# LOCAL OPERATOR SYSTEM STRUCTURES AND THEIR TENSOR PRODUCTS 

SURBHI BENIWAL, AJAY KUMAR, AND PREETI LUTHRA*

#### Abstract

We introduce and explore the theory of tensor products in the category of local operator systems. Analogous to minimal operator system OMIN and maximal operator system OMAX, minimal and maximal local operator system structures LOMIN and LOMAX, respectively, are also discussed.

## 1. Introduction

The study of locally $C^{*}$-algebra was initiated by Inoue in [7. It was introduced as a complete locally m-convex $*$-algebra with $C^{*}$-condition where topology is defined by a family of $C^{*}$-norms and was proved to be isomorphic to a closed *-subalgebra of the operator algebra in a generalized Hilbert space. Arveson called these algebra as Pro $C^{*}$-algebra (see [6]), which can be represented as projective limit of $C^{*}$-algebras. Their morphisms and tensor products in this category have been extensively studied (see [6, Section 31]). Further this theory was extended to operator spaces by Webster in [12, and their tensor products were also introduced and explored [4, 5, 12]. Dosiev in [2] revisited local operator spaces, introduced local operator systems in a concrete way and gave a locally convex version the Choi-Effros representation theorem. In [3], Dosiev used quantum cones with filtered base to classify local operator systems, which he called as quantum systems. Again local operator systems can be represented as projective limits of operator systems. Now, in the last decade the Paulsen et. al. 8] introduced the abstract definition of operator systems and initiated a systematic study of their tensor products. This research contributed a lot in the field of quantum information theory. Operator systems are considered as quantum versions of function systems.

In this paper, we give a short proof of the fact that the abstract definition of local operator systems is equivalent to the definition of local operator systems. In the same section, we show that local operator systems possess the structure of local operator spaces. We also prove that these abstract local operator systems are in fact the projective limit of abstract operator systems.

In [10], the authors associated with any Archimedean order unit space $V$, two operator systems, the minimal $\operatorname{OMIN}(\mathrm{V})$ and the maximal OMAX(V). In Section 4. we consider a parallel development for local operator systems.

Motivated by the theory of tensor products of operator systems, in Section 5 we give the definition of tensor product in the category of local operator systems. We

[^0]introduce minimal and maximal local operator system tensor products and explore their properties.

## 2. Preliminaries

In paper [2], it was proved that every local operator space can be realized as a linear space of unbounded operators on a Hilbert space and gave the following theory: For a fixed Hilbert space $H$, an upward filtered family of closed subspaces $\mathcal{E}=\left\{H_{\alpha}\right\}_{\alpha \in \Lambda}$ such that their union $\mathcal{D}$ is a dense subspace in $H$ with $p=\left\{P_{\alpha}\right\}_{\alpha \in \Lambda}$ family of projections in $B(H)$ onto the subspaces $H_{\alpha}, \alpha \in \Lambda$. The algebra $C_{\mathcal{E}}(\mathcal{D})$ of all non-commutative continuous functions on a quantized domain $E$ is given by

$$
C_{\mathcal{E}}(\mathcal{D})=\left\{T \in L(\mathcal{D}): T P_{\alpha}=P_{\alpha} T P_{\alpha} \in B(H), \alpha \in \Lambda\right\},
$$

where $L(\mathcal{D})$ is the associative algebra of all linear transformations on $\mathcal{D}$ and $\alpha \leq \beta$ whenever $P_{\alpha} \leq P_{\beta}$, so that $H_{\alpha} \subseteq H_{\beta}$. Thus each $T \in C_{\mathcal{E}}(\mathcal{D})$ is an unbounded operator on $H$ with domain $\mathcal{D}$ such that $T\left(H_{\alpha}\right) \subseteq H_{\alpha}$ and $\left.T\right|_{H_{\alpha}} \in B\left(H_{\alpha}\right)$, and $C_{\mathcal{E}}(\mathcal{D})$ is a subalgebra in $L(\mathcal{D})$. The set

$$
C_{\mathcal{E}}^{*}(\mathcal{D})=\left\{T \in C_{\mathcal{E}}(\mathcal{D}): P_{\alpha} T \subseteq T P_{\alpha}, \alpha \in \Lambda\right\}
$$

of all non-commutative continuous functions on $E$ is a unital $*$-subalgebra of $C_{\mathcal{E}}(\mathcal{D})$, with the involution $T^{*}=\left.T^{\star}\right|_{D} \in C_{\mathcal{E}}^{*}(\mathcal{D})$ for all $T \in C_{\mathcal{E}}^{*}(\mathcal{D})$ where $T^{\star}$ is unbounded dual of $T$ such that $\mathcal{D} \subseteq \operatorname{dom}\left(T^{\star}\right)$ and $T^{\star}(\mathcal{D}) \subseteq \mathcal{D}$.

A concrete local operator space is defined as a subspace of $C_{\mathcal{E}}(\mathcal{D})$, whereas a concrete local operator system $\mathcal{S}$ as a unital self-adjoint subspace of the multinormed $C^{*}$-algebra $C_{\mathcal{E}}^{*}(\mathcal{D})$.

Any linear space $\mathcal{E}$ with a separated family of matrix seminorms $\left\{p_{\alpha}: \alpha \in \Gamma\right\}$ is called an abstract local operator space. These two definitions, abstract and concrete, of local operator spaces were proved equivalent in [2, Theorem 7.1].

Let us establish some more terminologies related to local positivity that shall be used throughout:
(1) An element $T$ of a local operator system $\mathcal{S}$ is local hermitian if $T=T^{*}$ on a certain subspace $H_{\alpha}$, that is, $\left.T\right|_{H_{\alpha}}=\left.T^{*}\right|_{H_{\alpha}}=\left(\left.T\right|_{H_{\alpha}}\right)^{*} \in B\left(H_{\alpha}\right)$. Respectively, an element $T \in \mathcal{S}$ is said to be local positive if $\left.T\right|_{H_{\alpha}} \geq 0$ in $B\left(H_{\alpha}\right)$ for some $\alpha \in \Lambda$.
(2) Further, let $\mathcal{S} \subseteq C_{\mathcal{E}}^{*}(D)$ and $\mathcal{T} \subseteq C_{\mathcal{F}}^{*}(O)$ be local operator systems on quantized domains $\mathcal{E}=\left\{H_{\alpha}\right\}_{\alpha \in \Lambda}$ and $F=\left\{K_{i}\right\}_{i \in \omega}$ with their union spaces $D$ and $O$, respectively. A linear mapping $\phi: \mathcal{S} \rightarrow \mathcal{T}$ is said to be local matrix positive if for each $i \in \omega$ there corresponds $\alpha \in \Lambda$ such that $\left.\phi^{(n)}(v)\right|_{K_{i}^{n}} \geq 0$ whenever $\left.v\right|_{H_{\alpha}^{n}} \geq 0$, and $\left.\phi^{(n)}(v)\right|_{K_{i}^{n}}=0$ whenever $\left.v\right|_{H_{\alpha}^{n}}=0, v \in M_{n}(\mathcal{S})$, $n \in \mathbb{N}$, where $\phi^{(n)}: M_{n}(\mathcal{S}) \rightarrow M_{n}(\mathcal{T}), n \in \mathbb{N}$, are the canonical linear extensions of $\phi$ over all matrix spaces.
As we are dealing with projective limit of operator sytem so we refer the reader to [9, 11, 10, 8, for a detailed theory on operator systems, their structures and tensor products.

## 3. Abstract local operator systems

We start by defining a local version of ordered $*$-vector space, which can also be found in [1].

Definition 3.1. Let $V$ be $a$ *-vector space consisting of downward filtered family of cones $\left\{\mathcal{C}_{\alpha}: \alpha \in \Gamma\right\}$ satisfying two properties $\mathcal{C}_{\alpha}$ is a cone (need not be proper) in $V$ where $\mathcal{C}_{\alpha} \subseteq V_{h}=\left\{v \in V: v^{*}=v\right\}$. and $\bigcap\left(\mathcal{C}_{\alpha} \cap-\mathcal{C}_{\alpha}\right)=\{0\}$.

Then $V$ is called local $*$-ordered vector space and the elements of $\mathcal{C}_{\alpha}$ are called local positive elements, denoted by $v \geq_{\alpha} 0$. Also, we write $v_{1} \geq_{\alpha} v_{2}$ if $v_{1}-v_{2} \geq_{\alpha} 0$ in $V$.

Definition 3.2. For a local $*$-ordered vector space ( $V,\left\{\mathcal{C}_{\alpha}: \alpha \in \Gamma\right\}$ ), an element $e \in V_{h}$ is called an ordered unit for $V$ if for all $v \in V_{h}$ and for every $\alpha \in \Gamma$ there exists $r_{\alpha}>0$ such that $r_{\alpha} e \geq_{\alpha} v$. If, in addition, $e$ is an Archimedean order unit, we call the triple $\left(V,\left\{\mathcal{C}_{\alpha}: \alpha \in \Gamma\right\}, e\right)$ an Archimedean local $*$-ordered vector space or in short A.L.O.U space.

If $V$ is a $*$-vector space then $M_{n}(V)$ is also a $*$-vector space. For $A=\left[v_{i j}\right]_{n \times n} \in$ $M_{n}(V)$ we have $A^{*}=\left[v_{j i}^{*}\right]$ is an involution on $M_{n}(V)$ and $M_{n}(V)_{h}=\left\{A \in M_{n}(V)\right.$ : $\left.A^{*}=A\right\}$.

Definition 3.3. Let $V$ be $a *$-vector space. We say that the family $\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}$ is a local matrix ordering on $V$ if
(1) $\left(M_{n}(V),\left\{\mathcal{C}_{\alpha}^{n}: \alpha \in \Gamma\right\}\right)$ is a local $*$-ordered vector space for each $n \in \mathbb{N}$,
(2) for each $n, m \in \mathbb{N}$ and $X \in M_{n, m}$ and all $\alpha$, we have that $X^{*} \mathcal{C}_{\alpha}^{n} X \subseteq \mathcal{C}_{\alpha}^{m}$.

In this case, we call $\left(V,\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}\right)$ a local matrix $*$-ordered vector space.
For $e \in V_{h}$, let $e_{n}=\operatorname{diag}(e, e, \ldots, e)$ be the corresponding diagonal matrix in $M_{n}(V)$. We say that $e$ is a matrix order unit for $V$ if $e_{n}$ is an order unit for $\left(M_{n}(V),\left\{\left\{\mathcal{C}_{\alpha}^{n}: \alpha \in \Gamma\right\}\right\}\right)$ for each $n$. We say that $e$ is an Archimedean matrix order unit if $e_{n}$ is an Archimedean order unit for $\left(M_{n}(V),\left\{\left\{\mathcal{C}_{\alpha}^{n}: \alpha \in \Gamma\right\}\right\}\right)$ for each $n$. And call, $\left(V,\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty} ; \alpha \in \Gamma\right\}, e\right)$ an Archimedean local matrix ordered vector space.

Definition 3.4. An abstract local operator system is a triple $\left(V,\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty} ; \alpha \in \Gamma\right\}, e\right)$, where $V$ is a local $*$-ordered vector space, $\left.\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}\right\}$ is a local matrix ordering on $V$ and $e$ is an Archimedean matrix order unit.

As should be the case, we first observe that local operator systems defined in the sense of [2] are also abstract local operator systems in the sense of definition 3.4.

Remark 3.5. Every concrete local operator system is abstract local operator system.

