Convergence of the Finite Volume Method on Unstructured Meshes for a 3D Phase Field Model of Solidification

Aleš Wodecki, Pavel Strachota, Michal Beneš

Abstract

We present a convergence result for the finite volume method applied to a particular phase field problem suitable for simulation of pure substance solidification. The model consists of the heat equation and the phase field equation with a general form of the reaction term which encompasses a variety of existing models governing dendrite growth and elementary interface tracking problems. We apply the well known compact embedding techniques in the context of the finite volume method on admissible unstructured polyhedral meshes. We develop the necessary interpolation theory and derive an a priori estimate to obtain boundedness of the key terms. Based on this estimate, we conclude the convergence of all of the terms in the equation system.

Keywords: A priori estimate, compact embedding, convergence, finite volume method, phase field problem

1. Introduction

Phase field modeling [13, 28] and level set methods [38] have been utilized to solve various physical problems that involve moving interfaces. The phase field model in particular has been deployed to model problems such as crack propagation [3], viscous fingering [23], two phase flow of immiscible fluids [35, 7], phase transitions in porous media [44, 2, 3], and prominently, crystal growth. Historically, phase field modelling was made possible through the study of functionals describing interfacial energy [34, 17]. Throughout the years, the model derived using the groundwork laid out by Cahn and Hilliard gained more concrete form suitable for particular applications [1, 27, 28, 34]. More recently, the functional theory of phase transition has been formalized further leading to a more rigorous treatment [6, 21] and many new applications were found [29, 35, 33]. Our main focus is on a phase field model formulation that finds use in the modeling of dendritic growth and grain evolution during solidification [26, 27, 28, 43, 39, 41].

In this paper, we present the mathematical analysis of the finite volume method (FVM) on an unstructured mesh (defined in [22]) for a system of equations known as the phase field model (PFM) with a single order parameter. The two predominant classes of results on the numerical analysis of the PFM are adaptations of [22] and the use of approximative sequences of functions and compact embedding that show existence of the weak solution and convergence at the same time [19, 10, 5]. One can find examples of the first approach in our previous work [40] or [14] and the use of compact embedding techniques is demonstrated in [8, 18, 33, 20]. In our previous work [40], we took the first mentioned approach and derived estimates that show convergence rates of the FVM applied to a simplified phase field (Allen-Cahn) equation on an unstructured mesh. In this paper, we have chosen the second of the two mentioned approaches. The novelty of our proof lies in the application of the well known compact embedding techniques [32, 5] to the general setting of FVM on an unstructured mesh applied to the PFM, which gives both the existence of the weak solution and the convergence of the numerical scheme to this solution. We also introduce an interpolation theory tailored for this purpose. The weak convergence is given by an a-priori estimate that is derived in detail.

Preprint submitted to Elsevier
For the purposes of the analysis, we consider the isotropic PFM with a generically formulated reaction term, which is well suited for practical applications: In our related work [22], we propose a novel form of the PFM which is compatible with the presented numerical analysis. In addition, we also introduce its anisotropic variant. We demonstrate that numerical simulations of rapid solidification [15, 45, 25] based on this model produce results both in qualitative and quantitative agreement with experiments. Some traditional models such as [30] can also be treated by the presented framework.

2. Problem Formulation

Let \( \Omega \subset \mathbb{R}^3 \) be a bounded polyhedral domain and let \( J \equiv (0, T) \) be a time interval. The problem in question reads

\[
\frac{\partial u}{\partial t} = \Delta u + L \frac{\partial p}{\partial t} \quad \text{in } J \times \Omega, \\
\alpha \xi^2 \frac{\partial p}{\partial t} = \xi^2 \Delta p + f(u, p, \xi) \quad \text{in } J \times \Omega, \\
u \mid_{t=0} = u_{\text{ini}}, p \mid_{t=0} = p_{\text{ini}} \quad \text{in } \Omega, \\
u \mid_{\partial \Omega} = u_{\partial \Omega} \quad \text{on } J \times \partial \Omega, \\
p \mid_{\partial \Omega} = p_{\partial \Omega} \quad \text{on } J \times \partial \Omega,
\]

where \( u \) and \( p \) are the temperature field and the phase field (i.e. order parameter), respectively. Consider the function \( f(u, p, \xi) \) of the form

\[
f(u, p, \xi) = f_0(p) + b \beta \Lambda(g(u, p)),
\]

where

\[
f_0(p) \equiv p (1 - p) \left( p - \frac{1}{2} \right).
\]

\( L, \alpha, \beta, b \) are positive constants [11] and \( \xi \) is a parameter associated with the thickness of the diffuse interface. Assume that the initial conditions satisfy \( u_{\text{ini}}, p_{\text{ini}} \in C^2(\Omega) \) and the Dirichlet boundary conditions satisfy \( u_{\partial \Omega}, p_{\partial \Omega} \in C(\partial \Omega) \).

The function \( g \) in the reaction term [6] can be an arbitrary function of \( u \) and \( p \), which covers several well known variations of the phase field model such as the Kobayashi model [31] or some of the simpler models proposed in [11, 9]. In addition, we require that \( g \) is subject to a “limiter” function \( \Lambda \in C^1(\mathbb{R}) \) that bounds the range of \( g \) to a fixed interval \( [H_{\text{inf}}, H_{\text{sup}}] \), which is vital to the convergence analysis. For example, a suitable choice is

\[
\Lambda(x) = \begin{cases} 
  x & x \in [H_0, H_1], \\
  H_1 + \frac{2}{\pi} \left( H_{\text{sup}} - H_1 \right) \arctan \left( \frac{2 x - H_1}{H_{\text{sup}} - H_1} \right) & x \in (H_1, +\infty), \\
  H_0 + \frac{2}{\pi} \left( H_{\text{inf}} - H_0 \right) \arctan \left( \frac{2 x - H_0}{H_{\text{inf}} - H_0} \right) & x \in (-\infty, H_0),
\end{cases}
\]

where \( H_{\text{inf}} < H_0 < H_1 < H_{\text{sup}} \). On the other hand, during simulations using the above cited models, the term \( g(u, p) \) remains bounded and thus introducing \( \Lambda \) with a sufficiently wide interval \( [H_0, H_1] \) (where \( \Lambda(x) = x \)) has no practical implications.

3. Finite Volume Method on an Unstructured Mesh

Let \( B \subset \mathbb{R}^3 \). The 3- or 2-dimensional Lebesgue measure of the set \( B \) will be denoted \( m(B) \) or \( \tilde{m}(B) \), respectively. In cases where the dimension of the object in question is clear, the tilde will be omitted. The definitions in this section agree with [22].

Definition 1. Let \( \Pi \subset 2^\Omega \) be a set such that for all \( K \in \Pi, K \) is polygonal and convex, and let \( \mathcal{E} \) be the set of all faces. If \( \Pi \) and \( \mathcal{E} \) satisfy
1. $\bigcup_{K \in \mathcal{D}} K = \Omega$
2. $\forall K \in \mathcal{E} : \exists \mathcal{E}_K \subset \mathcal{E} : \partial K = \bigcup_{\sigma \in \mathcal{E}_K} \mathcal{P}_\sigma$
3. $(\forall K, L \in \mathcal{E}) \left( K \neq L \Rightarrow \left( m(K \cap L) = 0 \lor (\exists \sigma \in \mathcal{E} (K \cap L = \sigma)) \right) \right)$
4. $(\exists P \subset \Omega) \left( (\forall K \in \mathcal{E}) (\exists x_k \in P) (x_K \in \mathcal{K}) \land (\forall x \in P) (\exists K \in \mathcal{E} (x \in \mathcal{K})) \right)$
5. $(\forall K, L \in \mathcal{E}) \left( K \neq L \Rightarrow (x_k \neq x_L \land (x_K x_L \parallel K \cap L)) \right)$

then we call $\mathcal{E}$ an admissible mesh and $\mathcal{E}$ the set of faces associated with the mesh $\mathcal{E}$.

