorphism $\phi : \Pi_{X_1^\bullet} \rightarrow \Pi_{X_2^\bullet}$ induces a bijection of the set of closed edges*

$$\phi^{\text{sg}, \text{cl}} : e^{\text{cl}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{cl}}(\Gamma_{X_2^\bullet})$$

group-theoretically.

Proof. Let $\alpha_2, \alpha'_2 \in E_{\mathfrak{T}_{\Pi_{X_2^\bullet}}}^{\text{cl}, \star}$ and $\alpha_2 \stackrel{\text{def}}{=} \psi_{Y, \ell}(\alpha'_1)$, $\alpha'_1 \stackrel{\text{def}}{=} \psi_{Y, \ell}(\alpha'_2) \in E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}}^{\text{cl}, \star}$. We see immediately that $\alpha_1 \sim \alpha'_1$ if and only if $\alpha_2 \sim \alpha'_2$. Then the theorem follows from Lemma 5.13 and Proposition 5.2. \square

Next, let us reconstruct the sets of p -rank from ϕ . Note that the surjection ϕ induces a surjection of the maximal pro- p quotients

$$\phi^p : \Pi_{X_1^\bullet}^p \twoheadrightarrow \Pi_{X_2^\bullet}^p$$

of solvable admissible fundamental groups. Then every Galois (étale) admissible covering $h_2^\bullet : Z_2^\bullet \rightarrow X_2^\bullet$ over k_2 with Galois group $\mathbb{Z}/p\mathbb{Z}$ induces a Galois (étale) admissible covering $h_1^\bullet : Z_1^\bullet \rightarrow X_1^\bullet$ over k_1 with Galois group $\mathbb{Z}/p\mathbb{Z}$. Moreover, ϕ^p induces an injection

$$\psi_p : N_{X_2^\bullet} \stackrel{\text{def}}{=} \text{Hom}(\Pi_{X_2^\bullet}, \mathbb{F}_p) \hookrightarrow N_{X_1^\bullet} \stackrel{\text{def}}{=} \text{Hom}(\Pi_{X_1^\bullet}, \mathbb{F}_p).$$

We have the following lemmas.

Lemma 5.15. *We maintain the notation introduced above. Suppose that $\#v_{h_2}^{\text{ra}} = 0$. Then we have that h_1^\bullet is an étale covering, and that $\#v_{h_1}^{\text{ra}} = 0$. In particular, we obtain that*

$$\psi_p^{\text{top}} : N_{X_2^\bullet}^{\text{top}} \stackrel{\text{def}}{=} \text{Hom}(\Pi_{X_2^\bullet}^{\text{top}}, \mathbb{F}_p) \xrightarrow{\sim} N_{X_1^\bullet}^{\text{top}} \stackrel{\text{def}}{=} \text{Hom}(\Pi_{X_1^\bullet}^{\text{top}}, \mathbb{F}_p)$$

is an isomorphism.

Proof. Since h_i^\bullet is étale, the Riemann-Hurwitz formula implies that

$$gz_1 = gz_2.$$

Thus, similar arguments to the arguments given in the proofs of Proposition 5.10 imply that

$$\#v_{h_1}^{\text{ra}} = 0.$$

This completes the proof of the lemma. \square

Lemma 5.16. *We maintain the notation introduced above. Suppose that $\#v_{h_2}^{\text{ra}} = 1$. Then we obtain that h_1^\bullet is étale, and that $\#v_{h_1}^{\text{ra}} = 1$.*

Proof. Similar arguments to the arguments given in the proofs of Lemma 5.11 imply that $\#v_{h_1}^{\text{ra}} \leq 1$. If $\#v_{h_1}^{\text{ra}} = 0$, then the “in particular” part of Lemma 5.15 implies that $\#v_{h_2}^{\text{ra}} = 0$. This contradicts our assumption. Then we obtain that $\#v_{h_1}^{\text{ra}} = 1$. \square

We reconstruct the sets of p -rank of smooth pointed stable curves associated to vertices from ϕ as follows.

Theorem 5.17. *We maintain the notation introduced above. Then the (surjective) open continuous homomorphism $\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$ induces an injection of the set of vertices*

$$\psi_p^{\text{sg}, \text{ver}} : v(\Gamma_{X_2^\bullet})^{>0, p} \hookrightarrow v(\Gamma_{X_1^\bullet})^{>0, p}$$

group-theoretically. Moreover, let $v_2 \in v(\Gamma_{X_2^\bullet})^{>0, p}$ and $v_1 \stackrel{\text{def}}{=} \psi_p^{\text{sg}, \text{vex}}(v_2)$. Then we have

$$\sigma_{2, v_2} \leq \sigma_{1, v_1}.$$

Proof. Lemma 5.16 implies that

$$\psi_p(V_{X_2,p}^\star) \subseteq V_{X_1,p}^\star.$$

Let $\alpha_2, \alpha'_2 \in V_{X_2,p}^\star$ be elements distinct from each other such that $\alpha_2 \sim \alpha'_2$. It is easy to see that $a\alpha_2 + b\alpha'_2 \in V_{X_2,p}^\star$ if and only if $a\psi_p(\alpha_2) + b\psi_p(\alpha'_2) \in V_{X_1,p}^\star$ for each $a, b \in \mathbb{F}_p^\times$. Thus, by Proposition 5.1, we obtain an injection of the set of vertices

$$\psi_p^{\text{sg,ver}} : v(\Gamma_{X_2^\bullet})^{>0,p} \hookrightarrow v(\Gamma_{X_1^\bullet})^{>0,p}.$$

Let $v_i \in v(\Gamma_{X_i^\bullet})$. We put

$$L_{X_i^\bullet}^{v_i,p} \stackrel{\text{def}}{=} \{\alpha_i \in N_{X_i^\bullet} \mid v_{h_{i,\alpha_i}}^{\text{ra}} = \{v_i\}\},$$

where h_{i,α_i}^\bullet denotes the Galois (étale) admissible covering corresponding to α_i . Moreover, we denote by

$$[L_{X_i^\bullet}^{v_i,p}]$$

the image of $L_{X_i^\bullet}^{v_i,p}$ in $N_{X_i^\bullet}/N_{X_i^\bullet}^{\text{top}}$, where $N_{X_i^\bullet}^{\text{top}} \stackrel{\text{def}}{=} \text{Hom}(\Pi_{X_i^\bullet}^{\text{top}}, \mathbb{F}_p)$. Then we have

$$\#[L_{X_i^\bullet}^{v_i,p}] = p^{\sigma_{i,v_i}} - 1.$$

Suppose that $v_1 \stackrel{\text{def}}{=} \psi_p^{\text{sg,ver}}(v_2)$. Lemma 5.15 implies that ψ_p induces an injection

$$[L_{X_2^\bullet}^{v_2,p}] \hookrightarrow [L_{X_1^\bullet}^{v_1,p}].$$

Thus, we have

$$p^{\sigma_{2,v_2}} - 1 = \#[L_{X_2^\bullet}^{v_2,p}] \leq \#[L_{X_1^\bullet}^{v_1,p}] = p^{\sigma_{1,v_1}} - 1.$$

This means that

$$\sigma_{2,v_2} \leq \sigma_{1,v_1}$$

for each $v_2 \in v(\Gamma_{X_2^\bullet})^{>0,p}$. This completes the proof of the theorem. \square

In the remainder of the present subsection, we prove a proposition which will be used in Section 5.5.

Proposition 5.18. *We maintain the notation introduced above. Then the following statements hold:*

(a) *Let $S_1^{\text{cl}} \subseteq e^{\text{cl}}(\Gamma_{X_1^\bullet})$ be a subset of closed edges, $\alpha_{e_1} \in E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}, e_1}^{\text{cl}, \star, 0}$ for every $e_1 \in S_1^{\text{cl}}$,*

$$\alpha_1 \stackrel{\text{def}}{=} \sum_{e_1 \in S_1^{\text{cl}}} \alpha_{e_1} \in E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}}^*,$$

and $g_{1,\alpha_1}^\bullet : Y_{1,\alpha_1}^\bullet \rightarrow Y_1^\bullet$ the Galois admissible covering over k_1 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ corresponding to α_1 . Let $\phi^{\text{sg,cl}} : e^{\text{cl}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{cl}}(\Gamma_{X_2^\bullet})$ be the bijection of the sets of closed

edges obtained in Theorem 5.14, $\alpha_{\phi^{\text{sg},\text{cl}}(e_1)} \in E_{\mathfrak{T}_{\Pi X_2^\bullet}, \phi^{\text{sg},\text{cl}}(e_1)}^{\text{cl},\star,0}$ the element induced by ϕ for every $e_1 \in S_1^{\text{cl}}$,

$$\alpha_2 \stackrel{\text{def}}{=} \sum_{e_1 \in S_1^{\text{cl}}} \alpha_{\phi^{\text{sg},\text{cl}}(e_1)} \in E_{\mathfrak{T}_{\Pi X_2^\bullet}}^*,$$

and $g_{2,\alpha_2}^\bullet : Y_{2,\alpha_2}^\bullet \rightarrow Y_2^\bullet$ the Galois admissible covering over k_2 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ corresponding to α_2 . Suppose that $\#v_{g_{1,\alpha_1}}^{\text{sp}} = 0$. Then we have that

$$\#e_{g_{2,\alpha_2}}^{\text{op,ra}} = \#v_{g_{2,\alpha_2}}^{\text{sp}} = 0.$$

(b) Let $E_{\mathfrak{T}_{\Pi X_i^\bullet}, e_i}^{\text{op},\star,0}$, $e_i \in e^{\text{op}}(\Gamma_{X_i^\bullet})$, be the set of cohomology classes defined in Section 5.2, and let $S_1^{\text{op}} \subseteq e^{\text{op}}(\Gamma_{X_1^\bullet})$ be a subset of open edges, $\alpha_{e_1} \in E_{\mathfrak{T}_{\Pi X_1^\bullet}, e_1}^{\text{op},\star,0}$ for every $e_1 \in S_1^{\text{op}}$,

$$\alpha_1 \stackrel{\text{def}}{=} \sum_{e_1 \in S_1^{\text{op}}} \alpha_{e_1} \in E_{\mathfrak{T}_{\Pi X_1^\bullet}}^*,$$

and $g_{1,\alpha_1}^\bullet : Y_{1,\alpha_1}^\bullet \rightarrow Y_1^\bullet$ the Galois admissible covering over k_1 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ corresponding to α_1 . Let $\phi^{\text{sg},\text{op}} : e^{\text{op}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_2^\bullet})$ be the bijection of the sets of open edges obtained in Theorem 4.11, $\alpha_{\phi^{\text{sg},\text{op}}(e_1)} \in E_{\mathfrak{T}_{\Pi X_2^\bullet}, \phi^{\text{sg},\text{op}}(e_1)}^{\text{cl},\star,0}$ the element induced by ϕ for every $e_1 \in S_1^{\text{op}}$,

$$\alpha_2 \stackrel{\text{def}}{=} \sum_{e_1 \in S_1^{\text{op}}} \alpha_{\phi^{\text{sg},\text{op}}(e_1)} \in E_{\mathfrak{T}_{\Pi X_2^\bullet}}^*,$$

and $g_{2,\alpha_2}^\bullet : Y_{2,\alpha_2}^\bullet \rightarrow Y_2^\bullet$ the Galois admissible covering over k_2 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ corresponding to α_2 . Suppose that $\#v_{g_{1,\alpha_1}}^{\text{sp}} = 0$. Then we have that

$$\#e_{g_{2,\alpha_2}}^{\text{cl,ra}} = \#v_{g_{2,\alpha_2}}^{\text{sp}} = 0.$$

Proof. (a) Since $\#e_{g_{1,\alpha_1}}^{\text{op,ra}} = 0$, Theorem 4.11 imply that $\#e_{g_{2,\alpha_2}}^{\text{op,ra}} = 0$. On the other hand, we have

$$r_{Y_{1,\alpha_1}} = \ell(\#e^{\text{cl}}(\Gamma_{Y_1^\bullet}) - d\#S_1^{\text{cl}}) + d\#S_1^{\text{cl}} - \#v(\Gamma_{Y_1^\bullet}) + 1$$

and

$$r_{Y_{2,\alpha_2}} = \ell\#e_{g_{2,\alpha_2}}^{\text{cl,ét}} + \#e_{g_{2,\alpha_2}}^{\text{cl,ra}} - \ell\#v_{g_{2,\alpha_2}}^{\text{cl,sp}} - \#v_{g_{2,\alpha_2}}^{\text{cl,ra}} + 1.$$

Then Lemma 5.5 and Lemma 2.3 (b) imply that

$$0 = g_{Y_{1,\alpha_1}} - g_{Y_{2,\alpha_2}} \geq r_{Y_{1,\alpha_1}} - r_{Y_{2,\alpha_1}}.$$

Thus, we have

$$\#e_{g_{2,\alpha_2}}^{\text{cl,ra}} + \#v_{g_{2,\alpha_2}}^{\text{sp}} + \frac{1}{2}\#e_{g_{2,\alpha_2}}^{\text{op,ra}} = \#e_{g_{2,\alpha_2}}^{\text{cl,ra}} + \#v_{g_{2,\alpha_2}}^{\text{sp}} \leq d\#S_1^{\text{cl}}.$$

On the othe hand, Lemma 5.13 implies that $\#e_{g_{2,\alpha_2}}^{\text{cl,ra}} = d\#S_1^{\text{cl}}$. Then we obtain $\#v_{g_{2,\alpha_2}}^{\text{sp}} = 0$. This completes the proof of (a).

(b) The Riemann-Hurwitz formula and Theorem 4.11 imply that

$$g_{Y_{1,\alpha_1}} - g_{Y_{2,\alpha_2}} = \frac{1}{2}(d\#S_1^{\text{op}} - \#e_{g_{2,\alpha_2}}^{\text{op,ra}})(\ell - 1) = 0.$$

On the other hand, we have

$$r_{Y_{1,\alpha_1}} = \ell\#e^{\text{cl}}(\Gamma_{Y_1^\bullet}) - \#v(\Gamma_{Y_1^\bullet}) + 1$$

and

$$r_{Y_{2,\alpha_2}} = \ell\#e_{g_{2,\alpha_2}}^{\text{cl,ét}} + \#e_{g_{2,\alpha_2}}^{\text{cl,ra}} - \ell\#v_{g_{2,\alpha_2}}^{\text{sp}} - \#v_{g_{2,\alpha_2}}^{\text{ra}} + 1.$$

Then Lemma 5.5 and Lemma 2.3 (b) imply that

$$g_{Y_{1,\alpha_1}} - g_{Y_{2,\alpha_2}} \geq r_{Y_{1,\alpha_1}} - r_{Y_{2,\alpha_2}}.$$

Thus, we have

$$\#e_{g_{2,\alpha_2}}^{\text{cl,ra}} + \#v_{g_{2,\alpha_2}}^{\text{sp}} + \frac{1}{2}\#e_{g_{2,\alpha_2}}^{\text{op,ra}} - \frac{d\#S_1^{\text{op}}}{2} \leq 0.$$

This means that

$$\#e_{g_{2,\alpha_2}}^{\text{cl,ra}} = \#v_{g_{2,\alpha_2}}^{\text{sp}} = 0.$$

We complete the proof of (b). \square

5.4 Reconstruction of commutative diagrams of sets of vertices, sets of open edges, and sets of closed edges from surjections

We maintain the notation introduced in Section 5.3. In the present subsection, we suppose that X_1^\bullet and X_2^\bullet satisfy Condition A, Condition B, and Condition C. Moreover, let

$$\phi : \Pi_{X_1^\bullet} \rightarrow \Pi_{X_2^\bullet}$$

be an arbitrary open continuous homomorphism of the solvable admissible fundamental groups of X_1^\bullet and X_2^\bullet , and

$$(g_X, n_X) \stackrel{\text{def}}{=} (g_{X_1}, n_{X_1}) = (g_{X_2}, n_{X_2}).$$

Note that we have $r_{X_1} = r_{X_2}$, and that by Lemma 4.3, ϕ is a surjection.

We fix some notation. Let H_2 be an open normal subgroup of $\Pi_{X_2^\bullet}$, $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2)$ the open normal subgroup of $\Pi_{X_1^\bullet}$, $G \stackrel{\text{def}}{=} \Pi_{X_1^\bullet}/H_1 = \Pi_{X_2^\bullet}/H_2$, and $\phi|_{H_1}$ the surjection $\phi|_{H_1} : H_1 \twoheadrightarrow H_2$. Let $i \in \{1, 2\}$. We write

$$f_{H_i}^\bullet : X_{H_i}^\bullet \rightarrow X_i^\bullet$$

for the Galois admissible covering over k_i with Galois group G , $(g_{X_{H_i}}, n_{X_{H_i}})$ for the type of $X_{H_i}^\bullet$, and $\Gamma_{X_{H_i}^\bullet}$ for the dual semi-graph of $X_{H_i}^\bullet$. Furthermore, we suppose that $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition A, Condition B, and Condition C.

Let ℓ and d be prime numbers distinct from p such that $\ell \neq d$ and $(\#G, \ell) = (\#G, d) = 1$, and let

$$\mathfrak{T}_{\Pi_{X_2^\bullet}} \stackrel{\text{def}}{=} (\ell, d, \alpha_{f_{X_2}} : \Pi_{X_2^\bullet}^{\text{ét}} \twoheadrightarrow \mathbb{F}_d)$$

be an edge-triple associated to $\Pi_{X_2^\bullet}$ and $\mathfrak{T}_{X_2^\bullet} \stackrel{\text{def}}{=} (\ell, d, f_{X_2^\bullet} : Y_2^\bullet \rightarrow X_2^\bullet)$ the edge-triple associated to X_2^\bullet corresponding to $\mathfrak{T}_{\Pi_{X_2^\bullet}}$. By Corollary 5.7, we obtain an edge-triple

$$\mathfrak{T}_{\Pi_{X_1^\bullet}} \stackrel{\text{def}}{=} (\ell, d, \alpha_{f_{X_1}} : \Pi_{X_1^\bullet}^{\text{ét}} \twoheadrightarrow \mathbb{F}_d)$$

induced group-theoretically from ϕ and $\mathfrak{T}_{\Pi_{X_2^\bullet}}$. We write $\mathfrak{T}_{X_1^\bullet} \stackrel{\text{def}}{=} (\ell, d, f_{X_1^\bullet} : Y_1^\bullet \rightarrow X_1^\bullet)$ for the edge-triple associated to X_1^\bullet corresponding to $\mathfrak{T}_{\Pi_{X_1^\bullet}}$. On the other hand, we put

$$Q_i \stackrel{\text{def}}{=} \ker(\Pi_{X_i^\bullet} \twoheadrightarrow \Pi_{X_i^\bullet}^{\text{ét}} \xrightarrow{\alpha_{f_{X_i}}} \mathbb{F}_d).$$

We have that $H_i \twoheadrightarrow H_i/(H_i \cap Q_i) \cong \mathbb{F}_d$ factors through $H_i^{\text{ét}}$. Write $\alpha_{f_{X_{H_i}}} : H_i^{\text{ét}} \twoheadrightarrow \mathbb{F}_d$ for this homomorphism. We see that

$$\mathfrak{T}_{H_i} \stackrel{\text{def}}{=} (\ell, d, \alpha_{f_{X_{H_i}}})$$

is an edge-triple associated to H_i which is induced group-theoretically from $H_i \subseteq \Pi_{X_i^\bullet}$ and $\mathfrak{T}_{\Pi_{X_i^\bullet}}$. Note that \mathfrak{T}_{H_1} coincides with the edge-triple associated to H_1 induced group-theoretically from ϕ_{H_1} and \mathfrak{T}_{H_2} . Moreover, we denote by

$$\mathfrak{T}_{X_{H_i}^\bullet} \stackrel{\text{def}}{=} (\ell, d, f_{X_{H_i}^\bullet} : Y_{X_{H_i}^\bullet} \stackrel{\text{def}}{=} Y_i^\bullet \times_{X_i^\bullet} X_{H_i}^\bullet \rightarrow X_{H_i}^\bullet)$$

the edge-triple associated to $X_{H_i}^\bullet$ corresponding to \mathfrak{T}_{H_i} .

By applying Proposition 5.1, Remark 5.1.1, Proposition 5.2, and Remark 5.2.1, we have that the natural inclusion $H_i \hookrightarrow \Pi_{X_i^\bullet}$ induces the maps

$$\gamma_{H_i}^{\text{ver}, \ell} : V_{X_{H_i}, \ell} \rightarrow V_{X_i, \ell},$$

$$\gamma_{\mathfrak{T}_{\Pi_{X_i^\bullet}}, H_i}^{\text{cl}} : E_{\mathfrak{T}_{H_i}}^{\text{cl}} \rightarrow E_{\mathfrak{T}_{\Pi_{X_i^\bullet}}}^{\text{cl}}$$

group-theoretically. We put

$$\gamma_{H_i}^{\text{ver}} : v(\Gamma_{X_{H_i}^\bullet}) \xrightarrow{\kappa_{X_{H_i}, \ell}^{-1}} V_{X_{H_i}, \ell} \xrightarrow{\gamma_{H_i}^{\text{ver}, \ell}} V_{X_i, \ell} \xrightarrow{\kappa_{X_i, \ell}} v(\Gamma_{X_i^\bullet}),$$

$$\gamma_{H_i}^{\text{cl}} : e^{\text{cl}}(\Gamma_{X_{H_i}^\bullet}) \xrightarrow{\vartheta_{\mathfrak{T}_{H_i}}^{-1}} E_{\mathfrak{T}_{H_i}}^{\text{cl}} \xrightarrow{\gamma_{\mathfrak{T}_{\Pi_{X_i^\bullet}}, H_i}^{\text{cl}}} E_{\mathfrak{T}_{\Pi_{X_i^\bullet}}}^{\text{cl}} \xrightarrow{\vartheta_{\mathfrak{T}_{\Pi_{X_i^\bullet}}}} e^{\text{cl}}(\Gamma_{X_i^\bullet}).$$

Then the maps $\gamma_{H_i}^{\text{ver}}$ and $\gamma_{H_i}^{\text{cl}}$ can be reconstructed group-theoretically from the inclusion $H_i \hookrightarrow \Pi_{X_i^\bullet}$.

On the other hand, Theorem 4.2 implies that the sets $\text{Edg}^{\text{op}}(\Pi_{X_i^\bullet})$ and $\text{Edg}^{\text{op}}(H_i)$ can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$ and H_i , respectively. Note that we have a natural map

$$\text{Edg}^{\text{op}}(H_i) \rightarrow \text{Edg}^{\text{op}}(\Pi_{X_i^\bullet})$$

induced by the natural inclusions of the stabilizer subgroups. Moreover, this map compatible with the actions of H_i and $\Pi_{X_i^\bullet}$. Then we obtain a map

$$\gamma_{H_i}^{\text{op}} : e^{\text{op}}(\Gamma_{X_{H_i}^\bullet}) \xrightarrow{\sim} \text{Edg}^{\text{op}}(H_i)/H_i \rightarrow \text{Edg}^{\text{op}}(\Pi_{X_i^\bullet})/\Pi_{X_i^\bullet} \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_i^\bullet})$$

which can be induced by the inclusion $H_i \hookrightarrow \Pi_{X_i^\bullet}$ group-theoretically.

By Theorem 4.11, Theorem 5.12, and Theorem 5.14, the following maps

$$\begin{aligned} \phi_{H_1}^{\text{sg,ver}} &: v(\Gamma_{X_{H_1}^\bullet}) \xrightarrow{\sim} v(\Gamma_{X_{H_2}^\bullet}), \\ \phi_{H_1}^{\text{sg,op}} &: e^{\text{op}}(\Gamma_{X_{H_1}^\bullet}) \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_{H_2}^\bullet}), \\ \phi_{H_1}^{\text{sg,cl}} &: e^{\text{cl}}(\Gamma_{X_{H_1}^\bullet}) \xrightarrow{\sim} e^{\text{cl}}(\Gamma_{X_{H_2}^\bullet}), \\ \phi^{\text{sg,ver}} &: v(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} v(\Gamma_{X_2^\bullet}), \\ \phi^{\text{sg,op}} &: e^{\text{op}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_2^\bullet}), \\ \phi^{\text{sg,cl}} &: e^{\text{cl}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{cl}}(\Gamma_{X_2^\bullet}) \end{aligned}$$

can be reconstructed group-theoretically from $\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$ and $\phi_{H_1} : H_1 \twoheadrightarrow H_2$, respectively.

Proposition 5.19. *We maintain the notation introduced above. Then the following diagrams*

$$\begin{array}{ccc} v(\Gamma_{X_{H_1}^\bullet}) & \xrightarrow{\phi_{H_1}^{\text{sg,ver}}} & v(\Gamma_{X_{H_2}^\bullet}) \\ \gamma_{H_1}^{\text{ver}} \downarrow & & \gamma_{H_2}^{\text{ver}} \downarrow \\ v(\Gamma_{X_1^\bullet}) & \xrightarrow{\phi^{\text{sg,ver}}} & v(\Gamma_{X_2^\bullet}), \\ \\ e^{\text{op}}(\Gamma_{X_{H_1}^\bullet}) & \xrightarrow{\phi_{H_1}^{\text{sg,op}}} & e^{\text{op}}(\Gamma_{X_{H_2}^\bullet}) \\ \gamma_{H_1}^{\text{op}} \downarrow & & \gamma_{H_2}^{\text{op}} \downarrow \\ e^{\text{op}}(\Gamma_{X_1^\bullet}) & \xrightarrow{\phi^{\text{sg,op}}} & e^{\text{op}}(\Gamma_{X_2^\bullet}), \\ \\ e^{\text{cl}}(\Gamma_{X_{H_1}^\bullet}) & \xrightarrow{\phi_{H_1}^{\text{sg,cl}}} & e^{\text{cl}}(\Gamma_{X_{H_2}^\bullet}) \\ \gamma_{H_1}^{\text{cl}} \downarrow & & \gamma_{H_2}^{\text{cl}} \downarrow \\ e^{\text{cl}}(\Gamma_{X_1^\bullet}) & \xrightarrow{\phi^{\text{sg,cl}}} & e^{\text{cl}}(\Gamma_{X_2^\bullet}) \end{array}$$

are commutative. Moreover, all the commutative diagrams above are compatible with the natural actions of G .