Example 3.6. We now list some more examples of local operator systems:
(i) Every operator system is a local operator system.
(ii) Consider the set $C(\mathbb{R})$, the space of all complex valued continuous function S defined on $\mathbb{R}$.For every compact subset $K$ of $\mathbb{R}$, we define a family of cones as $C_{K}=\left\{f \in C(\mathbb{R})_{h}: f(x) \geq 0 \forall x \in K\right\}$ and Archimedean matrix order unit is $\mathrm{I}(x)=1 \forall x \in \mathbb{R}$, then $\left(C(\mathbb{R}),\left\{\left\{C_{K}^{n}\right\}: K \subseteq \mathbb{R}, K\right.\right.$ is compact $\left.\}, I\right)$ is a local operator system.
(iii) Let $H$ be Hilbert space, $\mathcal{D}$ is dense subspace in $H$ and $C_{\mathcal{E}}^{*}(\mathcal{D})$ be as defined in Remark 3.5. Take $T \in C_{\mathcal{E}}^{*}(\mathcal{D})$ we have $\mathcal{L O S}(T)=\operatorname{span}\left\{I, T, T^{*}\right\}$ is a local operator subsystem of $C_{\mathcal{E}}^{*}(\mathcal{D})$.
(iv) Let $M_{\infty}=\left\{\left[a_{i j}\right]: a_{i j} \in \mathbb{C} ; i, j \in \mathbb{N}\right\}$. For each $\alpha_{n}=n \in \mathbb{N}$, we have $C_{\alpha_{n}}^{1}=\left\{\left[a_{i j}\right] \in M_{\infty}:\left[a_{i j}\right] \in M_{n}^{+}\right.$for $\left.1 \leq i, j \leq n\right\}$. For higher orders, we have $C_{\alpha_{n}}^{m}=\left\{\left[A_{i j}\right] \in M_{m}\left(M_{\infty}\right):\left[\left.A_{i j}\right|_{n}\right] \geq 0\right\}$ where $\left.A_{i j}\right|_{n}$ denotes restriction to $n \times n$ coordinates. With Archimedean local matrix order unit $I=\left[e_{i j}\right]$, where $e_{i j}=\delta_{i j}$ is Archimedean local matrix order unit, clearly $M_{\infty}$ is a local operator system.
(v) We have another local operator subsystem of $M_{\infty}$ which is tridiagonal matrices i.e. $T_{\infty}=\operatorname{span}\left\{E_{i j}:|i-j| \leq 1\right\}$.
(vi) On the similar lines of remark 5.19 in [8], we can define graph $G_{\infty}$ on $\mathbb{N}$ which can be identified with a subset $G_{\infty} \subseteq \mathbb{N} \times \mathbb{N}$ satisfying the properties that $(i, j) \in G_{\infty}$ whenever $(j, i) \in G_{\infty}$ and $(i, i) \in G$ and $S\left(G_{\infty}\right)=\operatorname{span}\left\{E_{i j}:\right.$ $\left.(i, j) \in G_{\infty}\right\} \subseteq M_{\infty}$ is a local operator system.
(vii) We have an important algebra given by Cuntz which is Cuntz algebra. The Cuntz algebra $\mathcal{O}_{n}(n \geq 2)$ is the universal $\mathrm{C}^{*}$-algebra generated by n isometries $S_{1}, S_{2}, \ldots, S_{n}$ with $\sum_{i=1}^{n} S_{i} S_{i}^{*}=I$ where $I$ is the identity operator, for details refer to 13 . On the similar lines we tried to define a Pro C*-algebra as follows. Let $\mathcal{D}$ be a quantized domain of separable Hilbert spaces $H_{\alpha}$ where $\alpha \in \Gamma$. Let $\mathcal{O}_{n}^{l}$ denotes the Cuntz Pro $\mathrm{C}^{*}$-algebra generated by n elements $S_{1}, S_{2}, . ., S_{n}$ having the properties $\left.S_{i}^{*} S_{i}\right|_{H_{\alpha}}=I_{H_{\alpha}}$ for all $i$ and for all $\alpha$ and $\left.\sum_{i=1}^{n} S_{i} S_{i}^{*}\right|_{H_{\alpha}}=I_{H_{\alpha}}$ for all $\alpha$ We now define Cuntz local operator system. Let $\mathcal{O}_{n}^{l}$ be Cuntz Pro $C^{*}$-algebra generated by n elements $S_{1}, S_{2}, \ldots, S_{n}$ having the above two properties. Then we denote by $\mathcal{S O}_{n}^{l}$ the Cuntz local operator system defined as $\mathcal{S} \mathcal{O}_{n}^{l}:=\operatorname{span}\left\{I, S_{1}, S_{2}, . ., S_{n}, S_{1}^{*}, S_{2}^{*}, . ., S_{n}^{*}\right\}$.
In the next result we show that with respect to an induced family of seminorms, local operator systems possess the structure of local operator space.
Proposition 3.7. Let $V$ be a local operator system with family of cones $\left.\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}\right\}$ and $e$ is Archimedean matrix order unit and for each $X \in M_{n}(V)$ set $\|X\|_{\alpha}^{n}=$ $\inf \left\{r \geq 0:\left(\begin{array}{cc}r e_{n} & X \\ X^{*} & r e_{n}\end{array}\right) \in \mathcal{C}_{\alpha}^{2 n}\right\}$, then $\|\cdot\|_{\alpha}^{n}$ is a separating family of $*$-seminorms on $M_{n}(V)$ and $\mathcal{C}_{\alpha}^{n}$ is a closed subset of $M_{n}(V)$ in the topology induced by this separating family of $*$-seminorms. Hence, $\left\{V,\left\{\|\cdot\|_{\alpha}^{n}\right\}_{n=1}^{\infty}\right\}$ is a local operator space.
Proof. By some simple computations one can show that $\|\cdot\|_{\alpha}^{n}$ is a family of separating $*$-seminorms.

Finally, we show that $\mathcal{C}_{\alpha}^{1}$ is closed in the locally convex topology generated by the separating family of seminorms. Let $x$ be any limit point of $\mathcal{C}_{\alpha}^{1}$ then $\mathrm{V}(\alpha, n) \cap C_{\alpha}^{1}$ $\neq \phi \forall n \in \mathbb{N}$ and $\forall \alpha$ where $\mathrm{V}(\alpha, n)=\left\{y \in V:\|y-x\|_{\alpha}^{1}<\frac{1}{n}\right\}$. Note that $x=x^{*}$. Given any $r>0$ choose $n \in \mathbb{N}$ such that $\frac{1}{n}<r$. Let $y \in V(\alpha, n) \cap \mathcal{C}_{\alpha}^{1} \Longrightarrow\|x-y\|_{\alpha}<r \Longrightarrow$ $\left(\begin{array}{cc}r e & x-y \\ x-y & r e\end{array}\right) \in \mathcal{C}_{\alpha}^{2}$ This yields $2 r e+2 x-2 y=(1,1)\left(\begin{array}{cc}r e & x-y \\ x-y & r e\end{array}\right)(1,1)^{*} \in \mathcal{C}_{\alpha}^{1}$ $\Longrightarrow r e+x e \in \mathcal{C}_{\alpha}^{1}$, so that using Archimedean property $x \in \mathcal{C}_{\alpha}^{1}$. Hence $\mathcal{C}_{\alpha}^{1}$ is closed. Similarly, one can prove that $\mathcal{C}_{\alpha}^{n}$ is closed $\forall n \in \mathbb{N}$.
3.1. The Archimeadeanization of a local $*$-ordered vector space. Let $\left(V,\left\{\mathcal{C}_{\alpha}\right\}_{\alpha \in \Gamma}, e\right)$
be a local ordered vector space, where $V$ is a $*$ - vector space, $\left\{\mathcal{C}_{\alpha}\right\}$ family of cones, $e$ is an ordered unit that is not Archimedean. The process of enlarging cones to make the space Archimedean ordered unit space for ordered $*$-vector space was introduced in [11]. We now show that the same process works for local $*$-ordered vector spaces.

Definition 3.8. Let $\left.\left(V,\left\{\mathcal{C}_{\alpha}: \alpha \in \Gamma\right\}\right\}, e\right)$ be a local *-ordered vector space with an order unit e. Define $\mathcal{D}_{\alpha}:=\left\{v \in V: r e+v \in \mathcal{C}_{\alpha}\right.$ for all $\left.r>0\right\}$ for each $\alpha \in \Gamma$.

Clearly $\mathcal{D}_{\alpha}$ is a cone with $\mathcal{C}_{\alpha} \subseteq \mathcal{D}_{\alpha}$.
Proposition 3.9. Let $\left(V,\left\{\left\{\mathcal{C}_{\alpha}\right\}: \alpha \in \Gamma\right\}\right)$ be a local $*$-ordered vector space with an order unit e. Then $\mathcal{D}_{\alpha}$ is equal to the closure of $\mathcal{C}_{\alpha}$ in topology induced by family of seminorms introduced in Proposition 3.7 .

Proof. If $v \in \mathcal{D}_{\alpha}$, then $r e+v \in \mathcal{C}_{\alpha} \forall r>0 \Longrightarrow\|r e+v-v\|_{\beta}=r \quad \forall r>0 \quad \forall \beta \in \Gamma$. So $\mathcal{D}_{\alpha} \subseteq \overline{\mathcal{C}_{\alpha}}$. Conversely, for any $v \in \overline{\mathcal{C}_{\alpha}}$ and any neighbourhood $U$ of $v$, we have $U \cap \mathcal{C}_{\alpha} \neq \phi$. Now for $n \in \mathbb{N}$, choose $r_{n}>0$ such that $r_{n} \longrightarrow 0$. Take $U_{n}=\{u \in V$ $\left.:\|u-v\|<r_{n}\right\}$, as $U_{n}$ is a nbd of $v$ so $U_{n} \cap \mathcal{C}_{\alpha} \neq \phi \forall n \in \mathbb{N}$. For each $n \in \mathbb{N}$, assume $u_{n} \in U_{n} \cap \mathcal{C}_{\alpha}$. Thus $r_{n} e \pm\left(u_{n}-v\right) \in \mathcal{C}_{\alpha} \Longrightarrow r_{n} e+v-u_{n} \in \mathcal{C}_{\alpha} \Longrightarrow$ $r_{n} e+v \in \mathcal{C}_{\alpha} \forall n$ as $\mathcal{C}_{\alpha}$ is a cone. Since $r_{n} \longrightarrow 0$, it follows that $r e+v \in \mathcal{C}_{\alpha}$ $\forall r>0$.Thus $v \in \mathcal{D}_{\alpha}$. Hence we get $\mathcal{D}_{\alpha}=\overline{\mathcal{C}_{\alpha}}$.
3.2. Representation theorem for local operator systems. We now give a short alternative proof of the fact that abstract definition of local operator system given in this paper and concrete definition of local operator system given in [2] are equivalent.

Definition 3.10. Let $V$ and $W$ be two abstract local operator system with $\left\{\mathcal{C}_{\alpha}\right.$ : $\alpha \in \Gamma\}$ and $\left\{H_{\beta}: \beta \in \Omega\right\}$ family of cones, respectively. A linear map $\Phi: V \longrightarrow W$ is called

- unital local positive if for each $\beta \in \Omega$ there corresponds $\alpha \in \Gamma$ s.t. $\Phi\left(C_{\alpha}\right) \subseteq$ $H_{\beta}$ and $\Phi(e)=f$ where $e$ and $f$ are the Archimedean local matrix units of $V$ and $W$ resp.
- local order isomorphism if $\Phi$ is bijective, $\Gamma=\Omega$ and $\Phi\left(C_{\alpha}\right)=H_{\alpha}$ for all $\alpha$.

We denote the category of local operator systems with unital local completely positive maps by $\mathcal{L O}$
Now we define natural morphism in local operator spaces which is local completely bounded maps as given in [2, Section 4.3].
Definition 3.11. Let $E=\lim _{\leftarrow} E_{\rho}$ and $F=\lim _{\leftarrow} F_{\sigma}$ be two local operator spaces. $A$ linear map $\phi: E \rightarrow F$ is said to be locally completely bounded if for every $\sigma \in \Lambda$; there exists a $\rho \in \Gamma$ and $K>0$ s.t. $\left\|\pi_{\sigma}^{(n)} \phi^{(n)}(e)\right\|_{M_{n}\left(F_{\sigma}\right)} \leq K\left\|\pi_{\rho}^{(n)}(e)\right\|_{M_{n}\left(E_{\rho}\right)}$ for every $n \in \mathbb{N}$, $e \in M_{n}\left(E_{\rho}\right)$ where $\pi_{\rho}$ and $\pi_{\sigma}$ are projection maps given by $\pi_{\rho}: E \rightarrow E_{\rho}$ and $\pi_{\sigma}: F \rightarrow F_{\sigma}$ resp. We denote by $\|\phi\|_{(\rho, \sigma)}^{l . c . b}$ the local complete bound of $\phi$ w.r.t $(\rho, \sigma)$.