The elements of $\mathcal{E}$ are called finite volumes (or cells). Definition 1 ensures that two finite volumes only intersect at a point or a face and that the line segment connecting two significant points representing two adjacent volumes will always be perpendicular to their common face. Let $\mathcal{D}_{K,L}$ denote the line segment connecting two significant points $x_K x_L \parallel K \cap L$. Let $K \in \mathcal{E}$ such that $\exists \sigma \in \mathcal{E}_K : \sigma \subset \partial \Omega$. Assume that $x_K \notin \sigma$, then denote $\mathcal{D}_{K,\sigma} \equiv \tilde{x}_K y_\sigma$, where $y_\sigma$ is chosen such that $\mathcal{D}_{K,\sigma} \perp \sigma$. In agreement with [22], we use the following conventions:

- $\mathcal{E}_{\text{ext}} = \{ \sigma \in \mathcal{E} : \sigma \subset \partial \Omega \}, \mathcal{E}_{\text{int}} = \mathcal{E} - \mathcal{E}_{\text{ext}}$.
- For a face such that $\sigma = K|L \equiv K \cap L$, let $d_\sigma = |\mathcal{D}_{K,L}|$ be the Euclidean distance between points $x_K$ and $x_L$. Similarly, we define $d_{K,\sigma} = |\mathcal{D}_{K,\sigma}|$. For $\sigma \in \mathcal{E}_K \cap \mathcal{E}_{\text{ext}}$, we put $d_\sigma \equiv d_{K,\sigma}$.
- $\tau_{\sigma} \equiv \frac{m(\sigma)}{d_\sigma}$.
- $\mathcal{H}^1$ denotes the set of all functions $w : \mathcal{P} \to \mathbb{R}$, where $\mathcal{P}$ has the meaning of the set of all significant points of $\mathcal{E}$, given by Definition 1. For $w \in \mathcal{H}^1$, the simplified notation

$$w_K \equiv w(x_K) \quad \forall K \in \mathcal{E}$$

will be used.

**Remark.** Every admissible mesh satisfies

$$\sum_{\sigma \in \mathcal{E}} m(\sigma) d_\sigma = 3m(\Omega).$$

**Proof.** For each $\sigma \in \mathcal{E}_{\text{int}}$, $\sigma = K|L$, we have $d_\sigma = d_{K,\sigma} + d_{L,\sigma}$. Thanks to the orthogonality condition 5 in Definition 1, the expression $\sum_{\sigma \in \mathcal{E}_{\text{int}}} m(\sigma) d_\sigma$ represents the sum of volumes of the pyramids with base $\sigma$ and some vertex $x_K$ such that $\sigma \in \mathcal{E}_K$. These pyramids exactly cover the volume of all cells in $\mathcal{E}$ (recall the definition of $d_\sigma$ when $\sigma \in \mathcal{E}_{\text{int}}$ and when $\sigma \in \mathcal{E}_{\text{ext}}$), which in turn cover the whole domain $\Omega$.

Let $u_{\theta_1}, p_{\theta_1} : \mathcal{P} \to \mathcal{H}^1$ be the numerical solutions of problem (1)–(5) and similarly to (7), denote

$$u_K(t) \equiv u_{\theta_1}(t, x_K), \quad p_K(t) \equiv p_{\theta_1}(t, x_K).$$

Consider the following reformulation of equations (1)–(2)

$$\frac{\partial u}{\partial t} - \Delta u = L \frac{\partial p}{\partial t},$$
$$\frac{\partial p}{\partial t} - \Delta p = \frac{1}{\xi} f_0 (p) - b_0 \frac{1}{\xi} A(u, p).$$

By integrating (9) and (10) over a finite volume $K \in \mathcal{E}$ and using Green’s formula, we obtain

$$\int_K \frac{\partial u}{\partial t} (t, x) \, dx - \int_{\partial K} \nabla u(t, x) \cdot n \, dS = L \int_K \frac{\partial p}{\partial t} (t, x) \, dx,$$
\[
\alpha \int_{\Omega} \frac{\partial u}{\partial t}(t, x) \, dx - \int_{\partial \Omega} \nabla p(t, x) \cdot n \, dS = 0,
\]
\[
\int_{K} \frac{\partial p}{\partial t}(t, x) \, dx = \frac{1}{\xi^2} \int_{K} f_0(p(t, x)) \, dx - \frac{b\beta}{\xi} \int_{K} A(g(u(x, t) , p(x, t))) \, dx,
\]

where \( n \) is the outward pointing unit normal vector to \( \partial K \). Using additivity of the surface integral, we can rewrite (11) and (12) as

\[
\int_{K} \frac{\partial u}{\partial t}(t, x) \, dx + \sum_{\sigma \in \partial E_K} \int_{\sigma} \nabla u(t, x) \cdot n_{K, \sigma} \, dS = L \int_{K} \frac{\partial p}{\partial t}(t, x) \, dx,
\]

\[
\int_{K} \frac{\partial p}{\partial t}(t, x) \, dx + \sum_{\sigma \in \partial E_K} \int_{\sigma} \nabla p(t, x) \cdot n_{K, \sigma} \, dS = L \int_{K} \frac{\partial p}{\partial t}(t, x) \, dx,
\]

where \( n_{K, \sigma} \) is the unit normal vector to \( \sigma \in \partial E_K \) pointing out of \( \partial K \). The following approximations may be applied to the individual terms in equations (13) and (14)

\[
\int_{K} \frac{\partial p}{\partial t}(t, x) \, dx \to m(K) \hat{p}_K(t),
\]

\[
- \int_{\sigma} \nabla p(t, x) \cdot n_{K, \sigma} \, dS \to F_{K, \sigma}(p_{11}(t), p_{0\Omega}(t)),
\]

\[
\int_{K} \int_{\sigma} f_0(p(t, x)) \, dx \to f_0(K)(t) = m(K) f_0(p_K(t)),
\]

\[
\int_{K} \frac{\partial u}{\partial t}(t, x) \, dx \to m(K) \hat{u}_K(t),
\]

\[
- \int_{\sigma} \nabla u(t, x) \cdot n_{K, \sigma} \, dS \to F_{K, \sigma}(u_{11}(t), u_{0\Omega}(t)),
\]

\[
\int_{K} A(g(u(x, t) , p(x, t))) \, dx \to A_K(t) = m(K) A(g(u_K(t), p_K(t))).
\]

For \( w \in H_h \) and \( w_{0\Omega} \in C(\partial \Omega) \), we define

\[
F_{K, \sigma}(w, w_{0\Omega}) = \begin{cases} -\tau_{\sigma}(w_{L} - w_{K}) & \forall \sigma \in E_{ext}, \sigma = K|L, \\ -\tau_{\sigma}(w_{0\Omega}(y_\sigma) - w_{K}) & \forall \sigma \in E_{ext} \cap E_K, \end{cases}
\]

\[
F_K(w, w_{0\Omega}) = \sum_{\sigma \in \partial E_K} F_{K, \sigma}(w, w_{0\Omega})
\]

for each \( K \in \Pi \). Finally, in the sense of (7), it is natural to define a function \( F(w, w_{0\Omega}) \in H^1 \) as

\[
F(w, w_{0\Omega})(x_K) = \frac{1}{m(K)} F_K(w, w_{0\Omega}).
\]

The approximations (15)–(20) give rise to the semi discrete scheme for the finite volume method

\[
m(K) \hat{u}_K(t) + F_K(u_{11}(t), u_{0\Omega}(t)) = L m(K) \hat{p}_K(t),
\]

\[
am(K) \hat{p}_K(t) + F_K(p_{11}(t), p_{0\Omega}(t)) = \frac{1}{\xi^2} f_0(K)(t)
\]

\[
= \frac{b\beta}{\xi} A_K(t)m(K),
\]

\[
= \frac{b\beta}{\xi} A_K(t)m(K),
\]

\[
− \frac{b\beta}{\xi} A_K(t)m(K),
\]
∀K ∈ Π, ∀t ∈ J, with the initial conditions

\[ p_K(0) = p(0, x_K), \]
\[ u_K(0) = u(0, x_K). \]

The procedure of discretization using FVM led to the system of ordinary differential equations (23) and (24). These equations will be used to prove the existence, uniqueness of the weak solution, and convergence of the numerical scheme.

4. Interpolation Theory

In addition to the approximations presented in the previous section [22], we require a suitable interpolation theory that allows us to perform the proof. For the rest of this section, assume that Π is an admissible mesh in the sense of Definition 1. The notion of a dual mesh is crucial for defining a piecewise linear interpolation of a function from \( H^1_\Pi \).

**Definition 2.** For all \( x_K, x_L \in P \) such that \( x_K \neq x_L, \sigma \equiv K \cap L, (K \cap L) \neq 0 \), define \( \Sigma_{K,L} \equiv \text{convhull} \{ x_K, x_L, \sigma \} \). For all \( \sigma \in E \), define \( \Sigma_{K,\sigma} \equiv \text{convhull} \{ x_K, \sigma \} \), where \( x_K \) is the significant point of the control volume for which \( \sigma \in E_K \).

Then the dual mesh \( \Pi^* \) of \( \Pi \) is defined as

\[ \Pi^* = \{ \Sigma_{K,L} | K \in E_{\text{int}} \} \cup \{ \Sigma_{K,\sigma} | \sigma \in E_{\text{ext}} \}. \]

The elements of the dual mesh are depicted in Figure 1. Next, two interpolation operators will be introduced.