Proof. The commutativity of the second diagram follows immediately from Theorem 4.11. We treat the third diagram. To verify the commutativity of the third diagram, we only need to prove the commutativity of the following diagram

$$\begin{array}{ccc} e^{\text{cl}}(\Gamma_{X_{H_2}^\bullet}) & \xrightarrow{(\phi_{H_1}^{\text{sg}, \text{cl}})^{-1}} & e^{\text{cl}}(\Gamma_{X_{H_1}^\bullet}) \\ \gamma_{H_2}^{\text{cl}} \downarrow & & \gamma_{H_1}^{\text{cl}} \downarrow \\ e^{\text{cl}}(\Gamma_{X_2^\bullet}) & \xrightarrow{(\phi^{\text{sg}, \text{cl}})^{-1}} & e^{\text{cl}}(\Gamma_{X_1^\bullet}). \end{array}$$

Let $e_{H_2} \in e^{\text{cl}}(\Gamma_{X_{H_2}^\bullet})$, $e_{H_1} \stackrel{\text{def}}{=} (\phi_{H_1}^{\text{sg}, \text{cl}})^{-1}(e_{H_2}) \in e^{\text{cl}}(\Gamma_{X_{H_1}^\bullet})$, $e_2 \stackrel{\text{def}}{=} \gamma_{H_2}^{\text{cl}}(e_{H_2}) \in e^{\text{cl}}(\Gamma_{X_2^\bullet})$, $e_1 \stackrel{\text{def}}{=} (\gamma_{H_1}^{\text{cl}} \circ (\phi_{H_1}^{\text{sg}, \text{cl}})^{-1})(e_{H_2}) \in e^{\text{cl}}(\Gamma_{X_1^\bullet})$, $e'_1 \stackrel{\text{def}}{=} (\phi^{\text{sg}, \text{cl}})^{-1}(e_2) \in e^{\text{cl}}(\Gamma_{X_1^\bullet})$. We will prove that $e_1 = e'_1$.

Write S_{H_1} and S_{H_2} for the sets $(\gamma_{H_1}^{\text{cl}})^{-1}(e'_1)$ and $(\gamma_{H_2}^{\text{cl}})^{-1}(e_2)$, respectively. Note that $e_{H_2} \in S_{H_2}$. To verify $e_1 = e'_1$, it is sufficient to prove that $e_{H_1} \in S_{H_1}$.

Let $\alpha_2 \in E_{\mathfrak{T}_{\Pi X_2^\bullet}, e_2}^{\text{cl}, \star}$. Then the proof of Lemma 5.13 implies that α_2 induces an element

$$\alpha_1 \in E_{\mathfrak{T}_{\Pi X_1^\bullet}, e'_1}^{\text{cl}, \star}.$$

Write $Y_{\alpha_i}^\bullet$ for the pointed stable curve over k_i corresponding to α_i . We consider the Galois admissible covering

$$Y_{\alpha_2}^\bullet \times_{X_2^\bullet} X_{H_2}^\bullet \rightarrow Y_{X_{H_2}}^\bullet$$

over k_2 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$, and denote by β_2 the element of $E_{\mathfrak{T}_{H_2}}^*$ corresponding to this Galois admissible covering. Then we have

$$\beta_2 = \sum_{c_2 \in S_{H_2}} t_{c_2} \beta_{c_2},$$

where $t_{c_2} \in (\mathbb{Z}/\ell\mathbb{Z})^\times$ and $\beta_{c_2} \in E_{\mathfrak{T}_{H_2}, c_2}^{\text{cl}, \star}$. Note that we have $t_{e_{H_2}} \neq 0$. On the other hand, the proof of Lemma 5.13 implies that β_{c_2} induces an element $\beta_{(\phi_{H_1}^{\text{cl}})^{-1}(c_2)} \in E_{\mathfrak{T}_{H_1}, (\phi_{H_1}^{\text{cl}})^{-1}(c_2)}^{\text{cl}, \star}$. Then β_2 induces an element

$$\beta_1 \stackrel{\text{def}}{=} \sum_{c_2 \in S_{X_{H_2}} \setminus \{e_{H_2}\}} t_{c_2} \beta_{(\phi_{H_1}^{\text{cl}})^{-1}(c_2)} + t_{e_{H_2}} \beta_{e_{H_1}} \in E_{\mathfrak{T}_{H_1}}^*.$$

Note that since β_1 corresponds to the Galois admissible covering

$$Y_{\alpha_1}^\bullet \times_{X_1^\bullet} X_{H_1}^\bullet \rightarrow Y_{X_{H_1}}^\bullet$$

over k_1 with Galois group $\mathbb{Z}/\ell\mathbb{Z}$, the composition of the Galois admissible coverings $Y_{\alpha_1}^\bullet \times_{X_1^\bullet} X_{H_1}^\bullet \rightarrow Y_{X_{H_1}}^\bullet \xrightarrow{f_{X_{H_1}}^\bullet} X_{H_1}^\bullet$ is ramified over S_{H_1} . This means that e_{H_1} is contained in S_{H_1} .

Similar arguments to the arguments given in the proof above imply the first diagram is commutative. It is easy to check the “moreover” part of the lemma. This completes the proof of the proposition. \square

5.5 Combinatorial Grothendieck conjecture for surjections

We maintain the notation introduced in Section 5.3. In the present subsection, we suppose that X_1^\bullet and X_2^\bullet satisfy Condition A, Condition B, and Condition C unless indicated otherwise. Then we have $r_{X_1} = r_{X_2}$. We put $(g_X, n_X) \stackrel{\text{def}}{=} (g_{X_1}, n_{X_1}) = (g_{X_2}, n_{X_2})$. Let

$$\phi : \Pi_{X_1^\bullet} \rightarrow \Pi_{X_2^\bullet}$$

be an arbitrary open continuous homomorphism of the solvable admissible fundamental groups of X_1^\bullet and X_2^\bullet . By Lemma 4.3, we have that ϕ is a surjection.

We fix some notation. Let H_2 be an open normal subgroup of $\Pi_{X_2^\bullet}$, $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2)$ the open normal subgroup of $\Pi_{X_1^\bullet}$, $G \stackrel{\text{def}}{=} \Pi_{X_1^\bullet}/H_1 = \Pi_{X_2^\bullet}/H_2$, and $\phi_{H_1} \stackrel{\text{def}}{=} \phi|_{H_1} : H_1 \twoheadrightarrow H_2$ the surjection induced by ϕ . Let $i \in \{1, 2\}$. We write

$$f_{H_i}^\bullet : X_{H_i}^\bullet \rightarrow X_i^\bullet$$

for the Galois admissible covering over k_i with Galois group G , $(g_{X_{H_i}}, n_{X_{H_i}})$ for the type of $X_{H_i}^\bullet$, $\Gamma_{X_{H_i}^\bullet}$ for the dual semi-graph of $X_{H_i}^\bullet$, and $r_{X_{H_i}}$ for the Betti number of $\Gamma_{X_{H_i}^\bullet}$.

Lemma 5.20. *We maintain the notation introduced above. Then $X_{H_i}^\bullet$ satisfies Condition A, Condition B, Condition C (i).*

Proof. The first condition, the second condition, and the fourth condition of Condition A follow immediately from the definition of admissible coverings. Since X_i^\bullet satisfies Condition B and the third condition of Condition A, $X_{H_i}^\bullet$ also satisfies Condition B and the third condition of Condition A. Moreover, Condition C (i) follows immediately from Theorem 4.11. This completes the proof of the lemma. \square

Lemma 5.21. *We maintain the notation introduced above. Suppose that there exists an open normal subgroup $H'_2 \subseteq H_2$ such that $X_{H'_1}^\bullet$ and $X_{H'_2}^\bullet$ satisfy Condition A, Condition B, and Condition C, where $H'_1 \stackrel{\text{def}}{=} \phi^{-1}(H'_2) \subseteq H_1$. Then $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition A, Condition B, and Condition C.*

Proof. By Lemma 5.20, to verify the lemma, we only need to prove that $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition C (ii) and Condition C (iii).

Let $G' \stackrel{\text{def}}{=} \Pi_{X_1^\bullet}/H'_1 = \Pi_{X_2^\bullet}/H'_2$ and $G'' \stackrel{\text{def}}{=} H_1/H'_1 = H_2/H'_2 \subseteq G'$. By applying Proposition 5.19, the following commutative diagrams

$$\begin{array}{ccc} v(\Gamma_{X_{H'_1}^\bullet}) & \xrightarrow{\phi_{H'_1}^{\text{sg}, \text{ver}}} & v(\Gamma_{X_{H'_2}^\bullet}) \\ \gamma_{H'_1}^{\text{ver}} \downarrow & & \gamma_{H'_2}^{\text{ver}} \downarrow \\ v(\Gamma_{X_1^\bullet}) & \xrightarrow{\phi^{\text{sg}, \text{ver}}} & v(\Gamma_{X_2^\bullet}), \\ e^{\text{op}}(\Gamma_{X_{H'_1}^\bullet}) & \xrightarrow{\phi_{H'_1}^{\text{sg}, \text{op}}} & e^{\text{op}}(\Gamma_{X_{H'_2}^\bullet}) \\ \gamma_{H'_1}^{\text{op}} \downarrow & & \gamma_{H'_2}^{\text{op}} \downarrow \\ e^{\text{op}}(\Gamma_{X_1^\bullet}) & \xrightarrow{\phi^{\text{sg}, \text{op}}} & e^{\text{op}}(\Gamma_{X_2^\bullet}), \end{array}$$

$$\begin{array}{ccc}
e^{\text{cl}}(\Gamma_{X_{H'_1}^\bullet}) & \xrightarrow{\phi_{H'_1}^{\text{sg,cl}}} & e^{\text{cl}}(\Gamma_{X_{H'_2}^\bullet}) \\
\gamma_{H'_1}^{\text{cl}} \downarrow & & \gamma_{H'_2}^{\text{cl}} \downarrow \\
e^{\text{cl}}(\Gamma_{X_1^\bullet}) & \xrightarrow{\phi^{\text{sg,cl}}} & e^{\text{cl}}(\Gamma_{X_2^\bullet})
\end{array}$$

can be reconstructed group-theoretically from $H'_i \hookrightarrow \Pi_{X_i^\bullet}$, ϕ , and $\phi_{H'_1} \stackrel{\text{def}}{=} \phi|_{H'_1}$. Moreover, the commutative diagrams are compatible with the actions of G'' and G' . Then we obtain that

$$\begin{aligned}
\#v(\Gamma_{X_{H_1}^\bullet}) &= \#(v(\Gamma_{X_{H'_1}^\bullet})/G'') = \#(v(\Gamma_{X_{H'_2}^\bullet})/G'') = \#v(\Gamma_{X_{H_2}^\bullet}), \\
\#e^{\text{op}}(\Gamma_{X_{H_1}^\bullet}) &= \#(e^{\text{op}}(\Gamma_{X_{H'_1}^\bullet})/G'') = \#(e^{\text{op}}(\Gamma_{X_{H'_2}^\bullet})/G'') = \#e^{\text{op}}(\Gamma_{X_{H_2}^\bullet}), \\
\#e^{\text{cl}}(\Gamma_{X_{H_1}^\bullet}) &= \#(e^{\text{cl}}(\Gamma_{X_{H'_1}^\bullet})/G'') = \#(e^{\text{cl}}(\Gamma_{X_{H'_2}^\bullet})/G'') = \#e^{\text{cl}}(\Gamma_{X_{H_2}^\bullet}).
\end{aligned}$$

This means that $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition C. \square

Lemma 5.22. *We maintain the notation introduced above. Suppose that $(\#G, p) = 1$, and that f_{H_2} is étale. Then $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition A, Condition B, and Condition C.*

Proof. By Lemma 5.20, to verify the lemma, we only need to prove that $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition C (ii) and Condition C (iii). Moreover, since G is a finite solvable group, to verify the lemma, it is sufficient to prove the lemma when $G \cong \mathbb{Z}/\ell\mathbb{Z}$, where ℓ is a prime number distinct from p . Thus, Proposition 5.9 implies that f_{H_1} is also étale.

We denote by $H'_2 \subseteq H_2$ the inverse image $D_\ell(\Pi_{X_2^\bullet}^{\text{ét}})$ of the natural surjection $\Pi_{X_2^\bullet} \rightarrow \Pi_{X_2^\bullet}^{\text{ét}}$. Then H'_2 is an open normal subgroup of $\Pi_{X_2^\bullet}$. Let $H'_1 \stackrel{\text{def}}{=} \phi^{-1}(H'_2) \subseteq H_1$. We see that H'_1 is equal to the inverse image $D_\ell(\Pi_{X_1^\bullet}^{\text{ét}})$ of the natural surjection $\Pi_{X_1^\bullet} \rightarrow \Pi_{X_1^\bullet}^{\text{ét}}$. Since X_1^\bullet and X_2^\bullet satisfy Condition C, Theorem 5.12 and the structures of the maximal prime-to- p quotients of solvable admissible fundamental groups imply that $X_{H'_1}^\bullet$ and $X_{H'_2}^\bullet$ also satisfy Condition C. Then the lemma follows from Lemma 5.21. \square

Lemma 5.23. *We maintain the notation introduced above. Suppose that $(\#G, p) = 1$. Then $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition A, Condition B, and Condition C.*

Proof. By Lemma 5.20, to verify the lemma, we only need to prove that $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition C (ii) and Condition C (iii).

Since G is a finite solvable group, to verify the lemma, it is sufficient to prove the lemma when $G \cong \mathbb{Z}/\ell\mathbb{Z}$, where ℓ is a prime number distinct from p .

Let $\mathfrak{T}_{\Pi_{X_2^\bullet}} = (\ell, d, \alpha_{f_{X_2}} : \Pi_{X_2^\bullet}^{\text{ét}} \twoheadrightarrow \mathbb{F}_d)$ be an edge-triple associated to $\Pi_{X_2^\bullet}$, $\mathfrak{T}_{\Pi_{X_1^\bullet}} = (\ell, d, \alpha_{f_{X_1}} : \Pi_{X_1^\bullet}^{\text{ét}} \twoheadrightarrow \mathbb{F}_d)$ the edge-triple associated to $\Pi_{X_1^\bullet}$ induced by ϕ , and $\mathfrak{T}_{X_i^\bullet} = (\ell, d, f_{X_i}^\bullet : Y_i^\bullet \rightarrow X_i^\bullet)$ the edge-triple associated to X_i^\bullet corresponding to $\mathfrak{T}_{\Pi_{X_i^\bullet}}$.

First, we suppose that f_{H_2} is étale over D_{X_2} . Then Theorem 4.11 implies that f_{H_1} is also étale over D_{X_1} . Let $\alpha_{e_1} \in E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}, e_1}^{\text{cl}, *, 0}$, $e_1 \in e^{\text{cl}}(\Gamma_{X_1^\bullet})$,

$$\alpha_1 \stackrel{\text{def}}{=} \sum_{e_1 \in e^{\text{cl}}(\Gamma_{X_1^\bullet})} \alpha_{e_1} \in E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}}^*,$$

and $g_{1,\alpha_1}^\bullet : Y_{1,\alpha_1}^\bullet \rightarrow Y_1^\bullet$ the Galois admissible covering over k_1 corresponding to α_1 . Note that we have that $\#e_{g_{1,\alpha_1}}^{\text{op,ra}} = \#v_{g_{1,\alpha_1}}^{\text{sp}} = 0$. Let $\phi^{\text{sg,cl}} : e^{\text{cl}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{cl}}(\Gamma_{X_2^\bullet})$ be the bijection of the sets of closed edges obtained in Theorem 5.14, $\alpha_{\phi^{\text{sg,cl}}(e_1)} \in E_{\mathfrak{T}_{\Pi_{X_2^\bullet}}^{\bullet}, \phi^{\text{sg,cl}}(e_1)}^{\text{cl}, \star, 0}$ the element induced by ϕ for every $e_1 \in e^{\text{cl}}(\Gamma_{X_1^\bullet})$,

$$\alpha_2 \stackrel{\text{def}}{=} \sum_{e_1 \in e^{\text{cl}}(\Gamma_{X_1^\bullet})} \alpha_{\phi^{\text{sg,cl}}(e_1)} \in E_{\mathfrak{T}_{\Pi_{X_2^\bullet}}^{\bullet}}^*,$$

and $g_{2,\alpha_2}^\bullet : Y_{2,\alpha_2}^\bullet \rightarrow Y_2^\bullet$ the Galois admissible covering over k_2 corresponding to α_2 . Then Proposition 5.18 (a) implies that

$$\#e_{g_{2,\alpha_2}}^{\text{op,ra}} = \#v_{g_{2,\alpha_2}}^{\text{sp}} = 0.$$

We obtain that g_{i,α_i} is totally ramified over every node of Y_i , and that Y_{1,α_1}^\bullet and Y_{2,α_2}^\bullet satisfy Condition A, Condition B, and Condition C. Write $N_i \subseteq \Pi_{X_i^\bullet}$ for the open normal subgroup corresponding to Y_{i,α_i}^\bullet .

Let $H_i' \stackrel{\text{def}}{=} H_i \cap N_i$ and $X_{H_i'}^\bullet$ the pointed stable curve over k_i corresponding to H_i' . Note that $X_{H_i'}^\bullet$ is isomorphic to a connected component of

$$X_{H_i}^\bullet \times_{X_i^\bullet} Y_{g_{i,\alpha_i}}^\bullet.$$

We denote by $h_i^\bullet : X_{H_i'}^\bullet \rightarrow Y_{g_{i,\alpha_i}}^\bullet$ the Galois admissible covering over k_i corresponding to the injection $H_i' \hookrightarrow N_i$. By applying Abhyankar's lemma, f_{H_i} is étale over D_{X_i} implies that h_i is étale. Then the lemma follows from Lemma 5.21 and Lemma 5.22. This completes the proof of the lemme when f_{H_2} is étale over D_{X_2} .

Next, let us prove the lemme in the general case. We take $\beta_{e_1} \in E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}^{\bullet}, e_1}^{\text{op}, \star, 0}$ for every $e_1 \in e^{\text{op}}(\Gamma_{X_1^\bullet})$ such that $\#v_{g_{1,\beta_1}}^{\text{sp}} = 0$, where

$$\beta_1 \stackrel{\text{def}}{=} \sum_{e_1 \in e^{\text{op}}(\Gamma_{X_1^\bullet})} \beta_{e_1} \in E_{\mathfrak{T}_{\Pi_{X_1^\bullet}}^{\bullet}}^*,$$

and $g_{1,\beta_1}^\bullet : Y_{1,\beta_1}^\bullet \rightarrow Y_1^\bullet$ is the Galois admissible covering over k_1 corresponding to β_1 . Note that we have that $\#e_{g_{1,\beta_1}}^{\text{cl,ra}} = \#v_{g_{1,\beta_1}}^{\text{sp}} = 0$. Let $\phi^{\text{sg,op}} : e^{\text{op}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_2^\bullet})$ be the bijection of the sets of open edges obtained in Theorem 4.11, $\beta_{\phi^{\text{sg,op}}(e_1)} \in E_{\mathfrak{T}_{\Pi_{X_2^\bullet}}^{\bullet}, \phi^{\text{sg,op}}(e_1)}^{\text{op}, \star, 0}$ the element induced by ϕ for every $e_1 \in e^{\text{op}}(\Gamma_{X_1^\bullet})$,

$$\beta_2 \stackrel{\text{def}}{=} \sum_{e_1 \in e^{\text{op}}(\Gamma_{X_1^\bullet})} \beta_{\phi^{\text{sg,op}}(e_1)} \in E_{\mathfrak{T}_{\Pi_{X_2^\bullet}}^{\bullet}}^*,$$

and $g_{2,\beta_2}^\bullet : Y_{2,\beta_2}^\bullet \rightarrow Y_2^\bullet$ the Galois admissible covering over k_2 corresponding to β_2 . Then Proposition 5.18 (b) implies that

$$\#e_{g_{2,\beta_2}}^{\text{cl,ra}} = \#v_{g_{2,\beta_2}}^{\text{sp}} = 0.$$

We obtain that g_{i,β_i} is totally ramified over every marked point of Y_i , and that Y_{1,β_1}^\bullet and Y_{2,β_2}^\bullet satisfy Condition A, Condition B, and Condition C. Write $Q_i \subseteq \Pi_{X_i^\bullet}$ for the open normal subgroup corresponding to Y_{i,β_i}^\bullet .

Let $H_i'' \stackrel{\text{def}}{=} H_i \cap Q_i$ and $X_{H_i''}^\bullet$ the pointed stable curve over k_i corresponding to H_i'' . Note that $X_{H_i''}^\bullet$ is isomorphic to a connected component of

$$X_{H_i}^\bullet \times_{X_i^\bullet} Y_{g_{i,\beta_i}}^\bullet.$$

We denote by $h_i^{*,\bullet} : X_{H_i''}^\bullet \rightarrow Y_{g_{i,\beta_i}}^\bullet$ the Galois admissible covering over k_i corresponding to the injection $H_i'' \hookrightarrow Q_i$. By applying Abhyankar's lemma, $h_i^{*,\bullet}$ is étale over $D_{Y_{g_{i,\beta_i}}}$. By applying the lemma in the case where g_{i,β_i} is étale over D_{Y_i} , we obtain that $X_{H_1''}^\bullet$ and $X_{H_2''}^\bullet$ satisfy Condition A, Condition B, and Condition C. Then the lemma follows from Lemma 5.21. We complete the proof of the lemma. \square

Lemma 5.24. *We maintain the notation introduced above. Suppose that G is a p -group. Then $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition A, Condition B, and Condition C.*

Proof. By Lemma 5.20, to verify the lemma, we only need to prove that $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition C (ii) and Condition C (iii).

To verify the lemma, without loss the generality, it is sufficient to treat the case where $G \cong \mathbb{Z}/p\mathbb{Z}$. Since $f_{H_i}^\bullet$ is étale, $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition C (iii).

Let $V_i \subseteq v(\Gamma_{X_i^\bullet})^{>0,p}$ be the subset of vertices such that the natural homomorphism

$$\Pi_{\tilde{X}_{i,v_i}^\bullet} \hookrightarrow \Pi_{X_i^\bullet} \twoheadrightarrow G \stackrel{\text{def}}{=} \Pi_{X_i^\bullet}/H_i$$

is non-trivial (since $G \cong \mathbb{Z}/p\mathbb{Z}$, the homomorphism is a surjection). Then we obtain $\#v(\Gamma_{X_{H_i}^\bullet}) = p(\#v(\Gamma_{X_i^\bullet}) - \#V_i) + \#V_i$ and $\#e^{\text{cl}}(\Gamma_{X_{H_i}^\bullet}) = p\#e^{\text{cl}}(\Gamma_{X_i^\bullet})$.

Let

$$\psi_p^{\text{sg,ver}} : v(\Gamma_{X_2^\bullet})^{>0,p} \hookrightarrow v(\Gamma_{X_1^\bullet})^{>0,p}$$

be the injection induced by ϕ , which is obtained in Theorem 5.17. We put

$$V_1' \stackrel{\text{def}}{=} \{\psi_p^{\text{sg,ver}}(v_2)\}_{v_2 \in V_2} \subseteq v(\Gamma_{X_1^\bullet})^{>0,p}.$$

By applying Lemma 5.16, we see that

$$V_1 = V_1'.$$

Thus, we have $\#v(\Gamma_{X_{H_1}^\bullet}) = \#v(\Gamma_{X_{H_2}^\bullet})$ and $\#e^{\text{cl}}(\Gamma_{X_{H_1}^\bullet}) = \#e^{\text{cl}}(\Gamma_{X_{H_2}^\bullet})$. This completes the proof of the lemma. \square

Proposition 5.25. *We maintain the notation introduced above. Then $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition A, Condition B, and Condition C.*

Proof. Since G is a solvable group, the proposition follows from Lemma 5.23 and Lemma 5.24. \square

Next, we prove the main result of the present section which we call combinatorial Grothendieck conjecture for surjections.

Theorem 5.26. *We maintain the notation introduced above. Then the surjective open continuous homomorphism $\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$ induces surjective maps*

$$\begin{aligned}\phi^{\text{ver}} : \text{Ver}(\Pi_{X_1^\bullet}) &\twoheadrightarrow \text{Ver}(\Pi_{X_2^\bullet}), \\ \phi^{\text{edg,op}} : \text{Edg}^{\text{op}}(\Pi_{X_1^\bullet}) &\twoheadrightarrow \text{Edg}^{\text{op}}(\Pi_{X_2^\bullet}), \\ \phi^{\text{edg,cl}} : \text{Edg}^{\text{cl}}(\Pi_{X_1^\bullet}) &\twoheadrightarrow \text{Edg}^{\text{cl}}(\Pi_{X_2^\bullet})\end{aligned}$$

group-theoretically. Moreover, ϕ induces an isomorphism

$$\phi^{\text{sg}} : \Gamma_{X_1^\bullet} \xrightarrow{\sim} \Gamma_{X_2^\bullet}$$

of the dual semi-graphs of X_1^\bullet and X_2^\bullet group-theoretically.

Proof. By applying Theorem 4.11, the homomorphism $\phi : \Pi_{X_1^\bullet} \twoheadrightarrow \Pi_{X_2^\bullet}$ induces a surjective map $\phi^{\text{edg,op}} : \text{Edg}^{\text{op}}(\Pi_{X_1^\bullet}) \twoheadrightarrow \text{Edg}^{\text{op}}(\Pi_{X_2^\bullet})$ group-theoretically. We only need to treat the cases of ϕ^{ver} and $\phi^{\text{edg,cl}}$, respectively.

Let $\mathcal{C}_{\Pi_{X_2^\bullet}}$ be a cofinal system of $\Pi_{X_2^\bullet}$ which consists of open normal subgroups of $\Pi_{X_2^\bullet}$. We put

$$\mathcal{C}_{\Pi_{X_1^\bullet}} \stackrel{\text{def}}{=} \{H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2) \mid H_2 \in \mathcal{C}_{\Pi_{X_2^\bullet}}\}.$$

Note that $\mathcal{C}_{\Pi_{X_1^\bullet}}$ is not a cofinal system of $\Pi_{X_1^\bullet}$ in general. Moreover, by applying Proposition 5.25, we have that $X_{H_1}^\bullet$ and $X_{H_2}^\bullet$ satisfy Condition A, Condition B, and Condition C for every $H_2 \in \mathcal{C}_{\Pi_{X_2^\bullet}}$ and $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2) \in \mathcal{C}_{\Pi_{X_1^\bullet}}$.