We have already seen in Remark 3.5 that every concrete local operator system is abstract. Next result proves that converse also holds true.

Theorem 3.12 (Representation theorem). Let $V$ be an abstract local operator system, then there exists a unital complete local order embedding $\Phi$ from $V$ into $C_{\mathcal{E}}^{*}(D)$. Hence abstract local operator systems are equivalent to concrete local operator systems.

Proof. Let $V$ be a local operator system with family of cones $\left\{\mathcal{C}_{\alpha}^{n}\right\}_{\alpha \in \Gamma}$ and Archimedean order unit $e$. Put $S_{\alpha}^{(r)}=$ U.L.C.P. $\mathcal{C}_{\alpha}\left(V, M_{r}\right)$, the set of all unital local completely positive maps $w: V \rightarrow M_{r}$ with respect to cone $\mathcal{C}_{\alpha}$. Also, put $S_{\alpha}=\cup_{r \in \mathbb{N}} S_{\alpha}^{(r)}$ where
$\alpha \in \Gamma$. It follows that $\left\{S_{\alpha}\right\}$ is a directed family of sets. Let $\mathrm{S}=\cup_{\alpha \in \Gamma} S_{\alpha}$. For any $\alpha \in \Gamma$, consider the Hilbert space $H_{\alpha}=\oplus_{w \in S_{\alpha}} \mathbb{C}^{n(w)}$ where $n(w)=n$ whenever $w \in S_{\alpha}^{(n)}$ Let us introduce $\Phi_{\alpha}: V \longrightarrow \mathrm{~B}\left(H_{\alpha}\right)$ defined by $\Phi_{(\alpha}(v)=(w(v))_{w \in S_{\alpha}}$. We can easily show that $\Phi_{\alpha}$ is unital matrix positive map. Define $\Phi: V \longrightarrow C_{\mathcal{E}}(\mathcal{D})$ by $\Phi(v)=\Phi_{\alpha}(v)$ on $H_{\alpha}$. Clearly, $\Phi$ is unital matrix local order positive map because for each $\alpha \in \Gamma, \Phi(v) \geq_{\alpha} 0$ whenever $v \geq_{\alpha} 0$. Now we see that for every $\alpha \in \Gamma$ there exists $\beta \in \Gamma$ s.t. $\Phi(v) \not{ }_{\neq \beta} 0$ whenever $v \not{ }_{\neq \alpha} 0$ using Hahn-Banach Separation Theorem.

By [2, Proposition 3.1], dual of $\Phi(v)$ is $\Phi\left(v^{*}\right)$ thus we have that $\Phi(v) \in C_{\mathcal{E}}^{*}(\mathcal{D})$, i.e. $\Phi(V) \subseteq C_{\mathcal{E}}^{*}(\mathcal{D})$. Finally it is trivial that $\Phi$ is actually injective.
3.3. Projective limit of operator systems. We now consider the projective system of operator systems, and show that its projective limit possesses the structure of an abstract local operator system.

Let $\left\{\left(V_{\alpha}, f_{\alpha \beta}\right): \alpha \leq \beta\right.$ in $\left.\Gamma\right\}$ be a projective system of operator systems, that is, $\left\{V_{\alpha}: \alpha \in \Gamma\right\}$ is a family of operator system; $\Gamma$ being a directed set and $\left\{f_{\alpha \beta}: V_{\beta} \rightarrow V_{\alpha} \mid \alpha \leq \beta\right.$ in $\left.\Gamma\right\}$ a family of unital completely positive maps satisfying $f_{\alpha \beta} \circ f_{\beta \gamma}=f_{\alpha \gamma} \forall \alpha \leq \beta \leq \gamma$ in $\Gamma$ and $f_{\alpha \alpha}=I d_{V_{\alpha}} \forall \alpha \in \Gamma$. The set $V=\left\{\left(v_{\alpha}\right)_{\alpha \in \Gamma} \in \Pi_{\alpha \in \Gamma} V_{\alpha}: f_{\alpha \beta}\left(v_{\beta}\right)=v_{\alpha} \forall \alpha \leq \beta\right.$ in $\left.\Gamma\right\}$, is then the projective limit of projective system of the operator system. $V$ is, in fact, a *-vector space with involution defined as $(v)^{*}=\left(v^{* \alpha}\right)$ and family of cones $\left\{\mathcal{C}_{\alpha}\right\}$ where $\mathcal{C}_{\alpha}$ is defined as $\mathcal{C}_{\alpha}=\left\{v=\left(v_{\alpha}\right) \in V: v_{\alpha} \in V_{\alpha}^{+}\right\}$. Clearly, $\mathcal{C}_{\alpha}$ is a cone. Similarly, we can define for higher levels. Also, here we have that $v \in \mathcal{C}_{\alpha}^{n}$ and $v \in-\mathcal{C}_{\alpha}^{n} \forall \alpha$ then $v=0$ for each $n \in \mathbb{N}$. Also, $e=\left(e_{\alpha}\right)$, where $e_{\alpha}$ is the Archimedean order unit of $V_{\alpha}$. With the above observations, we have that V is a local operator system. We now prove that the converse is also true.

Proposition 3.13. Every local operator system (abstract) can be obtained by projective limit of operator systems (abstract).

Proof. We have that V is a local operator system with family of cones $\left\{\mathcal{C}_{\alpha}\right\}$. Let $M_{\alpha}=<\mathcal{C}_{\alpha} \cap-\mathcal{C}_{\alpha}>$, the subspace generated by $\mathcal{C}_{\alpha} \cap-\mathcal{C}_{\alpha}$. Let $V_{\alpha}:=V / M_{\alpha}$, which is a operator system with cone as $M_{n}\left(V_{\alpha}\right)^{+}=\left\{\left[v_{i j}+M_{\alpha}\right] \in M_{n}\left(V_{\alpha}\right):\left[v_{i j}\right] \in \mathcal{C}_{\alpha}^{n}\right\}$. Connecting maps are defined as for all $\alpha \leq \beta \in \Gamma$, define $f_{\alpha \beta}: V_{\beta} \rightarrow V_{\alpha}$ given by $f_{\alpha \beta}\left(v+M_{\beta}\right)=v+M_{\alpha}$, Therefore the above defined family forms a projective system of operator systems.

Remark 3.14. We have defined Cuntz local operator system in Examples 3.6 Now we see that they are the projective limit of Cuntz operator system. Indeed, $\mathcal{S O}_{n}^{l}=\lim \mathcal{S O}_{n}^{\alpha}$ where $\mathcal{S O}_{n}^{l}$ is Cuntz local operator system corresponding to domain $\mathcal{D}=\cup \overleftarrow{H}_{\alpha}$ and $\mathcal{S} \mathcal{O}_{n}^{\alpha}$ is Cuntz operator system corresponding to $H_{\alpha}$ Hilbert space with n isometries $\left.S_{1}\right|_{H_{\alpha}},\left.S_{2}\right|_{H_{\alpha}}, . .,\left.S_{n}\right|_{H_{\alpha}}$.

Remark 3.15. We also have an obvious result that Projective limit of Cuntz operator system is Cuntz local operator system.
4. Local operator system structures on Archimedean local ordered UNIT SPACES
4.1. LOMIN structure on Archimedean local ordered unit space. In [1], the minimal local operator system structure of A.L.O.U. spaces has been introduced. We here give a brief overview of this structure and prove some important characterizations. Given an Archimedean local ordered unit space ( $V,\left\{V_{\alpha}^{+}: \alpha \in\right.$ $\Gamma\}, e)$, define $N_{\alpha}=<V_{\alpha}^{+} \cap-V_{\alpha}^{+}>$and let $M_{\alpha}=V / N_{\alpha}$. Then $M_{\alpha}$ is a $*$-ordered vector space with cone $M_{\alpha}^{+}=\left\{v+N_{\alpha} \in M_{\alpha}: v \in V_{\alpha}^{+}\right\}$. If $S_{\alpha}$ denotes the set of all unital positive linear functionals on $M_{\alpha}$ s.t. $s\left(M_{\alpha}^{+}\right) \geq 0 \forall s \in S_{\alpha}$, then by [11, Theorem 5.2] there exists a compact Hausdorff topology on $S_{\alpha}\left(M_{\alpha}\right)$ such that $C\left(S_{\alpha}\left(M_{\alpha}\right)\right)$ is an operator system. Then $C\left(\cup S_{\alpha}\left(M_{\alpha}\right)\right)$ is a local operator system. *-vector space with involution given by $f^{*}(x)=\overline{f(x)}$ that becomes a local operator system with respect to family of cones given by $\mathcal{D}_{\alpha}^{n}=\left\{\left(f_{i j}\right) \in M_{n}\left(C\left(\cup S_{\alpha}\left(M_{\alpha}\right)\right)\right):\left.\left(f_{i j}\right)\right|_{S_{\alpha}\left(M_{\alpha}\right)} \geq 0\right\}$ and Archimedean matrix order unit $I$, where $I(x)=1 \forall x \in \cup S_{\alpha}\left(M_{\alpha}\right)$.

Define $\Phi: V \rightarrow C\left(\cup S_{\alpha}\left(M_{\alpha}\right)\right)$ by $\left.\Phi(v)\right|_{S_{\alpha}\left(M_{\alpha}\right)}(s)=s\left(v+N_{\alpha}\right)$. Clearly, $\Phi$ is a unital local order isomorphism onto its range. Also we have that

$$
\Phi^{-1}\left(\mathcal{D}_{\alpha}\right)=V_{\alpha}^{+}
$$

Using this map $\Phi$, define local matrix ordering $\left\{\mathcal{C}_{\alpha}^{n}\right\}$ on $\left(V,\left\{V_{\alpha}^{+}\right\}, e\right)$ as: $\left(v_{i j}\right) \in \mathcal{C}_{\alpha}^{n}$ if and only if $\Phi\left(v_{i j}\right) \geq 0$ in $M_{n}\left(C\left(\cup S_{\alpha}\left(M_{\alpha}\right)\right)\right)$. This discussion leads us to following result:

Proposition 4.1. Let $\left(V,\left\{\mathcal{C}_{\alpha}: \alpha \in \Gamma\right\}, e\right)$ be an Archimedean local ordered unit space. Then $\left(V,\left\{\left\{\left(\mathcal{C}_{\alpha}^{n}\right)^{\min }(V)\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}, e\right)$ is a local operator system induced by the inclusion of $V$ into $C\left(\cup S_{\alpha}\left(V_{\alpha}\right)\right)$.
Definition 4.2. Let $\left(V,\left\{V_{\alpha}^{+}: \alpha \in \Gamma\right\}, e\right)$ be an Archimedean local order unit space. For each $n \in \mathbb{N}$ and each $\alpha \in \Gamma$, define

$$
\left(\mathcal{C}_{\alpha}^{n}\right)^{\min }(V):=\left\{\left(v_{i j}\right) \in M_{n}(V): \sum_{i, j=1}^{n} \bar{\lambda}_{i} \lambda_{j} v_{i j} \in \mathcal{C}_{\alpha} \quad \forall \quad \lambda_{1}, \ldots . \lambda_{n} \in \mathbb{C} .\right\}
$$

We denote $\left\{\left(\mathcal{C}_{\alpha}^{n}\right)^{\min }(V)\right\}_{n=1}^{\infty}$ for each $\alpha \in \Gamma$ by $\mathcal{C}_{\alpha}^{\min }(V)$.
In the following result, we prove an alternative way to define $\mathcal{C}_{\alpha}^{\min }(V)$ which implies that with these cone structures $\left(V,\left\{\mathcal{C}_{\alpha}: \alpha \in \Gamma\right\}, e\right)$ is in fact a minimal local operator system structure possible on $V$.