**Definition 3.** Let \( w \in \mathcal{H}^1 \). We define the piecewise constant interpolation operator \( S_{\Pi} : \mathcal{H}^1 \rightarrow \{ f : \Omega \rightarrow \mathbb{R} \} \) as

\[ (S_{\Pi}w)(x) \equiv w(x_K), \forall K \in \Pi, \forall x \in K. \]

The piecewise linear interpolation \( Q_{\Pi} : \mathcal{H}^1 \rightarrow \{ f : \Omega \rightarrow \mathbb{R} \} \) is defined as

\[ (Q_{\Pi}w)(x) \equiv w(x_K) + \frac{1}{\|x_L - x_K\|^2} (x - x_K) \cdot (x_L - x_K) [w(x_L) - w(x_K)] \]

\[ \forall \Sigma_{K,L} \in \Pi^*, x \in \Sigma_{K,L}, \]

and

\[ (Q_{\Pi}w)(x) \equiv w(x_K) + \frac{1}{\|y_\sigma - x_K\|^2} (x - x_K) \cdot (y_\sigma - x_K) [-w(x_K)] \]
∀Σ_{K,τ} ∈ Π^∗, x ∈ Σ_{K,τ}.

**Definition 4.** For v, w ∈ H^Π, we define

\[
(v, w)_Π = \sum_{K \in \Pi} m(K) v_K w_K,
\]

\[
|w|_Π^2 = \sum_{K \in \Pi} (w_K)^2 + \sum_{σ \in E} |σ| \|w_K - w_L\|_2^2 + \sum_{σ \in E} |σ| \|w_L\|_2^2.
\]

**Lemma 1.** Let v, w ∈ H^Π, then the relationships

\[
(v, w)_Π = (S_Π v, S_Π w)_{L^2(Ω)},
\]

\[
|w|_Π^2 = \|S_Π w\|_{L^2(Ω)}^2,
\]

\[
[w]_Π^2 = 3\|\nabla Q_Π w\|_{L^2(Ω)}^2.
\]

hold.

**Proof.** (27) and (28) follow directly from the definition of the respective inner products. To prove (29), we recall **Definition (3), relation (8), and the notations of Figure 3** so that we can write

\[
[w]_Π^2 = \sum_{σ \in E \cap K} \tau_σ (w_K - w_L)^2 + \sum_{σ \in E \cap K} |σ| \|w_K - w_L\|_2^2
\]

\[
= \sum_{σ \in E \cap K} m(σ) (w_K - w_L)^2 + \sum_{σ \in E \cap K} \frac{m(σ)}{d_σ} w_K^2
\]

\[
= \sum_{σ \in E \cap K} m(σ) (d_{K,σ} + d_{L,σ}) \left(\frac{w_K - w_L}{d_σ}\right)^2 + \sum_{σ \in E \cap K} m(σ) \frac{w_K}{d_σ} \left(\frac{w_K}{d_σ}\right)^2
\]

\[
= \sum_{σ \in E \cap K} m(σ) (d_{K,σ} + d_{L,σ}) |\nabla Q_Π w(y_σ)|^2
\]

\[
+ \sum_{σ \in E \cap K} m(σ) d_{K,σ} |\nabla Q_Π w(y_σ)|^2
\]

\[
= \sum_{K \in \Pi} \sum_{σ \in K} m(σ) d_{K,σ} |\nabla Q_Π w(y_σ)|^2
\]

\[
= \sum_{K \in \Pi} \sum_{σ \in K} 3 |\nabla Q_Π w(x)|^2 dx = 3 |\nabla Q_Π w(x)| d_σ = 3 \|\nabla Q_Π w\|_{L^2(Ω)}.
\]

**Lemma 2.** Let Π be an admissible mesh. Then there exists a mesh dependent constant C_Π > 0 such that for all w ∈ H^Π, the inequality

\[
\|Q_Π w\|_{L^2(Ω)} \leq C_Π \|S_Π w\|_{L^2(Ω)}
\]

holds.
Proof. Let \( \Sigma_{K,L} \in \Pi^\ast \) be a cell of the dual mesh and denote \( \sigma = K|L \). From Definition \( \Box \) we easily get

\[
\|\mathbf{S}_Q\|_{L^2(\Sigma_{K,L})}^2 = \frac{1}{3} \tilde{m}(\sigma) \left( d_{K,\sigma} w_K^2 + d_{L,\sigma} w_L^2 \right).
\]

(31)

To evaluate \( \|Q\|_{L^2(\Sigma_{K,L})}^2 \), we represent \( \Sigma_{K,L} \) (see Figure 2) in an affine space centered at \( y_{\sigma} \) with an orthonormal basis \( V = (v_1, v_2, v_3) \) where \( v_1 = \frac{x_L - x_K}{|x_L - x_K|} \). The coordinates of a point \( x \in \Sigma_{K,L} \) in \( V \) will be denoted by \( (\alpha_1, \alpha_2, \alpha_3) \), i.e.

\[
x = y_{\sigma} + \sum_{i=1}^{3} \alpha_i v_i.
\]

By means of this transformation, we have

\[
\|Q\|_{L^2(\Sigma_{K,L})}^2 = \int_{-d_{K,\sigma}}^{d_{K,\sigma}} d\alpha_1 \int_{\tilde{S}(\alpha_1)} d(\alpha_2, \alpha_3) \left[ (Q_1w) \left( y_{\sigma} + \sum_{i=1}^{3} \alpha_i v_i \right) \right]^2
\]

(32)

where

\[
\tilde{S}(\alpha_1) = \left\{ (\alpha_2, \alpha_3) \in \mathbb{R}^2; y_{\sigma} + \sum_{i=1}^{3} \alpha_i v_i \in \Sigma_{K,L} \right\}.
\]

In addition, denote by \( S(\alpha_1) \) the corresponding planar cut through \( \Sigma_{K,L} \), i.e.

\[
S(\alpha_1) = \left\{ y_{\sigma} + \sum_{i=1}^{3} \alpha_i v_i; (\alpha_2, \alpha_3) \in \tilde{S}(\alpha_1) \right\}.
\]

In (32), Definition \( \Box \) allows to evaluate

\[
(Q_1w) \left( y_{\sigma} + \sum_{i=1}^{3} \alpha_i v_i \right) = w_K + \frac{\alpha_1 + d_{K,\sigma}}{d_{L,\sigma} + d_{K,\sigma}} (w_L - w_K)
\]

(33)

which only depends on \( \alpha_1 \). Next, the term \( \int_{\tilde{S}(\alpha_1)} d(\alpha_2, \alpha_3) \) represents the surface area of \( S(\alpha_1) \) which satisfies

\[
\int_{\tilde{S}(\alpha_1)} d(\alpha_2, \alpha_3) = \tilde{m}(S(\alpha_1)) = \begin{cases} \tilde{m}(\sigma) \frac{d_{K,\sigma} + \alpha_1}{d_{K,\sigma}} & \alpha_1 \in [-d_{K,\sigma}, 0], \\ \tilde{m}(\sigma) \frac{d_{L,\sigma} - \alpha_1}{d_{L,\sigma}} & \alpha_1 \in [0, d_{L,\sigma}]. \end{cases}
\]

(34)
Plugging (33) and (34) into (32) and performing the integration with respect to $\alpha_1$ leads to
\[
\|Q^1\|_{L^2(\Sigma_{\text{out}})}^2 = \frac{1}{12} \frac{\tilde{m} (\sigma)}{d_{K,\sigma} + d_{L,\sigma}} \left[ \left( d_{K,\sigma}^2 + 3d_{K,\sigma}d_{L,\sigma} + 3d_{L,\sigma}^2 \right) w_k^2 + 2 \left( d_{K,\sigma}^2 + 3d_{K,\sigma}d_{L,\sigma} + d_{L,\sigma}^2 \right) w_k w_L + \left( 3d_{K,\sigma}^2 + 3d_{K,\sigma}d_{L,\sigma} + d_{L,\sigma}^2 \right) w_L^2 \right].
\]

By the Young inequality, this can be estimated as
\[
\|Q^1\|_{L^2(\Sigma_{\text{out}})}^2 \leq \frac{1}{6} \frac{\tilde{m} (\sigma)}{d_{K,\sigma} + d_{L,\sigma}} \left[ \left( 2d_{K,\sigma}^2 + 2d_{K,\sigma}d_{L,\sigma} + d_{L,\sigma}^2 \right) w_k^2 + \left( 2d_{K,\sigma}^2 + 3d_{K,\sigma}d_{L,\sigma} + 2d_{L,\sigma}^2 \right) w_L^2 \right].
\]