We treat the case of ϕ^{ver} . Let \widehat{X}_i^\bullet be the universal solvable admissible covering of X_i^\bullet associated to $\Pi_{X_i^\bullet}$ and $\Gamma_{\widehat{X}_i^\bullet}$ the dual semi-graph of \widehat{X}_i^\bullet . Let $\widehat{w}_1 \in v(\Gamma_{\widehat{X}_1^\bullet})$ and $\Pi_{\widehat{w}_1}$ the stabilizer subgroup of \widehat{w}_1 . Write $w_{H_1} \in v(\Gamma_{X_{H_1}^\bullet})$, $H_1 \in \mathcal{C}_{\Pi_{X_1^\bullet}}$, for the image of \widehat{w}_1 . Proposition 5.19 implies that ϕ induces a cofinal system of vertices

$$\mathcal{C}_{\widehat{w}_2} \stackrel{\text{def}}{=} \{w_{H_2} \stackrel{\text{def}}{=} \phi_{H_1}^{\text{ver}}(w_{H_1})\}_{H_2 \in \mathcal{C}_{\Pi_{X_2^\bullet}}},$$

which admits a natural action of $\Pi_{X_2^\bullet}$. Then we obtain an element $\widehat{w}_2 \in v(\Gamma_{\widehat{X}_2^\bullet})$. Moreover, the stabilizer of $\mathcal{C}_{\widehat{w}_2}$ is $\Pi_{\widehat{w}_2}$. We see immediately that ϕ induces a surjective open continuous homomorphism

$$\phi|_{\Pi_{\widehat{w}_1}} : \Pi_{\widehat{w}_1} \twoheadrightarrow \Pi_{\widehat{w}_2}$$

group-theoretically. Then we define

$$\phi^{\text{ver}} : \text{Ver}(\Pi_{X_1^\bullet}) \rightarrow \text{Ver}(\Pi_{X_2^\bullet}), \quad \Pi_{\widehat{w}_1} \mapsto \Pi_{\widehat{w}_2}.$$

Next, we prove that ϕ^{ver} is a surjective. Let $\widehat{v}_2 \in v(\Gamma_{\widehat{X}_2^\bullet})$ and $\Pi_{\widehat{v}_2}$ the stabilizer subgroup of \widehat{v}_2 . Write $v_{H_2} \in v(\Gamma_{X_{H_2}^\bullet})$, $H_2 \in \mathcal{C}_{\Pi_{X_2^\bullet}}$, for the image of \widehat{v}_2 . Then we obtain a cofinal system of vertices

$$\mathcal{C}_{\widehat{v}_2} \stackrel{\text{def}}{=} \{v_{H_2}\}_{H_2 \in \mathcal{C}_{\Pi_{X_2^\bullet}}}$$

associated to \widehat{v}_2 . The cofinal system $\mathcal{C}_{\widehat{v}_2}$ admits a natural action of $\Pi_{X_2^\bullet}$. We see immediately that the stabilizer of $\mathcal{C}_{\widehat{v}_2}$ is equal to $\Pi_{\widehat{v}_2}$. Proposition 5.19 implies that ϕ and $\mathcal{C}_{\widehat{v}_2}$ induce a set of

$$\mathcal{C}' \stackrel{\text{def}}{=} \{v_{H_1} \stackrel{\text{def}}{=} (\phi^{\text{sg}, \text{vex}})^{-1}(v_{H_2})\}_{H_1 \in \mathcal{C}_{\Pi_{X_2^\bullet}}}$$

group-theoretically. By extending \mathcal{C}' to a cofinal system of vertices. Then we obtain an element $\widehat{v}_1 \in v(\Gamma_{\widehat{X}_1^\bullet})$ such that the image of \widehat{v}_1 in $v(\Gamma_{X_{H_1}})$ is v_{H_1} . Thus, ϕ induces a surjective

$$\phi|_{\Pi_{\widehat{v}_1}} : \Pi_{\widehat{v}_1} \twoheadrightarrow \Pi_{\widehat{v}_2}.$$

This means that ϕ^{ver} is a surjection.

By applying similar arguments to the arguments given in the proof above, we obtain that ϕ induces a surjective map $\phi^{\text{edg}, \text{cl}} : \text{Edg}^{\text{cl}}(\Pi_{X_1^\bullet}) \twoheadrightarrow \text{Edg}^{\text{cl}}(\Pi_{X_2^\bullet})$ group-theoretically. This completes the proof of the first part of the theorem.

The surjections ϕ^{ver} , $\phi^{\text{edg}, \text{op}}$, and $\phi^{\text{edg}, \text{cl}}$ imply the following surjections

$$\begin{aligned} \phi^{\text{sg}, \text{ver}} : v(\Gamma_{X_1^\bullet}) &\xrightarrow{\sim} \text{Ver}(\Pi_{X_1^\bullet})/\Pi_{X_1^\bullet} \twoheadrightarrow \text{Ver}(\Pi_{X_2^\bullet})/\Pi_{X_2^\bullet} \xrightarrow{\sim} v(\Gamma_{X_2^\bullet}), \\ \phi^{\text{sg}, \text{op}} : e^{\text{op}}(\Gamma_{X_1^\bullet}) &\xrightarrow{\sim} \text{Edg}^{\text{op}}(\Pi_{X_1^\bullet})/\Pi_{X_1^\bullet} \twoheadrightarrow \text{Edg}^{\text{op}}(\Pi_{X_2^\bullet})/\Pi_{X_2^\bullet} \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_2^\bullet}), \\ \phi^{\text{sg}, \text{cl}} : e^{\text{cl}}(\Gamma_{X_1^\bullet}) &\xrightarrow{\sim} \text{Edg}^{\text{cl}}(\Pi_{X_1^\bullet})/\Pi_{X_1^\bullet} \twoheadrightarrow \text{Edg}^{\text{cl}}(\Pi_{X_2^\bullet})/\Pi_{X_2^\bullet} \xrightarrow{\sim} e^{\text{cl}}(\Gamma_{X_2^\bullet}). \end{aligned}$$

Since X_1^\bullet and X_2^\bullet satisfy Condition C, we have that $\phi^{\text{sg}, \text{ver}}$, $\phi^{\text{sg}, \text{op}}$, and $\phi^{\text{sg}, \text{cl}}$ are bijections. Furthermore, by applying [7, Lemma 1.5, Lemma 1.7, and Lemma 1.9], ϕ induces an isomorphism of dual semi-graphs

$$\phi^{\text{sg}} : \Gamma_{X_1^\bullet} \xrightarrow{\sim} \Gamma_{X_2^\bullet}$$

group-theoretically. This completes the proof of the theorem. \square

Remark 5.26.1. We maintain the notation introduced above. We see immediately that Theorem 5.26 does not hold without Condition C (e.g. X_1^\bullet is a generic curve of $\overline{\mathcal{M}}_{g,n}$, and X_2^\bullet is a singular curve).

On the other hand, the author believes that Theorem 5.26 also holds without Condition B (e.g. $n_{X_i} = 0$). The main difficult is that we do not have a precise formula for limits of p -averages of arbitrary pointed stable curves. Moreover, if the question of [38, Remark 4.10.2] is true, without too much difficulty, similar arguments to the arguments given in the proofs of this section imply that Theorem 5.26 holds without Condition B.

Furthermore, the author also believes that Theorem 5.26 holds without Condition A and Condition B. For example, Theorem 5.30 below shows that Theorem 5.26 holds without Condition A and Condition B if $g_X = 0$. Moreover, Theorem 5.30 will play a key role in the proof of the main theorem of the present paper.

Corollary 5.27. *We maintain the notation introduced above. Let $Q_2 \subseteq \Pi_{X_2^\bullet}$ be an arbitrary open subgroup and $Q_1 \stackrel{\text{def}}{=} \phi^{-1}(Q_2) \subseteq \Pi_{X_1^\bullet}$. Then we have*

$$\text{Avr}_p(Q_1) = \text{Avr}_p(Q_2).$$

Proof. The corollary follows immediately from Theorem 5.26. \square

Lemma 5.28. *Let E^\bullet be a pointed stable curve of type $(0, n)$ over an algebraically closed field k of characteristic $p > 0$, Π_{E^\bullet} the solvable admissible fundamental group of E^\bullet , and ℓ a prime number such that $\ell \neq p$, and that $\ell \gg n$. We put*

$$\mathrm{Edg}^{\mathrm{op}, \ell, \mathrm{ab}}(\Pi_{E^\bullet}) \stackrel{\mathrm{def}}{=} \{pr^{\ell, \mathrm{ab}}(I_{\hat{e}}) \mid I_{\hat{e}} \in \mathrm{Edg}^{\mathrm{op}}(\Pi_{E^\bullet})\} = \{I_e\}_{e \in e^{\mathrm{op}}(\Gamma_{E^\bullet})},$$

where $pr^{\ell, \mathrm{ab}}$ denotes the natural surjective homomorphism $\Pi_{E^\bullet} \rightarrow \Pi_{E^\bullet}^{\ell, \mathrm{ab}}$, and $I_e \stackrel{\mathrm{def}}{=} pr^{\ell, \mathrm{ab}}(I_{\hat{e}})$. Let $a_e \in I_e$, $e \in e^{\mathrm{op}}(\Gamma_{E^\bullet})$, be a generator of I_e such that

$$\prod_{e \in e^{\mathrm{op}}(\Gamma_{E^\bullet})} a_e = 1,$$

and let $\alpha : \Pi_{E^\bullet}^{\ell, \mathrm{ab}} \rightarrow \mathbb{F}_\ell$ be a surjection and $r_e \stackrel{\mathrm{def}}{=} \alpha(a_e)$. Write

$$g^\bullet : X^\bullet \rightarrow E^\bullet$$

for the Galois admissible covering over k with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ corresponding to α . Suppose that $r_e \neq 0$ for every $e \in e^{\mathrm{op}}(\Gamma_{E^\bullet})$, and that

$$\sum_{e \in e^{\mathrm{op}}(\Gamma_{E^\bullet})} r_e = \ell$$

if we identify \mathbb{F}_ℓ to $\{0, 1, \dots, \ell - 1\} \subseteq \mathbb{Z}$. Then g^\bullet is totally ramified over every node and every marked point of E^\bullet . In particular, we have that the map of dual semi-graphs $\Gamma_{X^\bullet} \rightarrow \Gamma_{E^\bullet}$ of X^\bullet and E^\bullet induced by g^\bullet is a bijection, and that X^\bullet satisfies Condition A.

Proof. We prove the lemma by induction on $\#v(\Gamma_{E^\bullet})$. Suppose that $\#v(\Gamma_{E^\bullet}) = 1$. Then the lemma is trivial.

Suppose that $\#v(\Gamma_{E^\bullet}) \geq 2$. Let $v_0 \in v(\Gamma_{E^\bullet})$ and $\tilde{E}_{v_0}^\bullet$ the smooth pointed stable curve associated to v_0 . Note that the underlying curve \tilde{E}_{v_0} coincides with the irreducible component of E corresponding to v_0 . On the other hand, we define a pointed stable curve over k to be

$$E_0^\bullet = (E_0 \stackrel{\mathrm{def}}{=} \overline{E \setminus \tilde{E}_{v_0}}, D_{E_0} \stackrel{\mathrm{def}}{=} (D_E \cap E_0) \cup (E_0 \cap \tilde{E}_{v_0})),$$

where $\overline{E \setminus \tilde{E}_{v_0}}$ denotes the topological closure of $E \setminus \tilde{E}_{v_0}$ in E . Then g^\bullet induces Galois admissible coverings

$$\begin{aligned} g_{v_0}^\bullet : \tilde{X}_{v_0}^\bullet &\rightarrow \tilde{E}_{v_0}^\bullet, \\ g_0^\bullet : X_0^\bullet &\rightarrow E_0^\bullet \end{aligned}$$

over k with Galois group $\mathbb{Z}/\ell\mathbb{Z}$. To verify the lemma, we only need to prove that $g_{v_0}^\bullet$ and g_0^\bullet are totally ramified over every node and every marked point of $\tilde{E}_{v_0}^\bullet$ and E_0^\bullet , respectively.

Let $\Pi_{\tilde{E}_{v_0}^\bullet}$ and $\Pi_{E_0^\bullet}$ be the solvable admissible fundamental groups of $\tilde{E}_{v_0}^\bullet$ and E_0^\bullet , respectively. Since $\Gamma_{E^\bullet}^{\mathrm{cpt}}$ is 2-connected, [38, Corollary 3.5] implies that the natural homomorphism

$$\theta_{v_0} : \Pi_{\tilde{E}_{v_0}^\bullet}^{\ell, \mathrm{ab}} \rightarrow \Pi_{E^\bullet}^{\ell, \mathrm{ab}}$$

is an injection. Let

$$\theta_0 : \Pi_{E_0^\bullet}^{\ell, \text{ab}} \rightarrow \Pi_{E^\bullet}^{\ell, \text{ab}}$$

be the homomorphism induced by the natural (outer) injective homomorphism $\Pi_{E_0^\bullet} \hookrightarrow \Pi_{E^\bullet}$ (in fact, θ_0 is also an injection).

Let $\{x\} = E_0 \cap \widetilde{E}_{v_0}$, $e_{v_0} \in e^{\text{op}}(\Gamma_{\widetilde{E}_{v_0}^\bullet})$ the open edge corresponding to x , $e_0 \in e^{\text{op}}(\Gamma_{E_0^\bullet})$ the open edge corresponding to x , $\widetilde{E}_{v_0}^\bullet$ the universal admissible covering of \widetilde{E}_{v_0} , \widehat{E}_0^\bullet the universal admissible covering of E_0^\bullet , $\widehat{e}_{v_0} \in v(\Gamma_{\widehat{E}_{v_0}^\bullet})$ an element over e_{v_0} , and $\widehat{e}_0 \in v(\Gamma_{\widehat{E}_0^\bullet})$ an element over e_0 . We denote by $I_{e_{v_0}}$ the image of $I_{\widehat{e}_{v_0}}$ of $\Pi_{\widetilde{E}_{v_0}^\bullet} \twoheadrightarrow \Pi_{\widetilde{E}_{v_0}^\bullet}^{\ell, \text{ab}}$, and by I_{e_0} the image of $I_{\widehat{e}_0}$ of $\Pi_{E_0^\bullet} \twoheadrightarrow \Pi_{E_0^\bullet}^{\ell, \text{ab}}$. We put

$$a_{e_{v_0}} = \left(\prod_{e \in e^{\text{op}}(\Gamma_{\widetilde{E}_{v_0}^\bullet}) \setminus \{e_{v_0}\}} a_e \right)^{-1},$$

$$a_{e_0} = \left(\prod_{e \in e^{\text{op}}(\Gamma_{E_0^\bullet}) \setminus \{e_0\}} a_e \right)^{-1}.$$

Then $a_{e_{v_0}}$ and a_{e_0} are generators of $I_{e_{v_0}}$ and I_{e_0} , respectively. Moreover, we put

$$\widetilde{\alpha}_{v_0} : \Pi_{\widetilde{E}_{v_0}^\bullet}^{\ell, \text{ab}} \xrightarrow{\theta_{v_0}} \Pi_{E^\bullet}^{\ell, \text{ab}} \xrightarrow{\alpha} \mathbb{F}_\ell.$$

and

$$\alpha_0 : \Pi_{E_0^\bullet}^{\ell, \text{ab}} \xrightarrow{\theta_0} \Pi_{E^\bullet}^{\ell, \text{ab}} \xrightarrow{\alpha} \mathbb{F}_\ell.$$

Then the structures of maximal pro-prime-to- p quotients of solvable admissible fundamental groups implies that

$$\widetilde{\alpha}_{v_0}(a_{e_{v_0}}) = \ell - \sum_{e \in e^{\text{op}}(\Gamma_{\widetilde{E}_{v_0}^\bullet}) \setminus \{e_{v_0}\}} r_e = \sum_{e \in e^{\text{op}}(\Gamma_{E_0^\bullet}) \setminus \{e_0\}} r_e$$

and

$$\alpha_0(a_{e_0}) = \sum_{e \in e^{\text{op}}(\Gamma_{\widetilde{E}_{v_0}^\bullet}) \setminus \{e_{v_0}\}} r_e.$$

Thus, by induction, we have that $g_{v_0}^\bullet$ and g_0^\bullet are totally ramified over every node and every marked point of $\widetilde{E}_{v_0}^\bullet$ and E_0^\bullet , respectively. We complete the proof of the lemma. \square

Lemma 5.29. *Let E^\bullet be a pointed stable curve of type $(0, n)$ over an algebraically closed field k of characteristic $p > 0$. Then E^\bullet satisfies Condition B.*

Proof. Let $f^\bullet : W^\bullet \rightarrow E^\bullet$ be an arbitrary admissible covering over k , Γ_{W^\bullet} the dual semi-graph of W^\bullet , and $f^{\text{sg}} : \Gamma_{W^\bullet} \rightarrow \Gamma_{E^\bullet}$ the map of dual semi-graphs of W^\bullet and E^\bullet induced by f^\bullet . To verify the lemma, we only need to prove that $\Gamma_{W^\bullet}^{\text{cpt}}$ is 2-connected.

Suppose that f^\bullet is trivial. Then the lemma follows from that $\Gamma_{E^\bullet}^{\text{cpt}}$ is 2-connected.

Suppose that f^\bullet is non-trivial. Let $w \in v(\Gamma_{W^\bullet})$ and $v \in v(\Gamma_{E^\bullet})$. We denote by $\pi_0(w)$ and $\pi_0(v)$ the sets of connected components of $\Gamma_{W^\bullet} \setminus \{w\}$ and $\Gamma_{E^\bullet} \setminus \{v\}$, respectively.

Suppose that $v = f^{\text{sg}}(w)$. Let $C_w \in \pi_0(w)$. We see immediately that $f^{\text{sg}}(C_w)$ is a connected component of $\Gamma_{E^\bullet} \setminus \{v\}$. Write C_v for $f^{\text{sg}}(C_w)$. Since $C_v \cap e^{\text{op}}(\Gamma_{E^\bullet}) \neq \emptyset$, we obtain that $C_w \cap e^{\text{op}}(\Gamma_{W^\bullet}) \neq \emptyset$. Thus, $\Gamma_{W^\bullet}^{\text{cpt}}$ is 2-connected. This completes the proof of the lemma. \square

Moreover, Theorem 5.26 implies the following important result.

Theorem 5.30. *Let $i \in \{1, 2\}$, and let E_i^\bullet be a pointed stable curve of type $(0, n)$ over k_i of characteristic $p > 0$, $\Pi_{E_i^\bullet}$ the solvable admissible fundamental group of E_i^\bullet , and*

$$\phi_E : \Pi_{E_1^\bullet} \rightarrow \Pi_{E_2^\bullet}$$

an arbitrary open continuous homomorphism. Suppose that E_1^\bullet and E_2^\bullet satisfy Condition C. Then $\phi_E : \Pi_{E_1^\bullet} \rightarrow \Pi_{E_2^\bullet}$ induces surjective maps

$$\phi_E^{\text{ver}} : \text{Ver}(\Pi_{E_1^\bullet}) \twoheadrightarrow \text{Ver}(\Pi_{E_2^\bullet}),$$

$$\phi_E^{\text{edg, op}} : \text{Edg}^{\text{op}}(\Pi_{E_1^\bullet}) \twoheadrightarrow \text{Edg}^{\text{op}}(\Pi_{E_2^\bullet}),$$

$$\phi_E^{\text{edg, cl}} : \text{Edg}^{\text{cl}}(\Pi_{E_1^\bullet}) \twoheadrightarrow \text{Edg}^{\text{cl}}(\Pi_{E_2^\bullet})$$

group-theoretically. Moreover, ϕ_E induces an isomorphism

$$\phi_E^{\text{sg}} : \Gamma_{E_1^\bullet} \xrightarrow{\sim} \Gamma_{E_2^\bullet}$$

of the dual semi-graphs of E_1^\bullet and E_2^\bullet group-theoretically.

Proof. Lemma 4.3 implies that ϕ_E is a surjective. By applying Theorem 4.11, the homomorphism $\phi_E : \Pi_{E_1^\bullet} \twoheadrightarrow \Pi_{E_2^\bullet}$ induces a surjective map $\phi_E^{\text{edg, op}} : \text{Edg}^{\text{op}}(\Pi_{E_1^\bullet}) \twoheadrightarrow \text{Edg}^{\text{op}}(\Pi_{E_2^\bullet})$ group-theoretically. We only need to treat the cases of ϕ_E^{ver} and $\phi_E^{\text{edg, cl}}$, respectively.

Let ℓ be a prime number such that $\ell \neq p$, and that $\ell \gg n$. Let

$$\alpha_2 : \Pi_{E_2^\bullet}^{\ell, \text{ab}} \twoheadrightarrow \mathbb{F}_\ell$$

satisfying the assumptions of Lemma 5.28. Then Theorem 4.11 implies that ϕ_E and α_2 induces a surjection

$$\alpha_1 : \Pi_{E_1^\bullet}^{\ell, \text{ab}} \twoheadrightarrow \mathbb{F}_\ell,$$

which satisfies the assumptions of Lemma 5.28. Write $g_i^\bullet : X_i^\bullet \rightarrow E_i^\bullet$ for the Galois admissible covering over k_i with Galois group $\mathbb{Z}/\ell\mathbb{Z}$. Then Lemma 5.28 and Lemma 5.29 imply that X_1^\bullet and X_2^\bullet satisfy Condition A, Condition B, and Condition C.

Write $\Pi_{X_i^\bullet} \subseteq \Pi_{E_i^\bullet}$ for the open normal subgroup corresponding to g_i^\bullet . Let $\Pi_{\widehat{v}_{X_i}} \in \text{Ver}(\Pi_{X_i^\bullet})$, $I_{\widehat{e}_{X_i}} \in \text{Edg}^{\text{cl}}(\Pi_{X_i^\bullet})$, $\Pi_{\widehat{v}_i} \in \text{Ver}(\Pi_{E_i^\bullet})$ the unique element which contains $\Pi_{\widehat{v}_{X_i}}$, and $I_{\widehat{e}_i} \in \text{Edg}^{\text{cl}}(\Pi_{E_i^\bullet})$ the unique element which contains $I_{\widehat{e}_{X_i}}$. Since $\Pi_{\widehat{v}_i}$ and $I_{\widehat{e}_i}$ the normalizers of $\Pi_{\widehat{v}_{X_i}}$ and $I_{\widehat{e}_{X_i}}$ in $\Pi_{E_i^\bullet}$, respectively, the theorem follows immediately from Theorem 5.26. This completes the proof of the theorem. \square

6 The Homeomorphism Conjecture for closed points when $g = 0$

We maintain the notation introduced in Section 3. In this section, we will prove that $\pi_{g,n}^{\text{adm}}([q])$ is a closed point of $\overline{\Pi}_{g,n}$ for every $[q] \in \overline{\mathfrak{M}}_{g,n}^{\text{cl}}$ if $g = 0$. In particular, the Homeomorphism Conjecture holds when $(g, n) = (0, 4)$. *In the present section, we shall assume that all the fundamental groups of pointed stable curves are solvable admissible fundamental groups unless indicated otherwise.*

We fix some notation. Let $i \in \{1, 2\}$, and let X_i^\bullet be a pointed stable curve of type $(0, n)$ over an algebraically closed field k_i of characteristic $p > 0$, $\Gamma_{X_i^\bullet}$ the dual semi-graph of X_i^\bullet , and r_{X_i} the Betti number of $\Gamma_{X_i^\bullet}$. Note that $\Gamma_{X_i^\bullet}$ is a tree, and that X_{i,v_i} is isomorphic to $\mathbb{P}_{k_i}^1$ for every $v_i \in v(\Gamma_{X_i^\bullet})$. In particular, X_{i,v_i} is smooth over k_i . For simplicity, we shall use the notation X_{i,v_i}^\bullet to denote the smooth pointed stable curve $\tilde{X}_{i,v_i}^\bullet$ of type $(0, n_{i,v_i})$ over k_i associated to $v_i \in v(\Gamma_{X_i^\bullet})$. On the other hand, let $\Pi_{X_i^\bullet}$ be the solvable admissible fundamental group of X_i^\bullet and

$$\phi : \Pi_{X_1^\bullet} \rightarrow \Pi_{X_2^\bullet}$$

an arbitrary open continuous homomorphism. By Lemma 4.3, we see that ϕ is a *surjective* open continuous homomorphism. Then ϕ induces an isomorphism

$$\phi^p : \Pi_{X_1^\bullet}^{p'} \xrightarrow{\sim} \Pi_{X_2^\bullet}^{p'}$$

of the maximal prime-to- p quotients of solvable admissible fundamental groups. Let \widehat{X}_i^\bullet be a universal solvable admissible covering of X_i^\bullet corresponding to $\Pi_{X_i^\bullet}$, $\Gamma_{\widehat{X}_i^\bullet}$ the dual semi-graph of \widehat{X}_i^\bullet , and $e_i \in e^{\text{op}}(\Gamma_{X_i^\bullet})$. We put

$$\text{Edg}_{e_i}^{\text{op}}(\Pi_{X_i^\bullet}) \stackrel{\text{def}}{=} \{I_{\widehat{e}_i} \in \text{Edg}^{\text{op}}(\Pi_{X_i^\bullet}) \mid \widehat{e}_i \in e^{\text{op}}(\Gamma_{\widehat{X}_i^\bullet}) \text{ is an open edge over } e_i\}.$$

Moreover, in the remainder of the present section, we shall suppose that k_1 is an algebraic closure of \mathbb{F}_p .

Denote by

$$\text{Hom}_{\text{pro-gps}}^{\text{open}}(-, -), \text{Isom}_{\text{pro-gps}}(-, -)$$

the set of open continuous homomorphisms of profinite groups and the set of continuous isomorphisms of profinite groups, respectively. First, we have the following theorem which was proved by the author (cf. [36, Theorem 1.2 and Remark 7.3.1]).