Theorem 4.3. Let $\left(V,\left\{\mathcal{C}_{\alpha}: \alpha \in \Gamma\right\}, e\right)$ be an Archimedean local ordered unit space. Then $\left(v_{i j}\right) \in\left(\mathcal{C}_{\alpha}^{n}\right)^{\min }(V)$ if and only if $\left(s\left(v_{i j}+N_{\alpha}\right)\right) \in M_{n}^{+}$for each $s \in S_{\alpha}\left(M_{\alpha}\right)$ for all $\alpha \in \Gamma$ and $n \in \mathbb{N}$.

Definition 4.4. Let $\left(V,\left\{\mathcal{C}_{\alpha}: \alpha \in \Gamma\right\}, e\right)$ be an Archimedean local ordered unit space. We define LOMIN $(V)$ to be the local operator system $\left(V,\left\{\left\{\left(\mathcal{C}_{\alpha}^{n}\right)^{\min }(V)\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}, e\right)$.

Thus upto complete order isomorphism, LOMIN(V) can be identified with a subspace of $C\left(\cup S_{\alpha}\left(V_{\alpha}\right)\right)$. Next we prove a universal property of this local operator system structure whose proof is now trivial.
Theorem 4.5. Let $\left(V,\left\{V_{\alpha}^{+}\right\}: \alpha \in \Gamma, e\right)$ be an Archimedean local ordered unit space. If $\left(W,\left\{\left\{\mathcal{D}_{\beta}^{n}\right\}_{n=1}^{\infty}: \beta \in \Omega\right\}\right)$ is a local matrix $*$-order vector space and $\phi$ : $W \rightarrow \operatorname{LOMIN}(V)$ is a local positive linear map, then $\phi$ is completely local positive.

Moreover, if $V^{\prime}=\left(V,\left\{\mathcal{C}_{\alpha}^{n}\right\} ; \alpha \in \Gamma, e\right)$ is a local operator system with $C_{\alpha}^{1}=V_{\alpha}^{+}$and such that, for every local operator system $W$, any positive map $\psi: W \rightarrow V^{\prime}$ is completely local positive map, then the identity map is a unital complete local order isomorphism between $V^{\prime}$ and LOMIN $(V)$.
Corollary 4.6. Let $\left(V,\left\{V_{\alpha}^{+}\right\}: \alpha \in \Gamma, e\right)$ be an Archimedean local ordered unit space. If $\left(V,\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}, e\right)$ is any local operator system on $V$ with $\mathcal{C}_{\alpha}^{1}=V_{\alpha}^{+}$, for each $\alpha$, then $\mathcal{C}_{\alpha}^{n} \subseteq\left(\mathcal{C}_{\alpha}^{n}\right)^{\min }(V)$ for all $n$ and all $\alpha$.

Proof. The identity map from $\left(V,\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}, e\right)$ to $\operatorname{LOMIN}(\mathrm{V})$ is positive and hence by Theorem 4.5 we have the result.
4.2. LOMAX structure on Archimedean local ordered unit space. Now we discuss another important cone structures on an Archimedean local order unit space. For any $*$-vector space $V$, we identify the vector space $M_{n}(V)$ of $n \times n$ matrices with entries in $V$ with the (algebraic) tensor product $M_{n} \otimes V$ in a natural way.
Definition 4.7. Let $\left(V,\left\{V_{\alpha}^{+}: \alpha \in \Gamma\right\}, e\right)$ be a local order $*$-vector space. Define $\left(\mathcal{D}_{\alpha}^{n}\right)^{\max }(V)=\left\{\sum_{i=1}^{k} a_{i} \otimes v_{i} ; v_{i} \in V_{\alpha}^{+}, a_{i} \in M_{n}^{+}, i=1,2, \ldots, k ; k \in \mathbb{N}\right\}$ and $D_{\alpha}^{\max }(V)=\left\{\left(\mathcal{D}_{\alpha}^{n}\right)^{\max }(V)\right\}_{n=1}^{\infty}$ for each $\alpha$.
Lemma 4.8. Let $\left(V,\left\{V_{\alpha}^{+}: \alpha \in \Gamma\right\}\right)$ be a local ordered $*$-vector space. Suppose that $P_{\alpha}^{n} \subseteq M_{n}(V)_{h}$ is a cone for each $n \in \mathbb{N}$ for each $\alpha$, the family $\left\{P_{\alpha}^{n}\right\}$ is a compatible matrix ordering i.e. $X^{*} P_{\alpha}^{m} X \subseteq P_{\alpha}^{n}$ where $x \in M_{m \times n}(\mathbb{C})$ and $P_{\alpha}=V_{\alpha}$ for each $\alpha$. Then $\left(\mathcal{D}_{\alpha}^{n}\right)^{\max }(V) \subseteq P_{\alpha}^{n} \forall n \in \mathbb{N}, \forall \alpha \in \Gamma$.

Proof. We have $\left\{P_{\alpha}^{n}\right\}$ family of cones at each matrix level with $P_{\alpha}^{1}=V_{\alpha}, \forall \alpha$. If $X \in M_{n, 1}$ then $X V_{\alpha} X^{*}=X P_{\alpha}^{1} X^{*} \subseteq P_{\alpha}^{n}$. It follows that $a \otimes v \in P_{\alpha}^{n}$ for each $a \in M_{n}^{+}$of rank one and $v \in V_{\alpha}^{+}$. Since every element of $M_{n}^{+}$is the sum of rank one elements of $M_{n}^{+}$, we conclude that $a \otimes v \in P_{\alpha}^{n}$, for all $a \in M_{n}^{+}$and all $v \in V_{\alpha}^{+}$. Thus $\left(\mathcal{D}_{\alpha}^{n}\right)^{\max }(V) \subseteq P_{\alpha}^{n}, \forall n \in \mathbb{N}$ and $\forall \alpha \in \Gamma$.
Proposition 4.9. Let $\left(V,\left\{V_{\alpha}^{+}: \alpha \in \Gamma\right\}, e\right)$ be an Archimedean local order unit space, then the cones $\left(\mathcal{D}_{\alpha}^{n}\right)^{\max }(V)$ are given by
$\left(\mathcal{D}_{\alpha}^{n}\right)^{\max }(V)=\left\{\gamma \operatorname{diag}\left(v_{1}, v_{2}, \ldots, v_{m}\right) \gamma^{*}: \gamma \in M_{n, m}, v_{i} \in V_{\alpha}^{+}, i=1,2, \ldots, m ; m \in \mathbb{N}\right\}$.
Proof. Let $\mathcal{D}_{\alpha}^{n}$ denote the set in the right hand side. By some simple computation we can show that $\mathcal{D}_{\alpha}^{n}$ is a cone in $M_{n}(V)_{h} .\left\{\mathcal{D}_{\alpha}^{n}\right\}_{n=1}^{\infty}$ is compatible for each $\alpha$. It is also clear that $\mathcal{D}_{\alpha}^{1}=V_{\alpha}^{+}$. By Proposition 3.9, we have that $\left(\mathcal{D}_{\alpha}^{n}\right)^{\max }(V) \subseteq \mathcal{D}_{\alpha}^{n}$ for each $n \in \mathbb{N}$ and $\alpha \in \Gamma$. By the compatibility of $\left\{\mathcal{D}_{\alpha}^{n}\right\}_{n=1}^{\infty}$ we have the reverse inclusion. so we have $\mathcal{D}_{\alpha}^{n}=\left(\mathcal{D}_{\alpha}^{n}\right)^{\max }(V)$.

The next result is now obvious.
Proposition 4.10. Let $\left(V,\left\{V_{\alpha}^{+}: \alpha \in \Gamma\right\}, e\right)$ be an Archimedean local order unit space then $\left(\mathcal{D}_{\alpha}^{n}\right)^{\max }(V)$ defined in the Definition 4.7, is local matrix ordering on $V$ and $e$ is a matrix local order unit for this ordering.
Remark 4.11. Let $\left(V,\left\{V_{\alpha}^{+}: \alpha \in \Gamma\right\}, e\right)$ be an Archimedean local order unit space. By Lemma 4.8, we have that $\left(\mathcal{D}_{\alpha}^{n}\right)^{\max }(V) \subseteq P_{\alpha}^{n}$, where $\left\{\left\{P_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}$ is a local matrix ordering on V with $P_{\alpha}^{1}=V_{\alpha}^{+}$for each $\alpha \in \Gamma$. Thus $\left(\mathcal{D}_{\alpha}^{n}\right)^{\max }(V)$ is strongest cone structure on V . Though $e$ need not be Archimedean matrix order
unit. As in Example 3.6(ii) if we take cone corresponding to the interval $[0,1]$ then I the constant function taking value 1 is not Archimedean matrix order unit explained in [10. But we can Archimedeanize it to get a local operator system on V , which is the strongest local operator system and we call that local opeartor system $L O M A X(V)$.

## 5. Tensor products of local operator systems

Inspired by the work [8, we here attempt to define tensor product in the category of local operator systems. Analogous to the minimal min and maximal max operator system tensor products, we also introduce lmin and lmax tensor products, and the notion of nuclearity in the category of local operator systems. Since every operator system is also a local operator system, this section is essentially generalization of [8].

Definition 5.1. Given local operator systems (V, $\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}, e_{V}$ ) and $\left(W,\left\{\left\{\mathcal{D}_{\beta}^{n}\right\}_{n=1}^{\infty}: \beta \in \Lambda\right\}, e_{W}\right)$, a local operator system structure $l \tau$ on $V \otimes W$ is a matricial cone structure given by $\left\{\left\{\mathcal{T}_{\gamma}^{n}\right\}_{n=1}^{\infty}: \gamma \in \Omega\right\}$ where $\Omega \cong \Gamma \times \Lambda$ such that:
(1) $\left.\left(V \otimes W,\left\{\left\{\mathcal{T}_{\gamma}^{n}\right\}_{n=1}^{\infty}: \gamma \in \Omega\right\}\right\}, e_{V} \otimes e_{W}\right)$ is a local operator system.
(2) For every $\alpha \in \Gamma$ and $\beta \in \Lambda$, there exists a $\gamma \in \Omega$ such that $\mathcal{C}_{\alpha}^{n} \otimes \mathcal{D}_{\beta}^{m} \subseteq \mathcal{T}_{\gamma}^{n m}$ for all $n, m \in \mathbb{N}$ and for every $\gamma \in \Omega$, there exist $\alpha \in \Gamma$ and $\beta \in \Lambda$ such that $\mathcal{C}_{\alpha}^{n} \otimes \mathcal{D}_{\beta}^{m} \subseteq \mathcal{T}_{\gamma}^{n m}$ for all $n, m \in \mathbb{N}$.
(3) If $\phi \in \operatorname{LUCP}\left(V, M_{n}\right)$ and $\psi \in \operatorname{LUCP}\left(W, M_{m}\right)$ w.r.t $\mathcal{C}_{\alpha}$ and $\mathcal{D}_{\beta}$ respectively, then $\phi \otimes \psi \in L U C P\left(V \otimes W, M_{n m}\right)$ w.r.t $\mathcal{T}_{(\alpha, \beta)}$ for all $n, m \in \mathbb{N}$.
If for every pair of local operator systems $V$ and $W$, $l \tau$ is a local operator system structure on $V \otimes W$, it is said to be a local operator system tensor product, denoted by $V \otimes_{l \tau} W$.

As in the category of operator systems, a local opeartor system tensor product $l \tau$ is functorial if for any four local operator systems $V_{1}, V_{2}, W_{1}, W_{2}$ we have that $\phi \in$ $\operatorname{LUCP}\left(V_{1}, V_{2}\right)$ and $\psi \in \operatorname{LUCP}\left(W_{1}, W_{2}\right)$ implies the linear map $\phi \otimes \psi: V_{1} \otimes W_{1} \rightarrow$ $V_{2} \otimes W_{2}$ belongs to $\operatorname{LUCP}\left(V_{1} \otimes_{l \tau} W_{1}, V_{2} \otimes_{l \tau} W_{2}\right)$. Given $V, W$ local operator systems, $l \tau$ is a symmetric local operator system tensor product if the map $\theta: v \otimes w \rightarrow w \otimes v$ extends to a local unital complete order isomorphism from $V \otimes_{l \tau} W$ onto $W \otimes_{l \tau} V$. If for any three local operator systems $U, V, W$ the natural isomorphism yields a local complete order isomorphism from $\left(U \otimes_{l \tau} V\right) \otimes_{l \tau} W$ onto $U \otimes_{l \tau}\left(V \otimes_{l \tau} W\right)$ then $l \tau$ is called associative local operator system tensor product. Given local operator systems $V_{1} \subseteq V_{2}$ and $W_{1} \subseteq W_{2}$, if the inclusion map $V_{1} \otimes_{l \tau} W_{1} \subseteq V_{2} \otimes_{l \tau} W_{2}$ is a local complete order isomorphism onto its range then $l \tau$ is injective local operator system tensor product.