The equality (31) can be rewritten into a similar form
\[
\|S^1\|_{L^2(\Sigma_{\text{out}})}^2 = \frac{1}{6} \frac{\tilde{m} (\sigma)}{d_{K,\sigma} + d_{L,\sigma}} \left[ \left( 2d_{K,\sigma}^2 + 2d_{K,\sigma}d_{L,\sigma} + d_{L,\sigma}^2 \right) w_k^2 + \left( 2d_{K,\sigma}^2 + 3d_{K,\sigma}d_{L,\sigma} + 2d_{L,\sigma}^2 \right) w_L^2 \right].
\]

Defining
\[
C_{K,L} \equiv \max \left\{ \frac{d_{K,\sigma}^2 + 3d_{K,\sigma}d_{L,\sigma} + d_{L,\sigma}^2}{2d_{K,\sigma}^2 + 2d_{K,\sigma}d_{L,\sigma}}, \frac{2d_{K,\sigma}^2 + 3d_{K,\sigma}d_{L,\sigma} + 2d_{L,\sigma}^2}{2d_{K,\sigma}^2 + 2d_{K,\sigma}d_{L,\sigma}} \right\},
\]
we observe that
\[
\|Q^1\|_{L^2(\Sigma_{\text{out}})}^2 \leq C_{K,L} \|S^1\|_{L^2(\Sigma_{\text{out}})}^2.
\]
Note that $C_{K,L}$ is only dependent on the ratio between $d_{K,\sigma}$ and $d_{L,\sigma}$, not on their absolute values. Namely, it is independent of $w$ and of any mesh refinement as long as the geometry of the cells remains unchanged.

An analogous inequality in the form
\[
\|Q^1\|_{L^2(\Sigma_{\text{in}})}^2 \leq C_{K,L} \|S^1\|_{L^2(\Sigma_{\text{in}})}^2
\]
can be derived for the dual cells $\Sigma_{K,\sigma}$ at the boundary of $\Omega$. Define
\[
C^1 \equiv \max \left( \{ C_{K,L}; K \in \mathcal{E}_{\text{int}} \} \cup \{ C_{K,\sigma}; \sigma \in \mathcal{E}_{\text{ext}} \} \right).
\]

Summing up the estimates
\[
\|Q^1\|_{L^2(\Sigma_{\text{out}})}^2 \leq C_{K,L} \|S^1\|_{L^2(\Sigma_{\text{out}})}^2,
\]
\[
\|Q^1\|_{L^2(\Sigma_{\text{in}})}^2 \leq C_{K,L} \|S^1\|_{L^2(\Sigma_{\text{in}})}^2,
\]
over all cells of the dual mesh concludes the proof.

5. Convergence

The existence, uniqueness of the weak solution and convergence of the numerical scheme will be shown using a single procedure that relies on an a priori estimate to ensure boundedness of the respective numerical solutions. This estimate is independent of mesh refinement. The procedure uses and expands upon some of the ideas presented in [11] and [10]. For the sake of simplicity, the homogeneous Dirichlet boundary conditions
\[
u_{|\partial \Omega} = 0, \quad p_{|\partial \Omega} = 0
\]
are considered, allowing to simplify (31) and (32) to
\[
F_{K,\sigma} (w_{\Omega}) \equiv F_{K,\sigma} (w_{\Omega}, 0), \quad F_K (w_{\Omega}) \equiv F_K (w_{\Omega}, 0), \quad F (w_{\Omega}) \equiv F (w_{\Omega}, 0) \quad \forall w \in \mathcal{H}^1_{\Omega}
\]
5.1. Weak Formulation

Testing the equations (1)–(2) by \( \psi, \varphi \in C_0^\infty (\mathcal{J}) \) and \( v, q \in C_0^\infty (\Omega) \), the weak formulation

\[
\int_0^T \frac{d}{dt} \int_\Omega u(t, x) v(x) \, dx \, dt + \int_0^T \int_\Omega \nabla u(t, x) \cdot \nabla v(x) \, dx \, dt = \int_0^T \frac{d}{dt} \int_\Omega Lp(t, x) v(x) \, dx \, dt,
\]

arises, completed by the initial conditions

\[
u \big|_{t=0} = u_{ini}, \quad p \big|_{t=0} = p_{ini}. \tag{3} \]

**Definition 5.** A pair of functions \((u, p)\), such that \( u \in L^2 \left( \mathcal{J}; H_0^1 (\Omega) \right), \, p \in L^2 \left( \mathcal{J}; H_0^1 (\Omega) \right) \) that satisfy (36)–(37) with the initial conditions (3) for all \( \psi, \varphi \in C_0^\infty (\mathcal{J}) \) and all \( v, q \in C_0^\infty (\Omega) \) is called the weak solution of the problem (1)–(3) with the boundary conditions (4).

5.2. A priori Estimates

Let \( \Pi \) be an admissible mesh. Consider the semi-discrete scheme (23), (24). Multiplying equation (23) by \( \dot{u}_K (t) \) and equation (24) by \( \dot{p}_K (t) \) respectively, summing each of them over all \( K \in \Pi \) and using the definition of \((u, v)_\Pi\) yields

\[
\| \dot{u}_0 (t) \|_{1, \Pi}^2 + \| F (u_0 (t), \dot{u}_0 (t)) \|_{1, \Pi} = L (\dot{p}_0 (t), \dot{u}_0 (t))_{\Pi}, \tag{38}
\]

\[
\alpha \xi^2 \| \dot{p}_0 (t) \|_{1, \Pi}^2 + \xi^2 \| F (p_0 (t), \dot{p}_0 (t)) \|_{1, \Pi} = \sum_{K \in \Pi} m(K) f_0 (p_K (t)) \dot{p}_K (t) \tag{39}
\]

Using the chain rule and the fact that \( f_0 \) is the derivative of the double well potential \( w_0 \) (see [16, 11] and the proof of Lemma 3), we obtain

\[
f_0 (p(t)) \dot{p}_K (t) = - \frac{d w_0}{dt} (p_K (t)). \tag{40}
\]

Rewriting expression I. using (40), we get

\[
\sum_{K \in \Pi} m(K) f_0 (p_K (t)) \dot{p}_K (t) = \sum_{K \in \Pi} \frac{d w_0}{dt} (p_K (t)) m(K). \tag{41}
\]

The Schwarz and Young inequalities applied on the right hand side of (38) and (39) together with the boundedness of \( \Lambda \) (bounded by the constant \( B \)) and (41) give
\[
\frac{1}{2} \|\dot{u}_1(t)\|_{\Omega}^2 + (F(u_1(t)), u_1(t))_{\Omega} \leq \frac{1}{2} \|\dot{p}_1(t)\|_{\Omega}^2, \tag{42}
\]

\[
\frac{1}{2} \alpha \xi^2 \|\dot{p}_1(t)\|_{\Omega}^2 + \xi^2 (F(p_1(t)), \dot{p}_1(t))_{\Omega} + \frac{d}{dt} \sum_{K \in \Omega} w_0(p_K(t)) m(K)
\]
\[
\leq \frac{(h\beta)^2}{2\alpha} - B^2 m(\Omega). \tag{43}
\]

Multiplying (42) by \( \frac{\alpha \xi^2}{2L^2} \) and adding it to (43) results in a single inequality

\[
\frac{1}{4} \alpha \xi^2 \|\dot{p}_1(t)\|_{\Omega}^2 + \frac{1}{4L^2} \|\dot{u}_1(t)\|_{\Omega}^2 + \xi^2 (F(p_1(t)), \dot{p}_1(t))_{\Omega} + \frac{d}{dt} \sum_{K \in \Omega} w_0(p_K(t)) m(K)
\]
\[
\leq \frac{(h\beta)^2}{2\alpha} - B^2 m(\Omega). \tag{44}
\]

We reformulate the terms I. and II. Under the assumption (35), the term I. can be rewritten by summation over faces \( \sigma \in \mathcal{E} \) instead of cells \( K \in \Omega \) as follows

\[
I. = \sum_{k \in \Omega} \left( \sum_{\sigma \in \mathcal{E}_k} F_{K,\sigma} (p_1(t)) \right) \dot{p}_1(t)
\]
\[
= \sum_{k \in \Omega} \sum_{\sigma \in \mathcal{E}_k} - \tau_\sigma (p_L(t) - p_K(t)) \dot{p}_L(t)
\]
\[
+ \sum_{k \in \Omega} \sum_{\sigma \in \mathcal{E}_k} - \tau_\sigma (-p_K(t)) \dot{p}_L(t)
\]
\[
= - \sum_{\sigma \in \mathcal{E}_k} \tau_\sigma \left[ (p_L(t) - p_K(t)) \dot{p}_K(t) + (p_K(t) - p_L(t)) \dot{p}_L(t) \right]
\]
\[
+ \sum_{\sigma \in \mathcal{E}_k} \tau_\sigma p_K(t) \dot{p}_K(t)
\]
\[
= \frac{1}{2} \sum_{\sigma \in \mathcal{E}_k} \tau_\sigma \left[ \frac{d}{dt} (p_K(t))^2 - \frac{d}{dt} (p_L(t))p_K(t) + \frac{d}{dt} (p_K(t))^2 \right]
\]
\[
+ \frac{1}{2} \sum_{\sigma \in \mathcal{E}_k} \tau_\sigma \frac{d}{dt} (p_K(t))^2
\]
\[
= \frac{1}{2} \frac{d}{dt} \sum_{\sigma \in \mathcal{E}_k} \tau_\sigma [p_K(t) - p_L(t)]^2 + \frac{1}{2} \frac{d}{dt} \sum_{\sigma \in \mathcal{E}_k} \tau_\sigma (p_K(t))^2.
\]