Theorem 6.1. *We maintain the notation introduced above. Suppose that X_1^\bullet and X_2^\bullet are smooth over k_1 and k_2 , respectively. Then we have that*

$$\text{Hom}_{\text{pro-gps}}^{\text{open}}(\Pi_{X_1^\bullet}, \Pi_{X_2^\bullet}) \neq \emptyset$$

if and only if X_1^\bullet is Frobenius equivalent to X_2^\bullet . In particular, if this is the case, we have that X_2^\bullet can be defined over the algebraic closure of \mathbb{F}_p in k_2 , and that

$$\text{Hom}_{\text{pro-gps}}^{\text{open}}(\Pi_{X_1^\bullet}, \Pi_{X_2^\bullet}) = \text{Isom}_{\text{pro-gps}}(\Pi_{X_1^\bullet}, \Pi_{X_2^\bullet}).$$

Remark 6.1.1. Let $[q] \in \mathfrak{M}_{0,n}^{\text{cl}}$ be an arbitrary point. Theorem 6.1 and Proposition 3.6 (a) imply that

$$V(\pi_{0,n}^{\text{sol}}([q])) \cap \Pi_{0,n}^{\text{sol}} = \pi_{0,n}^{\text{sol}}([q]).$$

Then we have that $[\pi_1^{\text{sol}}(q)]$ is a closed point of $\Pi_{0,n}^{\text{sol}}$. In particular,

$$\pi_{0,4}^{\text{t}} : \mathfrak{M}_{0,4} \rightarrow \Pi_{0,4}, \quad \pi_{0,4}^{\text{t},\text{sol}} : \mathfrak{M}_{0,4} \rightarrow \Pi_{0,4}^{\text{sol}}$$

are homeomorphisms. Note that Theorem 6.1 cannot tell us whether or not $[\pi_1^{\text{sol}}(q)]$ is closed in $\overline{\Pi}_{0,n}^{\text{sol}}$. In fact, this is highly non-trivial, see Proposition 6.5 below.

Lemma 6.2. *We maintain the notation introduced above. Suppose that X_1^\bullet is a singular curve. Then X_2^\bullet is also a singular curve.*

Proof. Lemma 5.4 implies that there exists a Galois admissible covering

$$f_1^\bullet : Y_1^\bullet \rightarrow X_1^\bullet$$

over k_1 with Galois group G such that $(\#G, p) = 1$, that the Betti number of the dual semi-graph of Y_1^\bullet is positive, and that Y_1^\bullet satisfies Condition A. Then $\phi^{p'}$ induces a Galois admissible covering

$$f_2^\bullet : Y_2^\bullet \rightarrow X_2^\bullet$$

over k_2 with Galois group G . Write g_{Y_i} for the genus of Y_i^\bullet , and r_{Y_i} for the Betti number of the dual semi-graph of Y_i^\bullet .

By applying Theorem 4.11, we obtain that $g_{Y_1} = g_{Y_2}$. Moreover, Theorem 2.2 and Lemma 2.3 (b) imply that

$$0 < r_{Y_1} \leq r_{Y_2}.$$

This means that X_2^\bullet is a singular curve. We complete the proof of the lemma. \square

Let $\overline{\mathbb{F}}_p$ be an algebraic closure of the finite field \mathbb{F}_p , and let X^\bullet be a *smooth* pointed stable curve of type $(0, n)$ over $\overline{\mathbb{F}}_p$. We fix two marked points $x_\infty, x_0 \in D_X$ distinct from each other. Moreover, we choose any field $k' \cong \overline{\mathbb{F}}_p$, and choose any isomorphism $\varphi : X \xrightarrow{\sim} \mathbb{P}_{k'}^1$, as schemes such that $\varphi(x_\infty) = \infty$ and $\varphi(x_0) = 0$. Then the set of $\overline{\mathbb{F}}_p$ -rational points $X(\overline{\mathbb{F}}_p) \setminus \{x_\infty\} \xrightarrow{\sim} \mathbb{A}_{k'}^1(k')$ is equipped with a structure of \mathbb{F}_p -module via the bijection φ . Note that since any k' -isomorphism of $\mathbb{P}_{k'}^1$ fixing ∞ and 0 is a scalar multiplication, the \mathbb{F}_p -module structure of $X(\overline{\mathbb{F}}_p) \setminus \{x_\infty\}$ does not depend on the choices of k' and φ but depends only on the choices of x_∞ and x_0 . We shall say that $X(\overline{\mathbb{F}}_p) \setminus \{x_\infty\}$ is *equipped with a structure of \mathbb{F}_p -module with respect to x_∞ and x_0* . Then we have the following lemma.

Lemma 6.3. *We maintain the notation introduced above. Suppose that X_i^\bullet is smooth over k_i . Let $e_{1,0}, e_{1,\infty} \in e^{\text{op}}(\Gamma_{X_1^\bullet})$ be open edges distinct from each other. Theorem 4.11 implies that ϕ induces a bijection $\phi^{\text{sg},\text{op}} : e^{\text{op}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_2^\bullet})$ group-theoretically. We put $e_{2,0} \stackrel{\text{def}}{=} \phi^{\text{sg},\text{op}}(e_{1,0})$ and $e_{2,\infty} \stackrel{\text{def}}{=} \phi^{\text{sg},\text{op}}(e_{1,\infty})$. Let*

$$\sum_{e_1 \in e^{\text{op}}(\Gamma_{X_1^\bullet}) \setminus \{e_{1,\infty}, e_{1,0}\}} b_{e_1} x_{e_1} = x_{e_{1,0}}$$

be a linear condition with respect to $e_{1,\infty}$ and $e_{1,0}$ on X_1^\bullet , where $b_{e_1} \in \mathbb{F}_p$ for every $e_1 \in e^{\text{op}}(\Gamma_{X_1^\bullet})$. Then the linear condition

$$\sum_{e_1 \in e^{\text{op}}(\Gamma_{X_1^\bullet}) \setminus \{e_{1,\infty}, e_{1,0}\}} b_{e_1} x_{\phi^{\text{sg,op}}(e_1)} = x_{\phi^{\text{sg,op}}(e_{1,0})} = x_{e_{2,0}}$$

with respect to $x_{e_{2,\infty}}$ and $x_{e_{2,0}}$ on X_2^\bullet also holds.

Proof. See [36, Lemma 7.1]. \square

Lemma 6.4. *Let X^\bullet be a pointed stable curve of type $(0, n)$ over an algebraically closed field k of characteristic $p > 0$ and $\ell \geq 3$ a prime number distinct from p . Then there exists a Galois admissible covering $f^\bullet : Y^\bullet \rightarrow X^\bullet$ over k with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ such that the genus of Y^\bullet is 0, and that there exists an irreducible component Y_v of Y satisfying $\#(Y_v \cap D_Y) \geq 3$.*

Proof. Suppose that X^\bullet is smooth over k . Then the lemma is trivial. We may suppose that X^\bullet is singular. Since the type of X^\bullet is $(0, n)$, there exists irreducible components X_{v_1}, X_{v_2} of X distinct from each other such that $\#(X_{v_1} \cap D_X) \geq 2$ and $\#(X_{v_2} \cap D_X) \geq 2$.

Let $x_1 \in X_{v_1} \cap D_X$, $x_2 \in X_{v_2} \cap D_X$, and

$$f^\bullet : Y^\bullet \rightarrow X^\bullet$$

a Galois admissible covering over k with Galois group $\mathbb{Z}/\ell\mathbb{Z}$ such that f is totally ramified over x_1 and x_2 , and that f is étale over $D_X \setminus \{x_1, x_2\}$. We see immediately that the irreducible components $Y_{v_1} \stackrel{\text{def}}{=} f^{-1}(X_{v_1})$ and $Y_{v_2} \stackrel{\text{def}}{=} f^{-1}(X_{v_2})$ of Y satisfy the conditions $\#(Y_{v_1} \cap D_Y) \geq 3$ and $\#(Y_{v_2} \cap D_Y) \geq 3$, respectively. Moreover, the Riemann-Hurwitz formula implies that the genus of Y^\bullet is 0. This completes the proof of the lemma. \square

Next, we generalize Theorem 6.1 to the case where we only assume that X_1^\bullet is smooth over k_1 .

Proposition 6.5. *We maintain the notation introduced above. Suppose that X_1^\bullet is smooth over k_1 . Then X_1^\bullet is Frobenius equivalent to X_2^\bullet . In particular, we have that X_2^\bullet is smooth over k_2 , and that X_2^\bullet can be defined over the algebraic closure of \mathbb{F}_p in k_2 .*

Proof. If X_2^\bullet is smooth over k_2 , the proposition follows immediately from Theorem 6.1. Then we may assume that X_2^\bullet is singular (i.e., $\#v(\Gamma_{X_2^\bullet}) \geq 2$).

Let $\ell \geq 3$ be a prime number distinct from p . Lemma 6.4 implies that there exists an open normal subgroup $H_2 \subseteq \Pi_{X_2^\bullet}$ such that $\Pi_{X_2^\bullet}/H_2 \cong \mathbb{Z}/\ell\mathbb{Z}$, that the Galois admissible covering $f_{H_2}^\bullet : X_{H_2}^\bullet \rightarrow X_2^\bullet$ corresponding to H_2 is totally ramified over two marked points of X_2^\bullet , and that there exists $w_{H_2} \in v(\Gamma_{X_{H_2}^\bullet})$ such that $\#(X_{H_2, w_{H_2}} \cap D_{X_{H_2}}) \geq 3$. Write $H_1 \stackrel{\text{def}}{=} \phi^{-1}(H_2) \subseteq \Pi_{X_1^\bullet}$ for the open subgroup and $f_{H_1}^\bullet : X_{H_1}^\bullet \rightarrow X_1^\bullet$ for the Galois admissible covering over k_1 corresponding to H_1 . Theorem 4.11 implies that $f_{H_1}^\bullet$ is totally ramified over two marked points of X_1^\bullet , and that $n_{X_{H_1}} = n_{X_{H_2}}$. Since $f_{H_1}^\bullet$ is totally ramified over two marked points, we have that

$$g_{X_{H_1}} = g_{X_{H_2}} = 0.$$

If we can prove the proposition holds for $X_{H_1}^\bullet$, $X_{H_2}^\bullet$, and $\phi|_{H_1} : H_1 \twoheadrightarrow H_2$, then we obtain that X_2^\bullet is also smooth over k_2 . Then the proposition follows immediately from Theorem 6.1. Thus, by replacing X_1^\bullet , X_2^\bullet , and ϕ by $X_{H_1}^\bullet$, $X_{H_2}^\bullet$, and $\phi|_{H_1}$, respectively, we may assume that there exists $w_2 \in v(\Gamma_{X_2^\bullet})$ such that $\#(X_{2,w_2} \cap D_{X_2}) \geq 3$.

Let $e_{2,\infty}$, $e_{2,0}$, $e_{2,1} \in e^{\text{op}}(\Gamma_{X_2^\bullet}) \cap e^{\text{op}}(\Gamma_{X_{2,w_2}^\bullet})$ distinct from each other. Theorem 4.11 implies that ϕ induces a bijection

$$\phi^{\text{sg,op}} : e^{\text{op}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_2^\bullet})$$

group-theoretically. We put

$$e_{1,\infty} \stackrel{\text{def}}{=} (\phi^{\text{sg,op}})^{-1}(e_{2,\infty}), \quad e_{1,0} \stackrel{\text{def}}{=} (\phi^{\text{sg,op}})^{-1}(e_{2,0}), \quad e_{1,1} \stackrel{\text{def}}{=} (\phi^{\text{sg,op}})^{-1}(e_{2,1}).$$

Without loss of generality, we may assume that

$$x_{e_{i,\infty}} \stackrel{\text{def}}{=} \infty, \quad x_{e_{i,0}} \stackrel{\text{def}}{=} 0, \quad x_{e_{i,1}} \stackrel{\text{def}}{=} 1,$$

and that

$$X_1 = \mathbb{P}_{k_1}^1, \quad X_{w_2} = \mathbb{P}_{k_2}^1.$$

Let $\pi_0(\Gamma_{X_2^\bullet} \setminus \{w_2\})$ denote the set of connected components of $\Gamma_{X_2^\bullet} \setminus \{w_2\}$ in $\Gamma_{X_2^\bullet}$. Let $C_2 \in \pi_0(\Gamma_{X_2^\bullet} \setminus \{w_2\})$. Since X_2^\bullet is a pointed stable curve of type $(0, n)$ over k_2 , we have that $\#(C_2 \cap e^{\text{op}}(\Gamma_{X_2^\bullet})) \geq 2$. Let $e_{2,C_2,1}$, $e_{2,C_2,2} \in C_2 \cap e^{\text{op}}(\Gamma_{X_2^\bullet})$ be open edges distinct from each other. We put

$$\begin{aligned} e_{1,2} &\stackrel{\text{def}}{=} (\phi^{\text{sg,op}})^{-1}(e_{2,C_2,1}) \in e^{\text{op}}(\Gamma_{X_1^\bullet}), \\ e_{1,3} &\stackrel{\text{def}}{=} (\phi^{\text{sg,op}})^{-1}(e_{2,C_2,2}) \in e^{\text{op}}(\Gamma_{X_1^\bullet}). \end{aligned}$$

We denote by X_{2,C_2} the semi-stable subcurve of X_2 whose irreducible components are the irreducible components corresponding to the vertices of $\Gamma_{X_2^\bullet}$ contained in C_2 . Moreover, we write $e_{2,2}$ for the unique closed edge of $\Gamma_{X_2^\bullet}$ connecting w_2 and C_2 . Then the node $x_{e_{2,2}}$ corresponding to $e_{2,2}$ is the unique closed point of X_2 contained in $X_{w_2} \cap X_{2,C_2}$.

We put

$$\begin{aligned} Z_1^\bullet &= (Z_1 \stackrel{\text{def}}{=} X_1, D_{Z_1} \stackrel{\text{def}}{=} \{x_{e_{1,\infty}}, x_{e_{1,0}}, x_{e_{1,1}}, x_{e_{1,2}}, x_{e_{1,3}}\}), \\ Y_{1,1}^\bullet &= (Y_{1,1} \stackrel{\text{def}}{=} X_1, D_{Y_{1,1}} \stackrel{\text{def}}{=} \{x_{e_{1,\infty}}, x_{e_{1,0}}, x_{e_{1,1}}, x_{e_{1,2}}\}), \\ Y_{1,2}^\bullet &= (Y_{1,2} \stackrel{\text{def}}{=} X_1, D_{Y_{1,2}} \stackrel{\text{def}}{=} \{x_{e_{1,\infty}}, x_{e_{1,0}}, x_{e_{1,1}}, x_{e_{1,3}}\}), \\ Y_2^\bullet &= (Y_2 \stackrel{\text{def}}{=} X_{w_2}, D_{Y_2} \stackrel{\text{def}}{=} \{x_{e_{2,\infty}}, x_{e_{2,0}}, x_{e_{2,1}}, x_{e_{2,2}}\}). \end{aligned}$$

Moreover, we denote by Z_2^\bullet the pointed stable curve of type $(0, 5)$ over k_2 associated to the pointed semi-stable curve

$$(X_2, \{x_{e_{2,\infty}}, x_{e_{2,0}}, x_{e_{2,1}}, x_{e_{2,C_2,1}}, x_{e_{2,C_2,2}}\})$$

over k_2 (i.e., the pointed stable curve obtained by contracting the (-1) -curves and the (-2) -curves of $(X_2, \{x_{e_{2,\infty}}, x_{e_{2,0}}, x_{e_{2,1}}, x_{e_{2,C_2,1}}, x_{e_{2,C_2,2}}\})$). We see that Z_2 has two irreducible

components Z_{w_2} and Z_{C_2} such that Z_{w_2} is equal to X_{w_2} , that $x_{e_{2,2}} = Z_{w_2} \cap Z_{C_2}$, that $\{x_{e_{2,\infty}}, x_{e_{2,0}}, x_{e_{2,1}}\} \subseteq Z_{w_2}$, and that $\{x_{e_{2,C_2,1}}, x_{e_{2,C_2,2}}\} \subseteq Z_{C_2}$.

Next, we will see that the solvable admissible fundamental groups and the natural homomorphisms of the the solvable admissible fundamental groups of pointed stable curves constructing above can be reconstructed group-theoretically from ϕ . Let

$$I_1 \subseteq \Pi_{X_1^\bullet}, I_2 \subseteq \Pi_{X_2^\bullet}$$

be the closed subgroups generated by the inertia subgroups of

$$\begin{aligned} & \bigcup_{e_1 \in e^{\text{op}}(\Gamma_{X_1^\bullet}) \setminus \{e_{1,\infty}, e_{1,0}, e_{1,1}, e_{1,2}, e_{1,3}\}} \text{Edg}_{e_1}^{\text{op}}(\Pi_{X_1^\bullet}), \\ & \bigcup_{e_2 \in e^{\text{op}}(\Gamma_{X_2^\bullet}) \setminus \{e_{2,\infty}, e_{2,0}, e_{2,1}, e_{2,C_2,1}, e_{2,C_2,2}\}} \text{Edg}_{e_2}^{\text{op}}(\Pi_{X_2^\bullet}), \end{aligned}$$

respectively,

$$I_{1,1} \subseteq \Pi_{X_1^\bullet}, I_{1,2} \subseteq \Pi_{X_1^\bullet}$$

the closed subgroups generated by the inertia subgroups of

$$\begin{aligned} & \bigcup_{e_1 \in e^{\text{op}}(\Gamma_{X_1^\bullet}) \setminus \{e_{1,\infty}, e_{1,0}, e_{1,1}, e_{1,2}\}} \text{Edg}_{e_1}^{\text{op}}(\Pi_{X_1^\bullet}), \\ & \bigcup_{e_1 \in e^{\text{op}}(\Gamma_{X_1^\bullet}) \setminus \{e_{1,\infty}, e_{1,0}, e_{1,1}, e_{1,3}\}} \text{Edg}_{e_1}^{\text{op}}(\Pi_{X_1^\bullet}), \end{aligned}$$

respectively, and

$$I_{2,1} \subseteq \Pi_{X_2^\bullet}, I_{2,2} \subseteq \Pi_{X_2^\bullet}$$

the closed subgroups generated by the inertia subgroups of

$$\begin{aligned} & \bigcup_{e_2 \in e^{\text{op}}(\Gamma_{X_2^\bullet}) \setminus \{e_{2,\infty}, e_{2,0}, e_{2,1}, e_{2,C_2,1}\}} \text{Edg}_{e_2}^{\text{op}}(\Pi_{X_2^\bullet}), \\ & \bigcup_{e_2 \in e^{\text{op}}(\Gamma_{X_2^\bullet}) \setminus \{e_{2,\infty}, e_{2,0}, e_{2,1}, e_{2,C_2,2}\}} \text{Edg}_{e_2}^{\text{op}}(\Pi_{X_2^\bullet}), \end{aligned}$$

respectively.

Then Theorem 4.11 implies that $\phi(I_1) = I_2$, $\phi(I_{1,1}) = I_{2,1}$, and $\phi(I_{1,2}) = I_{2,2}$. Moreover, we see that $\Pi_{X_1^\bullet}/I_1$ and $\Pi_{X_2^\bullet}/I_2$ are (outer) isomorphic to the solvable admissible fundamental groups of Z_1^\bullet and Z_2^\bullet , respectively, that $\Pi_{X_1^\bullet}/I_{1,1}$ and $\Pi_{X_1^\bullet}/I_{1,2}$ are (outer) isomorphic to the solvable admissible fundamental groups of $Y_{1,1}^\bullet$ and $Y_{1,2}^\bullet$, respectively, and that $\Pi_{X_2^\bullet}/I_{2,1}$ and $\Pi_{X_2^\bullet}/I_{2,2}$ are (outer) isomorphic to the solvable admissible fundamental group of Y_2^\bullet . Note that $I_{1,1} \supseteq I_1 \subseteq I_{1,2}$ and $I_{2,1} \supseteq I_2 \subseteq I_{2,2}$.

On the other hand, ϕ induces the following surjective open continuous homomorphisms

$$\overline{\phi} : \Pi_{Z_1^\bullet} \stackrel{\text{def}}{=} \Pi_{X_1^\bullet}/I_1 \twoheadrightarrow \Pi_{Z_2^\bullet} \stackrel{\text{def}}{=} \Pi_{X_2^\bullet}/I_2,$$

$$\begin{aligned}\bar{\phi}_{1,1} : \Pi_{Y_{1,1}^\bullet} &\stackrel{\text{def}}{=} \Pi_{X_1^\bullet}/I_{1,1} \twoheadrightarrow \Pi_{Y_2^\bullet} \stackrel{\text{def}}{=} \Pi_{X_2^\bullet}/I_{2,1}, \\ \bar{\phi}_{1,2} : \Pi_{Y_{1,2}^\bullet} &\stackrel{\text{def}}{=} \Pi_{X_1^\bullet}/I_{1,2} \twoheadrightarrow \Pi_{Y_2^\bullet} \stackrel{\text{def}}{=} \Pi_{X_2^\bullet}/I_{2,2}\end{aligned}$$

which fit into the following commutative diagram:

$$\begin{array}{ccc}\Pi_{Y_{1,1}^\bullet} & \xrightarrow{\bar{\phi}_{1,1}} & \Pi_{Y_2^\bullet} \\ \psi_{1,1} \uparrow & & \psi_{2,1} \uparrow \\ \Pi_{Z_1^\bullet} & \xrightarrow{\bar{\phi}} & \Pi_{Z_2^\bullet} \\ \psi_{1,2} \downarrow & & \psi_{2,2} \downarrow \\ \Pi_{Y_{1,2}^\bullet} & \xrightarrow{\bar{\phi}_{1,2}} & \Pi_{Y_2^\bullet},\end{array}$$

where $\psi_{1,1}$, $\psi_{1,2}$, $\psi_{2,1}$, and $\psi_{2,2}$ denote the natural quotient homomorphisms.

Note that $\psi_{2,1} \circ \bar{\phi} \neq \psi_{2,2} \circ \bar{\phi}$, and that the homomorphisms of maximal prime-to- p quotients of solvable admissible fundamental groups $\bar{\phi}_{1,1}^{p'}$, $\bar{\phi}^{p'}$, and $\bar{\phi}_{1,2}^{p'}$ induced by $\bar{\phi}_{1,1}$, $\bar{\phi}$, and $\bar{\phi}_{1,2}$, respectively, are isomorphisms. Moreover, we see that $\psi_{2,1}(I_{\widehat{e}_{2,C_2,1}}) \in \text{Edg}_{e_{2,2}}^{\text{op}}(\Pi_{Y_2^\bullet})$ and $\psi_{2,2}(I_{\widehat{e}_{2,C_2,2}}) \in \text{Edg}_{e_{2,2}}^{\text{op}}(\Pi_{Y_2^\bullet})$ for every $I_{\widehat{e}_{2,C_2,1}} \in \text{Edg}_{e_{2,C_2,1}}^{\text{op}}(\Pi_{Z_2^\bullet})$ and every $I_{\widehat{e}_{2,C_2,2}} \in \text{Edg}_{e_{2,C_2,2}}^{\text{op}}(\Pi_{Z_2^\bullet})$.

Let $\widehat{e}_{i,0} \in e^{\text{op}}(\Gamma_{\widehat{X}_i^\bullet})$ be an open edge over $e_{i,0}$. By applying Theorem 4.13,

$$\mathbb{F}_{\widehat{e}_{i,0}} \stackrel{\text{def}}{=} (I_{\widehat{e}_{i,0}} \otimes_{\mathbb{Z}} (\mathbb{Q}/\mathbb{Z})_i^{p'}) \sqcup \{*\widehat{e}_{i,0}\}$$

admits a structure of field which can be reconstructed group-theoretically from $\Pi_{X_i^\bullet}$. Since we assume that k_1 is an algebraic closure of \mathbb{F}_p , we may suppose that $k_1 = \mathbb{F}_{\widehat{e}_{1,0}}$. Moreover, we have that ϕ induces a field isomorphism

$$\phi_{\widehat{e}_{1,0}, \widehat{e}_{2,0}}^{\text{fd}} : \mathbb{F}_{\widehat{e}_{1,0}} \xrightarrow{\sim} \mathbb{F}_{\widehat{e}_{2,0}}.$$

group-theoretically. By [T2, Lemma 3.4], there exists a natural number m prime to p such that $\mathbb{F}_p(\zeta_{1,m})$ contains m th roots of $x_{e_{1,2}}$, $x_{e_{1,3}}$, where $\zeta_{1,m}$ denotes a fixed primitive m th root of unity in $\mathbb{F}_{\widehat{e}_{1,0}}$. Let $s \stackrel{\text{def}}{=} [\mathbb{F}_p(\zeta_{1,m}) : \mathbb{F}_p]$. For each $e_{1,u} \in \{e_{1,2}, e_{1,3}\}$, we fix an m th root $x_{e_{1,u}}^{\frac{1}{m}}$ in $\mathbb{F}_{\widehat{e}_{1,0}}$. Then we have

$$x_{e_{1,u}}^{\frac{1}{m}} = \sum_{t=0}^{s-1} b_{1,u,t} \zeta_{1,m}^t, \quad u \in \{2, 3\},$$

where $b_{1,u,t} \in \mathbb{F}_p$ for each $u \in \{2, 3\}$ and each $t \in \{0, \dots, s-1\}$. Note that since $x_{e_{1,2}} \neq x_{e_{1,3}}$, there exists $t' \in \{0, \dots, s-1\}$ such that $b_{1,2,t'} \neq b_{1,3,t'}$.