Proposition 5.2. Let $V$ and $W$ be two local operator systems such that $V=\underset{\leftarrow}{\lim } V_{\alpha}$ and $W=\lim W_{\beta}$. Then corresponding to any operator system tensor product $\eta$, we have a local tensor product $\eta_{l}$ such that $V \otimes_{\eta_{l}} W=\lim _{\longleftarrow} V_{\alpha} \otimes_{\eta} W_{\beta}$.

Proof. From Section 3.3, we know that the $V$ and $W$ are abstract local operator systems with the family of cones $\mathcal{C}_{\alpha}^{n}=\left\{\left(\left(v_{\alpha}\right)_{\alpha}\right)_{i j} \in M_{n}(V):\left(v_{\alpha}\right)_{i j} \in M_{n}\left(V_{\alpha}\right)^{+}\right\}$and $\mathcal{D}_{\beta}^{n}=\left\{\left(\left(w_{\beta}\right)_{\beta}\right)_{i j} \in M_{n}(W):\left(w_{\beta}\right)_{i j} \in M_{n}\left(W_{\beta}\right)^{+}\right\}$, respectively. Since, $\lim V_{\alpha} \otimes_{\eta} W_{\beta}$
is an operator system for each $\alpha$ and $\beta, \lim V_{\alpha} \otimes_{\eta} W_{\beta}$ being the projective limit of operator systems is a local operator system with family of cones defined as $\mathcal{T}_{(\alpha, \beta)}^{n\left(\eta_{l}\right)}=\left\{\left(\left(v_{\alpha} \otimes w_{\beta}\right)_{(\alpha, \beta)}\right)_{i j} \in M_{n}(V \otimes W):\left(\left(v_{\alpha} \otimes w_{\beta}\right)_{i j} \in M_{n}\left(V_{\alpha} \otimes_{\eta} W_{\beta}\right)^{+}\right\}\right.$, that is, $\left.\left(V \otimes_{\eta_{l}} W, \mathcal{T}_{(\alpha, \beta)}^{n\left(\eta_{l}\right)}\right), e_{V} \otimes e_{W}\right)$ is a local operator system. Also, $\mathcal{C}_{\alpha}^{n} \otimes \mathcal{D}_{\beta}^{m} \subseteq \mathcal{T}_{(\alpha, \beta)}^{n m\left(\eta_{l}\right)}$ for all $(\alpha, \beta)$ and $m, n \in \mathbb{N}$. Further note that if $\phi: V \rightarrow M_{n}$ and $\psi: W \rightarrow M_{m}$ are local unital completely positive maps w.r.t $\mathcal{C}_{\alpha}$ and $\mathcal{D}_{\beta}$, then there exist unital completely positive map $\phi_{\alpha}: V_{\alpha} \rightarrow M_{m}$ s.t. $\phi_{\alpha} \circ \pi_{\alpha}=\pi_{m} \circ \phi$ and $\psi_{\beta} \rightarrow M_{n}$ s.t. $\psi_{\beta} \circ \pi_{\beta}=\pi_{n} \circ \psi$. As $\eta$ is a operator system tensor product, so we have $\phi_{\alpha} \otimes \psi_{\beta}: V_{\alpha} \otimes_{\eta} W_{\beta} \rightarrow M_{m n}$ is unital completely positive map. So we have $\phi \otimes \psi$ $: V \otimes W \rightarrow M_{n m}$ is local unital completely positive w.r.t $\mathcal{T}_{(\alpha, \beta)}^{\left(\eta_{l}\right)}$. Thus $\eta_{l}$ is a local operator system tensor product in the sense of Definition 5.1 such that $V \otimes_{\eta_{l}} W=\underset{\leftarrow}{\lim } V_{\alpha} \otimes_{\eta} W_{\beta}$.

Now we will define tensor product of local operator spaces with similar uniform conditions as that of tensor product of operator spaces. For complete details on tensor product of local operator spaces reader may refer [12, Section 3.3].

Definition 5.3. Let $\left(E,\|\cdot\|_{\rho}\right)$ where $\rho \in \Gamma$ and $\left(F,\|\cdot\|_{\sigma}\right)$ where $\sigma \in \Lambda$ be two local operator spaces, we say $\left(E \otimes F,\|.\|_{\delta}\right)$ where $\delta \in \Omega$ with $\Omega \cong \Gamma \times \Lambda$ is local operator spaces tensor product $\tau$ if following conditions are satisfied
(1) $\left(E \otimes F,\|\cdot\|_{\delta}\right)$ is a local operator space.
(2) For any $\rho \in \Gamma, \sigma \in \Lambda$ there exists $\delta \in \Omega$ s.t. $\|e \otimes f\|_{\delta}^{n m} \leq\|e\|_{\rho}^{n}\|f\|_{\sigma}^{m}$ and for any $\delta \in \Omega$ there exist $\rho \in \Gamma$ and $\sigma \in \Lambda$ s.t. $\|e \otimes f\|_{\delta}^{n m} \leq\|e\|_{\rho}^{n}\|f\|_{\sigma}^{m}$
(3) If $\phi: S \rightarrow M_{n}$ and $\psi: T \rightarrow M_{m}$ are local completely bounded maps w.r.t $\rho$ and $\sigma$ resp. then $\phi \otimes \psi: E \otimes F \rightarrow M_{n m}$ is a local completely bounded w.r.t. $(\rho, \sigma)$ and $\|\phi \otimes \psi\|_{(\rho, \sigma)}^{l . c . b} \leq\|\phi\|_{\rho}^{l . c . b}\|\psi\|_{\sigma}^{l . c . b}$.
Recall from Section 2 that every local operator system is also a local operator space whose matrix seminorms are determined by local matrix ordering. Thus it is important to understand the relationship between local operator system tensor products and local operator space tensor products. Let us first look at some elementary facts which are useful.

Lemma 5.4. Let $P, A$ be operators on a quantized domain $D$ obtained by union of Hilbert spaces $H_{\alpha}$ with $P \in C_{\alpha}$. If $\left(\begin{array}{cc}P & A \\ A^{*} & P\end{array}\right) \in C_{\alpha}^{2}$ then $A^{*} A \leq_{\alpha}\|P\|_{\alpha} P$. In particular $\|A\|_{\alpha} \leq\|P\|_{\alpha}$.
Proof. This result can be proven easily by taking two cases $\left.P\right|_{H_{\alpha}}=0$ and $\left.P\right|_{H_{\alpha}} \neq$ 0.

Theorem 5.5. Let $S \subseteq \mathcal{A}$ be local operator system, and let $\mathcal{B}$ be a Pro- $C^{*}$ algebra, and let $\phi: S \rightarrow \mathcal{B}$ be local completely positive say w.r.t. $(\alpha, \beta)$ Then $\phi$ is local completely bounded and $\|\phi(1)\|_{\beta}=\|\phi\|_{(\alpha, \beta)}=\|\phi\|_{(\alpha, \beta)}^{\text {l.c.b }}$
Proof. We have that $\|\phi(1)\|_{\beta} \leq\|\phi\|_{(\alpha, \beta)} \leq\|\phi\|_{\alpha, \beta}^{l . c . b}$, so it is enough to prove $\|\phi\|_{(\alpha, \beta)} \leq\|\phi(1)\|_{\beta}$. Let $A=\left(a_{i j}\right) \in M_{n}(S)$ with $\|A\|_{\alpha} \leq 1 . \quad$ As $\left(\begin{array}{cc}I_{n} & A \\ A^{*} & I_{n}\end{array}\right)$ is local positive w.r.t. $\alpha$ cone, therefore $\phi_{2 n}\left(\left(\begin{array}{ll}I_{n} & A \\ A^{*} & I_{n}\end{array}\right)\right)=\left(\begin{array}{ll}\phi_{n}\left(I_{n}\right) & \phi_{n}(A) \\ \phi_{n}(A)^{*} & \phi_{n}\left(I_{n}\right)\end{array}\right)$ is positive w.r.t $\beta$ cone. And by above lemma we are done.

Proposition 5.6. Let $S$ be a local operator system and $f: S \rightarrow \mathbb{C}$ be a local positive map then $f$ is local completely positive.
Proof. As $f$ is local positive so there exists $\alpha$ s.t. $f\left(C_{\alpha}\right) \geq 0$. Let $\left(a_{i, j}\right) \in C_{\alpha}^{n}$ and $x=\left(x_{1}, x_{2}, . ., x_{n}\right) \in \mathbb{C}^{n}$. We have that $<f\left(\left(a_{i, j}\right)\right) x, x>=f\left(\sum_{i, j} a_{i, j} x_{j} \bar{x}_{i}\right)$ and the summation that $f$ is being evaluated at is the $(1,1)$ entry of element in $C_{\alpha}^{n}$ if $\left(a_{i, j}\right) \in C_{\alpha}^{n}$. Thus $f$ is local completely positive.

Theorem 5.7. Let $S$ be a local operator system contained in a Pro $C^{*}$-algebra $A$ and let $\phi: S \rightarrow \mathbb{C}$ be local positive map then $\phi$ can be extended to local positive map on $A$.

Proof. As we know from Proposition5.6 that every local positive linear functional is local completely positive say w.r.t. $\alpha$, then by Theorem 5.5 $\|\phi\|_{\alpha}=|\phi(1)|=\phi(1)$. By Hahn-Banach theorem $\phi$ has an extension $\tilde{\Phi}: A \rightarrow \mathbb{C}$ such that $\|\tilde{\Phi}\|_{\alpha}=\phi(1)=$ $\tilde{\Phi}(1)$. By Corollary 4.1 in [5] we have $\tilde{\Phi}$ has the required property.

Let $V$ be a local operator space and if $A \in M_{n}$ then $A_{(i, j)}$ denote the $(i, j)$ th entry of $A$. If $\phi: V \rightarrow M_{n}$ is a linear map then we can associate a linear functional $s_{\phi}$ on $M_{n}(V)$ to $\phi$ such that $s_{\phi}\left(\left(a_{i, j}\right)\right)=\frac{1}{n} \sum_{i, j} \phi\left(a_{i, j}\right)_{(i, j)}$. If $V$ contains the unit and $\phi(1)=1$ then $s_{\phi}(1)=1$. Also if $s: M_{n}(V) \rightarrow \mathbb{C}$, then we define $\phi_{s}: V \rightarrow M_{n}$ by $\left(\phi_{s}(a)_{(i, j)}\right)=n . s\left(a \otimes E_{i, j}\right)$ where $E_{i, j}$ is canonical marix with all entries zero except one at $(i, j)$-th place and $a \otimes E_{i, j}$ is in $M_{n}(V)$ with all entries zero except $a$ at the $(i, j)$ th place.

Theorem 5.8. Let $A$ be a Pro-C* algebra with unit 1, let $S$ be a local operator system in $A$ and let $\phi: S \rightarrow M_{n}$. The following are equivalent:
(1) $\phi$ is local completely positive,
(2) $\phi$ is n-local positive,
(3) $s_{\phi}$ is local positive.

Proof. Proof follows on the lines of [9, Theorem 6.1].
Theorem 5.9. Let $A$ be a Pro $C^{*}$-algebra with unit and $S$ be a local operator system contained in $A$, and $\phi: S \rightarrow M_{n}$ local completely positive map. Then there exists a local completely positive map $\psi: A \rightarrow M_{n}$ which extends $\phi$.