An analogous calculation performed on term II. together with Definition 4 give

\[
I. = \frac{1}{2} \frac{d}{dt} \|u_1(t)\|_{\Omega}^2, \quad II. = \frac{1}{2} \frac{d}{dt} \|p_1(t)\|_{\Omega}^2. \tag{46}
\]

The identities (46) make it possible to write (44) in the form
\[ \frac{1}{4} \alpha \xi^2 \| \dot{p}_\Omega (t) \|_H^2 + \frac{1}{4} \alpha \xi^2 \| u_{\Omega} (t) \|_H^2 + \frac{1}{2} \xi^2 \frac{d}{dt} \| p_{\Omega} (t) \|_H^2 \]
\[ + \frac{1}{2} \xi^2 \frac{d}{dt} \| u_{\Omega} (t) \|_H^2 + \frac{d}{dt} \sum_{k} w_0 (p_K(t)) m(K) \]
\[ \leq \frac{(b \beta)^2}{2 \alpha} B^2 m(\Omega). \]

At this point, the inequality (47) will be used in two different ways. The first result will be used within the derivation of the second to obtain the final estimate. First, the nonnegative terms \| p_{\Omega} (t) \|_H^2 and \| u_{\Omega} (t) \|_H^2 are omitted from the left hand side of (47) and the nonnegative expression

\[ \xi^2 \frac{1}{2} \| p_{\Omega} (t) \|_H^2 + \frac{1}{2} \xi^2 \| u_{\Omega} (t) \|_H^2 + \sum_{k} w_0 (p_K(t)) m(K) \]

is added to the right hand side of (47), giving rise to

\[ \frac{1}{2} \xi^2 \frac{d}{dt} \| p_{\Omega} (t) \|_H^2 + \frac{1}{2} \xi^2 \frac{d}{dt} \| u_{\Omega} (t) \|_H^2 + \frac{d}{dt} \sum_{k} w_0 (p_K(t)) m(K) \]
\[ \leq \xi^2 \frac{1}{2} \| p_{\Omega} (t) \|_H^2 + \frac{1}{2} \xi^2 \| u_{\Omega} (t) \|_H^2 + \sum_{k} w_0 (p_K(t)) m(K) \]
\[ + \frac{(b \beta)^2}{2 \alpha} m(\Omega) B^2. \]

Let \( s \in J \). Substituting \( t \) for \( s \), multiplying the whole inequality by \( e^{-s} \) leads to

\[ \frac{d}{ds} \left( \frac{1}{2} \xi^2 \| p_{\Omega} (s) \|_H^2 + \frac{\alpha \xi^2}{4 \lambda} \| u_{\Omega} (s) \|_H^2 + \sum_{k} w_0 (p_K(s)) m(K) \right) e^{-s} \]
\[ \leq \frac{(b \beta)^2}{2 \alpha} B^2 m(\Omega) e^{-t}. \]

Integrating with respect to \( s \) over \( (0, t) \) gives

\[ \frac{1}{2} \xi^2 \| p_{\Omega} (t) \|_H^2 + \frac{\alpha \xi^2}{4 \lambda} \| u_{\Omega} (t) \|_H^2 + \sum_{k} w_0 (p_K(t)) m(K) \]
\[ \leq \left( \frac{1}{2} \xi^2 \| p_{\Omega} (0) \|_H^2 + \frac{\alpha \xi^2}{4 \lambda} \| u_{\Omega} (0) \|_H^2 \right) e^t + \left( \sum_{k} w_0 (p_K(0)) m(K) \right) e^t \]
\[ + \frac{(b \beta)^2}{2 \alpha} B^2 m(\Omega) (e^t - 1). \]

This inequality will be used as part of the next estimate.

Revisiting (47) and adding the nonnegative expression (48) to the right hand side yields
The relationship (50) is used to estimate the integral on the right hand side

\[ \frac{1}{4} \alpha \varepsilon^2 \| \dot{p}_t \|_{\Omega}^2 + \frac{1}{4} \alpha \varepsilon^2 \| u_t \|_{\Omega}^2 \]

\[ + \frac{1}{2} \frac{d}{dt} \left( \varepsilon^2 \| p_t \|_{\Omega}^2 \right) + \frac{1}{4} \frac{d}{dt} \left( \alpha \varepsilon^2 \| u_t \|_{\Omega}^2 \right) + \frac{d}{dt} \sum_{k_{\text{cell}}} w_0 (p_k(t)) m(K) \]

\[ \leq \frac{(b \beta)^2}{2 \alpha} B^2 m(\Omega) + \frac{1}{2} \varepsilon^2 \| p_t \|_{\Omega}^2 \]

\[ + \frac{1}{2} \frac{d}{dt} \| u_t \|_{\Omega}^2 + \sum_{k_{\text{cell}}} w_0 (p_k(t)) m(K). \]

Integrating this estimate with respect to \( t \) over \( J = (0, T) \) gives

\[ \int_0^T \frac{1}{4} \alpha \varepsilon^2 \| \dot{p}_t \|_{\Omega}^2 \, dt + \int_0^T \frac{1}{4} \alpha \varepsilon^2 \| u_t \|_{\Omega}^2 \, dt + \frac{1}{2} \varepsilon^2 \| p_t \|_{\Omega}^2 \]

\[ + \frac{1}{2} \frac{d}{dt} \left( \varepsilon^2 \| p_t \|_{\Omega}^2 \right) + \frac{1}{4} \frac{d}{dt} \left( \alpha \varepsilon^2 \| u_t \|_{\Omega}^2 \right) + \frac{d}{dt} \sum_{k_{\text{cell}}} w_0 (p_k(t)) m(K) \]

\[ \leq \frac{1}{2} \varepsilon^2 \| p_t(0) \|_{\Omega}^2 + \frac{1}{2} \frac{d}{dt} \| u_t(0) \|_{\Omega}^2 + \sum_{k_{\text{cell}}} w_0 (p_k(0)) m(K) \]

\[ + \int_0^T \frac{1}{2} \varepsilon^2 \| p_t \|_{\Omega}^2 + \frac{1}{2} \frac{d}{dt} \| u_t \|_{\Omega}^2 + \sum_{k_{\text{cell}}} w_0 (p_k(t)) m(K) \]

\[ + \int_0^T \sum_{k_{\text{cell}}} w_0 (p_k(t)) m(K) \, dt + \frac{(b \beta)^2}{2 \alpha} B^2 m(\Omega) T. \] (52)

The relationship (50) is used to estimate the integral on the right hand side

\[ \int_0^T \frac{1}{2} \varepsilon^2 \| p_t \|_{\Omega}^2 + \frac{1}{2} \frac{d}{dt} \| u_t \|_{\Omega}^2 + \sum_{k_{\text{cell}}} w_0 (p_k(t)) m(K) \, dt \]

\[ \leq \int_0^T \left\{ \frac{1}{2} \varepsilon^2 \| p_t(0) \|_{\Omega}^2 e^t + \frac{1}{2} \frac{d}{dt} \| u_t(0) \|_{\Omega}^2 e^t \right\} dt \]

\[ + \left( \sum_{k_{\text{cell}}} w_0 (p_k(0)) m(K) \right) e^t + \left( \frac{(b \beta)^2}{2 \alpha} B^2 m(\Omega) \left( e^t - 1 \right) \right) \}

\[ = \left\{ \frac{1}{2} \varepsilon^2 \| p_t(0) \|_{\Omega}^2 + \frac{1}{2} \frac{d}{dt} \| u_t(0) \|_{\Omega}^2 \right\} e^t \]

\[ + \left( \sum_{k_{\text{cell}}} w_0 (p_k(0)) m(K) \right) + \left( \frac{(b \beta)^2}{2 \alpha} B^2 m(\Omega) \right) \left( e^t - 1 \right) - \frac{(b \beta)^2}{2 \alpha} B^2 m(\Omega) T. \]