Let $Z_1 \setminus \{x_{e_{1,\infty}}\} = \text{Spec } \mathbb{F}_{\widehat{e}_{1,0}}[x_1]$,

$$f_{Q_1}^\bullet : Z_{Q_1}^\bullet \rightarrow Z_1^\bullet$$

the Galois admissible covering over $\mathbb{F}_{\widehat{e}_{1,0}}$ with Galois group $\mathbb{Z}/m\mathbb{Z}$ determined by the equation $y_1^m = x_1$, and $Q_1 \subseteq \Pi_{Z_1^\bullet}$ the open normal subgroup induced by $f_{Q_1}^\bullet$. Then f_{Q_1} is totally ramified over $\{x_{e_{1,0}} = 0, x_{e_{1,\infty}} = \infty\}$ and is étale over $D_{Z_1} \setminus \{x_{e_{1,0}}, x_{e_{1,\infty}}\}$. Note that $Z_{Q_1} = \mathbb{P}_{\mathbb{F}_{\widehat{e}_{1,0}}}^1$, and that the marked points of $D_{Z_{Q_1}}$ over $\{x_{e_{1,0}}, x_{e_{1,\infty}}\}$ are $\{x_{e_{Q_1,0}} \stackrel{\text{def}}{=} 0, x_{e_{Q_1,\infty}} \stackrel{\text{def}}{=} \infty\}$. We put

$$x_{e_{Q_1,u}} \stackrel{\text{def}}{=} x_{e_{1,u}}^{\frac{1}{m}} \in D_{Z_{Q_1}}, \quad u \in \{2, 3\},$$

and

$$x_{e_{Q_1,1}^t} \stackrel{\text{def}}{=} \zeta_{1,m}^t \in D_{Z_{Q_1}}, \quad t \in \{0, \dots, s-1\}.$$

Thus, we obtain a linear condition

$$x_{e_{Q_1,u}} = \sum_{t=0}^{s-1} b_{1,u,t} x_{e_{Q_1,1}^t}, \quad u \in \{2, 3\}$$

with respect to $x_{e_{Q_1,0}}$ and $x_{e_{Q_1,\infty}}$ on $Z_{Q_1}^\bullet$.

Since $(m, p) = 1$, there exists a unique open normal subgroup $Q_2 \subseteq \Pi_{Z_2^\bullet}$ such that $\overline{\phi}^{-1}(Q_2) = Q_1$. On the other hand, we put

$$Q_{1,1} \stackrel{\text{def}}{=} \psi_{1,1}(Q_1) \subseteq \Pi_{Y_{1,1}^\bullet},$$

$$Q_{1,2} \stackrel{\text{def}}{=} \psi_{1,2}(Q_1) \subseteq \Pi_{Y_{1,2}^\bullet},$$

$$Q_{2,1} \stackrel{\text{def}}{=} \psi_{2,1}(Q_2) \subseteq \Pi_{Y_2^\bullet},$$

$$Q_{2,2} \stackrel{\text{def}}{=} \psi_{2,2}(Q_2) \subseteq \Pi_{Y_2^\bullet}.$$

Note that the constructions of Q_1 and Q_2 imply that $P_2 \stackrel{\text{def}}{=} Q_{2,1} = Q_{2,2}$. The commutative diagram of profinite groups above induces the following commutative diagram of profinite groups:

$$\begin{array}{ccc} Q_{1,1} & \xrightarrow{\overline{\phi}_{Q_{1,1}}} & P_2 \\ \uparrow & & \uparrow \\ Q_1 & \xrightarrow{\overline{\phi}_{Q_1}} & Q_2 \\ \downarrow & & \downarrow \\ Q_{1,2} & \xrightarrow{\overline{\phi}_{Q_{1,2}}} & P_2. \end{array}$$

Let $j \in \{1, 2\}$. Write $Y_{Q_{1,j}}^\bullet$ for the pointed stable curve over k_1 corresponding to $Q_{1,j}$. Then we see that $e^{\text{op}}(\Gamma_{Y_{Q_{1,j}}^\bullet})$ can be regarded as a subset of $e^{\text{op}}(\Gamma_{Z_{Q_1}^\bullet})$. By applying Theorem 4.11 for $\overline{\phi}_{Q_{1,1}}$ and $\overline{\phi}_{Q_{1,2}}$, respectively, the commutative diagram of profinite groups above implies that we may put

$$e_{P_2,\infty} \stackrel{\text{def}}{=} \overline{\phi}_{Q_{1,1}}^{\text{sg,op}}(e_{Q_1,\infty}) = \overline{\phi}_{Q_{1,2}}^{\text{sg,op}}(e_{Q_1,\infty}), \quad e_{P_2,0} \stackrel{\text{def}}{=} \overline{\phi}_{Q_{1,1}}^{\text{sg,op}}(e_{Q_1,0}) = \overline{\phi}_{Q_{1,2}}^{\text{sg,op}}(e_{Q_1,0}),$$

$$e_{P_2,1}^t \stackrel{\text{def}}{=} \overline{\phi}_{Q_{1,1}}^{\text{sg,op}}(e_{Q_{1,1}}^t) = \overline{\phi}_{Q_{1,2}}^{\text{sg,op}}(e_{Q_{1,1}}^t), \quad t \in \{0, \dots, s-1\},$$

$$e_{P_2,2} \stackrel{\text{def}}{=} \overline{\phi}_{Q_{1,1}}^{\text{sg,op}}(e_{Q_{1,2}}) = \overline{\phi}_{Q_{1,2}}^{\text{sg,op}}(e_{Q_{1,2}}).$$

We denote by $\zeta_{2,m} \stackrel{\text{def}}{=} \phi_{\widehat{e}_{1,0}, \widehat{e}_{2,0}}^{\text{fd}}(\zeta_{1,m})$. Then we have

$$x_{e_{Q_2,1}^t} = \zeta_{2,m}^t, \quad t \in \{0, \dots, s-1\}.$$

Let $Y_{P_2}^\bullet$ be the pointed stable curve over k_2 corresponding to $P_2 \subseteq \Pi_{Y_2}^\bullet$. Moreover, by applying Lemma 6.3 for $\overline{\phi}_{Q_{1,1}}$, we obtain that

$$x_{e_{P_2,2}} = \sum_{t=0}^{s-1} b_{1,2,t} x_{e_{Q_2,1}^t}$$

with respect to $x_{e_{P_2,0}}$ and $x_{e_{P_2,\infty}}$ on $Y_{P_2}^\bullet$. On the other hand, by applying Lemma 6.3 for $\overline{\phi}_{Q_{1,2}}$, we obtain that

$$x_{e_{P_2,2}} = \sum_{t=0}^{s-1} b_{1,3,t} x_{e_{Q_2,1}^t}$$

with respect to $x_{e_{P_2,0}}$ and $x_{e_{P_2,\infty}}$ on $Y_{P_2}^\bullet$. This means that

$$\sum_{t=0}^{s-1} b_{1,2,t} \zeta_{2,m}^t = \sum_{t=0}^{s-1} b_{1,3,t} \zeta_{2,m}^t,$$

which is impossible as $b_{1,2,t'} \neq b_{1,3,t'}$ for some $t' \in \{0, \dots, s-1\}$. Then we obtain that X_2^\bullet is smooth over k_2 . Thus, the proposition follows immediately from Theorem 6.1. This completes the proof of the proposition. \square

Now, we can prove the first form of our main theorem of the present paper.

Theorem 6.6. *Let X_i^\bullet , $i \in \{1, 2\}$, be an arbitrary pointed stable curve of type $(0, n)$ over an algebraically closed field k_i of characteristic $p > 0$ and $\Pi_{X_i^\bullet}$ either the admissible fundamental group of X_i^\bullet or the solvable admissible fundamental group of X_i^\bullet . Suppose that k_1 is an algebraic closure of \mathbb{F}_p . Then we have that*

$$\text{Hom}_{\text{pro-gps}}^{\text{open}}(\Pi_{X_1^\bullet}, \Pi_{X_2^\bullet}) \neq \emptyset$$

if and only if X_1^\bullet is Frobenius equivalent to X_2^\bullet . In particular, if this is the case, we have that X_2^\bullet can be defined over the algebraic closure of \mathbb{F}_p in k_2 , and that

$$\text{Hom}_{\text{pro-gps}}^{\text{open}}(\Pi_{X_1^\bullet}, \Pi_{X_2^\bullet}) = \text{Isom}_{\text{pro-gps}}(\Pi_{X_1^\bullet}, \Pi_{X_2^\bullet}).$$

Proof. To verify the theorem, it is sufficient to prove the theorem when $\Pi_{X_i^\bullet}$ is the solvable admissible fundamental group of X_i^\bullet . The “if” part of the theorem follows from [40, Proposition 3.7]. Let us prove the “only if” part of the theorem. Suppose that $\text{Hom}_{\text{pro-gps}}^{\text{open}}(\Pi_{X_1^\bullet}, \Pi_{X_2^\bullet}) \neq \emptyset$, and let $\phi \in \text{Hom}_{\text{pro-gps}}^{\text{open}}(\Pi_{X_1^\bullet}, \Pi_{X_2^\bullet})$ be an arbitrary element. Then Lemma 4.3 implies that ϕ is a surjection.

Suppose that X_1^\bullet is smooth over k_1 . Then the theorem follows from Proposition 6.5. Thus, we may assume that X_1^\bullet is a singular pointed stable curve.

Note that since X_1^\bullet is singular, we have $n = \#e^{\text{op}}(\Gamma_{X_1^\bullet}) \geq 4$. We prove the theorem by induction on $\#e^{\text{op}}(\Gamma_{X_1^\bullet})$. Suppose that $\#e^{\text{op}}(\Gamma_{X_1^\bullet}) = 4$. Since X_1^\bullet is a singular pointed stable curve of type $(0, 4)$, we obtain that $\#v(\Gamma_{X_1^\bullet}) = 2$ and $\#e^{\text{cl}}(\Gamma_{X_1^\bullet}) = 1$. On the other hand, by applying Lemma 6.2, we obtain that X_2^\bullet is also a singular pointed stable curve of type $(0, 4)$. Thus, we have that $\#e^{\text{op}}(\Gamma_{X_2^\bullet}) = 4$, $\#v(\Gamma_{X_2^\bullet}) = 2$, and $\#e^{\text{cl}}(\Gamma_{X_2^\bullet}) = 1$. Then X_1^\bullet and X_2^\bullet satisfy Condition C defined in Section 5. Thus, by Theorem 5.30 and Theorem 6.1, we obtain that X_1^\bullet is Frobenius equivalent to X_2^\bullet .

Suppose that $\#e^{\text{op}}(\Gamma_{X_1^\bullet}) \geq 5$. Theorem 4.11 implies that ϕ induces a bijection

$$\phi^{\text{sg,op}} : e^{\text{op}}(\Gamma_{X_1^\bullet}) \xrightarrow{\sim} e^{\text{op}}(\Gamma_{X_2^\bullet})$$

group-theoretically. Let $e_{1,n} \in e^{\text{op}}(\Gamma_{X_1^\bullet})$ and $e_{2,n} \stackrel{\text{def}}{=} \phi^{\text{sg,op}}(e_{1,n})$. We denote by

$$Z_i^\bullet$$

the pointed stable curve of type $(0, n-1)$ over k_i associated to the pointed semi-stable curve $(X_i, D_{X_i} \setminus \{x_{e_{i,n}}\})$ whose underlying curve Z_i can be regarded naturally as a subcurve of X_i . Write $I_{i,n} \subseteq \Pi_{X_i^\bullet}$ for the closed subgroup generated by the subgroups $\text{Edg}_{e_{i,n}}^{\text{op}}(\Pi_{X_i^\bullet})$. Then we see that

$$\Pi_{Z_i^\bullet} \stackrel{\text{def}}{=} \Pi_{X_i^\bullet} / I_{i,n}$$

is (outer) isomorphic to the solvable admissible fundamental group of Z_i^\bullet . Moreover, Theorem 4.11 implies that $\phi(I_{1,n}) = I_{2,n}$. Then ϕ induces a surjective open continuous homomorphism

$$\overline{\phi} : \Pi_{Z_1^\bullet} \twoheadrightarrow \Pi_{Z_2^\bullet}.$$

By induction, we obtain that Z_1^\bullet is Frobenius equivalent to Z_2^\bullet . Then ϕ induces a bijection of dual semi-graphs

$$\overline{\phi}^{\text{sg}} : \Gamma_{Z_1^\bullet} \xrightarrow{\sim} \Gamma_{Z_2^\bullet}.$$

In particular, we put

$$\overline{\phi}^{\text{sg,ver}} = \overline{\phi}^{\text{sg}}|_{v(\Gamma_{Z_1^\bullet})} : v(\Gamma_{Z_1^\bullet}) \xrightarrow{\sim} v(\Gamma_{Z_2^\bullet}),$$

$$\overline{\phi}^{\text{sg,op}} = \overline{\phi}^{\text{sg}}|_{e^{\text{op}}(\Gamma_{Z_1^\bullet})} : e^{\text{op}}(\Gamma_{Z_1^\bullet}) \xrightarrow{\sim} e^{\text{op}}(\Gamma_{Z_2^\bullet}).$$

Note that $\Gamma_{Z_i^\bullet}$ can be regarded naturally as a sub-semi-graph of $\Gamma_{X_i^\bullet}$. Moreover, one of the following cases may occur: (i) $\#v(\Gamma_{X_1^\bullet}) = \#v(\Gamma_{Z_1^\bullet}) = \#v(\Gamma_{X_2^\bullet}) = \#v(\Gamma_{Z_2^\bullet})$; (ii) $\#v(\Gamma_{X_1^\bullet}) - 1 = \#v(\Gamma_{Z_1^\bullet}) = \#v(\Gamma_{X_2^\bullet}) - 1 = \#v(\Gamma_{Z_2^\bullet})$; (iii) $\#v(\Gamma_{X_1^\bullet}) = \#v(\Gamma_{Z_1^\bullet}) = \#v(\Gamma_{X_2^\bullet}) - 1 = \#v(\Gamma_{Z_2^\bullet})$; (iv) $\#v(\Gamma_{X_1^\bullet}) - 1 = \#v(\Gamma_{Z_1^\bullet}) = \#v(\Gamma_{X_2^\bullet}) = \#v(\Gamma_{Z_2^\bullet})$.

Suppose that either (i) or (ii) holds. Then X_1^\bullet and X_2^\bullet satisfy Condition C defined in Section 5. Thus, by Theorem 5.30 and Theorem 6.1, we obtain that X_1^\bullet is Frobenius equivalent to X_2^\bullet .

Suppose that (iii) holds. Let $v_2 \in v(\Gamma_{X_2^\bullet})$ such that $x_{e_{2,n}} \in X_{v_2}$. Since $\#v(\Gamma_{X_2^\bullet}) = \#v(\Gamma_{Z_2^\bullet}) + 1$, we have that $\#(X_{v_2} \cap D_{X_2}) = 2$. Note that $\{v_2\} = v(\Gamma_{X_2^\bullet}) \setminus v(\Gamma_{Z_2^\bullet})$.

Let $x_{e_{2,n-1}} \in X_{v_2} \cap D_{X_2}$ be the marked point distinct from $x_{e_{2,n}}$ and $e_{2,n-1} \in e^{\text{op}}(\Gamma_{X_2^\bullet})$ the open edge corresponding to the marked point $x_{e_{2,n-1}}$. On the other hand, let $w_1 \in v(\Gamma_{X_1^\bullet})$ such that $x_{e_{1,n}} \in X_{w_1}$. We put

$$w_2 \stackrel{\text{def}}{=} \overline{\phi}^{\text{sg,ver}}(w_1) \in v(\Gamma_{Z_2^\bullet}) \subseteq v(\Gamma_{X_2^\bullet}),$$

$$e_{1,n-1} \stackrel{\text{def}}{=} (\phi^{\text{sg,op}})^{-1}(e_{2,n-1}) \in e^{\text{op}}(\Gamma_{Z_1^\bullet}) \subseteq e^{\text{op}}(\Gamma_{X_1^\bullet}).$$

Since Z_1^\bullet is a pointed stable curve of type $(0, n-1)$, we have that

$$\#(X_{w_1} \cap D_{Z_1}) + \#(X_{w_1} \cap Z_1^{\text{sing}}) \geq 3.$$

Then we see that there exist marked points $x_{e_{1,n-2}}, x_{e_{1,n-3}} \in D_{Z_1} \setminus \{x_{e_{1,n-1}}\}$ distinct from each other such that the following conditions are satisfied:

- (1) if $\#(X_{w_1} \cap D_{Z_1}) \geq 3$, then $x_{e_{1,n-2}}, x_{e_{1,n-3}} \in X_{w_1}$;
- (2) if $\#(X_{w_1} \cap D_{Z_1}) = 2$ and $x_{e_{1,n-1}} \notin X_{w_1}$, then $x_{e_{1,n-2}}, x_{e_{1,n-3}} \in X_{w_1}$;
- (3) if $\#(X_{w_1} \cap D_{Z_1}) = 1$ and $x_{e_{1,n-1}} \notin X_{w_1}$, then we have that $x_{e_{1,n-3}} \in X_{w_1}$, and that the connected components of $Z_1 \setminus X_{w_1}$ (note that since $\#(X_{w_1} \cap D_{Z_1}) = 1$, the cardinality of the set of connected components of $Z_1 \setminus X_{w_1}$ is ≥ 2) containing $x_{e_{2,n-1}}$ and $x_{e_{n-2}}$ respectively are distinct from each other;
- (4) if $\#(X_{w_1} \cap D_{Z_1}) = 2$ and $x_{e_{1,n-1}} \in X_{w_1}$, then we have that $x_{e_{1,n-3}} \in X_{w_1}$, and that $x_{e_{1,n-2}}$ is contained in a connected component of $Z_1 \setminus X_{w_1}$;
- (5) if $\#(X_{w_1} \cap D_{Z_1}) = 1$ and $x_{e_{1,n-1}} \in X_{w_1}$, then we have that the connected components of $Z_1 \setminus X_{w_1}$ (note that since $\#(X_{w_1} \cap D_{Z_1}) = 1$, the cardinality of the set of connected components of $Z_1 \setminus X_{w_1}$ is ≥ 2) containing $x_{e_{1,n-2}}$ and $x_{e_{1,n-3}}$ respectively are distinct from each other;
- (6) if $\#(X_{w_1} \cap D_{Z_1}) = 0$, then we have that the connected components of $Z_1 \setminus X_{w_1}$ (note that since $\#(X_{w_1} \cap D_{Z_1}) = 0$, the cardinality of the set of connected components of $Z_1 \setminus X_{w_1}$ is ≥ 3) containing $x_{e_{1,n-1}}, x_{e_{1,n-2}}$, and $x_{e_{1,n-3}}$ respectively are distinct from each other.

Write $e_{1,n-2}$ and $e_{1,n-3} \in e^{\text{op}}(\Gamma_{Z_1^\bullet})$ for the open edges corresponding to the marked points $x_{e_{1,n-2}}$ and $x_{e_{1,n-3}}$, respectively. We put

$$e_{2,n-2} \stackrel{\text{def}}{=} \overline{\phi}^{\text{sg,op}}(e_{1,n-2}), \quad e_{2,n-3} \stackrel{\text{def}}{=} \overline{\phi}^{\text{sg,op}}(e_{1,n-3}).$$

Let Y_i^\bullet be the pointed stable curve of type $(0, 4)$ over k_i associated to the pointed semi-stable curve

$$(X_i, \{x_{e_{i,n}}, x_{e_{i,n-1}}, x_{e_{i,n-2}}, x_{e_{i,n-3}}\}).$$

By the construction of the set of marked points $\{x_{e_{i,n}}, x_{e_{i,n-1}}, x_{e_{i,n-2}}, x_{e_{i,n-3}}\}$, we see that Y_1^\bullet is smooth over k_1 whose underlying curve is X_{w_1} , and that Y_2^\bullet is singular whose irreducible components are X_{w_2} and X_{v_2} .

Next, we will see that the solvable admissible fundamental groups and the natural homomorphisms of the the solvable admissible fundamental groups of pointed stable curves constructing above can be reconstructed group-theoretically from ϕ . Let $I_i \subseteq \Pi_{X_i^\bullet}$ be the closed subgroups generated by the subgroups

$$\bigcup_{e_i \in e^{\text{op}}(\Gamma_{X_i^\bullet}) \setminus \{e_{i,n}, e_{i,n-1}, e_{i,n-2}, e_{i,n-3}\}} \text{Edg}_{e_i}^{\text{op}}(\Pi_{X_i^\bullet}).$$

We see that

$$\Pi_{Y_i^\bullet} \stackrel{\text{def}}{=} \Pi_{X_i^\bullet}/I_i$$

is (outer) isomorphic to the solvable admissible fundamental group of Y_i^\bullet . Moreover, Theorem 4.11 implies that $\phi(I_1) = I_2$. Then we obtain a surjective open continuous homomorphism

$$\overline{\phi} : \Pi_{Y_1^\bullet} \twoheadrightarrow \Pi_{Y_2^\bullet}.$$

This contradicts Proposition 6.5, since Proposition 6.5 implies that Y_2^\bullet is smooth over k_2 . Then (iii) does not occur.

Suppose that (iv) holds. Similar arguments to the arguments given in the proof of (iii) imply that (iv) does not occur. More precisely, we have the following.

Let $v_1 \in v(\Gamma_{X_1^\bullet})$ such that $x_{e_{1,n}} \in X_{v_1}$. Since $\#v(\Gamma_{X_1^\bullet}) = \#v(\Gamma_{Z_1^\bullet}) + 1$, we have that $\#(X_{v_1} \cap D_{X_1}) = 2$. Note that $\{v_1\} = v(\Gamma_{X_1^\bullet}) \setminus v(\Gamma_{Z_1^\bullet})$.

Let $x_{e_{1,n-1}} \in X_{v_1} \cap D_{X_1}$ be the marked point distinct from $x_{e_{1,n}}$ and $e_{1,n-1} \in e^{\text{op}}(\Gamma_{X_1^\bullet})$ the open edge corresponding to the marked point $x_{e_{1,n-1}}$. On the other hand, let $w_2 \in v(\Gamma_{X_2^\bullet})$ such that $x_{e_{2,n}} \in X_{w_2}$. We put

$$w_1 \stackrel{\text{def}}{=} (\overline{\phi}^{\text{sg,ver}})^{-1}(w_2) \in v(\Gamma_{Z_1^\bullet}) \subseteq v(\Gamma_{X_1^\bullet}),$$

$$e_{2,n-1} \stackrel{\text{def}}{=} \phi^{\text{sg,op}}(e_{1,n-1}) \in e^{\text{op}}(\Gamma_{Z_2^\bullet}) \subseteq e^{\text{op}}(\Gamma_{X_2^\bullet}).$$

Since Z_2^\bullet is a pointed stable curve of type $(0, n-1)$, we have that

$$\#(X_{w_2} \cap D_{Z_2}) + \#(X_{w_2} \cap Z_2^{\text{sing}}) \geq 3.$$

Then we see that there exist marked points $x_{e_{2,n-2}}, x_{e_{2,n-3}} \in D_{Z_2} \setminus \{x_{e_{2,n-1}}\}$ distinct from each other such that the following conditions are satisfied:

- (1) if $\#(X_{w_2} \cap D_{Z_2}) \geq 3$, then $x_{e_{2,n-2}}, x_{e_{2,n-3}} \in X_{w_2}$;
- (2) if $\#(X_{w_2} \cap D_{Z_2}) = 2$ and $x_{e_{2,n-1}} \notin X_{w_2}$, then $x_{e_{2,n-2}}, x_{e_{2,n-3}} \in X_{w_2}$;
- (3) if $\#(X_{w_2} \cap D_{Z_2}) = 1$ and $x_{e_{2,n-1}} \notin X_{w_2}$, then we have that $x_{e_{2,n-3}} \in X_{w_2}$, and that the connected components of $Z_2 \setminus X_{w_2}$ (note that since $\#(X_{w_2} \cap D_{Z_2}) = 1$, the cardinality of the set of connected components of $Z_2 \setminus X_{w_2}$ is ≥ 2) containing $x_{e_{2,n-1}}$ and $x_{e_{n-2}}$ respectively are distinct from each other;
- (4) if $\#(X_{w_2} \cap D_{Z_2}) = 2$ and $x_{e_{2,n-1}} \in X_{w_2}$, then we have that $x_{e_{2,n-3}} \in X_{w_2}$, and that $x_{e_{2,n-2}}$ is contained in a connected component of $Z_2 \setminus X_{w_2}$;
- (5) if $\#(X_{w_2} \cap D_{Z_2}) = 1$ and $x_{e_{2,n-1}} \in X_{w_2}$, then we have that the connected components of $Z_2 \setminus X_{w_2}$ (note that since $\#(X_{w_2} \cap D_{Z_2}) = 1$, the cardinality of the set of connected components of $Z_2 \setminus X_{w_2}$ is ≥ 2) containing $x_{e_{2,n-2}}$ and $x_{e_{n-3}}$ respectively are distinct from each other;
- (6) if $\#(X_{w_2} \cap D_{Z_2}) = 0$, then we have that the connected components of $Z_2 \setminus X_{w_2}$ (note that since $\#(X_{w_2} \cap D_{Z_2}) = 0$, the cardinality of the set of connected components of $Z_2 \setminus X_{w_2}$ is ≥ 3) containing $x_{e_{2,n-1}}, x_{e_{n-2}}$, and $x_{e_{2,n-3}}$ respectively are distinct from each other.

Write $e_{2,n-2}$ and $e_{2,n-3} \in e^{\text{op}}(\Gamma_{Z_2^\bullet})$ for the open edges corresponding to the marked points $x_{e_{2,n-2}}$ and $x_{e_{2,n-3}}$, respectively. We put

$$e_{1,n-2} \stackrel{\text{def}}{=} (\overline{\phi}^{\text{sg,op}})^{-1}(e_{2,n-2}), \quad e_{1,n-3} \stackrel{\text{def}}{=} (\overline{\phi}^{\text{sg,op}})^{-1}(e_{2,n-3}).$$

Let Y_i^\bullet be the pointed stable curve of type $(0, 4)$ over k_i associated to the pointed semi-stable curve

$$(X_i, \{x_{e_{i,n}}, x_{e_{i,n-1}}, x_{e_{i,n-2}}, x_{e_{i,n-3}}\}).$$

By the construction of the set of marked points $\{x_{e_{i,n}}, x_{e_{i,n-1}}, x_{e_{i,n-2}}, x_{e_{i,n-3}}\}$, we see that Y_1^\bullet is singular whose irreducible component are X_{w_1} and X_{v_1} , and that Y_2^\bullet is smooth over k_2 whose underlying curve is X_{w_2} .