Proof. Let $s_{\phi}$ be the local positive linear functional on $M_{n}(S)$ associated with $\phi$ and let $s$ be the local positive linear functional on $M_{n}(A)$ which extends $s_{\phi}$ by Theorem5.7. By Theorem 5.8, we have that the map $\psi$ associated with $s$ is local completely positive. Clearly $\psi$ is the extension of $\phi$ as $s$ is the extenion of $s_{\phi}$.
Lemma 5.10. Let $A$ and $B$ be Pro- $C^{*}$ algebras with unit 1 , let $V$ be a local operator space in $A$ and let $\phi: V \rightarrow B$. Define a local operator system $S_{V}^{l} \subseteq M_{2}(A)$ by $S_{V}^{l}=\left\{\left(\begin{array}{cc}\lambda 1 & v \\ w^{*} & \mu 1\end{array}\right): \lambda, \mu \in \mathbb{C}, v, w \in V\right\}$ and $\Phi: S_{V}^{l} \rightarrow M_{2}(B)$ via $\Phi\left(\begin{array}{cc}\lambda 1 & v \\ w^{*} & \mu 1\end{array}\right)=$ $\left(\begin{array}{cc}\lambda 1 & \phi(v) \\ \phi(w)^{*} & \mu 1\end{array}\right)$. If $\phi$ is local completely contractive then $\Phi$ is local completely positive.

Proof. As $\phi$ is local completely contractive there exist $(\alpha, \beta)$ such that $\phi_{(\alpha, \beta)}: V_{\alpha} \rightarrow$ $B_{\beta}$ is completely contractive where $V_{\alpha}$ is operator space and $B_{\beta}$ is $\mathrm{C}^{*}$-algebra then by lemma 8.1 in 9$]$ we have that $\Phi_{(\alpha, \beta)}: S_{V_{\alpha}} \rightarrow M_{2}\left(B_{\beta}\right)$ is completely positive so we have $\phi$ is local completely positive map.

Theorem 5.11. Let $A$ be a Pro $C^{*}$-algebra with unit and $\phi: A \rightarrow C_{\mathcal{E}}^{*}(D)$ be local completely bounded map. Then there exist local completely positive maps $\phi_{i}$ : $A \rightarrow C_{\mathcal{E}}^{*}(D)$ such that the map $\Phi: M_{2}(A) \rightarrow C_{\mathcal{E}^{2}}^{*}\left(D^{2}\right)$ given by $\Phi\left(\begin{array}{ll}a & b \\ c & d\end{array}\right)=$ $\left(\begin{array}{ll}\phi_{1}(a) & \phi(b) \\ \phi^{*}(c) & \phi_{2}(d)\end{array}\right)$ is local completely positive.
Proof. Using the Lemma 5.10. Theorem 5.9 and [9, Theorem 8.3] proof follows easily.

Proposition 5.12. Let $S$ and $T$ be local operator systems and let $\phi_{i, j}: S \rightarrow T$, $1 \leq i, j \leq n$ be linear maps. Define $\Phi: S \rightarrow M_{n}(T)$ by $\Phi(s)=\left(\phi_{i, j}(s)\right)$ and $\tilde{\Phi}: M_{n}(S) \rightarrow M_{n}(T)$ by $\tilde{\Phi}\left(s_{i, j}\right)=\left(\phi_{i, j}\left(s_{i, j}\right)\right)$. If $\tilde{\Phi}$ is local completely positive then $\Phi$ is local completely positive.

Proof. Define map $\delta: S \rightarrow M_{n}(S)$ by $\delta(s)=\left(s_{i j}\right)$ where $s_{i j}=s$ for all $1 \leq i, j \leq n$ is local completely positive and $\Phi(s)=\tilde{\Phi} \circ \delta(s)$ which implies that $\phi$ is local completely positive map.

Proposition 5.13. Let $S$ and $T$ be local operator systems and let $\tau$ be a local operator system structure on $S \otimes T$. If $\phi: S \rightarrow M_{n}$ and $\psi: T \rightarrow M_{m}$ are local completely positive then $\phi \otimes \psi: S \otimes_{\tau} T \rightarrow M_{n m}$ is local completely positive.
Proof. From 9, Exercise 6.2], there exist local unital completely positive maps $\phi_{1}: S \rightarrow M_{n}$ and $\psi: T \rightarrow M_{m}$ and positive matrices $P \in M_{n}$ and $Q \in M_{m}$ such that $\phi(x)=P \phi_{1}(x) P$ and $\psi(y)=Q \psi_{1}(y) Q$ which further implies that $\phi \otimes \psi(x \otimes y)=$ $(P \otimes Q)\left(\phi_{1} \otimes \psi_{1}(x \otimes y)\right)(P \otimes Q)$. Now by the third property of tensor product of local operator system we have the required result.

Proposition 5.14. Let $S$ and $T$ be local operator systems and let $\tau$ be a local operator system structure on $S \otimes T$. Then the local operator space $S \otimes_{\tau} T$ is a local operator space tensor product of the local operator spaces $S$ and $T$; that is the conditions in Definition 5.3 are satisfied.

Proof. Clearly condition (1) in Definition 5.3 is satisfied. Now we will prove condition (2) is also satisfied. Let $e$ and $f$ denote the local order unit of $S$ and $T$ resp. For condition (2) it will be enough to assume that $\|s\|_{\alpha}^{n} \leq 1$ and $\|t\|_{\beta}^{m} \leq 1$ and show that $\|s \otimes t\|_{(\alpha, \beta)}^{n m} \leq 1$. As $\|s\|_{\alpha}^{n} \leq 1$ so we have $P=\left(\begin{array}{cc}e_{n} & s \\ s * & e_{n}\end{array}\right) \in C_{\alpha}^{2 n}$. Similarly as $\|t\|_{\beta}^{m} \leq 1$ we have $Q=\left(\begin{array}{cc}f_{m} & t \\ t * & f_{m}\end{array}\right) \in D_{\beta}^{2 m}$. Now by using property (2) of tensor product of local operator system we can easily have the condition (2). Now we will prove the condition (3) in Definition 5.3. To prove this condition it will be enough to consider $\|\phi\|_{\alpha}^{l . c . b} \leq 1,\|\psi\|_{\beta}^{l . c . b} \leq 1$. We have that $\|\phi\|_{\alpha}^{l . c . b} \leq 1$ by Theorem 5.11 there exist a local completely positive map $\Phi: M_{2}(S) \rightarrow M_{2}\left(M_{n}\right)$ by $\Phi\left(\begin{array}{ll}s_{11} & s_{12} \\ s_{21} & s_{22}\end{array}\right)=\left(\begin{array}{cc}\phi_{1,1}\left(s_{11}\right) & \phi\left(s_{12}\right) \\ \phi\left(s_{21}^{*}\right)^{*} & \phi_{2,2}\left(s_{22}\right)\end{array}\right)$ where $\phi_{1,1}, \phi_{2,2}: S \rightarrow M_{n}$ are local unital completely positive maps. Also there exists a similar local completely positive map $\Psi: M_{2}(T) \rightarrow M_{2}\left(M_{m}\right)$ with analogues properties. Let $\Phi_{0}=\Phi o \delta: S \rightarrow M_{2}\left(M_{n}\right)$ so that $\Phi_{0}(s)=\left(\begin{array}{cc}\phi_{1,1}\left(s_{11}\right) & \phi\left(s_{12}\right) \\ \phi\left(s_{21}^{*}\right)^{*} & \phi_{2,2}\left(s_{22}\right)\end{array}\right)$ and $\Psi_{0}: T \rightarrow M_{2}\left(M_{m}\right)$ be defined in a similar way. By Proposition 5.12 We have that $\Phi_{0}$ and $\Psi_{0}$ are local completely positive
maps. By Proposition 5.13 $\Phi_{0} \otimes \Psi_{0}: S \otimes_{\tau} T \rightarrow M_{4}\left(M_{m n}\right)$ is local completely positive map and required result is now obvious.

We know that every operator space can be embedded into a operator system completely isometrically [8, Section 3]. We have similar result in case of local operator spaces. If $V \subseteq C_{\mathcal{E}}(D)$ where $D=\cup H_{\alpha}$ then $S_{V}^{l} \subseteq C_{\mathcal{E}^{2}}^{*}\left(D^{2}\right)$ where $D^{2}=\cup H_{\alpha} \oplus H_{\alpha}$ is the local operator system given by

$$
S_{V}^{l}=\left\{\left(\begin{array}{cc}
\lambda I & v \\
w^{*} & \mu I
\end{array}\right): \lambda, \mu \in \mathbb{C} ; v, w \in V\right\}
$$

We see $V \subseteq S_{V}^{l}$ via the inclusion $v \rightarrow\left(\begin{array}{ll}0 & v \\ 0 & 0\end{array}\right)$
Remark 5.15. If $V=\lim _{\leftarrow} V_{\alpha}$ then $S_{V}^{l} \cong \lim _{\leftarrow} S_{V_{\alpha}}$ in local complete isomporphism sense.

Definition 5.16. Let $X$ and $Y$ be local operator spaces, and $\tau$ be a local opeartor systems structure on $S_{X}^{l} \otimes S_{Y}^{l}$. Then the embedding $X \otimes Y \subseteq S_{X}^{l} \otimes_{\tau} S_{Y}^{l}$ endows $X \otimes Y$ with a local opeartor space structure; we call the resulting local operator space the induced local operator space tensor product of $X$ and $Y$ and denote it by $X \otimes^{\tau} Y$

Proposition 5.17. let $X$ and $Y$ be local operator spaces and $\tau$ be a local operator system structure on $S_{X}^{l} \otimes S_{Y}^{l}$ and let $X \otimes^{\tau_{l}} Y$ be the induced local operator space tensor product. Then $X \otimes^{\tau} Y$ is a local operator space tensor product in the sense of Definition 5.3.
Proof. Clearly first condition is satisfied. Second condition is also satisfied from Proposition 5.14 and the fact that the inclusion $X \subseteq S_{X}^{l}$ and $Y \subseteq S_{Y}^{l}$ are local complete isometry. Now we will see third condition can be proven easily using Lemma 5.10 and Property (3) of tensor product of local operator system.
5.1. The minimal tensor product. In this subsection, we give a construction of the local operator system tensor product lmin, which is minimal among all local operator system tensor products.

Let $\left(V,\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}, e_{V}\right)$ and $\left(W,\left\{\left\{\mathcal{D}_{\beta}^{n}\right\}_{n=1}^{\infty}: \beta \in \Lambda\right\}, e_{W}\right)$ be local operator systems. For each $\alpha \in \Gamma, \beta \in \Lambda, n \in \mathbb{N}$, define

$$
\begin{aligned}
\mathcal{T}_{(\alpha, \beta)}^{n(1 \operatorname{lnin})}:= & \left\{\left(p_{i j}\right) \in M_{n}(V \otimes W):\left((\phi \otimes \psi)\left(p_{i, j}\right)\right) \in M_{n k m}^{+}, \text {for all } \phi: V \rightarrow M_{k}\right. \\
& \text { local unital completely positive map w.r.t. cone } \mathcal{C}_{\alpha}, \psi: W \rightarrow M_{m} \\
& \text { local unital completely positive map w.r.t. cone } \left.\mathcal{D}_{\beta} \text { for all } k, m \in \mathbb{N}\right\}
\end{aligned}
$$

Lemma 5.18. Let $\left(V,\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}, e_{V}\right)$ be a local operator system and $A \in$ $M_{n}(V)$. If $\phi^{(n)}(A) \in M_{n k}^{+}$for every $k \in \mathbb{N}$ and for every $\phi \in S_{k}^{\alpha}(V)$ where $S_{k}^{\alpha}(V)$ denotes the set of local unital completely positive maps $\Phi: V \rightarrow M_{k}$ w.r.t. cone $\mathcal{C}_{\alpha}$, then $A \in \mathcal{C}_{\alpha}^{n}$.
Proof. By Theorem 3.12, we may assume that $V \subseteq C_{\mathcal{E}}^{*}(D)$ where $D=\cup H_{\alpha}$. Suppose that $A=\left(a_{i j}\right) \in M_{n}(V)$ and $\phi^{(n)}(A) \in M_{n k}^{+}$for every $\phi \in S_{k}^{\alpha}(V)$ and $k \in \mathbb{N}$. Let $\xi=\left(\xi_{1}, \xi_{2}, \ldots, \xi_{n}\right) \in H_{\alpha}^{n}$ and $\phi: V \rightarrow M_{n}$ be the mapping given by $\phi(x)=\left\langle x \xi_{j}, \xi_{i}\right\rangle_{i, j}$. We can easily show that $\phi$ is local completely positive map w.r.t $\mathcal{C}_{\alpha}$ hence $\phi^{(n)}(A)=\left(\phi\left(a_{i j}\right)\right)_{i, j} \in M_{n^{2}}$ which further implies that $\left.A\right|_{H_{\alpha}} \in$ $M_{n}\left(B\left(H_{\alpha}\right)\right)^{+}$.