Using this estimate to simplify the right hand side of (52) results in
Using (56) and Lemma 1, the estimate (53) can be rewritten as

\[
\int_0^T \frac{1}{4} \alpha \xi^2 \|p_{(t)}(t)\|_{\tilde{H}^1}^2 \, dt + \int_0^T \frac{1}{4} \alpha \xi^2 \|u_{(t)}(t)\|_{\tilde{H}^1}^2 \, dt + \frac{1}{2} \xi^2 \|p_{(t)}(T)\|_{\tilde{H}^1}^2 + \frac{1}{2} \xi^2 \|u_{(t)}(T)\|_{\tilde{H}^1}^2 \\
+ \frac{1}{2} \xi^2 \|u_{(t)}(T)\|_{\tilde{H}^1}^2 + \left( \sum_{k \in \mathbb{I}} w_0(p_k(T)) m(K) \right) \leq \frac{1}{2} \xi^2 \|p_{(t)}(0)\|_{\tilde{H}^1}^2 + \frac{\alpha \xi^2}{2L^2} \|u_{(t)}(0)\|_{\tilde{H}^1}^2 + \left( \sum_{k \in \mathbb{I}} w_0(p_k(0)) m(K) \right) \varepsilon_T \\
+ \frac{(b \beta^2)}{2 \alpha} B^2 m(\Omega) \left( \varepsilon_T - 1 \right) .
\]  

(53)

**Lemma 3.** There exists a constant \( c_w > 0 \) such that

\[ w_0(x) + c_w \geq x^2 \quad \forall x \in \mathbb{R}. \]  

(54)

**Proof.** Consider the relationship between \( f_0 \) and \( w_0 \)

\[ w_0(x) = - \int_0^x f_0(s) \, ds = \frac{1}{4} x^2 (x - 1)^2. \]

We rewrite the expression

\[ w_0(x) - x^2 = \frac{1}{4} x^2 [(x - 1)^2 - 4] = \frac{1}{4} x^2 (x + 1)(x - 3), \]

which shows that for any \( x > 3 \) or \( x < -1 \), (55) is positive. Hence the inequality (54) holds for any \( c_w \geq 0 \) when \( x \in (-\infty, -1) \cup (3, +\infty) \). We extend this inequality to any \( x \in \mathbb{R} \) by setting

\[ c_w \equiv \min_{x \in (-1, 3]} \frac{1}{4} x^2 (x + 1)(x - 3). \]

We apply Lemma [5] by estimating

\[ \sum_{k \in \mathbb{I}} w_0(p_k(t)) m(K) \geq \sum_{k \in \mathbb{I}} p_k^2(t) m(K) - (c_w, 1)_{\tilde{H}^1} \]

\[ = \|p_{(t)}(t)\|_{\tilde{H}^1}^2 - (c_w, 1)_{\tilde{H}^1} \]

\[ \geq - (c_w, 1)_{\tilde{H}^1}. \]  

(56)

Using (56) and Lemma [1], the estimate (53) can be rewritten as

\[
\int_0^T \frac{1}{4} \alpha \xi^2 \|S_{(t)} p_{(t)}(t)\|_{L^2(\Omega)}^2 \, dt + \int_0^T \frac{1}{4} \alpha \xi^2 \|S_{(t)} u_{(t)}(t)\|_{L^2(\Omega)}^2 \, dt \\
+ \frac{3}{2} \xi^2 \|\nabla Q_{(t)} p_{(t)}(t)\|_{L^2(\Omega)}^2 + \frac{3}{2} \frac{\alpha \xi^2}{2L^2} \|\nabla Q_{(t)} u_{(t)}\|_{L^2(\Omega)}^2 \\
\leq \frac{1}{2} \xi^2 \|p_{(t)}(0)\|_{\tilde{H}^1}^2 + \frac{\alpha \xi^2}{2L^2} \|u_{(t)}(0)\|_{\tilde{H}^1}^2 + \left( \sum_{k \in \mathbb{I}} w_0(p_k(0)) m(K) \right) \varepsilon_T \\
+ \frac{(b \beta^2)}{2 \alpha} B^2 m(\Omega) \left( \varepsilon_T - 1 \right) + (c_w, 1)_{\tilde{H}^1}. \]

(57)
5.3. Convergence of the Numerical Solution

All the quantities on the left hand side of (57) are nonnegative, thus the left hand side is bounded from below. The estimate (57) shows that the left hand side is also bounded from above. This implies that all of the expressions on the left hand side of (57) are bounded. Interpreting this boundedness in the context of Bochner spaces, we get

\[
\frac{\partial}{\partial t} S_{\Pi} p_{\Pi} = S_{\Pi} p_{\Pi} \in L^2 \left( \mathcal{J}; L^2 (\Omega) \right),
\]

(58)

\[
\frac{\partial}{\partial t} S_{\Pi} u_{\Pi} = S_{\Pi} u_{\Pi} \in L^2 \left( \mathcal{J}; L^2 (\Omega) \right).
\]

(59)

Furthermore, using Lemma 2, it also holds that

\[
\frac{\partial}{\partial t} Q_{\Pi} p_{\Pi} \in L^2 \left( \mathcal{J}; L^2 (\Omega) \right),
\]

\[
\frac{\partial}{\partial t} Q_{\Pi} u_{\Pi} \in L^2 \left( \mathcal{J}; L^2 (\Omega) \right).
\]

The finite Bochner norms together with the boundedness of \( \Omega \) and \( \mathcal{J} \) imply essential boundedness

\[
S_{\Pi} p_{\Pi} \in L^\infty \left( \mathcal{J}; L^2 (\Omega) \right),
\]

(60)

\[
Q_{\Pi} p_{\Pi} \in L^\infty \left( \mathcal{J}; H^1_0 (\Omega) \right),
\]

(61)

Finally, the estimate (57) also gives

\[
Q_{\Pi} u_{\Pi} \in L^\infty \left( \mathcal{J}; H^1_0 (\Omega) \right).
\]

(62)

In order to facilitate the subsequent analysis, we introduce the concept of a normal sequence of meshes.

**Definition 6.** The norm of an admissible mesh \( \Pi \) is defined as

\[
|| | \Pi | || \equiv \max_{K \in \Pi} \inf \left\{ r > 0 \mid \exists x_0 \in \mathbb{R}^3 : \forall x \in K : |x - x_0| < r \right\}.
\]

A sequence of admissible meshes \((\Pi_n)\) is called **normal** if and only if \[ \lim_{n \to +\infty} | | \Pi_n | | = 0. \]

**Lemma 4.** Let \( w \in L^2 (\Omega) \) and \( \Pi_n \) be a normal sequence of admissible meshes. Then

\[
S_{\Pi_n} P_{\Pi_n} w \to w \text{ in } L^2 (\Omega).
\]

(63)

**Lemma 4** is a consequence of the definition of the operators \( S_{\Pi_n}, P_{\Pi_n} \), and Lebesgue integration theory [32].

**Lemma 5.** Let \( u_{ini}, p_{ini} \in C^2 (\Omega) \) and let \((\Pi_n)\) be a normal sequence of admissible meshes. Then there exists an increasing sequence \((k_n) \subset \mathbb{N}\) and functions \( p, u \in L^2 \left( \mathcal{J}; H^1_0 (\Omega) \right) \) with the derivatives \( \frac{\partial p}{\partial t}, \frac{\partial u}{\partial t} \in L^2 \left( \mathcal{J}; L^2 (\Omega) \right) \) such that for \( n \to +\infty \), the following holds:

\[
Q_{\Pi_n} p_{\Pi_n} \to p,
\]

(64)

\[
S_{\Pi_n} p_{\Pi_n} \to p,
\]

(65)

\[
S_{\Pi_n} p_{\Pi_n} \to \frac{\partial p}{\partial t},
\]

(66)

\[
Q_{\Pi_n} u_{\Pi_n} \to u,
\]

(67)

\[
S_{\Pi_n} u_{\Pi_n} \to u,
\]

(68)

\[
Q_{\Pi_n} u_{\Pi_n} \to \frac{\partial u}{\partial t}.
\]
in $L^2 \left( \mathcal{J}; L^2 (\Omega) \right)$.