Let $I_i \subseteq \Pi_{X_i^\bullet}$ be the closed subgroups generated by the subgroups

$$\bigcup_{e_i \in e^{\text{op}}(\Gamma_{X_i^\bullet}) \setminus \{e_{i,n}, e_{i,n-1}, e_{i,n-2}, e_{i,n-3}\}} \text{Edg}_{e_i}^{\text{op}}(\Pi_{X_i^\bullet}).$$

We see that

$$\Pi_{Y_i^\bullet} \stackrel{\text{def}}{=} \Pi_{X_i^\bullet} / I_i$$

is (outer) isomorphic to the solvable admissible fundamental group of Y_i^\bullet . Moreover, Theorem 4.11 implies that $\phi(I_1) = I_2$. Then we obtain a surjective open continuous homomorphism

$$\overline{\phi} : \Pi_{Y_1^\bullet} \twoheadrightarrow \Pi_{Y_2^\bullet}.$$

This contradicts Lemma 6.2, since Lemma 6.2 implies that Y_2^\bullet is singular. Then (iv) does not occur. This completes the proof of the theorem. \square

Theorem 6.6 implies the following result concerning the Homeomorphism Conjecture which is the main theorem of the present paper.

Theorem 6.7. *We maintain the notation introduced in Section 3. Let $[q] \in \overline{\mathfrak{M}}_{0,n}^{\text{cl}}$ be an arbitrary closed point. Then $\pi_{0,n}^{\text{adm}}([q])$ and $\pi_{0,n}^{\text{sol}}([q])$ are closed points of $\overline{\Pi}_{0,n}$ and $\overline{\Pi}_{0,n}^{\text{sol}}$, respectively. In particular, the Homeomorphism Conjecture and the Solvable Homeomorphism Conjecture hold when $(g, n) = (0, 4)$.*

Proof. To verify the theorem, we only need to treat the case of solvable admissible fundamental groups.

Let $V(\pi_{0,n}^{\text{sol}}([q]))$ be the topological closure of $\pi_{0,n}^{\text{sol}}([q])$ in $\overline{\Pi}_{0,n}^{\text{sol}}$ and $[\pi_1^{\text{sol}}(q')] \in V(\pi_{0,n}^{\text{sol}}([q]))$ an arbitrary point. Then by Proposition 3.6 (a), we obtain that there exists a surjective open continuous homomorphism

$$\phi : \pi_1^{\text{sol}}(q) \twoheadrightarrow \pi_1^{\text{sol}}(q').$$

Theorem 6.6 implies that $q \sim_{f_e} q'$. Thus, we obtain that $[\pi_1^{\text{sol}}(q)] = [\pi_1^{\text{sol}}(q')]$. This means that $V(\pi_{0,n}^{\text{sol}}([q])) = [\pi_1^{\text{sol}}(q)]$ is a closed point of $\overline{\Pi}_{0,n}^{\text{sol}}$. Moreover, the “in particular” part of the theorem follows from Theorem 3.4 (b). This completes the proof of the theorem. \square

Remark 6.7.1. In [41], the author proved a similar result of Theorem 6.7 when $(g, n) = (1, 1)$ and $p > 2$.

7 Continuity of $\pi_{g,n}^{\text{adm}}$

In this section, we prove Theorem 3.5.

7.1 Moduli spaces of curves with level structures

We fix some notation. Let p be a prime number, k an algebraic closure of the finite field \mathbb{F}_p , and B, B' schemes over k . Let $X_B^\bullet = (X_B, D_{X_B})$ be a pointed stable curve of type (g, n) over B and $B' \rightarrow B$ a k -morphism. We shall write $X_{B'}^\bullet$ for $X_B^\bullet \times_B B'$ the pointed stable curve over B' . Let $f_B^\bullet : Y_B^\bullet \rightarrow X_B^\bullet$ be a finite flat morphism of pointed stable curves over B , $b \in B$, and $\bar{b} \rightarrow B$ a geometric point over b . We shall say f_B^\bullet an admissible covering (resp. a Galois admissible covering) over B if $f_B^\bullet \stackrel{\text{def}}{=} f_{\bar{b}}^\bullet \times_B \bar{b} : Y_{\bar{b}}^\bullet \rightarrow X_{\bar{b}}^\bullet$ is an admissible covering (resp. a Galois admissible covering) over \bar{b} for all $b \in B$.

Let $\overline{\mathcal{M}}_{g,n,\mathbb{Z}}$ be the moduli stack over $\text{Spec } \mathbb{Z}$ parameterizing pointed stable curves of type (g, n) and $\mathcal{M}_{g,n,\mathbb{Z}}$ the open substack of $\overline{\mathcal{M}}_{g,n,\mathbb{Z}}$ parameterizing smooth pointed stable curves. Let $\overline{\mathcal{M}}_{g,n} \stackrel{\text{def}}{=} \overline{\mathcal{M}}_{g,n,\mathbb{Z}} \times_{\mathbb{Z}} k$, $\mathcal{M}_{g,n} \stackrel{\text{def}}{=} \mathcal{M}_{g,n,\mathbb{Z}} \times_{\mathbb{Z}} k$, $\overline{M}_{g,n}$ the coarse moduli space of $\overline{\mathcal{M}}_{g,n}$, and $M_{g,n}$ the coarse moduli space of $\mathcal{M}_{g,n}$. We denote by $\overline{\omega}_{g,n} : \overline{\mathcal{M}}_{g,n} \rightarrow \overline{M}_{g,n}$ and $\omega_{g,n} : \mathcal{M}_{g,n} \rightarrow M_{g,n}$ the natural morphisms, respectively.

When $g = 0$, then $\mathcal{M}_{0,n}$ is a scheme over k . Thus, we have $\mathcal{M}_{0,n} = M_{0,n}$. Note that $M_{0,n}$ is a quasi-projective variety over k . In general, the coarse moduli space $M_{g,n}$ is not a fine moduli space. In order to build a family of curves over schemes, we use the level structures. Let $m \geq 3$ be an integer number prime to p .

Suppose that $g = 1$. We denote by $M_{1,1}^{(m)}$ the moduli stack over k classifying smooth pointed stable curves of type $(1, 1)$ with level m -structure (i.e., the moduli stack of elliptic curves in characteristic p with level m -structure). Then we have a natural morphism $\omega_{1,1}^{(m)} : M_{1,1}^{(m)} \rightarrow \mathcal{M}_{1,1} \rightarrow M_{1,1}$. Moreover, we put

$$M_{1,n}^{(m)} \stackrel{\text{def}}{=} M_{1,1}^{(m)} \times_{M_{1,1}} M_{1,n},$$

where $M_{1,n} \rightarrow M_{1,1}$ is the natural morphism induced by the forgetting morphism $\mathcal{M}_{1,n} \rightarrow \mathcal{M}_{1,1}$ determined by forgetting the last $n - 1$ marked points. Then we obtain a morphism

$$\omega_{1,n}^{(m)} : M_{1,n}^{(m)} \rightarrow M_{1,n}$$

determined by the second projection. Note that $M_{1,n}^{(m)}$ is a quasi-projective variety over k , and that $M_{1,n}^{(m)}(B)$ is the set of B -isomorphism classes of smooth pointed stable curves of type $(1, n)$ over B such that, by forgetting the last $n - 1$ marked points, the smooth pointed stable curves of type $(1, 1)$ are elliptic curves over B with level m -structure.

Suppose that $g \geq 2$. Let $M_{g,0}^{(m)}$ be the moduli stack over k classifying smooth pointed stable curves of type $(g, 0)$ with level m -structure. Then we obtain a natural morphism $\omega_{g,0}^{(m)} : M_{g,0}^{(m)} \rightarrow \mathcal{M}_{g,0} \rightarrow M_{g,0}$. Moreover, we put

$$M_{g,n}^{(m)} \stackrel{\text{def}}{=} M_{g,0}^{(m)} \times_{M_{g,0}} M_{g,n},$$

where $M_{g,n} \rightarrow M_{g,0}$ is the natural morphism induced by the forgetting morphism $\mathcal{M}_{g,n} \rightarrow \mathcal{M}_{g,0}$ determined by forgetting marked points. Then we obtain a morphism

$$\omega_{g,n}^{(m)} : M_{g,n}^{(m)} \rightarrow M_{g,n}$$

determined by the second projection. Note that $M_{g,n}^{(m)}$ is a quasi-projective variety over k , and that $M_{g,n}^{(m)}(B)$ is the set of B -isomorphism classes of smooth pointed stable curves of type (g, n) over B whose underlying curves are smooth projective curves of genus g over B with level m -structure.

For simplicity, we shall write $H_{g,n}$ for $M_{g,n}^{(m)}$ when $g \geq 1$, $H_{0,n}$ for $M_{0,n}$ when $g = 0$, $\omega_{g,n}^{(m)}$ for the natural morphism $H_{g,n} \stackrel{\text{def}}{=} M_{g,n}^{(m)} \rightarrow M_{g,n}$ (note that $\omega_{0,n}^{(m)} = \text{id}_{M_{0,n}} : M_{0,n} \rightarrow M_{0,n}$ when $g = 0$). Moreover, we denote by

$$X_{H_{g,n}}^\bullet = (X_{H_{g,n}}, D_{X_{H_{g,n}}})$$

the universal smooth pointed stable curve of type (g, n) over $H_{g,n}$ with a level m -structure $\tau_{H_{g,n}} \stackrel{\text{def}}{=} \tau_{H_{g,0}} \times_{H_{g,0}} H_{g,n}$ induced by the universal level m -structure

$$\tau_{H_{g,0}} : \text{Pic}_{X_{H_{g,0}}/H_{g,0}}^0[m] \xrightarrow{\sim} (\mathbb{Z}/m\mathbb{Z})_{H_{g,0}}^{2g}$$

when $g \geq 2$, by the universal level m -structure

$$\tau_{H_{1,1}} : \text{Pic}_{X_{H_{1,1}}/H_{1,1}}^0[m] \xrightarrow{\sim} (\mathbb{Z}/m\mathbb{Z})_{H_{1,1}}^2$$

when $g = 1$, and by the trivial level m -structure when $g = 0$.

7.2 The sets of finite quotients of admissible fundamental groups

We maintain the notation introduced in Section 3 and Section 7.1. Let $q \in \overline{M}_{g,n}$ be an arbitrary point, $\pi_1^{\text{adm}}(q)$ the admissible fundamental group of the pointed stable curve X_q^\bullet over an algebraic closure of the residue field $k(q)$ of q , Γ_q the dual semi-graph of X_q^\bullet , and $\pi_A^{\text{adm}}(q)$ the set of finite quotients of $\pi_1^{\text{adm}}(q)$. Since $\pi_1^{\text{adm}}(q)$ is topologically finitely generated, the isomorphism class of $\pi_1^{\text{adm}}(q)$ is determined completely by $\pi_A^{\text{adm}}(q)$ (cf. [2, Proposition 16.10.6]). First, we have the following lemmas.

Lemma 7.1. *Let $q_1, q_2 \in \overline{M}_{g,n}$ be arbitrary points such that $q_2 \in \overline{\{q_1\}}$, where $\overline{\{(-)\}}$ denotes the topological closure of $(-)$ in $\overline{M}_{g,n}$. Then we have that*

$$\pi_A^{\text{adm}}(q_2) \subseteq \pi_A^{\text{adm}}(q_1).$$

Proof. The lemma follows immediately from the specialization theorem of admissible fundamental groups of pointed stable curves (e.g. [33, Théorème 2.2]). \square

Lemma 7.2. *Let S be a smooth variety over k , η_S the generic point of S , and X_S^\bullet a smooth pointed stable curve over S . Let $Y_{\eta_S}^\bullet$ be a smooth pointed stable curve over η_S and*

$$f_{\eta_S}^\bullet : Y_{\eta_S}^\bullet \rightarrow X_{\eta_S}^\bullet$$

a Galois admissible covering over η_S . Then there exist an open subset $U \subseteq S$ and a Galois admissible covering

$$f_U^\bullet : Y_U^\bullet \rightarrow X_U^\bullet$$

of smooth pointed stable curves over U such that $f_U^\bullet \times_U \eta_S = f_{\eta_S}^\bullet$.

Proof. Write Y_S for the normalization of X_S in the function field of Y_{η_S} and D_{Y_S} for the set of the topological closures of points of $D_{Y_{\eta_S}}$ in Y_S . [5, Proposition 5] implies that, by replacing S by an open subset of S , we may assume that the fiber $Y_s \stackrel{\text{def}}{=} Y_S \times_S s$ is geometrically irreducible over every *closed* point $s \in S$.

The normalization $f_S : Y_S \rightarrow X_S$ induces a morphism

$$g_S \stackrel{\text{def}}{=} f_S|_{Y_S \setminus D_{Y_S}} : Y_S \setminus D_{Y_S} \rightarrow X_S \setminus D_{X_S}$$

over S . Since the restriction of g_S on the generic fiber η_S is a Galois étale covering over η_S , there exists an open subset $U \subseteq S$ such that $g_U \stackrel{\text{def}}{=} g_S|_U$ is a Galois étale covering over U . Thus, by replacing S by U , we may assume that g_S is a Galois étale covering. Since the fiber $Y_s \stackrel{\text{def}}{=} Y_S \times_S s$ is generically smooth over each $s \in S$, Y_s is geometrically irreducible over each point $s \in S$.

The normalization $f_S : Y_S \rightarrow X_S$ induces a morphism

$$g_S \stackrel{\text{def}}{=} f_S|_{Y_S \setminus D_{Y_S}} : Y_S \setminus D_{Y_S} \rightarrow X_S \setminus D_{X_S}$$

over S . Since the restriction of g_S on the generic fiber η_S is étale, there exists an open subset $U \subseteq S$ such that

$$g_u : Y_S \setminus D_{Y_S} \times_S u \rightarrow X_S \setminus D_{X_S} \times_S u$$

is étale for each $u \in U$. Thus, by replacing S by the open subset U , we may assume that g_S is étale. Since the fiber $Y_s \stackrel{\text{def}}{=} Y_S \times_S s$ is generically smooth over each point $s \in S$, Y_s is geometrically irreducible over each point $s \in S$.

Let X_S^{\log} be the log scheme over S whose underlying scheme is X_S , and whose log structure is determined by the marked points D_{X_S} . Since S is smooth over k , we see that X_S^{\log} is log regular. Note that f_S is tamely ramified over the generic point of every marked point of D_{X_S} . Then the log purity (cf. [9, Theorem B]) implies that g_S extends uniquely to a Galois log étale morphism $f_S^{\log} : Y_S^{\log} \rightarrow X_S^{\log}$ over S . Let $Y_S^{\bullet} \stackrel{\text{def}}{=} (Y_S, D_S)$. Then Y_S^{\bullet} is a smooth pointed stable curve over S . Thus, f_S^{\log} induces a morphism $f_S^{\bullet} : Y_S^{\bullet} \rightarrow X_S^{\bullet}$ such that the restriction of f_S^{\bullet} on η_S is equal to $f_{\eta_S}^{\bullet}$, and that $f_s : Y_s^{\bullet} \rightarrow X_s^{\bullet}$ induced by f_S^{\bullet} is a Galois admissible covering over every point $s \in S$. \square

Lemma 7.3. *Let $q \in M_{g,n}$ be an arbitrary point, V_q^{sm} the topological closure of q in $M_{g,n}$, and $C \subseteq V_q^{\text{sm,cl}}$ a subset of closed points of V_q^{sm} . Suppose that C is dense in V_q^{sm} . Then we have that*

$$\pi_A^{\text{adm}}(q) = \bigcup_{c \in C} \pi_A^{\text{adm}}(c).$$

Proof. If q is a closed point, then the lemma is trivial. We may assume that q is not a closed point. Lemma 7.1 implies that, to verify the lemma, it is sufficient to prove that, for any $G \in \pi_A^{\text{adm}}(q)$, there exists a closed point $c \in C$ such that $G \in \pi_A^{\text{adm}}(c)$.

Let $q^{(m)} \in (\omega_{g,n}^{(m)})^{-1}(q)$ be a point of $H_{g,n}$, $V_{q^{(m)}}$ the topological closure of $q^{(m)}$ in $H_{g,n}$, and $k(q^{(m)})$ the residue field of $q^{(m)}$ which is the function field of $V_{q^{(m)}}$. Write M' for the normalization of $V_{q^{(m)}}$ in $k(q^{(m)})$. Then there exists an open subset of $M \subseteq M'$

such that M is smooth over k . Moreover, the composition of the natural morphisms $M \hookrightarrow M' \rightarrow V_{q^{(m)}} \hookrightarrow H_{g,n}$ determines a smooth pointed stable curve $X_M^\bullet \stackrel{\text{def}}{=} X_{H_{g,n}}^\bullet \times_{H_{g,n}} M$ over M .

Let k_q be an algebraic closure of $k(q^{(m)})$. By the construction, k_q is also an algebraic closure of the residue field $k(q)$ of q . Let $Y_{k_q}^\bullet \rightarrow X_{k_q}^\bullet$ be a Galois admissible covering over k_q with Galois group G . By replacing $k(q^{(m)})$ by a finite extension l of $k(q^{(m)})$, the Galois admissible covering can be descended to a Galois admissible covering $Y_l^\bullet \rightarrow X_l^\bullet$ over l with Galois group G . Write N for the normalization of M in l , X_N^\bullet for $X_M^\bullet \times_M N$, and Y_N^\bullet for the normalization of X_N^\bullet in the function field of Y_l^\bullet . Then we obtain a covering

$$Y_N^\bullet \rightarrow X_N^\bullet$$

over N such that the base change via the natural morphism $\text{Spec } l \rightarrow N$ is the Galois admissible covering $Y_l^\bullet \rightarrow X_l^\bullet$ over l with Galois group G . Since N is generically smooth over k , by replacing N by an open subset of N , we may assume that N is smooth over k . Thus, Lemma 7.2 implies that there exists an open subset $U \subseteq N$ such that the morphism

$$Y_U^\bullet \stackrel{\text{def}}{=} Y_N^\bullet \times_N U \rightarrow X_U^\bullet \stackrel{\text{def}}{=} X_N^\bullet \times_N U$$

is a Galois admissible covering over U with Galois group G .

We denote by

$$W \subseteq V_q^{\text{sm}}$$

the image of U of the composition of the natural morphisms $U \hookrightarrow N \rightarrow M \hookrightarrow M' \rightarrow V_{q^{(m)}} \hookrightarrow H_{g,n} \rightarrow M_{g,n}$, which is a dense constructible subset of V_q^{sm} . Then W contains an open subset W' of V_q^{sm} . Since C is dense in V_q^{sm} , we obtain that $W \cap C \neq \emptyset$. This means that, there exists a closed point $c \in C$ such that $G \in \pi_A^{\text{adm}}(c)$. We complete the proof of the lemma. \square

We maintain the notation introduced in the proof of Lemma 7.3. We shall denote by

$$U_q \subseteq U$$

the inverse image of W' of the composition of the natural morphisms $U \hookrightarrow N \rightarrow M \hookrightarrow M' \rightarrow V_{q^{(m)}} \hookrightarrow H_{g,n} \rightarrow M_{g,n}$, which is an open subset of U . Then the proof of Lemma 7.3 implies the following corollary.

Corollary 7.4. *We maintain the notation introduced in the proof of Lemma 7.3. Let $q \in M_{g,n}$ be an arbitrary point, k_q an algebraic closure of the residue field $k(q)$, V_q^{sm} the topological closure of q in $M_{g,n}$, and $f_{k_q}^\bullet : Y_{k_q}^\bullet \rightarrow X_{k_q}^\bullet$ a Galois admissible covering over k_q with Galois group G . Then there exist a smooth k -variety U_q and a quasi-finite morphism $U_q \rightarrow H_{g,n}$ (not necessary a surjection) such that the following conditions are satisfied:*

- (i) *the image of U_q of the composition of the natural morphisms $U_q \rightarrow H_{g,n} \xrightarrow{\omega_{g,n}^{(m)}} M_{g,n}$ is an open subset of V_q^{sm} ;*
- (ii) *the morphism $U_q \rightarrow H_{g,n}$ induces a smooth pointed stable curve*

$$X_{U_q}^\bullet \stackrel{\text{def}}{=} X_{H_{g,n}}^\bullet \times_{H_{g,n}} U_q$$

over U_q with a level m -structure $\tau_{U_q} \stackrel{\text{def}}{=} \tau_{H_{g,n}} \times_{H_{g,n}} U_q$;

(iii) there exists a Galois admissible covering $f_{U_q}^\bullet : Y_{U_q}^\bullet \rightarrow X_{U_q}^\bullet$ of smooth pointed stable curves over U_q with Galois group G such that $f_{U_q}^\bullet \times_{U_q} \text{Spec } k_q = f_{k_q}^\bullet$.

In the remainder of this subsection, we will generalize Lemma 7.3 to the case where $q \in \overline{M}_{g,n}$.

Lemma 7.5. *Let S be a k -variety and $s_1, s_2 \in S$ two points of S such that $s_1 \neq s_2$ and $s_2 \in \overline{\{s_1\}}$. Then there exist a complete discrete valuation ring R and a morphism $\text{Spec } R \rightarrow S$ such that the image of the morphism is $\{s_1, s_2\}$.*

Proof. The lemma follows immediately from elementary algebraic geometry. \square

Lemma 7.6. *Let R be a complete discrete valuation ring, K_R the quotient field of R , and k_R the residue field of R such that k_R is an algebraically closed field containing k . Let*

$$f_{K_R}^\bullet : Y_{K_R}^\bullet \rightarrow X_{K_R}^\bullet$$

be a Galois admissible covering over K_R with Galois group G . Write $\Gamma_{X_{K_R}^\bullet}$ for the dual semi-graph of $X_{K_R}^\bullet$ and $\Gamma_{Y_{K_R}^\bullet}$ for the dual semi-graph of $Y_{K_R}^\bullet$. Suppose that $\tilde{X}_{K_R, v_X}^\bullet$, $v_X \in v(\Gamma_{X_{K_R}^\bullet})$, and $\tilde{Y}_{K_R, v_Y}^\bullet$, $v_Y \in v(\Gamma_{Y_{K_R}^\bullet})$, have good reduction over R , where $\tilde{X}_{K_R, v_X}^\bullet$ and $\tilde{Y}_{K_R, v_Y}^\bullet$ denote the smooth pointed stable curves of types (g_{v_X}, n_{v_X}) and (g_{v_Y}, n_{v_Y}) associated to v_X and v_Y , respectively. Then there exists a Galois admissible covering

$$f_R^\bullet : Y_R^\bullet \rightarrow X_R^\bullet$$

over R with Galois group G such that $f_{K_R}^\bullet = f_R^\bullet \times_R K_R$.

Proof. The smooth pointed stable curve $\tilde{Y}_{K_R, v_Y}^\bullet$ over K_R determines a morphism

$$c_{v_Y} : \text{Spec } K_R \rightarrow \mathcal{M}_{g_{v_Y}, n_{v_Y}}.$$

Write $c_{Y_{K_R}^\bullet} : \text{Spec } K_R \rightarrow \overline{\mathcal{M}}_{g_Y, n_Y}$ for the morphism determined by $Y_{K_R}^\bullet$ over K_R , where (g_Y, n_Y) denotes the type of $Y_{K_R}^\bullet$. Then the pointed stable curve $Y_{K_R}^\bullet$ determines a clutching morphism

$$\kappa_{Y_{K_R}^\bullet} : \bigtimes_{v_Y \in v(\Gamma_{Y_{K_R}^\bullet})} \mathcal{M}_{g_{v_Y}, n_{v_Y}} \rightarrow \overline{\mathcal{M}}_{g_Y, n_Y}$$

such that

$$\kappa_{Y_{K_R}^\bullet} \circ \left(\bigtimes_{v_Y \in v(\Gamma_{Y_{K_R}^\bullet})} c_{v_Y} \right) = c_{Y_{K_R}^\bullet}.$$

We denote by Y_{R, v_Y}^\bullet the pointed stable model of Y_{K_R, v_Y}^\bullet over R which is a smooth pointed stable curve of type (g_{v_Y}, n_{v_Y}) over R . By applying the clutching morphism $\kappa_{Y_{K_R}^\bullet}$, we may glue the pointed stable curves $\{Y_{R, v_Y}^\bullet\}_{v_Y \in v(\Gamma_{Y_{K_R}^\bullet})}$ in a way that is compatible with the gluing of $\{Y_{K_R, v_Y}^\bullet\}_{v_Y \in v(\Gamma_{Y_{K_R}^\bullet})}$ that gives rise to $Y_{K_R}^\bullet$. Then we obtain a pointed stable curve Y_R^\bullet over R .

Since $Y_{K_R}^\bullet$ admits an action of G , we obtain an action of G on the pointed stable model Y_R^\bullet . Let $Z_R^\bullet \stackrel{\text{def}}{=} Y_R^\bullet/G$, $f_R^\bullet : Y_R^\bullet \rightarrow Z_R^\bullet$ the quotient morphism, $Z_{K_R}^\bullet$ the generic fiber over K_R , and $Z_{k_R}^\bullet$ the special fiber over k_R . [18, Appendice, Corollaire] (or [8, Proposition 10.3.48]) implies that Z_R^\bullet is a pointed semi-stable curve over R . Moreover, since $f_{K_R}^\bullet$ is a Galois admissible covering over K_R with Galois group G , $Z_{K_R}^\bullet$ is isomorphic to $X_{K_R}^\bullet$ over K_R .