Lemma 5.19. Let $\left(V,\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}, e_{V}\right)$ and $\left(W,\left\{\left\{\mathcal{D}_{\beta}^{n}\right\}_{n=1}^{\infty}: \beta \in \Lambda\right\}, e_{W}\right)$ be local operator systems and $A \in M_{n}(V) \otimes W$. If $\left(\phi^{(n)} \otimes \psi\right)(A) \geq 0$ for all $\phi \in S_{\infty}^{\alpha}(V)$ and all $\psi \in S_{\infty}^{\beta}(T)$, then $(\Phi \otimes \psi)(A) \geq 0$ for all $\Phi \in S_{\infty}^{\alpha}\left(M_{n}(V)\right)$ and all $\psi \in S_{\infty}^{\beta}(W)$ where $S_{\infty}^{\alpha}(V)=\cup S_{k}^{\alpha}(V)$.
Proof. This lemma can be easily proven using Lemma 5.18 and [8, Lemma 4.2].
Lemma 5.20. If $\phi \in S_{\infty}^{\alpha}(V)$ and $\psi \in S_{\infty}^{\beta}(W)$ then $(\phi \otimes \psi)^{(n)}=\phi^{(n)} \otimes \psi$.
Proof. It is sufficient to check the equality on elementary tensors of the form $A=$ $X \otimes y$, where $X=\left(x_{i j}\right) \in M_{n}(V)$ and $y \in W$. For such a $A$, we have that $\left(\phi^{(n)} \otimes \psi\right)(A)=\left(\phi\left(x_{i j}\right)\right)_{i j} \otimes \psi(y)$. On the other hand, $(\phi \otimes \psi)^{(n)}(A)=((\phi \otimes$ $\left.\psi)\left(x_{i j} \otimes y\right)\right)_{i j}=\left(\phi\left(x_{i j}\right) \otimes \psi(y)\right)_{i j}$.
Theorem 5.21. Let $\left(V,\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}, e_{V}\right)$ and $\left(W,\left\{\left\{\mathcal{D}_{\beta}^{n}\right\}_{n=1}^{\infty}: \beta \in \Lambda\right\}, e_{W}\right)$ be local operator systems and let $i_{V}: V \rightarrow C_{\mathcal{E}}^{*}(D)$ and $i_{W}: W \rightarrow C_{\mathcal{G}}^{*}(F)$ be embedding that are local unital complete order isomorphism onto their ranges. The family $\left\{\left\{\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmin})}\right\}_{n=1}^{\infty}:(\alpha, \beta) \in \Gamma \times \Lambda\right\}$ is the local operator system structure on $V \otimes W$ arising from the embedding $i_{V} \otimes i_{W}: V \otimes W \rightarrow C_{\mathcal{E} \times \mathcal{G}}^{*}(D \otimes F)$ and we have $D \otimes F \cong \cup_{(\alpha, \beta) \in \Gamma \times \Lambda} H_{\alpha} \otimes K_{\beta}$ where $D=\cup H_{\alpha}$ and $F=\cup K_{\beta}$.
Proof. Let $R \in \mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmin})}(V, W)$. We show that $\left(i_{V} \otimes i_{W}\right)^{(n)}(R) \in\left(C_{\mathcal{E} \times \mathcal{G}}^{*}(D \otimes\right.$ $\left.F)^{n}\right)_{(\alpha, \beta)}^{+}$. Say $S=\left(i_{V} \otimes i_{W}\right)^{(n)}(R)$, we need to show that $\left.S\right|_{\left(H_{\alpha} \otimes K_{\beta}\right)^{n}} \geq 0$. Suppose that $S=\sum_{r=1}^{l} X_{r} \otimes y_{r}$, where $X_{r} \in M_{n}\left(i_{V}(V)\right)$ and $y_{r} \in i_{W}(W)$ for $r=1,2, . ., l$. Let $\xi_{s} \in H_{\alpha}^{n}$ and $\eta_{s} \in K_{\beta}$ for $s=1,2, . ., k$. and set $\xi=\sum_{s=1}^{k} \xi_{s} \otimes \eta_{s}$. Let $\Phi$ : $M_{n}\left(i_{V}(V)\right) \rightarrow M_{k}$, where $E_{\alpha}=\left\{T \in C_{\mathcal{E}}^{*}(D):\left.T\right|_{H_{\alpha}} \geq 0\right\}$ cones in $i_{V}(V)$; given by $\left(\Phi\left(\left(X_{i j}\right)_{i, j}\right)\right)_{s, t}=\left\langle\left(X_{i j}\right) \xi_{t}, \xi_{s}\right\rangle_{s, t}$ and let $\psi: i_{W}(W) \rightarrow M_{k}$ where $F_{\beta}=\{T \in$ $\left.C_{\mathcal{F}}^{*}(G):\left.T\right|_{K_{\beta}} \geq 0\right\}$ cones in $i_{W}(W)$; given by $(\psi(y))_{s, t}=\left\langle y \eta_{t}, \eta_{s}\right\rangle_{s, t}$. As in the proof of Lemma 5.18, $\Phi$ and $\psi$ are local completely positive w.r.t. cones $E_{\alpha}$ and $F_{\beta}$, respectively. Since $S \in \mathcal{T}_{(\alpha, \beta)}^{n(\min )}\left(i_{V}(V), i_{W}(W)\right)$ say $S=\left(s_{i j}\right)$. By Lemma 5.20, $\left(\phi_{0}^{(n)} \otimes \psi_{0}\right)\left(s_{i j}\right) \in M_{n k^{2}}^{+}$for all $\phi_{0}: i_{V}(V) \rightarrow M_{k}$ local unital completely positive maps w.r.t. $E_{\alpha}$ and all $\psi_{0}: i_{W}(W) \rightarrow M_{k}$ local unital completely positive maps w.r.t $F_{\beta}$. By Lemma 5.19, $(\Phi \otimes \psi(S)) \geq 0$. It follows that $\left.S\right|_{\left(H_{\alpha} \otimes K_{\beta}\right)^{n}} \in$ $\left(B\left(H_{\alpha} \otimes K_{\beta}\right)^{n}\right)^{+}$and thus claim is proved. We now prove the converse part. Let $T_{(\alpha, \beta)}^{n}$ is a cone in $M_{n}(V \otimes W)$ arising from the inclusion $i_{V}(V) \otimes i_{W}(W)$ into $C_{(\mathcal{E} \times \mathcal{G})}^{*}(D \otimes F)$. We show that $T_{(\alpha, \beta)}^{n} \subseteq \mathcal{T}_{(\alpha, \beta)}^{n(\min )}$. Suppose that $\phi: V \rightarrow M_{m}$ and $\psi: W \rightarrow M_{k}$ are local unital completely positive maps w.r.t $\mathcal{C}_{\alpha}, \mathcal{D}_{\beta}$ respectively. As $\phi$ and $\psi$ are local unital completely positive maps so there exist $\phi_{\alpha}: V_{\alpha} \rightarrow M_{m}$ and $\psi_{\beta}: W_{\beta} \rightarrow M_{n}$ unital completely positive map. Clearly, $\phi_{\alpha}$ and $\phi_{\alpha}$ are unital complete order isomorphisms onto their range. Now by using Arveson's extension theorem and $C^{*}$ - algebra theory we can easily have that $(\phi \otimes \psi)^{(n)}\left(p_{i j}\right) \in M_{n k m}^{+}$ Hence we have $T_{(\alpha, \beta)}^{n}=\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmin})}$. So $\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmin})}$ is local operator system structure on $V \otimes W$ with Archimedean matrix order unit $e_{V} \otimes e_{W}$.
Definition 5.22. We call $\left(V \otimes W,\left\{\left\{\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmin})}\right\}_{n=1}^{\infty}:(\alpha, \beta) \in \Gamma \times \Lambda\right\}, e_{V} \otimes e_{W}\right)$ the minimal local tensor product of $V$ and $W$ and denote it by $V \otimes_{\operatorname{lmin}} W$.

Corollary 5.23. Let $\left(V,\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}, e_{V}\right)$ and $\left(W,\left\{\left\{\mathcal{D}_{\beta}^{n}\right\}_{n=1}^{\infty}: \beta \in \Lambda\right\}, e_{W}\right)$ be local operator systems then $\mathcal{T}_{(\alpha, \beta)}^{n(1 \operatorname{lmin})}$ is the minimal local operator system tensor product structure of $V$ and $W$.
Proof. Let $T_{(\alpha, \beta)}^{n}$ be a local operator system tensor product on $V \otimes W$ and denote it by $V \otimes_{l \eta} W$. Let $\Phi: V \otimes_{l \eta} W \rightarrow V \otimes_{(1 \min )} W$ be the identity map. By using condition (3) in Definition 5.1, we have $T_{(\alpha, \beta)}^{n} \subseteq \mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmin})}$ for every $n \in \mathbb{N}$. Thus $\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmin})}$ is the minimal structure.

Corollary 5.24. The mapping lmin: $\mathcal{L O} \times \mathcal{L O} \rightarrow \mathcal{L O}$ sending $(V, W)$ to $V \otimes_{\operatorname{lmin}}$ $W$ is an injective, associative, symmetric, functorial local operator system tensor product.
Remark 5.25. $V \otimes_{\operatorname{lmin}} W \cong \lim _{\leftarrow} V_{\alpha} \otimes_{\min } W_{\beta}=V \otimes_{\min _{l}} W$; where $V=\lim _{\leftarrow} V_{\alpha}$ and $W=\lim _{\leftarrow} W_{\beta}$, and $\min _{l}$ is the tensor product in the sense of Proposition 5.2,

Proposition 5.26. Let $V$ and $W$ be A.L.O. $U$ spaces and tensor product $V \otimes W$ is equipped with the family of cones as $Q_{\min }^{(\alpha, \beta)}=\{u \in V \otimes W:(f \otimes g)(u) \geq 0$ for all $f \in$ $\left.S^{\alpha}(V), g \in S^{\beta}(W)\right\}$. Then $\operatorname{LOMIN}(V) \otimes_{l m i n} \operatorname{LOMIN}(W)=\operatorname{LOMIN}(V \otimes W)$.

Proof. We have $\operatorname{LOMIN}(V) \subseteq C(X)$ where $X=\cup S^{\alpha}(V)$. Similarly we have $\operatorname{LOMIN}(W) \subseteq C(Y)$ where $Y=\cup S^{\beta}(W)$. By injectivity of $l m i n$, we have that $\operatorname{LOMIN}(V) \otimes_{l \text { min }} \operatorname{LOMIN}(W)$ is a local operator subsystem of $C(X) \otimes_{l m i n} C(Y)$. Denote the matrix ordering on $\operatorname{LOMIN}(V \otimes W)$ by $\left\{Q_{n}^{(\alpha, \beta)}\right\}$ and matrix ordering on $\operatorname{LOMIN}(V) \otimes_{\text {lmin }} \operatorname{LOMIN}(W)$ by $\left\{D_{n}^{(\alpha, \beta)}\right\}$. Since $\operatorname{LOMIN}(V \otimes W)$ is the minimal local operator system structure $\left(V \otimes W, Q_{\min }^{(\alpha, \beta)}\right)$, we have that $D_{n}^{(\alpha, \beta)} \subseteq Q_{n}^{(\alpha, \beta)}$ for all $n \in \mathbb{N}$. Now we will show that reverse inclusion also holds. Suppose that $X=\left(x_{i j}\right) \in Q_{n}^{(\alpha, \beta)}$, we have that $\sum_{i, j=1}^{n} \bar{\lambda}_{i} \lambda_{j} x_{i, j} \in Q_{\min }^{(\alpha, \beta)}$ for all $\lambda_{1}, \lambda_{2}, \ldots, \lambda_{n} \in \mathbb{C}$. Let $\lambda=\left(\lambda_{1}, \ldots, \lambda_{n}\right)^{t}$ and we have that for $f \in S^{\alpha}(V)$ and $\left.g \in S^{\beta}(W),<(f \otimes g)\left(x_{i, j}\right)\right)_{i, j} \lambda, \lambda>=\sum_{i, j=1}^{n} \bar{\lambda}_{i} \lambda_{j}(f \otimes g)\left(x_{i j}\right) \geq 0$. It implies that $X \in D_{n}^{(\alpha, \beta)}$.
5.2. The maximal tensor product. We now construct the maximal local operator system tensor product and prove that this is in fact maximal tensor product structure possible in the category of local operator systems.