**Proof.** For each admissible mesh $\Pi_n$, the solutions of the semi-discrete problem (22) and (24) are $u_{\Pi_n}$ and $p_{\Pi_n}$. Let us recall the right hand side of (57) and label the terms as follows:

\[
\begin{align*}
&\text{I.} \quad \frac{1}{2} \xi^2 \left[ p_{\Pi_n} (0) \right]_{\Pi_n}^2 + \alpha \xi^2 \left[ q_{\Pi_n} (0) \right]_{\Pi_n}^2 \\
&\text{II.} \quad \left( \sum_{k \in V_n} w_0 (p_K (0)) m(K) \right) \xi^2 + \left( \frac{b g \Omega^2}{2 \alpha} m(\Omega) B^2 \xi^2 \right) (\xi^2 - 1) + (c_n, 1)_{\Pi_n}, \\
&\text{III.} \quad \left( \sum_{k \in V_n} w_0 (p_K (0)) m(K) \right) \xi^2 + \left( \frac{b g \Omega^2}{2 \alpha} m(\Omega) B^2 \xi^2 \right) (\xi^2 - 1) + (c_n, 1)_{\Pi_n}, \\
&\text{IV.} \quad \left( \sum_{k \in V_n} w_0 (p_K (0)) m(K) \right) \xi^2 + \left( \frac{b g \Omega^2}{2 \alpha} m(\Omega) B^2 \xi^2 \right) (\xi^2 - 1) + (c_n, 1)_{\Pi_n}.
\end{align*}
\]

We show that (69) is uniformly bounded with respect to $n$. IV. is just a constant and does not depend on $n$. The assumption $u_{\Pi_n}, p_{\Pi_n} \in C^2 (\Omega)$ implies the uniform boundedness of $p_{\Pi_n} (0)$ w.r.t. $n$. Since $u_0$ is a continuous function, the whole term III. is bounded. Terms I. and II. are treated in the same way and so the procedure will only be shown for term I. Thanks to (35), we have

\[ \| p_{\Pi_n} (0) \|_{n, \text{ext}} = 0. \]

Taking this into account, we can estimate I. as follows:

\[
\begin{align*}
\| [p_{\Pi_n} (0)]_{n, \text{int}} \| & = \left\| \sum_{\sigma \in E_{\Pi_n}} m(\sigma) d_{\sigma} [p_K (0) - p_L (0)] \right\| \\
& \leq \sum_{\sigma \in E_{\Pi_n}} m(\sigma) d_{\sigma} \left\| \frac{p_K (0) - p_L (0)}{d_{\sigma}} \right\| ^2 \\
& \leq 3 m(\Omega) C_\beta^2,
\end{align*}
\]

where $C_\beta$ is a constant that bounds the difference quotient $\frac{p_K (0) - p_L (0)}{d_{\sigma}}$ independently of $n$.

Since all of the terms on the right hand side of (57) are uniformly bounded in $n$, the left hand side must also be bounded (the left hand side is nonnegative). This implies

- $(S_{\Pi_n} p_{\Pi_n}), (Q_{\Pi_n} p_{\Pi_n}), (S_{\Pi_n} u_{\Pi_n})$ and $(Q_{\Pi_n} u_{\Pi_n})$ are uniformly bounded in $L^2 \left( \mathcal{J}; L^2 (\Omega) \right)$,
- $(S_{\Pi_n} p_{\Pi_n})$ and $(S_{\Pi_n} u_{\Pi_n})$ are uniformly bounded in $L^\infty \left( \mathcal{J}; L^2 (\Omega) \right)$,
- $(Q_{\Pi_n} p_{\Pi_n})$ and $(Q_{\Pi_n} u_{\Pi_n})$ are uniformly bounded in $L^\infty \left( \mathcal{J}; H^1_0 (\Omega) \right)$.

Since the inclusions $L^\infty \left( \mathcal{J}; L^2 (\Omega) \right) \subset L^2 \left( \mathcal{J}; L^2 (\Omega) \right)$ and $L^\infty \left( \mathcal{J}; H^1_0 (\Omega) \right) \subset L^2 \left( \mathcal{J}; H^1_0 (\Omega) \right)$ hold, a weakly convergent subsequence for each of the sequences exists. Let $(h_n)$ be the sequence for which

$(S_{\Pi_n} p_{\Pi_n}), (Q_{\Pi_n} p_{\Pi_n}), (S_{\Pi_n} u_{\Pi_n}), (Q_{\Pi_n} u_{\Pi_n})$

are weakly convergent. From $(h_n)$ we choose $(h_n)$ so that in addition to this

$(S_{\Pi_n} u_{\Pi_n}), (Q_{\Pi_n} u_{\Pi_n}), (S_{\Pi_n} u_{\Pi_n}), (Q_{\Pi_n} u_{\Pi_n})$

are weakly convergent. To simplify notation, we will use $\Pi_n$ to denote $\Pi_n$ in the following. Altogether, we may write

- $(S_{\Pi_n} p_{\Pi_n}), (Q_{\Pi_n} p_{\Pi_n}), (S_{\Pi_n} u_{\Pi_n})$ and $(Q_{\Pi_n} u_{\Pi_n})$ are weakly convergent in $L^2 \left( \mathcal{J}; L^2 (\Omega) \right)$,
- $(S_{\Pi_n} p_{\Pi_n})$ and $(S_{\Pi_n} u_{\Pi_n})$ are weakly convergent in $L^2 \left( \mathcal{J}; L^2 (\Omega) \right)$,
- $(Q_{\Pi_n} p_{\Pi_n})$ and $(Q_{\Pi_n} u_{\Pi_n})$ are weakly convergent in $L^2 \left( \mathcal{J}; H^1_0 (\Omega) \right)$.
Hence, the strong convergence of \( \Pi \) denoted again as operators gives Lemma 6.

Let \( q \) and \( u \) we will denote these limits \( \eta \) and \( \eta \). Using the compact embedding results from [32, 37], we get

\[
\eta \in L^2(\mathcal{J}; L^2(\Omega)),
\]

We conclude that \( \eta \) and \( \eta \) are weak limits of \( S_n \) and \( S_n \), respectively. Assume that \( \varphi \in C_0^\infty(\mathcal{J}) \) and \( \psi \in C_0^\infty(\Omega) \) are arbitrary. Then

\[
\int_0^T \langle (S_n \varphi(t)), \psi(t) \rangle \varphi(t) \psi(t) dt = \int_0^T \langle (S_n \varphi(t)), \psi(t) \rangle \varphi(t) \psi(t) dt
\]

The calculation above is possible due to and shows that \( S_n \varphi(t) \) weakly converges to \( \eta \) in \( L^2(\mathcal{J}; L^2(\Omega)) \). A similar procedure may be used to conclude that \( S_n u(t) \) converges weakly to \( \eta \) in \( L^2(\mathcal{J}; L^2(\Omega)) \).

**Lemma 6.** Let \( q \in C_0^\infty(\Omega) \) and \( \Pi \) be a normal sequence of admissible meshes. Then (for a suitable subsequence \( \Pi_n \))

\[
\sum_{K \in \Pi_n} q(x_K) F_K(p_{\Pi_n}(t)) \to \int_\Omega \nabla p(t, x) \cdot \nabla q(x) \, dx,
\]

\[
\sum_{K \in \Pi_n} q(x_K) F_K(u_{\Pi_n}(t)) \to \int_\Omega \nabla u(t, x) \cdot \nabla q(x) \, dx
\]

in \( L^2(\mathcal{J}) \).
Proof. We follow the ideas in [22, Theorem 9.1] and omit the integration with respect to \( t \in (0, T) \) for better readability. The left hand side of (71) can be rewritten as

\[
T_n \equiv \sum_{K \in \Omega_n} q(x_K) F_K(p_{ln}(t))
\]

\[
= \sum_{\tau \in E_{\text{int}} \atop \tau \in K} \tau (p_L(t) - p_K(t)) (q(x_L) - q(x_K))
+ \sum_{\tau \in E_{\text{ext}} \atop \tau \in K} \tau p_K(t) q(x_K) .
\]

(73)

In addition, consider the term

\[
T'_n \equiv -\int_{\Omega} (S_{ln} p_{ln}(t))(x) \Delta q(x) \, dx
\]

(74)

which thanks to (64) converges to

\[
-\int_{\Omega} p(x) \Delta q(x) \, dx = \int_{\Omega} \nabla p(x) \cdot \nabla q(x) \, dx
\]

as \( n \to \infty \). First, we rewrite (74) as

\[
T'_n = \sum_{K \in \Omega_n} -p_K(t) \int_{\overline{K}} \Delta q(x) \, dx
\]

\[
= \sum_{K \in \Omega_n} -p_K(t) \sum_{\sigma \in \partial K} \int_{\sigma} \nabla q(x) \cdot n_{K, \sigma} \, dS
\]

\[
= \sum_{\sigma \in \partial \Omega} \int_{\sigma} \nabla q(x) \cdot n_{K, \sigma} \, dS .
\]