On the other hand, write $f_{K_R}^{\text{sg}} : \Gamma_{Y_{K_R}^\bullet} \rightarrow \Gamma_{X_{K_R}^\bullet}$ for the map of dual semi-graphs induced by $f_{K_R}^\bullet$. Note that, for every $v_X \in v(\Gamma_{X_{K_R}^\bullet})$ and every $v_Y \in (f_{K_R}^{\text{sg}})^{-1}(v_X)$, $f_{K_R}^\bullet$ can be extended to a Galois admissible covering $f_{R,v_Y,v_X}^\bullet : Y_{R,v_Y}^\bullet \rightarrow X_{R,v_X}^\bullet$ of smooth pointed stable curves over R with Galois group G . Then we obtain

$$Y_{R,v_Y}^\bullet/G \cong X_{R,v_X}^\bullet$$

over R . This implies that $Z_{k_R}^\bullet$ is a pointed stable curve over k_R . Then we have $X_R^\bullet \cong Z_R^\bullet$ over R . We complete the proof of the lemma. \square

Proposition 7.7. *Let $q \in \overline{M}_{g,n}$ be an arbitrary point, V_q the topological closure of q in $\overline{M}_{g,n}$, and $G \in \pi_A^{\text{adm}}(q)$ a finite group. Then there exists a closed point $c \in V_q^{\text{cl}}$ such that Γ_q is isomorphic to Γ_c as dual semi-graphs, and that $G \in \pi_A^{\text{adm}}(c)$.*

Proof. If q is a closed point, then the proposition is trivial. To verify the proposition, we may assume that q is not a closed point. If $q \in M_{g,n}$, then the proposition follows from Lemma 7.3. Then we may assume that $q \in \overline{M}_{g,n} \setminus M_{g,n}$.

Let k_q be an algebraic closure of the residue field $k(q)$ of q . The natural morphism $\text{Spec } k_q \rightarrow \text{Spec } k(q) \rightarrow \overline{M}_{g,n}$ determines a pointed stable curve $X_{k_q}^\bullet$ over k_q . Let $\tilde{X}_{k_q,v_X}^\bullet$, $v_X \in v(\Gamma_q)$, be the smooth pointed stable curve of type (g_{v_X}, n_{v_X}) associated to v_X .

Let $Y_{k_q}^\bullet$ be a pointed stable curve of type (g_Y, n_Y) over k_q , $f_{k_q}^\bullet : Y_{k_q}^\bullet \rightarrow X_{k_q}^\bullet$ a Galois admissible covering over k_q with Galois group G , $\Gamma_{Y_{k_q}^\bullet}$ the dual semi-graph of $Y_{k_q}^\bullet$, and $f_{k_q}^{\text{sg}} : \Gamma_{Y_{k_q}^\bullet} \rightarrow \Gamma_q$ the map of dual semi-graphs induced by $f_{k_q}^\bullet$. For each $v_X \in v(\Gamma_q)$, write $\tilde{Y}_{k_q,v_Y}^\bullet$, $v_Y \in (f_{k_q}^{\text{sg}})^{-1}(v_X)$, for the smooth pointed stable curve of type (g_{v_Y}, n_{v_Y}) associated to v_Y . Then $f_{k_q}^\bullet$ induces a Galois multi-admissible covering

$$f_{k_q,v_X}^\bullet : \bigsqcup_{v_Y \in (f_{k_q}^{\text{sg}})^{-1}(v_X)} \tilde{Y}_{k_q,v_Y}^\bullet \rightarrow \tilde{X}_{k_q,v_X}^\bullet$$

over k_q with Galois group G . Note that $\bigsqcup_{v_Y \in (f_{k_q}^{\text{sg}})^{-1}(v_X)} \tilde{Y}_{k_q,v_Y}^\bullet$ admits an action of G induced by the action of G on $Y_{k_q}^\bullet$. This action induces an action of G on the set $(f_{k_q}^{\text{sg}})^{-1}(v_X)$. For each $v_Y \in (f_{k_q}^{\text{sg}})^{-1}(v_X)$, write G_{v_Y} for the inertia subgroup of v_Y . Then we obtain a Galois admissible covering

$$f_{k_q,v_Y,v_X}^\bullet : \tilde{Y}_{k_q,v_Y}^\bullet \rightarrow \tilde{X}_{k_q,v_X}^\bullet, \quad v_Y \in (f_{k_q}^{\text{sg}})^{-1}(v_X),$$

over k_q with Galois group G_{v_Y} .

The pointed stable curves $X_{k_q}^\bullet$, $\{\tilde{X}_{k_q,v_X}^\bullet\}_{v_X \in v(\Gamma_q)}$, $Y_{k_q}^\bullet$, and $\{\tilde{Y}_{k_q,v_Y}^\bullet\}_{v_Y \in v(\Gamma_{Y_{k_q}^\bullet})}$ over k_q determine morphisms $c_{X_{k_q}} : \text{Spec } k_q \rightarrow \overline{M}_{g,n}$, $\{c_{v_X} : \text{Spec } k_q \rightarrow \mathcal{M}_{g_{v_X}, n_{v_X}}\}_{v_X \in v(\Gamma_q)}$, $c_{Y_{k_q}} :$

$\text{Spec } k_q \rightarrow \overline{\mathcal{M}}_{g_Y, n_Y}$, and $\{c_{v_Y} : \text{Spec } k_q \rightarrow \mathcal{M}_{g_{v_Y}, n_{v_Y}}\}_{v_Y \in v(\Gamma_{Y_{k_q}^\bullet})}$, respectively. Then the pointed stable curves $X_{k_q}^\bullet$ and $Y_{k_q}^\bullet$ over k_q induce clutching morphisms

$$\begin{aligned} \kappa_{X_{k_q}} &: \bigtimes_{v_X \in v(\Gamma_q)} \mathcal{M}_{g_{v_X}, n_{v_X}} \rightarrow \overline{\mathcal{M}}_{g, n}, \\ \kappa_{Y_{k_q}} &: \bigtimes_{v_Y \in v(\Gamma_{Y_{k_q}^\bullet})} \mathcal{M}_{g_{v_Y}, n_{v_Y}} \rightarrow \overline{\mathcal{M}}_{g_Y, n_Y}, \end{aligned}$$

respectively, such that

$$\begin{aligned} \kappa_{X_{k_q}} \circ \left(\bigtimes_{v_X \in v(\Gamma_q)} c_{v_X} \right) &= c_{X_{k_q}}, \\ \kappa_{Y_{k_q}} \circ \left(\bigtimes_{v_Y \in v(\Gamma_{Y_{k_q}^\bullet})} c_{v_Y} \right) &= c_{Y_{k_q}}. \end{aligned}$$

On the other hand, the smooth pointed stable curve $\tilde{X}_{k_q, v_X}^\bullet$, $v_X \in v(\Gamma_q)$, over k_q determines a morphism $\text{Spec } k_q \rightarrow M_{g_{v_X}, n_{v_X}}$, and we denote by $q_{v_X} \in M_{g_{v_X}, n_{v_X}}$ the image of the morphism. Write $V_{q_{v_X}}^{\text{sm}}$ for the topological closure of q_{v_X} in $M_{g_{v_X}, n_{v_X}}$. Let $k_{q_{v_X}}$ be an algebraic closure of the residue field $k(q_{v_X})$ of q_{v_X} . Since the admissible coverings over algebraically closed fields do not depend on the choices of base fields, for each $v_Y \in (f_{k_q}^{\text{sg}})^{-1}(v_X)$, $f_{k_q, v_Y, v_X}^\bullet$ induces a G_{v_Y} -Galois admissible covering

$$f_{k_{q_{v_X}}, v_Y, v_X}^\bullet : \tilde{Y}_{k_{q_{v_X}}, v_Y}^\bullet \rightarrow \tilde{X}_{k_{q_{v_X}}, v_X}^\bullet$$

over $k_{q_{v_X}}$. Then Corollary 7.4 implies that there exist a smooth k -variety $U_{q_{v_X}}$ and a quasi-finite morphism $U_{q_{v_X}} \rightarrow H_{g_{v_X}, n_{v_X}}$ (not necessary a surjection) such that the following conditions are satisfied:

- (i) the image of $U_{q_{v_X}}$ of the composition of the morphisms $U_{q_{v_X}} \rightarrow H_{g_{v_X}, n_{v_X}} \xrightarrow{\omega_{g_{v_X}, n_{v_X}}^{(m)}} M_{g_{v_X}, n_{v_X}}$ is an open subset of $V_{q_{v_X}}^{\text{sm}}$;
- (ii) the morphism $U_{q_{v_X}} \rightarrow H_{g_{v_X}, n_{v_X}}$ induces a smooth pointed stable curve

$$X_{U_{q_{v_X}}, v_X}^\bullet \stackrel{\text{def}}{=} X_{H_{g_{v_X}, n_{v_X}}}^\bullet \times_{H_{g_{v_X}, n_{v_X}}} U_{q_{v_X}}$$

over $U_{q_{v_X}}$ with a level m -structure $\tau_{U_{q_{v_X}}} \stackrel{\text{def}}{=} \tau_{H_{g_{v_X}, n_{v_X}}} \times_{H_{g_{v_X}, n_{v_X}}} U_{q_{v_X}}$;

- (iii) for each $v_Y \in (f_{k_q}^{\text{sg}})^{-1}(v_X)$, there exists a Galois admissible covering

$$f_{U_{q_{v_X}}, v_Y, v_X}^\bullet : Y_{U_{q_{v_X}}, v_Y}^\bullet \rightarrow X_{U_{q_{v_X}}, v_X}^\bullet$$

of smooth pointed stable curves over $U_{q_{v_X}}$ with Galois group G_{v_Y} such that $f_{U_{q_{v_X}}, v_Y, v_X}^\bullet \times_{U_{q_{v_X}}} \text{Spec } k_{q_{v_X}}$ is equal to $f_{k_{q_{v_X}}, v_Y, v_X}^\bullet$.

Then the clutching morphism induces a morphism

$$\kappa : \bigtimes_{v_X \in v(\Gamma_q)} U_{q_{v_X}} \rightarrow \bigtimes_{v_X \in v(\Gamma_q)} H_{g_{v_X}, n_{v_X}} \rightarrow \bigtimes_{v_X \in v(\Gamma_q)} \mathcal{M}_{g_{v_X}, n_{v_X}} \xrightarrow{\kappa_{X_{k_q}}} \overline{\mathcal{M}}_{g, n} \xrightarrow{\overline{\omega}_{g, n}} \overline{M}_{g, n}$$

over k . Since the image of κ is a dense constructible subset of V_q , the image of κ contains an open subset

$$W \subseteq V_q.$$

Let c be a closed point of W . Note that Γ_c is isomorphic to Γ_q as dual semi-graphs. Then Lemma 7.5 implies that there exist a complete discrete valuation ring R with algebraically closed residue field and a morphism $\text{Spec } R \rightarrow W$ such that the image of the morphism is $\{q, c\}$. By replacing R by a finite extension of R , there is a pointed stable curve X_R^\bullet over R . Write K_R for the quotient field of R , \overline{K}_R for an algebraic closure of K_R , and k_R for the residue field of R . Moreover, we may assume that \overline{K}_R contains k_q . For each $v_X \in v(\Gamma_q)$, the smooth pointed stable curve

$$\tilde{X}_{\overline{K}_R, v_X}^\bullet \stackrel{\text{def}}{=} \tilde{X}_{k_q, v_X}^\bullet \times_{k_q} \overline{K}_R$$

of type (g_{v_X}, n_{v_X}) over \overline{K}_R determines a morphism

$$\text{Spec } \overline{K}_R \rightarrow \mathcal{M}_{g_{v_X}, n_{v_X}} \rightarrow M_{g_{v_X}, n_{v_X}}.$$

Let $\text{Spec } \overline{K}_R \rightarrow H_{g_{v_X}, n_{v_X}}$ be a morphism obtained by restricting the natural morphism

$$\bigsqcup \text{Spec } \overline{K}_R = \text{Spec } \overline{K}_R \times_{M_{g_{v_X}, n_{v_X}}} H_{g_{v_X}, n_{v_X}} \rightarrow H_{g_{v_X}, n_{v_X}}$$

on a connected component of $\text{Spec } \overline{K}_R \times_{M_{g_{v_X}, n_{v_X}}} H_{g_{v_X}, n_{v_X}}$ such that the image of $\text{Spec } \overline{K}_R \rightarrow H_{g_{v_X}, n_{v_X}}$ is contained in the image of $U_{q_{v_X}} \rightarrow H_{g_{v_X}, n_{v_X}}$. The morphism $\text{Spec } \overline{K}_R \rightarrow H_{g_{v_X}, n_{v_X}}$ above induces a level m -structure $\tau_{\overline{K}_R} \stackrel{\text{def}}{=} \tau_{H_{g_{v_X}, n_{v_X}}} \times_{H_{g_{v_X}, n_{v_X}}} \text{Spec } \overline{K}_R$.

By replacing R by a finite extension of R , $\tilde{X}_{\overline{K}_R, v_X}^\bullet$ descends to a smooth pointed stable curve

$$\tilde{X}_{K_R, v_X}^\bullet$$

over K_R , and the level m -structure $\tau_{\overline{K}_R}$ descends to a level m -structure τ_{K_R} on the smooth pointed stable curve $\tilde{X}_{K_R, v_X}^\bullet$ over K_R . Let

$$X_{R, v_X}^\bullet$$

be the pointed stable model of $\tilde{X}_{K_R, v_X}^\bullet$ over R . Note that, by the construction, X_{R, v_X}^\bullet is smooth over R . Then the level m -structure τ_{K_R} extends to a level m -structure τ_R . Thus, for each $v_X \in v(\Gamma_q)$, the smooth pointed stable curve X_{R, v_X}^\bullet over R with the level m -structure τ_R determines a morphism $\text{Spec } R \rightarrow H_{g_{v_X}, n_{v_X}}$ such that the image of the composition of the morphisms

$$\text{Spec } R \rightarrow \bigtimes_{v_X \in v(\Gamma_q)} H_{g_{v_X}, n_{v_X}} \rightarrow \bigtimes_{v_X \in v(\Gamma_q)} \mathcal{M}_{g_{v_X}, n_{v_X}} \xrightarrow{\kappa_{X_{k_q}}} \overline{\mathcal{M}}_{g, n} \xrightarrow{\overline{\omega}_{g, n}} \overline{M}_{g, n}$$

is $\{q, c\}$. Moreover, by replacing R by a finite extension of R , we may assume that the morphism $\text{Spec } R \rightarrow H_{g_{v_X}, n_{v_X}}$ obtained above factors through the morphism $U_{q_{v_X}} \rightarrow$

$H_{g_{v_X}, n_{v_X}}$. Thus, for each $v_X \in v(\Gamma_q)$ and each $v_Y \in (f_{k_q}^{\text{sg}})^{-1}(v_X)$, we obtain a Galois covering

$$\begin{aligned} f_{R, v_Y, v_X}^\bullet &\stackrel{\text{def}}{=} f_{U_{qv_X}, v_Y, v_X}^\bullet \times_{U_{qv_X}} \text{Spec } R : Y_{R, v_Y}^\bullet \stackrel{\text{def}}{=} Y_{U_{qv_X}, v_Y}^\bullet \times_{U_{qv_X}} \text{Spec } R \\ &\rightarrow X_{R, v_X}^\bullet \stackrel{\text{def}}{=} X_{U_{qv_X}, v_X}^\bullet \times_{U_{qv_X}} \text{Spec } R \end{aligned}$$

of smooth pointed stable curves over R with Galois group G_{v_Y} . Moreover, the clutching morphism $\kappa_{Y_{k_q}}$ implies that we may glue $\{Y_{R, v_Y}^\bullet\}_{v_Y \in v(\Gamma_{Y_{k_q}}^\bullet)}$ in a way that is compatible with the gluing of $\{Y_{k_q, v_Y}^\bullet\}_{v_Y \in v(\Gamma_{Y_{k_q}}^\bullet)}$ that gives rise to $Y_{k_q}^\bullet$. Then we obtain a pointed stable curve Y_R^\bullet over R such that the following conditions are satisfied: (i) $Y_R^\bullet \times_{K_R} \overline{K}_R \cong Y_{k_q}^\bullet \times_{k_q} \overline{K}_R$ over \overline{K}_R ; (ii) there exists a Galois admissible covering $f_{K_R}^\bullet : Y_{K_R}^\bullet \rightarrow X_{K_R}^\bullet$ over K_R with Galois group G such that $f_{K_R}^\bullet \times_{K_R} \overline{K}_R = f_{k_q}^\bullet \times_{k_q} \overline{K}_R$.

Then by applying Lemma 7.6, there exists a Galois admissible covering $f_R^\bullet : Y_R^\bullet \rightarrow X_R^\bullet$ over R with Galois group G such that the restriction of f_R^\bullet on the special fibers is a connected Galois admissible covering over k_R with Galois group G . This means that $G \in \pi_A^{\text{adm}}(c)$. We complete the proof of the proposition. \square

7.3 Continuity of $\pi_{g,n}^{\text{adm}}$

In this subsection, we prove the continuity of $\pi_{g,n}^{\text{adm}}$.

Lemma 7.8. *Let v be a closed point of $H_{g,n}$, $\widehat{\mathcal{O}}_{H_{g,n}, v}$ the completion of the local ring $\mathcal{O}_{H_{g,n}, v}$, $\widehat{V} \stackrel{\text{def}}{=} \text{Spec } \widehat{\mathcal{O}}_{H_{g,n}, v}$ with the natural morphism $\widehat{V} \rightarrow H_{g,n}$, and $X_{\widehat{V}}^\bullet \stackrel{\text{def}}{=} X_{H_{g,n}}^\bullet \times_{H_{g,n}} \widehat{V}$ the smooth pointed stable curve over \widehat{V} with a level m -structure $\tau_{\widehat{V}} \stackrel{\text{def}}{=} \tau_{H_{g,n}} \times_{H_{g,n}} \widehat{V}$. Let $Y_{\widehat{V}}^\bullet$ be a smooth pointed stable curve over \widehat{V} and*

$$f_{\widehat{V}}^\bullet : Y_{\widehat{V}}^\bullet \rightarrow X_{\widehat{V}}^\bullet$$

a Galois admissible covering over \widehat{V} with Galois group G . Then there exist a subring $A \subseteq \widehat{\mathcal{O}}_{H_{g,n}, v}$, a morphism $\alpha_E : E \stackrel{\text{def}}{=} \text{Spec } A \rightarrow H_{g,n}$, and a morphism $f_E^\bullet : Y_E^\bullet \rightarrow X_E^\bullet \stackrel{\text{def}}{=} X_{H_{g,n}}^\bullet \times_{H_{g,n}} E$ such that the following conditions are satisfied:

- (i) $X_E^\bullet \times_E \widehat{V}$ is isomorphic to $X_{\widehat{V}}^\bullet$ over \widehat{V} , and the pulling-back of $f_E^\bullet \times_E \widehat{V}$ via the natural morphism $\widehat{V} \rightarrow E$ is isomorphic to $f_{\widehat{V}}^\bullet$ over \widehat{V} ;
- (ii) f_E^\bullet is a Galois admissible covering with Galois group G over E .

Proof. Similar arguments to the arguments given in the proof of [20, Lemma 4.1] imply the lemma holds. For readers convenience, we attach the proof.

By applying [32, Proposition 4.3 (1)], there exists a subring $A' \subseteq \widehat{\mathcal{O}}_{H_{g,n}, v}$ which is of finite type over k such that $Y_{E'}^\bullet$ is smooth over $E' \stackrel{\text{def}}{=} \text{Spec } A'$, that the Galois admissible covering $f_{\widehat{V}}^\bullet$ can be descended to a finite morphism (a Galois covering) $f_{E'}^\bullet : Y_{E'}^\bullet \rightarrow X_{E'}^\bullet$ over $E' \stackrel{\text{def}}{=} \text{Spec } A'$ with a level m -structure $\tau_{E'}$ on $X_{E'}^\bullet$, and that $f_{E'}^\bullet|_{e'}$ is a Galois multi-admissible covering with Galois group G over every $e' \in E'$. Moreover, by the

construction, the pulling-back $f_{E'}^\bullet \times_{E'} \widehat{V}$ via $\widehat{V} \rightarrow E'$ is isomorphic to $f_{\widehat{V}}^\bullet$ over \widehat{V} . Moreover, the smooth pointed stable curve $X_{E'}^\bullet$ over E' with the level m -structure $\tau_{E'}$ determines a morphism $\alpha_{E'} : E' \rightarrow H_{g,n}$.

We denote by $v_{E'} \in E'$ the image of $v \in \widehat{V}$ via the natural morphism $\widehat{V} \rightarrow E'$ which is a closed point of E' . [5, Proposition 5] implies that, there exists an affine open subset $v_{E'} \in E \subseteq E'$ such that the fiber $Y_e^\bullet \stackrel{\text{def}}{=} Y_E^\bullet \times_E e$ is geometrically irreducible over each closed point $e \in E$. We shall put $A \stackrel{\text{def}}{=} \mathcal{O}_E(E) \subseteq \widehat{\mathcal{O}}_{H_{g,n},v}$. Moreover, since the underlying curve of $Y_e^\bullet \stackrel{\text{def}}{=} Y_E^\bullet \times_E e$ is smooth over each e , we have that Y_e^\bullet is geometrically irreducible over each point $e \in E$. Thus, for each point $e \in E$, the restriction of $f_E^\bullet \stackrel{\text{def}}{=} f_{E'}^\bullet \times_{E'} E$ on e is a Galois admissible covering over e with Galois group G . We put

$$\alpha_E \stackrel{\text{def}}{=} \alpha_{E'}|_E : E \rightarrow H_{g,n}.$$

Then we obtain the desired curve. This completes the proof of the lemma. \square

Definition 7.9. Let $q \in \overline{M}_{g,n}$ be an arbitrary point. For each $G \in \pi_A^{\text{adm}}(q)$, we define

$$U_G \stackrel{\text{def}}{=} \{q' \in \overline{M}_{g,n} \mid G \in \pi_A^{\text{adm}}(q')\}.$$

Moreover, we put $U_G^{\text{sm}} \stackrel{\text{def}}{=} U_G \cap M_{g,n}$.

First, let us prove that U_G^{sm} is an open subset of $M_{g,n}$.

Proposition 7.10. *Let q be an arbitrary point of $M_{g,n}$ and $G \in \pi_A^{\text{adm}}(q)$. Then U_G^{sm} is an open subset of $M_{g,n}$.*

Proof. To verify the proposition, Lemma 7.3 (or Proposition 7.7) implies that it is sufficient to prove that, for every closed point $c \in U_G^{\text{sm}}$, there exists an open subset $c \in U_c \subseteq M_{g,n}$ which is contained in U_G^{sm} .

Let $v \in H_{g,n}$ be a closed point such that $\omega_{g,n}^{(m)}(v) = c$. We maintain the notation introduced in Lemma 7.8. Then we obtain an affine k -variety E and a morphism $\alpha_E : E \rightarrow H_{g,n}$ over k such that $(\omega_{g,n}^{(m)} \circ \alpha_E)(v_{E'}) = c$. Moreover, since the image \widehat{V} of the composition of the morphisms $\widehat{V} \rightarrow E \xrightarrow{\alpha_E} H_{g,n} \xrightarrow{\omega_{g,n}^{(m)}} M_{g,n}$ is dense in $M_{g,n}$, the image of the composition of the morphisms $E \xrightarrow{\alpha_E} H_{g,n} \xrightarrow{\omega_{g,n}^{(m)}} M_{g,n}$ is also a dense constructible subset of $M_{g,n}$.

Write W for the image of E in $M_{g,n}$. Since W is a constructible subset, we have that

$$W = \bigcup_{i=1}^r W_i$$

is a finite disjoint union of local closed subsets $\{W_i\}_{i=1,\dots,r}$, of $M_{g,n}$. Without loss of generality, we may assume that $c \in W_1$. Since W_1 contains the image of \widehat{V} , we obtain that W_1 is an open subset of $M_{g,n}$. This completes the proof of the proposition. \square

Remark 7.10.1. In [20, Section 4], Stevenson proved that U_G^{sm} contains an open subset of $M_{g,n}$ when $n = 0$.

In the remainder of this subsection, we generalize Proposition 7.10 to the case of arbitrary points of $\overline{\mathcal{M}}_{g,n}$.

Lemma 7.11. *Let R be a complete discrete valuation ring, K_R the quotient field of R , and k_R the residue field of R such that k_R is an algebraically closed field containing k . Let X_R^\bullet be a pointed stable curve of type (g, n) over R and*

$$f_{k_R}^\bullet : Y_{k_R}^\bullet \rightarrow X_{k_R}^\bullet$$

a Galois admissible covering over k_R with Galois group G . Then, by replacing R by a finite extension of R , there exist a pointed stable curve Y_R^\bullet over R and a Galois admissible covering

$$f_R^\bullet : Y_R^\bullet \rightarrow X_R^\bullet$$

over R with Galois group such that $f_R^\bullet \times_R k_R = f_{k_R}^\bullet$.

Proof. Let $X_{\mathcal{M}'}^\bullet$ be the versal formal deformation of the special fiber $X_{k_R}^\bullet$ of X_R^\bullet over $\mathcal{M}' \stackrel{\text{def}}{=} \text{Spec } \mathcal{O}_{k_R}[[t_1, \dots, t_{3g-3+n}]]$, where \mathcal{O}_{k_R} is a regular local ring with maximal ideal $p\mathcal{O}_{k_R}$ and residue field k_R (cf. [1, p79]). The pointed stable curve X_R^\bullet over R determines a morphism $\text{Spec } R \rightarrow \mathcal{M}'$ such that $X_{\mathcal{M}'}^\bullet \times_{\mathcal{M}'} \text{Spec } R$ is isomorphic to X_R^\bullet over R . Moreover, since $R \cong k_R[[t]]$, the morphism $\text{Spec } R \rightarrow \mathcal{M}'$ factors through a morphism

$$\text{Spec } R \rightarrow \mathcal{M} \stackrel{\text{def}}{=} \text{Spec } k_R[[t_1, \dots, t_{3g-3+n}]].$$

The natural morphism $\mathcal{M} \rightarrow \mathcal{M}'$ induces a pointed stable curve $X_{\mathcal{M}}^\bullet \stackrel{\text{def}}{=} X_{\mathcal{M}'}^\bullet \times_{\mathcal{M}'} \mathcal{M}$ over \mathcal{M} .