Let $\left(V,\left\{\left\{\mathcal{C}_{\alpha}^{n}\right\}_{n=1}^{\infty}: \alpha \in \Gamma\right\}, e_{V}\right)$ and $\left(W,\left\{\left\{\mathcal{D}_{\beta}^{n}\right\}_{n=1}^{\infty}: \beta \in \Lambda\right\}, e_{W}\right)$ be two local operator systems. For each $n \in \mathbb{N}$ and $(\alpha, \beta) \in \Gamma \times \Lambda$, define

$$
\mathcal{K}_{(\alpha, \beta)}^{n(\max )}:=\left\{\alpha(P \otimes Q) \alpha^{*}: P \in \mathcal{C}_{\alpha}^{k} \text { and } Q \in \mathcal{D}_{\beta}^{m}, \alpha \in M_{n, k m}, k, m \in \mathbb{N}\right\}
$$

Lemma 5.27. For local operator systems $V$ and $W$ be local operator systems and $\left\{T_{\gamma}^{n}: \gamma \in \Omega\right\}$ be a compatible collection of cones, where $T_{\gamma}^{n} \subseteq M_{n}(V \otimes W)$ satisfies (2) in Definition 5.1. Then for each $\gamma \in \Omega$ there exist $(\alpha, \beta) \in \Gamma \times \Lambda$ such that $\mathcal{K}_{(\alpha, \beta)}^{n(\operatorname{lmax})} \subseteq T_{\gamma}^{n}$ for each $n \in \mathbb{N}$.
Proof. By condition (2), we have for any $\gamma$ there exist $\alpha$, $\beta$ s.t. $P \otimes Q \in T_{\gamma}^{k m}$ where $P \in \mathcal{C}_{\alpha}^{k}$ and $Q \in \mathcal{D}_{\beta}^{m}$ for any $k, m \in \mathbb{N}$. The compatibility of $\left\{T_{\gamma}^{n}\right\}$ implies that $\lambda(P \otimes Q) \lambda^{*} \in T_{\gamma}^{n}$ for every $\lambda \in M_{n, k m}$. Thus $\mathcal{K}_{(\alpha, \beta)}^{n(\operatorname{lmax}} \subseteq T_{\gamma}^{n}$.

Proposition 5.28. For any two local operator systems $V$ and $W$, the family $\left\{\left\{K_{(\alpha, \beta)}^{n(\operatorname{lmax})}\right\}_{n=1}^{\infty}:(\alpha, \beta) \in \Gamma \times \Lambda\right\}$ is a matrix ordering on $V \otimes W$ with order unit $e_{V} \otimes e_{W}$.
Proof. Since for any $X \in M_{n, m}, X^{*} K_{(\alpha, \beta)}^{n(\operatorname{lmax})} X \subseteq K_{(\alpha, \beta)}^{m(\operatorname{lmax})}$ proof follows immediately.

Definition 5.29. Let $\left\{\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmax})}\right\}_{n=1}^{\infty}$ be the Archimedeanization of the matrix ordering $\left\{K_{(\alpha, \beta)}^{n(\operatorname{lmax})}\right\}_{n=1}^{\infty}$ for local operator systems $V$ and $W$, we call the local operator system $\left(V \otimes W,\left\{\left\{\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmax})}\right\}_{n=1}^{\infty}:(\alpha, \beta) \in \Gamma \times \Lambda\right\}, e_{V} \otimes e_{W}\right)$ the maximal local operator system tensor product of $V$ and $W$ and denote it by $V \otimes_{\operatorname{lmax}} W$.

Proposition 5.30. Let $V$ and $W$ be local operator systems. Then $V \otimes_{\operatorname{lmax}} W$ is local operator system tensor product. Moreover, if $l \tau$ is a local operator system tensor product structure on $V \otimes W$, then $\operatorname{lmax}$ is larger than $l \tau$.
Proof. Let $V$ and $W$ be local operator system. By its definition, the family $\left\{\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmax})}\right\}_{n=1}^{\infty}$ satisfies property (1) and (2) of Definition 5.1. Since $\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmax})} \subseteq$ $\mathcal{T}_{(\alpha, \beta)}^{n(\ln \mathrm{~min})}$ it follows that $V \otimes_{\operatorname{lmax}} W$ satisfies property (3). In fact, lmax is maximal local operator system tensor product follows from Lemma 5.27,

Following now follows immediately [8, theorem 5.5].
Theorem 5.31. The mapping $\operatorname{lmax}: \mathcal{L O} \times \mathcal{L O} \rightarrow \mathcal{L O}$ sending $(V, W)$ to $V \otimes_{\operatorname{lmax}} W$ is a symmetric, associative, functorial local operator system tensor product.

Remark 5.32. Let $V$ and $W$ be two local operator systems s.t. $V=\underset{\sim}{\lim } V_{\alpha}$ and $W=\lim _{\longleftarrow} W_{\beta}$. Then we have $V \otimes_{\operatorname{lmax}} W \cong \lim _{\longleftarrow} V_{\alpha} \otimes_{\max } W_{\beta}=V \otimes_{\max } \overleftarrow{W}$. Define $\phi: V \otimes_{\operatorname{lmax}} W \rightarrow \lim _{\longleftarrow} V_{\alpha} \otimes_{\max } W_{\beta}$ by $\phi\left(\left(v_{\alpha}\right) \otimes\left(w_{\beta}\right)\right)=\left(v_{\alpha} \otimes w_{\beta}\right)$. So we have here that $\mathcal{T}_{(\alpha, \beta)}^{n\left(\max _{l}\right)} \subseteq \mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmax}))}$ as let $p \in \mathcal{T}_{(\alpha, \beta)}^{n\left(\max _{l}\right)}$ so we have $(p)_{(\alpha, \beta)} \in V_{\alpha} \otimes_{\max } W_{\beta}$ and by definition of operator system max tensor product, there exist $\lambda \in M_{m k, n}$ s.t. $(p)_{(\alpha, \beta)}=\lambda^{*}\left(v_{\alpha} \otimes w_{\beta}\right) \lambda$ where $v_{\alpha} \in\left(V_{\alpha}\right)_{m}^{+}$and $w_{\beta} \in\left(W_{\beta}\right)_{k}^{+}$so we have $p=\lambda^{*}\left(\left(v_{\alpha}\right) \otimes\left(w_{\beta}\right)\right) \lambda$ where $v_{\alpha} \in\left(V_{\alpha}\right)_{m}^{+}$and $w_{\beta} \in\left(W_{\beta}\right)_{k}^{+}$. Hence, we have $p \in$ $\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmax}))}$. On the other hand, we have $\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmax})} \subseteq \mathcal{T}_{(\alpha, \beta)}^{\left.n\left(\max _{l}\right)\right)}$ by using maximality of $\mathcal{T}_{(\alpha, \beta)}^{n(\operatorname{lmax})}$.

If $X$ and $Y$ are local operator spaces, then we let $X \otimes_{\wedge} Y$ denote the local operator space projective tensor product. We refer the reader to [12, Section 3] for more details of this tensor product.

Theorem 5.33. Let $X$ and $Y$ be local operator spaces. Then $X \otimes^{l m a x} Y$ coincides with the local operator space projective $X \otimes_{\wedge} Y$.

Proof. This result can be done on the same lines [8, Theorem 5.9] with seminorms.

Proposition 5.34. Let $\left(V,\left\{V_{\alpha}^{+}\right\}\right)$and $\left(W,\left\{W_{\beta}^{+}\right\}\right)$be A.L.O.U spaces. Equip the tensor product $V \otimes W$ with the Archimedeanization of the cone $P_{\text {lmax }}^{(\alpha, \beta)}=\left\{\sum_{i=1}^{k} v_{i} \otimes\right.$ $w_{i}: v_{i} \in V_{\alpha}^{+}, w_{i} \in W_{\beta}^{+}$and $\left.k \in \mathbb{N}\right\}$. Then $\operatorname{LOMAX}(V) \otimes_{\operatorname{lmax}} \operatorname{LOMAX}(W)=$ $L O M A X(V \otimes W)$.

Proof. We have that local matrix ordering on $\operatorname{LOMAX}(V)$ is the Archimeanization of $\left\{D_{n}^{l \max (\alpha)}(V)\right\}_{n=1}^{\infty}$ where $D_{n}^{l \max (\alpha)}(V)=\left\{\sum_{j=1}^{k} a_{j} \otimes v_{j}, a_{j} \in M_{n}^{+}, v_{j} \in\right.$ $\left.V_{\alpha}^{+}, k \in \mathbb{N}\right\}$. Similarly we have $\left\{D_{n}^{l \max (\beta)}(W)\right\}_{n=1}^{\infty}$ with resp. to the cone $W_{\beta}^{+}$and $\left\{D_{n}^{l \max (\alpha, \beta)}(V \otimes W)\right\}_{n=1}^{\infty}$ with respect to cone $P_{l \operatorname{lmax}}^{(\alpha, \beta)}$. For the required result we need to show that $D_{n}^{l \max (\alpha, \beta)}(V \otimes W)=\left\{A(P \otimes Q) A^{*}: P \in D_{k}^{l \max (\alpha)}(V), Q \in\right.$ $\left.D_{m}^{l \max (\beta)}(W), A \in M_{n, k m}\right\}$. Let $D_{n}^{(\alpha, \beta)}$ denotes the right hand side of the last equation. If $a_{j} \in M_{n}^{+}$and $\sum_{i=1}^{k_{j}} v_{i}^{j} \otimes w_{i}^{j} \in P_{l m a x}^{(\alpha, \beta)}, j=1, . ., l$ where $v_{i}^{j} \in V_{\alpha}^{+}$and $w_{i}^{J} \in W_{\beta}^{+}$then $\sum_{j=1}^{l} a_{j} \otimes\left(\sum_{i=1}^{k_{j}} v_{i}^{j} \otimes w_{i}^{j}\right)=\sum_{j, i} a_{j} \otimes v_{i}^{j} \otimes w_{i}^{j}$. Since $\sum_{i} a_{j} \otimes v_{i}^{j} \in$ $D_{n}^{l \max (\alpha)}(V)$ for each $j$ we have that $\sum_{j, i} a_{j} \otimes v_{i}^{j} \otimes w_{i}^{j} \in D_{n}^{(\alpha, \beta)}(V)$. Thus we have that $D_{n}^{l \max (\alpha, \beta)}(V \otimes W) \subseteq D_{n}^{(\alpha, \beta)}$. Now we will prove the other containment, which is obvious using the compatibility of the family $\left\{D_{n}^{l \max (\alpha, \beta)}(V \otimes W)\right\}$.

Remark 5.35. One can also relate the notion of nuclearity to the category of local operator system. Let $\left\{V_{\alpha}: \alpha \in \Gamma\right\}$ be projective system of $(\eta, \gamma)$-nuclear operator systems then it follows from Proposition 5.2 that, $V=\lim _{\longleftarrow} V_{\alpha}$ is a $\left(\eta_{l}, \gamma_{l}\right)$-nuclear local operator system.