The difference between (73) and (74) can therefore be written as

\[
T_n - T'_n = \sum_{\sigma \in E_{\text{int}} \atop \sigma \in K} m(\sigma) (p_L(t) - p_K(t)) R_{K, \sigma} + \sum_{\sigma \in E_{\text{ext}} \atop \sigma \in K} m(\sigma) p_K(t) R_{K, \sigma}
\]

where

\[
R_{K, \sigma} = \left( \frac{q(x_L) - q(x_K)}{d_{\sigma}} - \int_{\sigma} \nabla q(x) \cdot n_{K, \sigma} \, dS \mid \sigma = K|L \in \mathcal{E}_{\text{int}}, \sigma \in \mathcal{E}_{\text{ext}}, \sigma \in \mathcal{E}_K .
\]

Using Hölder’s inequality leads to

\[
|T_n - T'_n| \leq \left( \sum_{\sigma \in E_{\text{int}} \atop \sigma \in K} \tau (p_L(t) - p_K(t))^2 \sum_{\sigma \in E_{\text{ext}} \atop \sigma \in K} m(\sigma) \, d_{\sigma} \left| R_{K, \sigma} \right|^2 \right)^{1/2}
\]

\[
+ \left( \sum_{\sigma \in E_{\text{ext}} \atop \sigma \in K} \tau p_K(t)^2 \sum_{\sigma \in E_{\text{ext}} \atop \sigma \in K} m(\sigma) \, d_{\sigma} \left| R_{K, \sigma} \right|^2 \right)^{1/2}
\]

The regularity of \( q \) allows to use the Taylor expansion to show that

\[
\left| R_{K, \sigma} \right| \leq C m(\sigma)
\]
for some $C > 0$. By using $m (\sigma) \leq ||\Pi||$ for each $\sigma \in E_n$, the relation (8) and Definition 4 we further estimate

$$|T_n - T_n'| \leq 2C ||\Pi|| \sqrt{3m (\Omega)} \||p_{\Pi n} (t)||_{\Pi}$$

$$= 6C ||\Pi|| \sqrt{m (\Omega)} ||\nabla Q_{\Pi n}||_{L^2 (\Omega)},$$

where the last equality is by Lemma 1. The uniform boundedness of $||\nabla Q_{\Pi n}||_{L^2 (\Omega)}$ given by the a priori estimate (57) and the proof of Lemma 5 allows us to conclude that

$$\lim_{n \to \infty} |T_n - T_n'| = 0,$$

which gives the first part of the statement, i.e. (71). The proof of (72) is analogous. □

**Theorem 1.** Let $u_{ini}, p_{ini} \in C^2 (\Omega)$ and let $(\Pi_n)$ be a normal sequence of admissible meshes. Then the sequence $(S_{n k} u_{ini}, S_{n k} p_{ini})$ given by solutions of the semidiscrete scheme (23), (24) converges (as $n \to \infty$) to the unique weak solution $(u, p)$ given by Definition 4 in $L^2 (J; L^2 (\Omega))$.

**Proof.** Let us consider the semi-discrete scheme (23), (24) with the initial conditions (25), (26) and homogeneous Dirichlet boundary conditions (35)

$$m (K) u_K (t) + F_K (u_{ini} (t)), \forall K \in \Pi_n \tag{23}$$

$$am (K) p_K (t) + F_K (p_{ini} (t)) = \frac{1}{\xi^2} f_{0 k} (t) \tag{24}$$

$$- \frac{b f}{\xi} \Lambda (g (u_K (t), p_K (t))) m (K), \forall K \in \Pi_n$$

$$u_{ini}, |\partial_\Omega u = 0, p_{ini}, |\partial_\Omega = 0,$$

$$u_{ini} (0) = P_{ini} u_{ini} (0) = P_{ini} p_{ini}.$$
\[ \alpha \xi^2 \int_0^T (S_{1L} p_{1L}(t), S_{1L} q_{1L})_{H^{1/2}(\Omega)} \phi(t) \, dt \] (76)

\[ + \xi^2 \int_0^T \sum_{K \in \mathcal{K}_{\Omega}} \sum_{\sigma \in \mathcal{E}_K} F_{K,\sigma}(t) q_K \phi(t) \, dt \]

\[ = \int_0^T (S_{1L} f_0(p_{1L}(t)), S_{1L} q_{1L})_{H^{1/2}(\Omega)} \phi(t) \, dt \]

\[ - b \beta \xi \int_0^T (S_{1L} A(g(u_{1L}(t), p_{1L}(t))), S_{1L} q_{1L})_{H^{1/2}(\Omega)} \phi(t) \, dt. \]

By applying integration by parts to the first term of the equality and using the properties of \( \phi \), we get

\[ - \alpha \xi^2 \int_0^T (S_{1L} p_{1L}(t), S_{1L} q_{1L})_{H^{1/2}(\Omega)} \hat{\phi}(t) \, dt \] (77)

\[ + \xi^2 \int_0^T \sum_{K \in \mathcal{K}_{\Omega}} \sum_{\sigma \in \mathcal{E}_K} F_{K,\sigma}(t) q_K \phi(t) \, dt \]

\[ = \int_0^T (S_{1L} f_0(p_{1L}(t)), S_{1L} q_{1L})_{H^{1/2}(\Omega)} \phi(t) \, dt \]

\[ - b \beta \xi \int_0^T (S_{1L} A(g(u_{1L}(t), p_{1L}(t))), S_{1L} q_{1L})_{H^{1/2}(\Omega)} \phi(t) \, dt. \]

We investigate the limits of the individual terms in (77), considering again a suitable mesh subsequence \( \Pi_{k_n} \) denoted as \( \Pi_{k} \) for brevity.

Thanks to the relationships (62) and (64), taking the limit of I. results in

\[ \alpha \xi^2 \int_0^T (S_{1L} p_{1L}(t), S_{1L} q_{1L})_{H^{1/2}(\Omega)} \phi(t) \, dt \rightarrow \alpha \xi^2 \int_0^T (p, q)_{H^{1/2}(\Omega)} \phi(t) \, dt. \]

Since the strong convergence \( S_{1L} p_{1L} \rightarrow p \) in \( L^2(\mathcal{F}; L^2(\Omega)) \) signifies convergence almost everywhere in \( \mathcal{F} \times \Omega \) \([32]\), the limit of III. may be taken

\[ \int_0^T (S_{1L} f_0(p_{1L}(t)), S_{1L} q_{1L})_{H^{1/2}(\Omega)} \phi(t) \, dt \rightarrow \int_0^T (f_0(p), q)_{H^{1/2}(\Omega)} \phi(t) \, dt. \]
Similarly using (62) the limit of IV. may be taken

\[
b\beta \xi \int_0^T (S_{\Pi, p} \phi (u_{\Pi} (t), p_{\Pi} (t)), S_{\Pi, q_{\Pi}})_{L^2(\Omega)} \varphi (t) \, dt
\]

\[
\rightarrow b\beta \xi F \int_0^T (A (g (u, p), \cdot) q)_{L^2(\Omega)} \varphi (t) \, dt.
\]

Since we are considering the homogeneous Dirichlet boundary condition for \( p \), the term V. is equal to zero. Using Lemma 6 the limit of II. reads

\[
\xi^2 \int_0^T \left( \sum_{K \in \Omega_{\text{int}}} \sum_{e \in \Gamma_K} F_{K,e} (t) q_K (x) \right) \varphi (t) \, dt \rightarrow \xi^2 \int_0^T \left( \int_{\Omega} \nabla p (t, x) \cdot \nabla q (x) \, dx \right) \varphi (t) \, dt.
\]

After passing to the limit, the relationship (77) becomes the weak equality (37), i.e. \( p \) is the solution of the phase field equation. A similar procedure may be performed to show that \( u \) is the weak solution of the heat equation. The uniqueness of the solution may be shown using a similar procedure as in [12], using the specific form of \( f(u, p, \xi) = f_0 (p) - b\beta \xi A (g (u, p)) \). This implies that all convergent subsequences \( (S_{\Pi, u_{\Pi}}, S_{\Pi, p_{\Pi}}) \) have the same unique limit and thus the whole sequence \( (S_{\Pi, u_{\Pi}}, S_{\Pi, p_{\Pi}}) \) converges to \( (u, p) \) in \( L^2 \left( J, L^2 (\Omega) \right) \). \( \square \)

6. Conclusion

This paper provides a detailed proof of existence of the weak solution and convergence of the finite volume scheme to this solution for the isotropic phase field model suitable for solidification modeling in polyhedral meshes covered by admissible polyhedral meshes. We consider a general form of the reaction term in the phase field equation which allows to apply the presented results to existing models [30] as well as several new variants of the phase field model presented in our work [42]. We show that introducing an artificial limiter of the reaction term makes it possible to perform the analysis while not affecting the simulation results [42]. A semi-discrete form of the scheme is used, leaving temporal discretization up to the reader’s choice.