Let $\overline{\mathcal{M}}_{g,n}^{\log}$ be the log stack obtained by equipping $\overline{\mathcal{M}}_{g,n}$ with the natural log structure associated to the divisor with normal crossings $\overline{\mathcal{M}}_{g,n} \setminus \mathcal{M}_{g,n}$. Then we obtain a log scheme \mathcal{M}^{\log} whose underlying scheme is \mathcal{M} , and whose log structure is the pulling-back log structure induced by the natural morphism $\mathcal{M} \rightarrow \mathcal{M}' \rightarrow \overline{\mathcal{M}}_{g,n}$. Moreover, we obtain a stable log curve

$$X_{\mathcal{M}}^{\log} \stackrel{\text{def}}{=} \overline{\mathcal{M}}_{g,n+1}^{\log} \times_{\overline{\mathcal{M}}_{g,n}^{\log}} \mathcal{M}^{\log}$$

over \mathcal{M}^{\log} whose underlying curve is $X_{\mathcal{M}}$. Note that $X_{\mathcal{M}}^{\log}$ is log regular.

By replacing \mathcal{M}^{\log} by a finite log étale covering \mathcal{N}^{\log} , and replacing R by a finite extension of R , we obtain a morphism $\text{Spec } R \rightarrow \mathcal{N}$ induced by the morphism $\text{Spec } R \rightarrow \mathcal{M}$. We obtain a log scheme $s_{k_R}^{\log}$ whose underlying scheme is $s_{k_R} \stackrel{\text{def}}{=} \text{Spec } k_R$, and whose log structure is the pulling-back log structure induced by the composition of the morphisms $s_{k_R} \rightarrow \text{Spec } R \rightarrow \mathcal{N}$. Moreover, the Galois admissible covering $f_{k_R}^\bullet$ determines a log étale covering $f_{k_R}^{\log} : Y_{k_R}^{\log} \rightarrow X_{k_R}^{\log}$ over $s_{k_R}^{\log}$ such that the underlying morphism of $f_{k_R}^{\log}$ is f_{k_R} . By applying [6, Corollary 1], there exists a Galois log étale covering

$$f_{\mathcal{N}}^{\log} : Y_{\mathcal{N}}^{\log} \rightarrow X_{\mathcal{N}}^{\log} \stackrel{\text{def}}{=} X_{\mathcal{M}}^{\log} \times_{\mathcal{M}^{\log}} \mathcal{N}^{\log}$$

with Galois group G over \mathcal{N}^{\log} such that

$$f_{\mathcal{N}}^{\log} \times_{\mathcal{N}^{\log}} s_{k_R}^{\log} : Y_{\mathcal{N}}^{\log} \times_{\mathcal{N}^{\log}} s_{k_R}^{\log} \rightarrow X_{\mathcal{N}}^{\log} \times_{\mathcal{N}^{\log}} s_{k_R}^{\log}$$

is isomorphic to $f_{k_R}^{\log}$ over $s_{k_R}^{\log}$. Furthermore, by replacing \mathcal{N}^{\log} by a finite log étale covering of \mathcal{N}^{\log} , we may assume that the underlying morphism of $f_{\mathcal{N}}^{\log}$ is a morphism of pointed stable curves over \mathcal{N} .

Let s_R^{\log} be the log scheme whose underlying scheme is $\text{Spec } R$, and whose log structure is the pulling-back log structure induced by the morphism $\text{Spec } R \rightarrow \mathcal{N}$. Then we obtain a log étale covering

$$f_{\mathcal{N}}^{\log} \times_{\mathcal{N}^{\log}} s_R^{\log} : Y_{\mathcal{N}}^{\log} \times_{\mathcal{N}^{\log}} s_R^{\log} \rightarrow X_{\mathcal{N}}^{\log} \times_{\mathcal{N}^{\log}} s_R^{\log}$$

over s_R^{\log} . We denote by

$$f_R^{\bullet} : Y_R^{\bullet} \rightarrow X_R^{\bullet}$$

the morphism induced by the underlying morphism of $f_{\mathcal{N}^{\log}}^{\log} \times_{\mathcal{N}^{\log}} s_R^{\log}$ over R . Since the special fiber Y_R^{\bullet} is geometrically connected, the Zariski main theorem implies that $Y_R^{\bullet} \times_R R'$ is connected for every finite extension R' of R . Thus, the generic fiber of Y_R^{\bullet} is geometrically connected.

Let us prove that f_R^{\bullet} is a Galois admissible covering over R with Galois group G . Note that we have a log scheme $s_{K_R}^{\log}$ whose underlying scheme is $s_{K_R} \stackrel{\text{def}}{=} \text{Spec } K_R$, and whose log structure is the pulling-back log structure induced by the composition of the natural morphisms $s_{K_R} \rightarrow \text{Spec } R \rightarrow \mathcal{N}$. Then we see that

$$f_{\mathcal{N}}^{\log} \times_{\mathcal{N}^{\log}} s_{K_R}^{\log} : Y_{\mathcal{N}}^{\log} \times_{\mathcal{N}^{\log}} s_{K_R}^{\log} \rightarrow X_{\mathcal{N}}^{\log} \times_{\mathcal{N}^{\log}} s_{K_R}^{\log}$$

is geometrically connected Galois log étale covering over $s_{K_R}^{\log}$. This means that the underlying morphism of $f_{\mathcal{N}}^{\log} \times_{\mathcal{N}^{\log}} s_{K_R}^{\log}$ induces a Galois admissible covering over K_R with Galois group G . This completes the proof of the lemma. \square

Let $c \in \overline{\mathcal{M}}_{g,n}$ be a *closed point* and $k_c = k$ the residue field of c . Then the closed point c determines a pointed stable curve

$$X_{k_c}^{\bullet} = (X_{k_c}, D_{X_{k_c}})$$

over k . For each $v_X \in v(\Gamma_c)$, let $\tilde{X}_{k_c, v_X}^{\bullet}$ be the smooth pointed stable curve of type (g_{v_X}, n_{v_X}) over k_c associated to v_X . Then we obtain a morphism

$$c_{v_X} : \text{Spec } k_c \rightarrow \mathcal{M}_{g_{v_X}, n_{v_X}}, \quad v_X \in v(\Gamma_c),$$

determined by $\tilde{X}_{k_c, v_X}^{\bullet}$ over k_c . Write $c_{X_{k_c}} : \text{Spec } k_c \rightarrow \overline{\mathcal{M}}_{g,n}$ for the morphism induced by $X_{k_c}^{\bullet}$ over k_c . Moreover, $X_{k_c}^{\bullet}$ over k_c determines a clutching morphism

$$\kappa_{X_{k_c}} : \bigtimes_{v_X \in v(\Gamma_c)} \mathcal{M}_{g_{v_X}, n_{v_X}} \rightarrow \overline{\mathcal{M}}_{g,n}$$

satisfying $\kappa_{X_{k_c}} \circ (\bigtimes_{v_X \in v(\Gamma_c)} c_{v_X}) = c_{X_{k_c}}$. We denote by

$$M_c \stackrel{\text{def}}{=} \text{Im} \left(\bigtimes_{v \in v(\Gamma_c)} \mathcal{M}_{g_v, n_v} \xrightarrow{\kappa_{X_{k_c}}} \overline{\mathcal{M}}_{g,n} \xrightarrow{\bar{\omega}_{g,n}} \overline{M}_{g,n} \right)$$

the image of the composition of the natural morphisms. Note that $\Gamma_q \cong \Gamma_c$ for each $q \in M_c$.

Lemma 7.12. *We maintain the notation introduced above. Let $G \in \pi_A^{\text{adm}}(c)$ be a finite group. Then*

$$U_G \cap M_c$$

contains an open subset of M_c in which c is contained.

Proof. Let $Y_{k_c}^\bullet = (Y_{k_c}, D_{Y_{k_c}})$ be a pointed stable curve of type (g_Y, n_Y) over k_c and $f_{k_c}^\bullet : Y_{k_c}^\bullet \rightarrow X_{k_c}^\bullet$ a Galois admissible covering over k_c with Galois group G . Write $\Gamma_{Y_{k_c}^\bullet}$ for the dual semi-graph of $Y_{k_c}^\bullet$, and $f_{k_c}^{\text{sg}} : \Gamma_{Y_{k_c}^\bullet} \rightarrow \Gamma_c$ for the map of dual semi-graphs induced by $f_{k_c}^\bullet$. For every $v_X \in v(\Gamma_c)$ and every $v_Y \in (f_{k_c}^{\text{sg}})^{-1}(v_X)$, let $\tilde{Y}_{k_c, v_Y}^\bullet$ be the smooth pointed stable curve of type (g_{v_Y}, n_{v_Y}) over k_c associated to v_Y . Then $f_{k_c}^\bullet$ induces a Galois multi-admissible covering

$$f_{k_c, v_X}^\bullet : \bigsqcup_{v_Y \in (f_{k_c}^{\text{sg}})^{-1}(v_X)} \tilde{Y}_{k_c, v_Y}^\bullet \rightarrow \tilde{X}_{k_c, v_X}^\bullet$$

over k_c . Note that $\bigsqcup_{v_Y \in (f_{k_c}^{\text{sg}})^{-1}(v_X)} \tilde{Y}_{k_c, v_Y}^\bullet$ admits an action of G induced by the action of G on $Y_{k_c}^\bullet$. This action induces an action of G on the set $(f_{k_c}^{\text{sg}})^{-1}(v_X)$. For each $v_Y \in (f_{k_c}^{\text{sg}})^{-1}(v_X)$, write $G_{v_Y} \subseteq G$ for the inertia subgroup of v_Y . Then we obtain a Galois admissible covering

$$f_{k_c, v_Y, v_X}^\bullet : \tilde{Y}_{k_c, v_Y}^\bullet \rightarrow \tilde{X}_{k_c, v_X}^\bullet$$

over k with Galois group G_{v_Y} . Write $c_{Y_{k_c}} : \text{Spec } k_c \rightarrow \overline{\mathcal{M}}_{g_Y, n_Y}$ for the morphism determined by $Y_{k_c}^\bullet$ over k_c , and $c_{v_Y} : \text{Spec } k_c \rightarrow \overline{\mathcal{M}}_{g_{v_Y}, n_{v_Y}}$, $v_Y \in v(\Gamma_{Y_{k_c}^\bullet})$, for the morphism determined by $\tilde{Y}_{k_c, v_Y}^\bullet$ over k_c . Then the pointed stable curve $Y_{k_c}^\bullet$ over k_c determines a clutching morphism

$$\kappa_{Y_{k_c}} : \bigtimes_{v_Y \in v(\Gamma_{Y_{k_c}^\bullet})} \mathcal{M}_{g_{v_Y}, n_{v_Y}} \rightarrow \overline{\mathcal{M}}_{g_Y, n_Y}$$

satisfying $\kappa_{Y_{k_c}} \circ (\bigtimes_{v_Y \in v(\Gamma_{Y_{k_c}^\bullet})} c_{v_Y}) = c_{Y_{k_c}}$.

On the other hand, for each $v_X \in v(\Gamma_c)$, we denote by

$$q_{v_X} \in M_{g_{v_X}, n_{v_X}}$$

the image of $\omega_{g_{v_X}, n_{v_X}} \circ c_{v_X}$. Then the last paragraph of the proof of Proposition 7.10 implies that, for each $v_X \in v(\Gamma_c)$, there exist an affine k -variety $E_{q_{v_X}}$ and a morphism $\alpha_{E_{q_{v_X}}} : E_{q_{v_X}} \rightarrow H_{g_{v_X}, n_{v_X}}$ satisfying the following conditions:

- (i) the image of $\alpha_{E_{q_{v_X}}}$ contains an open subset $U_{q_{v_X}}$ of $H_{g_{v_X}, n_{v_X}}$ such that the image $\omega_{g_{v_X}, n_{v_X}}^{(m)}(U_{q_{v_X}}) \subseteq M_{g_{v_X}, n_{v_X}}$ contains q_{v_X} ;
- (ii) we have a smooth pointed stable curve $X_{E_{q_{v_X}}}^\bullet \stackrel{\text{def}}{=} X_{H_{g_{v_X}, n_{v_X}}}^\bullet \times_{H_{g_{v_X}, n_{v_X}}} E_{q_{v_X}}$ over $E_{q_{v_X}}$ with a level m -structure $\tau_{E_{q_{v_X}}} \stackrel{\text{def}}{=} \tau_{H_{g_{v_X}, n_{v_X}}} \times_{H_{g_{v_X}, n_{v_X}}} E_{q_{v_X}}$;
- (iii) for each $v_Y \in (f_{k_c}^{\text{sg}})^{-1}(v_X)$, there exists a Galois admissible covering

$$f_{E_{q_{v_X}}, v_Y, v_X}^\bullet : Y_{E_{q_{v_X}}, v_Y}^\bullet \rightarrow X_{E_{q_{v_X}}, v_X}^\bullet$$

over $E_{q_{v_X}}$ with Galois group G_{v_Y} such that the pulling-back of $f_{E_{q_{v_X}}, v_Y, v_X}^\bullet$ to every point of $(\omega_{g_{v_X}, n_{v_X}}^{(m)} \circ \alpha_{E_{q_{v_X}}})^{-1}(q_{v_X})$ is isomorphic to the Galois admissible covering $f_{k_c, v_Y, v_X}^\bullet$ over k_c with Galois group G_{v_X} .

Then the image of the composition of the natural morphisms

$$\bigtimes_{v_X \in v(\Gamma_c)} U_{q_{v_X}} \hookrightarrow \bigtimes_{v_X \in v(\Gamma_c)} H_{g_{v_X}, n_{v_X}} \rightarrow \bigtimes_{v_X \in v(\Gamma_c)} \mathcal{M}_{g_{v_X}, n_{v_X}} \xrightarrow{\kappa_{X_{k_c}}} \overline{\mathcal{M}}_{g, n} \xrightarrow{\overline{\omega}_{g, n}} \overline{M}_{g, n}$$

contains an open subset $W_c \subseteq M_c$ of M_c in which c is contained. To verify the lemma, it is sufficient to prove that $G \in \pi_A^{\text{adm}}(c')$ for each *closed point* $c' \in W_c$.

Since W_c is a k -variety, there exists a k -curve $C' \subseteq W_c$ (not necessary irreducible) which contains c and c' . Suppose that C' is irreducible. Write C for the normalization of C' , c_1 for a closed point of C over c , and c_2 for a closed point of C over c' . Let R_i , $i \in \{1, 2\}$, be a finite extension of $\widehat{\mathcal{O}}_{C, c_i}$ (then R_i is a complete discrete valuation ring), K_{R_i} the quotient field of R_i , \overline{K}_{R_i} an algebraic closure of K_{R_i} , and $k_{R_i} = k$ the residue field of R_i .

By replacing R_1 by a finite extension of R_1 , there is a smooth pointed stable curve $X_{R_1}^\bullet$ over R_1 whose special fiber $X_{k_{R_1}}^\bullet$ over the residue field $k_{R_1} = k$ of R_1 is isomorphic to $X_{k_c}^\bullet$ over k . Lemma 7.11 implies that the Galois admissible covering $f_{k_c}^\bullet$ over $k_c = k$ with Galois group G can be lifted to a Galois admissible covering

$$f_{R_1}^\bullet : Y_{R_1}^\bullet \rightarrow X_{R_1}^\bullet$$

over R_1 with Galois group G .

Let \overline{K} be an algebraically closed field which contains \overline{K}_{R_1} and \overline{K}_{R_2} . Since the admissible fundamental groups do not depend on the choices of base fields, the Galois admissible covering $f_{R_1}^\bullet \times_{R_1} \overline{K}_{R_1}$ over \overline{K}_{R_1} with Galois group G induces a Galois admissible covering $f_{\overline{K}_{R_2}}^\bullet : Y_{\overline{K}_{R_2}}^\bullet \rightarrow X_{\overline{K}_{R_2}}^\bullet$ over \overline{K}_{R_2} with Galois group G such that $f_{\overline{K}_{R_1}}^\bullet \times_{\overline{K}_{R_1}} \overline{K}$ is isomorphic to $f_{\overline{K}_{R_2}}^\bullet \times_{\overline{K}_{R_2}} \overline{K}$ over \overline{K} . By replacing R_2 by a finite extension of R_2 , there is a pointed stable curve $X_{R_2}^\bullet$ over R_2 whose special fiber $X_{k_{R_2}}^\bullet$ over the residue field $k_{R_2} = k$ of R_2 is isomorphic to $X_{k_c}^\bullet$ over k , and $f_{\overline{K}_{R_2}}^\bullet$ can be descended to a Galois admissible covering

$$f_{K_{R_2}}^\bullet : Y_{K_{R_2}}^\bullet \rightarrow X_{K_{R_2}}^\bullet$$

over K_{R_2} with Galois group G . Moreover, for each $v_X \in v(\Gamma_c)$ and each $v_Y \in (f_{k_c}^{\text{sg}})^{-1}(v_X)$, $f_{K_{R_2}}^\bullet$ induces a Galois admissible covering $f_{K_{R_2}, v_Y, v_X}^\bullet : Y_{K_{R_2}, v_Y}^\bullet \rightarrow X_{K_{R_2}, v_X}^\bullet$ over K_{R_2} with Galois group G_{v_Y} . By choosing a suitable level m -structure τ_{R_2, v_X} on $X_{K_{R_2}, v_X}^\bullet$, we obtain a morphism

$$l_{R_2, v_X} : \text{Spec } R_2 \rightarrow H_{g_{v_X}, n_{v_X}}$$

determined by $X_{K_{R_2}, v_X}^\bullet$ over R_2 and τ_{R_2, v_X} such that image of l_{R_2, v_X} is contained in $U_{q_{v_X}}$.

By replacing R_2 by a finite extension of R_2 , we may assume that $Y_{K_{R_2}, v_Y}^\bullet$, $v_Y \in v(\Gamma_{Y_{k_c}}^\bullet)$, has pointed stable reduction over R_2 . Next, let us prove that $Y_{K_{R_2}, v_Y}^\bullet$ has good reduction over R_2 .

If the image of l_{R_2, v_X} is a constant morphism, then $Y_{K_{R_2}, v_Y}^\bullet$ has good reduction over R_2 . We may assume that l_{R_2, v_X} is not a constant morphism. Let η'_{v_X} be a generic

point of $E_{q_{v_X}} \times_{H_{g_{v_X}, n_{v_X}}} \text{Spec } K_{R_2}$. Since $c' \in W_c$, there exists a closed point $s_{2,v_X} \in E_{q_{v_X}} \times_{H_{g_{v_X}, n_{v_X}}} k_{R_2} \hookrightarrow E_{q_{v_X}}$ contained in $V_{\eta'_{v_X}} \stackrel{\text{def}}{=} \overline{\{\eta'_{v_X}\}}$ such that $\alpha_{E_{q_{v_X}}}(s_{2,v_X})$ is equal to the image of

$$\text{Spec } k_{R_2} \hookrightarrow \text{Spec } R_2 \xrightarrow{l_{R_2, v_X}} H_{g_{v_X}, n_{v_X}},$$

where $\overline{\{\eta'_{v_X}\}}$ denotes the topological closure of η'_{v_X} in $E_{q_{v_X}} \times_{H_{g_{v_X}, n_{v_X}}} R_2$. Since $R_2 \cong k[[t]]$, the scheme-theoretic image of l_{R_2, v_X} is a local ring of dimension one, $V_{\eta'_b}$ is an one dimension k -scheme. Write A_{2,v_X} for the normalization of $\widehat{\mathcal{O}}_{V_{\eta'_{v_X}}, s_{2,v_X}}$. Note that A_{2,v_X} is a complete discrete valuation ring, and the natural morphism $\text{Spec } A_{2,v_X} \rightarrow \text{Spec } R_2$ is finite. We may assume that $A_{2,v_X} \subseteq \overline{K}_{R_2}$. Thus, we obtain a Galois admissible covering

$$f_{A_{2,v_X}, v_Y, v_X}^\bullet \stackrel{\text{def}}{=} f_{E_{q_{v_X}}, v_Y}^\bullet \times_{E_{q_{v_X}}} \text{Spec } A_{2,v_X} : Y_{A_{2,v_X}, v_Y}^\bullet \rightarrow X_{A_{2,v_X}, v_X}^\bullet$$

of smooth pointed stable curves over A_{2,v_X} with Galois group G_{v_Y} such that $f_{A_{2,v_X}, v_Y, v_X}^\bullet \times_{A_{2,v_X}} \overline{K}_{R_2}$ is isomorphic to $f_{\overline{K}_{R_2}, v_Y, v_X}^\bullet$ over \overline{K}_{R_2} . This implies that $Y_{K_{R_2}, v_Y}^\bullet$ has good reduction.

The clutching morphism $\kappa_{Y_{k_c}^\bullet}$ implies that we may glue $\{Y_{R, v_Y}^\bullet\}_{v_Y \in v(\Gamma_{Y_{k_c}^\bullet})}$ in a way that is compatible with the gluing of $\{Y_{K_{R_2}, v_Y}^\bullet\}_{v_Y \in v(\Gamma_{Y_{K_{R_2}}^\bullet})}$ that gives rise to $Y_{K_{R_2}}^\bullet$. Then we obtain a pointed stable curve $Y_{R_2}^\bullet$ over R_2 such that

(i) $Y_{R_2}^\bullet \times_{R_2} K_{R_2} \cong Y_{K_{R_2}}^\bullet$ over K_{R_2} ;

(ii) there exists a Galois admissible covering $f_{K_{R_2}}^\bullet : Y_{K_{R_2}}^\bullet \rightarrow X_{K_{R_2}}^\bullet$ of pointed stable curves over K_{R_2} which is a Galois admissible covering over K_{R_2} with Galois group G such that $f_{K_{R_2}}^\bullet \times_{K_{R_2}} \overline{K}$ is isomorphic to $f_{K_{R_1}}^\bullet \times_{K_{R_1}} \overline{K}$.

Then Lemma 7.6 implies that there exists a Galois admissible covering $f_{R_2}^\bullet : Y_{R_2}^\bullet \rightarrow X_{R_2}^\bullet$ over R_2 with Galois group G such that the restriction of $f_{R_2}^\bullet$ on the special fibers is a Galois admissible covering over k_{R_2} with Galois group G . Since $X_{k_{R_2}}^\bullet$ is isomorphic to $X_{k_{c'}}^\bullet$ over $k = k_{c'}$, we have that $G \in \pi_A^{\text{adm}}(c')$. This completes the proof of the lemma if $C' \subseteq W_c$ is irreducible.

Suppose that C' is not irreducible. Then we see that there is a set of closed points $\{c = c_1, c_2, \dots, c_r = c'\}$ of C' such that $c_i, c_{i+1}, i \in \{1, \dots, r-1\}$, are contained in an irreducible component of C' . Then the lemma follows from the lemma when C' is irreducible. This completes the proof of the lemma. \square

Corollary 7.13. *We maintain the notation introduced in Lemma 7.12. Let $G \in \pi_A^{\text{adm}}(c)$ be a finite group. Then*

$$U_G \cap M_c$$

is an open subset of M_c .

Proof. The corollary follows immediately from Proposition 7.7 and Lemma 7.12. \square

Next, we prove the main result of the present section.

Theorem 7.14. *Let q be an arbitrary point of $\overline{M}_{g,n}$ and $G \in \pi_A^{\text{adm}}(q)$. Then U_G is an open subset of $\overline{M}_{g,n}$. In particular, the maps*

$$\pi_{g,n}^{\text{adm}} : \overline{\mathfrak{M}}_{g,n} \rightarrow \overline{\Pi}_{g,n},$$

$$\pi_{g,n}^{\text{sol}} : \overline{\mathfrak{M}}_{g,n} \rightarrow \overline{\Pi}_{g,n}^{\text{sol}}$$

defined in Section 3.2 are continuous.

Proof. For each $j \in \mathbb{Z}_{\geq 0}$, we put $M_j \stackrel{\text{def}}{=} \{q' \in \overline{M}_{g,n} \mid \#e^{\text{cl}}(\Gamma_{q'}) = j\} \subseteq \overline{M}_{g,n}$, and denote by $\text{Gen}(M_j)$ the set of generic points of M_j . Note that $M_0 = M_{g,n}$, and that $M_j = \emptyset$ if $j \gg 0$. Since $M_{j'} \cap M_{j''} = \emptyset$ if $j' \neq j''$, we have that

$$\overline{M}_{g,n} = \bigsqcup_{j \in \mathbb{Z}_{\geq 0}} M_j.$$

Moreover, for each $\eta_j \in \text{Gen}(M_j)$, we put $M_{\eta_j} \stackrel{\text{def}}{=} V_{\eta_j} \cap M_j$, where V_{η_j} denotes the topological closure of η_j in $\overline{M}_{g,n}$. Since $M_{\eta'_j} \cap M_{\eta''_j} = \emptyset$ if $\eta'_j \neq \eta''_j$ for each $j \in \mathbb{Z}_{\geq 0}$, we obtain a disjoint union

$$M_j = \bigsqcup_{\eta_j \in \text{Gen}(M_j)} M_{\eta_j}.$$

Then we obtain

$$\overline{M}_{g,n} = \bigsqcup_{j \in \mathbb{Z}_{\geq 0}} \bigsqcup_{\eta_j \in \text{Gen}(M_j)} M_{\eta_j}.$$

Thus, we have

$$U_G = \bigsqcup_{j \in \mathbb{Z}_{\geq 0}} \bigsqcup_{\eta_j \in \text{Gen}(M_j)} M_{\eta_j} \cap U_G.$$

Corollary 7.13 implies that $M_{\eta_j} \cap U_G$ is an open subset of M_{η_j} . This means that $M_{\eta_j} \cap U_G$ is a constructible subset of M_{η_j} , and $M_{\eta_j} \cap U_G$ is stable under generization in $M_{\eta_j} \cap U_G$. Since M_{η_j} is a constructible subset of $\overline{M}_{g,n}$, we obtain that U_G is a constructible subset of $\overline{M}_{g,n}$.

Let $j' \geq j''$. If $M_{\eta_{j'}}$ is contained in the topological closure of $M_{\eta_{j''}}$ in $\overline{M}_{g,n}$ and $M_{\eta_{j'}} \cap U_G \neq \emptyset$, then Lemma 7.1 implies that $M_{\eta_{j''}} \cap U_G \neq \emptyset$. Since $M_{\eta_j} \cap U_G$ is stable under generization in $M_{\eta_j} \cap U_G$, $j \in \mathbb{Z}_{\geq 0}$, we obtain that U_G is stable under generization in $\overline{M}_{g,n}$. Thus, U_G is an open subset of $\overline{M}_{g,n}$. This completes the proof of the theorem. \square
